Taking this database logic one step further, what I suggest is that this third synthesis of time that already appears in the *Time-Image* (in a more or less disguised form) is the dominant sign of time under which cinema's images of the digital age are formed much more explicitly, and which allows for the conceptualisation of a third image type, that I propose to call the neuro-image. The serial and remixing logic of the database has become the dominant logic, corresponding to the temporal logic of the third synthesis under which the neuro-image is constructed. Of course there are still movement-images that operate under the logic of the rational cut, continuity editing and the integration of sequences into a whole (Deleuze 1989: 277), and are based in the first passive synthesis of time. And obviously time-images also find new directors whose work is grounded in the second synthesis of time reigned by the incommensurable or irrational cut of the coexisting layers of the pure past (277). But, arguably, the heart of cinema has moved into a database logic connected to the third synthesis of time. It is an impure image regime, because it repeats and remixes all previous image regimes (the movement-image and the time-image) as well as its temporal orders, but ungrounds all these orders due to the dominance of the third synthesis. In the larger project from which this paper is derived I explain more fully why these third type of images, could be called neuro-images.[3] Put in a very concise way, this has to do with an explicit reference to Deleuze's suggestion that 'the brain is the screen' and his call for looking at the biology of the brain for assessing the audio-visual image. Here, I simply want to emphasise that the starting point of the neuro-image is a change in cinema, where we slowly but surely have moved from following characters' actions (movement-image), to seeing the world filtered through their eyes (time-image), to experiencing directly their mental landscapes (neuro-image).

VII. Flashforward: The Neuro-Image from the Future

Some typical examples of contemporary neuro-images where we have moved quite literally in the character's brain world include *Source Code* (Jones 2011), which is announced with the pun 'an action flick with brains', and *Inception (Nolan 2010)*, where a whole team of dream invaders try to implant (or incept) one little thought in someone's mind that might change the future. *Avatar* (Cameron 2009) is another case in point of 'brain power' in cinema, where the avatars are operated by brain activity. And of course there is the world of the precogs appearing on the tactile screens in *Minority Report* (Spielberg 2002)

that predict future crimes. Typically in these films we see people hooked up to a kind of brain-scanning machine. Yet even when this is not so literally emphasised, contemporary cinema has become a mental cinema that differs in major ways from previous dominant modes of filming. Focusing only on the temporal dimensions of these images, it becomes evident that the future plays an important role that can be expressed on many different levels. In *Minority Report*, crime prevention is based on crimes that are about to happen, predicted by savants with the power of predicting the future. So the future is part of the narrative. The main character in *Source Code* acts with increasing knowledge of the future, every time he relives a variation of the past. If we think of *Inception*, it is possible to argue that the whole story is actually told from a point of view of the future. At the beginning of the film, the main characters meet when they are very old. At the end of the narrative, we return to this point, indicating that actually everything was told from this future moment of old age and even the moment of their death. Here, the future structures the narration. In a different way, *Avatar* is told from the point of view of the future of the planet. These are all examples from contemporary Hollywood, by and large still characterised by the movement-image (so we also still have typical characteristics of the temporal dimensions of the first synthesis of time, such as the sensorimotor orientation and genre expectations). But a different temporal order of repetition and difference, eternal return and serialisation with much more complexity typical for the digital age has definitively made its way to the cinema screen.

The American television series *FlashForward* is another interesting contemporary example of a neuro-image (with movement-image tendencies) that is told from the point of view of the future. *FlashForward* is based on the science fiction novel of the same name by Robert Sawyer (1999) in which the main character is a scientist who works at CERN, where the Large Hadron Collider particle accelerator is performing a run to search for the Higgs boson, with the side effect of a global blackout during which all people on earth have a flashforward of twenty-two years. The television series adds other main characters and changes the leap forward in time into six months, but the basic premise remains the same: everybody is confronted with an image from the future. The show questions the idea of what it is to live and act from a vision of the future. Since the future as such is always speculative (we just simply cannot know for sure what will happen in the future so it is not a matter of determinism even though destiny becomes an important

problem), some fear their vision will come true, others fear it will not come true; but all have to act in respect to their flashforward. As in *Hiroshima Mon Amour*, in *FlashForward* there is a collision between a collective fate and the fate of individuals, but the television series presents us with a much more mosaic story that is typical for the neuro-image's database narrative (presenting the countless possible variations of the future). Quite literally we see here how the idea of the future has now started to inform our image culture. We can also see this perspective of our present and past from an idea of a vision of the future more broadly in culture: since 9/11 the War on Terror has marked the moment of preventive war, tests that measure the telomeres in our DNA can predict the age of death, and the ecological future of the planet is more uncertain than ever. Again, there is more to say about the ways in which the neuro-image resonates with larger developments in contemporary culture.

At this point I will just make a few more comparative observations between the future in *FlashForward*, or, more generally, the future from the third synthesis of time in the neuro-image and the future in *Hiroshima Mon Amour*, or the future based in the second synthesis of time. In both *Hiroshima Mon Amour* and *FlashForward* the disaster is in fact caused by a scientific invention: the atomic bomb and the Large Hadron Collider, respectively. However, in *Hiroshima Mon Amour*, as we have seen, future disasters are imagined from this past event: it has happened; it will happen again. *FlashFoward* actually deals with speculations about a future disaster: we do not know if the Large Hadron Collider will create any effect as described. Most scientists agree that it will absolutely not provide anything like a blackout, let alone a leap in consciousness into the future. Nevertheless, it clearly poses the whole narrative as a dimension of the future. On a more individual scale, *Hiroshima Mon Amour* deals with the horror of forgetting the most intensive and unforgettable love affair of the past or that will become past. In *FlashForward* the horror (or surprise) is situated in the future. Some characters see themselves in the future in another love affair, something unimaginable in the present. In all cases, the future influences the present in *FlashForward*, just as much as the past influences the present in *Hiroshima Mon Amour*.

Now, one may object that *Hiroshima Mon Amour* and *FlashForward* are absolutely incomparable. And of course this is true. *Hiroshima Mon Amour* is an absolute masterpiece of modern cinema, a pure time-image in the Deleuzian sense, and an ostensive image (with naked references) in Rancière's terms. As I have argued at the beginning of this paper,

Hiroshima Mon Amour does not seem to fit Rancière's own classification and arguments for modern cinema as playfully critical, and impure in the sense that commercial and artistic images are mixed. I have tried to argue that Rancière's very useful classification does not match very well with the cinematographic examples upon which he draws, which are all time-images based in the second synthesis of time. The future of the image, as defined by Rancière, asks to move beyond the time-image into a new and impure regime of imageness where the commercial and the artistic are increasingly mixed. The neuro-image I here propose, in following Deleuze's suggestions to explore cinema's temporal dimensions (Deleuze 2000: 372) as part of the contemporary Hollywood machine, is such an impure image. But the neuro-image can also present itself in a more artistic way, which remains perhaps closer to the time-image, but which is rather found in the museum, gallery or on the Internet.

After Hiroshima Mon Amour (Kolbowski 2008) is a digital film presented as a museum installation that can also be viewed online. This film is an example of a critical and artistic remixing and operation on the image that would be closer to Rancière's third category of future-images. But, just like the key films in contemporary Hollywood, this film is a neuro-image in its temporal dimensions. Kolbowski's film repeats *Hiroshima Mon Amour* from the point of view of different future disasters (in this case the War in Iraq and the Katrina disaster in New Orleans); the allegorical love affair of the French woman and Japanese man is serialised and played by ten different actors of various ethnicities, races and genders. The famous opening scene of the 'ashembrace' is slowed down, made to stutter and filtered with colours; various scenes of the original film are recreated in black and white; contemporary material downloaded from the Internet is added, and the score and sound design of the original film is remixed. In this way the audio-visual relations become relations of time: while the texts address the past by recalling the exact dialogues of *Hiroshima Mon Amour* ('You have seen nothing in Hiroshima'), the images speak from repetitions in the future (images of soldiers' video diaries in Iraq), of multiplication of the wars and love affairs in an eternal return. With the concept of the neuro-image, that can take both artistic characteristics of the time-image and classical Hollywood characteristics of the movement-image, but which remixes, reorders and serialises these images in new ways, we can see how we have entered an image-type of the third synthesis of time, which speaks from the future, but which itself also indicates that the future is now.

Notes

1. This paper is a companion piece to 'Synaptic Signals' (Pisters 2011), which focuses on the schizoanalytic aspects of the neuro-image.
2. I do not mean to say that Rancière and Deleuze make a similar argument about the image. Rancière is more concerned with a political–aesthetical dialectics between the visible and the sayable, the visible and the invisible. Deleuze addresses the ontological problem of the complex temporal dimensions of cinema, the virtual and the actual (which is not the same as a play between the visible and the invisible). In a way, I try to develop a temporal ontology for the future of the image described by Rancière on a different level.
3. A fuller argument on the neuro-image is developed in Pisters (2012, in press).

A Criminal Intrigue: An Interview with Jean-Clet Martin[1]

Constantin V. Boundas Trent University

Abstract

With Jean-Clet Martin's book, *Une intrigue criminelle de la philosophie: lire la* Phénoménologie de l'Esprit *de Hegel*, the latter emerges as a philosopher of (negative) difference and (infinite) repetition, one of the first to inject Being with becoming, in other words, as the brother-enemy that Deleuze had been waiting for and with whom he did establish complex relationships that cannot be conveniently summarized in his Nietzschean moment. In view of his novel and striking reading of Hegel, Martin is invited by the interviewer to defend his suggestions that the negative and the dialectic need not turn into spoilers of the joys of Spinoza and the affirmations of Nietzsche; that Hegel's anti-humanism can be counted as a variation on Deleuze's own; that Hegel did anticipate Deleuze in the distinction between becoming and history and in the separation of the virtual event from the actual state of affairs; that Hegel's death of God ushers in, ahead of Nietzsche's Zarathustra, the death of man in the 'overman'; and that, despite their infinite proximity, Hegel and Deleuze are separated by two incompatible images of thought that make the difference between them a difference of nature and not only a difference of degree.

Keywords: Hegel, Deleuze, *Phenomenology of the Spirit*, negative, dialectics, anti-humanism

I. Introduction

In the 'Postface to the Anglo-American Edition' of his *Variations*, Jean-Clet Martin surprised his readers with the announcement of a new book on Hegel.

> I begin to feel, he wrote, the need for a book on the *Phenomenology of the Spirit*, where the enemy will find a better place in the network of friendships, introduced by Deleuze in *What is Philosophy?* than he has found in the smiles of the most ardent disciples. In this book, there would be a follow up, a fugue for a new variation seeking counterpoints and singularities in the patience of the negative, instead of in the joys and affirmations that Deleuze has legitimately found in Spinoza. (Martin 2010c: 216)

We did not have to wait long. Recently, this book has been published by La Découverte with the title *Une intrigue criminelle de la philosophie: lire la* Phénoménologie de l'Esprit *de Hegel*. And what a surprise it is! It asks a philosophically bearded Hegel to yield his place to a Hegel with the long nails and yellow eyes of Deleuze. The accursed share and the stubborn remainder of the ' *dimanches qui chantent*' are now shown to be figures of a criminal plot that labours to find the Absolute in what is most improbable: 'It is the most improbable, but also the most quarrelsome and indefinable that strives to come to being' (Martin 2010b: 236).

In the title of Martin's book, the word '*intrigue*' has the same amphisemy as the English 'plot'. It refers to the structure of a story, the articulation of a play, or to the paratactic and hypotactic concatenation of episodes in a *diegesis*. But it also refers to the unanticipated twists and turns, to the improbable sequence of events in a detective story that holds us breathless. Hegel's *Phenomenology* is, for Martin, an *intrigue* in both senses. To prepare the reader to approach Hegel's book as one would a fable or a tale, Martin introduces his chapters with '*où l' on apprend*' or '*où il est question*' or '*où l' on découvre*'. Take, for example, the first chapter – 'The Circle of Consciousness' – that Martin refers to as 'First Scene'. The summary that follows, placed in the centre of the page and surrounded by empty space, begins with the following sentence: '*OÙ L'ON APPREND que le philosophe porte secours aux criminels et que la philosophie s'entend en un sens extra-moral.*' The second scene – under the title 'The Roads of Desire' – has the curtain go up with this passage: '*OÙ IL EST QUESTION de la rumination animale du désir . . .* ' and so on and so forth. Now, neither a play nor a tale nor a detective story could be an example of their genre if its plot were arranged according to the deductive necessity of formal logic. It

would not be an intrigue. In order to present itself with intrigue, Hegel's *Phenomenology* has to attest to the contingency of becoming. 'History', writes Martin, 'cannot be conceived under the yoke of nature or the mechanical linking of social facts ... The Spirit has to tear itself off this double determination ... in order to enter History successfully and to achieve the freedom of its deployment' (Martin 2010b: 103).

But in what sense is the *Phenomenology*'s intrigue criminal? In what sense is it the tale of crime? Initially, Martin unearths an essay from 1807 – 'Who Thinks Abstractly?' (Hegel 1966) – in which Hegel supports the philosopher, who, in his effort to gather all factors relevant to the crime committed, appears to side with the criminal, against the facile abstractions of *doxa*. And then Martin goes on to write:

> We must assume a rapture, a scratch, in order to reach life – an inaugural crime that creates an opening ... Only in the death, the crime and the sacrifice of its perfection – only in the contestation of the angelic perfection of the Idea – does the Spirit find the means to open itself unto existence ... The Absolute does not bring about a separation in the direction of the heights; it does not detach itself from the world in transcendence. On the contrary, it separates itself in a *Fall*, which is a movement of being submerged and divided according to a trajectory of immanence. In the last analysis, it is evil that stands for the root of creation. (Martin 2010b: 236–7)

Now, instead of heaping quotation upon quotation, I invited Jean-Clet Martin to present his book to us by answering a few questions that occurred to me as I was reading it. He graciously accepted my invitation, and what follows is the transcript of an interview that I had with him in October 2010.

II. Interview with Jean-Clet Martin

Constantin V. Boundas (CVB): I would like to leave for others a discussion on your book's fidelity to Hegel. I was intrigued by the fact that you, one of the best readers of Deleuze today, chose to write it without even setting aside your Deleuze-coloured spectacles. You have written on Borges, Van Gogh, Aristotle and Nancy, but to us Anglo-Americans, you are best known as a reader of Deleuze – and for good reason. When in 1989, I approached Deleuze and asked him to help me choose contributors for the volume on his philosophy that Dorothea Olkowski and I were then collaborating on, Deleuze spoke of you with total confidence. You were, at that time, completing your *Ossuaire* and

your *Variations* had not yet been published. He knew, of course, of your book – he had already composed the *Letter* that now prefaces it – and we know it, too (2010), thanks to the translation that Edinburgh University Press has made available. Your profound understanding of Deleuze's positions that emerges from its pages, your creative fidelity to his work, and your dexterity at weaving variations that follow the modulations of his thought fully justify Deleuze's confidence in you and showcase your ability to think and write in accordance with Deleuze's lines of flight. But I cannot hide from you the surprise I felt when I read in the *Postface* of your book that you were experiencing the need to compose one more variation – this time, with Hegel in mind – where 'the enemy will find a better place in the network of friendships introduced by Deleuze'. As your reference to 'the enemy' reveals, you do not overlook the fact that, with very few exceptions, friends and foes of Deleuze continue to emphasise the abyss that separates the identity of the one from the difference of the other, to the point of assessing the *raison d'être* of Deleuze's 'libidinal deconstruction' as the dismantling of Hegel's Absolute Knowledge.[2] We may then begin our discussion of your book at this point.

One recent essay speaks of Deleuze's 'resentment towards Hegel' and adds that,

> of all major philosophers discussed by Deleuze . . . , Hegel receives by far the least sympathetic treatment; whereas in all the other cases, Deleuze is able to retrieve something useful for his own philosophy, his critique of Hegel is almost unrelentingly negative. (Baugh 2009: 130)

As our interview continues, we could try to come to grips with the specific arguments – Hegel's is a philosophy of identity; the *Phenomenology* is a humanism; the centrality of the negative muffles the voices of affirmation; desire collapses into need, etc., etc. – that ground the conclusion of this author and then bring your own assessments of Hegel's intentions to bear on your striking disagreement. But, before we follow this road, could you perhaps take us back to an earlier time – the time of the birth and origin of your need to seek 'counterpoints and singularities in the patience of the negative'? How and why does a reader today experience the need to re-open the files on the relationship between Deleuze and Hegel?

Jean-Clet Martin (J-CM): This is a broad and complex question; therefore, I will be able to focus on only a few of its points. Really, why would we want to return to Hegel if we follow in the footsteps of Deleuze, who obviously does not owe a great deal to Hegel? And I

would not forgive myself were I to suggest that Hegel had anticipated the multiplicities or the variations of Deleuze. To claim, like Slavoj Žižek, that Hegel had already sketched the horizon of contemporary thought is, in the last analysis, to say that Deleuze and Derrida did not exist, that they invented nothing and it would be enough to return to these more interesting precursors, Hegel or Schelling. This way of cancelling out the specificity of contemporary thought by returning to Marx or to Hegel does not correspond at all with my own position. Surely, Deleuze's reading of Marx would have been very different from Marx's own. One must be really very narrow-minded not to understand that Deleuze and Hegel do not participate in the same century or the same epoch and that it is impossible to find in Hegel what Deleuze deploys from the perspective of another 'image of thought'. It seems to me that Hegel himself would have refused to give up the singularity of Deleuze, if he could have read him, precisely because he was determined to keep the ages of the world distinct from one another and to show how the 'experience' of consciousness presupposes a form of empiricism. It is impossible not to discern in *The Phenomenology of the Spirit* this form that returns to the appearances instead of finding satisfaction with essences.

Well then, 'Why could not Deleuze appreciate Hegel?' is a different question whose answer depends on the way in which Deleuze thought about difference and repetition. The ritornello does not follow the movement of a circle or an encyclopaedia. This is it – we are on very different terrains, on milieus that cannot be superimposed. The ethologies of their concepts cannot be compared with one another because their images of thought are incompatible. It seems to me that, if Hegel is Deleuze's enemy, the enemy's position becomes interesting when we relate it to the way that Deleuze – in *What is Philosophy?* – transforms the friend into the engine of philosophy. Friends and enemies are found at the heart of the history of philosophy. We see it in Seneca, for example, who – at the centre of an empire (where people switch positions constantly) – reveals a friendship that is stronger than any family tie. Nevertheless, this friendship is ever changing, open to encounters; meanwhile the Greek city was preoccupied with the rivalry of clans and the oppositions and quarrels that Hegel himself denounces in his analysis of the family. I think that every epoch finds its definition in the posture of the friend. *Facebook* today offers us one example: each of us now has so many friends that we would love to have a few enemies to really read our profiles, instead of merely glancing over the simple clichés and announcements that are buzzing around. Friends like these

are, indeed, very sad companions. It seems to me that Hegel is truly the enemy that Deleuze was waiting for – the enemy worthy of him – he who would oblige us to reread Deleuze by way of a new strategy, instead of being satisfied with the often ridiculous repetition of those friends who use 'deterritorialisation' and 'rhizome' without ever thinking about their actual meaning.

So, Hegel and Deleuze are enemies. So be it! But how the enemy sees the friend – this is something really interesting! What does he or she find in him so remarkable that it makes him or her transcend the commonplace of indifference? How does the ordinary become something remarkable and singular? I think that the way in which I bring Hegel to bear on Deleuze is the result of the respect that makes Nietzsche say that we need a bit of air, that the friend suffocates us; that the one who has friends has many more problems with them than with the enemies against whom he really measures himself. As a personal anecdote, I would say that my book on Hegel corresponds to an event of my own trajectory. I had submitted an MA thesis on Hegel to the University of Strasbourg. The title was *Critique of Negative Difference*. It was a reading of *The Phenomenology of the Spirit* that I often discussed with Deleuze, who used to tell me that it is good, this work – 'Hegel is the first to think movement in the concept', to think the concept in terms of movement. Well, when Deleuze says that So-and-so is 'the first to . . . ', he really considers him a creator, the inventor of a notion that he endorses with his own name. Hegel is the name of movement. No doubt about it! However, this movement is not the movement of Deleuze – the rhythm and *dance* are not the same, the negative does not proceed from affirmation in the same manner as Spinoza's, its powers are not of the same nature. But it is this difference of nature that makes Hegel interesting as a dancer, as a wrestler, even if reluctantly and at an inopportune moment one must fight to discover a different way of thinking. This makes me think of a remark Borges made about tango: it is a duel, a *dance* of two enemy brothers, performed with knives – a mannerism of martial arts. In this context, my reading of Hegel makes possible a radiography of Deleuze: a negative – in the photographic sense of this word – that makes room for a new visibility. But under no circumstances is it a question of Hegel making the same movement as Deleuze – in the place of Deleuze – when we, the readers of Deleuze, know full well that this place has its own signature.

CVB: Readers of Deleuze know that philosophies of difference are not compatible with the thought of the negative, and that the Hegelian

dialectic is an expression and a subterfuge of the servile will. In *Nietzsche and Philosophy*, we read that

> for the affirmation of difference, [Hegel's dialectic] substitutes the negation of that which differs; for the affirmation of self, it substitutes the negation of the other; and for the affirmation of affirmation, it substitutes the famous negation of the negation. (Deleuze 1983: 96)

And we realise that this list of substitutions succinctly expresses Deleuze's critique of Hegel. Even Jean Wahl, in an attempt to safeguard the prerogatives of dialectic, and despite his otherwise complimentary review of Deleuze's book, could not help but express his reservations toward Deleuze's sustained effort to wipe out all vestiges of the dialectic from Nietzsche's philosophy (Wahl 1963). Among Anglo-American readers of Deleuze, there is an ongoing dispute between those who believe that Deleuze remained a dialectician of some sort, despite his denunciation of (a certain kind of) dialectics, and those who prefer to hold onto his anti-dialectic stance, without any qualifications. As you know well, this quarrel is not about who has the better grasp of the texts or who can claim his or her unshakeable fidelity to the legacy of the master. The quarrel has politico-philosophical implications. It is, therefore, intriguing to discover in your book subtle qualifications and circumspect hesitations that would prevent the negative and the dialectic from becoming the sworn enemies of a thought that takes its flight from the joys of Spinoza and the affirmations of Nietzsche. You hold that those who emphasise the omnipotence of the negative in Hegel's philosophy must not obscure the fact that it is the negative that prevents the system from closing in upon itself. Moreover, you write,

> the negative [would not] be able to operate… if the thing [did not] possess… the power and the capacity to bear the lack that torments it from the inside. On the other side of lack, we have the force of an entity that manifests its aptitude to transcend itself. (Martin 2010b: 29)

Or again, as you speak of need and desire, you say:

> We are far from a sheer lack, far from the void of a desire that passively submits to the object that would mechanically fill it… [It is not a question] of the expression of a privation but rather of a veritable force, a push and a tendency that comes from the organism, which is ready to take up this division that causes its inside to relate to an outside… (Martin 2010b: 57)

And, for good measure, you quote from Hegel's *Logic:* 'Negativity is the immanent pulsation of an autonomous, spontaneous and living movement' (Hegel 1929: 70). Finally, when you speak of the Hegelian

dialectic, you characterise it in a way that brings it closer to the critical unmasking that we are accustomed to associating with the genealogy:

> Hegel calls . . . dialectical overturning a critical enterprise that attempts to bring about the fall of all masks – even those that are to be found in the most sublime nooks and crannies, being dissimulated behind the morality of the master and the servant. (Martin 2010b: 191)

But what would you say to the one who voices his suspicion that your qualifications subordinate the negative to an originary affirmation and fail to emphasise, beyond its critical function, the creative potential of the dialectic movement? Unmasking and creating are not the same thing – are they?

J-CM: It seems to me that Deleuze dislikes the dialectic not only for moral but also for instrumental reasons. The dialectic is a tool. The eternal recurrence is a completely different tool. The question then is what is the value of these tools from a functional point of view? Is not morality dependent upon functions whose distant effects – but also the least expected ones from the point of view of symptomatology – were discovered by Nietzsche? Is it true that the dialectic is the tool of the weak, according to the reading that Deleuze reserves for Nietzsche, and that the active forces do not operate in accordance with a dialectical mode? We could speak of anti-dialectics in this context, if it were not for the fact that 'anti' is already dialectical. Affirmation abandons the dialectical scheme because from the beginning it is pointed toward the future – a javelin thrown in the direction of a distant target whose rules are not typical. The dialectic, on the other hand, repeats in an identical style the forms of exploration that depend on memory and, as a result, it remains a prisoner of the past – not unlike the donkey. We should leave behind the obstinacy of the donkey. It is a question of forgetting, of the salutary forgetting of those who affirm and the creative cry of a force liberated from the same old refrain.

However, we cannot cling to this vision and extend it over the totality of Deleuze's work. Obviously it is a significant moment, absolutely valid in the context of Deleuze's interpretation of Nietzsche. The mistake will be to forget its instrumentality and to conclude that the tool of this selective distinction of the passive from the active may be projected as an *absolute* over the rest of Deleuze's texts. Can we ever imagine Deleuze in the rigid posture of one who forces this scheme past the territory of its own validity? Can we expand or exchange territories without modifying the concepts themselves? We must take care not to freeze the opposition and not tinker with dualisms because of our obstinacy and our fidelity

to Deleuze. As soon as Deleuze reads Bergson, he is suddenly before notions that demand a new toolbox. It is easy to understand that the couple 'Matter' and 'Memory' will not be able to function in accordance with the mode active/reactive. A new machine must be built. Forgetting may very well be a good thing as long as we are situated inside the break within which Nietzsche operates. But quite the contrary, it is memory that we need inside Bergson's break. We must then be prudent when we read Deleuze, and be aware of the plateau whereupon we find ourselves. Notice, after all, that in *What is Philosophy?* Hegel strikes Deleuze as an important dramaturgist when it comes to organising the 'moments' and 'figures' that compose the dimensions of the concept. This is not a contradiction in the economy of Hegel's work; it is a simple redeployment of tools. That Deleuze is not a dialectician does not prevent him from creating an immense arrangement with the help of Bergson, with *Creative Evolution* providing the 'historical' montage and *Matter and Memory* the counterpart, 'Logic'. It is in the new reading of Bergson that Deleuze discovers the multiplicities and the new pair, actual/virtual, which is very different from the active/reactive pair. In view of the newly discovered territory, we are now measured against planes that overlap, that bring about stratifications, extensions and envelopments, while diffused in matter and contracted in memory. Even if we were to try both machines and taste similar intensities in different contexts, Bergson's cone is a much more complicated machine than the twists and turns of the eternal return. On the other hand, it seems to me that, on this plane, the fabrication of machines demands other alliances, friends other than the Nietzscheans – whose avid reader never have I ceased to be. Inside this factory, the enemy Hegel may come across as a partner, and as interesting as Nietzsche, provided that we focus on the texts that Hegel dedicates to the idea of life or even to the machine before we begin to discuss desire.

I return, however, to the question of the dialectic. There isn't the slightest doubt that the Hegelians transformed it into a hackneyed tale; it is the same mistake that a Deleuzian makes when he forcibly stretches a concept over every plateau of his work. For my part, what I retain from the dialectic is its 'dialect' aspect – a dialect that insinuates itself inside the margins and infiltrates the seediest parts of Western culture in order to listen to a language very different from that of morality, and to reveal from time to time what morality, with its mask of good and common sense, often dissimulates. Dialectics, therefore, I understand to be a dialect and even, underneath the dialect and its operatic folklore, I see dialectics as a diabolical force – the devil (*dia*ble) in his essence

being *dia*bolical – inside minor dialects that shipwreck the power of the 'unilectic' language. The word 'unilectic', of course, does not exist but we should invent it when it comes to the discourse of authority – the pontifical language.

Deleuze is therefore elsewhere – beyond the simple opposition dialectic/anti-dialectic – no matter how clear the stakes of this pair may be, as long as we stick with *Nietzsche and Philosophy*. Deleuze lives in an epoch in which the *infinite* no longer exists as a problem: it has lost its appeal and no longer has the same impact, especially when placed next to *Chaos*. The Hegelian dialectic, I think, responds to the question of the modern infinite, whereas the logic of multiplicities is rather a response to the Chaos that the contemporary epoch requires us to face. I try to confront this problem in my latest book, *Plurivers: Essai sur la fin du monde* (2010a), where no dialectics would remember how to fabricate a world. Not even the devil would be able to promise us a new life – as he does in *Faust*. Only the strange entities that Deleuze has us encounter through the impersonality of becoming-animal could do this. I think this is the real novelty of Deleuze: that he places us in front of the animal – face-to-face with animal sensations and animal spirits that the West must understand before they become extinct, and face-to-face with machines that we must learn to handle before we leave this life. In Hegel's philosophy, on the other hand, becoming is still thought in terms of the opposition nature/culture: the question here is how to transcend the animal and how to be free of the machine. And yet, inside *The Phenomenology of the Spirit* where the animals are often shown the door in the name of an essentially anthropological desire, my reading finds them re-entering through the windows. As for machines, we will undoubtedly have the opportunity to talk again.

CVB: That Hegel is the severe critic of Kant *and* his moral vision of the world is beyond dispute. He sees that a grandiloquent morality grounded on duty is the expression of a servile will – and an empty expression, to boot. You expose this critique masterfully. But does this critique make him a genealogist of 'beyond good and evil'? And if it does, are you still entitled to read the *Phenomenology* as a *criminal* intrigue? It seems to me that the clearest statement as to why the intrigue is criminal comes at the very end of your book. You write:

> The Absolute does not bring about a separation in the direction of the heights. It is separated from itself through a *Fall,* and in accordance with a movement that causes it to sink and to be divided along a line of immanence. *In the last analysis, it is evil that stands at the root of creation*. (Martin 2010b: 237; my emphasis)

Now, if Hegel holds evil to be the root of creation, you are right in receiving the *Phenomenology* as a criminal plot. But then it will be difficult to maintain that Hegel's critique of the moral vision leads to a space 'beyond good and evil'. A space 'beyond good and evil' can be maintained only if the *Fall* ushers in a 'disease' (not a crime) which, like pregnancy, gives rise to the new, the better and the nobler. In other words, the conclusion of your book should accommodate crime and the evil-doer as little as your earlier discussions of figures of bad-conscience – stoicism, scepticism, etc. – have done. It was, you recall, with these figures in mind that you invoked Nietzsche's diagnosis of pregnancy. And, despite your qualifications, to assimilate the Fall of the Absolute to crime will cause the negative to have the last word; not to mention the fact that the God thinking His own thought of *The Science of Logic* will not match the *archē* and the *eschaton* of the Hegelian saga.

J-CM: It seems to me that Hegel's philosophy is not a moral philosophy and in this respect he is among the first to consider moral judgements to be constructions whose histories must be accounted for. Indeed, morality has a history of morality and this is important when we think of Kant, who posits morality as a 'fact of reason' that cannot admit any outside interference. Nothing touches it; nothing can affect it other than morality itself. For Kant, 'the fact of reason' that the 'categorical imperative' represents is a universal understanding with an absolutely unconditioned causality that is autonomous with respect to natural causality. The imperative is the first fact – the only fact that we can respect, without deriving it from any prior determination. Nothing exists before it! In the last analysis, the Kantian critique gives itself ready-made what it should have investigated. Is it possible to launch a different and stronger critique?

Hegel's critique precisely consists of showing that morality itself is a phenomenon – a historically determined mode of appearing. Leaving behind the presumption that morality is given as an absolute, we must re-examine its real formation. The claim that morality is autonomous leads Kant in the direction of the phenomenon of an inaugural fact that is valid for all places and all times. He is, therefore, doing everything possible to keep morality away from phenomenology. In contrast, Hegel thinks that a real critique must be less naïve and that the critique of reason that considers itself pure must move beyond, very much beyond, the aspirations – themselves metaphysical and illusory – of theoretical reason to swallow the practical field. Produce a history of practical reason – no one had thought of it, with the exception of the Enlightenment with which Hegel would very carefully establish relations. To say that there

is an origin of moral judgements means to assert that such-and-such a figure has not always existed, that it behoves us to discover the point where this figure begins, and to acknowledge that it manifests itself here; whereas different forms prevail elsewhere. Such a submission of morality to an origin and a beginning that it does not want to acknowledge I call a 'genealogy of morals'. However, Hegel's genealogy differs over many points from Nietzsche's, because Nietzsche's pays more attention to the psychic and instinctual (*pulsionnelle*) moral arrangement; whereas Hegel insists on social facts and the geo-historical variation of moral judgements. Is it criminal to think this way or is the term I use a mere metaphor?

A gesture of this nature seems criminal to me with respect to German idealism. I think that Hegel's adventure would appear dangerously insane to Fichte, taken up, as he was, in the splendour of the 'I = I'. It would come across as insensible to the splendour of morality inside which idealism will try to drown theoretical reason, having taken the categorical imperative as the origin of the world – the world as Will. (It seems to me that Schopenhauer owes everything to Kant as far as this point is concerned; he represents the last stage of idealism becoming sceptic.) I tried to rethink Hegel within the context of the image of thought that was dominant in his time, and place him inside the philosophies of absolute identity, only to realise that Hegel is not a member of the family because he has difficulties with the University – the thing that endeared him to me, I should say... At any rate, Hegel is bound to come across as a renegade and, certainly, he worked out a method that Nietzsche will not fail to adopt in his own way as soon as he turns his back on Schopenhauer. To this extent, there is a fracture that assumes the name 'Hegel' – a singular point that does not belong to his time; one that creates a margin that would scandalise and be necessarily incomprehensible to, and cursed by, his peers.

This is the first criminal point. It is, if I am allowed to put it this way, intra-philosophical. But we can also count on a non-philosophical occurrence to help us understand how Hegel behaved within the context of his time and how he came to see himself as an old owl. Ridiculed by the newspapers of his time, his abstractions mocked, Hegel replied with the illustration of the criminal. The criminal is condemned by the opinion that demands guilty pleas right away and, under these circumstances, the opinion demonstrates an even bigger abstraction – a judgement that abstracts from all circumstances, provided that a person is found guilty and is condemned as soon as possible. Therein lies the expeditious abstraction of the judgement of God. Hegel, it seems to

me, sides with those that are called criminals; that is, he sides with those who challenge the common sense and the usual rhythm (*les empêcheurs de penser en rond*) that transgress the moral categories and show that they are the spontaneous decision-makers of a society bent on protecting itself. Suddenly, freedom is no longer on the side of morality; it is no longer the elegant '*factum rationis*' of Kant, but rather it is lumped together with the excluded, the pariah, the slave – on the side of those Foucault calls 'infamous men'. From now on, we are invited to understand that the slave is not only the 'reactive', but that his liberty carries with it an insurrectional potential – the type of potential that Kant detested, as is evident from his devotion to the masters we discover in reading *What is Enlightenment?* This is also why I say that Hegel is not an idealist, that it is impossible to put him next to Kant or Fichte; that he reveals the powerful movement of Fall – of a creative Fall that opens up new potentialities. To founder is not always to plunge into *ressentiment* and culpability; it is often to enter a new life – that of the humiliated and the offended, in the underground of infamous men and beasts of burden. All of a sudden, submitting morality to a genealogy seems much more radical to me than the stubbornness with which we try to forget the criminal side of the young philosopher in order to savour the tranquil spirit of Hegel's *Logic*, which lags far behind the contestatory thrust of the *Phenomenology*. I think that a new reading of the *Logic* is required and I do not know whether I will have the time and the appetite to do it myself. I allude a little to this problem in my *Plurivers* as I relate Hegel to Russell. The *Science of Logic* seems to suit a logic of the paradox. It brings about the pulverisation of its founding eminence. But this is a complicated point that I leave hanging for the time being, as I am already at some distance from your question.

CVB: You wrote:

> Hegel's philosophy is not an anthropology … With a gesture comparable to Nietzsche's own, Hegel demands that man be overcome. It is not possible to bring this philosophy over to Feuerbach's humanism … *The Phenomenology of the Spirit* can never be confused with humanism and the existence in the name of which Hegel offers us his instructions cannot be reduced to the freedom of man. (Martin 2010b: 218)

And you went on to say:

> The Hegelian intrigue rises towards a *logical* arrangement, towards the apprehension of a thought whose notions are no longer at the mercy of man, but they rather demand the creation of a mode of impersonal and inhuman

> narration indebted to the Concept capable of explicating itself in accordance with its own ways. (Martin 2010b: 221)

Nevertheless, you do admit that between the *Phenomenology* and *The Science of Logic* there is difference in form and content. The *Phenomenology* is a 'tale of initiation'; *The Science of Logic* asks that logic 'be understood as the system of pure reason . . . [Its] content is the exposition of God as he is in his eternal essence, before the creation of nature and a finite mind' (Hegel 1929: 44, 50). Now, it seems to me that this difference demands that you offer a more elaborate explanation than the one you give of the relation between the *Phenomenology* and the *Logic*. What is the relationship between the tale of initiation and the *noēsis noēseos*? How can one be initiated to the thought of God before Creation if the road to initiation goes by the way of Dasein? How does Hegel succeed where Heidegger and Bultmann have failed? It seems that we need a more elaborate demonstration; that Hegel is in fact an anti-humanist; and that his anti-humanism can be considered a variation on Deleuze's own. There is one more claim of yours that makes me wonder: 'Man', you say, 'in the finitude of his most rudimentary values [. . .] experiences a desire in view of which he appears to himself as a being that must be overcome'(Martin 2010b: 218). Now, I grant you that Hegel thinks so. But then you add: 'It is this desire that derails the merely organic life and sends it over to the inorganic of art and philosophy.' This may be Deleuzian, but I am not yet convinced that it is Hegelian. In derailing desire and overcoming man, some of Hegel's readers seem to have established man's deification, rather than the production of the life of the inorganic.

J-CM: Well, this a very complicated question and I do not exactly know how to approach it. Let us begin with Heidegger. In Hegel, there is an apprehension of modes of existence, the association of which is given the name 'Spirit', and not at all the name of subject or substance. We cannot count on any subject that is either given or can be logically constructed, nor can we count on any substance accessible to the human reason as an a priori form. The Spirit is rather born from a Fall, from a process of failure of the essence, and only its most 'illogical' characteristics show a relationship with existence. The best candidates for existence are not perfect essences (as is the case with Descartes, where we are only certain of the fact that perfection exists necessarily). With Hegel, it is from a different approach that we must think of essences in their power (*puissance*) to manifest themselves. To the point, one could argue that only from accidental essences and from notable

incoherences can we expect emerging and surprising effects capable of engaging History. I do not think we could consider History in Hegel to be a history of metaphysics. There are dimensions other than those of metaphysics that will carry us to the depths of history. It is in this context that we should understand the status of evil in *The Phenomenology of the Spirit*.

The 'Spirit', therefore, should not be thought as the understanding of God or as the manifestation of human perfection and, in this sense, the term 'Dasein' could help us understand its profound 'inhumanity', keeping in mind that Heidegger also refuses to make Dasein the property of man. Nevertheless, if Dasein is the expression of a world rather than of man, neither the stone nor the animal is shown to be in a relationship with Dasein for Heidegger; whereas in Hegel we can count on inchoative forms of the Spirit (the pebble that causes circles in the water, the dolmen, etc.). The expression 'objective spirit' interests me in this context. Buds and animals reveal spiritual formations to the point that Hegel will look to the buds as a figure of movement and a force of overcoming (*Aufhebung*) that I refuse to accept as a metaphor. And then, if we decide to look at the greatness of the soul, things are not so cosy there either, as every mystic understands. The spirit is no more human in its animal babblings than it is in its access to eternity, which presupposes the death of man. This is the same with Christ who, in dying, drags down man and God alike in his Fall. For all these reasons, I think that we are very far from Heidegger, for whom truth obviously is not only logical nor an affair of correct reasoning, but rather something that dissimulates itself and retreats. There is in Heidegger a veneration of the pre-Socratics, a sort of archaeological phantasm – really, something for the museum – a nostalgia that we do not find in Hegel. Hegel constantly shows that Egypt and Greece do not possess any truth that we have lost or that we must restore with the help of etymology, which is, for me, the summit of humanist preoccupations. In this context, I would add that Heidegger and Nietzsche share philological family relationships – the kind of concerns that we do not find in Hegel at all – a writing that is really based on language, either in its metaphorical veils or in its occult forest clearings. If Hegel is not Nietzschean, it is because of the accidental manner through which he envisages the relationship between Logic and Existence.

Now, the inorganic, for me, means two things. It is, first, in the *Logic*, which I understand on the basis of the *Phenomenology*, a desire to recompose the faculties according to a new arrangement that we can call 'Spirit'. This rearrangement, however, does not have to endure, as

is the case with Heidegger and occasionally with Derrida, a reflection on discourse or on the procedures of language. Hegel refuses to go through language (which nonetheless does not fail to be the most accomplished form of the organism and the organisation of his corpus). I find throughout Hegel, the example and the transversal play of processes that overflow the function of the enunciation and discursive relations as they carry us in the direction of other logics – the logic of a stomach that digests, of an animal that devours, of a plant that poisons, of a spider that sucks the blood of its victim or of a guillotine that cuts off heads. And this travels by roads that are not those of signification – something that occasionally makes Hegel unreadable. This is it: I think that there are functions and functionings in Hegel that we have not been able to appreciate because of the primacy we continue to give, since Nietzsche, to language and to our obstinacy of limiting the *Logic* to the confines of grammar, as well as the proposition that grammatology in particular was supposed to have *deconstructed*. And it seems to me that it is this impoverishing reduction to grammar that Hegel puts out of play when he reflects on the composition of a 'Logic' upon completion of the *Phenomenology*. As for the question of art, he is not explicitly concerned with poetry and tragedy, but with many other forms of visibility where the question will be about a Spirit that is not filtered through the snares of language. The aesthetics that follows shows the anti-humanism that dismantles the relationship of art to imitation and beauty. But this is another point that threatens to take us away from our purpose.

CVB: Permit me to quote you once more:

> Hegel's book displays two planes, each one of which has a different speed of composition: the raging, conflictual series of acting *figures* that we apprehend with the help of events; and another series, which, in every section, reaches a different point of interpretation. This latter series is a repetition that he who acts in History does not see, being unable to read what he does and ignorant of the becoming that he helps hatch. This line of sense occurs 'behind his back'; it is the series of *moments* – the slower and ampler of the two – the pacified thread of which the philosopher-historian is going to follow retrospectively backwards. (Martin 2010b: 130–1)

This way of referring to the two planes makes me think that, according to your reading, the Hegelian planes with their difference prefigure Deleuze's distinction and supplementarity between becoming and history. And you seem to confirm this suspicion when, a few paragraphs earlier, you quote from Deleuze and Guattari's *What is Philosophy?*:

> Hegel powerfully defined the concept through the Figures he created and the Moments he posited. The Figures become parts of the concept because they constitute the aspect through which the concept is created by and in consciousness, through successive minds; whereas the Moments form the other aspect, according to which the concept posits itself and unites minds in the absolute of the Self. (Deleuze and Guattari 1994: 11–12)

Now, the difference that Deleuze and Guattari postulate between becoming and history is essentially the difference between the virtual and the actual. But then what do you mean to say when you write that 'at the time of the *Phenomenology*, the moorings of this amphibious being have yet to be found: the reconciliation of the two worlds that Hegel senses moving inside him – the real and the virtual – proves to be very far away'? (Martin 2010b: 234–5). Is your qualification of the two worlds – made in terms of the real and the virtual – a mere *lapsus calami*? Did you mean to write, instead, 'the actual and the virtual'? If it were not your intention here to express a point in a Deleuzian garb (whereby both actual and virtual would be real), then you may be saying that, at the time of the *Phenomenology*, the *possible* and the *real* are still far apart from each other. But if your 'real' at this point stands indeed for the actual-real, and your 'virtual' for the virtual-real, your reader may be excused for being confused, since he or she brings to his or her reading the knowledge that the incommensurability between becoming and history, in Deleuze, is not affected by the passage of time. You could perhaps help this reader by further elaborating on the anticipation/promise that you seem to have built around a sentence that begins with an 'unless': 'There would be no logic capable of accounting [for a new, superhuman existence], *unless* a different *Logic* were to be reinvented, with a sense that is no longer terrified of the absurd' (Martin 2010b: 235; my emphasis).

J-CM: Yes, you are right about the two planes to which you refer: they do not adopt the same rhythm. I wanted to show that History, in Hegel's sense, is not a mere succession of facts chained together according to the ternary circulation of what we call dialectics, but that, rather, we are faced with a serial history, which is very different from that of the historians of his time. Serial and qualitative. I would also like to draw attention to the following fact: the word 'dialectics' rarely appears in the text of *The Phenomenology of the Spirit*, and when it does, it is in an extremely minimalist and timid way, as if it were to describe an immanent movement, a process that returns to itself and coils in on itself. It has nothing to do with the meaning that the word has in Plato, Aristotle or Kant, who always use it for their own

specific purposes. But what have Hegel's commentators done? Well, they have discovered dialectics to be ubiquitous, to the point of completely forgetting the incredible and extraordinary events of which Hegel speaks in the *Phenomenology* and in the *Logic*. They have maintained a ternary skeletal structure, believing themselves to be happy and reassured at the illumination of the affair, allowing the rest to be registered as merely decorative. You understand of course that I followed the inverse procedure.

We could forget about the word 'dialectics', that occurs only three times in the *Phenomenology*, and move on, or we could explain it a little – explain why at the level of the *Phenomenology* readers expose themselves to be more Hegelian than Hegel, yet so very stingy with justifications. It was not through me that the reading of Hegel was forced. I tried instead to go back to this emblematic thinker in an amiable way (without ever forgetting the concerns I expressed in my earlier books where the approach is not the same and the criticisms have their place and their justification). There are, then, in Hegel two planes – the pacified plane of moments, and the raging plane of figures that intersect in keeping with a method we could call 'dialectics', provided that we do not forget the infernal virtues of the dialectic to which I alluded in my third response – the wealth of dialects that spring up with it, to the point of obscuring the very exposition of the system. And, of course, I have been thinking of Deleuze's claim in his book on Spinoza that distinguishes the volcanic chain of the 'scolia' from the continuous line of 'propositions' in the *Ethics*. Let us simply say that I could not resist the desire to read Hegel in the way that Deleuze taught me to read Spinoza. Nor could I resist noticing a certain relationship with the acceleration of the last chapter of *The Phenomenology of the Spirit* that places us squarely inside eternity, inaugurating a machine that did not exist earlier – a machine that Hegel calls 'Absolute Knowledge', and which is neither the eternal return nor Bergson's cone. And believe me, this machine operates with an efficacy that we do not find elsewhere. How can we tackle this machine? I must confess that it is a complete mystery and that the 'Absolute Knowledge' is so illogical that until now nobody has been able to tell us what makes it revolve, notwithstanding the declarations that find in it Science, System, etc. It is, indeed, very curious that we forget to ask what Hegel means by 'science' and 'system', and fail to remember that the 'science of the spirit' has nothing to do with what we call 'science' in the domain of matter and nature. Not to mention the fact that objective and subjective logic would not suffice to bring us to the intelligence of absolute logic.

Well then, to answer your question, I would put the 'real' on the side of time, of the chain of time that the moments offer us; whereas the virtual is to be found entirely in leaps and anachronisms. The latter reveals the racing rhythm of figures that intervene in many different moments or places where, like a demon, they were not expected – casual and surprising, sharing in an instance that I would call 'eternity'. The real and the virtual, the moments and the figures interlace time and eternity. The question is – how is this passage realised? Is it in a logical manner? My response is 'yes', if you wish, but on the condition that we understand logic other than in the usual way reserved for this word, in a way that is not exempt from absurdities, as I tried to explain in my fourth reply in showing that 'perfection' does not lead to existence, that it is merely possible and unable to aspire to any virtuality. You could then ask me about the nature of this paradoxical and quantic logic. You yourself suggest the word 'sensation'. This is perfect! It is something that proceeds from the statute of the image (*tableau*), from the circulation of images having become for-themselves – as they pass from the *in itself* to the *for itself* – to the point where they no longer need our brains to survive, having been entirely liberated in a form of pure, almost cinematographic, sensation. That's it. It looks difficult, but this is the point responsible for the monstrous beauty of the whole, a point of tipping over to which we will probably return.

CVB: You wrote some beautiful pages about Antigone – echoing the beautiful pages that Hegel dedicated to her. You spoke of the indispensability of the family in the acquisition of identity; you highlighted the family's ability to make death lose its contingency and accidentality; and you followed Hegel in his discussion of families' capacity to create a space for the desexualised and sublimated love of the sister–brother relationship. Also moving are the pages that you wrote, following Hegel, on the clash between the laws of the city and the laws of the family and on Antigone's double bind. And you went on to designate the relationship between brother and sister as 'a motiveless relationship and a veritable *body without organs*' (Martin 2010b: 137). In a footnote to this designation, you claimed that 'this concept of Gilles Deleuze fits marvelously to the passages that Hegel dedicates to the concept of an essentially non-Oedipal family' (137, n.19). In fact, you suggested that Freud and Lacan failed to read Sophocles with the care that characterises Hegel's reading. Had they done so, they could not have failed to recognise the anti-Oedipal and anti-psychiatric anticipations of *Antigone* (123). I wonder, having read all these claims, whether you

would concede the boldness of your own reading and of your own conclusions. You know well that Lacan's interpretation of *Antigone* has fuelled readings and debates among readers that vigorously challenge the plausibility of attributing 'non-Oedipal' and 'BwO-like' designations to Sophocles' masterpiece. Lacan's reading makes Antigone's appeal to the law of the gods an unsustainable breach of the symbolic order (Lacan 1986). Not to be outdone, Judith Butler counters by discovering in this appeal the scandalous performative disruption and perversion of the symbolic order (Butler 2000: 22). When it comes to what *Antigone* is all about in the Greek tragedy, you know it very well, the interpretations are indeed legion: the intended supplementarity of the laws of the city and the laws of the family have been advocated; Antigone's refusal to assume any responsibility has been emphasised; the claim that the real clash in the tragedy is between the laws of the gods and their prohibition against killing anyone who is a Greek, and the laws of the city, the application of which narrowly governs the affairs of the city itself, has found merit with several readers. All these readings go against yours, and some of them have inspired powerful political agendas. Do you want to take this opportunity to outline the merits of your approach?

J-CM: I must confess that my reading of Hegel kept itself away from what Lacan might have thought. For the little that I know, there are at least two fundamental differences between Lacan and my own complex reading of *Antigone*. On one hand, a reconsideration of Creon and his 'becoming-man' that sidelines the father whose authority I do not think he embodies; and on the other, my impression that, at long last, the young girl – the young woman, the woman in the direction of whom the becoming of the statute mother is being propelled – is about to be liberated. Creon is not adopting a father's attitude any more than Antigone seems to endorse the role of a mother! What Hegel seems to say without pause is that, in this distanciation from the couple father/mother, the brother/sister relationship loses its familial character, as I myself tried to show on the basis of my reading of Derrida's *Glas*. By the same token, it is true that I lift the tragedy of Sophocles out of the economy of the household and therefore out of psychoanalysis in order to place it on the side of the Anti-Oedipus that remains hostile towards the familial romance. We have always known that the Oedipal complex does not work well with the girl and that Freud always had a hard time with this subject. It seems to me that Antigone is the exact counterproof of Oedipus and that Freud omitted the reading of this sequence as he concluded his universal complex with an appeal to castration.

I believe, by the way, that my reading moves away from our habit of naturalising Antigone as a representative of natural right (essentially maternal) and again away from this other tendency to hold Creon culpable and to see him as a paternalist tyrant mobilising an arbitrary or rather positive right as a result of his violence. There is no real opposition in Sophocles' story between natural and positive right. The feminine and the masculine must be liberated from all vestiges of a factical naturalisation; but also Creon, it seems to me, must be credited for liberating the right from the terror of families and for betting on a State that does not place the fathers' slogan justice at the service of legitimising holy wars for the defence of an essentially maternal soil. Creon escapes the temptation of the maternal – justice being claimed in the name of the mother. Everywhere, in all our school lessons, Creon is presented as a horrible chap, a symbol of the coldness of the State, and we rebel at his repudiation of Antigone's gesture, which is so much closer to the heart and to intimate morality. But we then forget that the love that Antigone shows her brother has nothing to do with anything genital; that it is something extra-familial because it does not expect any sexual outcome; that it is a love pure of all *jouissance* – and, if I may put it this way, a love beyond the pleasure principle, in a new sense. We are very far from the incestuous Oedipal situation and I do not think that we take it into account often enough. This text does not work either with Freud's schemes or with Lacan's because the Oedipus complex no longer works in Antigone's situation – the brother and sister have left behind every incestuous consideration, as well as the prohibition itself, rendered universal around Oedipus's name.

Antigone would be at fault if she had allowed herself to sink to the attraction of a natural right, and to become caught in her becoming-woman by a maternal capture looking for ways to save the honour of the family instead of the image – the desexualised image – of the brother who, in fact, she embodied in such a singular manner. It is because of this fault – this aborted destiny of the 'becoming-woman' – that, according to Hegel, the Greek city was unable to keep its democratic promises and allowed itself to be deterritorialised by genetic economies. It is the Roman Empire that, for nomadic reasons, knew how to bring about an extra-familial and extra-conjugal friendship, in a State where the function carried more weight than the honour of the paternal or maternal name. Indeed, 'Caesar' is not a family name. By the way, I think that my reading shows the exit door to structural anthropology and to psychoanalysis, both, for those who know how to read between the lines.

CVB:

> The affair of Christ implies that God becomes man only on the condition that man becomes a superior being, an 'overman', if I am permitted to assume, in an untimely manner, the expression that will become Nietzsche's own. (Martin 2010b: 193)

> God steps outside the limits of His perpetual reclusion as He negates himself as 'One' . . . In such a negation of His retreat, man's approach to God is being prolonged; it is pursued in the vision that God has of Himself – Himself being taken in the hems of His own dissipation and having descended to the point where evil begins to expand. To the point that the eye of man and the eye of God are both open upon the same background . . . as if, without man, God would not be able to reach the knowledge of Himself, and, without God, man could not overcome his all-too-human humanity. (Martin 2010b: 217–8)

In other words, Hegel suggests that the *kenosis* of God is central to the transformation of man. But the death of the mediator reveals that God is not one to come in and help us escape our dire straights. Instead, Hegel, conflating Easter and Pentecost, argues that the death of the mediator becomes the presence of the Spirit. The agony of realising that we humans are finite becomes the realisation that the life lived on the other side of the death of God is what is meant by the life of the Spirit. That may well be a new kind of life that transcends our prior existence. But does it justify the coining of a new term – 'overman' – for this new humanity, along with the anti-humanist rhetoric that this term carries with it? Besides, the bi-conditional that links the transformation of man with the death of God makes me wonder about the place of 'grace' in Hegel's system. My reason for asking is this: Christianity's central claim, I take it, is that soteriologically speaking, man cannot lift himself to salvation by his own bootstraps. When, therefore, I read in your book about the overcoming of man, I need to know whether the overcoming is proclaimed à la Nietzsche (and his bootstraps) or whether Christ is, for Hegel, the one whose death combines the *ef' hapax* (absolute singularity) of his death with the universality of the becoming-Spirit. This is where I would want to see grace coming in. What do you think?

J-CM: This question of grace is interesting. It seems to me that, yes, grace comes from the outside. I mean, it is not human, it hardens in traits and figures that are beyond man and, at the same time, beyond God. Notice that Christianity needed to match it with a 'holy spirit', with light, with a 'son', with a trinity that is barely paternal and borders on heresy. I would like to set aside the Hegelian – and theological – plane in order to make myself understood as I turn toward my earlier work

on eroticism (Martin 2003: 63–9). Grace seems to me to depend on the set of lines that come to drape over a figure. It is an inversion of the Aura. It is not an expression but rather an impression, a print, a nexus of curbs, which meet and produce an intersection that we can call a Subject – a subject as an ensemble of coordinates. Think, for an example, of a Roman orator. He learns gestures, he casts himself in gestures, he acquires the manner of a *dancer* in figures that exist independently of him, as he embodies signs whose signification is received by his body. This could well describe the *ecstasis* that prepares us to receive a place waiting for us, like a scar that we embody. I really think that this is the way to understand Deleuze when, in *The Logic of Sense*, he says that our wound has been waiting for us, and that the event is a surface effect.

In order to understand this point better, let's consider Giacometti's sketches. We see in them a multiplicity of intersecting traits, a veritable ball, an intersection of threads coming from all directions, which, when completed, succeed in creating a portrait. Where then does the figure come from? It did not pre-exist like a substance; rather, it happens like an incorporeal event being incorporated inside a concretisation, a singular concrescence of volutes, like a hurricane that comes progressively to give itself an eye. It is not a face that shines, but rather the lines of the landscape that are being inflected upon it. The inversed aura does not become fused, it does not emanate; rather, it immanates: it is a gravitational collapse of lines that produce a figure as they intersect. Thus, we come nearer to the forces of the outside that are really the Spirit and come from a distance to be joined in the movement of grace.

We can then see that 'Spirit' does not mean 'consciousness' or 'self-consciousness'. On the contrary, the movements of consciousness need the Spirit in order to be concatenated. And this is why man must be really overcome in favour of the impersonal, which is the light that shines when God himself is lost in his own diffraction, much like a universe under expansion or like the *pluriverse* that James knew something about. I see the relationship between all of these with photography or cinema, both of which are arts that capture the intervening of grace. And I wonder whether this is what Hegel means with the notion 'tableau' that circulates in the 'kingdom of the Spirit'. We should come back to this.

However, it seems that this way of helping man and God meet each other amidst this piercing light that conserves and effaces them both is very different from what Nietzsche called 'death of God', and Foucault, 'death of man'. I would say that God dies in the way that a light

bulb burns out in order to liberate the light under which men are frightened/find a new way (*s'effraient*), seized that they are by the sudden entry of becoming (*effraction*), as if they had waited for the event that precedes them. It is interesting that Hegel says that the philosopher is a 'bird of the night'. I cannot stop thinking of the eyes of the barn-owl (*effraie*) – which is the name of a species of owl in French, but also of fright, which is a clearing (*frayage*), a composition of relationships and also a very great fear. Yes, I cannot stop reading Hegel in a Deleuzian way (a bit more grave perhaps than Deleuze's reading), where I can find cinema, image, the art of photography, etc. Does this mean that I force what Hegel really said? It is possible, but I would say that this is a good sign. We should read an author in order to renew him –instead of repeating with the orthodoxy of the friend who always muffles him. This is my way of being Hegel's enemy, by reinventing him as I refuse the readings that have blessed him and tempered him to the point of becoming a caricature. But, at the same time, this way of understanding the light is perfectly in agreement with Hegel's times, especially as we learn that he was the reader of Goethe's *Theory of Colors* (Goethe 1970), and, together with Schelling, he discovered that bodies are electric phenomena. It is, in a certain way, the electrification of the death of God in the universal effusion of a Spirit that reveals. Revelation itself becomes a photographic revelation. But to understand this obligates us to first understand what a concept is for Hegel.

CVB: Your chapter on the Hegelian concept, as it emerges from the pages of the *Phenomenology*, could have been written with equal plausibility and without any addition or subtraction, about the Deleuzo-Guattarian concept, as it emerges from the pages of *What is Philosophy?* The Hegelian concept is not a notion (Martin 2010b: 23); it is not an abstraction that retains the general characteristics of a sample of similar entities (24); it is not placed in the service of classification (25); it is not the result of a subjective intellectual operation (24). It is processual (24); it is an operation of the real itself (24); its function is not to differentiate one set of entities from another, but rather to account for the internal constitution of things and the ability of different processes to have the same rhythm (25–6). Since Hegel, you claim, 'the concept is not an idealization external to things. Rather, it designates the force of creation and destruction – an intimate life' (26). When we turn to Deleuze, we find repeated in his work the bold equation, concepts – events, and the equally bold proclamation of the *eventum tantum* – the (one) event – with its internal differentiation. Two questions, therefore: do you find in Hegel the anticipation of the Deleuzian distinction between the virtual

event and the actual state of affairs? Would such a distinction make the Hegelian Concept virtual? And, second question: where would Hegel and Deleuze differ from one another with respect to the Concept?

J-CM: You are right on many points, but it is not correct to say that I would have written the same things if I were writing on Deleuze's concept. With Deleuze, we are inside a radical immanence and this is already the case with Hegel. This is indisputable – it is a philosophical fact. We then discover in both situations the necessity to generate the concept on the basis of experience. There is a Hegelian insistence in the idea of experience, which by itself merits an entire monograph. But we do not deal with the same experience in the works of the two philosophers. Deleuze's 'transcendental empiricism' requires the virtual; that is, a form of different/ciation that we do not find in the Hegelian movement. At this point, we should reread Deleuze, in order, at long last, to clarify the proper way to insist on the notions of immanence and the outside – the two concepts that are not always well understood and that may even seem contradictory to one another. Even before we read *What is Philosophy?* we can easily grasp that the Deleuzian conceptual matrix is different/ciation with respect to which the pair, virtual/actual, is what permits it to gain momentum. If I may put it this way, with Deleuze, unlike Hegel, we have an idea of reality that is much more that of Borges. There are in Deleuze many strata that attach themselves to the events that are actualised. I am referring to the double lineage of the event in Deleuze, wherein the virtual haunts the actual without becoming concrete – an immense chaotic machine that Hegel would not have been able to conceive because he did not know the same outside – perhaps he would even refuse this outside. It seems to me that Hegel makes use of the negation and non-being in places where Deleuze discovers the outside. Now, if we come to *What is Philosophy?*, the concept appears to be more of a skeletal structure, a set of fragments that are combined in a constructivist way, a dry consolidation that Hegel would not share either – he who prefers the round biscuits, the circles of circle, the intersections and fusions more than the additions and the arrangements of exteriorities. This too merits further development. The *Logic* would give us a better idea; but this a project for the future.

As far as I am concerned, there are many things that differ, but I can provisionally sort them by a rather crude division – the distinction between the infinite and Chaos. Hegel knows nothing of the Chaos that Deleuze experiments with because he is positioned on a different scale of time. We will say the same thing about Spinoza, whom Deleuze admires. It is not the same mental geography and, as a result, the

tenor of the concept would not be of the same nature. We should not forget that a concept, for Deleuze, will be added to components that are not themselves concepts: these are the functions of science and the compositions of the arts, in the company of which the concept will braid singularities. This is equally true for Hegel, but in an encyclopaedic way; that is, through the cycle, whereas Deleuze works by means of a dramatisation based on bifurcations and networks.

Well, this point is essential. Even if I were to discuss resemblances, the fact is that the concept enters structures that do not result from philosophy – the non-philosophical adventure. Deleuze's concept of multiplicity will come to be related to the fractal functions of mathematics and to the fissures of contemporary art that Hegel fully ignores. For me, these are not the same machines; but having tried both, sometimes I love to accelerate on the one as I do with the other, to negotiate bends as I go through the same motions. This is inevitable! It is a way of planting in the Hegelian garden a few Deleuzian shoots that will grow from the middle and slightly derail the orbits of *The Phenomenology of the Spirit*. This is very exciting for someone who is at the controls and finds an old machine on which to take a joyride.

I conclude with another point that appears to be Hegel's invention. The concept, for him, is the '*Begriff*'. It is like a claw mark, something haptic: it is not a question of putting my hands on the object in order to take hold of it; it is rather to take an impression of it, take the fingerprints, and memorise the grooves. I work with grooves in a book I called *Le Corps de l'empreinte*. It is a book on the art of photography. I believe that the Hegelian sublation is a photographic process, a capturing of shadows and lights that the Absolute Knowledge will dilute, and absorb like a siphon. Here is an idea, an image of the criminal machine that Hegel calls 'Absolute Knowledge' – the Absolute being a solution within which events come undone in order to leave marks that the concept will internalise. But with this in mind, we already move to another circle whose speed becomes infinite (like a rapid sequence of blinks).

CVB: In the concluding chapter of your final scene, 'The Survival of the Image', you say:

> The Hegelian Concept creates the possibility of re-animating all the ectoplasms of whatever appears. This almost technical feat does not have to wait for the invention of movies that it nevertheless inspires. It finds its first manifestations, in Hegel's time, in the strange creation of Faraday's wheel, capable of connecting sketches that are separated from one another. Their rotation induces a real perception of movement, to the point that it renders

> possible the famous re-creation of the galloping horse . . . This particular form of circularity . . . permits its animations to acquire a virtual eternity. (Martin 2010b: 231)

You are, therefore, crediting the Hegelian Concept with the ability to anticipate Nietzsche's vision of the eternal recurrence – this absolutely novel notion of movement that you call 'mental movement' (Martin 2010b: 231). In the next page of your book, you introduce the notion of the 'spiritual automaton' with these words:

> The entire Preface of *The Phenomenology of the Spirit* celebrates this spiritual automaton, capable of conferring upon the image the appearance of reportage – a reportage of our silhouettes, dead forever, yet also able to project and to maintain themselves upon an absolute and inalterable support. (Martin 2010b: 232)

Now, the notion of the 'spiritual automaton' comes to us from Leibniz and Spinoza and, as you know very well, plays an important role in Deleuze's attempt to leave subjectivism and humanism behind in the context of his quest for the identity of being and thought freed from idealism. It follows, therefore, that the *ordo geometricus* of Spinoza's *Ethics* is not a whimsical choice, a mere pedagogical device chosen to impress the mentally undisciplined. It is a demonstration that the laws of physics (body) and the laws of logic (mind) work in tandem; in other words, that being and thinking are identical in the incessant actualisation of the virtual. Now, you argued in several places of your book that Hegel's becoming leaves ample space for contingency. And we know that the presence of the spiritual automaton in Deleuze's philosophy also does not prevent him from giving contingency a royal place. This is, I take it, the main reason why 'vice-diction' assumes the place of prediction in his writings. Would you mind explaining here how the spiritual automaton can leave room for contingency in Hegel – or in Deleuze, for that matter?

J-CM: My response will attempt to cover your points in general terms. The Absolute, for me, is a process that requires a 'physics of thought', a machine that revolves around itself in order to generate a powerful non-organic life. This life, once it moves beyond a certain regime, displays a dynamism that comes from contingency but has an absolutely necessary validity – a kind of dicethrow that is the inverse of Mallarmé's or, as you say, a process of vice-diction. To write a philosophy book, as far as I am concerned, is not to ask whether one becomes famous, whether anyone is going to read us, whether the cover is beautiful, or whether it will lead us to the vocation of an academic. Rather, it is the creation of a kind of grace that has us feel something rise from the depths of

our thinking – something that does not come from us or, at least, if the idea is ours, that it is able to communicate with something else that moves us and transforms us into an insane machine. Herein lies the contemplative aspect of philosophy. The philosopher is not a merchant of books: he is the one who fabricates a probe, a lunar lemma that gives us a foothold in a wild region, asking all along whether others would be willing to embark upon the same boat and whether there would be machines – better lubricated than himself – able of do it. I think that Nietzsche's eternal return, Bergson's cone and Spinoza's *conatus* are examples of this sort; and we could, of course, find others. This is what interests Deleuze in the 'body without organs'. Bergson himself, in *The Two Sources of Morality and Religion*, did say that 'the essential function of the universe . . . is a machine for the making of gods' (Bergson 1977: 317), which is indeed a very curious formula. And I also think that Hegel, whenever he speaks of 'Absolute Knowledge', does not wish to inform us that he is a man of science or that reading him would teach us anything. Absolute Knowledge is not positivism. It does not offer the certainty of facts. It is nothing but a pathway, a door that opens on a life that will come from the animal or from desire, but a life nevertheless capable of finding its niche in regions that are no longer merely organic. It is not an affair of the sublimation of instincts in a secondary process, but rather a sufficiently direct construct inside which instinct is unloaded onto the eternal quiet, and thereafter drags to his death its carrier along with the machine that brought him there. To drink from the cup of the infinite, the way that *The Phenomenology of the Spirit* concludes, is not a small affair. And as we drink from it, the problem of proving that we are eternal is not really important to the philosopher, who is not a theologian. Rather, what is important is to live from now on with the feeling that we are somehow eternal, experiencing in our own body that a line of the universe has been crossed and that it behoves us to follow the spiritual automaton adept at creating it.

I think that this might resonate with Williams James's themes on faith and pragmatism. It is a question of regime. The spiritual automaton, on low gear, permits us to hear all the cracklings of its mechanism, like an association of ideas that would be achieved as the machine stalls, with all the failings that this entails. Even in Spinoza, we must find the suitable speed. The first genre of knowledge is a miserable failure where all the dented wheels bump into one another and squeak. With the second genre, the outlook improves, but the contraption does not stop spattering. Only when the machine performs at its best does the automatism create a new kind of life. There are levers that exist in order

to launch the machine beyond its own speed. It seems to me that, with respect to Hegel, this machine does not follow the wheels of the chain of ideas that parallel the affects of bodies – nor does it follow Spinoza's. Instead of fabricating the automatism of the idea turning away from the monstrous imagination, the Germans experience with Spinoza a renewal pursued entirely on behalf of the image – especially with respect to Goethe, Hölderlin and Schelling. Briefly, I would say that Goethe is the first to put movement inside the idea, and also inside the image. The image becomes animated, the disks are colourful and he discovers the play of colours. He fabricates small machines that produce black and white by having them rotate on their axis. Now, the image begins to move. And this happens the moment Hegel begins to write. And then, only a few years after the composition of the *Phenomenology*, Faraday invents the wheel – a spiritual chalice, which, with the alternations of black-and-white bands, produces incorporeal and virtual effects, as well as movements by means of which the horses dance and the birds fly – as types of magical lanterns. This is the Absolute Knowledge, a circulation of tableaus registering and collecting the world's scratches and sweepings inside a bowl where it will be reflected. This is not the cinema; it is the cinema that becomes possible from then on, what the cinema has available to be presented and actualised. It is the intellectual machine that explains why we started making movies. Indeed, when we read Deleuze's books on the cinema, cinema becomes very exciting and we like to push the transformations of movement and time a little further. I replied without breaking down your question into its components in order not to lose its spirit. What is certain is that I read the chapter on Absolute Knowledge as if it were a photogrammatic whole unrolling history, much like a black-and-white silent film could have done. It was entirely fascinating and unexpected . . .

CVB: In recognising Deleuze as the thinker of the transcendental understood as a sort of ungrounding, Miguel de Beistegui (Beistegui 2004: 21), by implication, provides us with an excellent characterisation of a philosophy of difference that would be worthy of its name. Difference, in order to be more than a mere difference between two identities, must be the transcendental condition of the endless ungrounding of being. No longer referring back to subjectivity or to the conditions of possibility of experience, the transcendental, in a philosophy of difference that would not revert to identity, would be the agent of the actual generation and production of phenomena that take place in a virtual time and a virtual space, no longer bearing a relationship to the well-known Kantian forms of intuition. This point

can also be expressed succinctly as follows: philosophies of difference are in name only philosophies of difference as long as they cannot reach for, and think, difference in itself – a process which is the indivisible arrangement of a differentiating/differenciated real process. However, this process cannot be thought without the simultaneous grasp of the sort of intensive time that inherits the space left unclaimed after time – with and after Kant – succeeded in coming off its hinges. As our discussion up to this point indicates, Hegel's concept is difference differentiating itself – difference in itself. What is left to be determined is whether or not Faraday's wheel and Goethe's experiments with colour are able to support an argument for the presence of intensive time in Hegel's *Phenomenology* as well as a vision of the eternal recurrence of the different. You seem to think that the vision already exists. You write:

> The circle, the wheel infinitely circulates a retinue of dead images, which, thanks to their being superimposed on one another, are capable of moving in one and the same place. This particular form of circularity of the optical wheel that Faraday imagined promises its animations a virtual eternity: it shows the galloping animal that revolves without beginning or end, when the origin returns endlessly. (Martin 2010b: 231)

It does not seem to matter that the 'dead images' that rotate are not in themselves the moving images of a cinema-to-come. The symbol of the eternal return has already made its presence felt. Would the reader then be justified to conclude that, for you, between Hegel and Deleuze, when it comes to a question of being philosophers of pure difference, the difference is in the details – a matter of degree rather than of nature? And if this is the case, how can we help but conclude that your book proves Deleuze to be mistaken in his assessment of the distance that separated him from Hegel?

J-CM: I do not think that Deleuze was mistaken in keeping his distance from Hegel. Their difference is in fact a difference in nature. The mechanisms are not the same and the histories skirt each other, being nevertheless suspended from a common transcendental plane from which they draw their inspiration and are detached, much like lightning is from the black sky (here I repeat the formula of *Difference and Repetition*). Beginning with these traces that fuse together in all directions, I would say that Hegel came to know a more important becoming in North America than in France, especially through an entire series of nineteenth-century thinkers that led to James's pluralism. As for Deleuze – no matter what critics have to say – he seems to me to be closer to Ravaisson, to Bergson and perhaps to Schelling, himself

a reader of Spinoza. The genealogies, therefore, are not the same at all. But there are bridges and parallelisms that I made use of in order to pass from the system of 'negative difference' to Deleuze's more affirmative plan. I would say that there is a plethora of Anglo-American thinkers, from Bradley to Royce, who are not in the analytic tradition and who could help us work out a new image of thought. There are necessarily differences of nature between the Hegelian landscapes and the wild landscapes of the Deleuzians – similar to the differences between continents – but there are also passages and discoveries to be made as we circulate between the two, in a fault line that would contribute to the encounter between the continental and North American philosophies, between literature and the cinema. The real centre of thought for the future is here – a *pluriverse* with pathways that diverge, but also intersect one another in the elaboration of a new machine intending to explore spaces and times of different dimensions, like Royce's map which is self-contained, but its coordinates become deformed as we alter the scales. Royce was able to invent a fantastic world on the basis of the disquieting mathematical speculations on the subject of the infinite being reflected inside the finite and its parts. This is what interests me and this could open a new line of research and writing after my forthcoming book on Derrida.

Introduction: The Smooth and the Striated

Flora Lysen and Patricia Pisters

A Thousand Plateaus' '1440: The Smooth and the Striated' introduces smoothness and striation as a conceptual pair to rethink space as a complex mixture between nomadic forces and sedentary captures. Among the models Deleuze and Guattari describe for explicating where we encounter smooth and striated spaces, the maritime model presents the special problem of the sea (Deleuze and Guattari 1988: 479). The sea is a smooth space par excellence: open water always moved by the wind, the sun and the stars, nomadically traversable by noise, colour and celestial bearings. Increased navigation of the open water resulted in demands for its striation. Although Deleuze and Guattari note that this took hold progressively, the year 1440, when Portuguese discoverers introduced the first nautical charts, marked a turning point in the striation of the sea. Maps with meridians, parallels, longitudes, latitudes and territories gridded the oceans, making distances calculable and measurable. It meant the beginning of the great explorations – and of the transatlantic slave trade and the expansion of the European State apparatus. The smooth and the striated concern the political and politics.

While the smooth and the striated are not of the same nature and *de jure* oppositional, Deleuze and Guattari indicate that *de facto* they only exist in complex mixed forms. Moreover, the smooth and the striated work in different domains. If the sea is the spatial field par excellence that brings out smoothness and striation, art is perhaps the domain that can give the most varied and subtle expression of the complex dynamics between them. The present collection investigates the smooth and the striated in the broad field of artistic production. It was instigated by the Third International Deleuze Studies Conference

Deleuze Studies 6.1 (2012): 1–5

www.eupjournals.com/dls

in Amsterdam (2010) that focused on the connections between art, science and philosophy. Along with conference papers, the role of art was explored through the work of participating artists and in a curated exhibition, *The Smooth and the Striated*. This exhibition focused on the constant interplay between delineating and opening forces in the works of the eight participating contemporary artists. Together, the installations, videos, drawings and photographs spurred a wealth of new connections and ideas in relation to the concepts of smoothness and striation: the artworks touched upon the solidification of historical memory and the transformation of ever growing archival material; the striation of subterranean city space; the politics of vast demographic datasets; the visualisation of scientific patents; and more.[1]

Similar to the exhibited artists in the context of the Deleuze Studies Conference, the authors in this volume think with art to shed new and interdisciplinary light upon the concepts of smoothness and striation, and, conversely, upon the way the smooth and the striated can give important insights into artistic practices. The smooth and the striated directly address processes in (social, political, geographical, biological) life, taken up in philosophy and art. Most of the contributions in this volume discuss the concepts of the smooth and the striated in relation to specific artworks that, in Claire Colebrook's words, 'are not representations of images *of* life', but, if we consider the emergence of the genesis of art and philosophy, can be understood as 'something of life's creative potential' (Colebrook 2006: 30). Hence, the singular artworks or artistic practices are not to be taken as illustrations of the concepts but as singular ways of embodying or expressing the various aspects that the smooth and the striated envision. 'If we *intuit* the forces that produce any single work of art or any single concept, then we might begin to approach singularity as such: the power of making a difference' (Colebrook 2006: 30). The essays in this special issue contribute to this power of difference in the complex interweaving between the smooth and the striated in its philosophical and artistic dimensions.

In the opening article, Eric Alliez argues for a conception of contemporary art theory as diagrammatic agency that differs from the aesthetic regime of contemporary art as defined by Jacques Rancière. The latter describes a regime in which the experience of art is always organized according to the image-metaphor. In contrast, contemporary art very often disorganizes the image, expressing directly the powerful forces of inorganic life (that are then connected to other assemblages of power). Ernesto Neto's sculptural environment *Leviathan Toth* (2006)

produces a semiotics of intensities that breaks through the image of power of the State by undoing the image with a read thread and white cloth. Smoothness is expressed in a non-organic Body without Organs, which is a Body without Image. While Alliez looks at the force-signs that are produced in the smooth spaces of contemporary art, Jay Hetrick returns to the question of nomadic art by retracing Deleuze's understanding of Riegl's haptic space through a reading of Benjamin's concept of *Kunstwollen* and the value of minor art forms that are able to produce a 'shock to thought', touching the spectator directly in close vision and haptic space. Hetrick gives significant emphasis to the role of cinema in modernism, the *kinaesthetic*, as moving sensation at the origin of all modern art.

After Eric Alliez' and Jay Hetrick's closer look at genealogies of art theory in relation to nomadic diagrammatics of intensive forces and movements, Colin Gardner and Todd Satter present important alternatives to conventional, modernist art-historical readings of painting and architecture. Gardner turns attention to the pre-eminent modernist painter, Barnett Newman, to show how the conventional formalist understanding of his large colourfield canvases fails to account for Newman's intricate relation to time and temporality. Reading with Deleuze and contra the famous formalism of modernist art critic Clement Greenberg, Gardner's Newman is a painter of *sites* of time; time is the event of the picture itself. Gardner proposes to read Newman's pictorial invention named 'zip' as the aesthetic figure that brings about this temporal sensation and a glimpse of the infinite. In a similar vein, Todd Satter's alternative, nomadic reading of the work of James Stirling unveils an underexposed side of architectural modernism. Opposing a dominant functionalist discourse, Stirling's sites generate a dynamic interplay between extensive (spatial) and intensive (temporal) forces in fragmented and indeterminate architecture, one that resituates embodiment and propagates assemblages between subjects and the environment.

Two artistic practitioners and scholars, designer Guy Keulemans and artist Charlotte Knox-Williams, argue for a dynamic interplay between theory and artistic practice. Deleuzian theory, for Knox-Williams, needs to be activated in, with and through art practice. By interweaving reflections of her own studio practice in film and drawing with thoughts on memory in Deleuze and Bergson, Knox-Williams' essay causes actual slippages and snags, thereby expounding on attention and inattention, matter and memory, on different, interlinking levels. In a different way, Guy Keulemans puts Deleuzian theory to use in several case studies

of generative design. He considers special approaches in designing yachts, vases and chairs to point to different trajectories and links between designers, input and output. Deleuze's emphasis on open-ended possibilities is important for understanding generative design as constituted ofterms in play.

The last three contributions to this volume focus explicitly on the different body politics that concern forces of smoothing and striating. Asli Özgen Tuncer takes as her starting point the activity of walking as a way to explore boundaries and openings in striated spaces. In a reading of several films by Agnes Varda, she identifies the body of the female protagonists as the embodiment of encounters with different types of striations such as the operations of a society of spectacle, the social pressure involved in settling down, and the process of aging. In this way Özgen Tuncer discusses a particular feminist body politics that Varda articulates in her films as nomadic resistance through an encounter with the outside world, expressed in the bodies of her heroines and through her cinematographic language. Zach Horton's essay investigates body politics though the work of 'hunger artists' Franz Kafka and Steve McQueen. He demonstrates how the fasting body of Kafka's 'Hunger Artist' creates a Body without Organs that resists the normal organization of the organism (and smoothes out the stratified body) while being captured by the powers of capitalism-spectacle. In his film *The Hunger* Steve McQueen not only shows the fasting and starving body of IRA-activist Bobby Sands (Michael Fassbender) as a BwO, but cinematographically he also presents the prison, striated place par excellence, as a giant BwO. As such, the body of the protagonist multiplies, spills over into the audience and traces the intensities for new resistances to come. Jean Hillier closes this volume with an investigation of the liquid spaces of the work of two contemporary artists, Antony Gormley's *Another Place* and Olafur Eliasson's *Your Watercolour Machine*. While subjected to countless striations through state regulations and institutional forces, both works invite the spectator to engage with assemblages of water, light, sound and metal that provoke smoothing effects through the vibrations and sensations of matter and non-organic life. Inviting us to embark among the waves they entice us, as Eliasson maintains, 'to consider everything from the perspective of waves'. And so, at the end of this volume and after having encountered a variegated spectrum of organic and non-organic embodiments that all art practices seem to call for, we return to the sea. The sea as work of art, one of these 'other places' that engages us more intensely with the smooth and the striated.

Diagrammatic Agency Versus Aesthetic Regime of Contemporary Art: Ernesto Neto's Anti-Leviathan[1]

Eric Alliez Kingston University

Abstract

Ernesto Neto's installation at the Panthéon in Paris, *Leviathan Toth* (2006), brings us into a semiotics of intensities that does not belong to the 'aesthetic regime' as described by Jacques Rancière but rather to a Diagrammatic Agency of Contemporary Art. In this case study, the latter is constructed *after* Deleuze and Guattari – from a politics of the Body without Organs critically and clinically identified to a Body without Image.

Keywords: Diagrammatic, Leviathan, State-Form, Body without Image, coenaesthesic penetrable non-object, non-organic life, politics of experimentation

> After the First World War, I said : Sovereign is the one who decides on the 'State of Exception'; after the Second World War, thinking of my own death, I say now: 'Sovereign is the one who has the waves of space at his disposal.'

In the immense emptiness and sepulchral chill of the Panthéon, it seems to emerge, suddenly, like a ballooning, billowy suspension of innumerable artificial columns veiled in a delicate white material (stretchable Lycra), whose distended bases, which bulge with faintly perfumed ballast, descend randomly to many levels or reach as far as the ground. This forest of sorts is attached to the vaulting of the Panthéon like some monstrous parasite, in a sort of reverse shot to the strict alignment of the building's columns. High up, hanging liana-columns pass through holes in immense sheets of Lycra stretched out between the four branches of the Panthéon in an uneven sinuous network with long, undulating pockets that are constricted or bloated, and to which a number of shafts are also connected. Its capacities exceeded, the eye is led to *contain*, *at a distance*, this body that is radically heterogeneous both to the place that it invades and to any identifiable reality. It attempts to encompass it by means of an *aesthetic metaphor* – that of some giant, monstrously octopus-white whale whose entrails are distended and swollen from devouring the Panthéon.

Metaphorisation confers the status of a half-figurative, half-abstract *image* – and therefore the character of a description (such as 'the innumerable suspensions of an inverted and parasitical forest') – on what is otherwise unidentifiable and whose radical alterity, in relation to image-effects, poses the question of knowing if it is *still* of an *aesthetic* order. According to Jacques Rancière, there is aesthetics when, breaking with all representative agreement – including the *immediately* metaphorical agreement between the sayable and the visible that 'figures' it – the 'image' becomes a 'theatre of defiguration' as a free play of 'form-signs' or 'phrase-images' wherein discourse has the double function of instituting the visibility of new disruptive forms and the intelligibility which surmounts their chaotic potentialities. It is to this dialectical play of textual excess with regard to the defiguring/defigured life of forms that Rancière has given the name 'aesthetic regime', in so far as it participates in a metaphorics that becomes superior at every point by renewing in a meta-descriptive sense the Schillerian principle of a *logos* identical to a *pathos* (Rancière 2007). One will not fail to notice here that a certain highly contemporary aesthetic turn takes place, or displaces itself, in this post-romantic regime. It is in relation to this *imagery* that it is necessary, at the outset, to distance ourselves.

I. Aesthetics Versus Diagrammatics

This said, it cannot be denied that our initial descriptive approach to Neto's installation for the Autumn Festival of Paris (2006), which

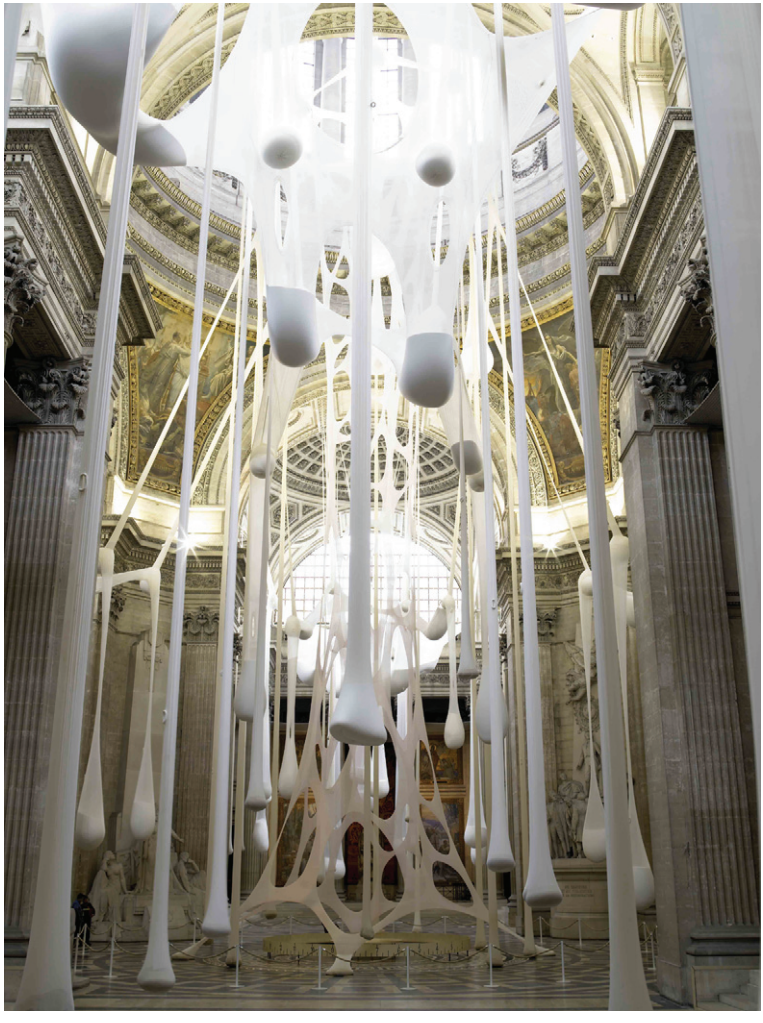

Figure 1. Ernesto Neto, *Leviathan Thot*, 2006, Pantheon, Paris. Photo: Marcus Wagner. Courtesy of the artist; Galeria Fortes Vilaça, São Paulo; and Tanya Bonakdar Gallery, NY

seems intent on *metamorphosising* its inevitably optical, distant, static, monumental capturing in view, presents itself as a heterogeneous *chaining together* of metaphors (vegetable, architectural, landscape, animal, biological…). But one could *imagine* other equally (in)adequate metaphors to whose descriptions the installation would lend itself (under such and such an *aspect*), whilst evading them globally. And perhaps it should be noted that, in their own 'theatrical' way, photographic images

precipitate and aestheticise the putting into image of the installation, by fixing (it in) spectacularly distanced long or close-up shots. It remains the case that the multiplication of metaphors or images that are heterogeneous to one another, and the possibility of interpreting them as the index of a mode of assemblage or of proliferating chains that is not of the order of the image, nonetheless poses the question of their (non-)relation to the image. Thus, if for Rancière 'the intensity-image is not a visual intensification, [but] a differential intensification [indicating that there] is image, aesthetically speaking, whenever there is an intensive leap from one register to the other', it is still in order to propose that 'the wheel of metaphors… is the truth of the singular image' (i.e. which pluralises or dialectises its forms). 'The image', he continues, 'always speaks transformation, it is, then, the operator of a regime of metamorphosis… that is what is characteristic of the image in the aesthetic regime of the arts' (Rancière 2009: 233–4). An aesthetic regime in which the play of metaphors becomes the motor of the metamorphosis, which in its turn animates the image-metaphor, derogates the intensity whose differential only plays between regimes of forms that are discursively implicated and complicated: relation, non-relation, or relation of non-relation to the image… Relaunched by *Leviathan Toth*, the title of Ernesto Neto's installation at the Panthéon, is at first an enigmatic linking of two names, that in turn poses the question of its relation to statements (*énoncés*).

However, everything changes from the moment that the spectator becomes an ambulant incorporator: he or she becomes a sensori-motor *component* of this body, which ingests him or her, and into which s/he is plugged. The spectator experiences this body – which is defined only by the set of tensions which animate it (tractions, suspension, stretching, inflation, constrictions, torsions) – in a coenaesthesic (rather than kinaesthesic[2]) and tensive manner. But make no mistake: coenaesthesic deambulation is not a way of experiencing the immediacy of the naked, sensible presence of a body suspended in space or the properties of a hybrid material that would carry us along in the special effects of a *materia informis*. Hence it *is not* the bearer of an aesthetic experience, at least in the primary sense of a pure sensible apprehension. It is, rather, the way in which we sense, in the first place, a mobilising energetic potential that acts on us in the manner of a field of forces, independently of any sort of discursive mediation or imaginary transport, but in and through the *semiotically machined agency* (*agencement*) in situ *of tensions* (we are in the Panthéon…). And it is through this potentiality, which envelops us with the inkling of forces that pass into sensation, that

what one must resolve to call *a powerful non-organic life* is given to us to undergo in our own Brain-Body movement. A powerful non-organic life that 'overflows' the immanent but limited, fleeting but ceaselessly relaunched experience that we have of it, or rather which traverses us. Via this 'neurotic' entrance into the installation, deambulation *starts up* what can only be 'interpreted' by beginning to experience the diagram of forces stretched out above our heads and around us – as we would experience 'the intrusion of another world into the visual world of figuration' (Deleuze 2003: 100). Absolutely *disorganised* by the most direct connection with the body – the coenaesthesic corporeality – the installation puts everything in tension and in motion, the visible that it expresses (what it feels and enacts in the sensation without distance that put it in motion) and the virtual that it constructs in *realising* the strange operation to which it is submitted.

One might reproach us with extending the Deleuzian diagram well beyond its pictorial usage. But one will equally understand that Rancière can reproach Deleuze precisely for 'short-circuit[ing] the work of metaphor' whilst the diagram, following Rancière, 'only makes visible if its labour is rendered equivalent to that of metaphor, if words construct such equivalence' in separating the presence in(side) art of 'any epiphany of the present' (Rancière 2007: 82). But this is to postulate the possibility of an equivalence between the work of forms, even if it is dynamic or dialectic (the work of the sayable and hence metaphorisable[3]) and the (non-discursive and post-discursive) work of forces. Now, the dynamic/dialectic of *forms-signs* animating the *aesthetic regime* cannot in any way be equivalent to an energetics of forces because this participates in a completely different regime, the *diagrammatic agency*. It doesn't aim at the negation of forms and the denegation of signs (participating, for example, in the symbolic montage of the Panthéon). Rather it aims at fusing and deterritorialising them as *forces-signs* (which make the referential territorialisation of significance and iconic territorialisation of interpretance of the Panthéon take flight). Carried off in this *semiotics of intensities* (Guattari's formula), 'information' fissures and is dissociated from the discursiveness in which it was caught (its intelligibility is suspended, scrambled, thrown into crisis). The work of the diagram, then, doesn't consist in putting the chaotic genesis of a pure visibility of forms into presence, even if they are mobilized by a spectator who is equally mobile in an 'environmental participation'. It tends to the 'capture of forces', to making 'insensible forces [anaesthetized in the symbolic semiology of the national monument] sensible'. The real stake of this agency (*agencement*) of forces, in itself a-signifying and

non-discursive, is to engage a 'diagnosis of our current becomings' in a *politics of experimentation*, a politics of experimentation which *really* begins with the production of novel conjunctions in the tissue of fluxes of materials and of signs… It is not that metaphor must be ignored, but instead of having the agency of the 'work' fall back on a metaphorical displacement (the equivalence reductive of forces and idealising of forms, appealing to an imaginary discursiveness), it must be relaunched on the body by investing the process of enunciation which animates the formation of statements, engaging metaphoricity itself and the matter-sense of statements in a semiotics of sensation. Signs here do not form signifying chains transported into the imaginary by 'metaphor', but half-coded, half-decoded chains. They form Markov chains, connecting elements of every kind (words, figures, fragments of the architecture or installation, a whole multi-sensoriality mixed with a world of analogons and schemas and affects) that are caught up directly in 'physical' effects in which every kind of real distinction between form of expression and form of content is abolished. It confers on signs a new material power of decoding which destratifies the space (physical, symbolic, discursive, institutional) in which it is inscribed by rendering sensible the trans-semiotic presence of insensible/anaesthetised forces.

In Neto's installation it would therefore be a matter of something completely different to an 'image', in the sense of an aesthetic *mise-en-scène*. An aesthetic *mise-en-scène* would be charged with 'un-veiling' an invisibility in a dialectic of hiding and showing internal to the image, or between images, or between the visible and the sayable. This invisible would be at one and the same time both the truth and the guarantee of the aesthetic operations of the *mise-en-scène*, even if this were at the cost of a permanent putting back into play of its operations (as it is with the sublime, for example). Rather Neto's installation is instead a matter of an *optically impenetrable* work which would in truth be better defined using two Brazilian passwords of the 1960s. It is a *coenaesthesically / signaesthesically 'penetrable non-object'* (*nao-objeto penetravel*). Lygia Clark and Helio Oiticica, in whose descendence Neto's entire oeuvre is situated, effectively made use of these expressions to think the 'total incorporation (in-corporation) of what one previously saw as environmental', according to a formula Oiticica used in his Notes on what he ends up calling the *ready constructible*. He presents this as the 'proposition of a meta-sculpture or a *new perception* going from the sculptural [*vinda da escultorica*] to a sort of art simultaneously situated on the ground and in the air' (Oiticica 1978 [1992]: 200). Neto's installation can be *penetrated* and *re-constructed* from everywhere and

from all directions as it has neither beginning nor end. Certainly there is a centre, but of decentering and axes which derive from it but only to be twisted out of joint. *Leviathan Toth* is a 'counter-installation' or an 'environmental appropriation' (in Oiticica's words). It doesn't seek to profit from the space of the Panthéon in order to *exhibit itself* (environmental art), or to exhibit its *heterogeneity*, in a symbolic or dialectical relationship to its environment. Rather, it is *in situ* that *Leviathan Toth* acts or agitates but so as to take on the *site-specificity* of the Republic's temple and locus of national memory 'conceived ideally as the centre of the territory, the heart of the nation' (Ozouf 1997: 155).

II. Dismantling the Image of Power

Consequently, Operation-Neto modulates into a *critical and clinical* operation. Critically, *Leviathan Toth* confronts the building and its sheer size and grapples with it by placing all its physical and metaphysical coordinates into and under tension. The operation thus engages with nothing less than the *image of power* related to the *power of the image* which animates it and gives it a discursive existence – because the *architectural denunciation* of the Panthéon produced by Neto doesn't occur without the (Hobbesian) *metaphysical enunciation* that is projected onto it. This enunciation is de-posed in the title of the 'contra-' installation in the manner of a '*d/enunciation*' reinforced by the mysterious *Toth* appended to it, and the no less strange orthography adopted by Neto for the Egyptian god Thoth.[4] Clinically, it sustains the claim to the affirmative dis-position of the operation: to the extent that this putting into tension is itself subtended by the fundamentally energetic nature of the process of environmental appropriation whose non-discursive grasping of being (*prise d'être*) liberates its effect as a 'counter-image' from the labour of the negative within the image as much as with regard to a purely critical relation to its aesthetic forms so as to introduce the intensive fact of a 'powerful non-organic life'.[5] Between the critical and the clinical, the pathology of the Body without Organs can thus awaken the anoptic quality of the Body without Image in a biopolitics of space which dismisses every metaphor of the invisible.

The part of Neto's counter-installation occupying the space of the Panthéon presents itself as a sort of tall, broad cylinder of fabric forming a vast, stretched out and deformed reticulation, as if the reticular structure of the cupola was *torn apart*. It opens out towards the *ground*, where it is solidly anchored around the oscillations of Foucault's Pendulum. Under the impact of other forces, the catastrophe extends

Figure 2. Floor of Pantheon with pendulum and statue of cat-goddess, partial view of Ernesto Neto, *Leviathan Thot*, 2006, Pantheon, Paris. Photo: Ernesto Neto

by contamination to the domes and vaults that develop geometrically around the central cupola. This cupola is covered with octagonal panelling that converges towards the summit, the design implying a hemispheric anamorphosis of the gridwork of the panels. This type of composition is repeated in the other cupola and on the circular floor tiling corresponding to them. As to the properly orthogonal grid, it is visible in the many criss-crossing patterns and tiles on the ground, and it provides a subjacent order to the whole plan of the work as the principle of its rationalisation *more geometrico*.

One will notice that the structure of the panelled cupola is not without analogy to the frontispiece of Hobbes' *Leviathan* as designed by Abraham Bosse, a major advocate of geometrically constructed perspective. The arrangement of the panelling in effect evokes that of the anonymous subjects presented from behind with their heads converging towards the sovereign, in an 'egalitarian' perspective, calculated in an egalitarian way. What is more, in the image, the sovereign associates the sword and the cross, in the same way as the Panthéon associates a secular temple with a church, not one which is consecrated but which is still present symbolically, topped with a cross to sacralise the Republic.

Figure 3. Frontispiece of Thomas Hobbes's *Leviathan* (1651) designed by Abraham Bosse

The analogy extends further since the eye of the cupola opens onto a second cupola occupied by a painting by Antoine Gros, *The Apotheosis of Saint Genevieve*, the base of which itself figures a corona of persona surrounding four sovereigns. The smallest eye of the cupola opens in turn onto a pure summit of light, which comes from the skylighting of the external dome, an ultimate supplementary dimension covering the system and the central void of Power to which all must equally submit.

It is against the ground and the aerial centre of this monument-image of power that Operation-Neto works. The large and loose netting of the immense pseudo-cylindrical, spidery reticulation which descends from the central cupola is not the simple deployment in space of the patterning on the ground of large folded fabrics but the sensory diagram of forces which, by stretching, distend the grid and deform it, substituting for the geometric rigidity of a rigidly cellular world, the perpetually changing dynamic of direct (immanent) relations between all the tensions. Concerning the part of Leviathan we have just dealt with, Neto has said that it is the monster's head, 'the seat of fear . . . the seat of

the purification of sentiments' by the cold and calculating rationality of modernity. At its feet, Thoth, the Egyptian god of writing and calculus, who the Greeks associated with astronomy and 'politics' watches over Foucault's Pendulum, which hangs in the middle of this central piece. But this god is an ambivalent figure: the god of writing and of calculus, he is also the registrar of the dead, he counts down the days of the living and weighs up the heart-soul of death. He is thus qualified from every point of view to preside over the death of Leviathan, of which he is at the same time both the instrument of power and death's first 'bureaucrat'.

The extendable fabric which (dis)incarnates the head of Leviathan – a sort of stripped off epidermis – is nothing but a bare surface, where the grid, both sign and operator of rationality in the cupola, is submitted to the dynamicising and dynamiting of its geometry. The whole of the central apparatus is suspended at eight points from the eye of the cupola (by analogy with the octagonal structures of the edifice). Like everywhere else, it results from a system of equilibrium between the weights and counterweights of suspended masses, between the gravity to which they are submitted and the elasticity of the tissue which contains them. The disfigured cylindrical net, which constitutes a sort of 'dorsal fin' for the ensemble, comprises at its base four terminal prolongations in the form of weighted pockets, sinking to the ground, where they anchor it, divided up around the pendulum. The counterweight is assured by the hanging of four sort of large pendentives that Neto calls 'drops' which descend half-way to the ground and whose weight overhead the visitor senses; while eight slim 'columns', on the contrary, run all the way to the ground which they are held just above or joined with (without settling on it). The body moving around the counter-installation experiences in a coenaesthesic manner the work of muscles tautened by the tensions this skeletal Leviathan undergoes from both above and below. It *participates* in this politically informed sensation *in situ*.

The decisive political stake of this apparatus is nothing less than the subversion of the Art that Hobbes explicitly declares, in the introduction of his major work, to 'create this great LEVIATHAN that is called COMMONWEALTH or STATE (in Latin CIVITAS)...'. ('Commonwealth', it will be recalled, is the English translation of *res publica*). In the optic of a constitutional reduction to the One, the art which stems from it bears the imperative of effectively producing a *public representation* of the body of the Republic, such that the multitude of subjects 'see' that they *constitute* its members, that the sovereign at its head is the bearer of the *most real image of Power*, capable of unifying the body of the people by representing all its

members in a consenting organism, at peace with itself, which is nothing other than the 'State', the constitutional State. Such a representation can only *link or bind* its subjects together under the sovereign that they institute in a constitutive manner by defeating, by undoing, 'this other multitude which has no order, which is like a many-headed hydra' (Hobbes, *De Cive* VI, 1).[6] Failing which, the Republican Contract which founds our democratic societies on Representation (nationally and in all the plasticity of the term) is unable to become effective.

Magisterially analysed in all its visual strategies by Horst Bredekamp, this is what the frontispiece executed by Abraham Bosse for *Leviathan* teaches us.

> The gaze which is directed by men everywhere towards the head of the colossus is directed back by its eyes at the observer, who joins with the view of the figures with their back to us at ground level and is at the same time, at the level of the gaze of the sovereign, directly interpellated by it. The contradictory character of the body politic as the product of men subjected by the sovereign is already manifest in the exchange of looks between citizens, Leviathan and the observer. (Bredekamp 2003: 9)

The common orientation of everyone towards the head of the sovereign proclaims the moment of contractual engagement of all, including the observer, who also *participates* in the apparatus, in this way verifying that representation is *tutela praesens*. 'It is only by its representative, that is to say, the sovereign, that the commonwealth is a person and has the capacity to do anything at all: the sovereign is the only legislator' (Hobbes, *Leviathan* XXVI). But again, as the German historian explains, 'for conventions and laws to become controlled actions, words must be changed into bodies, and it is this mediating step that the image of Leviathan accomplishes . . . It [thus] becomes a powerful machine for definitions, a "*sovereign definer*" ' (Bredekamp 2003: 128–9). One must understand that the contractual basis of the State *formally* founded on an egalitarian definition of citizens so as to suppress the state of nature (the perpetual war of the multitude maintained through a relative equality of forces) calls for the control of words as much as for the monopoly of violence. Relayed and represented by images which incorporate their sovereign majesty, the control of words is oriented towards 'the fact that we can command and understand commands' (it is the 'greatest benefit of speech' [Hobbes, *De Homine* X 3]), the exercise of which requires 'perspicuous words, but by exact definitions first snuffed, and purged from ambiguity' (Hobbes, *Leviathan* V).[7] Hence the *representation* of

Leviathan on the frontispiece of Hobbes' book is the centre of gravity of images because it is the exclusive sign of the *sovereignty* of the State related to the *right of representation*.

We have seen one avatar of this sign in the structure of the cupola of the Panthéon that Neto literally tears up (by opposing to its 'regime of representation' something other than an aesthetic regime of the image, in Jacques Rancière's sense). In this process, the Brazilian also attacks the political body of Leviathan understood as an *artificial man*, in its modern constitution. In theory it is indifferent whether the representative is a Monarch or a representative assembly – because it is the *representative* character of the sovereign, depositary of the 'personality of the republic', which founds absolute sovereignty on an egalitarian 'republican' contract of all with all (*inter pares*). Hence sovereignty is in truth the axiomatic corollary of representation (the *pact of representation*). Leviathan is thus the symbol of a *homo artificialis*, *automaton* or *machine*, whose power can only obey the principled rationality which created it in the name of the people (*rex est populus*), whilst each individual recognizes him or her self as the *author* of the acts and judgements of this *actor*, this sovereign representative that every individual institutes. In this way it is verified that the power of the legally represented 'subject' has no other condition of reality than the subjectivation of a power which finds here its first modern 'contractual' form. In *We Have Never Been Modern* – whose influence on his installation Neto acknowledged – Bruno Latour summarises the situation: 'Hobbes invents the naked calculating citizen, whose rights are limited to possessing and to being represented by the artificial construction of the Sovereign. He also creates the language according to which Power equals Knowledge, an equation which is at the root of the entire modern Realpolitik' (Latour 2006: 26). This is announced by the first phrases of *Leviathan*, grounding the mechanical creation of a political, or artistico-technological, android – which presides over the birth of modern political philosophy as a *science of submission* rationally founded on a calculus of interests (*philosophia civilis*[8]) in a theory of art. The sovereign governs with unlimited power in the name of all those he represents, who in return *equally* authorise the 'public person' to decide and to act in its place. Failing this, there would only be an aggregate totality, a *multitudo dissoluta*, because it is via the head of the sovereign, who personifies the *common*-will thus represented, that the political Body lives and moves.

In this way the civil 'unity' of the people, the people 'united in one person . . . called a COMMONWEALTH' (Hobbes, *Leviathan* XVII),

strictly correlated with the existence of the State, is substituted for the 'dissolute' multiplicity of the multitude, a sort of *Moby-Dick* avant la lettre.[9] Via this short-circuit (which is also the shortest circuit) between aesthetics and politics, Operation-Neto stages a sort of critical and clinical diagnosis of Representation, in every sense of the term, aiming at an *expansive disorganisation* of the multitude living under the republican regime of contractual representation, a regime for which the Panthéon is the temple as much *ex nostro arbitrio* as *more geometrico*. The disorganisation that affects the centre of Leviathan extends out to the other members of its body so as to invest the *multitudo dissoluta* with a radical vital de-construction and re-composition. If this is the more properly affirmative component of Operation-Neto taking place alongside the critical moment that was necessitated by the political take on the Panthéon, both are part of the same lesson in political anatomy. It starts up again from the top of the reticulated cylindrical shape. The fabric of this volume, in a tension that runs counter to its vertical fall, is stretched towards the exterior in four long forking branches. At their extremities, these four forks are then fixed on to the two 'arms' forming extensions towards the centre of the members of Leviathan occupying the four lateral axes of the Panthéon. The ends of these forking branches fix these arms across the fabric that is stretched under the weight of their endings. They form a sort of suture between the heterogeneous parts of the body of Leviathan. Although there are similarities between them, and internal symmetries, each one of these developed branches of the 'installation' is different from the others and is assembled in a fashion that is both 'vital' and inorganic. Neto calls this heterogeneous body a 'humanoid monster' and adds that 'in this highly masculine building it is a work of highly feminine contrast'. Rather than this contrast – the polarities of which could be inverted or associated within the terms of the opposition – a new ambivalence may be pointed out, related to the figure of Thoth. The statue on guard at the foot of Foucault's pendulum isn't really Thoth (figured with the head of an ibis or a dog or a cynocephalus) – and in any case, the identity of the gods of the Egyptians is no less variable than their names. Rather, it is a copy of Bastet (or Bast or Ubasti...), the cat-goddess, the peaceful avatar of a lion-goddess. Bastet has been considered most notably as the protector of the home and of motherhood, and associated with the joy of music and dancing, those arts that Neto associates with the Brazilian life experience, the *vivência brasileira* of his work.

Nothing is positively figured outside of the 'representation' aimed at by the defection whose object it is and which is also that of the image whose aesthetic form is as if devoured by the omnipresent apparatus

which is the whole of what one perceives. It is experienced corporeally, in a coenaesthesic fashion, as a sensational bloc of forces put into continuous variation. Thus, in the watering of the fabric filtering the light, it is not the optical effect which matters for itself, but the degree of tension of the elastic tissue-skin that results from the reciprocal, quantitative-energetic play of all forces, linking up step by step. If something akin to 'organs' appear – Neto talks of a head, stomach, arms, fingers and even alludes to sexual organs – they only function as pure intensities which accumulate in pockets or flow in a 'jet of energy' playing on the 'fluid aspect of matter'.[10] Forms here don't assume any function: they are the contingent result of a static energy (i.e. one that is frozen, *suspended*). This static energy itself results from the technically highly complex process by which the fabric, cut out in inert forms on the ground, is raised and stretched in such a way as to distribute both matter and the tensions to which it is susceptible so as to balance out the weights. Things only move now by a gentle, accidental oscillation incorporating the gradient of freedom belonging to the system. This is not without producing a Rhizome-Effect (Deleuze and Guattari 1984: 19) in the intensive-extensive continuum thus projected.[11] Tensions here function directly in an unformed matter, a matter-flux only presenting degrees of intensity, resistance, conductivity and stretching which condition its extension in space and which the ambulant relaunches coenaesthesically on his or her own body. Extension itself becomes the result of a fusional multiplicity whose 'quality' is the contraction, the *intension* of the quantity liberated by the *dissolution* of constant form as a *state function*, to the profit of dynamic differences which bring into relation the most diverse latitudes and longitudes, the most varied speeds and slownesses. The organising form of matter is in this way *suspended* by the putting into tension of the materials-forces, whose local results mobilize the ensemble of 'trajects'. *To suspend* is to struggle *with* the universal gravity which *striates* homogeneous space through 'the verticals of gravity, the distribution of matter into parallel layers, the lamellar and laminar movement of flows' summarised by Deleuze and Guattari as 'the space of *pillars*' (Deleuze and Guattari 1984: 408, italics added). But to suspend is equally to stop the regulated exercise of the organs (as forms subjected by the head) of the Leviathan-Body, and the relation that every human organism is supposed to maintain, using its head, with metric space in general. The organism's machinic enslavement to the abstract-form of space-measure is part of the domain of Thoth. In the first place it will have been necessary to *skin* the Leviathan-Body *because organs stick to the skin before depending on* '*this organic organisation of organs that is called the organism*', from which the

System of Judgement of the Leviathan-God extracts a work that is useful 'to the *prosperity* and the *wealth* of all particular members' on which the whole 'force' of Leviathan rests (Hobbes, *Leviathan* Introduction). The 'skin' here – which Neto specifies is neither the envelope nor the growth of any 'flesh' – is this *rising to the surface* of the organs liberated by the emptying out of the Socius-Corpus. This emptying out will have made a 'Body without Organs' surge up from and in the disaffected space of the Panthéon-Leviathan (the expression 'Body without Organs' may be found in Neto[12]), bearing with it an entirely different social physics to that of 'work' (*Leviathan Toth*, *catalogue Festival d'Automne* 2006: 35).

III. Blueprints, A Thread of Red Velour, White

Despite the absence here of any 'house-space' offering the 'bubbles of possibilities' of a 'new leisure-world' (the kind of *House* abundantly explored by Neto[13]), one might risk taking up the expression *crelazer* again. It was an expression forged by Oiticica to define the social

orientation of all his work, and it literally signifies 'creative leisure' (or, more exactly creation/playful belief), by double opposition to 'leisure' understood as submission to a preconditioned distraction, and to 'work' in its submission to the constraints of production. Now, 'leisure' is only 'creative' if it is not of a 'representative' order, if it escapes from any predetermination in the use of objects, the consumption of images, aesthetic jouissance or contemplation, and if it is not presented as 'participation' in formatted activities. *Crelazer* deterritorialises the spectator on the basis of the *objective* structure of 'propositions' that are made to him and which should contribute to the 'expansion of his habitual sensorial (and motor) capacities' by bringing to the fore the 'direct vital-living element [of an experience], which goes beyond the problem of the image [*o elemento vivencial direto, que vai além do problema da imagem*]'. It appeals to a 'new perceptive behaviour' corresponding to 'going beyond the object, which marks the end of the aesthetic expression [*uma superaçao do objeto como fim da expressao estética*]'.[14] Thus, in the Panthéon, the body of the spectator is forced to dis-place itself incessantly, to wander around so as to see and take in the excess of what it sees. The body is forced to *perceive* the space of the experiment within which it is caught and against which collision incessantly menaces, at the very moment that the 'hybrid element' is stretched out overhead like a skeletal star of skin.

In this way, the spectator is subjected to the experience of the Body without Organs of Space itself, the intensive *Spatium* rather than *Extensio*, in the haptic destruction of the optic of power, resulting from the fluidification of space by mass. This itinerant geography, which decentres every point of view in the continuous variation of orientations of a generalised elasticity, puts us in movement, in 'becoming'. We ambulate in the smooth space of a *nonument* (in the words of Gordon Matta-Clark) that only exists in the critical and clinical confrontation with the 'historical' striated space of the Monument, whose *sensible matter* has thus been awoken. This sensible matter propagates here like a counter-image liberating itself *energetically* from the task of *imaging* because it projects a new type of reality. An infra- and supra-organic reality, which draws its 'energy' as much from the *space of virtualities* liberated by the concrete physics of the power that acts with the forces internal to gravity as from the forces of the *multitudo dissoluta* caught up in and liberated from the monumental history of the Leviathan that it *invaginates*. It is by means of this Body without Organs, which is *in itself* a 'Body without Image' (Deleuze and Guattari 1984: 9), that Neto can give body *for us*, in a certain *delirium ambulatorium*, to the (rhizomatic

Figure 5. Build-up of Ernesto Neto, *Leviathan Thot*, 2006, Pantheon, Paris. Photo: Marcus Wagner. Courtesy of the artist; Galeria Fortes Vilaça, São Paulo; and Tanya Bonakdar Gallery, NY

and bioenergetic) subversion of the Image of the State-Machine, the *State-Form* such as it is inscribed on the pediment of the Panthéon sculpted by David d'Angers, where the word 'Nation' appears between 'Liberty' and 'History'.

Although Neto could not have conceived as complex a work as this without the support of an overall plan superposed on the ground and elevation plan of the Panthéon, the very course of the operation made this plan itself undergo a heterogenesis such that the result doesn't correspond to any prior image. Guided by this plan, and after having orientated himself with a rough sketch, with the help of a thread of red velour, Neto sized up and marked out the openings and multiple sections of fabric on the folded layers of material destined to become the diverse members of this inorganic body. The fabric was then cut out following this thread and sewn together before being filled with various substances (polystyrene, sand, lavender). *Cut out/sew in*. Confronted with the work, the plan appears as a graphical formalisation, an optical blueprint of an operation that escapes it because it is of an entirely different nature. This supple line was drawn/weighed up/posed by what Neto calls a 'hand-brain'; it slipped between the fingers, was 'worked'

by the displacement of the body, applied by gravity – all operations that transform an inert trace on paper into a living, fluid line, fluctuating according to the artist's intimate dance with all the parameters, both present and virtual, of his operation. Because there is a 'pressure of virtuality which disquiets the image that is already available to make space for a new dimension' opened up by a gesture which 'is not a simple spatial displacement: it decides, liberates and proposes a new modality of "moving" ' (as affirmed by Gilles Châtelet to explain how the *virtual requires the gesture* [Châtelet 1993: 32–3]). And the artist could only evaluate coenaesthesically the degree of elasticity of the Lycra at the moment he laid down his visually static but virtually dynamic line. In this regard, nothing is more striking than the distance between the sketched plan on the ground – right and proper, with the 'fine' curves and symmetries of its biomorphic and pseudo-organic regularity – and the body which takes on a life of its own in suspension in space. It is a life which is elastic as much as rhizomatic, so much does the plasticity of mass affirm here its irreducible difference from extension (*Extensio*), in suspension in space submitted to resistance – that is to say, to speak Leibnizian, *action and passion*. No direct deduction from the plan to the body can be made at all.

In the erection of the diverse members of the body ('the experience begins', says Neto[15]), gravity henceforth becomes the fundamental agent to which all the virtualities of both space and the volume of the cut and sewn material forms are subjected *by force*, giving rise to continuous processes of transformation. Operational machination appeals to an intuition in act as much as to an extension of its act, which redefines the artist as an *artisan* and the artisan as *the itinerant, the ambulant* (Deleuze and Guattari 1984: 452). One may recall that the operation began well before the setting up of the installation, when Neto bundled up the Lycra in his workshop in Rio (the workshop of a couturier rather than the studio of an artist) before laying it out in the Panthéon, as he says, like 'a travelling salesman, a street vendor', a *camelot* carioca. These *camelots* are the 'natural' inhabitants of the favelas and champions of the 'informal' economy which informs and deforms the landscape of Rio, deployed in an 'unplanned order'. They are, Frank Leibovici summarises, 'the social equivalent of the favelas, which are themselves the urban equivalent of *bromeliae* growing all the way down the trunks of palm trees' (Lebovici in *Leviathan Toth* 2006: 29–30). It is also this 'tropical forest' that in a sort of environmental mutualism Neto makes grow (processually, not iconically) right in the middle of the Panthéon, like it grows all over Rio, with the favelas whose physical and human geography clings to hillsides. If *natural*

or, more broadly – Foucault's pendulum obliges – *cosmic* mutualism (as Brazilians also say, *à la Deleuze-Guattari*) has some paradigmatic (or *cosmopolitical*) relevance here, Operation-Neto evidently shows that it is on condition of understanding environmental mutualism in a strictly constructivist – in the words of Oiticica, 'anti-naturalist' and 'multi-transformable' – sense. As Latour puts it definitively, between 'nature' and 'society', 'if we are constructivist in one instance, then we have to be constructivist for both' (Latour 2006: 95).

As to the whiteness of the material Neto unpacks in the Panthéon before he cuts it up, this ready-made colour immanent to an industrial-synthetic material, which confronts us strangely with the 'white without form' denounced by Hegel in the Preface to *The Phenomenology of Spirit*, is directly incorporated into the environmental value of the installation. It works away haptically in the light under the effect of the tensions which the Lycra undergoes, but in the manner of *a bodily restraint* (*une contrainte par corps*) which violates and blinds the optical reception of light in the 'total activity of the eye'.[16] (Im-penetrable, *white without form* is *a tangible white* forbidding any 'division of retinal activity', *gathered up*, *crushed, forbidden and deranged* in the ready-made white). It is worth recalling here that Oiticica conceived, even hallucinated, Malevich's *White on White* as a 'a necessary step in which the 'plastic arts' shed their privileges BY WHITENING THEMSELVES SO AS TO BECOME SKIN/BODY/AIR'. It is exactly the 'nonumental' components that Neto utilises and which he comes back to in the text presenting *Leviathan Toth*, specifying their tensive or intensive values so as to define the mutualism of his apparatus – giving a meaning to what he calls the 'ethic of action' (*a ética da ação*) (Artes & Ensaios 2008: 16). There comes a moment when, as he writes,

> the touching, the intimate relation, the spatial limit between skin and matter, solid in its essence but liquid in its spherical envelope, which adjusts to every movement like the sand which flows through the neck of an hourglass, whose fluid mass defines the body of the work, are intensified in ascension … Like mutualism … in a tropical forest … everything is re-organised in this space of passage, of tensions, volume adapts and forms itself again here and there in a dance of calculations and chance … than toth! (*Leviathan Toth Catalogue* 2006: 53).

Notes

1. A first version of this text was published as Eric Alliez, 'Body without Image: Ernesto Neto's *Leviathan Thot*', *Radical Philosophy*, 156 (2009), pp. 23–34 (translated by Andrew Goffey). This new version was presented at

the Internationales Kolleg für Kulturtechnikforschung und Medienphilosophie (IKKM), Weimar, on 19 May 2010. A more elaborated version of this argument, which compares Jacques Rancière's aesthetic regime to George Didi-Huberman's phenomenology of art will be found in E. Alliez and Jean-Claude Bonne, *Défaire l'image. De l'art contemporain* (forthcoming).

2. Because in one way or another, the (phenomenological) *flesh of the world* is enveloped by and into the kinaesthetic dynamism constituting phenomenologisation.
3. Or even: the metaphorisable and hence sayable.
4. Questioned on the subject, Neto told me that he had wanted to introduce a principle of variation that accorded with his own 'operation' on Leviathan. I will therefore respect the spelling *Toth* wherever it is a question of the title of the work and will use the normal spelling when it is a question of the figure of the Egyptian God.
5. On the 'powerful non-organic life' in its relation to the Body without Organs, see Deleuze 2003: 46–7.
6. The citation is from the Sorbières translation of *De Cive*.
7. From which it can be verified that an analytic definition of philosophy cannot work without its a priori being conditioned by political information. Hobbes appears here as the proto-founder of linguistically defined analytic philosophy. One will not fail to notice the extreme resonance of a counter-effectuation as we know it from Deleuze and Guattari: 'the elementary unit of language – the statement – is the order-word. Rather than common sense, a faculty for the centralisation of information, we must define an abominable faculty consisting in emitting, receiving and transmitting order words. Language is made not to be believed, but *to be obeyed, and to compel obedience*' (Deleuze and Guattari 1987: 84).
8. *Philosophia civilis*, which, if we are to believe Hobbes in the epistle dedicatory of *De Corpore* '[is] no older than [his] book *De Cive*'. Its modernity is thus inscribed in the wake of the scientific revolution of Copernicus and Galileo.
9. But which one must take literally. Mob = the dangerous mass, and Dick = the devil.
10. According to the declarations made by Neto in the video accompanying his installation.
11. '[T]he final global result [is] synchronised without a central agency' (Deleuze and Guattari 1984: 19).
12. In *Leviathan Toth*, *catalogue Festival d'Automne* 2006: 35.
13. For example *House-Ship* (*Nave*) where the influence of Oiticica is in some way overdetermined by that of Lygia Clark, culminating provisionally in *The Malmö Experience* (2006). It is of course the critical-clinical dimension of *Leviathan Toth* that forbids its principle, whereas its 'un/civil instruction' *in situ* (although irreducible to any kind of *site-specific criticism*) problematises the 'participation' of the visitor-citizen in the extreme.
14. Cf. Hélio Oiticica, *Aparecimento do Suprasensorial* (1967), *Tropicalia* (1968), *Eden* (1969), *Crelazer* (1970). These texts are reprinted in Oiticica 1978. The first phrases explaining 'house-space' (*o espaço-casa*) are extracted from *Crelazer*.
15. Leviathan Toth, catalogue Festival d'Automne 2006: 35.
16. 'The sensation of white or of light, that is to say the total activity of the eye . . . ', writes Schopenhauer in his letter to Goethe, 11 November 1815, when he tries to push his master's anti-Newtonism to its final physiological limit. (Schopenhauer [1818] (1986): 125).

What is Nomad Art? A Benjaminian Reading of Deleuze's Riegl

Jay Hetrick University of Amsterdam

Abstract

In *A Thousand Plateaus*, Deleuze and Guattari offer a description of what they call 'nomad art' by detailing its three primary characteristics: close-range vision, haptic space, and abstract line. In an attempt to unpack the significance of this provocative term, this paper will sketch the provenance of the first two of these characteristics, both of which come from Deleuze and Guattari's particular reading of Alois Riegl. Together, close-range vision and haptic space delineate the synaesthetic vision of the artist as well as the space s/he creates in the work. Walter Benjamin will be invoked as a sort of phantom link between Riegl and Deleuze, a link that will both provide the proper orientation towards the central aspect of the haptic — against a Phenomenology of affect — as well as inject the necessary political significance into the discussion of nomad art.

Keywords: Riegl, Benjamin, haptic, *nomos*, art

Deleuze's appropriation of the Viennese art historian Alois Riegl for the development of his own philosophy of art is well documented. My aim here is not so much to recount systematically the intricacies of this appropriation as it is to highlight the theoretical stakes of misreading any of Deleuze's philosophical manoeuvres. One of the most critical issues is the significance of the concept of the 'haptic', since it is central to Riegl's art theory and since it also ultimately lies at the core of all three aspects of nomad art. I will attempt a philosophical genealogy of this term from Riegl to Deleuze, mediated through the

Deleuze Studies 6.1 (2012): 27–41

www.eupjournals.com/dls

work of Walter Benjamin. I specifically use Benjamin in order to save Deleuze from trends that uncritically employ the term haptic to develop seductive phenomenologies of 'multi-sensory media' or that – by freely connecting the term to psychological or even psychoanalytic meanings of affect – reduce it to a function of embodied Being-in-the-world. My purpose is not to argue for a strong theoretical lineage from Benjamin to Deleuze, which would probably prove to be an impossible task, but rather to suggest that reading Deleuze's Riegl through Benjamin is one way of avoiding a collapse into phenomenology. The Benjaminian reading of Riegl is also useful since it imparts a political dimension to the latter's mostly apolitical analyses of art. In the end, I hope to show that the most important feature of a haptic *Kunstwollen*, or regime of art, for Benjamin and Deleuze is that it signals a non-Romantic and non-phenomenological aesthetics of shock, which takes its cue from the late-nineteenth-century discourses concerning psychophysics and physiological psychology to which Riegl was himself directly responding. This shock, rather than inducing a form of political quietism, necessitates an ethico-political response at the level of the work, that is, within the smooth space it draws.

I. Benjamin's *Kunstwollen*

In *The Origin of German Tragic Drama*, Benjamin adopts Riegl's art historical methodology and applies it to literature, in particular seventeenth-century Baroque *Trauerspiel*. Although Benjamin only occasionally cites him directly, Riegl's concepts can be detected in essays connected to the themes of this book as early as 1916 and continued to play a central role throughout Benjamin's career including in his famous essay 'The Work of Art in the Age of its Technological Reproducibility' (Jennings 1987: 154). In short, it is hard to overemphasise the influence of Riegl on the development of Benjamin's thought. Despite his relative reticence on this fact, we do have one explicit and emphatic declaration of allegiance – in a short review article, published a year after his *Trauerspiel* book, concerning 'four great works of German scholarship' that have 'remained alive' – in which he describes Riegl's *Late Roman Art Industry* as an

> epoch-making work that applied with prophetic certainty the sensitivity and insights of expressionism (which occurred twenty years later) to the monuments of the late Imperial period, [which] broke with the theory of 'periods of decline', and recognised in what had previously been called 'regression

> into barbarism' a new experience of space, a new *Kunstwollen* . . . Indeed, in the last four decades no art-historical book has had such a substantive and methodologically fruitful effect (Benjamin 1980: 170).

Benjamin acknowledges that what drew him to Riegl was the constellation of a few ideas which revolve around the concept of *Kunstwollen*, an idea which helps us relate art objects to the broader cultural and spiritual concerns of a historical period. The details of a work are expressions of this *Kunstwollen*, a 'realm of perception that', according to Benjamin, 'changes over time and in accordance with shifts in cultural and intellectual direction' (Benjamin 1999: 667). Although Riegl himself sometimes confuses the matter by using language that might link *Kunstwollen* with the subjective will of an individual artist, he makes it clear that it is ultimately linked to the general cultural attitude of the period: 'The character of this *Wollen* is always determined by what may be termed the conception of the world at a given time [*Weltanschauung*]' (Riegl 1985: 231). Modifying Rancière's vocabulary, the *Kunstwollen* might be characterised as the general 'distribution of sensation' of a particular episteme since, as Riegl explains, it 'regulates the relation between man and objects as we perceive them with our senses; it is how we always give shape and colour to things' (Riegl 1985: 231).

An important consequence of Riegl's *Kunstwollen* for Benjamin is that it completely relativized the concept of beauty and undermined any version of the claim to eternal values. That is, it provides an art theoretical way out of the classicist conception of value in judgements of art. In Riegl, Benjamin saw for the first time a serious scholarly consideration of an artistic period and its works – late Roman antiquity as illustrated, for example, by the sketchiness of the Pompeii paintings – that was usually considered unworthy of study. Just as late Roman art was largely dismissed as decadent by the classicist aesthetes, so was German Baroque drama. Thus Riegl initiated a new art historical methodology that legitimated Benjamin's own analyses whether in literature, art, or the new medium of cinema. He saw Riegl attempting to theorise, through the close analysis of artworks, an objective organising principle intrinsic to the style of the period and a value which made sense only in relation to its *Kunstwollen*. That is, Benjamin understood the revolutionary importance of Riegl's art historical method to lie in the fact that it locates the value of a work within the mode of perception through which it was produced and consumed. Qualitative distinctions between low, high, and applied arts could no longer be substantiated. Rather, the concept of *Kunstwollen* demanded an entirely different

criteria of judgement: not the quasi-moral value implied by the concept of beauty, but rather a psychophysical value which is measured on a sliding scale between what Riegl called the optic and the haptic.

In *The Origin of German Tragic Drama*, Benjamin articulates this new stance regarding the judgement of art with terminology familiar to Deleuzians: he argues for the necessity of bringing to the fore 'the laborious efforts of minor writers' (Benjamin 1998: 58). It is quite possible that there is a direct inheritance of the idea of minor literature from Benjamin given the fact that Deleuze was familiar with this work and even acknowledges his debt to it for his own conception of the Baroque (Deleuze 1993: 125). To this it should be added that 'Toward a Minor Literature' is the subtitle to Deleuze's book on Kafka, an author who in many ways Benjamin regards as *the* literary exemplar that most fully expresses 'tradition falling ill' in modernity: 'To do justice to the figure of Kafka in its purity and its peculiar beauty, one must never loose sight of one thing: it is the figure of a failure' (Benjamin 1994: 565–6). In any case, in the *Trauerspiel* book Benjamin already goes as far as to suggest that a *Kunstwollen* only fully appears in works that exhibit 'eccentric features' that are 'offensive or even barbaric to refined taste' (Benjamin 1998: 58, 50). Likewise, decadent periods are 'historically responsible' precisely to the extent that they tend to not produce works which display classical or organic beauty:

> These are the periods of 'decadence' in the arts, the periods of artistic 'will.' Thus it was that Riegl devised this term [*Kunstwollen*] with specific reference to the art of the final period of the Roman empire. The form as such is within reach of this will, a well-made individual work is not. (Benjamin 1998: 55)

Again, this sentiment is directly inspired from Riegl. In the introduction to his *Late Roman Art Industry*, he argues that choosing to focus upon the late Roman period was deliberate and productive for objective analysis precisely because the values of taste intrinsic to its *Kunstwollen* were completely removed from those of his own. In fact, Riegl's entire intellectual career was motivated by the desire to legitimise the study of under-appreciated arts and crafts.

II. *Kunstwollen* in Modernism

Benjamin's 'Work of Art' essay can also be read as an adaptation of Riegl, this time to the era of modern art, which is intimately tied to the birth of cinema. Indeed, one could almost argue that his account of the destruction of the aura in modern art is fully comprehensible

only as a highly original appropriation of Riegl's concepts of haptic and optic perception. The essay proceeds with analyses of photographic and cinematic media combined with assertions about a new regime of sensibility, without specifically arguing for a strong relation of cause and effect in either direction. However, Riegl's influence on Benjamin makes the relation clear. Given the former's framework, cinema would simply be an expression of the *Kunstwollen* of the era, or 'mode of perception', which is itself inseparable from the broader *Weltanschauung* or 'mode of existence' (Benjamin 2002: 104). Although both Riegl and late Roman art are specifically evoked in this crucial section of the essay, the reader has to connect the dots. Here, what ultimately interests Benjamin are the characteristics of this new mode of perception – as well as, in a move beyond Riegl, its social implications – rather than simply the birth of a medium. He even goes so far as to suggest later in the essay that this new mode of perception was inaugurated prior to the invention of cinema by a new type of group experience of landscape paintings in the mid-nineteenth century. Therefore, rather than being a progenitor of the haptic regime, cinema is merely a more adequate expression of it: 'The simultaneous viewing of paintings by a large audience, as happens in the nineteenth century, is an early symptom of . . . a crisis triggered not exclusively by photography but, in a relatively independent way, by the artwork's claim to the attention of the masses' (Benjamin 2002: 116). Furthermore, the spectator of cinema is assaulted by constant and abrupt changes that Benjamin also compares to the modern experience of being jostled in a crowd, thus confirming this connection between the modern reception of painting and cinema. In this regard, Benjamin relies upon Baudelaire's essays on art, whose various descriptions of the 'shock' effect of movement through the urban landscape announce the 'renunciation of the magic of distance' associated with the loss of aura (Benjamin 2003a: 172).[1] The aura is defined by Benjamin as the quality of 'authenticity' that accumulates within the contemplative space between subject and object, 'the unique apparition of a distance, however near it may be' (Benjamin 2002: 105). The 'destruction of the aura' is a 'process of immeasurable importance for both thinking and perception' since it indicates a disruption of the given distribution of sensibility as well as the birth of a new mode of perception that seeks to overcome distance with a desire 'to 'get closer' to things' (Benjamin 2002: 105). As we shall see, this language of nearness and distance is intimately connected to Riegl's opposition between the haptic and optic. Thus, we should take Benjamin to mean that the birth of modern art, as measured by the destruction of the aura, is to be understood as a

fundamental shift from an optic to a haptic distribution of the senses. The cinematic *Kunstwollen* marks a distinction between a bygone era of 'alluring visual composition[s]' to one which turns 'the artwork into a missile'. Cinema jolts 'the viewer, taking on a tactile quality' and producing a 'physical shock effect' and thus evokes the 'decadence' and 'barbarism' of Dada, which 'attempted to produce with the means of painting or literature the effects which the public today seeks in film'. Like the experience of moving through an urban crowd, the cinema is characterised by 'successive changes of scene and focus which have a percussive effect on the spectator' (Benjamin 2002: 118–19). In Riegl, the categories of optic and haptic were only employed in tracing the historical development of the arts from ancient Egypt (primarily haptic), through to Greece (optic-haptic), and ending with late Imperial Rome (primarily optic). Although he wasn't the first or last to break with this schema while retaining Riegl's concepts – Deleuze also cites Wilhelm Worringer and Henri Maldiney in this regard – Benjamin's labelling of the modern regime as fundamentally haptic implicitly rejects any Hegelian reading of Riegl, like that of Hans Sedlmayr, who argues that the optical regime reached its teleological apex with Impressionism.

The main points outlined so far can be applied to Deleuze's philosophy of art as much as they can be attributed to Benjamin's interpretation of Riegl. Indeed, they more or less sum up Deleuze's position concerning the significance of the haptic. Along with the optic, the haptic indicates a displacement of the criteria for the judgement of art from one based on a quasi-moral theory of aesthetic value to one that uses the practical and tangible language of psychophysics. This allows for the rejection of value theory without falling into a postmodern abyss in which *any* qualification becomes impossible or irrelevant. It also is an advance over Rancière's otherwise useful conception of different regimes of art, which relies too heavily upon the ambiguity of the term 'sensible' – thus unnecessarily confusing the registers of *Kunstwollen* and *Weltanschauung* – and which seems to be, in fact, a direct appropriation from Deleuze's *Foucault*.[2] For Benjamin and Deleuze, the character of a *Kunstwollen* and an individual work of art can be qualified, without judgement, on a sliding scale from the glowingly contemplative to affecting a violent jolt to the nervous system. The haptic for Deleuze indicates first and foremost an aesthetics of psychophysical shock along the lines we have been describing; it refers to the act of touching (Greek, *haptikos*) only in so far as art is able to deliver, through cinema, '*a shock to thought, communicating vibrations to the cortex, touching the nervous and cerebral system directly*'

(Deleuze 1989: 156). But, like Benjamin, the haptic *Kunstwollen* is another name for this cinematic distribution of sensation – with or without film – since it involves, as Deleuze now argues in his book on Francis Bacon, a 'violence of sensation . . . inseparable from its direct action on the nervous system' (Deleuze 2003: 34). Finally, this shock forces the subject to move beyond the organisation of the lived body which 'is still a paltry thing in comparison with a more profound and almost unliveable Power' towards what Deleuze calls the 'body without organs' (Deleuze 2003: 39). Similarly Benjamin, quoting Baudelaire, writes that with 'the experience of shock', the human is effaced by 'a reservoir of electric energy' and reduced to a mere 'kaleidoscope' (Benjamin 2003b: 328). Therefore, any 'reterritorialisation' back into the realm of phenomenology under the guise of the term haptic completely betrays the enormous amount of philosophical work Deleuze has performed in order to move beyond this discourse. It is true that Deleuze relies upon the phenomenological work of Henri Maldiney. But he does so strictly for two reasons, neither of which turns *him* into a phenomenologist. First, Maldiney extends and amends Riegl's history to include the movement of the haptic and optic from Byzantine to Modern art. Second, Maldiney's reading of neurologist Erwin Straus' account of perception gives Deleuze the technical vocabulary he needs – for example the notions of systole, diastole, and rhythm – to bolster his own psychophysical conception of the haptic. Furthermore, the handful of references to Merleau-Ponty and Heidegger in the Bacon book should be understood as nothing more than another instance of Deleuze's philosophical 'buggery', which in this case focuses on their respective moves away from the intentional subject towards Being. In particular, the provocative comment that sensation is 'Being-in-the-World' cannot be read with a straight face given the elegance and force of Deleuze's conception of the 'being of the sensible', articulated more than a decade earlier (Deleuze 2003: 31; Deleuze 1994: 139–40).

III. Haptic and Optic Distributions of Sensation

After piggy-backing on Maldiney's art historical account in order to move beyond Riegl, Deleuze also jettisons it in favour of a more Benjaminian view, which holds that a certain trajectory within modern art is fundamentally haptic. Specifically, while Maldiney defines the late Cézanne's use of colour as representing the apex of purely optical art, Deleuze sees it as the beginning of a lineage that continues with the work of Francis Bacon and which should be properly described as

haptic. Without getting into the details here, the seemingly paradoxical term 'haptic colourism' points to another important aspect of Deleuze's concept of the haptic. It involves 'the formation of a third eye, a haptic eye, a haptic vision of the eye... as if the duality of the tactile and the optical were surpassed visually in this haptic function born of the diagram' (Deleuze 2003: 129). Haptic vision is therefore synaesthetic, not in a strictly clinical sense, but in that there is a disjunctive 'joining together of the two senses of touch and sight' (Deleuze 2003: 99) in which the 'eye itself has a haptic, non-optical function' (Deleuze and Guattari 1987: 494).[3] Furthermore, the haptic 'may be as much visual or auditory as tactile' (Deleuze and Guattari 1987: 493). The main issue here is not synaesthesia – which, incidentally, is specifically evoked by Benjamin in one of his descriptions of haptic shock – but rather the fact that Deleuze loathed any art which involves a hierarchy of the senses.[4] Specifically, he is attracted to art that escapes the haptic-optic *Kunstwollen* with which Riegl defines the ancient Greek aesthetic, and which Deleuze argues continued, for the most part, in Western representational art from the Renaissance until the nineteenth century. This type of art – which he characterises as expressing figuratively the 'organic activity of man' (Deleuze 2003: 102) – does not depend upon an egalitarian distribution of the senses, but is primarily optic, utilising tactile elements only subordinately in order to produce the illusion of three-dimensional space. While the space of both Byzantine art and Maldiney's Cézanne is a step beyond representational figuration, it still prioritises the optical. It is only with Deleuze's characterisation of Cézanne and Bacon as 'haptic colourists' and his appropriation of Wilhelm Worringer's 'Gothic line' – which exhibits 'an impure, and to a certain extent uncanny, amalgamation' (Worringer 1957: 42) of abstraction and empathy, terms Worringer uses as rough psychological equivalents to Riegl's haptic and optic – that we move away from a distribution of sensation which subordinates one sense to another.

Another characteristic of the haptic-optic regime of art – where the hand and eye work together under the controlling gaze of the latter – is that it produces 'striated space', which Deleuze defines as a 'mode of distribution' that restricts free movement through the use of 'walls, enclosures, and roads between enclosures' (Deleuze and Guattari 1987: 381). It denotes the type of compulsive parcelling-out of the ideal city Plato describes at the end of Book V of his *Laws*. That is, 'haptic' and 'optic' qualify not only a particular distribution of the senses, but also the type of distribution of space they draw out. Specifically, the type of distribution of space in a work is determined by the relative

nearness or farness required for both producing and viewing it. Deleuze describes the haptic distribution of space as 'smooth' and relates it to the 'close vision' involved in haptic viewing. As Deleuze notes, it was again Riegl who 'gave fundamental aesthetic status to the couple *close vision/haptic space*' in his descriptions of ancient Egyptian bas-relief sculpture. (Deleuze and Guattari 1987: 492). Riegl convincingly argues that the surfaces of these reliefs are characterised by a

> tactile plane suggested by the sense of touch . . . this is the plane which the eye perceives when it comes so close to the surface of an object, that all the silhouettes and, in particular all shadows which otherwise could disclose an alteration of depth, disappear. The perception of objects, which characterises this first level of the ancient *Kunstwollen*, is thus tactile and in as much as it has to be optical to a certain degree, it is *nahsichtig*; ancient Egyptian art expresses it in almost its purest form (Riegl 1985: 24–5).

However, Riegl's categories of *Nahsicht* (close vision) and *Fernsicht* (distant vision), which are fundamental qualities of the haptic and optic regimes of art respectively, are modelled upon the concepts of *Nahbild* (close image) and *Fernbild* (distant image) put forth by the German sculptor Adolf Hildebrand almost ten years before the publication of *Late Roman Art Industry*. This point is not only interesting because it rectifies the proper genealogy of these terms; it is also important because Deleuze ultimately amends Riegl's conception of close vision and the space it creates, preferring one that is in a certain way reminiscent of Hildebrand. Hildebrand suggests that in looking at a distant background, a spectator does not need to move the gaze; the eyes remain still and the image appears flat, almost two-dimensional. However, in order to see a nearby object and bring it into focus, the eyes have to continually shift from one viewpoint and depth-of-field to another, in effect scanning the object in a way akin to examining it through touch. He argues that these 'two different means of perceiving . . . not only have separate existence in our faculties for sight and touch, but are united in the eye' (Hildebrand 1907: 14). What is important for Deleuze's conception, although he doesn't cite Hildebrand, is that the continuous scanning of the eyes in close vision is qualified by Hildebrand not merely as the 'mixing' of the visual and the tactile but also as 'kinaesthetic' (Hildebrand 1907: 14), that is, as the sense of movement of and between the two. Rather than simply synaesthetic, which presupposes a rigid partitioning of individual sense modalities, haptic vision in Deleuze should be understood as a nomadic kinaesthesia in both the physiological sense – the self-perception of

movement, which is closely related to affect, within a body without organs – as well as the etymological sense – *kinein* (moving), *aisthesis* (sensation) – of the term. 'This rhythmic unity of the senses can be discovered only by going beyond the organism', where 'sensation is vibration' and 'the state of the body 'before' organic representation' is defined by 'axes and vectors, gradients, zones, kinematic movements' (Deleuze 2003: 39).

Likewise, the smooth space drawn out on a canvas subsequent to such a haptic vision should also be understood as nomadic. Deleuze's main critique of Riegl's account of the close vision/haptic space couple is precisely that it eliminates this nomadic quality. This is because Riegl approaches it only 'under the imperial conditions of Egyptian art . . . conditions under which it already serves to striate space'. These conditions include 'the presence of a horizon-background; the reduction of space to the plane . . . the rectilinear outline enclosing individuality and withdrawing it from change. Like the pyramid form, every side a surface, against the background of the immobile desert' (Deleuze and Guattari 1987: 495). Deleuze emphatically argues that the distribution of space produced by haptic vision cannot be reduced only to that which is suggested in Egyptian art, although he does agree that the strange contortion and distortion of heads, eyes, torsos, and limbs in these works is a good first approximation. However, they still exhibit a geometric delimitation of background, plane, and contour, which cannot occur in a purely smooth space. Riegl's relatively sober depictions of Egyptian bas-relief figures become wild and almost carnivalesque in Deleuze's rendering: 'twisted animals have no land beneath them; the ground constantly changes direction, as in aerial acrobatics; the paws point in the opposite direction from the head, the hind part of the body is turned upside down' (Deleuze and Guattari 1987: 494). But, even more than this, the best descriptions of haptic space according to Deleuze are taken from examples of visions of the desert, ice, and sea in which the eye nomadically scans the field of vision unable to find rest since 'orientations, landmarks, and linkages are in continuous variation': 'no line separates earth from sky, which are of the same substance; there is neither horizon nor background nor perspective nor limit nor outline or form nor centre; there is no intermediary distance, or all distance is intermediary' (Deleuze and Guattari 1987: 493–4).

With the depiction of such a smooth space on the canvas, we simultaneously enter the nomadic expanse of the desert pictorially as well as the brain of the artist who has suffered a haptic shock to thought and is able to render this disorienting close vision: 'This is what Bacon calls a . . . diagram: it is as if a Sahara, or a zone of the Sahara,

were suddenly inserted into the head' (Deleuze 2003: 82). This smooth, 'diagrammatic' space is neither homogeneous nor heterogeneous but amorphous, following a Riemannian rather than Euclidian topology, and bears a similarity to certain works of abstract expressionism. It is a space 'occupied by intensities, wind, noise, forces, and sonorous and tactile qualities . . . far more than by formed and perceived things' (Deleuze and Guattari 1987: 479). Rather than simply disclosing a latent Orientalism in Deleuze, the purpose of his evocation of visions of the desert is specific and strategic. Furthermore, the repetition of this theme across several of his works marks its crucial importance for a proper understanding of his aesthetics.[5] Its function is to dispel any remnants of striated space in Riegl's descriptions of Egyptian bas-relief. Smooth space is more analogous to the nomadic space of shifting desert sands than it is to the structure and decoration of pyramid walls, whose monolithic geometry punctuates and organises space in a way that indicates a move away from the purely haptic.

IV. *Nomos* and Nomad Art

Deleuze's nomadology should be taken neither too literally, as a Romantic reference to 'real' nomads, nor simply as a suggestive metaphor. Rather, he develops a functional, and highly technical, definition of the *nomos*, which draws on the work of linguist Emmanuel Laroche and anthropologist Jean-Pierre Vernant.[6] Before it was understood in the normative sense of custom or law, as in Democritus and Plato, the *nomos* referred to the unpartitioned and common land outside the boundaries of the *polis*, which was itself divided according to a geometric *logos*. This meaning of the *nomos* was later taken up in Zeno's *Republic*, securing for the Stoic the title of 'the best exponent of anarchist philosophy in ancient Greece' by Peter Kropotkin (Kropotkin 1995: 236). Deleuze uses the term both in this early etymological sense as well as in the sense of its root, *nemô*, which means to distribute. That is, his nomadology should be understood as employing these two aspects of the *nomos* simultaneously, against the Platonic law, such that smooth or haptic space implies an unpartitioned distribution. It is a nomadic *nomos*,

> a distribution which must be called nomadic, a nomad *nomos*, without property, enclosure, or measure. Here, there is no longer a division of that which is distributed but rather a division among those who distribute *themselves* in an open space – a space which is unlimited, or at least without precise limits. (Deleuze 1994: 36).

A nomadic distribution is one in which, for example, nomads traverse the smooth, unregulated expanse of the desert – beyond the confines of the Egyptian state – without themselves dividing it. For Deleuze, this functional definition can apply to 'real' nomads – 'Egypt had its Hyksos, Asia Minor its Hittites, China its Turco-Mongols . . . the Hebrews had their Habiru, the Germans, Celts, and Romans their Goths, the Arabs their Bedouins' (Deleuze and Guattari 1987: 495) – as much as it can to other, more recent, constructions like Baudelaire's *flâneur* or Debord's psychogeographer. The *nomos* for him is simply a type of distribution and movement, which functions outside of any principle that organises and defines the borders, both internal and external, of a territory. It is therefore anarchically indifferent to the *logos* that partitions Plato's ideal metropolis, where numerous distinct blocks 'should radiate, dividing the city itself as well as the whole territory' (Plato 1988: 133).

Deleuze's *nomos* has both intensive and extensive senses corresponding to close vision and haptic space, respectively. Just as close vision should be understood as a nomadic distribution of sensation in that it kinaesthetically involves different sense modalities, haptic space should be understood as the nomadic re-distribution of the space of a work, which is a direct result of this disorienting, indeed shocking, vision. Beyond Riegl, haptic space is the smooth, diagrammatic space created on a canvas that suggests the mind-twisting logic of a Riemannian manifold. It is populated by what Deleuze calls 'events', intensities or forces in flux rather than fully formed entities, that erase all the figurative clichés inherited from the *nomos* – now understood in the Platonic sense of habit or law – of the history of art. In short, the diagram is simply the name Deleuze gives to the smooth space of art in his book on Bacon, where it is more fully articulated under this new terminology. It is the principle of generative deformation that marks the interval between vision and creation in a work and, as such, it lies at the very heart of what Deleuze calls nomad art. The diagram is the preparatory phase that primes the canvas, replacing the normative *nomos* of figurative givens with a nomadic one. This conception of *nomos* is thus political precisely in the sense in which Rancière's and Benjamin's politics of aesthetics converge: a politics that traces the coordinates and consequences of changes to the 'organisation of perception' at a particular historical moment, 'using art to draw such conclusions' (Benjamin 2002: 104). Although neither go as far as Deleuze in championing a nomadic distribution, Benjamin comes close in his admiration of the anarchic spirit of Dada, which he singles out as expressing, in a highly charged manner, the haptic shock of the cinematic, or modern,

regime of art. In effect, smooth space challenges Riegl's 'will to art', a notion that Deleuze must ultimately put into question in favour of nomadic *nomos*, which re-distributes the sensory coordinates of a given *Kunstwollen* with every new successful work. This problem reaches its peak in the cinematic regime since – and here Deleuze both cites Benjamin's 'Work of Art' essay as well as appropriates its language and political argument – the shock to thought in modernity coincides with a fascist 'atomisation of the masses' in which the politics of aesthetics is reduced to a situation where 'politics becomes "art" ' (Deleuze 1989: 264).[7] In this regime of shock to the brain, Deleuze continues with an implicit reference to Riegl, artists are continuously 'circling the question: cerebral creation or deficiency of the cerebellum?' because 'all will to art' now risks being reduced to 'a business, a pornography, a Hitlerism' (Deleuze 1989: 266). Deleuze's ethico-political answer to this problem is that the shock of a close vision – rather than initiate the collapse into a catatonic, quietist, or even 'theophanic' state (Hallward 2006: 4) – *must* involve a movement beyond this debilitating moment, a creative movement of nomadic expression adequate to its 'profound and almost unliveable Power' (Deleuze 2003: 39). This is not a normative imperative, but simply a functional definition of what counts as nomad art. This reading explains the placement of the pages concerning nomad art at the conclusion not only to 'The Smooth and the Striated' but to *A Thousand Plateaus* as a whole, arguably Deleuze's most political book. But whereas Benjamin proposes countering the mind-numbing anaesthetisation of fascist politics with a communist politics of aesthetics – in which revolution is defined by a productive 'innervation of the collective' (Benjamin 2002: 124) – for Deleuze, a slightly different sort of revolution already begins with the production of haptic space in nomad art.

Notes

1. In his 'The Painter of Modern Life', Charles Baudelaire describes this experience as 'a more or less violent nervous shock that reverberates in the very core of the brain' (Baudelaire 2006: 398, translation modified).
2. In 1986 – a decade before Rancière coined the term 'le partage du sensible', which was subsequently applied to regimes of art in 2000 – Deleuze characterized Foucauldian historical formations as implying a 'distribution' or 'répartition du visible et de l'énonçable … une perception historique ou sensibilité, non moins qu'un régime discursif' (Deleuze 1986: 56). Foucault uses similar language in describing the new regime of medical vision in the Preface to his *Naissance de la clinique*: 'une nouvelle découpe des choses'; 'une nouvelle distribution des éléments discrets'; 'tout le rapport du signifiant au signifié se redistribue' (Foucault 1963: xiv–xv).

3. It should be noted that Riegl – working within the post-Herbartian context of physiological psychology in which the phenomenon of synaesthesia, clinical as well as poetic, attracted a great deal of attention – admitted in 1902, a year after he published *Late Roman Art Industry*, that haptic was indeed a better word than tactile to describe the Egyptian aesthetic. 'Physiology has long since introduced the more fitting designation "haptic" … and I intend henceforth to use this proposed term' (Riegl 1988: 190).
4. Deleuze does acknowledge the power of synaesthesia elsewhere for its ability to challenge not only the hierarchy of the senses, but also 'the hegemony of the signifier' (Deleuze and Guattari 1987: 15). Benjamin links 'synaesthesia' with the 'breakdown' of 'modern man' in his 'On Some Motifs in Baudelaire' (Benjamin 2003b: 333).
5. For example, he cites not only Francis Bacon's 'Sahara', but also the various visions of the desert depicted in Wilfred Thesiger's *Arabian Sands*, Thomas de Quincey's *Revolt of the Tartars*, and T. E. Lawrence's *Seven Pillars of Wisdom*. Deleuze also shows that visions of ice or sea landscapes can replace these desert visions, proving that he doesn't rely merely on the Oriental implications of desert nomads. See his use of Edmund Carpenter's *Eskimo* and Paul Virilio's *L'Insécurité du territoire* in *A Thousand Plateaus* (Deleuze and Guattari 1987: 572–4).
6. For the following etymology of *nomos*, I am indebted to John Sellars (Sellars 2007: 30–7).
7. Compare this to the last two sentences of Benjamin's essay, where he states that 'the aestheticizing of politics, as practiced by fascism' must be countered by a communist 'politicizing of art' (Benjamin 2002: 122).

Barnett Newman's Zip as Figure

Colin Gardner University of California, Santa Barbara

Abstract

Challenging the formalist critical legacy of Clement Greenberg and Michael Fried, this essay advocates an alternative philosophical lineage for Modernist painting through a specific focus on Barnett Newman's vertical stripe or 'zip'. This genealogy is rooted in Newman's own self-confessed interest in painting as a disclosure of the sensation of time and Deleuze's overt break with Kant. In light of the latter, the zip takes on the function of Deleuze's Figure: the material support that generates, sustains and also disperses a precise sensation.

Keywords: Newman, formalism, Figure, rhythm, hapticity

Largely due to the critical legacy of Clement Greenberg and Michael Fried, New York School painting is traditionally read through a combination of neo-Kantianism – the artwork as a disinterested, autonomous entity artificially divorced from the multiplicitous deterritorialisation of real-world contexts, all the better for its vicissitudes to be reined in within a transcendental logic of reason – and the philosopher Gotthold Lessing's *Laocoön: An Essay on the Limits of Painting and Poetry*, written in 1766, which argues that painting must remain true to its own inherent properties (i.e. flatness and the spatial limits of the picture plane and its confining frame). However, a particular focus on Barnett Newman's seminal *Onement I* (1948), *Vir Heroicus Sublimis* (1951) and *Who's Afraid of Red, Yellow and Blue* (1966), discloses an alternative philosophical lineage for Modernist painting. The grounds for this revised genealogy are rooted in Newman's own self-confessed interest in painting as a disclosure of the sensation of time and

Gilles Deleuze's own overt break with Kant. In the latter case, the non-conceptual event-as-rhythm (Newman's famed vertical stripe or 'zip') is born out of the chaos of the expansive colour field as a suprasensible 'logic of sensation', whereby line no longer serves as a static demarcating agent (a sedentary striated space), dividing the picture plane into self-contained fields of activity, but becomes a dynamic *force* of becoming, a stuttering zone of creation in-itself, the 'genetic' element of the pictorial order yet to come. The zip is thus a smooth, haptic space of pure nomadism, for as Deleuze and Guattari point out in 'The Smooth and the Striated', the nomad line is

> *a line that delimits nothing, that describes no contour*, that no longer goes from one point to another but instead passes between points, that is always declining from the horizontal and the vertical and deviating from the diagonal, that is constantly changing direction, a mutant line of this kind that is without outside or inside, form or background, beginning or end and that is as alive as a continuous variation – such a line is truly an abstract line, and describes a smooth space (Deleuze and Guattari 1987: 497–8).

I. Lessing, Greenberg and Medium-Specificity

The chief defining difference between the formalist and nomadic aesthetic lineages is their contrasting approaches to the problem of time, an issue central to Lessing's original discussion of Laocoön and inherited with little or no critique by Greenberg and his acolytes. The subject of Laocoön is the classic depiction of pain in Western sculpture as evidenced in the marble figurative grouping, believed to be from the first century AD, of the Trojan priest and his sons attacked by monstrous sea serpents. Lessing used the sculpture as a case study in order to define a clear-cut difference between the visual arts and literature. The latter was absorbed by time, as well as the conventional sign of language, which in itself had an arbitrary relationship to its referent. On the other hand, time hardly existed in the visual arts because, through mimesis, the means of representation were directly related to the thing represented. As a result, while literature could describe horrific events without resorting to horrific words, representational media could only express the horrific by showing it in all its gory detail. How then could it produce a noble work of art when it places the spectator in the same distressing position as the victim, Laocoön himself? The solution is that visual artists tone down the harrowing features of their subject in order to place it within the universal field of aesthetic norms. Thus, instead of an agonized Laocoön roaring like a bull, for Lessing, the tightly constricted position

of his jaw would allow for little more than a low groan, thus making for a more pleasing aesthetic composition.

The main upshot of this debate is that Lessing's interpretation eventually became the critical paradigm for Modernist painting. His separation of the arts based on their divergent modes of expression and his increasing differentiation between literary genres based on their intended effects laid the necessary groundwork for critics such as Greenberg to advocate the freeing of painting from its dependence on other media. It's no accident that Greenberg's own 1940 essay on the need for a similar purification of modern painting is entitled 'Towards a Newer Laocoön'. According to Greenberg:

> When it happens that a single art is given the dominant role, it becomes the prototype of all art: the others try to shed their proper characters and imitate its effects. The dominant art in turn tries itself to absorb the functions of the others. A confusion of the arts results, by which the subservient ones are perverted and distorted; they are forced to deny their own nature in an effort to attain the effects of the dominant art. However, the subservient arts can only be mishandled in this way when they reached such a degree of technical facility as to enable them to pretend to conceal their *mediums*. In other words, the artist must have gained such power over his material as to annihilate it seemingly in favor of *illusion*. (Greenberg 1988: 24).

Although the avant-garde attempted to redress the balance by imitating every other art except literature, Greenberg saw a greater hope in the tendency of contemporary abstract painting to refer only to its own mechanical properties. Thus, he asserts:

> If the poem, as Valéry claims, is a machine to produce the emotion of poetry, the painting and statue are machines to produce the emotion of 'plastic sight'. The purely plastic or abstract qualities of the work of art are the only ones that count. Emphasize the medium and its difficulties, and at once the purely plastic, the proper values of visual art come to the fore... The history of avant-garde painting is that of a progressive surrender to the resistance of its medium; which resistance consists chiefly in the flat picture plane's denial of efforts to 'hole through' it for realistic perspectival space. In making this surrender, painting not only got rid of imitation – and with it, 'literature' – but also of realistic imitation's corollary confusion between painting and sculpture. (Greenberg 1988: 34).

Epitomized by the work of Rothko, Pollock, de Kooning and Newman, painting abandons chiaroscuro and modelling; brush strokes are defined for their own sake; primary colours replace tones and tonality; line returns as a third colour between two other colour areas; forms are

simplified and geometrical, while the painterly whole is influenced by the contours of the stretcher. 'But most important of all', noted Greenberg, 'the picture plane itself grows shallower and shallower, flattening out and pressing together the fictive planes of depth until they meet as one upon the real and material plane which is the actual surface of the canvas; where they lie side by side or interlocked or transparently imposed upon each other' (Greenberg 1988: 35). The result is optical illusions that announce themselves as such, not realistic ones.

II. The 'Zip' as Temporal Dimension

Given this aesthetic template, Newman's zip paintings would seem to provide a ready exemplar of Greenberg's dictum. Take, for example, Newman's most spatially expansive painting, *Vir Heroicus Sublimis*. Over eight feet high, and almost eighteen feet across, the work consists of a large horizontal vista of cadmium red, itself situated on a reflective scale between medium and dark so that its faint earth-colour tinge allows the field to partially advance towards the spectator while at the same time creating a recessive depth. According to art critic and Newman specialist Thomas Hess, '[Newman] was preoccupied with a horizontal format divided by verticals (among other themes), and only if he could get the painting wide enough could the zips act both as self-contained presences and as cuts (that is, drawing) in color' (Hess 1971: 68). Thus Newman 'applied two tapes to the left, two to the right in order to form a hidden square in the center of the painting. The resultant zips are the same color as the cadmium red field, albeit a bit darker and heavier, except for the second from the left, which is white' (Hess 1971: 70). The zips seem to have been placed intuitively to mask the central positioning of the perfect square, a masking reinforced by giving it a white left edge and a red right edge. The zips also allude to cinema, in so far as the colour field looks like a flattened film strip with the zips acting as edits or splices. Significantly, a few weeks before the work's first public unveiling, Newman added a fifth zip at the extreme right – yellow brown against the red expanse. As Hess correctly points out, adding the extra pale stripe 'reduces the apparent length of the red field and acts to make the square seem off-center… Here, color in modern painting breaks through its last constraints, and is proclaimed the essence of visual art; in its liberated surge, the zips do not act as reins, but as spurs, heightening the pressure of the sensation' (Hess 1971: 70). This sensation ultimately spills over into the surrounding wall, as if the painting had 'started again', with the zips acting as both borders to a new colour field (the gallery itself) and creative fields in their own right. This argument is born

out by Newman's follow-up series featuring just the zips. The fact that *The Wild* (1950) is $95\frac{3}{4}$ inches tall by a mere $1\frac{5}{8}$ inches wide, the exact dimensions of a single zip in *Vir Heroicus Sublimis*, suggests that the white gallery wall is the equivalent of the red field in the latter painting. This is also alluded to by the white and pale yellow zips in the latter, which potentially extend the painting to infinity.

Just as Hess takes us to the verge of a Deleuzian reading, whereby the rhythm and vibrating colour of the work produce a heightened logic of sensation rooted in a perpetual becoming of creation, Greenberg's Lessing- and Kant-based reading reduces *Vir Heroicus Sublimis*'s painterly language to an exercise in reductive formalism. 'Broken by relatively few incidents of drawing or design', he notes in his 1958 essay '*American-Type' Painting*, 'their surfaces exhale color with an enveloping effect that is enhanced by size itself. One reacts to an environment as much as to a picture hung on a wall. But still, in the end one does react to the picture as a picture, and in the end these pictures, like all others, stand or fall by their unity as taken in at a single glance' (Greenberg 1961: 226). The last phrase is telling, insofar as a painting must always exude perpetual presence before the beholder and cannot be temporally contingent on external factors such as the surrounding wall, gallery space or the mobile presence of the spectator, a trait that Fried, in his seminal 1967 essay 'Art and Objecthood', would later dismiss as literalism or theatricality. For Greenberg the zips act less as spurs to a sensation beyond the materially objective form of the painting's inherent flatness and demarcating edge, than as echoes of the painting's external frame, repeated in stutter-steps within the pictorial field of the painting as a whole. Discussing the use of line in Rothko and Newman, he avers that both artists make their way out of geometry via a focus on geometry itself:

> Their straight lines, Newman's especially, do not echo those of the frame, but parody it. Newman's picture becomes all frame in itself, as he himself makes clear in three special paintings he has done – paintings three to four feet long but only two to three inches wide, that are covered with but two or three vertical bands of color. What is destroyed is the Cubist, and immemorial, notion and feeling of the picture edge as a confine; with Newman, the picture edge is repeated inside, and *makes* the picture, instead of merely being *echoed*. The limiting edges of Newman's larger canvases, we now discover, act just like the lines inside them: to divide but not to separate or enclose or bound; to delimit but not limit. The paintings do not merge with surrounding space; they preserve – when they succeed – their integrity and separate unity. (Greenberg 1961: 226–7).

This is, of course, a valid point, but it fails to take into consideration the more temporal elements that are intrinsic to Newman's work, specifically through the element of rhythm, the source of the temporal event. It is here that Deleuze (the 'logic of sensation') and Deleuze and Guattari ('The Smooth and the Striated') can help us move beyond a constraining Kantian formalism. For example, every painting manifests itself through different *sites* of time – the time of production, consumption, diegetic time within the painting's internal narrative and the time of circulation to name just a few. There is also the time that the painting *is*, whereby time is the event of the picture itself, its own self-annunciation.

III. Chaos and Rhythm

The importance of the latter ontology of time is born out by Newman's own comments on his work. As he once put it, in his 'Prologue for a New Aesthetic', an unfinished 'monologue' from 1949: 'My paintings are concerned neither with the manipulation of space nor with the image, but with the sensation of time... Not the *sense* of time, which has been the underlying subject matter of painting, which involves feelings of nostalgia or high drama; it is always associative and historical...' (quoted in Lyotard 1991: 86). This monologue was written in response to an August 1949 trip to the Indian mounds in the south-west corner of Ohio and Indian fortifications at Newark, OH. Newman suffered a staggering epiphany of self against undefined space: 'Suddenly one realises that the sensation is not one of space, [of] an object in space. It has nothing to do with space and its manipulations. The sensation is the sensation of time – and all other multiple feelings vanish like the outside landscape' (Newman 1992: 174–5).

Deleuze's writings on Francis Bacon offer us the opportunity to re-evaluate Newman's paintings' formal properties in light of the philosopher's broader break with Kantian aesthetics, particularly the latter's rationalization of the Sublime. As Daniel Smith points out, Deleuze no longer defines Ideas via their transcendence to nature, but instead as events immanent to experience itself:

> Ideas remain suprasensible, but they now reveal the *forces* or intensities that lie behind sensations, and which draw us into nonhuman or inhuman becomings. In Deleuze, in other words, the power of Nature in the unformed or the deformed appears in the form of the *nonorganic life of things*... Sensations are given, but it is force that constitutes the condition of sensation. The

> artistic question then becomes: How to render sensible forces that are not themselves sensible? How to render the nonvisible visible in painting, or the nonsonorous sonorous in music? (Smith 2003: xxiii).

Whereas for Kant, perception presupposes the object-form as one of its conditions (derived from the *a priori* concepts of understanding), Deleuze moves in reverse, smashing the basic form of recognition that helps to ground us in the unity of apperception. This means there are no longer categories of mediation, and thus, by extension, no grounds for critical judgement. Instead, he gives us four elements of analysis: 1) Aesthetic Comprehension or Measure; 2) Rhythm; 3) Chaos; and 4) Force. For our purposes, it is Chaos and Rhythm – as well as the additional 'formal' function of the Figure – that are keys to producing a logic of sensation within Newman's paintings whereby clear-cut demarcations between smooth and striated space are irrevocably undermined. Where Aesthetic Comprehension allows us to apprehend the successive parts of an event based on lived evaluation, usually rooted in the situatedness of our bodies in relation to our being-in-the-world, Rhythm provides a purely aesthetic comprehension of the unit of measure, subjectively determined. This, however, is not fixed but is subject to constant re-evaluation and constant variation. Deleuze calls this the grasping of a rhythm which takes place without a concept. The rhythm – which is always heterogeneous and experimental – lies beneath the concept. But this raises a key question. What if the rhythm underlying perceptual synthesis starts to become unravelled, so that our imagination wavers from its appointed task? This leads to a series of catastrophes, whereby our entire structure of perception starts to collapse.

Kant labels this temporary overrunning of the imagination 'The Sublime', which once again conveniently reins it in under the aegis of Reason. In contrast, Deleuze – and by extension, Newman – actually start by affirming chaos. Both recognise that it can also produce order or rhythm and, as Smith rightly points out, Deleuze's book on the logic of sensation is grounded on this 'rhythm-chaos' coupling. To write about Newman's paintings is to attempt to find the common ground of lines, colours, tonalities and retinal pulsations. This common ground *is* rhythm itself. Thus we move progressively from the synthesis of perception (apprehension, reproduction, recognition) to aesthetic comprehension (rhythm) to catastrophe (chaos) and back again via a completely different Form (the Figure). In his 1945 essay, 'The Plasmic Image', Newman proclaimed that:

> The subject matter of creation is chaos … The present painter can be said to work with chaos not only in the sense that he is handling the chaos of the blank picture plane but also in that he is handling chaos of form. In trying to go beyond the visible and known world he is working with forms that are unknown even to him. He is therefore engaged in a true act of discovery in the creation of new forms and symbols that will have the living quality of creation. (Newman 1992: 139–40)

In other words, the artist is a true creator because he delves into chaos: 'It is precisely this that makes him an artist, for the Creator in creating the world began with the same material – for the artist tried to wrest truth from the void' (Newman 1992: 140).

IV. Smooth and Striated: Deleuze's Figure

In Newman's work, this 'rhythm-chaos' coupling is closely tied to Deleuze and Guattari's interpenetration of smooth and striated space. Although they assert that the two spaces and their accompanying characteristics – nomad and sedentary – are not of the same nature (Deleuze and Guattari 1987: 474), they also acknowledge that 'the two spaces in fact exist only in mixture: smooth space is constantly being translated, transversed into a striated space; striated space is constantly being reversed, returned to a smooth space. In the first case, one organises even the desert; in the second, the desert gains and grows; and the two can happen simultaneously' (Deleuze and Guattari 1987: 474–5). Indeed we see this simultaneity directly enacted in Newman's first zip painting, *Onement I* of 1948. Measuring 27 by 16 inches, this vertical canvas consists of a dark, cadmium red field with a single red-orange zip, raggedly painted over masking tape applied down the centre of the painting. Although Newman was never religious in the conventional sense – he was violently opposed to mysticism of any sort – he did nonetheless have 'a feeling and taste for the infinite' (Hess 1971: 52). The artist, Newman pointed out, must start with chaos, the void: with blank colour, no forms, textures or details. Newman's first move is thus an act of division, straight down, creating an image. The image not only re-enacts a kind of primal gesture, it also presents the gesture itself, the zip as an independent shape. *Onement* is thus another way of asserting the 'Genetic Moment' as the creation of an image.

In this case the zip takes on the function of Deleuze's Figure, for Newman aims to cut the Figure from its natural milieu in a process of deterritorialization, all the better to disclose 'The presence of a body

without organs under the organism, the presence of transitory organs under organic representation' (Deleuze 2003: 43). In this regard, the Figure helps Newman to avoid the triadic stranglehold of the figurative, illustrative and representational in art. Instead he creates a nomadic set of non-relations, much like the 'war machine' – '*Nomadism* is precisely this combination 'war machine-smooth space" (Deleuze 1995: 33) – the linear assemblage which constructs itself on lines of flight. In this respect, 'The relation of the Figure to its place defines a 'fact': 'the fact is…', 'what takes place is…' Thus isolated, the Figure becomes an Image, an Icon' (Deleuze 2003: 6). For Deleuze, the Figure (as a process of extraction and isolation) and Abstraction are the two main mechanisms for avoiding the relational, for both allow the artist to capture sensations, render visible invisible forces, to make them immediate and perceptible so that they may act directly on the viewer's nervous system. The main drawback of Abstraction however – most notably Abstract Expressionism – is that it is too cerebral: it passes through the brain and must be *interpreted* before it can be appreciated (a case of the Logos preceding the sign). In contrast, artists like Cézanne, Bacon and Newman substitute the new, more haptic trajectory of the isolated Figure, which Cézanne appropriately calls *sensation*: 'The figure is sensible form related to sensation; it acts immediately upon the nervous system, which is of the flesh, whereas abstract form is addressed to the head and acts through the intermediary of the brain, which is closer to the bone' (Deleuze 2003: 31).

Deleuze's discussion here seems directly relevant to the structural parameters of nonrepresentational painting in general, 'Sensation has one face turned toward the subject (the nervous system, vital movement, 'instinct', 'temperament' – a whole vocabulary common to both Naturalism and Cézanne)', (i.e. the temporal space of how the painting 'is') 'and one face turned toward the object (the 'fact', the place, the event)', (i.e. the material world of the painting in the exhibition space in relation to real bodies, real objects). 'Or rather', Deleuze adds in qualification, 'it has no faces at all, it is both things indissolubly, it is Being-in-the-World, as the phenomenologists say: at one and the same time I become in the sensation and something *happens* through the sensation, one through the other, one in the other' (Deleuze 2003: 31). In short then, creating the Figure thus involves isolating the object, extracting it from its surroundings, cutting it off from relationality so it can act directly on the nervous system. This is exactly why Deleuze argues that it is extremely difficult to make a pure image (i.e. nothing but image), unsullied by its connections to the language of hermeneutics and retaining nothing of

the personal or rational: 'To *make* an image from time to time . . . Can art, painting, and music, have any other goal, even if the contents of the image are quite meagre, quite mediocre?' (Deleuze 1997: 158).

This is one reason why specific spatio-temporal contexts are a major problem because they carry a great deal of interpretative baggage and thus circumscribe the image within a relational field of representations and helps to explain why Newman strives to create the autonomous image from the non-specified any-space-whatever. A pure image may be insubstantial but it is also real and material, and it can only be produced through a non-relational presentation. In this scenario, levels of sensation would be like arrests or snapshots of motion, allowing the artist to recompose movement synthetically in order to disclose a latent centre of gravity, thereby creating a different form of motor continuity, as in Synthetic Cubism, Futurism, Muybridge's photographic decomposition of movement and, one might fruitfully add, Newman's zip.

V. The Infinite and Hapticity

In the latter case it's not a question of what the painting means, but rather of how it functions as a deterritorialised multiplicity. The zip as Figure thus has a number of roles. It defines the surrounding fields of colour, acts as a contour between them, thus enabling itself to be isolated, but also acts as an unlimitable breach in the surface of the canvas, a body without organs opening itself up to disclose the chaotic creation that lies beyond, caught in the gap of the interstice. According to Tom Conley,

> The interstice is the interval turned into something infraliminary in a continuum in which an event can no longer be awarded the stability of a 'place' in the space of the image. The interstice becomes what exhausts – and thereby creates – whatever space remains of the image in the sensory-motor tradition. It supersedes the interval and, by doing so, multiplies the happenings of events. (Conley 2000: 320)

It is here in the interstice that the Figure does its best creative work, as a temporal form connected to the somatic violence of a sensation. It is here that the universe or cosmos reveals itself not as a line but as an infinite, continuous plane. In *What Is Philosophy?*, for example, Deleuze and Guattari describe how a monochromatic patch of plain colour is something far more than a background or line:

> Blue in particular takes on the infinite and turns the percept into a 'cosmic sensibility' or into that which is most conceptual or 'propositional' in nature – colour in the absence of man, man who has passed into colour . . . In short, the area of plain, uniform colour vibrates, clenches or cracks open because it is the bearer of glimpsed forces. (Deleuze and Guattari 1994: 181).

In Newman's oeuvre, it is the zip that plays the role of this Figure of glimpsed infinite forces: it functions as the material support that generates, sustains and also disperses a precise sensation. This is Newman's personal solution to the problem of how to extract the Figure from its figurative, narrative, and illustrational links: i.e. how to 'paint pure sensation' or 'record the fact' of its creation. The result is the construction of a purely haptic space that appeals as much to the physical body as it does to visual perception, highlighting isolation, deformation, coupling, oscillating rhythm, and perpetual becoming – in short a smooth space born out of the inherent nomadic properties of the striated.

This formal instability is reinforced by the interchangeable nature of how the painting is perceived in terms of close and long-distance vision. For Deleuze and Guattari, 'It seems to us that the Smooth is both the object of a close vision par excellence and the element of a haptic space (which may be as much visual or auditory as tactile). The Striated, on the contrary, relates to a more distant vision, and a more optical space – although the eye in turn is not the only organ to have this capacity' (Deleuze and Guattari 1987: 493). In Newman however, there is a constant reversibility and imbrication between the two positions, so that smooth space is often the impetus for a long-distance viewpoint – the vast, cadmium red colour field of *Vir Heroicus Sublimis* can only be taken in as a whole from a detached perspectival position across the gallery – while striated space encourages the spectator to move in and examine the zips less as abstract demarcation lines than as infinite spaces/places in their own right, opening up interstitially into the very depths of the canvas. Deleuze and Guattari describe this viewing process perfectly when they state that 'The nomad line is abstract in an entirely different sense, precisely because it has a multiple orientation and passes *between* points, figures and contours: it is positively motivated by the smooth space it draws, not by any striation it might perform to ward off anxiety and subordinate the smooth' (Deleuze and Guattari 1987: 496).

We see this double action at work in Newman's *Who's Afraid of Red Yellow and Blue IV* from 1969, where the 22 inch-wide zip serves as

both a blue dividing 'line' between equal-sized (nine feet square) red and yellow squares *and* a colour field of primal creation in its own right. At first glance, as in the case of *Vir Heroicus Sublimis*, the red and yellow squares are not apparent *as* squares, and even when the spectator discerns them as such their geometrical outline tends to get lost again due to the retinal instability generated by the intense colours. This lack of formal demarcation is aided and abetted by the fact that the squares are on the outside of the canvas and create a deterritorializing shift to the periphery and the surrounding wall. Under these conditions, the middle blue is like a hinge or spine under extreme pressure. It marks a return to the dynamic event of creation of *Onement* but is more nomadic given the smooth spread of the luminous palette. In this case, one is never really 'in front' of the painting, tying it to a Euclidean formal logic, but rather one inhabits it as a series of shifting places. 'The first aspect of the haptic, smooth space of close vision', note Deleuze and Guattari,

> is that its orientations, landmarks and linkages are in continuous variation; it operates step by step. Examples are the desert, steppe, ice, and sea, local spaces of pure connection. Contrary to what is sometimes said, one never sees from a distance in a space of this kind, nor does one see it from a distance; one is never 'in front of', any more than one is 'in' (one is 'on'. . .). (Deleuze and Guattari 1987: 493).

It is this haptic move which allows Newman to confront the problem of colour as a chaos to be transformed into sensation via the one-two combination of Rhythm-Figure. Recalling the creative genesis of the *Who's Afraid* series, Newman notes that

> It was at this moment that I realised that I was now confronting the dogma that color must be reduced to the primaries, red, yellow and blue. Just as I had confronted other dogmatic positions of the purists, neo-plasticists and other formalists, I was now in confrontation with their dogma, which had reduced red, yellow and blue into an idea-didact, or at best had made them picturesque. Why give in to these purists and formalists who have put a mortgage on red, yellow and blue, transforming these colors into an idea that destroys them as colors? I had, therefore, the double incentive of using these colors to express what I wanted to do – of making these colors expressive rather than didactic and of freeing them from the mortgage. Why should anyone be afraid of red, yellow and blue? (Newman 1969: n.p.).

Why indeed?

James Stirling's Architecture and the Post-War Crisis of Movement

Todd Jerome Satter Massachusetts Institute of Technology

Abstract

Deleuze's cinema project identifies a crisis of movement, action and thought, established initially in the war-devastated spaces of neo-realist cinema. Indirectly these spaces subordinate architecture as the locus of crisis, which only new, temporal artistic practices can avert. However, an architectural model of the smooth and striated, revealing a sophisticated interplay of the two concepts, can reinstall design practice and the intentional built environment as part of a productive and affirmative image of thought. The designs of James Stirling, whose career unfolds alongside significant developments in post-war spatial thought, reveal sensual expressions of new modes of subjectivity and individuation to accompany the increasingly aleatory and lacunary nature of movement.

Keywords: architecture, intensities, modernism, movement, space

Gilles Deleuze transitions between the two volumes of his cinema project by identifying a crisis of movement in post-war cultural and aesthetic practices. As film liberates itself from causal logic and linear displacements, introducing a differential subjectivity to replace static identity, space and time are (re)conceptualised to accommodate incompossible worlds. In establishing these late modern dynamics, seen initially in neo-realist spaces devastated by the Second World War, Deleuze indirectly subordinates architecture as the locus of the crisis, which only innovative, temporal practices can avert. Deleuze reframes modernism as a critical and exploratory tendency influenced by movement rather than prescriptive and proscriptive spatial guidelines.

He posits a conditional distinction between movement and space when he writes that 'space covered is past, movement is present, the act of covering' (Deleuze 1986: 1). In other words, space is divisible, part of a provisional set, while movement is whole and changes qualitatively with each division. As such, a subject who orients herself in terms of movement experiences pure relations of speed and intensity, while the subject who orients herself in terms of constructed space imposes a provisional totality.

However, in *A Thousand Plateaus*, Deleuze and Guattari posit two types of space – the smooth and the striated – as processes that resist a strict binary or dialectic, existing 'only in mixture: smooth space is constantly being translated, transversed into a striated space; striated space is constantly being reversed, returned to a smooth space' (Deleuze and Guattari 1987: 474). The relationship between the smooth and the striated elucidates the thought and creation of space, as well as the process of subject formation and individuation that occurs through it. While each type of space can be distinguished and studied separately via *de jure* abstraction, the inextricable linkage of the two concepts constitutes an important element of assemblage. Assemblages are tetravalent, Deleuze and Guattari maintain, with two sides, one of material bodies, the other of semiotic expressions. Both aspects are simultaneously pulled in two directions, one towards a molar stabilisation of striation or an articulation of a code with a milieu, the other towards its dissolution or mutation through smooth and molecular deterritorialisation that detaches and unhinges the code from its milieu. To think in terms of either concept is to enframe action, perception and affection in a fabric of relations and to emphasise the capacity of sense and thought to address the genesis of movement and the process of its imaging.

Architecture integrates space and time, combining the smooth as unfoldings that refuse to follow preconceived trajectories and the striated as structured, socialised and distributed boundaries. Architecture as a professional practice is heavily striated through economics, client demands, programming, functional and other constraints, as well as through conventional representational tools (plans, sections, perspectives, diagrams) legible by clients, contractors, consultants and builders. Striation allows for certain predictability and workability, which can only be measured via translation into metric and divisible space. That is, a building as actual and material operates to make the virtual visible and assures we are working within a system, not from outside it. Smooth space, on the other hand, measured only in terms of force, guards against territorialising hegemony and cannot be divided

without qualitatively changing. The smooth prevents the foreclosure of the structure to the virtual potential of a life after construction. In short, striation reveals a provisional process of selection from a purview of reality, while smoothing negotiates and intuits the durational whole of which perception only reveals a part.

An architectural model for the smooth and the striated serves to reinstall design practice and the intentional built environment as part of a productive image of thought in which temporal movement becomes inseparable from spatial movement. James Stirling (1926–92), in particular, whose career unfolds alongside significant developments in post-war thought, creates an ongoing exchange between the actual and the virtual, the sedentary and nomadic, and processes of territorialisation and deterritorialisation. Through a sophisticated interplay of the smooth and the striated, Stirling returns to the creative genesis of modernism as an open mode of thought to recover the singularity lost to the banality of functionalism and to dismantle the unproductive dualisms that plague representational modes of thinking. His projects posit a density of signs and an archaeological palimpsest that obfuscate the boundaries between landscape and building, natural and constructed, past, present and future, acting as a critical reflection on the nature of difference over identity, maintaining a unitary and singular concept that accommodates a multiplicity of events in what Deleuze calls 'the affirmation of all chance in a single moment' (Deleuze 1990: 180).

I. Movement in Crisis

The nascent crisis of action, movement and thought that Deleuze finds in mid-twentieth-century cinema reflects the particularly acute discursive conundrums facing all cultural, aesthetic and creative enterprises in the decades immediately following the Second World War, the horrors of which gave rise to a radical questioning of truth, the modernist agenda, as well as spatial and temporal relations. Deleuze identifies the point of significant impasse from which he will develop a new image of thought when he writes:

> But precisely what brings this cinema of action into question after the war is the very break-up of the sensory-motor schema: the rise of situations to which one can no longer react, of environments with which there are now only chance relations, of empty or disconnected any-space-whatevers replacing qualified extended space. It is here that situations no longer extend into action or reaction in accordance with the requirements of the movement-image. (Deleuze 1989: 272)

The movement-image structured by the sensory-motor schema assumes a rigorous causal logic to reinforce rational continuities between images and signs as they appear, as well as vestiges of teleology. Deleuze writes, 'The characters can act, perceive, experience, but they cannot testify to the relations which determine them' (Deleuze 1986: 201). The subject who confronts limitations of thought and representation continually returns to habitual modes of recognition and maintains the possibility of a universal image of totality to confine movement.

In order to address this incapacity of a logical sensory-motor schema to allow for new modes of thought, cinema had to question its own presuppositions through the creation of visual and auditory signs that break sensory-motor linkages and refuse extension into action, characterised by Deleuze as:

> pure optical and sound situations, in which the character does not know how to respond, abandoned spaces in which he ceases to experience and to act so that he enters into flight, goes on a trip, comes and goes, vaguely indifferent to what happens to him, undecided as to what must be done. But he has gained in an ability to see what he has lost in action or reaction: he SEES so that the viewer's problem becomes 'What is there to see in the image?' (and not now 'What are we going to see in the next image?'). The situation no longer extends into action through the intermediary of affections. It is cut off from all its extensions, it is now important only for itself, having absorbed all its affective intensities, all its active extensions. (Deleuze 1989: 272)

In *Last Year at Marienbad* (1961), written by Alain Robbe-Grillet and directed by Alain Resnais, perception becomes detached from action and reattached to the performance of thought through irrational linkages that forestall movement. Deleuze argues that 'a to-and-fro occurs between the narrative speech which creates the event and the static hotel grounds which assume a mineral or tectonic value, with their different areas, white, grey, black' (Deleuze 1989: 324n). The expansion of anxiety, separation, velocity and perpetual intervals supplant determinate locations, and this crisis forces movement, consciousness and reality to take on increasingly stochastic tendencies, individual bodies to become centres of indetermination, and reality to exceed the limits of conscious thought, narrative and representation. The characters of A and X emerge through foldings in disjunctive yet shared geographies and temporalities, and their thoughts become individuated even as identity, space and time are made indiscernible. Through this process, the film's smooth narrative always remains subject to recodification, just as the striated architecture constantly re-smooths linkages.

From Deleuze's cinema project, we can extract concepts useful to a (re)consideration of the natural and built environments to address issues that arise when space and time are disjoined from representational modes of thought and attached to a new logic of sense and sensation. In the conclusion to his cinema project, Deleuze writes:

> A theory of cinema is not 'about' cinema, but about the concepts that cinema gives rise to and which are themselves related to other concepts corresponding to other practices, the practice of concepts in general having no privilege over others, any more than one object has over others. It is at the level of the interference of many practices that things happen, beings, images, concepts, all the kinds of events. The theory of cinema does not bear on the cinema, but on the concepts of the cinema, which are no less practical, effective or existent than cinema itself. (Deleuze 1989: 280)

That is, the extraordinary development of signs and images Deleuze explores through cinema affords a means for investigating the ways in which its concepts intervene in other aesthetic and cultural practices, including architecture.

The histories of late modern architecture generate anxiety concerning the built environment's perceived inability to refer to anything beyond the closed system of its own syntax or to attain meaning only through embodied and cultural use. In either case, these approaches reinforce dualisms between architectural and lived experience. Architecture is exhausted either as an autonomous art object or as a relational system of functional signs. More important, like the movement-image, such formalism and ideology seek a new timelessness and universality rather than subtle strategies of perception, action and affect that reveal the genesis of thought and the production of the new. As physical infrastructure becomes fragmented and indeterminate, the subject's affective disposition requires a complementary flexibility to productively navigate this new terrain, as well as new strategies for mapping movement and its intensities and for making them thinkable. Similarly, through Michel Foucault, Deleuze finds a means for embracing the flux of existence and gaps of meaning in the spatio-temporal environment without literal reification of movement. He writes:

> But [Foucault] soon reaches another solution. If different examples of architecture, for example, are visibilities, places of visibilities, this is because they are not just figures of stone, assemblages of things and combinations of qualities, but first and foremost forms of light that distribute light and dark, opaque and transparent, seen and non-seen, etc. (Deleuze 1988: 57)

In other words, architecture operates via intensities before it ever materialises. The smooth and the striated are conceptually adept at negotiating these dynamics, treating architecture as assemblages linking content and expression, concrete without being functionally reductive and expressive without being naively utopian. Intensities posit architecture as metastable entities that can be lessened or augmented but cannot be divided, subtracted from or added to without qualitatively changing.

II. Stirling and the Striation of the Smooth

James Stirling develops strategies for architecture's continuing relevance and influence on the built environment, alternatively looking back to the failures of modernism and looking forward towards late-modern concepts of movement. Stirling provides the capacity to think time, space, their genesis and potential from within a localised place. Stirling is seminal in conceiving of the crisis in movement and for understanding its intricacies. According to Raphael Moneo, 'the evolution of contemporary architecture begins with [Stirling]' (Moneo 2004: 3), because his work references the myriad influences on modernism while presaging new notions of complexity and presenting a new material and discursive image of architecture. While Stirling was influenced by the academic tradition, he recognised early in his career that the popularisation of the functional avant-garde rendered it myopic and banal, blind to its connection to the development of cities and societies. He continually returns to the genesis of modernism as a creative uprising to produce the eternal return of difference, rather than accepting its tenets as a dogmatic or historical certainty.

Manfredo Tafuri, an influential surveyor of the crises of modernist architecture, characterises this architectural practice as restrained and solipsistic, producing a self-enclosed language without external referent and a regressive utopia struggling against institutional practices. He contends that 'the elements of the modern architectural tradition are all at once reduced to enigmatic fragments – to mute signals of a language whose code has been lost – shoved away haphazardly in the desert of history' (Tafuri 1987: 267), leaving architecture with two options: silence or false representation. Other post-war spatial theorists also, overtly or tacitly, inveigh against architecture as excessively striated, utopian, technocratic and teleological. They find the power of the smooth only in incidental spaces and heterotopias, as well as in the subversive and quotidian practices of strangers and *flâneurs*,

who reappropriate the postmodern landscape despite its architecture. Notwithstanding superficial differences, all of these modernisms treat movement as atemporal, the subject as pre-constituted and context as a pre-given totality.

Opposed to blatant critique, Stirling strategically undermines the dichotomy between building and context by returning to the creative genesis of modernist thought. His first professional works overtly pay homage to, while departing from, high modernism. His Dom-ino apartments (1951), like its namesake, Le Corbusier's early modern modular system, utilises prefabricated elements. However, unlike his forebear, Stirling emphasises transformation over the development of an apodictic architectural form for rote repetition, permitting shifts in scale and organisation. The Woolton House (1954), exploits a rural and vernacular tradition, not as an alternative ideology or telos, but as a means for recovering the singular and specific lost to modernism's focus on universal construction and normative strategies.

Stirling judiciously understands that while potentially reductive strategies of striation (representational conventions, economic considerations, client demands, construction systems, programming, context and other design constraints) are unavoidable, striation acts as a creative force only in so far as it deterritorialises the tools of the trade, creating new strategies for mapping movement, diagramming intensities, and treating constructed buildings themselves as generative machines in which expression and content converge to constitute each other. Striation reveals discontinuities in thought, as well as points of tension, disjunctions and differentials in spatial practice, giving rise to rational and irrational gaps as loci of intensities that reimpart smooth space. The hegemony of striation, its tendency to organise an existing reality without producing new conditions of thought, is mitigated by its ability to localise and provide context, which smoothness, despite its capacity to make connections at will, necessitates in order to affect its potential for qualitative change.

The process of striating the smooth is most forcefully evident in Stirling's Engineering Building at the University of Leicester (1959–63). The Leicester project constitutes a complex assemblage of masses and forms to accommodate auditoriums and theatres, one- and two-story workshops covered by diamond-shaped glass, installed on the bias to capture northern light, punctuated by a vertical ensemble of towers containing offices, laboratories, lifts and stairs, as well as an exhaust chimney (Figure 1). This project also augments Stirling's fascination with expressive drawing modes, such as the section and axonometric,

Figure 1. Exterior of the Engineering Building at the University of Leicester. (Source: Matt Neale)

well suited to analysing the vertical sequencing of space as a means for reconfiguring relationships, linkages and movement and to depart from the rigidity of the plan (Figure 2). At Leicester, the autonomy of the parts reflects an acute awareness of an open whole and creates a series of events as a critical reflection on the nature of difference. Stirling employs utility to his advantage, treating stairs, rails, windows and corners as opportunities to unify the site through the creation of events at various scales. Stirling also returns to British functionalism, regional vernaculars, nineteenth-century traditions and Colin Rowe's academic theories as potential creative origins of modernism from which singular architectural vitalities emerge primed for further exploration. In the process, Tafuri argues:

> Stirling has rewritten the 'words' of modern architecture, constructing an authentic 'archaeology of the present' . . . that, as in his most recent works, can very well reach the point of deforming language, of exhausting it. But it always remains an exhaustion that stops short of a complete shattering of language. The works of Stirling are 'texts,' not explosions of an imaginary utopia. (Tafuri 1987: 268–9).

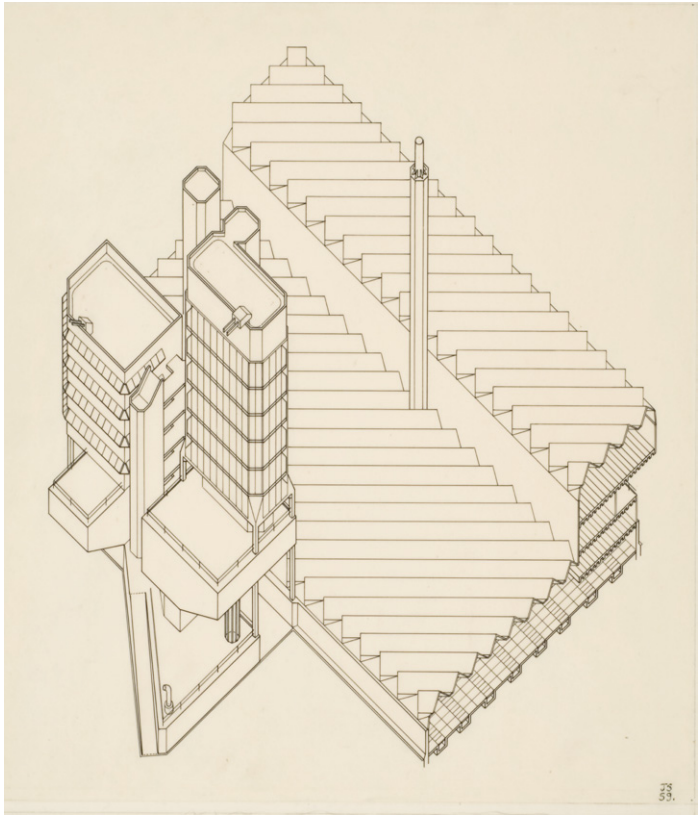

Figure 2. Axonometric drawing of the Engineering Building at the University of Leicester, 1959–1963. (Source: James Stirling/Michael Wilford fonds Collection Centre Canadien d'Architecture/Canadian Centre for Architecture, Montréal).

However, Stirling's 'quotations' – references to nineteenth-century British structural engineering, Paxton's Crystal Palace, Russian constructivism, Italian Futurism, as well as the heroic modernism of Le Corbusier – do not emerge as easy witticisms or obvious allusions. Rather, they acknowledge that, as Deleuze and Guattari argue, 'information and communication, and even signifiance and subjectification, are subordinate to redundancy' (Deleuze and Guattari 1987: 79). That is, language, like building details, is repeated within a social field and does not emerge from individual minds or objects. Stirling's forms repeat and reference to situate themselves within flows of meaning that precede subjectivity. The building, as such, neither stands

outside the system of cultural production nor merely repeats without difference a message ad nauseam.

The Engineering Building situates itself within a material and discursive flow that performatively enacts incorporeal transformations. This is a radically different experience from the supposed 'conceptual destruction' referenced by Tafuri, who writes, 'Stirling reduces the solid volume to a paper-thin surface; where the glass would seem to suggest a dematerialisation – the block of sheds or the office tower – he treats the glass as a prism, thereby making it contradict its "natural" evanescence' (Tafuri 1987: 271). However, this inversion of mass and void, solid and transparency, strong and weak materials is more appropriately treated as Stirling's creative capacity to highlight the virtual potential of materials, which the building decodifies, decentring tectonic expectations and dispersing its informational function.

Tafuri isolates Stirling's building from the world, arguing that, as text and pretext, it signifies but does not actualise utopia; it represents the space of community and integration but has no power to act or forge tangible connections to an actual space of lived experience. Kenneth Frampton echoes these sentiments in referring to the building's ship-like appearance as 'A dream with maritime associations' (reprinted in Tafuri 1987: 269), or in Tafuri's own words, 'a virtual iceberg that navigates in the sea of the park in which it is casually placed, according to a mysterious course' (Tafuri 1987: 269). However, materially, the design actually responds to a rather tight site on a university campus, and, despite its iconic appearance, is anything but floating in space. It is more productively conceived as a series of abstract machines in which plans, sections, elevations and perspectives operate transformatively, allowing expression and content to converge and materialise. Deleuze and Guattari write:

> A true abstract machine has no way of making a distinction within itself between a plane of expression and a plane of content . . . [It] is neither an infrastructure that is determining in the last instance nor a transcendental Idea that is determining in the supreme instance. Rather, it plays a piloting role. The diagrammatic or abstract machine does not function to represent, even something real, but rather constructs a real that is yet to come, a new type of reality. Thus . . . it does not stand outside history, but is instead always 'prior to' history (Deleuze and Guattari 1987: 142).

The Engineering Building takes modernism in a new direction that eschews the sleek finishes and empty formalism of earlier modernism in favour of affective intensities that permit the singular to subvert the

universal. Insisting on a linear logic, Tafuri only partially 'reads' the architect when he contends that 'The "scandal" of Stirling's architecture is constituted by man, as he is forced to ricochet between architecture as pure object and the redundancy of hermetic messages, deranged by a "rhetoric of interruption" ' (Tafuri 1987: 273). Stirling's 'scandal' is actually a carefully articulated interplay between machinic assemblage and collective assemblage of enunciation, or what Deleuze and Guattari define as 'two constantly intersecting multiplicities, "discursive multiplicities" of expression and "nondiscursive multiplicities" of content' (Deleuze and Guattari 1987: 67). Stirling's architectural montage intentionally sacrifices ideological content such that the exhaustion Tafuri uncovers is in fact a constant passage between the smooth and the striated, fictioning zones of indiscernibility that allow the virtual to emerge from the actual and vice versa. Stirling recreates the becoming of modernism through myriad episodes, but his repetitive strategy is differential to avoid didacticism and posit his design as a virtual part of an immanent process. As such, the built environment becomes an assemblage of capacities rather than the sum of its functions, design concepts become responses to problems comprehended from the perspective of a creative genesis, and architecture develops its own means of striving irreducible to contextual relics decorated with human desire.

III. Stirling and the Smoothing of the Striated

This process of deterritorialisation and striation also provides a new milieu, which enables striated space to be resmoothed through differentials of speed, delays, accelerations, variations, dis- and re-orientations. Smooth space is needed to implement qualitative environmental change, since stratification only organises an existing reality in stasis. In this sense, the actual emerges from the virtual, which is a non-metric continuum, a state of constant creation, part of this world of becoming, repeatedly defined by Deleuze as 'real without being actual, ideal without being abstract' (see Deleuze 1994: 208; 2000: 58; 2004: 101). Smooth space is comprised of forces and sensations in which dwelling is subordinated to the journey, interior and exterior are integrated along with the intensive and extensive, and in which connections can be made at will to create a provisional whole arising from the fragments of the city. According to Deleuze and Guattari, if the sea was increasingly striated by the sky above and its derivative measurements, the developments of commercial cities, especially by the State, soon followed suit, acting as a territorialising force. They

elaborate: 'In contrast to the sea, the city is the striated space par excellence; the sea is a smooth space fundamentally open to striation, and the city is the force of striation that reimparts smooth space, puts it back into operation everywhere, on earth and in the other elements, outside but also inside itself' (Deleuze and Guattari 1987: 481). The city accomplishes this re-smoothing by developing points of tension and intensity through sprawl and disjunction, which also adds a third, spatial dimension to the smooth and striated.

The most critical and productive architecture for Stirling emerges through the development of three urban museums designed for German cities: the Nordrhein-Westfalen in Dusseldorf (1975), the Wallraf-Richartz Museum in Cologne (1975), and the limited competition for the Neue Staatsgalerie in Stuttgart (1977–83), only the latter of which was constructed. A decade after Leicester and his attempt to overthrow the perceived permanence of architectural modernism, Stirling had grown more comfortable manipulating historical and modernist architectural syntax to facilitate the flow of an increasingly contingent modernism. As Moneo writes, 'This is architecture where the accidental predominates, and where the guiding thread is movement' (Moneo 2004: 41). The process of the Neue Staatsgalerie's creation is revealed as one of intensities beginning with drawings – sketches of widely disparate elements progressing down the urban hillside, staging episodes and engaging the physical and historical landscape in a critical discourse (Figure 3). The architectural promenade, connecting the topography of the city as well as the individual moments of the design, is a sculptural event staging sensation rather than assuming a pre-constituted subject put in motion and merely added to static space. Neue Staatsgalerie was primarily designed in plan and given a relatively modest section measured against its surroundings, a strategy that allows the building to read as a topographical extension of the city rather than an object in it (Figure 4). Stirling obfuscates the distinction between figure and ground, which oscillate to allow the contextual background to alternatively submerge and re-emerge. The collage of forms and details expressively unites to make the building's relations productively indiscernible. Formally, the unbalanced symmetry is reinforced by the irregular, elemental forms of the rotunda and cubic gallery spaces on either side of the dynamic entrance (Figure 5).

This archaeology, like that at Leicester, is temporal and spatial, productively mining the remains of modernism rather than desperately lamenting its downfall or nostalgically rescuing souvenirs from its more idealistic moments. The most overt historical reference, the pronounced

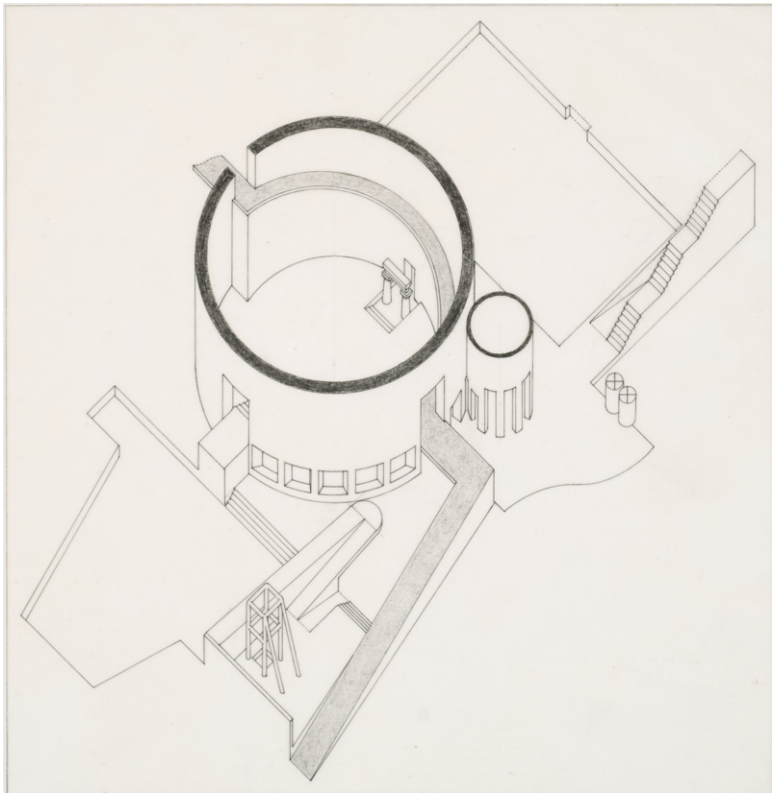

Figure 3. Axonometric drawing of the Neue Staatsgalerie Stuttgart, Germany, 1977–1984. (Source: James Stirling/Michael Wilford fonds Collection Centre Canadien d'Architecture/Canadian Centre for Architecture, Montréal).

cylinder, alludes to Karl Friedrich Schinkel's Berlin Altes Museum, which is here fragmented, then reconnected by a promenade and embedded into the urban environment of Stuttgart. Elements of the recent past appear in the form of an exact copy of Le Corbusier's detailing, as well as references to Stirling's own Olivetti building at Haslemere. Intensities of continually unfolding experiences, such as the elevator qua mechanical toy and vivid colours to counterpoise the stretches of classical stone revetment, instil a lack of repose or closure to the elements in the design by always referring to something yet to come.

Stirling meticulously unites movement and event by negotiating the smooth and the striated in order to address the temporality of design. Of

this process, Tafuri writes that its 'reassemblage follows two seemingly divergent laws: on the one hand, it imitates the mechanical world; on the other, it reduces the formal assemblages, obtained by the accumulation of forms, to a succession of "events" ' (Tafuri 1987: 271). While Rowe, Stirling's teacher and foil, lamented the lack of façades on the project, such a feeling is merely symptomatic of his inability to move beyond historical precedent and overarching structures for representational design. Anthony Vidler writes, 'Without a face or façade, Rowe believed a building lost any frontality, and thus any "metaphorical plane of intersection between the eyes of the observer and what one might dare to call the soul of the building (its condition of internal animation)" ' (Vidler 2008: 103). Rowe's concept of movement, in other words, remains picturesque and classical, while Stirling's incorporates more subtle forms of dynamism and duration.

Stirling's capacity to create, fuse together and obfuscate the boundaries between compositional and expressive layers is a compelling architectural version of the time image, a robust strategy for moving beyond the crisis of movement. The design's synthetic structure resolves social, institutional and tectonic imperatives within a single envelope that reveals traces of a deformational field. In the process, Stirling destabilises Tafuri's fear that symbolism as external to life is all that speaks through architecture in the form of either the monument as 'the artificial creation of a collective memory' or the tomb as 'the illusion of a universe beyond death' (Tafuri 1987: 275). That is, by reifying aspects of the life-world, architecture renders them impotent and precludes the human element of chance along with 'that expression *par excellence* of change, human behaviour' (Tafuri 1987: 273). Quoting György Lukács, Tafuri argues that 'a form that preserves and is open to life, does not occur' (Tafuri 1987: 274), adding, 'the space of life, of time as it is actually experienced, excludes the space of form or, at least, holds it constantly in check' (Tafuri 1987: 276).

In contrast to such apprehension, Neue Staatsgalerie can be seen as a spatial and temporal palimpsest that smooths the striated city, creating a new structure while connecting disparate elements of its environment. It stands as a singular assemblage containing a multiplicity of events with complex social, institutional and technical demands. Figure and ground, system and environment, architecture and landscape all fluctuate, preventing the structure from being read as an autonomous object. Stirling's true accomplishment here is to install complexity through a density of signs that release history, memory and time and resist a reductive formal clarity. The building operates like Bartleby, 'the man without references, without possessions, without properties, without qualities, without particularities: he is too smooth for anyone to be able to hang any particularity on him. Without past or future, he is instantaneous' (Deleuze 1998: 74).

The smooth and striated mark a division between intensive and extensive space and resituate embodiment, the subject's relationship to shelter, how she segregates herself from, or forms an assemblage with, the environment. For Deleuze and Guattari, the creation of materials and activities constitute technology as a process that imbricates humans, tools and matter (woman-needle-fabric). Striated space is given a function, which is imparted on a subject, while smooth space allows subjects to distribute themselves within and throughout space to form a new assemblage (human-building-environment). In striated space, the house separates the body from its surroundings and demarcates a

boundary between interior and exterior. That is, the striated annexes and segregates through immobile shelter. Smooth strategies, on the other hand, integrate interior and exterior, emphasise the journey and act to filter the environment.

Striated space reveals context and the background against which space emerges, while smooth space, which lacks a context, allows for connections to be made freely. In addition, space traversed can be measured and studied only after it has been striated into a provisional separation or closure from its durational whole, constituted by smooth space. The former process is necessary to operate in a quotidian fashion, to provide equivalences of exchange and communication, while the latter reminds us of the spatio-temporal duration of which our selective perception only affords a small portion at any time. Deleuze and Guattari write, 'smooth space allows itself to be striated, and striated space reimparts a smooth space, with potentially very different values, scope, and signs. Perhaps we must say that all progress is made by and in striated space, but all becoming occurs in smooth space.' Perhaps, most significantly, this is a ceaseless process in which 'Nothing is ever done with' (Deleuze and Guattari 1987: 486), as evinced through Stirling's architectural strategies, which express, rather than represent, the force of events as organisational intensities, and imbricate, without immobilising, time, space and their potential.

The Trajectories of Yachts and Snot: Strategies for Generative Designers

Guy Keulemans College of Fine Arts, University of New South Wales, Australia

Abstract

The interrogation of generative design practice with concepts from Deleuze and Guattari's *A Thousand Plateaus* can lead to an understanding of how creative forces are used by generative designers. The shared notion of hyperspaces, respectively parameter space and rhizomatic space, defined as smooth or striated, allows the construction of analogies producing a framework for investigating the development and presentation of form. Richard Dawkins (together with several designers inspired by his biomorphs) and Marcel Wanders, representative of the divergent forms to which generative design has developed since its conception, are used to illustrate and interrogate this framework. From this interrogation the concept of trajectory (inward or outward), the direction in which smooth spaces are explored and striated space constructed, is proposed as a means to guide generative practice.

Keywords: rhizome, evolutionary design, biomorph, software tools, inward and outward trajectories

The qualities of spatiality have been recognised in the certain parts of the philosophical work of Gilles Deleuze and Félix Guattari. In particular, their concept of the rhizome has been documented to have had an important influence on American architects in the late 1980s, even though Deleuze himself had very little interest in architecture (Brott 2010). Nevertheless there are relationships between Deleuze and generative design, such as can be found in the work of Bernard Cache and

Deleuze Studies 6.1 (2012): 72–88

Greg Lynn.[1] In drawing relationships between the philosophical aspects of the rhizome and generative design, generative practitioners unfamiliar with the ideas of Deleuze and Guattari must also be considered. There seems room for a framing of generative design within the theories of Deleuze and Guattari (distinct from the individual frameworks of Lynn or Cache) that is capable of broadly addressing developmental issues across the field. Can the concept of the rhizome be used to address and influence the practice of generative design? Given the intuitive relationships between the rhizome and the conceptual/technical structures of generative design arising from their shared sense of spatiality, it is worth a systematic interrogation. Consequentially, strategies arising from this investigation may guide generative designers to develop their own practice in conscious directions. In particular, this investigation can provoke an awareness of how practice can be controlled for discrete purposes, such as establishing style or engaging an audience.

The concept of the rhizome was developed by Deleuze and Guattari in the 1960s and 1970s and is well captured in their 1980 book *A Thousand Plateaus: Capitalism and Schizophrenia*. The concept seeks to understand the world in terms of constant change, multiplicity, and non-hierarchal connections, incorporated into a huge rhizomatic network, or *plane of consistency* (Deleuze and Guattari 1987). Certain concepts within and adjacent to Deleuze and Guattari's conception of the rhizome appear relevant to generative design, namely: *smooth* and *striated* space; *trajectory* through smooth space; the perception of multiplicity and the mediation of this process by the *anomalous*.

The term *generative* encompasses a wide range of different processes in the field of design (or art) that use a generative system between designer and product (Fischer and Herr 2002). A generative system can be anything that mediates between the designer and the outcome, generates output relatively independent of the designer, and which therefore produces novelty and variation. As the output of a generative system can be fed back into the system to influence future outcomes, the generative process is often cyclical. The primary example of a cyclical generative system is evolutionary design, which is commonly practised through software by the use of algorithmic functions and selective procedures to generate form. This approach is applicable to a number of different disciplines, such as architecture, design, art and computer science. Common to all is their basis in the biological model of evolution and therefore also the modelling of the environmental factors that shape development. These factors are *crossover* (reproduction), *mutation*, and *fitness*. Objects can be generated (through crossover), modified (crossover and mutation) and assessed by selective criteria (fitness)

(Bentley 1998). Such processes feature prominently in several of the case studies examined in this paper, selected to provide an overview of how evolutionary design is applied across various different disciplines. Examples are Richard Dawkins the evolutionary theorist, generative designers Celestino Soddu and Enrica Colabella, and John Frazer the evolutionary architect. These practitioners are notable within the field yet each apply generative processes for different purposes. Potentially this serves to test the applicability of frameworks arising from their study to generative design for other purposes and perhaps any purpose in general.

Despite designing for different purposes, these practitioners share in common the use of software tools. However, software tools are not necessarily required for generative design.[2] John Frazer comments: 'It is the conceptual model of generative tools, not the hardware or software that is important' (Frazer 1995a: 24). Rolling dice to determine composition in neo-constructivist chance art is a mid-twentieth century example of non-software based generative technique. Marcel Wanders is an example of a designer who has created generative systems without software tools by harnessing generative visual qualities found in nature, such as the natural variation of sea sponges. In terms of producing a working definition, this example can lead to other examples at a logical extreme, such as in carpentry, in which the act of cross-sectioning a piece of wood to expose the grain is essentially generative (the generative system is the action of the saw, that generates the otherwise unknown characteristics of the hidden wood grain). So are *wabi-sabi* style Japanese ceramics, whose glazes are designed to colour unpredictably in the kiln. However, by convention, the term 'generative' is limited to practices that draw specific attention to their generative aspects, so *wabi-sabi* glazes might be considered generative, but wood working is not. Specifically though, the term is often used to describe recent practices from the late twentieth century to the present day that seem to comprise a movement. The case studies in this paper purposefully date from the experimental years of generative design in the 1980s (Dawkins is the pre-eminent example) to the 1990s and early 2000s, a period of significant development for both software and non-software based practices.

I. The Rhizome: Multiplicity, Molecular, Molar, and the Plane of Consistency

The principal analogy of the *rhizome* is the botanical rhizome, a runner-like element of underground rootstock systems. The rhizomes are in multi-phase contact with other rhizomes, forming a rhizomatic network.

The concept is based on 'principles of connection and heterogeneity' and 'multiplicity'; the rhizome is defined by its connections to others and 'to anything' (Deleuze and Guattari 1987: 7–9, 34). Each node on the rhizome is considered a molecule which, grouped together with other molecules, can form disciplined multiplicities, or *molarities*. Disciplined not as in fixed but as stable enough to 'exist as a whole' and to be 'grasped as such by outside forces' (Massumi 1992: 55–7).

The idea of a beer glass can be used as a simple analogy. One glass is molecular; it exists by itself, but connects us with concept of many beer glasses, the molarity of beer glasses. This is a multiplicity confined to the notion of a glass that holds beer, in which sense it is a disciplined multiplicity because it has been limited by its own definition. However, it also connects to other multiplicities. These include the tables on which beer glasses rest, the mouths that drink from them and all the people whose hands hold them throughout the course of the night, the images of beer glasses in magazines, the idea of a beer glass in the mind of a philosopher, and so on to infinity. These multiplicities therefore include everything that exists or could possibly exist, immanently forming a philosophical space that Deleuze names the *plane of consistency*, filled with a multiplicity of elements that is impossible to grasp in its entirety.

Generative designers work within operative spaces which reflect aspects of this philosophical space, which can be illustrated with the work of our first case study, evolutionary theorist Richard Dawkins. Dawkins is important to generative design because he was one of the first practitioners to illustrate clearly how generative and evolutionary design can be produced programmatically. The project is documented in his book *The Blind Watchmaker* (1986), and although his motivation was to explain the neo-Darwinist model of evolution as opposed to generating artwork for its own sake, his experiments widely influenced generative designers and artists (Whitelaw 2001). Dawkins wrote simple programs that generated pictographic 'biomorphs' comprised of small lines that could be interbred and evolved using a human as the selector (Figure 1). By his own account, the program was quite successful and Dawkins himself was surprised by the originality and fecundity of its output (Dawkins 1986: 59–63). He was eventually able to generate vast arrays of these biomorphs, conceptualised as existing within the software universe he created and named 'Biomorph Land'.

Biomorph Land is conceived as a parametric hyperspace, or parameter space, that can contain all possible permutations of a program's output. Each of Dawkins' biomorphs has nine computer code 'genes' and so the

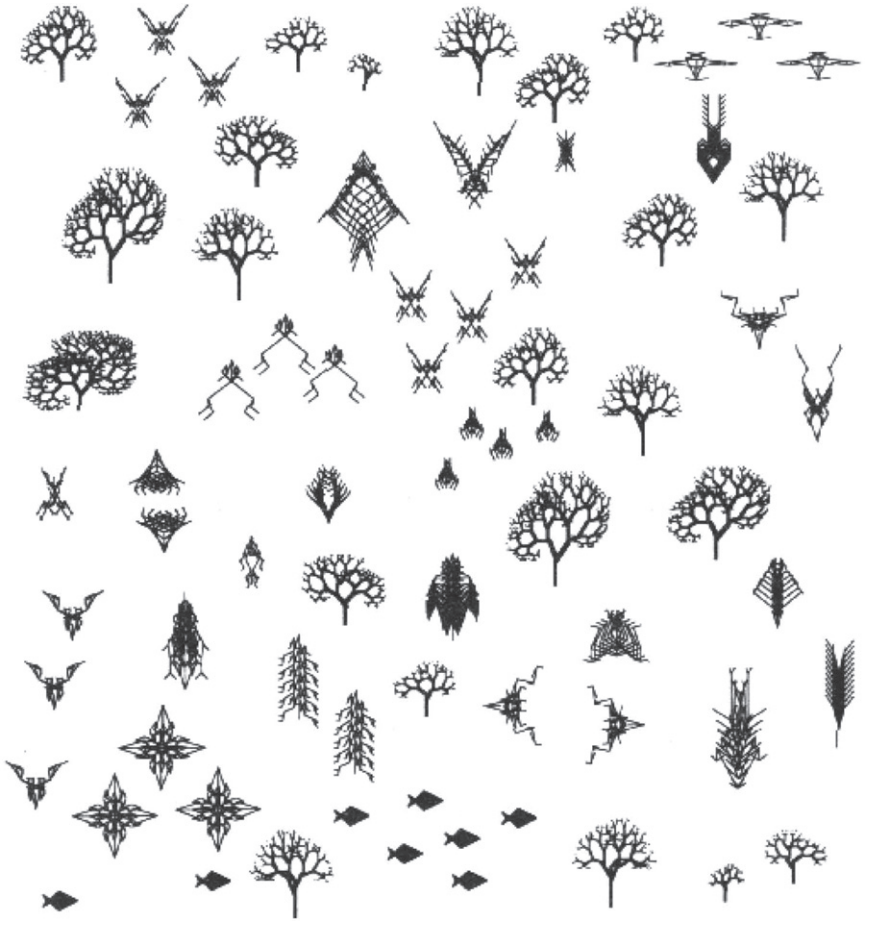

Figure 1. Biomorphs by Richard Dawkins. (Source: Dawkins 1986)

space is nine-dimensional. He cuts through this thick, nine-dimensional space with a plane 'like a flat piece of glass' to illustrate how quickly the formal attributes vary as the code genes change in measurable distance from one another. Dawkins extrapolates this mathematical model into an analogy for animal evolution. The inhabitants are not just all the species that exist on our earth, rather they are a subset of an infinite array including extinct ancestors, future descendants and all the animals that could ever exist; 'impossible monsters' reached by 'theoretical trajectories' (Dawkins 1986: 66–73).

Generative designers consider the hyperspatial qualities of such spaces significant (Whitelaw 2001). They resonate with Deleuze and

Guattari's plane of consistency. Both are multi-dimensional, consisting of permutations and generative acts that produce molecular elements. Each element has a mapable relationship to every other, and potentially a rhizomatic relationship. However, it is important to understand the conflicts created by this comparison. While the dimensionality of rhizome space might be infinite, generative hyperspaces are bound by programmatic limitations. Dawkins' space, for example, is nine-dimensional, so it is defined and contained by this parametrical limit. Deleuze and Guattari contend that the rhizome is 'a stranger to any idea of genetic axis or deep structure' because it is the nature of the rhizome to connect to anything (Deleuze and Guattari 1987: 12). It cannot be contained. So there are limitations to applying the concepts of the rhizome to evolutionary based systems. However, there are ways generative systems can expand their parametrical limits. For example, by interaction with users or designers via interfaces or input devices, they vastly expand the complexity of their hyperspatial qualities. These practices of human mediation, viewing, analysis and use are also significant in opening up rhizomatic connections.

The relationship between human and machine is of interest due to the magnitudes of complexity generated by their interaction – an atmosphere of creativity permitting results neither could produce alone (Sims 1993). Human interaction is used in the construction of hyperspaces found in the generative practice of Celestino Soddu and Enrica Colabella.

Soddu and Colabella generate form, including architecture and furniture, using a 'morphogenetic code' inside a human alterable computer environment. As in the case of Dawkins, there is a human, also known as artificial, interaction guiding the computational process; however, the artificial criterion is not evolutionary selection, but rather the use of operable fields that work directly on the genome and environment, affecting the growth and 'embryology' of form. Its products can have the same code, but different forms, and hence allow the creation of a 'population' of species (Soddu 1997). The approach is less cyclical than that of Dawkins (the populations do not inform new generations), requiring a different understanding of its hyperspatial outcomes. While the parameter space created by Dawkins may be capable of infinite production, it can also be considered bounded by the dimensions of the code genome, while running intact. Guiding a selection process does not change the space, only explores it. Soddu and Colabella's operable fields, however, alter the geography of their hyperspace by modifying the genome and environmental conditions. The nature of their hyperspace is contingent on this human interaction;

Figure 2. Generative chair designs by Celestino Soddu and Enrica Colabella. (Source: Soddu 1997)

the computer and human are connected via a conceptual relationship, forming an extended hyperspace beginning to more closely embody the rhizomatic relationships proposed by Deleuze and Guattari.

Another way to extend the hyperspace is to conceptualise it as having the rhizomatic ability to connect to anything, and, in fact, everything. Deleuze and Guattari's own speculations on the theory of evolution are contingent on such an extended connective ability. Arguing that evolution as a whole forms a large complex rhizome, they do not see the evolution of single animals, rather they see animals and animal packs: 'troops of monkeys and schools of fish', connected by 'terms in play and assignable relations' (Deleuze and Guattari 1987: 239). The connections go beyond species and physicality. These terms in play bind many things together, including objects and animals, but also places and effects. In this way, rhizomatic relationships also include the *experience* of objects. When discussing generative design within a rhizomatic framework, these experiences can be theoretically interrogated as part of an extended experiential space connected to generative hyperspaces, although they may not exist concretely in the same way. Their construction relies on

the analysis of how a designed object activates the mind. An example of such a different kind of rhizomatic relationship is demonstrated by the generative systems of Dutch product designer Marcel Wanders.

In the 1990s, Wanders engaged in generative processes involving both selective and non-selective aspects. The forms of his *Sponge* vases (1997) are generated by casting liquid porcelain in the random patterns of natural sea sponges. The resulting vases are as different to each other as are sea sponges in the natural environment of the sea. As such, the system can be said to have no selection criteria.[3] Conversely, Wanders' *Snotty* vases illustrate a generative process in which selection is integral to the production process.

Common to both is the lack of a software model, though computers are used in the case of the *Snotty* vases, albeit not in a generative way. That task is reserved for the human body. The form of the vase is derived from a 3-dimensional scan of a mucus glob, or snot, expectorated from a person by sneezing. The form of the snot is digitally captured in mid-air travelling at high velocity. Numerous scans were collected and then assessed for their qualities, for example beauty, complexity, but notably also a 'logical gravity situation', i.e. the functional ability to stand up. Adapting the selected 3-dimensional scans into a vase involved enlarging and hollowing the form with a computer program, but consideration was given to the integrity of the generative process and as little was changed as possible. As Erna Theys of the Marcel Wanders Studio remarks, 'it is important to accept the situation as it is' (Theys 2002). The vases are then built in polyamide using a 3-dimensional printer. The capturing process is comparable to the exploration of parameter spaces as practised by Dawkins, with the primary difference that Wanders exploits the human body as a generative system, and so explores a space of variation produced naturally by the activity of sneezing.[4]

The resulting object is a strangely beautiful vase that is also vaguely repulsive. It is possessed of a familiarity that is unsettling given social attitudes to bodily functions and waste, and one cannot help but think about its nasal origins and the substances inside noses everywhere. How does a rhizomatic understanding emerge from this? As mentioned, Deleuze and Guattari describe the rhizome possessing *assignable relations* and *terms in play*. For the vase, a form generated from snot frozen in time and space, the terms in play are these very elements: snot, time, and space. Suggestible is the notion that such elements are shared by many millions and billions of snot particles travelling through time and space. Your snot, my snot, someone else's snot, and also the snot of history and the snot of the future. All snot in

Figure 3. *Snotty* vases by Marcel Wanders (clockwise from top, *Influenza*, *Sinusitis*, *Ozaena*, *Pollinosis and Coryza*). (Source: Photo by Maarten van Houten. Provided by Erna Theys of the Marcel Wanders Studio, 2002)

existence landscaping a huge snot-space linking all our noses; a rarely considered multiplicity.

II. Smooth and Striated Space

Deleuze and Guattari contend that rhizomatic relationships are contingent upon a placement in *smooth* or *striated* space, or in a space shifting from one to the other. Smooth space is described as being a place of 'continuous variation, continuous development of form', whereas striated space is that which 'produces order . . . and organises' based on 'measures and properties' (Deleuze and Guattari 1987: 474, 478–9). Therefore, when discussing the practice of design, the open-ended possibilities of smooth space correspond to the inventive, creative and lateral thinking associated with the practice of design. However, as smooth space is explored and developed, the process of recognition and mapping produces striation. Striated space, in terms corresponding to design, is a conceptual location for the systems and knowledge that inform the design process. In turn, these factors engage with further acts of creativity, leading the design processes back into the exploration of new smooth spaces. So in design, as in the rhizome, inhabited spaces are constantly shifting back and forth between the two.

This constant shifting can be illustrated using Dawkins' experiments with his biomorphs. In the very first running of his program he noticed certain biomorph configurations resembling insects. Surprised by this zoomorphism, he selectively bred the most insect-like together, until they had, in his own words, 'eight legs like a spider, six legs like an insect . . . ' (Dawkins 1986: 60), and a variety of insect-like creatures were expressed in the program's parameter space. Dawkins self-directed discovery of these biomorphs is his journey through a *smooth* space, an area of 'continuous variation, continuous development of form' (Deleuze and Guattari 1987: 478). The recordings Dawkins made of this biomorph evolution can be thought of as a series of points or coordinates that describe the evolution of the insect biomorphs. Deleuze and Guattari note that in striated space 'lines or trajectory tend to be subordinated to points, one goes from one point to another' (Deleuze and Guattari 1987: 478). Hence, the smooth space in which the insects develop becomes striated as a result of their own discovery.

The ability to record and steer these kinds of explorations is the driving force behind an area of evolutionary design known as *optimisation*. Optimisation has been used to effectively solve a number

of difficult engineering problems including flywheel design (Bentley 1998) and yacht hull design (Frazer 1995b), problems that can be defined by fairly precise parameters, such as material weight to strength ratios or aerodynamic characteristics. Within the space defined by such parameters, *genetic algorithms* search by evolving themselves until an optimal solution is found (Zarzar 2002). Care is taken to make the search space as small as possible so as to reduce computational time and error. The process is self-contained and no human interactions occur after its initial modelling, and so the process is said to be internal and 'natural' in relation to the 'natural' model of Darwinian evolution (Westbrook 2002).

Optimisation sacrifices design creativity for the sake of specific output. The exploration space is small, suitable for engineering, but less suitable for design fields with broader criteria for success. However, the search space can be expanded by any change in parameters or environmental conditions voiding the search results. This occurs with human interaction in hybridised optimisation processes, such as those used by John Frazer in his yacht-building experiments. In these experiments, optimisation processes evolved yachts based on computer-assessed levels of fitness, subjected to crossover and mutation.

'Stability, centre of buoyancy, wetted surface area, [and other] "hydrostatic characteristics" [which] give some indication of likely hull performance and potential speed... were chosen as factors that could be evolved and reliably assessed by the computer' (Frazer 1995b). Meanwhile, Frazer and his team oversaw the crossover process visually and interjected to discard yachts lacking aesthetic appeal. It can be considered that during this process the designers experience a rhizomatic interaction with the software. While the software produces striated space though optimisation processes, smooth space is expanded by the production of variants whose aesthetics are matched against a fuzzy ideal in the minds of Frazer and his team. This is a smooth space, exogenous to the software space, containing only an abstraction of a yacht, or, we could say, a multiplicity of possible yachts. In other words, they don't know what the yacht looks like until they see it generated by the computer, guided by their own intuition. Through respective activities the connected spaces striate until a precise and desirable model of the yacht stares out at them from the computer monitor. Deleuze and Guattari comment: 'the metrics of striated spaces (*metron)* are indispensable for the translation of the strange data of a smooth multiplicity' (Deleuze and Guattari 1987: 486).

III. Outward Trajectory

Deleuze and Guattari's model of smooth and striated space is contingent on lines. In striated space these lines are subjected to the points, they are concrete. However, in smooth space it is the opposite and the lines are vectors, tipped with an arrowhead possessing direction, a trajectory of movement. Trajectory is not a term frequently used by Deleuze and Guattari in *A Thousand Plateaus*, however, much of their description of smooth and striated space is contingent upon related terms: 'the course of one's crossing', 'lines of flight', 'abstract line–concrete line'. Deleuze and Guattari exhort: 'Look only at the movements' (Deleuze and Guattari 1987: 481, 117, 496, 282). The line of such exploration has the potential to change smooth space, or cross a threshold into new smooth space. It can be *abstract or nomadic*, a line of *deterritorialisation* that dissolves or escapes striation. In contrast, the *concrete* line is not so much a line, but a force that is constantly being subjugated to the points left in the wake of the exploratory line. This is the activity of striation. To understand the exploratory line in context, we need to see how the line progresses and its effect on the space it negotiates. In which direction does its arrowhead point?

It is salient to discuss trajectory, and in particular an *inwards* trajectory that imparts an increasingly denser stratification in its wake as it moves through a bounded smooth space, thereby expressing increasing homogeneity, and an *outwards* trajectory that jumps across the boundaries of striated space, a line of flight discovering new smooth spaces and, through its own form of striation, linking spaces together. The process of experiencing Wanders' *Snotty* vase appears to run in an outward trajectory. It follows an abstract line to new territories by linking a presentation of snot with an experiential understanding, an empathic awareness, of all snot in existence, the snot-space inside all our noses. This is the process of engaging with multiplicity. However, Deleuze and Guattari note, 'wherever there is a multiplicity, you will also find an exceptional individual, and it is with that individual that an alliance must be made' (Deleuze and Guattari, 1987: 243).

They name this exceptional individual the *anomalous*, the thing that mediates the transition to the multiple. The vases are anomalous to snot because they are vases and *not* snot. They stand many orders of magnitude larger than snot, and they are solid, smooth and plastic as opposed to soft, sticky and organic. They are frozen, immobile, gravity dependent, not flying nor actively changing form as they do so. Yet, somewhat gravity defiant as fluidly shaped vases, they express this

temporal, aero-spatial character. To use Deleuze and Guattari's own analogy, they are to ordinary snot what Moby-Dick the great white whale is to ordinary whales. Random glances at real snot, whether in tissues or hocked onto the street, do not necessarily produce an engagement with a molarity of snot. The vase is both familiar and significantly unfamiliar. It is not abnormal, rather its exceptionality is a transgression of characteristics simultaneously confirming those characteristics as essential, but diverse. It belongs to the multiplicity because it confirms the heterogeneity of the multiple. In other words, despite being strange, it shares qualities with its own group. The familiar aspects produce recuperation points for us to consider the unfamiliar. For example, the change in material from mucus to plastic skews us to examine other qualities of snot, such as shape and form.

Additionally, the naming of the *Snotty* vases continues the play with familiarity: *Influenza*, *Sinusitis*, *Ozaena*, *Pollinosis* and *Coryza*. One might think in regards to the more familiar names, *I too have had influenza, or sinusitis*; meanwhile, the more exotic Latin medical names for illnesses extend the scope of our thought to the unfamiliar. We become aware of the vases' connection to many kinds of snot. The presentation of a group of five variant vases is also important because it prevents a perception of the vase as abnormal (it belongs to a group), while gently nudging us towards a sense of the multiple. In this manner, the anomalous object has mediated an outwards trajectory, facilitating the growth of the rhizome in experiential space.

IV. Inwards Trajectory

Conversely, Dawkins explores his parameter space with an inwards trajectory. While the space is parametrically bound, he argues that production is limitless. Theorist Mitchell Whitelaw comments that because such practice claims qualities of infinite variety, it has also been claimed that the space contains all the art that has, could or would ever exist: the *Mona Lisa*, Munch's *The Scream*, and a photo of a tattoo of the Scream. Yet, in practice, evolutionary artists cannot break free of stylistic limitations. There is self-similarity in Dawkins work; black and white line work, fractal branching, and various forms of symmetry. Whitelaw assesses another generative practitioner, the evolutionary artist Steven Rooke, in much the same way, noticing repeated fractal motifs and the contrast of high-complexity spaces interrupted by flat washes of supersaturated colour. In both Rooke and Dawkins, these

qualities are indicative of programming limits. While the process has endless variation, the evolutionary development appears paradoxically consistent and possessed of an 'algebraic aesthetic' (Whitelaw 2001). From image to image, the qualities in such work, which become noticeably homogeneous the greater the number of examples viewed, reflect the harder to evaluate 'creative potentialities of striated space' (Deleuze and Guattari 1987: 494). Smooth space is still being explored, but within ever shrinking boundaries created by an inward trajectory of exploration.

The same qualities can be seen in the chairs generated by Soddu and Colabella. Although intended to express novelty, they also share similar aesthetic features. Blocky forms and a similar, but seemingly arbitrary, fusion of elements based on primary shapes are shared by all the chairs. These characteristics are interesting because they possess a geometric incoherence, a kind of biological-like diversity within each single chair. Yet as a whole, as a species or population of chairs, the commonality of these features becomes apparent. Noticeably, the chairs share a common palette of bright colours, which also suggests that formal relationships across the chairs are as important as the formal qualities within any particular chair. Soddu states that the idea behind the chairs should be 'recognisable notwithstanding the differences among the individual chairs' (Soddu 1997). In rhizomatic terms, the recognition of this idea indicates a molarity disciplined by a series of concrete lines; the creation of each chair, and every chair, falls between these lines of striation. This denotes an inwards trajectory, and as with Dawkins and Rooke, this establishes style.

For Rooke, there seems to be a conscious motivation behind his inwards trajectory. Rooke discusses his work with energy. He talks about evolutionary design sessions of 'two or three days' resulting in 'dozens of generations with one or two hundred individuals in the population' (Whitelaw 2001). It appears that in the process of mapping there is a desire to exhaust the potential of the parameter space; or to grab at something hidden and elusive within it. By generating successive waves of subtly differentiated novelty, Rooke is applying denser and denser layers of striation upon his work. Perhaps his search is an attempt to depict not the outcomes of the space, but the space itself, chasing the *grain* of the space by squeezing the smooth space out of existence, to a recuperation point of infinite density. Like a kind of quantum mechanical space-foam; a striation so dense it is utterly smooth again. This is resonant with Deleuze and Guattari who comment that striated spaces are spaces for recuperation, spaces grounded in the absolute;

'when the striated attains its ideal of perfect homogeneity, it is apt to re-impart smooth space' (Deleuze and Guattari 1987: 488). Alternatively, Rooke's solidly, almost solipsistically inward trajectory may be a result of becoming overly accustomed to the behaviour of the machine. His design sessions indicate a state of hybridisation with his software that, despite the generation of complexity, have been criticised by theorist Stanford Kwinter for lockstepping human choices into 'deterministic spaces' (Kwinter 2008). In which case, the selective pressures Rooke places upon his artwork have only the semblance of free will: in practice he can only make choices the software is capable of offering.

V. Conclusion

It appears that the notion of context becomes important in assessing the nature of generative design. One of Soddu and Colabella's chairs, standing by itself, can exhibit a range of elements embodying the fecundity of generative design. Yet, because of an intention to communicate the process, the chairs are displayed collectively. Then, paradoxically for an approach stated by its authors to be 'individually distinct' (Soddu 1997), the common design factors become noticeable, diminishing the individual originality of each chair.

One can suppose from this that the value of generative design might be the uniqueness of the single object taken and digested quietly alone, rather than engorging on a vast number of outcomes. A strategy for generative designers may be to present fewer outcomes of their practice, with sensitivity to each variation. Although novelty is certainly an expression of a multiplicity, Deleuze and Guattari are clear that multiplicity is not something that can be grasped in its entirety, and trying to do so is overwhelming. Getting a sense of the multiple, however, via molarities, is mediated by the anomalous, the unique member of its multiplicity that stands out and beckons for attention (Deleuze and Guattari 1987: 245). So it could be argued that the presentation of singular, anomalous examples is more effective than the presentation of many more collected expressions of novelty. Marcel Wanders implements this kind of strategy with his *Snotty* vases, cleverly manipulating various aspects of familiarity/unfamiliarity associated with the anomalous to resonate with his audience.

However, the intention to explicitly draw attention to their own process requires different strategies from generative designers. By publishing collections of their products, in rows and columns, Soddu and Colabella convey the formal qualities shared by their chairs and in

doing so communicate a sense of the operations and generative factors which produce them. This is a presentation of an inwards trajectory. It establishes style for a generative designer, although it may also expose the limitations of the technology. Potentially, as with Rooke, it can send the designer on an inwards path of producing self-reflecting novelty that becomes paradoxically homogeneous. Inwards trajectory explains the tendency of generative design to exhaust creative potentiality from one source. Whilst some flexibility arises from the ability to modify parametric factors, without broader changes to the conceptual approach outcomes can become static, routined to the deterministic spaces of the machine and ultimately in conflict with the purpose of the generative process to produce novelty.

Notes

1. In brief, Greg Lynn has extrapolated concepts from such books as Deleuze's *The Fold* into the design of soft, co-extensive architecture that responds to surrounding conditions. Bernard Cache was an early generative practitioner experimenting with mass customisation, well documented in his book *Earth Moves*, later referenced by Deleuze.
2. There are many other computer-aided generative design systems based on models other than the evolutionary model. These include rule-based software systems, for example fractals, and self-organization software systems such as swarm modelling.
3. Although ironically one particular version is dominant in design media and image searches as a consequence of being actively selected through the process of marketing.
4. Wanders was not the only Dutch conceptual designer working in this manner in 1990s; Jurgen Bey and Hella Jongerius also experimented with introducing generative systems to the production of ceramics. Jongerius' 'B-set' is a notable critique of uniformity in serial mass production.

Weaving and Warping: Free Indirect Movements Between Theory and Art Practice

Charlotte Knox-Williams Winchester School of Art, University of Southampton

Abstract

Through an exploratory interrelation of theory with fine art practice, this article sets out to address the role of memory in the transitions and transformations between smooth and striated states. The article constructs a striated, woven formation between virtual and acquired memory, and attentive and inattentive perception, before going on to investigate how its regularity is disrupted through disturbances, slippages and snags.

Keywords: Bergson, theory, art practice, time-image, (in)attentive memory

Bergson's theories of the interconnected nature of perception, consciousness and reality in spirals and circuits can been intertwined directly with Deleuze and Guattari's concepts of the smooth and the striated to produce an interwoven composition. An interpenetration of perception and memory, the interrelation of the recollected and experienced in this interwoven structure, encompasses a correspondence between 'the real and the imaginary, the physical and the mental, the objective and the subjective, description and narration, the actual and the virtual' (Deleuze 2005: 44). It will be argued that this structure constitutes a dialectic (striated), and yet is at the same time inclusive of elements that are of a different nature, being qualitatively smooth. From within this reticulated structure arise incidents that interrupt or derail

Deleuze Studies 6.1 (2012): 89–102
DOI: 10.3366/dls.2012.0048

www.eupjournals.com/dls

its measured regularity. These snaps or slips are found to be inherent within it. 'Time is out of joint' (Deleuze 2005: xiii), and through these 'aberrations', 'disturbances of memory and the failures of recognition' (Deleuze 2005: 52), there ensues an exploration into the function of memory between states of smoothness and striation which at the same time reveals new ways for thinking interrelationships between Deleuzian theory and art practice.

In my studio practice, digital film, analogue transparencies and the surfaces of drawings are overlaid in 'a series of rich and complex operations' (Deleuze and Guattari 2008: 536). Projections are traced and traced again, generating entangled and densely drawn areas. Through drawing and film, documentation and recordings are superimposed, revealing interpenetrating yet distinct durations. This article sets out to investigate how the variable interrelationship between surfaces of drawing and film in practice can be understood in terms of transitions that move between gridded enclosure and states of enmeshed smoothness. The relationship between theory and practice that has been employed here is not one of simple transfer or application – taking a concept and applying it to an image or event in the studio; neither is it a case of one emulating or reflecting the other. 'Theory does not express, translate, or serve to apply practice: It is practice' (Foucault 1977: 208). This proposition must be understood in an experimental rather than a reductive way, and this demands the *activation* of Deleuzian theory through a number of speculatory conjunctions in, with and through art practice.

It could be argued that Deleuzian concepts form, or are beginning to form, an established 'canon', a template or fixed shape for thinking that works *against* them. It seems vital that Deleuze's concepts be not merely explored and recombined, but that they also be extended, adapted and 'put to use' (Buchanan 2006). This method is similar to Moulard-Leonard's description of Deleuze's approach to Bergson's philosophy, as 'faithfully travelling down the same path, pushing Bergson's insights to their extreme limits' (Moulard-Leonard 2008: 9).

I. Fabrication

In their chapter on the smooth and the striated, Deleuze and Guattari refer to Bergson's oppositional pairing of two multiplicities: 'one qualitative and fusional, continuous, the other numerical and homogenous, discrete' (Deleuze and Guattari 2008: 234). Two direct correlations are drawn here, linking spatial, discontinuous multiplicity

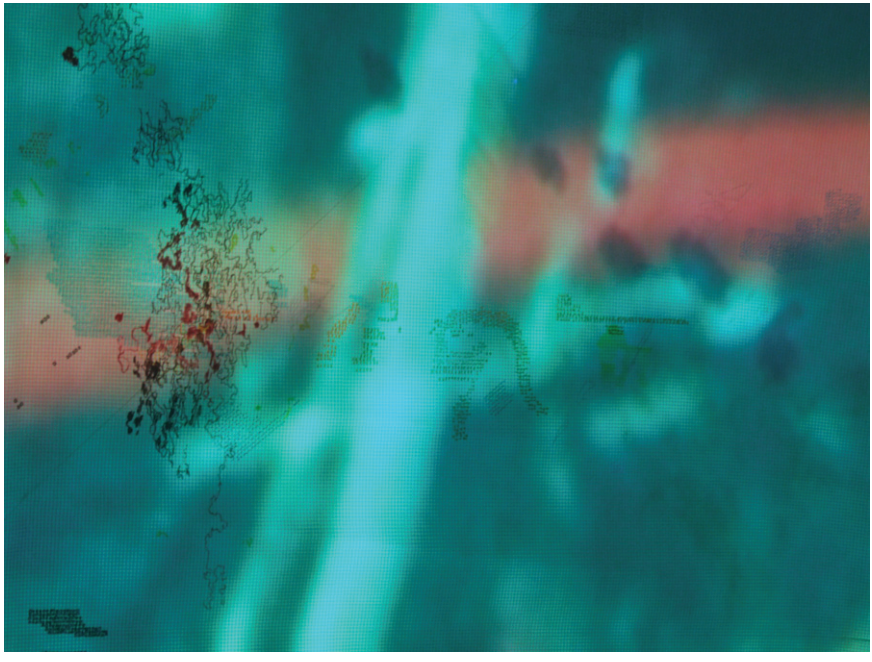

Figure 1. Digital film still from *Collider* (2011), Charlotte Knox-Williams.

with striation, and durational, continuous multiplicity with smoothness. Spatial multiplicity is counted, measured and metered, characteristics that all conform to the definition of the striated. A continuous multiplicity, on the other hand, cannot be divided without altering the whole, and it is this state that Bergson attributes to duration or pure temporality. Homogenous, open and expandable in any direction, clear parallels exist here with the description of smooth states and spaces. Based in this understanding, further parallels can be constructed between the dual nature of memory as detailed by Bergson in *Matter and Memory*, and the opposing states of smoothness and striation.

The past endures into the present through memory according to two separate functions, one automatic and the other acquired. Acquired or learned memory is constructed through repetition, an action is carried out several times in order to create 'motor mechanisms' that can then be recalled and re-enacted as required. This acquisition of memory entails the separation of the action into parts, followed by the replication of these segments, leading gradually to the point at which the separation is no longer apparent. Eventually, the whole can be re-created from

beginning to end. Bergson offers the example of learning a text by heart, where repetition of a sequence of words and sounds gradually brings about the blending of one into the next until the whole can be replicated. A recollection formed in this way has a fixed duration, and in order to activate the memory, the passage or text must be recalled in its entirety following its original succession. Asked to repeat the third word of the second sentence, the only way to retrieve this memory is to repeat the passage from the beginning. Acquired memory, then, 'requires a definite time, the time necessary to develop one by one, were it only in the imagination, all the articulatory movements that are necessary' (Bergson 2004: 91). This kind of recollection is based in movement and therefore in space, it is 'lived and acted, rather than represented' (Bergson 2004: 91). Acquired memory is developed through repetition of the same.

In contrast, automatic memory is purely temporal and exists, independently of space and movement, in recollected images (Bergson 2004: 87). At every instant, continuously and without pause, this automatic or virtual memory expands to encompass the past in its entirety and variety. Enduring into the present only as representation, virtual memory persists as a store of memory images adding to itself constantly at every moment. Unlike learned or acquired memory, pure memory does not have a fixed duration and can be condensed into a single instantaneous image and also expanded indefinitely. It is not necessary to re-enact the entire sequence in order for recollection to take place, indeed 'there is nothing to prevent me from grasping the whole of it instantaneously, as in one picture' (Bergson 2004: 91). Further to this, acquired memory, rooted as it is in movement and action and therefore in the present, only maintains a relationship with the past through virtual memory, in these separate recollections that were stored up automatically.

The two functions of memory, like the opposing states of smoothness and striation, are distinct, qualitatively different from one another; 'one imagines, the other repeats' (Bergson 2004: 96). Acquired memory entails a fixing, measuring and delimiting of actions in the present so as to create a 'closed system of automatic movements which succeed each other in the same order'. Inherently spatial and discontinuous, this function of habitual memory could be described as having a striating function. A striated space is measured and counted, just as acquired memory acts to 'discriminate and classify . . . it points out, one after another, within the total movement, the lines that mark off its internal structure' (Bergson 2004: 137–8). Virtual memory, in opposition to a striating function, has no 'fixed or mobile elements but rather distributes

a continuous variation' (Deleuze and Guattari 2008: 525). Pure memory is identifiable with qualities of smooth spaces; heterogeneous and continuous, it does not operate from a centre nor according to any fixed succession or sequence.

Virtual and habitual memory are distinguished through a further separation between two kinds of recognition, attentive and inattentive. Inattentive recognition occurs in action and constitutes a sensory-motor response, and this is contrasted with a concentrated or attentive act of recognition which consists of 'an effort of the mind' (Moulard-Leonard 2008: 35). This kind of perception engages the sensory-motor schema that has been constructed through acquired memory. At the same time, however, attentive recognition is also employed. This is the state within which memory images, those automatically stored up at each moment, are sought out and applied to the present action or situation. Perception, whether attentive or inattentive, coordinates what Deleuze calls 'sensory-motor images' and 'recollection images', accrued through acquired and virtual memory respectively, according to need or interest (Deleuze 2005: 54. Bergson offers the example of meeting a passer-by on the street on a second or third occasion: 'I recognize him, in the sense that the concomitant circumstances of the original perception, returning to my mind, surround the actual image with a setting which is not a setting actually perceived' (Bergson 2004: 105).

Another binary pair is established, creating an opposition between attentive and inattentive perception. Just as states of smoothness and striation are always processing into and arising from one another, however, so the dual aspects of memory and recognition are continuously feeding into one another. It is perhaps true that each kind of memory might be considered as either smooth or striated in their pure form, but this purity is never apparent to us; 'the two forms of memory are theoretically independent, although in practice neither is ever encountered as such' (Bergson, 2004: 105). Indeed, both kinds of memory and both attitudes of recognition are incorporated into a delicately interwoven structure, thereby displacing the oppositional pairings (Deleuze and Guattari 2008: 525).

A striated space intertwines co-functioning elements that are organised vertically and horizontally. There is an interrelation between these elements that constitutes a dialogue or dialectic, a back and forth motion. These two elements have separate functions, one being mobile whilst the other is static, and in this way striation consists in an interlacing of 'fixed and variable elements' (Deleuze and Guattari 2008: 528). The two kinds of memory remain distinct from one another, but

exist in combination and equilibrium. They are reciprocally supportive, holding each other in a tightly woven structure, the fixed element of which is provided by the delimitations and repetition of acquired memory, and is enacted through inattentive recognition.

Acquired sensory-motor schemas provide a framework that defines how past recollections are sought by the mind according to their use within the present situation. To be included within the tightly woven configuration, memory must be found to be useful in present action; 'these threads which receive disturbances or stimulations from the external world and return them to it in the form of appropriate reactions, these threads so beautifully stretched from the periphery to the periphery, are just what ensure by the solidarity of their connexions and the precision of their interweaving the sensory-motor equilibrium of the body' (Bergson 2004: 227). Through this regulating structure, qualitatively smooth, virtual memory is brought to bear in the present through the intellectual act of attention. The smooth images arising from virtual memory are delimited as they are applied and incorporated into the weave created by inattentive recognition and habitual memory. Composed of fragments or pieces that must be accommodated together, the whole is produced in a way that is limited by succession and repetition, regulated by the fixed warp.

Digital film is extendable and expandable in any direction. Clips can be stretched, lengthened or contracted to increasingly brief durations. The framing and focus of any shot can be adjusted, areas pulled into close-up or multiple frames accommodated in a single screen. Digital film in this way constitutes a smooth space, but remains in this state only whilst it is being edited. As soon as it is assembled into a whole, shots edited together to form a sequence, it is striated. Bounded and constrained by a fixed duration, progressing with a regular, metered advancement. The surface is filmed, captured, parcelled up into strips and squares of digital code. Mapped, striated, translated or over-coded according to a 'central perspective' and an optic or 'long-distance vision' (Deleuze and Guattari 2008: 545). Once transposed through this process, however, the recorded surfaces are again rendered manipulable. Opened for editing, stretched, separated or joined together, the digitised records can also be re-projected, re-inserted into the process again. In this way, striation succeeds in 'subjugating, over-coding, metricizing smooth space, in neutralizing it, but also in giving it a milieu of propagation extension, refraction, renewal and impulse' (Deleuze and Guattari 2008: 536).

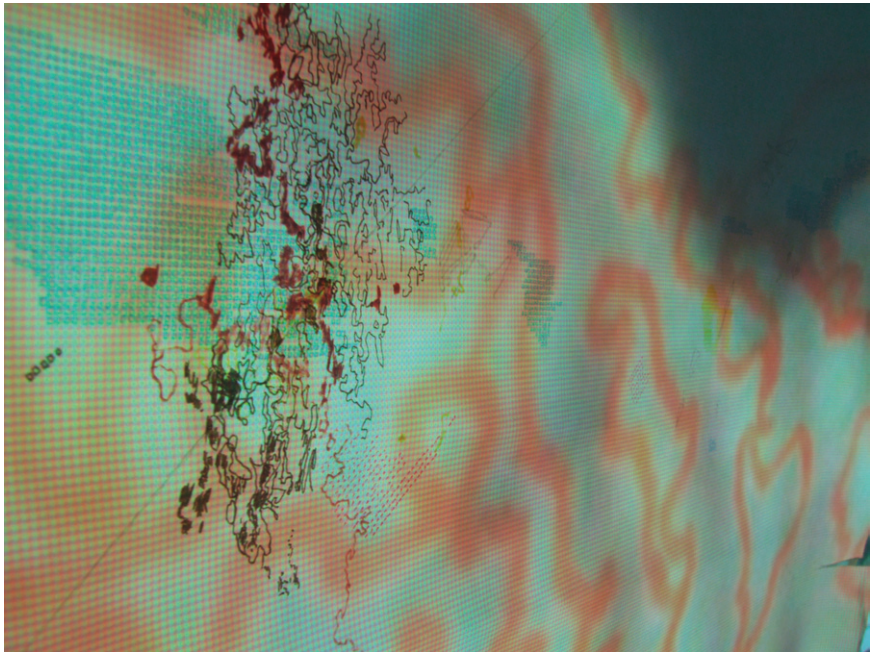

Figure 2. Digital film still from *Collider* (2011), Charlotte Knox-Williams.

The interrelated function of memory and recognition is enacted according to a double function: connecting the thought and the experienced into circuits that turn inwards towards the perception of the object in the present, whilst also looping back outwards, to re-engage with memory again: 'beside the afferent process which carries the impression to the centre, there is another process, of contrary direction, which brings back the image to the periphery' (Bergson 2004: 125). Both virtual and acquired memory are employed in the useful pursuit of the present, combined through sensory-motor schema and applied in understanding and negotiating the world through recognition and action. 'We do not perceive the thing or the image it its entirety, we always perceive less of it, we perceive only what we are interested in perceiving, or rather what it is in our interests to perceive' (Deleuze 2005: 19). Incorporating smoother, more mobile elements, the characteristics of a striated space can nevertheless be attributed to this interwoven, four stranded structure; its tendency is to regulate and articulate according to actions and recognitions that are useful within the present moment.

The film is projected onto the surface of the drawing. Under a digital projection, every image is broken down into a grid, subjected to this totalising striation. And yet, standing up close to the paper, the reticulated surface begins to dissolve and disintegrate. In the infra-thin space where the film slips over the paper, digital film is experienced as smooth; 'there is neither horizon nor background nor perspective nor limit nor outline or form nor centre' (Deleuze and Guattari 2008: 545). To draw in this space of extreme proximity is 'to be too close to it, to lose oneself without landmarks in a smooth space' (Deleuze and Guattari 2008: 544). Segments and areas of the stilled image are traced, individual pixels of the projection are delineated, tiny blocks of colour outlining each opening in the gridded surface. Enacted within and upon a smooth space of projection, the drawing is an orientation that progresses through fixing, measuring, situating and pinpointing.

Within the reticulation of attention and memory, useless or inapplicable images are delegated to a 'less illuminated fringe' that lies at the edge of the area of concern within any given present moment (Bergson 2004: 199). Under particular conditions, in the absence of the delimiting influence of the sensory-motor schema, perception of these 'useless' images becomes possible (Bergson 2004: 199). Through a disturbance or disruption of the mechanism of sensory-motor response, or through a slackening of the tension held between the elements that make it up, a direct experience of the smooth spaces of dream, the pure virtuality of memory or mental derangement, arises through the stable, striated formation that has been described. Bergson writes that such a perturbation could 'relax for a moment the tension of the threads which go from the periphery to the periphery by way of the centre, and immediately these darkened images come forward into the full light' (Bergson 2004: 97). These disturbances, through which smooth states arise in the striated configuration described, are of two kinds: a slip and a snag. The slip is centrifugal; an unfurling in which the tightly woven interrelation between memory, perception and action drifts and loosens. The snag is centripetal; a disruption or stoppage that impinges on the smooth operation of action and reaction.

II. Slip

Bergson describes the gradual process through which, as attention remains focused on an object, the identification or recognition of the correspondence between the perceived and remembered becomes

increasingly distant. In a motion that radiates outwards from the centre, memory and attention 'reconstruct together with this object the more and more distant, or profound, *conditions* with which it forms a system' (Moulard-Leonard 2008: 51). The weaving of memory images (pure, virtual, and smooth), so that they are incorporated into the sensory-motor schema of cause and effect, in this way moves outwards from the centre in a centrifugal direction, in 'the descriptive handling of the object in attentive recognition, which makes the object remain the same but pass through different mental planes' (Moulard-Leonard 2008: 62).

Bergson writes that in states of profound distraction or of dreaming, a loosening or unwinding of conscious attention from the present moment takes place (Bergson 2004: 97). This relaxation or unfurling of the tension that maintains the regular inter-functioning of memory, action, perception and recognition constitutes a detachment that allows the dreamt and imagined to be interspersed with useful images arising in the present (Bergson 2004: 227). It is as if the parabola inscribed by the mind, arcing away from the object of perception, leads outside of this gravitational field and careers off through fragments of memory images. These loops, at their most distanced or distended, come to include the visionary, the dreamt or imagined, and it is possible for the linkages back to the actual to be entirely lost (Moulard-Leonard 2008: 41). 'This is no longer the sensory-motor link of the action-image in habitual recognition, nor is it the various circuits of perception-recollection which come to supplement it in attentive recognition; it would rather be the weak and dislocatory connection' (Deleuze 2009: 54).

The line of distraction that is inscribed acts to connect together fragments of memory and delusion, piecing them together through 'infinite, successive additions' to create a smooth, open and de-centred space (Deleuze and Guattari 2008: 525). The detachment of attention from action and perception generates a smooth space, pieced rather than interwoven, that links together a number of fragments without producing a whole; 'an aggregate of intrication of this kind is in no way homogeneous' (Deleuze and Guattari 2008: 525). Attention is loosened, slackened from the tightly woven fabric of cause and effect and turns away, forming a looping linkage through remembered and imagined images as in a patchwork, 'an amorphous collection of juxtaposed pieces that can be joined together in an infinite number of ways' (Deleuze and Guattari 2008: 526).

The drawing surface, like the digital film that served as its instigator, forms 'a loose or even unbound network of tensions of the same charge

that are distributed all over the image-field. No one place or site has privilege over another' (Conley 2007: 8). The drawing is composed of scraps or fragments that are spread out, intersecting and linking into one another according to no prescribed route or pattern. The process of drawing constitutes a smooth space, 'moving from part to part … in an infinite succession of linkages and changes in direction' (Deleuze and Guattari 2008: 545). In a film, as in a map, such an interconnection of fragments constitutes a smooth space to which gradual progressions and localised knowledges are ascribed. Between the film and the drawing a process of translation-transcription takes place, within which 'orientations, landmarks and linkages are in continuous variation; it operates step by step' (Deleuze and Guattari 2008: 544). Marks are generated, traced from the film, as unitary sequences of dots or marks. The projection is altered and shifted, and new mappings must be generated in response. 'The map is open and connectable in all dimensions; it is detachable, reversible, susceptible to constant modification. It can be torn, reversed, adapted' (Deleuze and Guattari 2008: 14–15). The texts, films and the drawings are continuously open to further modification: Cut, joined and re-joined; turned, pieced and re-combined.

Within the reticulated structure existing between matter and memory, the smooth images of recollection and dream are regulated according to the demands of events in the present. The slackenings and unfurlings of this tightly woven structure are smooth elements arising from within the grid to perform looping linkages and create pieced, partial surfaces.

III. Snag

Our sensory-motor schema – that is, our knowledge of our surroundings acquired through movement – provides a framework that defines how past recollections are sought by the mind according to their use within the present situation. This framework is a stable, regulated surface that interweaves acquired, habitual memory and inattentive recognition. The shortest circuit that can be formed between memory, perception and recognition forms the internal limit of this system. This limit is a snag, a stoppage in the regular procession of sensory-motor schemas that results in an indistinguishability between the actual and the virtual.

The sensory motor forms a screen towards the centre of which virtual images spiral, and upon which memory images can be traced, embroidered or applied. In attentive recognition, 'we are given an external perception, the consciousness of which really consists

in centripetal movements of imitation continuing this perception' (Moulard-Leonard 2008: 47). Onto the framework formed by acquired sensory-motor schemas, these attentive recognitions are traced and re-traced, the regular fabric becoming subject to an increasing number of these elaborations: 'we go on from similarity to similar objects, embroidering upon the similarity, as on their common stuff or canvas, the variety of individual differences' (Bergson 2004: 215). Attentive recognition, through this process of 'embroidery', adds to the object under scrutiny, contributing a 'temporal' dimension by applying a 'recollection image' directly onto it (Szaloky 2010: 61).

The film is projected onto the smooth, white surface of the paper. Onto this plane are traced the areas of pixellated colour that constitute the film still. The similarity of the projection and the drawing is delineated, traced and re-traced, at the surface of the paper. The digital film is broken up into stills, halted in order to be traced. Attention consists initially in an 'inhibition of movement, an arresting action. But upon this general attitude, more subtle movements will soon graft themselves' (Bergson 2004: 122). The tiny movements of the nib of the pen, the gradual marking out of the drawing in small sections over this stilled surface. One projection is succeeded by another, and each is traced and plotted in turn in a set of procedures that can be identified with 'the imagination's superimposition of a large number of images of the same kind to find their congruence' (Szaloky 2010: 62).

In a particular focusing of the attention in recognition, Bergson describes how memory images trace and re-trace the outline of the perceived object, reproducing its image. This process can continue indefinitely, 'Memory can be dilated indefinitely and reflect upon the object an increasing number of suggested images' (Moulard-Leonard 2008: 51). In this way, embellishment is added to embellishment, forms are traced and re-traced, over and over. The 'central theme or motif' that characterised the striated, centred and measured space of embroidery can no longer be discerned in the complication, the overlaying of these multiple outlines (Deleuze and Guattari 2008: 545).

The same area of the drawing is covered repeatedly with the regular marks and chartings. The striated surface of the drawing, produced from gridded areas and delineated contours, builds in complication. Fragments overlap and intersect with one another and, gradually, lacunae develop in their midst. The striation fails, falters, begins to dissolve, allowing smooth holes to emerge from within it.

In the process of attention, images from memory are repeatedly embroidered over perception. There is a point at which these memory images can become so thoroughly enmeshed with the perception that they are indistinguishable. This is the smallest possible circuit, 'the point of indiscernibility between the actual and the virtual', a direct perception of an image of time (Moulard-Leonard 2008: 52). As in a piece of cloth that is embroidered repeatedly so that no motif can be discerned and the threads tangle and snag, the time-image, or perception of the smooth space of pure memory, arises through 'an aggregate of intrication'. Within the configuration regulated by the sensory-motor schema, smooth spaces arise through 'entanglement obtained by fulling', where separate elements from memory and perception are so tightly wound through one another that they become indistinguishable (Deleuze and Guattari 2008: 525). The time-image, the smallest circuit between perception, thought and virtual memory, is formed through an intertangling of memory in the present. This surface is no longer appliquéd or embellished, it is hooked and tangled within itself.

The film is paused. This still image is traced, the contours marked out and areas delineated. The film runs, projected over the surface of the drawing. For a moment, for an instant, the shape of the marks on the paper overlay and match exactly with the film. Disrupting, derailing the progression of the film, this interruption opens up a previously unseen space. Between the film projection and the drawing surface, the film coincides suddenly with the drawn mark and they are caught up with one another in an anticipatory matrix and a direct image of pure temporality emerges.

A direct image of time is revealed in film when we see the past splitting from the present that it was, indistinguishable from the moment of its separation. A double-double capture transpires. The film seizes the drawing in a still moment, suddenly covering its configuration. The drawing encapsulates the film, marking out a part of its outline and fixing it. It is the common limit, the circuit within which separate elements are indistinguishable from one another, that marks the time-image.

IV. Conclusion

In the interwoven interrelation of matter and memory, perception is never in the present but is always inherently past, entangled with its own conditions. In slips and snags, it has been argued, instances are activated

that 'reveal connections of a new type, which are no longer sensory motor and which bring the emancipated senses into direct relation with time and thought... To make time and thought perceptible, to make them visible and of sound' (Deleuze 2005: 17).

Distractions and re-linkages between theory and practice have meant that both come to precede, prefigure and follow after one another. In this sense, they serve both as maps for and of one another (Pickles 2004: 29). A map shapes, dictates and influences how the places it describes are seen and navigated, and between fragments of text, film and drawings a similarly reciprocal transformatory relationship exists. The interrelated processes of reading, drawing and filming lead to the creation of the new ground to be covered, rather than merely recording it, 'setting out the coordination points for worlds-in-progress' (O'Sullivan 2006: 35). The books lie open on the table and fragments are selected and extracted. Connected together in diagonal movements that draw links across chapters and between texts. In an approach similar to Deleuze's 'free indirect discourse', transversal lines are thus formed between texts, drawings and films, selected and re-linked according to their own propensity of connection, rather than through similarity or resemblance, whether to each other or indeed to the original intention of whichever author formed them. Forming part of these distended circuits, fragments of film, drawing and text serve as extenders for one another, projecting forwards to further possible routes.

In an inventive approach, aspects of Deleuze's theories have been experimentally connected to one another, and at the same time set into conjunction with fine art practice. This kind of invention demands a thorough understanding of the concepts or components selected for use, and the aim of such an inventive approach would be to maintain 'the pragmatic and constructive nature of Deleuze's thought whilst at the same time creatively bringing it into contact with other worlds and always with our own projects' (O'Sullivan 2006: 3). To invent is not merely to arrive at a solution, but to generate unforeseen potential applications.

Women on the Move: The Politics of Walking in Agnès Varda

Aslı Özgen Tuncer University of Amsterdam

Abstract

This article focuses on images of walking in Agnès Varda's films – *Cléo de 5 à 7* (1962), *Sans toit ni loi* (1985), and *Les Plages* d'*Agnès* (2008). The activity of walking (as urban flânerie, circular travelling or walking backwards) is central to these films, and can be seen as a corporeal practice that not only interweaves striated and smooth spaces but also offer a gender-sensitive, political contemplation on the forces of striation and smoothing as well as a re-invention of space. The women in movement in Varda's films embody a transgression of stratified territories such as the image-oriented society of the spectacle in *Cléo*, myths of adolescence and settled living in *Sans toit ni loi*, or the boundaries of aging in *Les Plages d'Agnès*.

Keywords: flânerie, nomadism, feminism, embodiment, cinécriture

In an interview on the cinema of Agnès Varda, film critic Jonathan Romney underlines a major trait of Varda's filmmaking: 'She is re-inventing herself all the time. She seems a thousand different filmmakers but one filmmaker at the same time. Whether working on a document or fiction, there is a sense that she is going out into the world to find something new. There is always a readiness to invent' (Romney 2010). Agnès Varda's continual becoming as a filmmaker is most evident in her filmography, which comprises an immense variety of films from documentary to experimental shorts, from video manifestos to auto-portraits, and some others that would hardly fit any definition. Varda's

nomadism in re-inventing not only her own cinematic language but also cinematographic language as such time and again resonates with her feminist activism in challenging the dominant paradigms of feminine identity in innovative ways. If Varda cultivates a new visual aesthetics in her films on an artistic level, this undertaking is always in line with questioning those dominant paradigms of identity on a discursive level. Hence, nomadism here is a political attitude that implies a consciousness of resisting settling into the socially coded modes of thought and behaviour. Nomadic shifts designate a creative sort of 'becoming', defined by Rosi Braidotti as 'a performative metaphor that allows for *otherwise unlikely encounters* and unsuspected sources of interaction of experience and of knowledge' (Braidotti 1994: 6, emphasis mine.) Hence, explorations of new forms of political subjectivity are made possible. From this standpoint, Varda's cinema becomes 'a vector of deterritorialisation', whereby established notions (of femininity, of social order, of cinematographic language) are levelled at every step to give way to new ones: a new narrative of the self, a new language of cinema, a new (temporary) identity, a new politics of disagreement, and a new politics of aesthetics.

One of the ways Varda achieves such nomadism is through the embodiment of a female character on the move. The mobility of the woman protagonist is a perfect figure for Varda to convey a nomadic consciousness of feminist activism and filmmaking as sites of resistance to fixating and sedentary tendencies. Hence, Varda brings about *a politics of walking* in her cinema. From this standpoint, *Cléo de 5 à 7* (1962), *Sans toit ni loi* (1985) and *Les Plages d'Agnès* (2008) deserve particular attention in analysing the different forms of walking Varda has created. If the urban *flânerie* of Cléo, the circular travelling of Mona in *Sans toit ni loi*, and the walking backwards of Varda herself in *Les Plages d'Agnès* share a common trait, it is the fact that the very activity of walking in these films not only connects striated spaces to smooth ones, but also *smoothes out* striations to re-invent the lost, or suppressed, multiplicities of spaces.

I. The Nomadic Body

In *A Thousand Plateaus*, Deleuze and Guattari maintain that smooth spaces are wedded to a very particular type of multiplicity, one that 'can be explored only by *legwork*' (Deleuze and Guattari 2004: 409, emphasis mine). The emphasis on corporeality and mobility here is important for two main reasons. Firstly, it follows that bodily contact

is a precondition for getting to know the multiplicity of a smooth space. Secondly, mobility underscores the *process* of striating and smoothing forces, which, according to Deleuze and Guattari, is more interesting to probe into. They write, 'What interests us in operations of striation and smoothing are precisely the passages or combinations: how the forces at work within space continually striate it, and how in the course of its striation it develops other forces and emits new smooth spaces' (Deleuze and Guattari 2004: 551). The three films in the scope of this paper contemplate on various passages and combinations whereby striation and smoothing slide into each other. Furthermore, the films posit the peripatetic body as the site of these passages and combinations. The effects of place on social relations and on characters have been a recurrent thread in Varda's work, and she mostly reflects upon a dynamic between stasis and mobility as well as the interaction between character and environment (Flitterman-Lewis 1996: 224–37).

When Deleuze and Guattari counterpoint nomad space and sedentary space in their writing, they point to such a corporeal mobility. Even though they posit that nomadology does not require movement, in their writing walking appears as a significant activity that not only connects striated and smooth spaces, but also possesses an advantage of elusiveness by virtue of which the body flows within striated spaces smoothing them out. In *Anti-Oedipus* they propose the 'schizophrenic out for a walk' as a better model than a 'neurotic lying on the analyst's couch'. Hence, walking is posited as 'a breath of fresh air, a relationship with the outside world', and as such as a political activity with transformative qualities (Deleuze and Guattari 2007: 2).

Given its powers to construe diverse spaces and fluid bodily movement, cinema is the most eloquent field to philosophise smooth and striated spaces as well as the ways they slide into each other through the body. When Deleuze writes that 'it is through the body (and no longer through the intermediary of the body) that cinema forms its alliance with the spirit, with thought' he refers to the power of the body to stand as a figure that has reflections on the thought, and particularly creative thought that reinstates multiplicities suppressed by the striations (Deleuze 2005: 182). It is along this line of thought that the cinema of Agnès Varda construes the stroll as a way of resisting the fixating tendencies of striations. With its feminist agenda, Varda's cinema explores the smoothing forces of rebellious female bodies in movement that are walking without a pre-determined, targeted territory: 'Voyaging smoothly is a becoming, and a difficult, uncertain becoming at that' (Deleuze and Guattari 2004: 532).

Varda's three films par excellence involve walking in striated spaces such as the city of Paris in *Cléo de 5 à 7*, and smoother spaces such as the Southern France countryside in *Sans toit ni loi* and a Belgian beach in *Les Plages d'Agnès*. In light of Deleuze and Guattari's proposition that the city is the striated space par excellence while the sea is the smooth space par excellence (Deleuze and Guattari 2004: 529, 531) this invites an investigation into how, in Varda's cinema, striated space opens itself to being smoothed and smooth space allows itself to be striated. Yet, Deleuze and Guattari also warn the reader against thinking of these spaces in terms of a binary opposition: 'Nothing is ever done with: smooth space allows itself to be striated, and striated space reimparts a smooth space' (Deleuze and Guattari 2004: 537). The process is never simply the clash or conflict of two binary opposites. In Varda's films, this dynamics is eloquently translated into her own *cinécriture*.

II. *Cléo de 5 à 7*: A Newfound Flânerie

Cléo de 5 à 7 takes place on 21 June 1961 in Paris from 5 p.m. to 6:30 p.m. The film concerns a young starlet, Cléo, who is waiting for the results of a biopsy to learn whether her abdominal tumour is malignant or not. Throughout the film, we follow Cléo from the apartment of a tarot-reader, through the streets of Paris to a café, a hat shop, her apartment, and then on a lonely walk in the city with a number of spontaneous stops and 'otherwise unlikely' encounters. Varda structures the film around a number of oppositions such as superstition and medical science, documentary reality and fiction, objective time and Bergsonian duration (Nelson 1983: 735). One can also add gaze and look, life and death, a healthy body and a sick body. All these oppositions are there in the film to be unknotted, further complicated, and destroyed via the peripatetic body of Cléo. Constantly on the move, Cléo's body becomes the site where corporeal, spatial and temporal striations are smoothed.

One of the major oppositions listed above, 'gaze and look', points to the primary striation taken up in the film. According to Janice Mouton, the film is mainly structured upon a transition from 'being looked at' to 'learning to look' (Mouton 2001: 3). This transformation from the gaze to the look, according to Mouton, also underlines Cléo's passage from an object to a subject. By taking Mouton's argument to another level, one may argue that Cléo actually sheds the striations imposed on her fetishized star body by the society of the spectacle. By opening her body up to outside interactions, she discovers a multiplicity

she has long lost, or never possessed. This is why many critics or scholars interpreted Cléo's *flânerie* as a journey into self-discovery (see for instance, Morrissey 2008; and for the figure of the *flâneuse* in cinema, Friedberg 1994 and Bruno 2007). However, the main idea about Cléo's *flânerie* is that it does not have a defined end, nor an aim to unveil a so-called hidden self. On the contrary, Cléo's *flânerie* is one that leads to further fragmentation of her self, perhaps to reach a body without organs by smoothing most of the striations. With respect to this dynamics, the most important element the film employs is the mirror. The first 40 minutes of the film are dominated by mirrors and reflecting surfaces as well as reflections of Cléo that appear in random spaces (Mouton 2001: 3–6; Flitterman-Lewis 1996: 268–83).

The spectators are made aware of the constructedness of Cléo's image in the opening sequence, which begins with body fragments. The close-up of hands moving in and out of frame on the tarot table present a fragmented body, while the characters in the film are introduced via a close-up of the tarot cards: Before we see the real Cléo, we see an image on a tarot card associated with her. The framed and unified image as opposed to the body fragments establishes the discourse of mirrors as early as the prologue. Similarly, the very first shots of Cléo are far from setting up a perfect image of a star. She is shattered by what the cards reveal; a series of close-ups show her face ridden with fear. As she leaves the apartment, we shift from the close-up of Cléo's face in a series of jump-cuts to subjective shots that flow down the stairs unsteadily. She descends the last set of stairs only to meet a huge wall mirror where she pulls herself together. She ceremonially passes before the mirror, pauses elegantly, and reveals an endless *mise-en-abyme* of her reflection. Then we zoom into her face upon which falls the following line of internal monologue: 'Being ugly, that's what death is. As long as I am beautiful, I am alive.' The scene marks a threshold: aware as we are of Cléo's fragmented being, we witness her transformation into a complete fetishised object of gaze. Varda here portrays an instance of striation which, intentionally or otherwise, recalls Lacan's mirror stage. In this scene, 'she becomes the woman she is not', writes Mouton, 'a fantasy, a fetishized object, someone to be looked at' (Mouton 2001: 4). It could be argued that Varda's cinema of body here shows a striated form of a ceremonial body, described by Deleuze as follows:

> It is no longer a matter of following and trailing the everyday body, but of making it pass through a ceremony, of introducing it into a glass cage or crystal, of imposing a carnival or masquerade on it which makes it into a

> grotesque body, but also brings out of it a gracious and glorious body, until at last the disappearance of the visible body is achieved. (Deleuze 2005: 183)

The image of Cléo's body from this moment on undergoes an adventure in precisely the terms in which Deleuze formulates the cinema-body-thought link in the above quoted sentence. Varda, first of all, presents us with a ceremonial procession of Cléo's body from the hallway of the fortune-teller to the café. She is tall and bright, wearing a floaty dress and with a highly stylised coiffure. By placing her body against darker backgrounds and contrasting her image with modest attire of her secretary Angèle, Varda ensures that Cléo catches the eye. On the other hand, the masquerade imposed upon her as a striation becomes grotesque with her excessively stylised outfit. Indeed, the first thing Cléo would shed after singing *Cri d'amour* is this look, with her flashy garments and coiffure. Until she bursts into the street with a simple black gown and undone hair, Cléo has to reassure herself of her image in almost every reflecting surface she can find. Among these, the hat shop sequence deserves particular attention, again with regard to the body-thought link posited by Deleuze.

Returning home with Angèle, Cléo stumbles upon a hat shop. Allured, she wanders around the shop like a feline about its prey, trying on unusual hats. We see multiple reflections of her in multiple mirrors, sometimes superimposed with the reflections of the street. With its massive windows, the store recalls an aquarium – a milieu designed to be looked at from the outside. The scene – with all its elements and components designed either to reflect or to be displayed – becomes a huge mirror or a multi-faceted voluminous crystal symbolic of Cléo's self-absorption. Varda's formula in the script for this scene is 'L'eau + le cristal = le mirroir' (Ungar 2008: 49). The formula, as well as the aesthetics of the sequence, point to the main striation that is the concern of the film: consumerism and the spectacle. Cléo's fluid desire gushing from one commodity to another, her dependency on the image of her own body as capital and as fetishized object (Baudrillard 2005), and the proliferation of mirrors everywhere, all recall and maintain the continuity of the spectacle. The mirrors and reflecting surfaces gradually disappear in the last 45 minutes of the film, which is marked by Cléo's *flânerie* around Paris.

The pivotal moment that triggers Cléo's transformation is a singing rehearsal, where she chants a love song named *Cri d'amour* (see also Gorbman 1981). The sequence is an intermezzo with respect to its cinematography where the camera mimics music and travels between

territories, ultimately bringing about a deterritorialisation. From this standpoint, the scene with all its elements works as an abstract machine whereby the stratifications of the society of spectacle are smoothed. After singing the song, Cléo no longer clings to the doll look and questions the meaning of the song's big success ('What is a song? How long does it last?!'). With its allegory of lack and extinction, and its symbols of loneliness, aging and death, *Cri d'amour* carries Cléo away, or, in more Deleuzian terms, she experiences the kind of uncalled-for line of flight that music can provoke (Deleuze and Guattari, 2004: 329–41). This line of flight and deterritorialisation is embodied in the unsettling 90-degree pan of the camera whereby various levels such as diegetic, non-diegetic and meta-diegetic are folded onto each other. Slowly zooming in and isolating Cléo's face against black, the camera shifts to non-diegetic as a full orchestra joins Cléo's voice. In this 'glossy studio effect', in Gorbman's words, we see Cléo's stage persona (Gorbman 1981: 46); however, when the song ends with tears gushing down Cléo's face, the camera makes a vertiginously quick zoom-out from the close-up of her face. The zoom-out embodies the deterritorialising affect of the song. We fall back into the diegetic, yet the world of the film is now completely altered – it is a different territory. The transformation is triggered by Cléo's (as well as the camera's) becoming-music. The next moment, Cléo revolts, removes all the accessories that make up her doll image and rushes out onto the streets of Paris. If the first half of the film is dedicated to how the striae impose a spectacle on Cléo's body, the second half is dedicated to 'desecrating the gracious body'. While walking, Cléo gradually sheds the masquerade imposed upon her, further smoothing out those striae. Mirrors begin to distort, break and fragment reflections, eventually to disappear from the narrative gradually as tokens of fixating tendencies. Simultaneously, smoothing forces start to appear as Cléo chances upon them in her *flânerie*.

On the streets, Cléo encounters three peculiar images of the body that are emblematic of smoothing forces. These images are but war-machines that attack the striae internalised by Cléo and trigger a mutation in her subjectivity. The first instance marking the desecration of the body is a public performance Cléo comes upon: a man swallowing frogs. The figure of the frog is encountered many times in the film: Cléo wears a ring which has a small frog clutching a pearl (Cléo is called a pearl several times), and the handsome soldier Antoine later associates himself with the frog. One may claim that Varda uses this figure to indicate the outside forces that transform Cléo's subjectivity. The second image is again a public spectacle: a man is drawing a sword into his arm.

Again contributing to the desecration of the body, this image is a little later followed by an incident where a man is shot dead. The body then disappears, but only to be reborn – the third special image Cléo encounters is that of a premature baby in an incubator, which could be seen as a metaphor for the fragility of Cléo's newfound corporeality (and subjectivity for some critics). The striations on the body are smoothed (there no more mirrors after this scene) and the body returns to a stage of new beginnings. This image also smoothes out the metaphorical meaning of the 'glass cage' established in the first half of the film. Where it previously indicated the restrictions imposed on the body by the society of the spectacle, it now becomes a symbol for re-birth. At the end of the film, still walking, Cléo is no longer afraid for her diseased body and has confidence in the future.

III. *Sans toit ni loi*: Nomadic Wandering

Walking as a metaphor for continual resistance and transformation is portrayed in *Sans toit ni loi* in closer proximity to nomadology than to *flânerie*. The title of the film translates as 'without a roof or law' and connotes fixating striae such as sedentary living and the State. Reading Varda's masterpiece through Deleuze and Guattari's nomadology as described in *A Thousand Plateaus* offers some insights regarding a highly political conceptualisation of the activity of walking in cinema. Again in this film, Varda works through oppositional pairs, but this time with a deeper complexity on a multitude of levels. Documentary and fiction, absence and presence, nomadic and sedentary living are interweaved and smoothed by the character of Mona. In many ways, Varda envisions Mona as a mythical feminine character (she emerges from the sea like Venus at the beginning of her story) and creates a nomadic persona for her that allows us to 'think through and move across established categories', in the words of Braidotti (Braidotti 1994: 5). Mona constantly eludes capture throughout the film and hence becomes a token of nomadic existence. With her non-stop loitering, Mona not only becomes a 'vector of deterritorialisation' but also a nomadic war-machine disturbing the laws of the State.

The film starts with the discovery of Mona's dead body in a ditch and proceeds with the testimonies of those who had encountered her in the last few weeks before her tragic death. Comparable to *Citizen Kane* but in the feminine, the film follows (and subverts) the style of a documentary, where several characters reveal their encounters with Mona in a direct address to the camera. While each narrative strives to

fix Mona with a definition, viewers are well aware that she has never stayed long in the territories of these people and that their definitions actually reveal their own internalised stratifications. However, what these narratives have in common is that Mona has brought about a change in their territories as a force of the outside. What Varda calls the 'Mona Effect' is but a transformation in the striated territory triggered by the nomadic war-machine (Flitterman-Lewis 1996: 314). Mona is never a part of the striated territories concerned, but always a smoothing force coming from the outside. She is sent back to the outside in a number of instances when the State cannot domesticate her into the territorial striae. From this standpoint, her smelliness and uncleanliness, which are referred to multiple times in the film, become sensuous tokens of her resistance to being appropriated, internalised by the sovereignty of the State. Deleuze and Guattari write, 'From the standpoint of the State, the originality of the [wo]man of war, his [/her] eccentricity, necessarily appears in a negative form: stupidity, deformity, madness, illegitimacy, usurpation, sin' (Deleuze and Guattari 2004: 390). Almost all of these allegedly negative qualities, and others, are those imputed to Mona by those who have encountered her. However, Varda's dialectics is not simple at all when it comes to *Sans toit ni loi*. She complicates almost every concept, matter and medium that structures the film. Mona's mobility is counterpointed not only to stasis (for example, the mansion of Tante Lydie) but also to striated forms of mobility. In the film, Mona encounters a farmer, an immigrant and a perambulatory palaeontology professor. It is possible to read these forms of mobility as variegated counterpoints to Mona's nomadic wandering.

The first instance concerns the goatherd episode. A farmer, who is later revealed to hold a master's degree in philosophy, gives her a ride and offers her accommodation. In their first dialogue, where they talk about different ways of existing in the world and sharing the goal of pursuing an alternative lifestyle, Mona and the farmer seem to partake in a common revolt. The farmer gives Mona a piece of land on which to grow potatoes, and a caravan to manage her own living. However, Mona is unwilling to take up farming; she hardly leaves the caravan where she spends all her time reading. The two have a long dialogue where the difference between the striated farmer and the smoothing nomad come to the surface. Deleuze and Guattari write, 'the sedentary's relation to the earth is mediatised by something else, a property regime, a State apparatus'. The itinerancy of a farmer or animal-raiser is only secondary: 'Transhumants only secondarily follow a land flow . . . [They change] land after it is worn out, or else seasonally'

(Deleuze and Guattari 2004: 452). Highlighting the distinction between an itinerant and a nomad, Deleuze and Guattari emphasise that 'the primary determination of nomads is to occupy and hold a smooth space: it is this aspect that determines them as nomad' (Deleuze and Guattari 2004: 452). Mona's nomadism is counterpointed to another mobile figure, a migrant worker named Assoun. As a reterritorialised inhabitant, Assoun is an itinerant figure whose labour power has been settled, sedentarised, and restricted. Mona, however, rejects any sedentarising tendencies; she 'moves' and will not be beguiled by a piece of land.

After leaving the goat shed, Mona is taken up by an ambulatory palaeontology professor, Madame Landier, who is conducting a research on a contagious disease that kills plane trees. Madame Landier's similar attitude in approaching both the trees and Mona recalls what Deleuze and Guattari name 'royal science' in *A Thousand Plateaus*. In the chapter on nomadology, the recession of the forest is associated with the emergence of smooth space: the tree disappears and rhizome spreads (Deleuze and Guattari 2004: 420). However, Mona fails to defeat the arborescent striae in the end, since she is (quite literally) attacked by tree-people – villagers dressed in tree costumes for a traditional festivity – a burlesque attack on someone who does not fit into the community and that leads to Mona's death.

Mona's nomadism is further enhanced at the level of the medium by Varda's *cinécriture*. Varda states that 'the whole film is one long tracking shot', and according to Susan Hayward, 'the tracking shot is Mona's sign' (Hayward 2000: 272). Yet Varda complicates the tracking shot as a straightforward epitome of wandering through different techniques. First of all, she subverts the conventional spatial logic of the tracking shot by moving from right to left. This technique also generates a subversion of the temporal logic of the tracking shot. The camera sliding 'backwards' signals a going back in time and keeps the motif of death alive at all times. In brief, the camera not only glides spatially but also temporally. Secondly, Varda allows an unsettling dynamic to occur between the movement of the camera and the movement of Mona, who mostly eludes framing. Either she walks out of the frame or the camera continues tracking after accompanying her for a while. According to Hayward, this style highlights Mona's contingency (Hayward 2000: 273). Similarly, this way of framing also accentuates Mona's ephemerality as a force of the outside, as a nomadic war-machine, and her unfixability by striations. The fluidity of tracking shots is counterpointed to the stasis of the scenes where Varda interviews those who have encountered Mona. Varda counterpoints mobility and stasis

at the level of the medium by allowing Mona's body to flow smoothly in and out of the striations of cinema. At the level of the story, she achieves a similar smoothing effect by denying the viewer information and subverting conventional storytelling techniques with discontinuities and non-linear causality. *Sans toit ni loi* and its protagonist thereby come to epitomise nomadology on an aesthetic and political level.

IV. *Les Plages d'Agnès*: Walking Backwards

From the body of Cléo to the body of Mona we have travelled from *flânerie* to nomadology and considered both forms of mobility with regard to their powers of resistance, transgression and transformation. In her book *Nomadic Subjects*, Braidotti writes, 'Nomadic consciousness is a form of political resistance to hegemonic and exclusionary views of subjectivity' (Braidotti 1994: 23). In line with Braidotti's approach of taking 'the nomad as the prototype of the man or woman of ideas' (Braidotti 1994: 22), I shall focus on the body of Agnès Varda herself in her quasi-documentary style auto-portrait, *Les Plages d'Agnès*. In this film, Varda's body becomes a multi-faceted crystal, which blends smooth and striated spaces of subjectivity (self), cinema, history and memory through an immense multiplicity of folds. As the setting for this self-reflexive meta-narrative, Varda chooses the beach. 'If you opened people, you would find landscapes; if you opened me, you would find beaches', she says. The beach becomes a crystal image which re-appears in between episodes and includes deterritorialised objects from Varda's films or memories. The beach also serves as a milieu where the musings on cinema take place. Hence, it is created on the screen as a milieu of creativity and multiplicity.

In *Les Plages d'Agnès*, Varda films herself walking backwards, creating herself as a wanderer on the beach. This is the first trope that allows Varda to contemplate on the smooth and striated through her own body and cinematic aesthetics. The film opens with a tracking shot from left to right, a remembrance of the travelling Varda used in *Sans toit ni loi*. After a pan of the empty beach, the camera starts following Varda herself walking backwards. Her hair is several inches white in the roots, and dye remains only at the tips – an embodiment, or an image, of time. In her auto-portrait, she associates walking backwards with remembering, delving into her own history, and hence travelling in time. Here again, Varda complicates several binaries such as past and present, procession and retrocession, extensive and intensive movement. The activity of walking backwards here is not the opposition of process,

or of a line of flight, but a movement that smoothes the conventional distinctions of past, present and future as well as the conventional sense of movement as an extensive act that occurs in an extensive space. Varda's backward march is an expression of an intensive movement that delves into the present in search of time passed.

The second most important contemplation on the smooth and striated concerns the striations and smoothing forces of cinema itself. In the opening sequence, Varda sets up a maze of mirrors at different angles to reflect fragments of the beachscape. This play of a proliferation of frames is, first of all, a way to contemplate on the unavoidable striations involved in filmmaking. According to Deleuze and Guattari, the sea is the archetype of smooth space, but also the archetype of all striations imposed upon smooth space (Deleuze and Guattari 2004: 427). From this standpoint, all of Varda's experiments with travelling shots and sense of space that have been analysed previously are taken to another self-reflexive level with multifold explorations into time and space. Secondly, the multiplicity of mirrors is also a metaphor for reflecting upon the fragments of identity. The multiple memory pieces, personal connections, spatial fragments, and lost objects that are reflected, reproduced and re-enacted in the film are bits and pieces that make up Agnès Varda: her image 'dispersed in 'a plurality of ways of being present in the world,' of belonging to sets, all incompatible and yet coexistent' (Deleuze 2005: 196).

The cinema of Agnès Varda puts forward a political agenda through the figure of walking in favour of nomadic consciousness. The image of walking in the films analysed here is a multilayered one that resonates not only on the level of story, but also on the level of aesthetics and politics. The female protagonists who are on the move not only constantly elude fixating and sedentarising powers, but also trigger a transformation in the territories they travel through. Braidotti defines nomadism as a 'vertiginous progression towards deconstructing identity; molecularisation of the self' (Braidotti 1994: 16). As such, challenging sedimented systems may be emancipatory yet also painful. The nomad, according to Deleuze and Guattari, is deterritorialised on the deterritorialisation itself. Her line of flight, as in *Cléo de 5 à 7*, *Sans toit ni loi*, and *Les Plages d'Agnès*, is rhizomatic, without a defined itinerary or end. The smooth space and the smoothing forces of the moving body remain a site of revolution against the sedentarising powers of the State. If the State operates by controlling the pace and movement of bodies (via public ways, gates, barriers, borders, filters, and so on), these sites of movement can be claimed to give birth to a nomadic

potential, which in turn occupies them as if they were smooth. While discussing this potential, Deleuze and Guattari refer to Paul Virilio who has pointed to the importance of the revolutionary theme of holding the street (Deleuze and Guattari 2004: 426). From this standpoint, one can also locate Varda's nomadic personae within the feminist struggles and women's movement in which she partook actively. Regarding the revolutionary potential of smooth spaces, Deleuze and Guattari state that they 'are not in themselves liberatory. But the struggle is changed or displaced in them, and life constitutes its stakes, confronts new obstacles, invents new paces, switches adversaries. Never believe that a smooth space will suffice to save us' (Deleuze and Guattari 2004: 551). Varda never believes that a smooth space will save the politically, socially or economically underprivileged. Her *cinécriture*, however, is a form of striation dedicated to showing how the smooth may transform the striated and how striated may allow for smoothing forces. The smoothing forces she brings to our attention are those of her aesthetics and philosophy of movement embodied by her female protagonists.

Can You Starve a Body Without Organs? The Hunger Artists of Franz Kafka and Steve McQueen

Zach Horton University of California, Santa Barbara

Abstract

This essay examines the anti-producing human body in its limit case of public self-induced starvation, as figured in Franz Kafka's short story 'A Hunger Artist' and Steve McQueen's film *Hunger*. Both works represent the fasting body as hollowed out, a resistance to capitalist-spectator capture that spatialises itself as a smoothing, a relative reconfiguration of parts to whole through the evacuation of flows. In both works the human body becomes a local body without organs, paradoxically disarticulated from the more complex assemblages that constitute it while recording potential circuits of disturbance or resonance predicated upon the porousness of bodily boundaries.

Keywords: expressionism, body without organs, spectatorship, fasting, starvation

I. Diagnosis

Steve McQueen's 2008 film *Hunger* opens in agitated tumult, an asignifying, multitudinous roar of sound, like metallic rain or the collapsing of a tall building. The visual register slowly resolves into an image: scores of human bodies banging what appear to be the lids of pots against the ground. An array of bodies, faces. This is, it seems at first, a chaos that contains the totality of narrative possibilities, the whole cloth from which the film will subsequently select a protagonist. Yet

Deleuze Studies 6.1 (2012): 117–131

we never encounter these bodies again in any recognizable form. Nor will we be able to positively identify the precise location of this brief, elliptical scene. It maintains no representational continuity with what follows. This essay responds to the film's fissures, its dams and flues, with an experimental investigation of the bodily boundaries produced and perturbed by self-induced starvation. It will focus on the production of the human body – the body that produces – through the form of its limit-case, the body that fasts. Considered thus, the human body, traced as and reduced to a posited boundary, is a particularly telling site of desiring-production, a spatialised interplay of flows and partitions, the smooth and the striated. This paper will examine the fasting body in two works, two mediums: 'A Hunger Artist' by Franz Kafka and *Hunger* by Steve McQueen. In both cases it will raise the question of the individual body's relation to spectatorship and multiplicity. In considering fasting as anti-production, as the smoothing of a local body into a body without organs, it will figure Kafka's short story as a diagnosis of a BwO that fails to activate its virtual potentialities in a renewed process of striation to effect a political resonance through its constitutive audience. *Hunger* picks up where Kafka left off, presenting a tentative solution to the problem of individuated escape through a molecularisation of the subject within the medium of film itself. Ultimately, *Hunger* effects a perspectival shift that approaches the (virtual) collective from below, from the point of view of the subject become multiple, finally approximating the Hunger Artist's dream of satiation.

II. Capture and Withdrawal

Perhaps surprisingly, Deleuze and Guattari have little to say about 'A Hunger Artist', this quintessential story of bodies and flows, in their book-length study of Kafka. They note only that 'Fasting is also a constant theme in Kafka's writings. His writings are a long history of fasts. The Hunger Artist surveyed by butchers, ends his career next to beasts who eat their meat raw, placing the visitors before an irritating alternative' (Deleuze and Guattari 1986: 20). They here figure fasting as an alternative, or perhaps more aptly a digestive impediment, to the most primal source of food, raw meat – the consumption of one assemblage by another. This follows a passage in which they figure writing itself in the same position: 'writing goes further in transforming words into things capable of competing with food' (Deleuze and Guattari 1986: 20). Is writing, then, a form of fasting, or fasting a form of writing?

'A Hunger Artist' presents fasting as an oscillation between spectacle and art. The text details the professional struggles of a freelance faster, self-described and publicly billed as an artist. In the course of the story his career status declines from world famous act to out-of-fashion novelty. Eventually he joins a circus as a sideshow and is promptly forgotten, left to die. His artwork is his body, which he deforms, reshapes, shrinks, desiccates. Nonetheless, he never exists as a fully autonomous body; much to his consternation, he is only an artist by virtue of his spectators, and he ardently wishes for their approval, for popular success as an entertainer. He produces his body only in relation to other bodies:

> The artist now submitted completely; his head lolled on his breast as if it had landed there by chance; his body was hollowed out; his legs in a spasm of self-preservation clung close to each other at the knees, yet scraped on the ground as if it were not really solid ground, as if they were only trying to find solid ground; the whole weight of his body, a featherweight after all, relapsed onto one of the ladies, who... first stretched her neck as far as she could to keep her face at least free from contact with the artist... (Kafka 1976: 248)

Kafka details an extended series of bodily encounters: the Artist's body, reconfigured and hollowed out, his head against his breast, knee against knee, makes tentative contact with the ground, with the body of a female spectator, and later that of an attendant. Meanwhile, these molecular encounters modify the bodies around him: the woman with whom he comes into contact strains her neck like a Lamarkian giraffe[1] in order to decouple from him. Her plastic morphology mirrors the artist's; his own bodily reconfiguration seems to be a struggle against a resurgent, spasm-inducing force of self-preservation. His body, art object, struggles to maintain its form, its upright stature, the contour of its boundary line. It is this curious struggle that provides the audience with the spectacle it craves, but also participates in the redrawing of the Artist's bodily boundaries, forming a higher-order assemblage articulated to him through desiring-production even as its lower-order components seek to disconnect, to shore up his barriers, to squelch his spasmodic-ecstatic perturbation of the audience-machine. The hollowed body refuses food only to fuse with other bodies: a becoming-molar that is also a becoming-molecular. Paradoxically, the smoothing of the Artist's body re-articulates it through spectacle to the bodies of his observers in a reterritorialisation of desire that renders him simultaneously co-extensive with them and affectively traced in a reinforcement of the geometrical contours of the organism-body. His

40-day fasts (enforced by his impresario as the limit beyond which the public's stimulation 'by a steadily increasing pressure of advertisement' cannot be maintained) mark periods of productive withdrawal from nutritional flows only through an auratic nodal fixing within a network of monetary flows (Kafka 1976: 247). The body becomes smooth surface, its virtuality preserved and affirmed, at the moment that it is captured and immobilized by the forces of capital-spectacle.

This paradox, activated within the text as a line that has traversed a 'nomadic life' spent within a cage (Kafka 1976: 245), is precisely the paradox of boundaries tackled by Spinoza in his *Ethics*. For Spinoza, even though 'the whole of nature is one individual', provisional boundaries are *produced* through modal interactions (Spinoza 2005: 43). Spinoza's *conatus*, later reconfigured into Deleuze and Guattari's desire-as-plenitude, is a principle of production, the generation of idea and body at a site of interaction. Where boundaries are produced bodies are expressed, along with the 'joy of action'. For the Deleuze of *Expressionism in Philosophy: Spinoza*, expression is primarily a model of perspective: Spinoza's true radicalism lies in the obliteration of the distinction between subject and object. '*Substance expresses itself to itself*' (Deleuze 1992: 185). The Artist's body in Kafka's story, considered as a site of Spinozan expression, is produced by the audience at the same time that it singularises itself precisely because these are two modes of the same substance. Considered from one perspective, the audience produces the Artist's body from itself, its larger assemblage, by delineating boundaries, by recording the striating effects of immanent forces. Considered from another perspective, the Artist (as assemblage rather than as subjective agent) produces his own body by smoothing it – that is, by disarticulating it from the continual flows (of energy, capital, attention) that capture it, recovering the potential for new configurations with the larger assemblage of which it is part. Thus his (re)constructed body, as 'organic representation' or art object, is both a deterritorialising joyous affect and a reterritorialising 'feeling presiding over striated space' (Deleuze and Guattari 1987: 499).

Kafka's Hunger Artist, as machinic assemblage, stops up his bodily orifices, cuts off all flows, becomes a grid of potential (but unactualised) circuits. In other words, a BwO. 'It is only by means of the body without organs (eyes closed tight, nostrils pinched shut, ears stopped up) that something is produced, counterproduced, something that diverts or frustrates the entire process of production, of which is it is nonetheless still a part' (Deleuze and Guattari 2009: 37–8). The BwO, then, is really Deleuze and Guattari's version of Spinoza's substance, affirming

difference – the complete set of differentiated modes – through primal unity. The human body, as site of production, is thus both a desiring-machine and a BwO, production and anti-production in constant tension.

The smooth space of the Artist's affect-body-without-organs is constantly recapitulated into the striated space of public performance, periodised in the form of imposed fast-breaking every 40 days. The Artist despises these breaks, and comes to abhor the re-articulation to other bodies that they produce. The re-activation/reactive-ation of his inputs produces a striated public space composed of vast chains of connective syntheses that he resists as BwO while seeking virtually as desiring-machine. This appears to be exactly the affective tension Mark Rothko has in mind when he declares that art 'lives by companionship, expanding and quickening in the eyes of the sensitive observer' yet similarly dies 'by the eyes of the vulgar and the cruelty of the impotent who would extend their affliction universally!' (Serota 1987: 83). The Hunger Artist, who produces (anti-produces) only himself, enters this bidirectional affective chain as a sort of recording device, tracing its lines on his own hollowed body. The artist's encounter with the artwork's constituting audience recalls Deleuze and Guattari's perspectival distinction between content and expression. Brian Massumi reminds us – articulating *A Thousand Plateaus*' discussion of expression with Deleuze's earlier reading of Nietzschean force – that in any encounter of forces, one envelops the other:

> One side of the encounter has the value of a content, the other of an expression. But content and expression are distinguished only functionally, as the overpowered and the overpowering. Content is not the sign, and it is not a referent or signified. It is what the sign envelops, a whole world of forces. Content is formed substance considered as dominated force-field. (Massumi 1992: 12)

Content and expression are two perspectival sides of the same coin – tossed in every encounter. Spinozan *conatus*, already relativising the distinction between subject and object, spectator and artwork, is vectorised by Nietzschean force. When we observe or experience an encounter from the dominant position, the dominated appears as content, captured and manipulable, ordered by signification. The artwork, thus woven into the striated space of the gallery, stage or circus, has become molar and inert: the deadly combination Rothko dreads. But what of the inverse perspective, that of the dominated force? If the Hunger Artist is captured by spectatorship, does he not also perturb that

machine, test its boundaries and thereby expand his own? The potential to do so, figured early in the story as detailed above, dissolves as the text continues and negative affect mounts to a complete withdrawal, a desire to avoid all contact with other bodies even amidst the Artist's desire to be constituted in relation to them. Late in the story this ambivalence leads him to work for a circus, which Kafka figures as pure flow: 'A large circus with its enormous traffic in replacing and recruiting men, animals and apparatus can always find a use for people at any time, even for a hunger artist, provided of course that he does not ask too much' (Kafka 1976: 251). The flow of technical and organic machines that comprise the circus engulf the artist as constitutive component, incorporating him into its apparatus. As BwO, however, he resists the territorialising operations of these flows, rendering connections virtual by sealing off his body, which thereby registers, records these potential circuits as a totality. He becomes a barrier within this flow, 'only an impediment on the way to the menagerie' (Kafka 1976: 253). He disjunctively links to other machines through potential interruption, yet his desiccated body becomes merely a record of virtual connections never made. The Artist has lost his audience.

Why does he never activate these connections? Deleuze and Guattari remind us what is at stake here, on the taut surface of the BwO produced through fasting. The attraction and repulsion between the desiring-machine(s) and the BwO should give rise to a new structure, a 'celibate machine' that modifies them both, 'forming a new alliance between the desiring-machines and the body without organs so as to give birth to a *new humanity* or a glorious organism' (Deleuze and Guattari 2009: 17, emphasis added). Because the Artist's *conatus* has been turned against itself, made reactive, this greater deterritorialisation remains closed to him, as does the 'eroticism of the machine liberated over unlimited forces' (Deleuze and Guattari 2009: 18). At the end of the story, just before he dies, he explains that he needs to fast 'because I couldn't find the food I liked. If I had found it, believe me, I should have made no fuss and stuffed myself like you or anyone else' (Kafka 1976: 255). On one hand, this is a simple failure of *conatus*, which Spinoza describes as an 'appetite' that 'is nothing else but the effort by which each thing strives to persevere in its being, each body in extension, each mind or each idea in thought (*conatus*)' (Spinoza 2005: 21). Whereas the celibate machine *produces* consumption, the Artist remains reactive, defensive, circumscribed by the flows of capital and consumption-machines. Ingesting nothing, he is himself consumed.

On the other hand, as Massumi reminds us, this is a question of perspective as much as affect. The dominated Artist sees himself only from the perspective of the audience that has ordered and objectified him. To activate the obverse perspective would mean to view the larger audience-circus-performance assemblage as an expression of its molecular components, of which his body is but one. It would be to register and trace the active perturbation of boundaries, the shock waves sent through that assemblage by his active manipulation of flows. Fasting would have to be more than the inability to take pleasure in food, a reactive resistance to the flows of spectator-capital. In becoming a BwO, he has effected a disarticulation from these flows, but only at the cost of a new and paralysing unity: he remains a singular, molar object, a world of forces contained in a sign. Even in the end, when he becomes a blockage instead of a focal point, a set of forces virtualised by his smoothing, truly blockading flows, he remains unified by the sign of Art. He fails to become molecular; the text falls short of recuperating him as such. As individual, as subject of and to negative affect, he can only be rendered as content, one character in his eponymous story, at the centre even as he shrinks to a point, left to die an objective death. From this perspective, he could only have rejected all flows, all food, in a textual closure, the local site of stalled *conatus*, the capping of the freeplay of signification that the text had previously kept open.[2]

III. Striation, Flow, and the Cinematic Subject

This failure of desiring-production is further mapped in a more recent work by artist Steve McQueen, *Hunger*, which attempts to recover the revolutionary potential of fasting through molecularisation, picking up where Kafka's text left off. *Hunger* is ostensibly the story of IRA member Bobby Sands, who led a hunger strike while incarcerated at HM Prison Maze in Northern Ireland in 1981 – in which Sands died. The film chronicles a series of events in the everyday routine of the prison, leading to Bobby's beating, his subsequent decision to lead a hunger strike, the slow decline of his health through starvation, and his eventual death. However, McQueen decentres the film's subject from the very beginning, opening *Hunger* with a different individual apparently in the role of the protagonist, a prison guard eating his breakfast. We follow his daily routine as well as that of a new inmate as the paths of both intersect amidst the flows and assemblages of the prison machine: guards' lockers serve to segment and block symbolically endowed objects from domestic life in a decoupling that emphasizes the possibilities of

productive synthesis: a wedding ring decoupled from a hand that will later begin to beat Sands – only to fail to connect in an instant, coupling instead with the concrete wall of the prison, which in turn deforms the hand's boundary by breaking the skin, releasing a flow of blood. The logic here – prison logic – is inexorable: the hand is soaked in a sink, the blood mixing with water in a repetitive act; each repetition slightly different from the last, the flesh less contained, a series only halted in a further act of deformation, a point-blank gunshot wound that empties his blood directly onto his catatonic mother, herself only one embroidered pink shape amidst the homogeneous, striated space of a pastel nursing home.

Flows of fluid – blood, water, urine, excrement – are traced throughout the film. Each runs into the others; the prison's H-block becomes the site of these transformations, this production. Circuits of flows are traced on the celluloidal surface, over the striated texture of the prison's topology: along its corridors, its series of parallel doors, its bars, slits and doorways. The site of maximum blockage and maximum flow, and thus the most generative site of production, of intensities, is the prison cell. The new inmate joins another in a cell smeared floor to ceiling with excrement. Food is delivered by the guards, consumed by the prisoners, transformed into shit, and made to encounter the structure of the prison itself, transfiguring it, in this case, into aesthetic object, a striking painting that is at once non-representational and aesthetic emergence through a celibate machine: the cell, deterritorialised from H-block's striated mosaic through the shit-smearing-smoothing of its surface, acts as the BwO upon which de-formed organic assemblages both mingle and stall, where production occurs precisely because it is halted.

Perhaps the most striking visual example of connective synthesis in the film occurs when the two prisoners use the undifferentiated mass of leftover food to mould a barrier around their cell door, a miniature wall formed by turning the flow of food against its source, segmenting and concretising it, giving shape to a basin that echoes that in which the prison guard soaks his bloodied fists. Into this makeshift structure they pour a pot brimming with urine, transferring this fluid from one vessel to another, but with a difference: this second basin makes use of another connector, the gap under the cell door, and the wall of food serves to direct the flow of urine out of the cell, into the connective passageway of the corridor, designed for the transfer of humans and here used as transitive site of convergence. As the urine seeps under the door, it traces a path into and down the corridor; the long-shot of the

corridor itself reveals that similar flows are pouring out of all of the cell doors; the camera holds as these slowly snake toward the centre of the hall and begin to meet, forming a new connective, a new aggregate flow. Though no prisoners can be seen or heard in this shot, a new machinic assemblage is formed from their aggregate connectors, recorded on the surface of the empty corridor, and at the same time forming a smooth, heterogeneous surface overlaying not only the diegetic corridor but the otherwise striated space of the still image, here born, dying, born as cinema.

The collective urine machine clears the way (intensity degree zero) for the emergence of a new subject, a new subjectivity, in the form of Bobby Sands himself. Bobby as an individual character is only featured in the central 40 minutes of the film, after a half hour of narrative flows. In the space of the film he is produced by these flows, liquid and social as well as imagistic and aural, represented and representational. The urine, faeces, rotting food, proliferation of doors and corridors gradually coalesce into a representation of the historical personage nominally at the centre of McQueen's film. The two prisoners hear the unscheduled approach of the guards and brace themselves for a violent encounter. They stand, tensed, facing the door of their cell. The film cuts to what should be a reverse shot of the door opening, but is instead Bobby yanked from *his* cell, typologically identical yet defined by a different set of coordinates. Then, in the lavatory, a return, a repetition: the prison guard's fist slammed into a wall, coupling of flesh and blood to water, intercut with the violent shearing of Bobby's hair. Blood, dirt, water, flesh and hair commingle, then eventually recede, out of the frame, to reveal a face. Thus the protagonist emerges as a focal point, a sort of golem constructed out of a social assemblage of political prisoners, filmed bodies, flows of blood, the sound of blows against flesh, excreted fragments of celluloid.

In *A Thousand Plateaus*, Deleuze and Guattari slightly recast the BwO as *that which one can make oneself*. This is in contrast to *Anti-Oedipus*, which primarily figured the BwO as a substratum upon which things are built (through desiring-production, always in opposition to the BwO). In the later book, the BwO is a set of practices, a space made smooth through the vectors of its inhabitants, 'such as tribes in the desert' (Deleuze and Guattari 1987: 484), and thus intimately connected to subjectivity itself as its effect and the sum of its potential pathways: 'But you are already on it, scurrying like a vermin, groping like a blind person, or running like a lunatic: desert traveller and nomad of the steppes' (Deleuze and Guattari 1987: 150). The subject traverses the

circuits traced on, the lines that form, the BwO. It has no fixed identity, no fixed meaning. It is 'forever decentred, *defined* by the states through which it passes' (Deleuze and Guattari 2009: 20).

Without organs the body is opened to new pathways, new vectors; the subject is better able to realize its already nomadic nature, becomes more fluid, increases its power of action, increases its joy. The BwO here becomes a creative challenge, echoing Deleuze's Nietzschean re-rereading of Spinoza in *Spinoza: Practical Philosophy*: 'We speak of consciousness and its decrees, of the will and its effects, of the thousand ways of moving the body, of dominating the body and the passions – but *we do not even know what a body can do*' (Deleuze 2001: 18). In his second book on Spinoza, then, Deleuze re-negotiates the boundaries of bodies as the spatialised interplay of affect. Instead of the differentiation within unity explored in *Expression in Philosophy*, he mobilizes a characteristic of what he would later describe as smooth space, 'a space of affects, more than one of properties' (Deleuze and Guattari 1987: 479). The mathematically defined organism-body (described by ratios of relative movement) of striated space here becomes the continuously variable, vector-based nomadic subject of ametric space. While expressionism allowed for the co-production of body and mind, space and idea, through the tracing of parallel boundaries as in 'A Hunger Artist', here *conatus* is spatialised as a nomadic subject, continuously traversing the lines of its own multiplicity.

The temporally central segment of *Hunger* is concerned with Bobby's decision to lead a hunger strike. Here, after emerging as a differentiated subject out of the detritus of the film, he immediately turns that subjectivity against himself, against his organs. This is the only segment of the film which remotely resembles a typical filmic narrative, a character study. Here we witness banal scenes wherein he meets with his parents, who ask him if he is eating well. The prison guard is assassinated in the presence of his own mother. Each series comes to an end, the flows are arrested, the subject, now at the centre of the picture, buries them, smoothes them over. The section culminates in a 23-minute conversation (17 minutes of which unfold in a single, still, wide-shot) between Bobby and his friend, a priest. It contains the only sustained dialogue in the film, detailing Bobby's belief that he is nothing more than a political tool of the Irish Republican leadership, that his ineffectuality has been determined by them. Accordingly, to effect some change in the status quo, he will act unilaterally, refusing to eat until the British capitulate or his body dies. The priest is appalled, accuses him of devaluing life, becomes angry. But Bobby is resigned to his action, which

he sees as the inauguration of a series that will likely continue past his foreshortened lifespan, that won't be completed until substantial change is achieved. Seventy-five prisoners have volunteered to join the strike. Each one who dies will be replaced by another; thus one act becomes a connective synthesis, a linking of bodies in series, forming a larger assemblage. So ends the conversation, and Bobby's isolated, centred subjectivity. To make this series, thus far rendered only as intellectual possibility, actualisable, the molar subject labelled 'Bobby Sands' must dissolve.

The scene is immediately followed by the recapitulation of a shot we've seen before: the empty corridor, lined by facing cell doors, criss-crossed with pools of urine. A sanitation worker appears, wearing rubber boots and wielding a shop broom. Slowly, laboriously, he sweeps the urine, en mass, over the surface of the hall. The camera never moves, but he slowly approaches us, eventually propelling the co-mingled fluid directly under the lens, into the virtual space of the audience. The deterritorialised production of the prisoners as ad-hoc collective is thus reterritorialised into the cinematic apparatus, the viewer's gaze as directed by the camera itself. Just as we have constructed the golem of Bobby Sands, we will now be asked to dismantle him, to deconstruct our own spectatorship and enter into new configurations with the film itself.

The final 25 minutes of *Hunger* refigure the protagonist as hunger artist, positioning the audience uneasily between the roles of clinician and patient. A doctor, off-screen, booms a litany of symptoms, each involving the deformation of one or more organs,[3] to Bobby's parents; the patient is absent from the shot. Who in the audience here does not posit herself in that role, does not consider the status of her own organs at this moment of spectatorship? When the narrative's patient reappears he is no longer Bobby Sands. His body has become withered, desiccated. Every rib protrudes from his shrunken skin; we know that it is precisely the organs that are missing. Like Kafka's Hunger Artist, his body has become hollowed out. Curiously, however, as the body takes shape through its hollowing, the film loses any trace of docudrama, becomes documentary. The camera is here refigured as a medical instrument, surveying a body; the viewer assumes the role of clinician. The subject that has been revealed through the smoothing of the narrative-machine, the refocusing of the audience gaze from art spectacle to medical spectacle, is no longer Bobby Sands, historical personage and sutured protagonist. *The figure in the centre of the frame is now Michael Fassbender, the actor.*

IV. Becoming Multiple

Deleuze and Guattari are careful to allay our suspicions that dismembering the Self is really an act of suicide:

> Dismantling the organism has never meant killing yourself, but rather opening the body to connections that presuppose an entire assemblage, circuits, conjunctions, levels and thresholds, passages and distributions of intensity, and territories and deterritorialisations measured with the craft of a surveyor. Actually, dismantling the organism is no more difficult than dismantling the other two strata, signifiance and subjectification. (Deleuze and Guattari 1987: 160)

Are we relieved? Surely we can take Fassbender's body as a model of dismantling, of hollowing out, of smoothing. For we wonder, of course, how much it can take, and ask ourselves, *what are its limits?* The subject is dissolved, bifurcating into two actors (one ostensibly representing the younger Bobby). The body comes apart: blood is discharged from the rectum, vomit from the mouth. Traces of the body are left as mysterious emanations on the sheets that make contact with it. This disintegration, this molecular decomposition, is also a becoming: not only a becoming-molecular and becoming-other, but a becoming-multiple. As the desiccated Fassbender lies in bed, affectless, diffuse, the camera swoops above and around him aggressively as if in search of its subject. But the shot fades several times into a double exposure: a flock of birds in flight, the collective beating of their wings forming an aural collage, a smoothing of striated sound, a blending and a proliferation that accompanies the deformation of the singular image, the image of the fixed subject, now absent from the unitary body. The body of the hunger artist has become the multiplicity it always already was, a BwO and part of a larger body without organs, the film itself as smooth space. Here McQueen-Fassbender-Sands have managed what Kafka's Hunger Artist could not: the reactivation of desiring production in the absence of the monadic subject, the conversion of the body without organs into a connective multiplicity. Kafka renders the conditions for transformation, but does not fully realize, in 'A Hunger Artist', the project of becoming-other, of reterritorialising the body without organs. McQueen's film recuperates the hunger artist through a recovery of the multitude, the formation of new multiplicities. Signifiance, subjectification, organization. *Hunger* displaces the historical-singular signifier of Bobby Sands from the actor-signifier Michael Fassbender, itself decentred and diffused amidst celluloidal flows. Finally, the film

effects a perspectival shift; as the molecularised, multiple body of its decentred protagonist comes into view through its diffusion, it reverses the direction of forces that constitute it (the filmic apparatus itself, the striated space of spectatorship), creating a new conjunctive synthesis that potentially spreads this process of molecularisation to other beings: The equation is reversed, the social grid is itself altered, resonating to new frequencies set in motion by its lower-order singularities. *Hunger*'s true political dimension, then, lies not in its representation of resistance as narratological-historical trope, the expression of a counterforce against hegemonic domination from above (in this case Thatcher's incarceration machine), but rather the far more radical reconfiguration of the filmic apparatus to effect a perspectival shift, a revealing of the conditions of production themselves. The limit case of the starving body, as Kafka shows us, lies between subject and object, the productive synthesis of art and the capture of spectacle. The body that fasts becomes simultaneously disarticulated from its constituent flows and reformulated as discursive focal point of quasi-medical spectacle. But if the hollowing of the body is a kind of smoothing, indeed a smoothing-over of the striated Subject, it can also become a virtual operation: in Deleuze's re-reading of Spinozan *conatus* and in McQueen's film, the molar subject at the centre of the machinic apparatus of production is rendered smooth, as primary unity with its disarticulated flows, as prelude to another order of production, inscribed on this surface. Bare life blossoms into productive multitude; the lines traced on the BwO produce a virtual collective that potentially includes not only Kafka's fictional connoisseurs of professional fasting but the actual amateurs who watch McQueen's film and thereby construct and deconstruct Bobby Sands. Where Michael Fassbender's body comes into view a new set of intensities is born. A tone is struck, a resonant frequency synthesised in a state of becoming, a pregnant space waiting to be occupied by other bodies in the process of becoming multiple.

Only the final dissolution of the body of Fassbender-Bobby-inmates-viewers-prison-Ireland-Britain-flock-God-camera imbues the enigmatic opening of the film, with its chaotic aural roar and multitudinous anonymous bodies, with provisional meaning. I would like to suggest that this lid-banging scene is not the beginning of the film but its end, the product of the film-as-process, its production of itself, the individual become multiplicity through the construction of a body without organs, the ultimate work of the hunger artist become molecular, the tracing of a continuously variable contour, of a revolutionary collective to come.

Notes

1. Lamark's theory of evolution, in which organisms morphologically adapt to their environment and then pass those traits on to future generations, is notably active and additive rather than passive and subtractive as in Darwin's theory of natural selection. Henri Bergson reformulates Larmarkism into *élan vital*, a tendency towards self-directed or creative change that is central to Deleuze's thought as the formula for the virtual and thus lays the ground for desiring production (see Bergson 1998: 76–97 and Deleuze 1988: 96–8).
2. See Derrida 1980: 292 on freeplay, and Deleuze and Guattari 1986: 53 on the proliferating series.
3. We may compare this to a similar scene in *David Blaine: Above the Below*, which documents magician and endurance artist David Blaine's enactment of Kafka's fictional role in the spectacle of 44 days of fasting while publicly displayed inside a transparent box suspended over the Thames in 2003. Beforehand, a doctor describes the hypothetical effects on Blaine's organs; after the spectacle, this striating gesture will be again reterritorialised in the form of an article in the medical journal *Nutrition* that curiously utilises its own data to establish the 'validity' of the fast, and thus of its own data. Here Blaine's body is smoothed only to be recapitulated as a striated graph of ketone bodies per urine volume (see Jackson et al. 2006: 893).

Liquid Spaces of Engagement: Entering the Waves with Antony Gormley and Olafur Eliasson

Jean Hillier RMIT University, Melbourne

Abstract

Antony Gormley's *Another Place* and Olafur Eliasson's *Your watercolour machine* exemplify passages and combinations of smooth and striated space as beings of sensation on planes of technical and aesthetic composition. They are frames which striate the smoothness of light, water, molten iron, etc., using scientific planes of reference. Smooth and striated mix as boundaries between visitors' bodies and installation become permeable. Optic becomes tactile, becomes haptic, generative engagement. Both artists experiment with the interface between striated and smooth to encourage visitors to experiment and experience sensation. The installations are liquid spaces; forms of perpetual non-permanence which affect and react with others' behaviours in processes of co-emergence.

Keywords: plane of composition, plane of reference, co-emergence, material vitalism, capture, sensation

> Everything can be considered from the perspective of waves.
> (Olafur Eliasson 2008)

Gilles Deleuze regards water (the sea) as a 'smooth space par excellence' (Deleuze and Guattari 1987: 479): a space of waves – ocean waves, sound waves, light waves – a space of movement, change and becoming; a space of percepts and affects. A space of sensation. The role of art, for Deleuze, is to create new sensations, drawing the humans and

Deleuze Studies 6.1 (2012): 132–148

www.eupjournals.com/dls

non-humans which encounter that art into its material vitality. As such, Deleuze suggests that 'the basic thing is to get taken up in the movement of a big wave' (Deleuze 1992: 281), to experience and experiment with it and what it can do.

I discuss encounters with the material vitalities of two art installations in which assemblages of water, waves, metal and so on enter into dynamic composition with 'visitors' as participants. Antony Gormley's *Another Place* (*AP*) on Crosby Beach, North East England, and Olafur Eliasson's *Your watercolour machine* (*Ywm*) in Copenhagen. Both ask in different ways, what does it mean to be visionary?, how might the haptic as a generative force escape the organisational control of optical space? Both installations engage the human body as a field of surfaces which are simultaneously productive and receptive of sensory experience.

April 2007

Squelch. Mud. Sticky, clayey mud. Smearing. Oozing. Gluing. Iron bodies. Bare and smooth. Warm in the sun. Slimy, wet, green algae. Roughness of barnacles. Shapely. Shapeless.

I taste the salt and sand on the wind, sink knee-deep in ooze trying to escape incoming waves, dodge dogs chasing birds and children's footballs. Gulls mew, children shriek, dogs bark, insects buzz, waves crash on the shore, water slopping against iron bodies, susurrating. This synaesthesia is Another Place *where Antony Gormley's 100 iron statues of his naked body stare in expectation at the horizon along 3 km of mudflats at Crosby Beach, Liverpool. Motionless, the 189 cm tall men emerge from and are submerged into the sea as the tides ebb and flow. Undetermined assemblages emerge and crystallise temporarily. Limitless connectivities of heterogeneous entities, 'and . . . and . . . and' (Deleuze and Parnet 2002: 9).*

AP was originally exhibited at Cuxhaven in Germany, a place, like Liverpool, heavily involved in the seventeenth- and eighteenth-century slave trade and in the voluntary emigration to the Americas during the nineteenth and early twentieth centuries. Men stood on the shore, imagining, with anticipation, apprehension and fear, 'another life in another place' (Gormley, quoted in Wroe 2005: n.p.). The iron men arrived in Crosby in July 2005, a year after 23 mud-stranded Chinese cocklepickers drowned in nearby Morecambe Bay. Scheduled to stay for 20 months before

embarking for New York, the high number of visitors to the site led the South Sefton Development Trust to consider purchasing the installation from Antony Gormley so that it could remain permanently on the beach. The Trust, therefore, applied for an extension to their planning permits in order to purchase the artwork and obtain the necessary planning and health and safety approvals, marine consent and other licences. The extension was refused, however, by the local authority, Sefton Metropolitan Borough Council, on grounds of potential danger to humans and potential disruption to feeding birds. Approval was finally given in 2007, conditional upon some statues being relocated, and all being mapped and numbered and bounded by flashing marker buoys.[1] *Notwithstanding such striation, the men of AP act as attractors and creators of fantasies and desires for locals and tourists, human and non-human performances.*

Figure 1.2. *Another Place* by Antony Gormley. (Photograph by Jean Hillier.)

May 2009

In the small dark room I gaze at a rainbow on a screen. A whirr of machinery and the colours fragment and dance; meeting, separating, flickering. Behind the screen a projector shines light, refracted through a prism onto the surface of a shallow tank of water. The pool of colour is reflected via two mirrors onto the screen as a vertical rainbow. The motor whirrs again. The tank tilts, the water rushes back and forth in waves, the colours wave and dance. Then silence. Stillness.

I can't resist. I have to put my hand in the water, to physically engage with Olafur Eliasson's Your watercolour machine. *Gingerly at first, I dabble my fingers. Water ripples, gently turbulent. Colours flutter on water and screen. Bolder, I make waves, splashing and swishing the water; colours swirling and scattering like birds in flight. Alone in the Copenhagen quayside gallery I play, experimenting with different movements of my hands. Loud*

indigos, warm oranges and purples overlap, colouring my skin, the water, the mirrors and the screen. Inclusive disjunction.

Joy. 'My' watercolour machine.

Eliasson's Ywm *was subsequently purchased by the Danish National Gallery in June 2009. It is not currently on display.*[2] *I doubt whether visitors would be permitted to touch the installation.*

As assemblages of metal, water, light, sound, and . . . and . . . and, *AP* and *Ywm* are liquid spaces: forms of perpetual non-permanence which affect and react with human and non-human others' behaviours in processes of co-emergence. They flow across frames, yet do not dissolve into chaos: a mix of smooth and striated in perpetual motion.

Deleuze argued for the importance of studying examples from 'concrete social fields, at specific moments' (Deleuze and Parnet 2002: 135). Despite their differences in place and size,[3] my encounters with these two installations fold together 'fluctuating intensities, smoothings

Figure 2.2. Continued.

and striations' (Malins 2007: 158) of materialities and expressivities: of colour, texture, text, smell, volume – of iron, aluminium, steel, water, sand, sea, dogs, birds, planning, health and safety (and museum) regulations... – in visionary, tactile and haptic spaces. The installations open new connections between humans and non-humans involving disruption of participants' cognitive and conceptual capacities (Deleuze 1994: 139).

The idea of encounter is of importance especially for Eliasson (and the title of a later exhibition). He aims to stimulate encounters as events, comings together and collective experiences with transformative potential. Installations often include 'Your' in their name; a possessive pronoun which affords agency to each visitor in their spatio-temporal

relationship with his work. Eliasson (in Gilbert 2004) actually admits to a strong Deleuzian influence on his interest in the experience of space and art as co-creation made apparent by the self-reflexion of those engaging with it; 'seeing yourself seeing', 'sensing yourself sensing' (Eliasson 2008).

Both *AP* and *Ywm* exemplify phantastically entwined relations between smooth and striated space. Smooth space is a boundless chaotic space of affect and sensation in which heterogeneous elements fold together, conjoin and disjoin in infinite variation. Emerging through relations between elements, smooth space shifts with each movement of forces and intensities. For instance, a bird perched on the shoulder of an iron man experiences space not as the gridded totality of the local authority planners, but in terms of speeds and slownesses (of air currents, or flatworms on the beach) which call forth powers to be affected (soaring joyously) and to affect (swooping, gulping, eating). Striated space, in contrast, is gridded, measured and bounded: the space of control in which the elements or points are more important than the force relations between them.

Gormley's and Eliasson's artworks take 'a bit of chaos in a frame': frames which striate the smoothness of light, water, molten iron, etc., using scientific planes of reference – reflection, refraction, dispersion of light and metallurgy, government legislation and regulations. Smooth and striated space mix as boundaries between visitors' bodies and installation become permeable. Skin encounters wetness of water, smoothness of metal, sliminess of algae, roughness of oxidisation. Immanent capabilities of flows of matter-energy-information make what is ordinarily hidden rise to sensory intuition.

The creators of both installations use the interface between striated and smooth to experiment and to encourage visitors themselves to experiment and to experience. Eliasson's 'Your' becomes 'My' and Crosby Beach becomes 'My Place'. This is what engineering can do at its experimental/experiential limit. The produced 'objects' in the installations (rainbows, iron men) transform the inhabited spaces of the gallery and beach into living events; self-embracing micro-climates of experience.

I. Material Vitalities, or, 'Your Engagement Has Consequences' (Eliasson 2009a)

> . . . what metal and metallurgy bring to light is a life proper to matter. (Deleuze and Guattari 1987: 409).

I seek, like Jane Bennett, 'a form of agentic capacity not restricted to the human actor, a potentiality within materiality' (Bennett 2007: 133): an active 'thing-power' (Bennett 2010), or material vitalism (Deleuze and Guattari 1987: 411) which exerts forces and creates affects. Defining art as the capture of forces, a substantiation of affects in matter (Sauvagnargues 2006: 35), I regard the iron men of *AP* and the floating colours of *Ywm* as relational compositions of intensities, of encounters of corporeal proximity between speeds and slownesses, of affects, actions and reactions. In my encounters with these worlds of 'flows and fluxes, topological spaces and floating durations' (Bogue 2007: 37), I identify *vague*[4] or 'vagabond' essences (Deleuze 1979: 6) in 'a lapping of waves, a murmuring of sands, a mist, a dance of dust' (Deleuze 1988a: 115).

Through their materials, the works force the percept from perceptions of objects and the affect from affections, to extract a pure being of sensation. The forces captured and sensations created are invisible and indeterminate, becoming visibly sensational when materialised as iron bodies in the waves or rainbows reflected in glass and water. Sensation is created not so much in the material, as when the material becomes a being in space and time. For instance, the force of the iron men would not exist if Liverpool had not been a slaving port or the cocklepickers had not drowned in Morecambe Bay. Sensation does not lie in the iron, but is harboured by the metal.

Sensation impacts the bodies of those who encounter *AP* and *Ywm*, drawing them into the artworks. As Deleuze writes, 'we experience *joy* when a body encounters ours and enters into composition with it, and *sadness* when, on the contrary, a body or an idea threaten our coherence' (Deleuze 1988b: 19): the rainbow-induced smile, the delight at iron heads appearing above the waves, the disgust and shame of naked iron men, the joyful fun of splashing in water, the anguish of impotently watching as iron men 'drown', slowly and impassively overcome by the flowing sea. Art affects us by showing us ourselves: 'seeing ourselves seeing'.

Ywm is literally a machine of light and mirrors for colouring perception which makes felt the experience of vision (see Bogue 2003a: 29–35; Manning 2008a). Artworks make every sense function as an eye. Art vibrates through the entire sensing body: 'painting gives us eyes all over' (Deleuze 2003: 45). Senses of touch, smell and sound are as engaged as the sense of vision –

> the colours of the sand, sea, sky, statues, spectrum . . .
> the sounds of waves, motor, birds, dogs, children, insects . . .

> the smells of the sea, the gallery space, perfume . . . .
> the taste of salt on the wind, water on fingers . . .

– vibrating as compounds of sensations according to 'strong and weak beats, projections and hollows' such that 'we no longer know whether it is the light or the air that sculpts or is sculpted' (Deleuze and Guattari 1994: 168).

The installations draw the body of the participant/'viewer' in by the finger-tips. The eye invites the hand (Massumi 1998), but then optic becomes tactile, becomes haptic, smooth spaces of close vision in which there is no hand-eye (or sensory) subordination (Deleuze and Guattari 1987: 493; Deleuze 2003). The corporeal participation of humans (and non-humans) activates much of Eliasson's work, such that he refers to visitors as 'users', handing us a 'responsibility' to 'negotiate with surfaces' (Eliasson 2008). The artist states his intention to demythify the optic and eliminate the concept in favour of a more generative haptic engagement (Eliasson 2004).

The haptic eye produces 'a metallurgical vision' (Zepke 2005: 144): a 'vitalised geometry' (Deleuze and Guattari 1994: 182) of colour fragments and iron men, in the midst of which, in Deleuze and Guattari's maritime model, participants 'distribute' themselves 'according to frequencies and in the course of their crossings' (Deleuze and Guattari 1987: 481) of the beach, such that it becomes difficult to distinguish between figures and visitors standing 'enveloped by space . . . our feet on the earth and our eyes on the horizon' (Bogue 2003b: 140).

Waves may be haptic spaces (see Deleuze 2003); smooth spaces of intensities which 'dematerialise' metal, water, algae, sounds and so on in close vision. The 'how' of the visionary thus engages our senses in their entirety as we 'touch' the installations, enfolded in them. Our orientations and perspectival landmarks blur and flow into each other, contrasting with the distant vision of optic, striated space. We lose ourselves, becoming one with the work, escaping, for a while, the organisational control of the Coastguard beach patrol and gallery curator.

II. Advancing Like a Wave: Shifting Borderlines on Planes

> Waves are vibrations, shifting borderlines inscribed on the plane. (Deleuze and Guattari 1987: 252)

From the 'chaos' of molten iron, fire and helium, of water and light, Gormley's and Eliasson's installations emerge on planes of

composition. Deleuze and Guattari distinguish between planes of technical composition – the work of the material (iron men, tanks of water, prisms, mirrors and so on) that often calls on scientific planes of reference (mathematics, physics, chemistry, anatomy) – and immanent planes of aesthetic composition – the work of sensation (Deleuze and Guattari 1994: 191–2).

Whilst the authors suggest that only aesthetic planes fully deserve the name 'composition', Gormley and Eliasson develop different ways of engaging technology-mediated actualisations which combine the propositional (e.g. the melting point of iron, the refraction of light) with the compositional (the sensational). Deleuze and Guattari outline a spectrum of possible combinations, in which, at one end 'sensation is realised in the material' (Deleuze 1994: 193–4). Here, sensation adapts to the well-formed, organised and regulated matter of 'a material surface that already contains within it the spatial schemata that structure its figures' (Bogue 2003b: 169), such as the cast iron men of *AP*. At the other end of the spectrum 'the material... passes into sensation' (Deleuze and Guattari 1994: 193), whereby the material ascends into the aesthetic plane of compositional forces. In *Ywm* the light, water and mirrors themselves articulate forces. Technology becomes merely 'a function of aesthetic problems of composition', 'covered over' by the aesthetic plane (Deleuze and Guattari 1994: 196). While Gormley and Eliasson deliberately expose some of the technologies underpinning their work – seams, sprues and rivets in the iron men, motors, mirrors and prisms in *Ywm* – the artworks enable the technologies to become more than themselves; visible functions on aesthetic planes of composition.

Actualisation of the assemblages of *AP* and *Ywm* has proceeded, and is proceeding, through movements of differentiation. Particles are extracted from the chaotic virtual through processes of creative compositional differentiation and actualised as artworks, articulated through planes of reference. Planes of reference relate to the differential field of potential transformations of scientific material systems (Duffy 2006). They enable actualisation to occur through the construction of functions of systems of coordinates, including the speed of light, the melting-point of iron, health and safety regulations and so on. Such functions and co-ordinates are determinative of states of affairs, framing or limiting the conditions in which systems actualise. In other words, the virtual or 'chaos' is actualised in identifiable forms and configurations, such as rainbows and cast iron men.

In *Ywm*, colour 'visibilities' take form within regimes of light of reflection and refraction. Reflection is the change in direction of a

wave of light, sound or water between two different media, such as between Eliasson's tank of water and mirrors. It is an exchange of the unequal – between actual and virtual – indiscernible, yet distinctly different.

Refraction is the change in direction of a wave due to a change in speed. Generally, changes occur when a wave passes from one medium to another at angles other than 90° or 0°. Light waves refract on entering and leaving glass and water, for instance. White light is split into a rainbow-spectrum as it passes through a glass prism (see Deleuze 1994: 227–8). Inspired by Isaac Newton's 'private rainbow in a dark room' (Eliasson 2005: 13) and Moholo-Nagy's Light and Space art (Eliasson 2009b), *Ywm* combines light refraction and reflection with kinetic sculpture.

The men of *AP* embody scientific planes of reference of moulding and casting iron. As Deleuze explains, traditional views of moulding[5] represent a mould as a form imprinted on inert, homogeneous matter and which is removed once the matter becomes structured and reaches an equilibrium state (Deleuze 1979: 8) . However, as Deleuze points out, 'if one was inside the mould', as Antony Gormley effectively was, we would recognise that moulding is actually an operation of modulation or 'moulding in a continuous and variable manner'. The composition of cast iron structures always varies owing to even minute changes in pour conditions and differential cooling of sections (such as arms and torsos). The smooth space of molten iron becomes striated as 'replicas' of Gormley's body. Yet the replicas are not copies as such, but simulacra. Actualisation is differentiation. It breaks with resemblance (Deleuze 1994: 212). The differential never produces wholes, but creates singularities that are 'both one and many' (Manning 2008b: 14).

III. Smooth and Striated: Encounters, Combinations and Passages

> Organising good encounters, composing actual relations, forming powers, experimenting. (Deleuze 1988b: 119)

Deleuze and Guattari (1987: 474) point out that striated and smooth spaces 'exist only in mixture', with striations being smoothed and smoothings striated in passages and combinations of both. It is the forces at work in these passages and combinations which are of interest in *AP* and *Ywm*.

Territorialising frames have transformed the predominantly smooth space of Crosby Beach and the randomly located men into space striated by rules, regulations and stereotypical subjectivations. As Deleuze and Guattari point out, 'one of the fundamental tasks of the State is to striate the space over which it reigns' (Deleuze and Guattari 1987: 385). As such, the iron men were subjected to several striating events. The State (embodied by Sefton Council as local planning authority) performs as an apparatus of capture, drawing the men and other actants to itself and the development assessment system. Arguments and activities are constrained, stratified according to deemed 'material planning matters', structured according to imposed time-frames (of public consultation and committee-meeting schedules) and a specific decision arena.

This is a striated space, instituted by State apparatus, where matter is gridded and organised along lines of fixed orientation. For instance, planning legislation turns the iron men into a legal issue. It crystallises the men's signification by demanding coordinates of orientation, including compliance with a Marine Consent licence under the 1949 Coast Protection Act, a licence under the 1985 Food and Environmental Protection Act, and also with national Planning Policy Statements, Regional Spatial Strategies, Local Development Frameworks and 1994 Habitat Assessment Regulations.

State apparatuses, such as the Health and Safety Executive (HSE) and the Marine and Coastguard Agency (MCA), regarded the iron men as potentially dangerous: 'a hazard to navigation', 'a continuing risk to beach users' (MCA 2006) and 'a foreseeable entrapment hazard' (McAleavy 2007) for those unfamiliar with the beach and its rapidly rising tides. A managerial discourse of territorialisation and striation demanded exclusion zones, safety areas and search and rescue corridors. The Environment Agency, Natural England and other environmental groups represented the men as potentially causing flocks of waterbirds to starve to death, chased away by visitors' dogs and prevented from feeding. These agencies striated the beach into 'feeding' and 'non-feeding' areas and demanded the removal of men from the former.

In order that all the necessary permissions and licences could be granted for *AP* to remain on Crosby Beach, 13 men were relocated away from 'dangerous mudflats'; three were moved from key bird-feeding areas and four were reassigned to create additional Coastguard access. The iron men were all fitted with numbered identity bracelets and mapped on MCA charts. They have become striated points, a geometry in a metric grid cast over continuous variation.

The men were also striated by actants into categories as, variously, tourism attractors, stimulators for economic regeneration, 'a waste of money', 'man-made muck', 'an eyesore', 'mesmerising', 'fun', 'fantastic' (The Mersey Partnership [MP] 2006), whilst visitors were regarded by local residents (them versus us) as people having no connection with Crosby, who drop litter, cause parking problems, make noise, make a mess in public toilets and bring dogs to foul the beach and scare away wildlife (MP 2006), for all of which it is the fault of *AP*.

It is the interaction between the differential relations of power, knowledge and subjectivation which determines the singularities of the iron men. The actualisation of these differential relations and singularities by organisations including Sefton Council, the MCA, local residents and so on, stratifies and temporarily fixes the significations of the men. Crosby beach, as a material space, makes an assemblage of iron bodies emerge and be seen. The materiality of planning regulations and the development assessment system defines a field of expression in which the iron men receive sentence – in this instance, to life on the beach.

In some ways, Crosby Beach has been museumified. As has *Ywm* in the Danish National Gallery, with its regulated visiting hours and conditions including 'no touching', 'no flash photography', countermanding Eliasson's interactive intent. These state spaces, framed and striated by enclosures (marker buoys, museum walls), regulations, maps and grids, contrast with the haptic, smooth space in which orientations, landmarks and linkages are in continuous variation as the tide ebbs and flows in *AP* and colours fragment and dance in the dark in *Ywm*. As Deleuze comments, in smooth space 'there is no line separating earth and sky, there is no intermediate distance, no perspective or contour; visibility is limited; and yet there is an extraordinarily fine topology that relies not on points or objects, but rather on haecceities, on sets of relations' (Deleuze and Guattari 1987: 382).

There is an infinite diversity of perspectives and subjectivities; of 'voyages in place' which follow 'streaming, spiralling, zigzagging, snaking, feverish line(s)' rather than points (Deleuze and Guattari 1987: 499). Lines which dematerialise frames in an 'out-of-field' or 'beyond-the-frame', which can sensationally open new spaces of thought (Grosz 2009).

These new spaces of thought are 'phantastical' for Deleuze, applying to simulacra and 'phantasms', such as *AP* and *Ywm*. As Deleuze explains, they are conditions of real experience, 'reuniting' experience and experiment and 'presiding' over both 'nomadic distributions' of

imagination and 'sedimentary distributions' of categories. They are complexes of space and time; 'the objects of an essential encounter' (Deleuze 1994: 285).

It is this which particularly fascinates Olafur Eliasson (May 2003: 18), whose work experiments with encounters between participants' rational expectations and their visceral experiences. For both Eliasson and Gormley, the body is central in the mediation of spatialities and temporalities. Boundaries become permeable between visitors and installations as they conjoin in new assemblages: fingers, illuminated with colour, dabble and swish in shallow water; children and adults climb on iron shoulders; dogs rub and urinate against iron legs; birds perch on iron heads. Skin encounters sweet wetness of water, smoothness of never-submerged iron, warmed by the sun, sliminess of wet algae, newly emerged from the sea, bleeds, grazed by rust or bruised by solid mass. Through such immersive experiences, participants 'see through [their] skin' (Deleuze and Guattari 1987: 151), experiment with the opportunities offered and generate 'a creative rapport with the situation in question' (Guattari 2009: 67).

AP and *Ywm* fold to themselves a range of encounters, combinations and passages between the smooth and the striated, between planes of composition and planes of reference. Deleuze and Guattari recognise the possibility of creative 'interference', blurring the distinctions between the planes and practices of art and science (and philosophy) (Deleuze and Guattari 1994: 216). In both installations, science performs visibly on the plane of aesthetic composition such that 'sensations and functions become undecidable, at the same time as philosophy, art and science become indiscernible' (Deleuze and Guattari 1994: 218).

Installations, for both Gormley and Eliasson, are theatres for open-ended experimentation (Deleuze 1994); for the performance of different possibilities and the actualisation of different virtualities (O'Sullivan 2006: 139). Gormley's iron men and Eliasson's watercolour machine do not impose form on inert matter, but are rather relational compositions of intensities, of affects and actions in which *Another Place* becomes 'My Place' and *Your watercolour machine* becomes 'mine'. In such alliances or encounters between chemistry and art, between knowledge and experience (Eliasson 2010), between striated and smooth, margins are pushed and frames exceeded. 'Experimentation is what goes beyond' (Eliasson 2008: 131).

The installations 'draw us into the compound' and make us vibrate with them, as part of them, becoming with them. This co-production or co-poiesis actualises the possibility of an 'art in common' (Alliez and

Bonne 2009: 111); an ethical, creative potentiality; a living event in which Eliasson desires that 'my work is you'.

IV. Conclusions: Entering the Waves

> Physics has found no straight lines – only waves. (Buckminster Fuller 1983: 7)

Though all artworks produce sensations, they blend smooth and striated space in ways uniquely negotiated with each visitor or participant. An encounter with *Another Place* and *Your watercolour machine* is in itself an aesthetic act of production, drawing participants haptically into the work, where they become elements in new assemblages, creating waves (of sound, light, water...) that resonate into other elements through 'a chaosmic plunge into the materials of sensation' (Guattari 1995: 90). This plunge, or immersive experiment, intensifies relative speeds in regulated, ordered, striated spaces such that the space is occupied with 'a vector of deterritorialisation' and smooth space is (re)imparted (Deleuze and Guattari 1987: 387). Where technologies of physical construction, planning, health and safety regulations, subjectivations and so on build finite worlds of striation, art 'tears open the firmament' to rediscover the infinite (Deleuze and Guattari 1994: 202). *AP* and *Ywm* exceed their frames, flowing in lines of flight which carry participants away, 'across our thresholds, towards a destination which is unknown, not foreseeable, not pre-existent' (Deleuze and Parnet 2002: 125): another place.

Whilst artworks may be part of a territorial place, grounded in striated planes of scientific reference, smooth space emerges through the close vision and tactile relations of any number of observers in 'an infinite succession of linkages and changes in direction' (Deleuze and Guattari, 1987: 493–4) which cannot be predetermined or circumscribed. We thus become one with, and lose ourselves in, *Another Place* and *Your watercolour machine*. We voyage in place, sensing ourselves sensing, as we imagine other possible worlds or *plage(s) d'immanence* (Deleuze 1985) from which to embark among the waves.

Félix Guattari in the Age of Semiocapitalism

Edited and introduced by Gary Genosko

Twenty years after Félix Guattari's untimely passing in 1992, this special issue of *Deleuze Studies* presents a series of essays that will assist readers in bringing Guattari into the present by providing examples of how to read him anew, perhaps even for the first time. In the recently published collection *The Guattari Effect*, editors Eric Alliez and Andrew Goffey introduce their project with reference to the Guattarian concept of the collective assemblage of enunciation that 'operate[s] to enable novel emergences to be detected and the urgency of events to be elaborated' (2011: 1). Semiocapitalism plays a similar catalytic role here, with a no less experimental and urgent task of diagnosis and micropolitical elaboration. Why semiocapitalism? Among Guattari's numerous prescient concepts may be found a three-tined insight: 'capital is a semiotic operator' that 'seizes individuals from the inside' (1996b: 200, 212) and has the goal of 'controlling the whole of society'. This statement contains three closely related insights that introduce the semio-commodity; situate subjectification at the heart of a subsumption that has turned intensive, thus marking the passage from an incorporative, formal to a real subsumption; and, pose the question of resistance within a predicament of massive control that is only superficially blamed on machines (surveillance). Subjectification in Guattari's estimation is a political concept that has a machinic character defined by the involuted relationships between users and information technologies (the latter emerging in great variety and with profound influence from the machinic phylum that more and more entangles human and non-human ecologies).

Franco 'Bifo' Berardi (2007: 76) defines semiocapital as 'capital-flux that coagulates in semiotic artefacts without materializing itself'. This focuses attention on a middle state of coagulation that displays reticence before materialisation. Coagulation of capital flux in semiotic artefacts suggests that there are nuanced states of substantialisation that do not yet accede, or at least immediately proceed, to hard materialisation; this process of slowing down and pooling, a semiotic settling, describes the immaterial factors of pre-material existence betwixt immateriality and materiality. In a Guattarian vocabulary, then, a semio-commodity consists of the material aspects of the semiotic – affective and productive – and in infotech often consists of a-signifying part-signs whose production and passage through digital networks are akin to signals perfectly adapted to the quasi-material fluxes of their environment – they precisely trigger, activate and work flush with automated processes of information exchange and do not require a representational dimension, which is superfluous (but may undoubtedly exist). Guattari disliked the language of signs because it had for too long entailed a divorce from materiality. In this context, Bifo, too, wonders why we need such a term as immaterial, anyway (2008: 157).

Both Guattari and Bifo emphasise that entire circuits and overlapping and communicating assemblages integrate – that is, machinically enslave – cognitive labour and the capitalistic exploitation of its content. Mental as opposed to manual labour involves a closing of the gap between execution and innovation and a deferral of materialisation: Bifo's explanation contains a key qualification: 'The materials to be transformed are simulated by digital sequences. Productive labour (labour producing value) consists in enacting simulations later transferred to actual matter by computerized machines' (2009: 75). In this temporal qualification, labour does not so much have 'residual materiality' but is mental work on abstract 'signs rich in knowledge'. Flexibility and fluidity are imposed on such labour by means of the reticular form that frames, captures, commands and recombines the fragments produced in and through it. Devices of recombination or part-signs are multiplying in the personal digital assistants, laptops and cell phones that accompany us throughout our entire days and nights – this is our machinic apprenticeship. For Guattari, this is an example of how machinic subjection enters human labour. For Bifo, labour has become cellular activity: as production becomes semiotic, precariously employed cognitive workers – on occasional, contractual, temporary bases without guarantees or benefits – engage in labour that involves the

elaboration of 'a specific semiotic segment that must meet and match innumerable other semiotic fragments in order to compose the frame of a combinatory entity that is an info-commodity, Semiocapital' (2009: 89). Semio-commodities are thus: partial, combinable and recombinable; and dependent upon the digital network. Bifo's re-employment of semiotic for immaterial, in the context of cognitive labour within a networked environment, points to the role of technology in integrating fragments previously allocated to dedicated sites of a dramatically fragmented labour process. He also specifies that semiocapital depends upon simulation of 'signs-in-formation' (2011: 106–7).

There is a certain degree of overlap between the Guattarian conception of Integrated World Capitalism, Semiocapitalism and post-Fordism. During the 1980s Guattari developed in collaboration with Eric Alliez a theory of globalisation called Integrated World Capitalism (IWC). This stage of post-industrial capitalism is marked by the preponderance of modes of machinic production and their integration (that is, by means of permanent crisis); by dominant semiotic-economic systems in which the market becomes transnational; and the state becomes minimal and speculative. The authors wrote: 'Integrated World Capitalism ... [is] based upon semiotic means of evaluation and valorization of capital which are completely new and have an increased capacity for the machinic integration of all human activities and faculties' (Guattari 1996a: 244). Corresponding to some of the features of post-Fordism, as well as hinting at the emergence of the importance of immaterial labour, Guattari and Alliez announce the emergence of semiocapitalism. Guattari clarifies: 'Post-industrial capitalism, which I prefer to describe as Integrated World Capitalism, tends increasingly to decanter its sites of power, moving away from structures producing goods and services towards structures producing signs, syntax and ... subjectivity' (2000: 47).

In post-Fordist production, industrial labour does not disappear; it is relocated to regions where wages are low and regulations are lax. Certain segments of cognitive activity follow along and are 'externalised' for the same reasons. Accompanying Bifo's deferral, geographic marginalisation of the moment of hard materialisation is the automated support of the processes of recombination so that program languages, data formats and robotic systems cohere and combine into a legible frame for the assembly of an info-commodity.

Bifo forestalls materialisation by means of coagulation in semiotic artefacts because he wants to underline the dependency of cognitive labour on information fluxes in the global networks of semiocapitalism.

He does more than suspend the manufacturing moment; he is offering a variation on the Guattarian matter-function relation. We have inherited from linguistics the idea that languages give different forms to thought. Louis Hjelmslev figured the projection of form onto matter as the shadow of a net, a grid, cast onto what was for him undivided sand. This inspired Guattari to recast form as an abstract machine (irreducible to language) that constitutes and conjugates the components of assemblages. It is not the net but its shadow; it is not the form but its function. In Guattari's thought, an abstract machine is a function rather than a form. A function is not yet semiotically fully formed – it is a formless form that has no substance – and this makes it 'pure Matter-Function' because the matter it works is 'not yet' formed (into stratified substance) (Deleuze and Guattari 1987: 141).

Using the conceptual language that Guattari adapted from Hjelmslev that form as a pure matter-function maintains its independence before the emergence of distinct breaks that apply to itself and to what it distributes, the conceptual indebtedness of semiocapitalism to this reticent semiotics is perhaps obvious in the form that is distilled into a function and does not (yet) culminate in a distinct thing, a physically formed matter as a stratified substance.

What Bifo is suggesting is that 'neuro-workers' plug themselves into terminals of the net, tap into a vast pharmacological support battery, not to mention absorbing many ideological fictions from the cyberlibertarians of the new economy. This precipitates widespread psychopathologies, drug dependencies and social dysfunctionality because life and work tend to bleed together, with diminishing returns. Bifo pays close attention to how the machinic arrangements of fixed capital are evolving, and describes the semioticisation of the production process in a mutating, artefactual ecology with long tendrils reaching across the globe in which partial manufacturing may be spread widely, and these quasi-material fragments coordinated by computerised assembly in another peripheral location: 'the process of production is in *large part* dematerialized' (2008: 20). One may also say that production is in *some part* still materialised but that this passage is heterogeneous and involves semiotic substantialisations with their own characteristics that differ in nature from an obvious end product, which is not always the destination of the coagulated part-signs.

The language of coagulation suggests, then, not a direct and immediate concreteness, but a viscous semiosis requiring attention to the divergences of semiotic types, gradients of formedness, container effects ('artefacts'). Coagulation of blood is a chemical process of clogging

that requires the internal and active presence of platelets and specific proteins that become sticky. The theory of semiocapitalism counts on the complexity of soft substantialisation, and the flutter of inactuality (not yet) that makes it impossible to exhaustively grasp, and suggests the fundamental fragmentariness of what is being combined and recombined through capitalistic networks but in ways that confirm openness and multiplicity, certainly before materialisation.

Consider Maurizio Lazzarato's two-pronged statement that immaterial labour 'produces the information content of the commodity', in this way pointing to changes in 'workers' labour processes' with skills involving 'cybernetics and computer control'; and indicates the kind of activities that produce this content 'are not normally recognized as "work"' which includes 'defining and fixing cultural and artistic standards, fashions, tastes, consumer norms and... public opinion' (Lazzarato 1996: 132). This remains a landmark theoretical reformulation for understanding recent restructurings of labour and new mutations of capitalism. As the subjectivity of workers becomes a raw material for the production of the kind of social relations that grow up around and persist in the immaterial dimension of commodities, that is, immediate sensory and more abstract affective attachments like excitement, fidelity to certain virtual environments, logos and cultural codes, Lazzarato asks his readers to cast off their 'factoryist prejudices' in order to grasp the temporality of the cycle of production that is summoned by the capitalist for the duration of a task after which it disappears back into the networks that make it possible. Productive units consisting of self-employed workers, intellectual proletarians of a dispersed precariat, whose professional and managerial skills are exploited in the technical and semiotic labour of producing a commodity's content, and who are often required to coordinate the immaterial labour of others, underline the significance of labour's intellectualisation and immaterialisation without eschewing either embodiment (for the sake of a purely cognitive labour) or materiality (in favour of completely intangible commodities).

Indeed, over almost ten years from the publication of *Empire* to *Commonwealth*, Michael Hardt and Toni Negri's presentation of the significance of immaterial labour has accumulated a number of models: where first the intangible products of immaterial labour were modelled on affective (health and entertainment sectors) and symbolic-analytic services (computer and high-tech sectors) (2000: 290–1), the most recent work more fully acknowledges the feminisation of labour without gender equality as a model for how affective labour, which is 'required

of women disproportionately on and off the job', (2009: 133) has come to assume a central place for capitalist valorisation.

Acknowledging that immaterial labour processes are not entirely cognitive but may involve manual applications, and that the products of such labour may have material manifestations in autonomous objects, suffices to affirm the kind of hybridity insisted upon by Negri above, and cannot be read as mere capitulation to the necessity of corporeal mediation. Together Hardt and Negri (2009: 132–3) insist that immaterial factors may 'outweigh' the material aspects of commodities, and the labour that produces them is both corporeal and cognitive. Immaterial labour points to a fundamental change within post-Fordist production in which human semiosis ('general intellect') has become directly and immediately productive of value without any immediate material mediation.

Theorists of semiocapitalism want to regain, from the capitalist exploitation of not yet material products, by pulling out, redirecting and reapplying the latent potential 'coalesced' in their semiotic substantialisations, stealing it away from capital's semio-operations, from evaporating in the chimerical value production of financial capital, and forging a social time distinct from capital time. Perhaps it may be put this way: the creativity of cognitive labour harbours a potential to be otherwise that coalesces as a counter-tendency in the very process of coagulating semio-commodities. In this way coalescence breaks from coagulation.

On the question of resistance, Negri (2008a: 25) writes in a Guattarian tone:

> There is no outside to our world of real subsumption of society under capital. We live within it, but it has no exterior; we are engulfed in commodity fetishism – without recourse to something that might represent its transcendence. Nature and humanity have been transformed by capital. From now on, all aspirations to alterity ... are not only outdated but also vain. And yet: from inside this fetishistic world, the antagonism of living work is affirming itself and resistance is building.

There are cracks in the world that practices of immanence – like the horizontal participatory multitude forms of the Occupy Movement identified by Hardt and Negri (2011) – may regain for different ends against the setting to labour of all of life and the equation that life equals labour time (Negri 2008b: 214). Whatever leaks through the cracks and cannot be contained by capital, in the mutual hybridisation of material and immaterial labour, in its control networks of television and other

mass media, is available for the creation of the common no matter how awkward the transitions.

Reading together old colleagues Negri and Guattari reveals a quandary of alterity: for Guattari, alterity is vitally important to the collective process of subjectification that takes place before and beyond the person, and is itself non-human, but always in relation to 'an alterity that is itself subjective' (1995: 9), even if this is a machine, social, technical, large or small. Indeed, Guattari imagined a process that involved the detachment of 'semiotic segments . . . from the field of dominant significations' (1995: 13), these 'part-signs' serving as vehicles of autonomy and 'the promotion of a mutant desire'. Subjectification is for Guattari an ethico- and politico-aesthetic process of singularisation that works in and against the dominant modes of capitalistic subjectification, on the scorched earth of the social field wrought through ecological destruction, decimation of the public sphere by means of deregulation, and irresponsible – often criminal – financialisation. He describes this as a semio-chemical process of 'extraction' and 'separation' that is both poetic and precarious. There are a number of different alterities in Guattari's understanding of subjectification and they involve multiple interfaces: the other-machines (not only technological devices, but values possessing a 'specific enunciative consistency' [1995: 34]); other singular subjectifications; but also at the basis of the pathic logic/knowledge rather than rational production of subjectivity, an autonomous alterity installs itself prior to the binary subject–object relation that is not received passively, but is actively intensive and without extrinsic coordinates. In short, for Guattari there remains a choice, an ethical and political one, to be made between forces of normalisation that level and reduce everything, or for richness, polyvocality, processuality and singularisation, with the proviso that taking a chance on the latter is no guarantee of escaping from the daily grind.

For Guattari, subjectification is animated by an intensive machinic alterity (a 'supplement' [1995: 37]) that resists structuralisation and initiates breakdowns, hiccups and stalling as it diagrams a virtual universe for other human and non-human machines to enunciate. This machinic node places a 'proto-subjective' feature at the heart of subjectification. These two basic alterities – human-machine and machine-machine – are ramified by Guattari into multiple registers: between machines and their components; alterification of internal material consistencies; formal diagrammatic consistencies; difference from the evolutionary phylum itself; and between machines of war and

desiring machines; as well as alterities of scale and their correspondences across different levels (1995: 45).

In his 'Letter to Félix Guattari on Social Practices', (2001a: 560–2) Negri had already in the mid-1980s isolated the need for a destructive dislocation that would defeat modernisation by 'removing and freeing' the technical and material means for its realisation from the control of the 'totality' that imposed them. In this period of bitter defeat, Negri recognised the 'fragility of the relations of domination' especially in the 'capacity to produce subjectivity'. While this has increased in semiocapitalism, the liberation of independent components of 'radical ontological difference' and the transversal assemblage of singularities has also increased with the emergence of the social worker and the growing importance of his or her personal qualities that can become, as Negri hoped, 'consciousness of singularity' (2001b: 573) and the communitarian, international and cooperative dimensions of social production. The optimism that Negri and Guattari shared was focused on the potential for new subjectifications that desire ceaselessly constitutes, and which coalesce in the present, but also move towards a new future. In the same way Guattari sought out multiple 'machinic modalities of valorization' that capital, which tries to redirect them into the mortiferous spiral of its own law of value, could not capture and reduce, in a hopeful deduction of the determinations of the economic and juridical from an 'axiological complexion' – the maintenance of its heterogeneity remaining vital for its survival and the condition of its 'untiring renewal' (1995: 56).

How did Guattari overcome the allergy to ethics that haunts leftist politics? He valorised activist practices that engage artistic production towards maximising the incomparable and automodelising traits of mental and social ecologies with a commitment to ethically responsible negotiations of collective actions and large-scale ecopolitical engagements, since subjectivity is intimately imbricated in mutually dependent bio- and mechano-spheres. The ethico-political articulation across the three ecological registers would be accomplished with attention to both micro-and macro levels, by building a critique of technocratic solutions, and highlighting the role of artists in fostering emancipatory eco-praxes. In short, Guattari closely linked art and ecology in the production of subjectivity in a way that would assist in extracting potential for existential change and assisting in the development of new processes that are more complex, sustaining and enriching. It is the aesthetic, however, that characterises innovation in subjectification as 'one creates new modalities of subjectivity in the same

way that an artist creates new forms from the palette' (1995: 7). He underlines that the most promising selection of components will result in authentic alterifications and fructuous auto-modelisations that make themselves available for new collective assemblages of enunciation.

The first texts in this special issue show us how Guattari himself took up writing and drama as a practice of auto-elaboration and collaborative experimentation, imbued with his own select heterogeneous components borrowed from his critical repertory. While she was a doctoral candidate at University Paris IV-Sorbonne, Flore Garcin-Marrou discovered six plays written by Guattari between the years 1980–90. These plays are bursting with ribald pastiche of psychoanalysts and their beloved concepts, not to mention sacred cows of philosophy. The play, for example, *The Moon Master* (*Le Maître de Lune*) from 1985 ridicules Lacan's *objet petit a*. The IMEC Fonds Guattari contains in addition to the plays found by Garcin-Marrou further theatrical dialogues that remain to be read – for example, 'Parmenides' – filed under 'Ecrits littéraires'.

In her contribution, 'To Be or Not to Be Socrates: Introduction to the Translation of Félix Guattari's *Socrates*', Garcin-Marrou notes the following plays: *The Affair of the Lancel Handbag* (*L'Affaire du sac de chez Lancel*) is a political drama in the satirical cabaret style that dates from 1979 and *Nighttime, the End of Possibilities* (*La Nuit, la fin des moyens*) is Guattari's final play, and a work of childhood memory, written in 1990 and read at the Avignon Festival. *Psyche Ghost Town* (*Psyche ville morte*) displays Beckettian elements and offers a critique of desire. *Aimed at the Black Man, Killed the White One* (*Visa le noir, tua le blanc*) is a formal exercise displaying a tension between drama and non-drama.

The play that Garcin-Marrou introduces here in the first English translation by Solène Nicolas is titled *Socrates* (*Socrate*). While there is no shortage of plays bearing the name of the famous philosopher in their titles, Guattari's homage is to a cuckolded schizosopher. *Socrates* was performed in 1988 at Théâtre Ouvert Paris with playwright Enzo Cormann. Guattari knew Cormann from his work with director Philippe Adrien on the production of *Les Rêves de Kafka* in 1984 (see Genosko 2009). According to François Dosse, of all the plays that Guattari had sent to Cormann, *Socrates* was the only one he kept 'because its facetious tone amused him' (Dosse 2010: 430). Cormann considers his reading of the play together with Arnaud Carbonnier, with Félix in the wings, and the occasional shout-outs to Félix inserted into the truncated text, to be a good example of 'schizotheatre'. Heavily indebted to Aristophanes'

satirical *Clouds*, Guattari's *Socrates* bounces around with madcap glee between conjugal breakdown, a Pythonesque postman trying to deliver a parcel of what appears to be hemlock; postal jokes on Freud; cracks at Geneva School linguistics as an anti-humanitarian weapon ('signifying gases') and a Challenger we never knew from *A Thousand Plateaus*. *Guattari écrivain*, to adopt a coinage from Barthes, is a new way of reading Guattari today.

Guattari's commitment to the free radio movement is often located specifically in Italy with Bifo Berardi, Radio Alice and A/traverso. But there is also the equally famous example of his creation of Radio Tomate in Paris (for which his son Bruno was a programmer), as well as participation in the Minitel group 36–15 Alter, with the journal *Terminal*, and its notorious regulars like Eric Alliez and Pierre Halbwachs (Prince and Videcoq 2005). Guattari displayed a great deal of curiosity about free radio wherever he travelled, and this is evident in *Molecular Revolution in Brazil*, where he spoke at length about the movement during an interview with journalism professors and students at Pontifical Catholic University in São Paolo, detailing the differences between molar uses of free radio by national politicians and molecular deployments of the medium by mobile, neighbourhood militants. In a detailed discussion, Guattari explained the hybrid significations of machinic orality in such broadcasting, technical limitations on broadcast range, the effects of state interventions in the sector, and organisational innovation in some of the micro-stations such as Radio 93 and Radio Coeur d'Acier. Circa 1982, his interlocutors underlined the degree of media repression by the Brazilian state and explained to him that 'here not only would a free radio station be jammed, but also those involved could go to jail. My question is, if Lula were to create a Workers' Radio, would that lead to repression? (Guattari 2008: 155–6). For Guattari, the question of post-media did two things: it superseded postmodernism and presented a quandary about whether media and singularity could coexist. In his contribution to this volume 'Guattari and Japan', Toshiya Ueno places Guattari in the headquarters of the mini-FM station Radio Homerun in Tokyo and recalls the events of the visit. Regaining pirate aesthetician Tetsuo Kogawa's important contributions to post-media theory in Japan,[1] and specifying the singular dimension of the Japanese free radio experience, Ueno participated in the 'political pilgrimage' that Guattari undertook into the most troubled zones of Tokyo, including the Yakuza-controlled slum of day labourers known as Sanya. Ueno opens up this discussion by finding precursors and cross-references in Japanese letters and philosophy for Guattarian thought, focusing on the novelist

Kobo Abe and philosopher Kiyoteru Hanada. As Deleuze studies enters China with the translation of *A Thousand Plateaus* (Massumi 2010) and a major conference this year, there is a tendency to forget the role that Japanese scholars (translators), artists, architects and activists played for Guattari in furthering his understanding of the relationship between subjectification and global capitalism. Ueno reminds us about 'Cool Japan' and the 'bubble economy' of the 1980s that had both collapsed by the early 1990s. This was Guattari's Japan (Genosko 2002: 122–54) and his visits are marked by strange sponsorships from the most radical to the most conservative of hosts. There is still important work to be done on Guattari's visits to Japan in the 1980s as his dialogue with Min Tanaka is yet to be translated from Japanese (see also the rarely screened film by Joséphine Guattari and François Pain, *Min Tanaka à la Borde*, 1986). Of course, today in the shadow of the terrible events of Japan's 3/11 (earthquake and tsunami) and the Fukushima nuclear accident, there has been an upsurge in the anti-nuclear protest movement and large-scale, politically effective, and creative forms of youth agitation are integrated globally into the Occupy Movement (for instance, Japanese activists of Shiroto no Ran [Amateur Riot] brought their no nukes message to the Occupy Wall Street Movement in New York in November 2011). Post-media radicalism, assisted by social media, no longer sees mini-FM and micro-TV as adequate for social change in the technical cartographies of minoritarian becoming. Yet new hardware and software hacks remain vital.

In my contribution to this special issue 'Guattari TV, By Kafka', I consider the ambivalent role of television in Guattari's life and work with reference to his 'Project for a Film By Kafka'. Readers of *Deleuze Studies* will be aware of Guattari's plans dating from the 1980s to produce a film based on Kafka's oeuvre. He left many rough drafts that survive in the archives. There is a 'final' posthumous version, but no dialectical progression or corpus to speak of. Guattari envisaged a workshop spread over six months in which video would be shot, scripts developed and panels of experts convened that would generate enough material for a series of television programmes. Guattari believed he could use high-quality video to provide continuity between workshops. With around twelve to twenty hours of video in hand as 'basic material' after the workshops were complete, Guattari then envisaged a phase of script development and:

> a series of TV shows, with the aim of absorbing costs ... might result in a cultural series. But it should be understood from the outset that at no point

> should the workshop be impelled by the video team towards 'making a show'. The video team will have to submit a report, and participate in the rest of the work, without imposing its point of view, which would be that of the presentation to television viewers. (Guattari 2009: 153)

Here, then, television is a means of generating revenue for a project that would, in its initial workshop phase, yield a broadcast-quality 'series', which could be purchased by a network; ultimately, a stand-alone film would result. Television is a stepping stone. Details about each phase are not given in detail. Guattari even suggests that the 'making of a show' may not be a necessity if a producer decides to take the project on and find a co-producer for the film project alone. The likely order of events is relevant here as television is a proving ground for the final cinematic version (which might again be shown on television). Many state-run television stations have lost their production wings over the last twenty years due to cost-cutting, but during this period many new speciality and 'premium' cable channels and indeed entire networks have emerged with commissioning budgets. Networks like HBO (owned by Time Warner) have promoted themselves as TV-against-itself innovators with critically praised dramatic series such as *The Sopranos* and *Six Feet Under*, and such success has elevated the television writer and producer (David Chase and Alan Ball respectively, among others) to lofty *auteur* status, whose signature vision shows through in the series format and the bureaucracy of television itself. But HBO also has a film wing that has been dubbed an 'auteur studio' (Auster 2000, quoted in Heller 2008: 45). And *Cahiers du Cinéma* recently asked its readers to 'savour the consecration, by the small screen, of genuine auteurs' in the guise of Chase and his colleagues (Tessé 2010: 7). Guattari would have been well versed in French 'auteur TV' in the halcyon days of Institut national de l'audiovisuel commissions, and he likely modelled his project on this phenomenon. I maintain, however, that a number of critical provisos are required in the course of my exploration of this claim for the télé-auteur model that is subject to a theoretical displacement through the theory of affect. The transition from theatre to television and film (and, in fact, across the latter two media as the latest incarnation of auteur theory insists), widens the scope of media in which Guattari wanted to practise, notably in the last two decades of his life, and also complicates the reception of what is considered to be his contribution to media theory.

The question of Guattari's modernism, which is evident in his 'Project for a Film By Kafka', is explored in depth by Stephen Zepke in 'Art as Abstract Machine: Guattari's Modernist Aesthetics'.

Guattari's modernism presents a diagram ('abstract line') of aesthetics based on painting – his 'unpopular' choices include Balthus, Pollock and Modigliani, among others. Eschewing conceptuality for material processes of expression, Guattari embraced a modernism that was transformative, producing what is to come, and fundamentally political. Zepke provocatively regains this modernism against critical tendencies to situate Guattari's aesthetics in the anti-art tradition, which he debunks. Zepke reminds us of the synthesiser as Edgard Varèse described it in terms of the expression of the 'intense complexity of materials abstracted from their referents', and the figure of the 'cosmic artisan', who far from rejecting art, seeks a modernist politics in which a 'new future' is summoned by means of abstraction that frees the singular. This approach describes well Guattari's hopes for Kafka TV through which a new people is sought in a way that is not determined by the present, yet immanent to it and acting on it. Here, then, art is not overtly political but exudes a utopic excess.

The catalogue essay 'Machinic Animism' by audiovisual artist Angela Melitopoulos and social and political philosopher Maurizio Lazzarato was created as part of the curated exhibition 'Assemblages' which explored the role of animism in Guattari's thought; this contribution appeared in the 'Animism' show curated by Anselm Frank of Extra City, Antwerp, in 2010. Drawing on images from films by Fernand Deligny and Victor Renaud, as well as François Pain, and video interviews with a number of Guattari's friends and colleagues, the authors consider Guattari's scattered remarks on animism that are indexed to both Brazil and Japan and, more generally, to the archaic and its hybrid, modern mutations. Guattari often commented about the mixture of animistic religions, such as Shinto-Buddhism and Candomblé, with contemporary media technologies, as offering interesting recipes for subjectification beyond the typical impasses capitalism makes available (1996a: 105). This 'reconversion of the archaic' that Guattari identifies with the reinsertion of animism into contemporary life is not restricted to religion. In *Molecular Revolution in Brazil*, Guattari's sense of the opposing poles of identity (individual and cultural) and subjectifications such as Candomblé, which serves as a form of resistance for the Black population of Bahia (2008: 37, 96–7), expresses his concern with how fundamentally different worlds of reference like the latter act as bulwarks against capitalistic modes of subjectification. In a canny way, Melitopoulos and Lazzarato point beyond these obvious examples into more complex ideas within Guattari's *Chaosmosis* in which animistic elements occupy diverse worlds from infancy to creativity as such,

inhabiting objects, and overlapping subjectifications, that may form a powerful 'nucleus' within an assemblage (Guattari 1995: 101–2). What Guattari strives for is to understand how animism works as a partial enunciator with 'unframing' effects within assemblages of enunciation (131); recall how a particle-sign might catalyse an innovative coalescence outside the frame of the semio-commodity. Guattari shifts from religious (from the role of orishas in ritual possessions to aesthetic extractions from the real) to semiotic and machinic considerations as animism crosses the domains of anthropology, psychoanalysis and aesthetic production into how in its updated guises it influences subjectification.

Felicity Colman pushes off from Guattari's recently translated *The Machinic Unconscious* (2011) in order to investigate the molecular revolutionary potential of the machinic aesthetics of play in 'Play as an Affective Field for Activating Subjectivity: Notes on *The Machinic Unconscious*'. Her efforts to regain play from capitalistic valorisation work through an analysis of mediatisation and its effects on subjectification with an emphasis on how processes resistant to dominant models stir in aesthetic activities. Mediatisation, Colman argues, is open to all kinds of connections, and is not a deterministic or closed interpellation. Rather, play displays a mobile transversality in a 'field' that guides machinic assemblages through various media. Colman is attentive to the affects-times-speeds of how subjectification is positioned by media platforms, demonstrating that subjective assemblages are embedded in the evolutionary phylum and conditioned by the machines of one's time. She picks up Guattari's example of the pile of stones mentioned earlier in my essay on television as mediatic modelisation of a proto-machine, a pile of stones, into a wall (and its crumbling), and the political and aesthetic ends that such a process entails. For Colman, mediatisation produces and occurs through machinic interfaces, and she pursues their affective workings on the knife edge of machine and structure. We see how play is an extract that opens new universes of virtuality and options for aesthetic cartographies, in this sense gathering in Melitopoulos and Lazzarato's insistence on the animistic effects of aesthetic activities. Guattari (1995: 107) specified that the aesthetic machine has the power to disclose new dimensions of finitude, alterity and incorporeality, as well as requiring responsibility: 'Machinism, in the way I understand it, implies a double process – autopoietic-creative and ethical-ontological (the existence of a 'material of choice') – which is utterly foreign to mechanism' (108).

Colman's investigation of play's transversal field is conceptually consonant with Bryan Reynolds' theorisation of minor criminality as

a 'gateway' to transversal territory: it may be entered upon exiting from structure and individuation and identity ('subjective territory') and affords 'experiential alterity' (Reynolds 2002: 19). Field and territory as they are deployed by Colman and Reynolds recall Guattari's specifications of different types and interactions of pragmatic fields (Guattari 2011: 59ff.): the individuated, for instance, is vulnerable to capitalistic abstractions; whereas the diagrammatic finds potentialities in non-human machines and a-signifying semiotics. Play in an affective field disturbs the impositions of order, is less attached to abstract identities and attuned to more complex assemblages.

Acknowledging the important contributions of performance theory in Deleuze studies from the work of Reynolds to Laura Cull and Gerald Raunig (bringing together war and theatre machines in the performances of micropolitical agitation in Europe [Raunig 2010: 73]), Anja Kanngieser advances a concept of the 'performative encounter' in '... And ... and ... and ... The Transversal Politics of Performative Encounters' that does not take a theatrical form as such and is characterised as mobile, allusive and transversally transformative of collective subjectifications and enunciations. The primary cases under study are the German Umsonst campaigns of the zero-zero decade. Just as Colman situated play and, just plain fucking about, on an affective field of transformation, Kanngieser underlines the playful, pleasurable and temporary characteristics of the activist encounters in her analysis, but without neglecting the anti-capitalist and 'movement without bosses' spirit of the organisations at issue. But Kanngieser is most interested in the role of transversality and the subjugated–subject groups distinction as a conceptual tool for understanding Umsonst.

Regaining Guattari's early practical and theoretical innovations, Kanngieser exposes the emergence of a theory of groups that distinguishes non-absolutely between subject (actively exploring self-defined projects) and subjugated groups (passively receiving directions), each affecting the relations of their members to social processes and shaping the potential for subject formation and for molecular revolution. A subject group is best able to accept openness and role definition without letting it become a threat to its negotiation of otherness, a loss of security precipitating its decay into a subjugated group; a subjugated group is able to pass through the walls of its silent retreats and subservience and find its voice. It was through the modification of introjects such as alienating fantasies of a leader's power, or realisation that a group was not the revolutionary subject of history, and cleansed of the familialism and mythical

psychoanalytic complexes, that the superego could admit new ideals and demands. The application of Guattari's group/assemblage theory to Umsonst actions renews the richness and subtlety of the original formulations and brings them to bear upon a post-militant, transitory, leaderless assemblage, initiating a trenchant critique of German neo-liberalism evident in the 'performative encounters' that touched everyday issues such as public transportation that were felt most acutely by socially marginalised groups and precarious labourers. The nuances of Umsonst subjectifications and transversal relations are delineated in both their micropolitical but also aesthetic dimensions, detailing the temporary subject groups of Umsonst and their moments of 'affective composition'.

In her case study Kanngieser extends the trajectory of transversality which, within Guattari's lifetime, began at La Borde, where he developed the 'grid', a double-column entry table consisting of rotating tasks and times, that redefined roles, created new groups, introduced novel orientations. From this emerged a new way to communicate involving a specialised vocabulary, the *feuille de jour* (daily sheet), as well as challenges to and parodies of supervisors, and sudden valorisations or ghettoisations of activities and places. The grid changed over time during periods which saw the waxing and waning of centralisation and decentralisation, and was modified to maximise its therapeutic effects in response to changing conditions in the clinic from which were extracted whatever displayed the greatest transversal potential. Transversality began as a way of diagramming the unconscious of an institution and graduated to a descriptor of the potential for new progressive axes unleashed in processes of political depolarisation, which is also how Guattari understood the fall of the Berlin Wall. Kanngieser contributes to the renewal of the somewhat dated German reference points of Guattari's thought.

In the contribution of Adam Bryx & Bryan Reynolds, 'Go Fractalactic: A Brief Guide through Subjectivity in the Philosophy of Félix Guattari and Transversal Poetics', the stakes of group subjectification and transversality are laid bare as the authors extend Guattari's practices of metamorphosis in a clinical setting through a new conceptual vocabulary that fearlessly regains drug experience as a key touchpoint. Passing beyond the Guattarian bestiary and in Reynolds' established vocabulary, mapping departures from subjective territories, Bryx & Reynolds situate 'unblinkering' through a meditation on the tensions within wilful parameterisations of dissident becomings. Drawing from popular literature on LSD, which,

incidentally, recapitulates key issues within psychedelic psychiatry and the role of colourful characters like 'Captain Tripps' (A. M. Hubbard), who was director of the West Coast-based Commission for the Study of Creative Imagination, and whose refinements to the clinical setting were well received by professionals (Dyck 2008), parameter settings serve protective ends but are not fail-safe. The phantasy architecture of a good trip, just like the trappings of a romantic evening, guide subjectifications in practical ways and expose the contours of control that spikes toward the unexpected while taking cover under the predictable. Regaining *The Guattari Reader* as a kind of user's manual, Bryx & Reynolds seize upon opportunities for reinjecting the role of reflexive-consciousness into alterification, not as a by-product, and in order to win it back from deferment in the name of sustainability. This emphasis generates an array of suggestive concepts that describe the dynamism of subjectification along emergent and vectorial lines as it passes into transversality: fractalactic occurrences are akin to event-advents about to pop into place during the pauses of motored-consciousness: a combination of shifting speeds with the persistence of reflexive consciousness.

Bryx & Reynolds remind us that drugs posed intractable problems for Guattari; his productive use of gamma OH (gamma hydroxybutyrate) in the construction of his own subjectivity should not be taken as evidence of an attitude of casual experimentation with illicit drugs and alcohol. It is useful to think of his use of this 'uncontrolled' (at the time in 1971) substance in terms of a 'controlled' chaoticisation that danced around the rim of a subjective black hole. Many drugs, both legal and otherwise, would seem to count as substances that increase powers of action, and while Guattari supported decriminalisation of all illicit drugs, especially marijuana in the light of France's draconian search and seizure legislation, he also debunked the Beat mythologisation (theatricalisation) of drug culture (Genosko 2012). In a recent essay on the meaning of pharmacoanalysis and the illusions of consciousness, Gregg Lambert (2011) leaves no room for sustainable drug experiences in finding that all lines point to abolition and the diminishment of desire. Yet 'the moment the transversal turns into a line of abolition' (Deleuze and Guattari 1987: 299) hangs in the balance as the recalibrations of subjectification have both successful and failed elements that, as Bryx & Reynolds advise, require careful parameter settings.

One key challenge of how to read Guattari today is the requirement of inventively applying his examples from the 1970s, 80s and early 90s to the heterogeneous unrests appearing around the globe against the

'1%'. This is the project of Janell Watson in 'Culture as Existential Territory: Ecosophic Homelands for the Twenty-first Century'. Here it is not so much an issue of the prescience of his concepts, but rather, which features are best deployed to scrutinise contemporary issues. Watson pursues the mutating assemblages of singular subjectifications through an analysis at the ethological level of affective politics, utilising Guattari's ontological quadrant in ways that allow her to highlight the simultaneously progressive and reactionary roles of machinic phyla and focus on the necessity of existential territories that have become increasing portable and mobile. Watson regains some of the political essays from Guattari's under-read *Les Années d'hiver* ([1986] 2009) in order to regain his sense of what the 'fifth world nationalitarianism' of the twenty-first century might look like. Guattari's prediction of a reflux of archaic and residual ethno-nationalism that would vanquish the enemies of humanity is critically investigated by Watson who accepts certain hypotheses – the contestatory dimension of alt-modernities among second- and third-generation immigrants – but points out that certain others have not materialised, such as the waning of religious monotheisms, the enthusiasm for which seems inexhaustible. Using a case study of the Islamic headcovering as a focal point, Watson refocuses critical commentary by shifting the conceptual vocabulary from socio-semiotics to Guattarian componential analysis and providing an intimate picture of how an existential territory opens onto universes of reference. Finally, Watson opens up what is surely a Guattarian can of worms: culture as a deterritorialising force and how to move it beyond mass media and capitalism. Guattari once remarked that culture is a reactionary concept because it prevents us from grasping the processes of capitalistic subjectification based on equivalence (value and time) and uneven distribution of assets; it is guilt ridden and animated by infantilism: 'there is only one culture: capitalistic culture' (2008: 33). Understanding how culture compartmentalises semiotic productions as attributable cultural expressions and spheres, makes use of scales of measure to judge and classify cultural levels, and how the programmes of state agencies seek to increase cultural assets of places and peoples, are all part of a diagnosis whose treatment requires the cultivation of machinic, molecular singular becomings, processualities, and the garnering of all – even the most unlikely – challenges to capitalism. At low points in his later life, Guattari was less than optimistic: 'one is forced to admit that there are very few objective indications of a shift away from oppressive mass-mediatic modernity toward some kind of more liberating post-media era in which subjective assemblages

of self-reference might come into their own' (1996a: 98). The task for Guattarians today is to forge contemporary tools adequate to the passage beyond mass media and to assemble components whose processuality defies the lures of mass culture.

In 'Institutional Schizophasia and the Possibility of the Humanities' 'Other Scene': Guattari and the Exigency of Transversality', Michael Eng applies Guattari's group theory to the contemporary predicament of the humanities and the long, slow burn of the 'end of the University' itself. In this innovative take on the humanities' predicament or, more precisely, the predicament of those of us situated within the humanities, Eng writes from the perspective of a American philosopher on a death watch of sorts. His Guattari offers a trenchant analysis and escape route from the semiocapitalism of the contemporary neoliberal university with its penchant for more and more a-signifying pedagogical strategies (real-time student responses and automated performance analyses of attention drift and knowledge retention), precarisation of labour ('sweated' and hidden), and corporate research partnerships (tropes of excellence and knowledge transfer and community partnerships). But first some hard questions need to be posed, and some even harder answers given. Is the threat to the humanities another case of scholarly narcissism or an effect of the corporate university? Eng's argument is that defences of the humanities illustrate Guattari's understanding of the dependencies of a subjugated group that is incapable of recognising the core, capitalist purpose of the contemporary university. It is the complicity of the humanities in the fulfilment of this purpose, that is, in their own deaths, the orders for which are passively received, that troubles and interests Eng and he deploys the concept of transversality as a practical exploration of this untenable condition. What makes this approach innovative is that Eng regains the university as an institution of concern as it did not figure largely in Guattari's thought. Of course, Guattari had little interest in university life and did not move in academic circles. But it is not exceptional.

Eng's analysis of the complicity of the humanities in the reproduction of capitalistic subjectivity in the university is through a number of gateways – consumer goods, psychoanalysis, linguistics. These function as institutional objects not easily given up, and result in a double failure to grasp the humanities' own group fantasies and assume some responsibility for their predicament. Eng's question is not so much the need to take a sober look at how phenomena like rank and other comforts from anxiety shield the humanities from itself and from the realisation that only academic publications hear their cries, but rather,

what to do about this situation with the tool of transversality in hand. How, then, to disturb the status quo? In quite different ways Colman, Kanngeiser, Bryx & Reynolds, and Eng return to transversality and Guattari's theory of groups in a search for new ways to configure resistance and innovation in the age of semiocapitalism.

To Be or Not to Be Socrates: Introduction to the translation of Félix Guattari's *Socrates*

Flore Garcin-Marrou

Abstract

The Fonds Guattari contain a number of unpublished manuscripts catalogued under the title of 'écrits littéraires' which include a set of theatrical dialogues. Noting the scope of these titles, as well as their likely models, Guattari's theatrical practices are introduced with reference to the only play that was actually staged, *Socrates*, courtesy of Enzo Cormann at the Théâtre Ouvert, in Paris, in 1988.

Keywords: theatre, postdramatic, schizosophy, archives

Gilles Deleuze and Félix Guattari are not known for having a deep, enduring interest in theatre. Deleuze ([1988] 2004) explained in *L'Abécédaire* his disinterest in theatre with force and clarity: 'Theatre is too long, and too disciplined'; it is 'an art that remains entrenched in the present and in daily issues, while never advancing beyond the dimensions of the present'. While showing admiration for the directors Bob Wilson and Carmelo Bene, he nonetheless expressed regret unambiguously: 'I cannot sit in an uncomfortable armchair for hours anymore. That alone destroys theatre for me.' While Deleuze took theatre along new lines of flight and pushed it to the verge of pure abstraction, Guattari explored the links between theatre and television, theatre and cinema, and theatre and music. He intimately hoped to become a man of letters or a man of theatre, and he wrote six plays for the stage between 1980 and 1990: *The Case of the Lancel Handbag* (*L'Affaire du sac de chez*

Deleuze Studies 6.2 (2012): 170–172
DOI: 10.3366/dls.2012.0055

Lancel), *Psyche Ghost Town* (*Psyche ville morte*), *The Moon Master* (*Le Maître de lune*), *Socrates* (*Socrate*), *Aimed at the black man, killed the white one* (*Visa le noir, tua le blanc*) and *Nighttime, the End of Possibilities* (*La Nuit, la fin des moyens*). All these plays are unpublished in France.

These are neither philosophical dramas, nor are they what is often referred to as 'Theatre of Ideas' – the theatre of Jean-Paul Sartre, for instance. Instead, these plays are sometimes reminiscent of the *Ubu* cycle of Alfred Jarry, at other times suggestive of the Dadaist and surrealist theatrical experiments. Guattari referred to them as 'chaosmic sketches', and he wrote them rapidly and with no intention of philosophical seriousness. The plays are composed in the tone and style of daily life, peppered with occasional childish wit. Guattari satirised and mocked the patrons and icons of psychoanalysis (Freud, Melanie Klein, Jung) and of philosophy (Socrates, Lucretius), and, of course, himself. Guattari stages a crisis of the character which implies a crisis of dialogue and fable. The personalities of the characters are ill defined. They are devoid of idiosyncrasy and like the coming together of collective enunciation, so that their subjectivities are schizophrenic and kaleidoscopic. The dialogues no longer mean anything: words are scattered like palimpsests; they go through the bodies of the characters which thereby become the source of jumbled social, political and poetical thoughts. The story that is being told has lost its logic along the way. The heterogeneity of dramatical elements is the foundation of a rhapsody whose elements are assembled like a patchwork reminiscent of the *Riemannian* framework that is repeatedly mentionned by Deleuze and Guattari in *A Thousand Plateaus*. What Guattari brings on stage is the 'schizo' theatre which was devised with Deleuze as early as *Anti-Oedipus*: it is no longer an opportunity to interpret theatre but to experiment with it.

Socrates may have been written for one of the theatrical representations that used to be staged each year, on 15 August, at the La Borde clinic where Guattari worked for most of his career. In March 1987, Guattari and the lighting designer Jean Kalman considered staging *Socrates* and they thought of the following cast: Ryszard Cieslak (a favorite of Jerzy Grotowski's) in the role of Socrates, Maïté Nahyr in the role Carmen, Hans-Peter Cloos in that of Alphonse and Gabisou in that of Challenger. *Socrates* is actually the only play by Guattari that was staged: the playwright Enzo Cormann and actor Arnaud Carbonnier organised a performance in the Théâtre Ouvert, in Paris, in 1988.

In Aristophanes' *The Clouds*, Socrates had already been portrayed as a ridiculous character: Socrates was a bum, sleeping on a pallet full

of fleas, and trying to see the world of Ideas by ascending in a basket suspended from a tree bringing him up to within a few metres of the sky where Ideas were supposed to be located. Guattari, in his own manner, places the Father of all philosophers upon the stage in a most unflattering light. The plot of *Socrates* can be summarised as follows: the character called Georges claims to be Socrates. Carmen, his wife, tries to calm him down. Georges seems to be suffering from a spasm of delirium, a spell of mystical hallucination, during which he thinks he is the Greek philosopher. Socrates is now nothing more than a schizophrenic, the herald of the terrorism of the Logos, detesting Lacanism, evoking the poisonous thought of Ferdinand de Saussure, and connecting linguistics to the Geneva School and the Geneva Conventions of humanitarian law...

The play starts with a triangle made up of husband (Georges), wife (Carmen) and lover (Challenger) – typical vaudeville material – and builds to something quite different: subjectivity enters a crisis as relativism and falsification are unbound, echoing the restoration of illusions that was expressed in *Difference and Repetition* as well as in *The Logic of Sense*. The bombing that rains on the scene marks the end of a world, and the scene then transforms itself, first into an icefield, then into a tundra with a burning bush. Georges is trapped in his delirium, or in a locked room (possibly standing for his brain), but this situation is eventually disrupted by Challenger's appearance – a *deus ex machina* wearing the uniform of an American soldier. Challenger is a recurring character in the works of Deleuze and Guattari: an heir to the character of Conan Doyle's *The Lost World*, he embodies the concept of the *double bind* in *A Thousand Plateaus*.

This play confirms that the theatre of Guattari is consistent with the definition of the *postdramatic theatre* theorised by Hans-Thies Lehmann: there is a crossover at work as all the other arts are involved in it. This is another form of *theatre total*, and it considers that neither the action, characters nor the dramatical conflict are essential elements to produce theatre. Drama, which entered a crisis in the late nineteenth century, is taken beyond its own limitations, towards new lines of flight. This drive carries it towards freer forms, and sometimes towards the absence of forms altogether.

Socrates

Félix Guattari[1]

In a shadowy light.

Georges:	I am Socrates.
Carmen:	Now, now, here he goes again!
Georges:	What? What's wrong with this? I am Socrates, big deal! There's no need to make a mountain out of it! *He goes near Carmen and starts talking with a Russian accent*: What is it, my Karmen, my candy Karma?
Carmen:	It's ok, drop it!
Georges:	Would She rather be my Catholic Caramel?
Carmen:	Stop it, you're a real pain!
Georges:	Notwithstanding, could I have the great good fortune and privilege to have a conversation with Her about a question that I dare describe as being in our common interest?
Challenger:	Can't you see she just answered: not now!
Georges:	Could I be a-dreaming? Or could it be that someone just had the nerve to talk to me instead of her? Stand back, turkey turnkey!
Carmen:	Will you please stop your act! Come on then, come here: what was it you wanted to tell me? *She beckons Challenger to walk away*. Challenger, you will give us some space for a minute, won't you? *To Georges:* And don't *you* take advantage of the situation. And try to understand this is the last time.

Deleuze Studies 6.2 (2012): 173–186

www.eupjournals.com/dls

Georges: The very last one! Damn! If that is so, I will relinquish it for good then and might come to wearing my heart on my sleeve and having death on my banner. Surely you expected this to happen, my darling chimera: I'm not really the half-hearted kind. Shit, I'm a proud man after all!

Carmen: *Threatening*: Shut it! Come here, and come here quick. *Georges moves near her, scared, with bulging eyes.*

Georges: But I haven't done anything wrong!

Carmen: Come on, what is it you wanted to say?

Georges: Don't you worry! It's nothing really. For one thing, I've already told you.

Carmen: What? That you're Socrates?

He nods pitifully.

Carmen: *To Challenger, who is still within earshot, though with his back turned:* Did you hear him this time? See, it's all starting up again.

An increasingly loud droning of planes can be heard. It is reminiscent of the bombers of the previous world war.

Challenger: *Sidles up to Georges in a friendly way.* Are you at least positive about this?

Georges points to the sky.

Challenger: Yes, I know that it's the Americans, but we should not worry too much about it!

Georges: It sounds more like military sedition to me.

Challenger: Forget about it. I'd rather hear about how it all came back.

Georges: *Casually*. How what came back? My being . . . Socrates? Oh, that's easy enough. First there was like the striking of a match that is being broken in the middle, except that this time there was also the empty shape of sound – does that make any sense to you? So tell me, you really think that there is going to be war again?

Challenger: Maybe you haven't counted properly?

Carmen: How many weeks late?
Georges: I don't really know, it's difficult to say. But what I know for sure is that all the tests are positive.
Carmen: Surely you should have taken precautions.

. . .

Alphonse: *Greeting Carmen ceremoniously.* Do you know, fair lady, that this could be a massive breakthrough!
Challenger: What's-that-you-say?
Alphonse: My heartiest apologies, ladies and gentlemen, for interrupting your conversation. But when I saw what was brewing, it came as a shock and I said to myself, dear old Alphonse, surely the time has come . . .
Challenger: What's that intrusive one going on about?
Alphonse: In my defence, you cannot ignore that in case of *force majeure*, they'll discard you as vain and smug if you don't have a stooge, but if there's two, or three, or four, or plenty of you, then no one will question your words. Therefore, bear with me, though I do not have the honour of a formal agreement, things can go smoothly . . .
Challenger: That's what you say!
Carmen: But Mister . . . what's your name again?
Alphonse: Alphonse, from Belgium.
Carmen: Dear Alphonse, since Alphonse you are, what have you inferred from your first approach to the problem?
Alphonse: The truth is, little more than the common folk, except that in this type of case one is entitled to expect additional information . . . .
Challenger: *That's* what I was expecting.
Carmen: Information about what, if you please?
Alphonse: *Doubtfully.* Something like a spiritual increase, a right to follow, a guarantee that it'll work or die . . . .
Carmen: Couldn't you be any more explicit?
Alphonse: Oh, but what do *I* know? Something that'd say he is mortal . . . .
Carmen: Quite a vague thing to say!
Alphonse: Or that he is a man . . .
Challenger: I can't see any connection here!

They say the final lines from the top of their voices: the droning of the planes, which had at first decreased, gets louder and louder until it completely covers the voices. All the characters eventually flee from the explosion of bombs, leaving no one on the stage but Georges.

. . .

Georges walks to and fro.

Georges: In the shell of anguish

A voiceless

So

Soundless

Sound

Stone-deaf

Signifier signifying little

Beginning of something new . . .

An extremely tall postman who is very busy deciphering the address on a parcel walks past without seeing him.

Postman: I say, this thing here is absolutely illegible. BER . . . MACR . . . ARBEIT . . .

Georges: *He walks up to him:* May I?

Postman: Who are you?

Georges: Me? Hem . . . Let's say I'm Socrates.

Postman: Wait a minute . . . That doesn't look right. That's pushing it a bit! What with our poor wages! By the way, your thing, how do you spell it?

Georges: What? Socrates? The way it is pronounced: S for Socrates, O for Octavian, C for Caligula . . . But let me have a look . . .

Carmen: *Interrupting:* Don't give it to him! Don't you give it to him!

The postman raises his arms, holding the packet really high, so that none of them can reach it.

Postman: God! Make up your minds!
Carmen: But I'm telling you he's not the one!
Postman: *Showing the parcel.* But then, this thing here, who'd that be destined for? *Showing Carmen.* And that whirligig there, where does she come from?
Georges: You might call her my wife.
Postman: Good heavens! That's the story of my life, when there's too many things and too many people, I get mixed up.
Carmen: Stop the chatting, give that to me now.

She grabs the postman by the sleeve and tries to grab to parcel.

Postman: Ouch! Mrs Socrates, have mercy! I happen to be extremely ticklish! No! Anything but that! Stop it or I'll call for help! Help! Someone help me!

Challenger walks in.

Challenger: Hey! You weirdos! What's the racket all about?
Postman: It's because of the Socrateses, Sir, they keep pestering me while I'm on duty.
Challenger: But you're mistaken, my dear friend! These people have nothing to do with Socrates!
Postman: Ah! Teach me something! It's my lucky day! But then . . . But then . . .

He scrutinizes the label on the parcel again.

Postman: Heavens! It does look like this is the name that's written there.
Georges: *Shouting in triumph:* Ah Ah! Of course! Zounds! I told you! Who was right? And how much had we bet on this?
Challenger: Be that as it may, Mister postman, rest assured that your man is not here.
Georges: Stop there! It's postmarked isn't it? What do you make of that? Where does it come from? Check the postmark! *Georges starts jumping in the air again to try and grab the parcel.* The postmark! The postmark! We want the postmark! I'm a taxpayer, I am! And I am entitled to read the postmark . . .

Carmen: *Reproachfully*. See the state he's in because of you!
Postman: Calm down, my friend. Wait, we'll check that together. It seems indeed to be a foreign stamp. *He shows the postmark to Georges who is standing on the tips of his toes.* There, *you* read it, for I haven't got the right glasses.

Georges deciphers the postmark painfully.

Georges: D . . . E . . . L . . . Deli.
Challenger: New Delhi?
Postman: I'd rather expect something like Delicatessen.
Challenger: In that case, you could have Delfzije, Maigret's hometown.
Postman: No, it's De . . . li . . . gny. Or maybe: Del . . . phoï. Yes, that right: Del . . . phi. Delphi, in Phocis, on the hills of Montparnasse. Ah! Hometown! Home sweet home! Benzaï! Benzaï!

He catches the postman unawares, snatches the parcel out of his hands and flies away with it.

Postman: Wait! Wait and see! Per favor, Sir Socrates! You could at least sign the receipt for me!

Upset, he turns towards Carmen and holds out his ball point pen to her.

Postman: You, Mrs Socrates, you're the last reasonable person on this planet! You ain't gonna let me down, are you? You're gonna sign my receipt for me, aren't you?

Carmen walks away with a shrug of her shoulders as the poor postman falls on his knees, his arms still outstretched in her direction.

Postman: *Facing the public:* It's no wonder, in front of such ungratefulness, that the tricuspid valves of a man end up falling apart. Oh! I know that quite a few of us would have equally overlooked such an apparently futile stumbling of the symbol. Nothing to write home about, nothing to upset the original cosmic soup. Ok!

I grant you that! Except that this comes as an echo to the cracking of the match that was previously pinpointed by our dear Georges, so don't we have ground to fear for the worst now: a general tumbling down of the dominos, a thorough and rolling disorder of all sports! But let's not procrastinate any longer, and let's now hunt for our unfortunate friend.

. . .

Georges, holding the parcel in one hand and a bike in the other, is walking deeper into the ice flow.

Georges: They wouldn't have treated me any worse than this if I had robbed the key to the wind and rain!

Challenger's indistinct talking in the distance.

Georges: Goodbye! Vain mobs! Watch as I'll go and vanish into the chasm.

Challenger: Georges! Don't screw things up! Wait for me!

Challenger trips over a tree stump and falls down into a pond.

Challenger: OUCha! Somebody help me! Georges, can't you see I'm burning?

The head of Georges comes out of a burning bush on the tundra which is standing, as though on purpose, right next to Challenger.

Georges: Who art thou? Who comes hither and dares interrupt my celestial journey?

Challenger: But Georges! Don't you recognize me? Georges, Mister Georges! It's me, Challenger, your faithful adversary.

Georges: *Raising his arms in the air*: Ah, dear Mister Challenger! What a surprise! And how is war developing? And how is our Lady-Wet-Blanket doing?

Challenger: You must be referring to Mrs Carmen? Well, she is as good as can be really. By the way, she insisted that I bring you back home *presto*.

Georges: Well, there, sweet companion . . . for the time being, I am far from being done with all the life that's going on here. *He holds out the parcel.*

Challenger: What! You still haven't opened it?

Georges: It takes a fair amount of caution, if I may say so. And in those days . . . .

Challenger: Do you fear something like a parcel bomb?

Georges: Please! Don't make me say things that you wouldn't want anyone else to have hushed from you! And do mark that I leave you with the entire responsibility of your assumptions. For, the truth is . . .

I have been through so many tropical torpors,

Brain horrors

Semantic storms

Used so many verbs in the spring of the future

In the present of the summer

In the imperative of the winter,

In the imperative of the autumn.

I have been through red fire,

I have swallowed purple pills,

I have chewed some . . .

What's their name again, those flowers with orange bells, as crispy as pizza crusts?

Challenger: Hem!

Georges: *With a motion of his mouth*. Ok then. May the bubbling torrents of octopus ideas and one-eyed algae that stew in my heart of hearts overflow and cover all things. But, enough emotion, tender Challenger, I've had enough of your standing here, sheepishly listening to me, you drive me nuts and bolts.

He holds out a huge gun and starts firing in the air.

Georges: Away you go, villain! Or it will be the end of you. Let's go! A fair amount of soup and to bed! And give the certified copy of my feelings to Carmen loud and clear.
Challenger: Precisely, she had thoroughly insisted that I . . . .

Gunshots again, this time aiming at Challenger's legs.

Georges: We know your tricks, you scoundrel!
Challenger: The bugger is going for my legs! Me, a mere messenger. Have mercy, mercysir, have mercy.
Georges: *Derisively*. Mercysir! Mercy sir who?
Challenger: *With a ceremonious bow:* With your permission, I figure . . . .
Georges: There ain't no father figure or mother figure anymore, not as long you haven't poured your heart out, my good man. So, back to steerage. And first, port. What can you see?
Challenger: From port, I see the tundra's heart beating wildly. I see the chamois on the top and brim of laws, I see the gossamer sparrow and the tarantella mozzarella, I see . . . .
Georges: Here, right in front of you! Damn! Right here – *he points to himself* – what is there that you can see?
Challenger: Hem!
Georges: Avanti, popolo!
Challenger: What I see here, Master? But with no hesitation and no stooge, I see you, quite simply you, in your unflinching splendour, both unmatched and unequalled.
Georges: Isn't that just great? Pure wool! And with a handsome model, I grant you that. But me who what?
Challenger: *Aside*. The bugger! He's trying to trap me!
Georges: Come, speak boldly, regardless of my opinion and if you have something better to say, you'll have my blessing, I promise. I wouldn't be so surprised if your views turned out to be better than mine, for you seem to have studied these questions and learnt from the lessons of the other.

Challenger: When the salting came

Went to meet

With Balthazar

Hola, Caesar! . . .

Georges: You're evading my questions, you fool! Will you answer? Am I, or am I not the ultimate destination of this parcel? And there's no room for any mistaking, for you could *presto* become the final destination of the present bullet.

Showing his pistol.

Countdown: 7, 5, 14, 8, 3, 2 . . .

The bombing starts again.

Challenger: That's it! You're Socrates! Have it your way, scum!
Georges: I didn't quite hear you, say it again. And double-quick or I'll blow your brains out!

There is some shy knocking at the door, which is soon followed by by various sounds of pipes coming from the opposite wall. This gives way to new, louder sounds from the ceiling. It all combines to form a kind of symphony. Georges stands up cautiously and goes to look through the keyhole. He turns the lock as noiselessly as possible and comes back to his seat.

Georges: *Whispering.* At first, I hadn't taken it really seriously. Those things, you think that it will always be soon enough to think them through again. Moreover, in those days, I was still chased by that pack of children who cried out to me, from morning to night: 'Hola! Father Hemlock, aren't you going to open your parcel?' So I would turn around, good-humouredly, and threaten them: 'Just you wait, scoundrels, wait until I catch one of you!' They went and came like a flock of robins. But the day when there was no one and nothing . . . .

Scratching at the door.

Carmen: *With a plaintive voice*. Open, I beg you. Open, I know you're in there!

The phone rings. Georges's gaze goes from the door to the phone that is on the floor, and back again. He tiptoes his way to the phone, lifts up the receiver and puts it down without bothering to listen to it.

Georges: It feels like it's all starting up again!

Crystal clear voices seem to be raining from different sides:

Chorus: A B C D time has come . . . when time's up . . . it's not time . . . when time's up

Multiple voices: Daglock, clock, knock, flock, lovelock, hemlock, wedlock, unlock, Sherlock . . .

Georges: Where was I? Yes, at first, I always came back without frowning to the cracking that they would later describe as essential:

CRACK

DIMENSION

NO HESITATION

This is all very nice, but, then, you're kind of stuck there. And meanwhile, I heard the echo of the nagging nag of the poor postman's despair or, to put it differently, it was like the bursting of all possible factorial analysis, what others had hurriedly linked to the fall from the post horse, which is famously crucial in the monograph of 'Little Hans'.

Someone kicks in the door. Georges leans against it to prevent it from being destroyed.

Carmen: Georges! Georges darling! Open to your Candy Carmen. Come back to me, don't leave me! You'll be my Socrates for life and I'll be your tarantella for the

weekends. And every now and then, I swear to you, I'll hallow thy name, oh, my Socrates! The only object of my impact!

She puts her ear to the door, as Georges starts whispering again.

Georges: Apparently, nothing proves that this is actually hemlock. There's no tag on it, after all! Let's suppose it is though, we can't be sure that the bloody parcel was really addressed to me *in vino veritas*. We can't be sure that Postman Lanky wasn't the king of cheats and, supposing, just supposing, that the name here on the label is indeed Socrates, we still have to prove with no manipulation whatsoever that the applicant is indeed *recto verso* the one that's here talking to you Ladies and Gentlemen, and moreover that he-had-always-been-that, that is, that he was a man, and to top it off, that he was mortal and all that comes with that. Therefore, during that time, you must realize that… *(He gives the finger)* I'm taking to my heels! Especially since we've left aside the question of whether it is possible to be a man without being mortal and *vice versa*, to be mortal without being a man, which is a lot less economical, I grant it, but there's no avoiding that you'll always have variations galore, all you can eat, and even, in the most extreme cases, it would have been seriously wise to actually give me some hemlock, but we should have checked in good time: *PRIMO* that it was *safo*, of the Conium maculatum type, not Aethusa cynapium or dog parsley, or sweet-and-sour-to-wash-it-down and, *SECUNDO*, that I hadn't myself been mithridatparalized in my suckling days or by a habit contracted while ambling around the world. And if they relentlessly told me that I moaned so much about the soup that someone would eventually think something about myself, vergogno! I would say to them, *in vitro and in peto*, that even facing them and without hindsight I would always have the liberty to come back to the shortest way, that is, speaking from a phenomenological point of view: what is that little thing our lives come down to? A something *outside*

surrounded by a certain quantity of something *inside*. Presumably! Or if you'd rather, an outward doubled with some kind of interiority. That's not bad, boy! It has the same hard-on as Archimedes's lever. From then on, you can gather the ins and outs of why I fell pregnant. For, beware, my friends, no one ever speaks about that thing here! It has become, sort of, one two three, Totem and Taboo. But let us just suppose – a simple supposition, that we tie it back to that story, a medley of a story, with a clown's knickers and with my sister who has a bun in the oven! Mehr licht! Yet another bountiful idea! They give you three caskets: that of the body-jug to pour life *(he puts his hand on his stomach)*, that of the gloom-room that is besieged by that mad woman *(he points to the door behind which Carmen is still restless)* and that of the hemlock to see the spry old birds through *(he pretends to drink a cup)*. Alleluia, come down Yahweh! Bring down dawn and some phylum to unfreeze what's coming next . . .

The ceiling tumbles down under the weight of Challenger who is dressed up as an American soldier. The strings of his parachute keep him hanging in the air.

Georges: Oh my! You again!
From outside: What's the matter with you my angel?

Carmen: You're not hurt, are you? Would you like me to call the firemen?

Challenger: *Telling him not to reveal anything with his forefinger on his mouth*. Hush. *He now points to his ears:* Mission Alcibiade: I have come *incognito*.

Georges: *Turning in Carmen's direction:* Don't you worry, ginger, everything's ok.

Georges climbs on a chair to try and take Challenger off his hook but the latter pushes him away.

Challenger: Let me do this, it's a rising model.

Challenger now shows what he meant and uses a remote control to go up and down. Then he starts twisting and turning above the parcel.

Georges: We can see what the little bastard is driving at. So that's why he had come back to see me. I'm such a scatterbrain: I thought he wanted to take care of my transcendence! But why do they all make such a fuss about the bloody grinding process of the partial object!

Carmen: Georges! My beloved Socrates, I sense that you're hiding something from me. Will you open to me, *psychorama mio*?

Challenger: *Whispering*. Don't do anything! It's probably a trick from the left. I'd rather you gave me the thing – *he points to the parcel with his foot*. Quick! I still have quite a bit of shopping to do: the night is coming and the shops will close. *He goes up and down impatiently.*

Georges: *Stubbornly refusing*. There is no reason to do this! There is no reason to do this! It could only upset me!

Challenger: Cut the crap: if you're a French patriot, you have to give it to the American scholars.

Georges: By Jove! And in no time they'll be coming up with some devilish object!

Challenger is gesticulating like a mad man while ordering him to remain silent.

Georges: After Star Wars, the logo war! That's where one hundred years of Lacanism took us! But as far as I know, the Saussurian Conventions of Geneva haven't ruled out the use of signifying gases have they?

Challenger, in one final effort, manages to grasp the parcel with his feet and starts to rise.

Georges: Stop! Not so fast! Sign a receipt or, at least, an acquittal, and I'll go and join him on the road of sex, join him in the alembic of sex!

Georges holds on to Challenger's leg; they both disappear through the ceiling while Carmen keeps on whining, desperately banging on the door.

Guattari and Japan

Toshiya Ueno

Abstract

Revisiting Guattari's visits to Japan in the 1980s during the country's 'bubble economy', this paper investigates from a personal perspective the Radio Homerun mini-FM station as well as other stops on Guattari's Tokyo 'pilgrimage'. Guattari's reception and influence in Japan is contextualised through the writer Kõbõ Abe and philosopher Kiyoteru Hanada, in addition to the groundbreaking work of Tetsuo Kogawa, against the backdrop of the rise of postmodernism. Similarities between Guattari's sense of Japan and Brazil are then broached.

Keywords: Japan, free radio, mini-FM, bubble economy

It is well known that Félix Guattari was so fascinated by Japan that he visited the country several times. This essay aims to explore the conceptual and political meaning of his interest in Japan. Of course, given that his works could never be reduced to 'Japanology' in any sense, the scope of this paper must also be deployed in a broader sense. His address of Japan, for instance, is to be interpreted along with his positive assessment and almost enthusiastic regard for Brazil. Even in his interviews and workshops held throughout Brazil, Guattari frequently draws on Japan and posits various comparisons with Tokyo. Both societies are for him quite symptomatic cases that consist of a strange mixture between modernity and archaism (pre-modernity at least) (Guattari and Rolnik 2008: 453–4, 457).

The second section will look at two key Japanese intellectuals who came before Guattari, but who develop concepts that overlap with his: Kõbõ Abe and Kiyoteru Hanada.

I. 'Micro-political Pilgrim': Guattari's Visits to Japan

During his visit to Japan in 1985, Guattari joined in 'a political excursion' wandering around downtown Tokyo. This was organised by Gen Hirai, an anarchist writer and friend of Ryuichi Sakamoto (a well-known international musician and ex-member of Yellow Magic Orchestra) stretching back to their days in the high-school student movement in the late 1960s. As part of his 'fieldwork', Guattari visited our tiny pirate station, Radio Homerun, in order to have a discussion about cultural politics in the street, slum and (post-)media situation of Japan. Due to the strict regulation of the airwaves, free radio in Japan was only allowed to broadcast inside a radius of one kilometre; this is the reason why it is called 'mini-FM'. This also enabled us to invent the post-(mass-)media concept of 'narrow-casting', which differs significantly from the conventional idea of broadcasting in mass media.

A critic and media theoretician, Tetsuo Kogawa, a friend of Guattari, who had introduced the political theory of Italian Autonomia and practice of free radio into Japan in the early 1980s, did not join the fieldwork with Guattari despite their regular correspondence. Strangely enough, although François Dosse's (2007) biography of Deleuze and Guattari dedicated an entire section to the reception of their philosophy in Japan, he never mentions him. Kogawa invented the term 'informational capitalism' (*Jyoho Shihon Shyugi*), which can roughly be understood as a synonym of semio-capitalism, in order to criticise all strains of neo-liberal deregulation in the economy, gentrification in urbanism, and control in (mass) media. Even Guattari's typewritten manuscript of the book he wrote with Negri, *Communists Like Us* (1990), was delivered to Kogawa by 'snail' mail in 1984. Kogawa's (1984) name was constantly raised during the excursion, however. In my view, at that time, he seemed sceptical about this excursion and tried to distance himself from the rising current of postmodernism and its accompanying political apathy in Japan.

Kogawa had already criticised the manner of introducing Deleuze and Guattari's works into Japan since its very early stage from the late 1970s. He contended that the Deleuze and Guattari boom in Japan was deeply based on the discursive formation of an apolitical climate, that is, an inclination to 'Deleuze & Guattari minus activism', or 'Deleuze without Guattari'. The same holds true for the Anglophone world, despite Slavoj Žižek's (2004) complaint about a 'Guattarised Deleuze'. Žižek calls Guattari a delirious thinker tripping within an 'interpretive delirium' (191). I am tempted to use the term 'Deleuze Guattariser' against the

Figure 1. Félix Guattari (centre right, seated) and the author (near left, seated) at Radio Homerun in Tokyo, 27 November 1985. (Photo: Toshiyuki Maeda, reproduced by permission.)

grain woven by Žižek, because it figures Guattari as a creative catalyser of Deleuzian thought and philosophy in terms of micro-politics and molecular revolution in a pragmatic sense. The Guattarian thesis that 'before Being there is politics' should be recalled here as a clue for thinking of multiplicity within the machinic unconscious.

Seen from Kogawa's critical perspective, the majority of interpretations of Deleuze and Guattari by Japanese audiences seemed to completely lack a linkage with politics and activism. Despite his insightful, rich but slightly provocative socio-philosophical interpretations of Deleuze and Guattari, Kogawa's works have been known exclusively in media-art scenes, as pieces not by a theoretician but by a micro-radio performing artist (Fuller 2005; Berardi [2007] 2010).

As a member of Radio Homerun, and a graduate student of social philosophy, I also participated in this 'political pilgrimage', visiting the *Sanya* district, a notorious slum in Tokyo, from where many precarious workers were sent to thousands of workplaces of urban construction, including nuclear power plants, coordinated by local Yakuza (Japanese mafia) agents. The term 'pilgrimage', utilised by Guattari, derives from the assassination of a filmmaker engaged with producing a documentary

film featuring homeless, precarious workers in this area (see Genosko 2007; Guattari 2007). The following year Yakuza assassinated our guide for that day, Kyouichi Yamaoka, on the street in Shinjuku.

My report below is not merely a narration of empirical facts, although some lines reflect our experience directly, but rather is concerned with the more conceptual and philosophical issues around Guattari's thoughts at the time.

As Guattari himself realised, there was a certain degree of conflict among the participants and even organisers of the excursion: an uneasy balance existed between postmodern writers/publishers and political/media activists. Guattari sensed a difficult tonality from the atmosphere. He proclaimed during his presentation, 'Amazing, we are like a small conflict zone traversing Tokyo!' Certainly, this echoes his own statement such as 'we are all groupuscules' as well as Deleuze's remark that 'Félix was a man of groups, of bands or tribes, and yet he is a man alone, a desert populated by all these groups and all his friends, all becomings' (Deleuze 2006: 12–13).

However, on the occasion of his second visit in Japan, the speculative (so-called 'bubble') economy had peaked. And, surprisingly, his third visit was subsidised by a major department store (Seibu Group). He even appeared in an advertisement for Suntory Whisky in the Nikkei Newspaper in April 1987!

In the essay concerning his second visit to Japan entitled 'Tokyo, the Proud', Guattari did not hide his enthusiasm for both Japan and Brazil in terms of a coming cultural revolution, which could provide 'a kind of huge cyclotron of production of mutant subjectivities' (Guattari and Rolnik 2008: 453–4). His expectation of Brazil was not really betrayed by its history, but contrary to his belief, Japan did not become 'the northern capital of the emancipation of the Third World'. Lula, a politician with whom Guattari was sympathetic, for instance, became the president of Brazil later and his party (PT) retains in power there today. But Guattari's 'vertigo of another Japanese way' takes another vector in this world, even though it never exhibits an image of revolution, but of regression or involution in the form of infancy through a series of info-aided addictions and mental illnesses. Often represented by manga, anime and computer games, this nevertheless has a potentiality as micro-politics in the era of post-media. 'Japanisation' in popular cultural consumption, which made Tokyo the capital of anti-revolution or a 'cyclotron' for a regressive subjectivity, still haunts this globe. Of course, the bizarre hype around 'Cool Japan' no longer prevails because of the long economic recession and its adjunct mental

stagnation, and especially in the aftermath of the recent big earthquake and its subsequent nuclear crisis in 2011.

Becoming-child (or just remaining a 'mature youth') in Japanese society is a kind of imperative imposed on people as the regulation of molar bio-politics, which sometimes misleadingly results in an essentialism about the particularity of Japanese culture that is celebrated as a peculiar 'animalisation' of mankind in Japan (and in the United States), from a pseudo-Hegelian view on the end of history (courtesy of Alexandre Kojève); or, is critically articulated in the term 'infantile capitalism' used by Akira Asada (1989: 274) in comparison with the 'elder capitalism' of Europe and 'adult capitalism' of America. In contrast to such theses, in Guattari's view, the notion of childhood is not always ascribed to a negative moment but rather retains a positive implication. Guattari often evaluates the capacity of people, especially their infancy or childhood, as a sort of creative madness composed of machinic differentiation (Guattari and Rolnik 2008: 458–9). Putative Japaneseness is radically deconstructed and transferred to his interest in a mixture between archaism (pre-modernity) and hyper-modernity, the molar and molecular.

Guattari had already recognised a paradoxical appearance of the molecular process of production of subjectivity within Japanese society that is normally regarded as a whole molar process. He even envisioned the threshold of negotiation between the molecular and molar in the most vulgar part of everyday life of Japan. For instance, after business hours employees in firms (*Sarariman*) – mostly consisting of men – gather with their colleagues and even boss(es) to drink, talk and eat. During his excursion, Guattari questioned me about this tiny spectacular chaos, asking whether there is something in common with queer culture in such a gathered-drinking ritual. The same question goes for present-day gatherings of male geek (*Otaku*) subcultures. Although my response to him was, and still is, negative – 'just because these are completely dependent on homosocial masculinity' – I must admit some potential exists for traversing processes of both the molecular and molar in such a quasi-socio-dramatic process in Japanese society.

II. Bêtise of the Left

During this gathering, Akira Asada, the top postmodernist attributed with introducing poststructuralism in Japan, undertook the crucial role of moderator and reliable transcriber. In this discussion Asada endorsed a more orthodox approach of trade union-based struggle, evident in

the term 'bêtise of the Left' and to deny the potentiality of post-media cultural movements such as free radio. His intention was straightforward and rather simply modernist. He was also sceptical of the 'humanistic' tone in the discourse of alternative media, contra Kogawa, that seemed for Asada dependent on a strange mixture between phenomenology (phenomenological Marxism) and Deleuze and Guattari's philosophy. In several interviews with Guattari, Kogawa repeatedly questioned him about the role of phenomenology in conceptualising machinic assemblages – in part because of his involvement with the Telos Group in New York city, once a stronghold of phenomenological Marxism in the United States. But there is still room to consider this point: at least, Guattari also presupposed a 'machinic phenomenology' in explaining a pragmatics of assemblages in *The Machinic Unconscious*:

> a pragmatics of assemblages does not presuppose a phenomenology of essences or a phenomenology of existents, but instead a machinic phenomenology taking account of every entity escaping the subject's immediate consciousness to the extent that it presents a definitive degree of machinic consistency ('purely' theoretical consistency, experiential consistency, aesthetic, fantastical, etc . . .). (2011: 190)

Put simply, Kogawa's position seemed for Asada to be influenced by the theory of alienation that tended to regress to 'humanism', precisely because this view shared an idea of the 'living world [lifeworld]' (*Lebenswelt*) or the pre-linguistic human-body as a conceptual safety zone of leftist discourse and a narrative of emancipation. For Guattari, subjectification within a machinic phenomenological support would be entirely self-constructed by whatever is convenient and 'at hand'.

In *Difference and Repetition* (1994) (the fifth postulate of the third chapter), Deleuze contended that, insofar as individuation can neither give a background nor a form to thought, bêtise is just an interaction between thought and individuation, which traverses the ego/self by constituting the cognitive through what is not recognised, that is, unknown. Bêtise is always inevitably humanistic – or at least, immanent to humanity – which nevertheless retains an animality or beastly in/human part. In terms of the discussion with Guattari, the 'bêtise of the Left' should be read in an affirmative or tactical sense. Both traditional leftism and post-media activism can depart from a mere 'humanism' but indicate a reverse side of humanity as 'bêtise, or the notion of humanism as becoming-animal or -imperceptible'.

Guattari moderately intervened in this topic by suggesting that people, under oppression in a broad sense, are condemned to marginalisation

in a condition of bêtise, rather than provided with critical (collective) intelligence, so as to require a certain assemblage that catalyses relations. The free pirate radio movement, Guattari insisted, can be utilised as one of these catalysers. Asada hesitated to agree completely with this suggestion.

Our station, Radio Homerun, was based in a small apartment in Shimokitazawa, near downtown Tokyo. During the discussion, Guattari got hungry and reached his hand to a wrapped rice-ball (*Onigili*), a popular fast food in Japan. Though a traditional food, this one was bought from a convenience store in the neighbourhood. Usually, each wrapper is made of a piece of cellophane, which needs a specific motion to open by pulling a red ribbon, a feature with which almost all Japanese are familiar. But Guattari could not figure out how to open it by himself, so I exhibited to him the way to unfold the wrap. His astonishment was so serious that he was totally fascinated by the procedure for a while and, after laughing, remarked, 'This is the very technology!' Beyond a mere anecdote, it is also possible to recognise in this a core of Deleuze and Guattari's significant conception in his surprise, for instance, a folding/unfolding/refolding of an incorporated body and existential territory.

III. Translocal Comparison for a Deleuze Guattariser

To focus on the potentiality of the 'raving' (Guattari and Rolnik 2008: 457) thinker or 'Deleuze Guattariser', and drawing from Guattari's interest in Japan, this essay will embark upon a comparative approach which intends to think through an unavowable potential alliance of Deleuze and Guattari with Japanese post-war intellectuals. Certainly it does not rely upon an empirical perspective to create a work of conventional comparative cultural theory but rather draws on what I call a 'translocal' cultural theory, a term used frequently by Kogawa in his Internet studies, but also by scholars working in diaspora studies.

The term 'translocal' is utilised in this essay to suggest that as detailed, singular moments are dug in and out of any local site, something common emerges from within. 'Translocal' indicates a horizon that overcomes local limits and inverts the borders within different cultures. The translocal perspective is distinguished conceptually from both globalism and regionalism (localism). Unlike the universal current of global political economy (and its geopolitics), it tends to focus on a

singularity that is cooperative with transversality among heterogeneous moments, even under driving forces of unification such as globalisation.

Interpreting Guattari through some notions in Japanese post-war thought, and, conversely, reading Japanese literature or critical theory in terms of Guattarian philosophy, this twofold attitude is a crucial part of the following section of this essay. This attempt focuses upon unknown transversal alliances that result from a 'textual unconscious' rather than an intertextual relation.

IV. Abe and Hanada

Japanese novelist Kōbō Abe (1924–93), whose works have been translated into numerous languages, is known for the similarity of his fiction with the literature of Kafka. In many respects, most of Deleuze and Guattari's analysis of Kafka can be applied to the interpretation of Abe: losing face, minor literature (jamming and stuttering in the mother tongue), and cartography, etc. Moreover, Guattari referred to Abe in his essay 'Tokyo, the Proud', which was compiled in the book *Tokyo Gekijou* (*Tokyo Theater*) (1986) after his visit to Tokyo. Guattari addressed Abe's famous novel, *The Ruined Map* (2001), in terms of an uncanny cartography of urbanism through the view of a detective wandering through a suburban cityscape, so as to express his impression about Abe's statement on the slum: '*Sanya* is perhaps less representative of an absolute misery than an irrevocable refusal of the existing order' (2007: 98). According to journalist Corinne Bret, who was a correspondent with the French daily *Libération* and also a friend of Guattari, as well as one of the members of the aforementioned pilgrimage, Guattari had a conversation with Abe about the literature of Kafka and Elias Canetti, etc., first in Paris and then a second time in Tokyo in the 1980s. Therefore, there is evidence that they met, although the details are not yet known.

There is another intellectual figure fitting for my attempt at a translocal comparative approach. Kiyoteru Hanada (1909–74), a Japanese dissident leftist critic, was known as an organiser of varied cultural movements in the 1950s and 60s. Kogawa is deeply inspired by him in his elaboration of the notion of post- (mass) media and micro-politics, although Hanada has remained unknown outside of Japan. During the Second World War (the early 1940s), Hanada survived by contributing to a pro-fascist newspaper, using his excessive rhetoric in order to avoid censorship by the Japanese military regime, and successfully hiding his own leftism. His critical works on cinema,

literature, art, TV and radio in the post-war period have been accepted as a precursor of cultural and media studies in his emphasis on the active agency of consumer, audience and reader in popular cultural consumption. In Anglophone academia on Japanese studies and literature, Hanada is sometimes introduced as a mentor for Abe but this is not true. Just after the Second World War, Hanada and Okamoto Taro – who was a Japanese surreal artist and also known as a member of Acéphale, a secret society in Paris during the 1930s, and a close friend of Georges Bataille – began to organise the workshop called the 'Circle of the Night' (*Yoru no Kai*), an avant-garde group which consisted of novelists, artists, filmmakers and critics. Abe was also a member of this experimental workshop.

Both Hanada and Abe were attracted by the concept of schizophrenia, as symptomatic gesture that presents ambiguity, ambivalence and double-binds under the formation of capitalism and nationalism.

Hanada and Abe may be counted among other artists and intellectuals in the Circle of the Night who were interested in the process of 'transforming', that is, 'becoming', rather than a mere magical mutation or cultural mimicry of behaviour. Becoming-plant, -animal, -insect and -mineral, etc. is aligned with, but at the same time beyond, the Freudian concept of the death drive, and this was a crucial theme for the avant-garde theory and literature of both Hanada and Abe. These authors deal with metamorphosis, transmutation and transforming in their writings; Abe wrote many stories that address metamorphosis or becomings-animal, -plants and -materials. Certainly, as Deleuze and Guattari insist, becoming is never about imitation and mutation of what has already existed, nor has it anything to do with the imagery of surrealism or phantasm in psychoanalysis. While granting this point, it is possible to envision 'becoming-' within/through the (surrealistic) transmutation into the inhuman, a theme which Abe and Hanada developed in their writings. In his personal draft of *Anti-Oedipus*, Guattari himself writes: 'the ultimate meaning of machinic filiation is a sort of *surrealism*, residues, witness to the impossibility of 'reducing' desiring machines' *coded* flows (singular infinitives)' (2006: 183).

Hanada asks how can humans become animals, plants or minerals? Or how can these transformed beings turn back into humans? In a more contemporary context, these questions can be paraphrased like this: how can the singularity of humans produce itself in becoming post-human? During and just after the situation of wartime inhumanity, at least Hanada already held a germ of an idea of post-humanity. In his essay 'The Narrative of Metamorphosis' in *The Spirit of Revival*

([1946] 1986), this is Hanada's main question under the wartime fascist regime. Here, he potentially articulated his disguised political conversion from the Left to the Right – if not he did not explain it so literally – as tactical camouflage or pragmatic performative mimicry in 'passing', just like a tactical transvestitism of women into soldiers as described in *A Thousand Plateaus* (Deleuze and Guattari 1987: 237) in the notion of becoming-woman. Hanada envisions the mode of 'becoming-material, -thing and -object' (*Buttai ni Narukoto*) as a task of the proletariat who can fall in love and sympathise with non-living beings and even machines. This figuration is comparable to 'conceptual persona' such as the general intellect in Marx's *Grundrisse* as a crystallised form of collective intelligence or group-mind.

In 'Objective Materialism' ([1949] 1971), Hanada writes of how in the process of objectification and reification, subjectivity finds liberation as 'becoming-object'. It is no wonder that Hanada had an idea that at the edge of self-abandonment one could reclaim and retrieve identity. This passage is not a theory of alienation but rather can be understood as another version of 'becoming-imperceptible' in the proximity to other existences, or 'becoming-material'. He articulates certain units or modules constituted by the correlation between machines and humans under the Fordist formation of production which requires workers to be in tune with assembly lines and assemblages of organisation, for which Hanada adopted the term 'collage'. Hanada had already engaged with the issue of cyborg-hybridity composed of man-machine in terms of 'becoming or transmuting animal or plant, and material, etc.', a becoming which is never reducible to metaphor or imagination but rather is envisioned as the very multiple articulations of heterogeneous moments before and beyond individuality or humanity.

In *Avant-garde Art* (1954), Hanada drew on the 'law of participation' by French anthropologist and philosopher Lucien Lévy-Bruhl (Guattari and Rolnik 2008: 25) to analyse Kafka's novel, *The Metamorphosis*, where Gregor Samsa transforms into a strange beetle. Nevertheless, not only is there supposed to be a certain kind of resemblance, but also an intensive transmutation or mutual incorporation among human and non-human. In shamanistic rituals and totemism, a myriad of metamorphoses are confirmed, which is basically a consequence of pre-logic (or savage mind) in primitive tribes, a phantasm for a certain schizophrenic process, but even an individual in contemporary society might have such an altered state of mind. The 'law of participation' is a principal logic for thought in primitive societies, in which, unlike conventional perception based on a distinction between subject and

object, the law of participation destabilises and even disturbs perceptions and affects of humans. For Guattari, this notion of participation indicates a collective subjectivity of investing (cathexis) in a certain object, which is meaningful for focusing the singular point of the existential group subject.

In some types of literature and philosophy, 'participation against nature' is recognised in a radical conceptual modification of Lévy-Bruhl's term. In *A Thousand Plateaus*, Deleuze and Guattari utilised several times a strange term which might derive from this conception, 'unnatural participation', by addressing the literature of Lovecraft, Woolf and Hofmannsthal, etc. Writers, authors and philosophers are always engaged with becoming and belonging to something or events through their own writings. Many writers have committed suicide, not because they sought to sacrifice themselves for their own works or for the sake of the world, but as a way of inventing a series of unforeseen alliances within nature, where nature was never posited as an object of correspondence or filiation; that was the reason why the issue in becoming and writing was 'not pity but unnatural participation' (Deleuze and Guattari 1987: 240). Unlike the evidence of substantial influence among authors or intellectuals presented by positivistic explanation, or the filiation by heredity in the biological world, unnatural participation proceeds with epidemic and contagion as in the case of 'vampire', more physically in the conjuncture of a bacterium, a virus and a molecule. I am almost tempted to call it 'informatic participation', just because it precedes the emergent or structural combinations. While anthropological concepts of participation could afford the model of symbiosis among different social groups, the notion of 'unnatural or informatic participation' might posit a matrix of conviviality in which a variety of cultures – including 'races' or ethnicities, and different semiological regimes – could live together.

Hanada also elaborated his own minor philosophy by using ethnology and anthropology. Although Hanada did not yet know about the development of Internet technology, his posture in critical theory and practice is still very valuable for understanding the contemporary info-socio-environment. Aligning him- or herself with the thinking of materiality, a Guattarian would respond with a vision of the future: the existential territory of human individuation will emerge from a propensity toward inhuman and incorporated universes enabled by the escalation of informational technology, as transfigured in the development of the net-based subjectivity, which will then entail the unfolding or opening of animal, plant, mineral, machine and cosmos, etc.

V. Becoming-Organisation

For Deleuze and Guattari 'becoming-animal always involves a pack, a band, and a multiplicity' (1987: 239). In Hanada's theory and practice (the same holds for Abe especially in his involvement in literary, theatre and filmmaking circles) mass populations, or simply, folks or crowds, can be grasped as 'materials' or 'objects' rather than as individual agents. Hanada's theory of groups and collectivities, deployed in his varied essays on social and cultural activism called 'the circle movements' in the late 1950s, consisted of a variety of genres of activity ranging from publishing zines through filmmaking to writing novels or poetry with manual workers in industrial factories, in addition to working with all kinds of corporate firms. As I suggested earlier, Kogawa's media theory and his initiative of free (pirate) radio activism was inspired by Hanada's writings and cultural-political activity.

Both his attempts to create circle groups and to co-edit informatic-data in expressive assemblages of visual art, cinema, literature, plays, as becoming unforeseen forms of organisation, are closely tied up with a vital resistance, in contrast to readings that might dismiss them as simply lazy or unproductive. It is no wonder that so many activists in the Japanese Communist Party or other leftist initiatives in the post-war period were enthusiastically interested in film and its theories. Such an activity is deployed precisely because it is playful without any ground that is conventionally attributed to ideology. Information, affects and activity all are compiled and translated into the collaboration as a collective ensemble of expressive enunciation.

What Hanada tried to deploy in theory and practice around the circle movements in the 1950s has its counterpart in Guattari's engagement with the institutional psychiatric cure at La Borde, where Guattari strived to have less hierarchical and more flexible relationships between patients, non-medical and medical staff.

The subject for Guattari is neither simply an individual ego nor an individuated person but rather is woven by an interactive dynamics consisting of moments of pre-individual and extra-individuation so as to constitute an entangled assemblage of different moments, where each subject is posited itself as a terminal for transition, criss-crossing and networking. 'Becoming-organisation', in this context, is interpreted as becoming an agency of collective intelligence or 'general intellect', which undertakes the role of catalyst for the emancipation and subversion of the 'status quo' of a given society. 'Becoming-organisation' does not intend to construct a political party or group with a shared idea,

but instead, constitutes by gathering through the gesture of rendering organisation more complex and multiple.

In Hanada's essays the term 'circle' is frequently utilised with the concept 'transversalising' (*Sougouka*), which echoes Guattari's crucial notion of 'transversality'. Usually *Sougouka* in Japanese is translated as universalising, integration and synthesising. However, Hanada's notion does not convey the meaning of generalisation or universalisation, but is rather concerned with a dynamics of assemblage, connection, association and collaboration of different genres and regimes of art, discourse and expression, that is, 'an opposition without synthesis'.

What is at stake in his (post-)media theory is the issue of how to integrate pre-modern modes of communication (expressive regimes of oral, dance and gestural communication) with modern technology or contemporary culture in a transversal manner. In order to extend this argument, Hanada addressed disciplines such as ethnography and folklore by combining an emergent sociological media theory with the conceptual resources drawn from anthropology, ethnographic fieldwork and even Surrealist art. His view on the trans-modern or overcoming modernity has a more radical potentiality. Hanada wanted to conceive of a new or trans-modernity through the available resources of pre-modernity as well as the non-Occidental, which Guattari prefers to call 'the archaic'. This gesture, however, cannot be reduced to taking a path of regression to the past or 'Orient'. An anti-modern or anti-Enlightenment stance is never at issue but rather his critical assessment of the present is always folding moments of the past.

Hanada envisions oral communication in folklore, ritual and festival in pre-modern (Japanese) culture and society as tactical or alternative resources for the singular/collective arrangement of enunciation and expressive activity in the future. The conditions of hypermodern or the vision of 'overcoming modernity', which should be distinguished from the same term utilised under the Fascist/Imperial regime of Japan in the 1940s, and post-media can arise in a dynamic and practical hybridisation between the pre-modern and modern. In this sense, Hanada's theory can be seen as a precursor of Guattari's concept of post-media. The post-media gesture is embodied by a hybridisation of plural media and mongrel mixtures of expressive genres constituted by varied subcultures.

Hanada's re-evaluation of pre-modernity intends to open up alternative possibilities of media, no longer dependent upon 'printing culture' (*Insatsu Bunka*), by deploying 'airwave culture' (*Dennpa Bunka*) based on pre-modern moments such as oral expression (myths or fairy tale) or improvised performance (dance and music). In his

view, the transversal relationship of various arts may be achieved by the conjuncture between 'electronic airwave culture' (*Denpa Bunka*) and 'printing culture', a connective junction that will be treated as a machinic phylum in Guattarian terms. For instance, it is easy to find such a collision between old and new communication in the initiatives and experiments of free radio.

In most Euro/American contexts, free or pirate radio (including student or community radio) usually has high-power equipment for broadcasting, which could cover the same range as local corporate stations. In France, after the Socialist Party's victory in the early 1980s, hundreds of free radios were 'legalised' with official licences by the government. As a result of the deregulation of the airwaves, all free radio initiatives were co-opted into corporate forms while losing their radical virtues delivered from illegal or pirate media. Such an ironic recuperation or legalisation of pirate media has never happened in Japan. But due to the particular limitations within both technological and legal conditions of free radio, the micro-radio initiative in Japan (mini-FM) displayed a different potentiality. Because of the very small power of transmission, mini-FM broadcasting could not so much cover wide areas as, instead, constitute a 'virtual' extended body connected in a chain (network) of numerous micro-radio stations; admittedly this might sound old wave in the present era of Internet streaming. Putting aside the 'renaissance' or re-actualisation of pre-modern (oral or performative) communication in electronic media, the initial spirit of free radio is still open to different dimensions of media technology, which, for instance, have often been observed in open-air techno party scenes and Internet radio streaming of club parties or live gigs.

Expressive post-media such as free micro-radio is an unfolding or explication of what expresses itself; in other words, the one manifesting itself as multiplicity, emerging as thousands of Radio Alices or Homeruns, etc. Conversely, the expressive multiplicity assumes a kind of unity, which inclines towards a mutual solidarity or tolerance. Mass media always involves a vector towards the one, whereas post-media relentlessly proliferates existential territories and universes of reference.

VI. Losing Face, Faciality and Masks

'With Nietzsche, everything is mask,' Deleuze once proclaimed. This insight is well suited for reading one of Abe's novels, *The Face of Another* (2003). The protagonist is a scientist seriously injured in a laboratory accident in which he lost his face; he tries to recover his

relationships with others, including his wife, by wearing a mask that is a perfectly undetectable copy of his face. He even attempts to seduce his wife with the mask of another person. In this novel, the face provides the very kernel of politics in which the decomposition of the face is at issue, accompanying a variety of becomings. Through the protagonist's reflection, Abe contends that the face is a passageway connecting the inside (interiority) and the outside (exteriority) in the sense that the human mind, physiology and formation of subjectivity are herein combined. A face is an entrance of binding, a disjuncture of folding and unfolding of immanent planes, both the inside and outside of human agency.

A face is always already a mask, a view that is the main scheme of the novel, whose logic can be explained as an assemblage and abstract machine that enables one to become others. Abe also seems to consider a coupling of face and mask to be a sort of technology, media, supplement and machine, not just an instrument. 'According to one theory a mask is apparently the expression of an extremely metaphysical aspiration to give oneself a kind of transcendental disguise, for the mask is not simply something compensatory' (2003: 19). Thus a mask is a machine producing the expressions of a face, while a face as such can function as a mask.

For Guattari, losing face is not directly at issue, but the concept of faciality enables us to conceive of defacement or dismantling of a face. Language, by definition, is always indexed on features of the face or faciality. That is the reason why the protagonist in *The Face of Another* has to weave different expressions of language for his relentless meditation on his decomposed face and its effects on others. The face belongs to the regime of icons but at the same time is set out in the reterritorialisation of signifying systems. However, faciality is constantly transformed into the a/post/signifying affective regime with its redundancy, insofar as it is operative of a 'body of the signifier'. From another angle, faciality is a point of departure for a dynamics of deterritorialisation that permits everything else to bring about a line of flight. The production and constitution of a face, which forms an organised body and cuts a head from a body, is a process of significance which escapes from a conventional physiological scheme, that is, a function of signification which is outside the signifying scheme in an organism and deterritorialises the regime or form of communication. Here a face itself emerges as a kind of fetish or simulacra. A face is deployed as a redundancy of signification beyond any meaning of words, or conversely with some lack of signification. A face seems to look like a

sort of white screen that affords a structural grid of interpretation, while it is emerging as the field for subjectification of affect and meaning, a vital or creative void in Deleuze and Guattari's sense, which engulfs all impressions and expressions, a black hole penetrating an empty spot on a white wall.

In the early days of his collaboration with Guattari, well before publishing the chapter on faciality in *A Thousand Plateaus*, Deleuze wrote:

> The movement of betrayal has been defined as a double turning-away: man turns his face away from God, who also turns his face away from man. It is in this double turning away, in the divergence of faces, that the line of flight – that is, the deterritorialisation of man – is traced. Betrayal is like theft, it is always double. (2006: 30)

This gesture of betrayal could explain the strange relationship between protagonist and wife in *The Face of Another*: he cheats on her and she has an affair with another, knowing his real identity as her husband. It can neither be said that an ethics which cannot evade responsibility to the other precedes politics, nor that, through relentless acts of negation in thinking, a certain absolute is posited beyond each moment of communication. The same holds for Abe's novel *The Woman in the Dunes* (1991) in terms of an uncanny coupling constituted by the protagonist and the woman in the sandpit, which presents a diagrammatic machine to reject the conventional form of loving and conviviality. If we see a radical dynamic rapport and interrelation within the mutual betrayal of faces, then in encountering an exposure of face, we must focus on micro-politics as a relationship of betrayal that is prior to society and ethics. Or rather, it may be said that there is a politics which has priority over ethics. The assumption that the face is political does not intend to prefer politics or ideology to literature or art, but instead to situate betrayal as the primal form of micro-politics at the roots of literature and cultural expression. For both Deleuze and Guattari and Abe, losing face, and mutual betrayal, are the condition of literature and writing as such. This novel shows that one has to lose one's own identity and face for the advent of singularity in which to disappear, becoming imperceptible, indiscernible and unknown.

Such an idea was already present in Hanada's early essay, 'The Expression of the Mask' ([1949] 1971: 44), in which quoting Nietzsche, the mask is a way to the discovery of one's true face. For Deleuze, the concept of mask has always been a reference point, in which everything can be a mask with Nietzsche, for whom his health as such is a first

and significant mask for his genius, and, in turn, whose suffering also becomes a mask for both his genius and health. The same can be said for the protagonist of *The Face of Another*. It is helpful to refer to this passage because of a fundamental paradox that the revelation of true (face) is deduced from a mask. If a moralist hates a mask, then instead a mask holds a certain ethics, because envisioning a mask leads to delivering the freedom of play and the capacity to disguise, as well as taking responsibility to affect the will and desire of others beyond the distinction between good and evil (Saldanha 2005).

During the Second World War, fanatic nationalists and Japanese ideologues seemed for Hanada to be wearing inappropriate masks to address their identity. Both Bororo tribesmen and Japanese nationalists have something in common in this respect. Hanada thinks that a particularity of Japanese culture may not only be ascribed to something Japanese, but at the same time, is always the effect inspired by the West (through culture, technology and economy). Their entanglement is an objective reality of Japaneseness. Even contemporary hype such as Cool Japan or cute (*kawaii*) culture amidst globalisation is evoked as an example: these have nothing to with a Japanese cultural essence or originality but, by themselves, are a result of circulation, intersection and translation driven by global capital. Hanada's insight just after the war does not indicate any sense of eclecticism between the Japanese and the Western. His point in this essay can be summarised like this: a mask can be a clue to reaching the exposure of the 'real' face, just as a hypothesis is a prerequisite for scientific discourse. Fanatic nationalism in Japan, for Hanada, seems to reveal a kind of symptom of schizophrenia during wartime. Put differently, the inadequate mask was mistaken for the interaction between concealment and defacement of the constructed 'true' face. Hanada seeks to convince us that fanatic Japanese ideologists share a similar attitude with both schizophrenics and tribal peoples. Hanada applied again the 'law of participation' of Lévy-Bruhl to explain the ethnocentrism of wartime Japan through the logic of the mask. Fanatic ethno-centrists and nationalists were crazy about searching for their 'real' (proper) face, and under the law of participation, A can be A at the same time being not-A, a status which Hanada called 'schizophrenic'. He insists that a self-identity can always exist and appear by detaching from oneself. The mutual exchange and substitution between the Eastern and Western, the Orient and Occident, for Hanada, is focused as an actual issue of thought. But is it dialectical?

Certainly, Deleuze's philosophy is defined as the philosophy of anti-dialectic, the evidence of which is hard to deny, even though Deleuze can

be called 'a thinker of synthesis' (Jameson 2009: 182), but Guattari's position is more complicated and subtle. Guattari's ambiguous position with regard to the dialectic is closer to Hanada's. Beyond a conventional mode of dialectic in the Marxist sense, Hanada had already posited the very contemporary – if you prefer 'postmodern' – concept of dialectics, called the 'dialectics without synthesis' that is also called the 'dialectics without ends' or 'endless dialectics' which Jacques Derrida once utilised for his deconstructive interpretation of Georges Bataille in terms of his concept of general economy, which raised the model of dialectics with a lack of integration, synthesis and *telos*. The strange dialectics of Hanada is defined as an attempt to traverse both sides of opposing terms by preventing the very opposition from integrating, or what may be called conflict without synthesis. There is a commonality between Guattari's complicated relationship with the notion of dialectics, and all kinds of 'diamat' type of thought including Sartre's philosophy, in which he posits himself as an anti-systemic or a-systemic thinker. Guattari pointed towards a liquidation and fragmentation of dialectics in terms of enduring yet functional antagonisms (Guattari and Rolnik 2008: 237). This strange 'dialectic without synthesis' is, in *A Thousand Plateaus* (Guattari 1987: 330), articulated within the conception of the abstract machine.

VII. Refrain and Crystallisation

No one can deny a link between thinking and rhythm; without rhythm, neither thinking nor living is possible. It is significant to see tonality, musicality and repetitive beats in this respect. Life goes on, 'terrifyingly repetitive', considering heartbeats and ritual practices. Certainly, Guattari (2011: 146) was not the first to think rhythm, which he admitted by referring to the philosophy of Ludwig Klages.

It is remarkable that Hanada also thought of the significance of rhythm in the humanities. Addressing the nonsense in *Alice in Wonderland* and *Mother Goose* in *Avant-garde Art* (1954), Hanada introduced an opposition between 'interior reality' and 'exterior reality'. The former indicates the drive of the unconscious or subconscious, that is distinct from a mere psychological reality; whereas the latter represents 'the very reality of material things', called simply 'the outside', and contains a dark side that has not so far been grasped by consciousness. It resembles the Lacanian Real, insofar as it is difficult or almost impossible to reach. Exterior reality as the outside world or materiality is no less 'nonsense' than interior reality. Avant-garde artists and thinkers,

in Hanada's perspective, should not fear facing up to an irrationality and absurdity of exterior reality as such, because one has to regard the exterior world by the gaze which has so far been poured into the interior reality. The same holds true for post-media activists in contemporary society, insofar as exterior reality should not simply be reduced to practical or empirical reality. In this context, Hanada presents a similar conception to the machinic unconscious, in which the turn from the interior to the exterior never constitutes a return to empirical factual reality, but instead a recursive turn that appropriates the way of tracing interior reality for pursuing exterior reality. Herein something emerges akin to the Deleuzian fold. Abe's famous short story, *Dendorocacalia* (1973), must also be interpreted in this respect, in which the surface and inside, the exterior and interior of the body of the protagonist, Mr Common, is turning upside down by becoming a plant called *Dendorocacalia* in an uncanny reversibility. Certainly the plant in this novel provides us with the issue of the double, which is never merely a projection of his interiority but is an interiorisation of exteriority, an eruption or intrusion of the outside.

A turn or fold between exteriority and interiority, Hanada insists, has a close affinity to music and rhythm in thinking, where an improvisational performativity holds a crucial point that can be observed in jazz or gestures in the theatre play of *commedia dell'arte*. By making disjunctive links, rather than correspondences, among the concrete objects delivered from the exterior into the interior through a series of metaphors, analogies and rhetorical figures, thought is becoming 'musical' so as to create repetitive beats like in the syncopation or ragtime of some music genres. Hanada contended that 'musical thought' and 'filmic thought' as machinic expressions converge and intersect with each other in various arts. Deleuze and Guattari can say here, 'a color will 'answer to' a sound' (1987: 330). In the machinic beauty (*Kikai-Bi*) rather than the beauty of nature, or in the expression of machinic reproduction such as film or popular music rather than drawing pictures or sculpturing, rhythmic thought emerges as a hinge of a turn from interior to exterior, which is a resource for Hanada to read the interior reality incorporated within the nonsense of exterior reality.

When Hanada thinks about the relationship between repetitive rhythm and social organisation, the issue of the refrain is front and centre. Refrain is part of the movement and dynamics of repetitive heterogeneity, which is raised to a sort of stop motion of dialectical-oppositional movement. Refrain as repetition within Hanada's endless dialectic is not a doubling of the same or the identical, but a redundant

duplication of the other, insofar as it does not reproduce the identity, but just repeats the other. The refrain provides the existential territory for the collective assemblage of expression, such as avant-garde art and literature, that is a great resource for contemporary tactical media experiments.

Hanada conceives of crystallisation as transformative organisation. Hanada was interested in the process of transfiguration from something inorganic to organic. In *Two Worlds* ([1949] 1989), Hanada asks how can the stiff, ordered structure of society turn into a more vital, flexible and infinitely complex organisation? He then invokes the concept of crystallisation, as in the case of a generating organism passing through a crystal in the natural world, as the period of transition or transformative epoch for revolution or evolution. In a more contemporary context, especially in the era of digital media and network technology, the process of organisation and production shapes something analogical to the biological, so as to bring about an autonomic organic system that is comparable with both human and social nerve systems. Any group or firm can be treated theoretically as a quasi-living organism, especially in the post-Fordist formation of immaterial and cognitive-affective labour, with which Hanada's intuition is aligned (Pasquinelli 2008).

The crystallised structure of matters/substances communicates and transmits itself by reproducing a form, which is delivered through components of atomic or molecular particles, while in the case of animals or plants, the transmission is accomplished by a serial metabolism through genetic codes. Even our cognitive process for various info-environments is enabled by an effect of crystallisation of actual percepts and virtual objects. The situation of informatic reality as such is defined as a crystallised conjuncture of exteriority and interiority in Hanada's perspective. The image we grasp in watching cinema and television emerges as the crystallisation of dynamics between what has already been projected and what is going to be projected. For Hanada, cinema was not a mere metaphor to explain our cognitive reality; rather, the pragmatics of the image in audiovisual media could provide the very constitution of reality. The same may be said for the potentiality of the net culture and electronic media, which can appropriate a wide range of resources from different types of media that predate computer-aided technology. In other words, the reality or situation crystallises a criss-crossing conjunction between the actual and the virtual. For Guattari, an abstract machine is always in charge of transforming or deterritorialising matter and flow that is constituted of crystals of potentiality catalysing virtual connections. In his understanding and definition, crystallisation is

a process that passes through an infinite series of expressive assemblages linking discursive actual moments with non-discursive virtual moments.

Usually the possible is understood as an equivalent of 'dynamis' in the lineage of Greek philosophy, such as that of Aristotle, and considered to be a primal material potentiality waiting for deployment in reality, 'energeia', as a form of embodiment in/of this world. Among the plural possibilities embedded within this pure potentiality, one is opted for as the reality of random choices, which nevertheless is retroactively conceived as a destiny or fate for human agency. It should be remarked, however, that the possible in Guattari's conception proceeds in a different way. Within the ongoing reality deployed here and now, other options of the possible are always already functioning. That is the reason why the notion of the virtual is evoked here in both Guattari and Hanada's thought, in which the virtual as pure potentiality is constantly operative within this ongoing world as the actual. When one finds some figurations of animals or somebody's facial traits in the shape of clouds or constellation of stars, one comes across the indexes of ontological crystallisation, which generate and modulate heterogeneities. Herein faciality as an abstract machine can make a concrete face from within the crystal of possibility.

Put simply, Guattari posited an idea of the economy of the possible, which is determinant and operative in the affects, material scarcity, desires and empirical percepts, etc. In his thought the virtual can transverse the real, and the possible, the actual. If we consider his idea of chaos or chaosmosis, which is neither a simple confusion nor indifference, but a singular ontological weft – chaos as 'sieve' – it is from within delirium or ecstasy that a nucleic point may be extracted and articulated, such as an ultimate awareness in Zen which, in my mind, Guattari himself exemplified.

In this way both Guattari and Hanada conceived of crystals of possibility which could weave singular points of ontological crystallisation by generating their own organisation and producing something other than themselves in modulating heterogeneities. As the result or effect of crystallisation between the possible universe and the actual situation, both grappled with the chiasmic cutting edge of the virtual and the real as the point of singularity.

VIII. Conclusion

What I have developed in this essay is articulated in the following five points. First, Guattari was very interested in Japan and attracted

by its putative cultural singularity, which nevertheless is not restricted to a cultural essentialism. Aligned with his affirmative view of Brazil, Guattari sought to find something positive in Japanese society and its tactical micro-media experiments such as mini-FM.

Second, it is possible to pose an affinity between Guattari's philosophy ('ecosophy') and certain philosophical approaches adopted by some Japanese post-war intellectuals. In fact, exactly during the period in which Guattari started to engage with his practical and theoretical elaboration of institutional analysis at La Borde, Hanada was engaged in the circle movements and avant-garde experiments. Abe's literature was also very much indebted to the theoretical articulations of Hanada. Guattari greatly admired Abe and considered him, alongside Beckett and Kafka, as a great analyst of subjectification.

Third, Japanese intellectuals who predated the critical analysis of infoculture and globalisation (integrated world capitalism) still provide us with many useful resources, especially for contemporary media activism, and my approach has been to regain their ideas and bring them into the present.

Fourth, there is a productive crossover between Guattarian and Japanese thought engaged with the elaboration of idea of an aesthetic-political perspective that articulated the emergence of post-human becomings.

And the last, fifth, both Guattari and Hanada saw the significance of rhythm and refrain for thinking and social action.

Gary Genosko once remarked that 'Guattari himself was a subject group, a collective assemblage, a machinic *il* rather than a structural personal *moi-je*' (2002: 226). The same can be said about Hanada and Abe's idea and practices of collaboration and organisation. From this perspective the works by both Hanada and Abe can be utilised as tactical resources for reading Guattari together with Japan. Subjectivity is always a wrecked and failed *cogito*, while a pragmatic map (perhaps a deviant cartography) emerges from archipelagos in which the conceptual desert islands, such as certain Guattarian insights and some Japanese post-war intellectual production, disjunctively intersect with one other.

Guattari TV, By Kafka

Gary Genosko

Abstract

Guattari looked for crossovers between film and television in a posthumously published 'Project for a Film By Kafka'. His critical comments on television and the mixed reception of television within the Deleuzo-Guattarian literature provide the occasion for an investigation of what Guattari thought television could do for his project. The auteur model best suits his needs in this regard, with the proviso that it is animated by a modernist aesthetic oriented towards the conjuring of a people to come who would join the Kafka assemblage as part of their viewing experience.

Keywords: Kafka, television, auteur, modernism, minor

> A heap of stones is not a machine, whereas a wall is already a static proto-machine, manifesting virtual polarities, an inside and outside, an above and below, a right and left.
>
> (Guattari 1995: 42)

Guattari's 'Project for a Film By Kafka,' translated by Jakub Zdebik for *Deleuze Studies* in 2009, is based on a series of notes for an unrealised project. We know that Guattari was fascinated with Kafka's dreams; he collected and numbered them (*Soixante-cinq rêves de Franz Kafka, 2007*), commenting that they 'engage the most diverse and heterogeneous semiotic means: those of theatre, dance, cinema, music, plastic forms, and once again, to be sure, writing!' (2007: 29) Moreover, these dreams are 'open, machinic indices' consisting of literary and schizoanalytic machines; they are open in 'how they have fertilized and broken such and such semiotic or behavioral chains' (2006: 405).

A machinic dream interpretation follows the deterritorialising line and its sputtering flows of particle-signs.

François Dosse (2007: 294ff.) reminds us of another Guattari: an inventive curator – though the heavy lifting was done by Yasha David (Guattari 1996a: 235; Guattari 1984: 1) – of multimedia exhibitions, a 'Kafka event' on the occasion of the 100th anniversary of his birth, mounted in the summer and autumn of 1984 at the Centre Pompidou in Paris. In this exhibition we find dream texts, dream theatre courtesy of Philippe Adrien, seminars, dream cinema (by François Pain, a good friend of Guattari and a key connection to his visual production). It may be said without exaggeration that Guattari never stopped working on Kafka, who was, after all, his favourite author (Guattari 2006: 146).

There is, however, a semiotic mode at issue: cinema. To the existing relation of Kafka and minoritarian becoming in a literary key, Guattari adds a cinematic project that passes *through* television. What he envisaged was a made for television film in the form of a cultural series that would help to fund the final film project. His ideas were quite practical since he wanted to attract funding and engage a professional production team.

Project for a film *by* Kafka? Guattari's emphasis is deceptively simple. The affects with which Kafka wrote may live in film and television because they are independent and survive their author, remaining available for 'non-human becomings' (Deleuze and Guattari 1994: 173) of readers to come: 'artists are presenters of affects, the inventors and creators of affects. They not only create them in their work, they give them to us and make us become with them' (175).

The question is: does minor cinema assist us in conceiving of a 'minor' Guattari TV? For Guattari, minor cinema precipitates becomings minor (practical enrichments of schizo desire) in the mass, just the sort of people he wanted to reach with 'Le Siècle de Kafka'. And to become minor is not to be in a minority or the representative of a minority or even to formally acquire the characteristics or status, what we call 'identity', of a minority through some affiliation. It is not a question of mimesis or membership, but how to produce becomings that might summon a people with whom minor cinema connects. Guattari thought that anti-psychiatric cinema worked in this way, reaching the uninformed and misled and changing the way they thought of and connected to madness. The fundamental theoretical problem is what it means to summon a new people without teleological or messianic politics. But the semiotic is also hybrid, for the film at issue involves television. Television was a transitional medium in Guattari's search for

a potential public, a public yet to come, with which he attempted to connect through minor Kafka becomings, engaging sensibilities not yet fully entangled in dominant normative modelisations; assembling Kafka affects that connect across existing strata and blend with real material fluxes, intervening in and resisting stolid representations, enriching flight paths of singularisation and auto-modelisation.

Guattari's sense of television is often confined to a scene of decoding, an existential territory bathed in the blue glow of the screen; a vivid machinic assemblage of subjectification and flickering sensory affects of all sorts. At the same time it needs to be kept in mind that Guattari was no stranger to mass television, appearing over the course of his career a number of times, but his attitude to the medium was often linked to becoming stupid: 'I watch tv like everybody else. I'm just as dumb, no question about it' (commenting on the first Gulf War) (Guattari 1996b: 139). Yet he insisted that one has to watch it but without becoming trapped in its 'infernal circle'.

Watching television is for Guattari an intense experience of territorialisation and he uses ethological concepts to describe how the milieu components of broadcasts (voice, music and image) initiate animal becomings. By the same token, we know that Guattari could be found in the depths of his depression slumped before the television, a black hole of subjectification which resonated all too well with the condition of his desire at the time (see Helle 2008: 497; Dosse 2007: 291).

What I wish to reach in this paper is an understanding of Guattari's ambivalence about television and his desire to work in it by first appreciating the limits of transferring the principles and goals of minor cinema to television. A second task is to find the most appropriate model of television to explain this ambivalence. Rather than taking the route of connecting minor with autonomous media experimentation such as the bold example of Telestreet which taught many 'how to do television' (Berardi 2008: 152–3), I turn elsewhere. Instead, the long-standing, but recently renovated, idea of the *télé-auteur* working in a creative capacity for the small screen has been in circulation in Europe for many decades, and has recently found a new place in discussions of American speciality cable networks and select series. Although Guattari (1996b: 152) expressed misgivings about the development of cable channels in the context of 'capitalist eros', noting that 'nothing guarantees us that what they will develop . . . will not be even more reactionary than what is broadcast by national television', and did not witness the blossoming of the cable universe and its passage into territories of art and new assemblages of subjectification, I suggest that his 'Project

for a Film By Kafka' is closest to auteur TV. Of course, I stake this claim with the proviso that the figure of the ciné-auteur is limited as Guattari was prepared to eschew the signature style of a master for the sake of anonymous, more participatory, DIY aesthetic production and for ethically and politically committed documentary work (one of his exemplars in this respect was Sato Mitsuo, director of *YAMA: An Eye for an Eye* [1985] about the Yakuza-controlled slum in Tokyo). However, with these provisos in mind, it is productive to grasp the incredible care for content and detail of execution that is found in Guattari's 'Project' outline as fundamentally different from tactical media and closest to the auteur TV model, yet not divorced from the minoritarian becomings of cinema. The cerebral and abstract qualities of Guattari's 'Project' (the emphasis on the wall and faciality), however, as well as the expressionistic elements that he links together in a series of highly austere shots, are punctuated with comic moments, imagistic fragments and incomplete dialogue. It is this kind of content and aesthetic that evokes modernism and the auteur – not bastardised, but shrunk to the size of the small screen. Guattari's 'modernism' with respect to painting has been well documented (Zepke 2011: 213–14), and it is linked not to a flight from art institutions but to a return to them in order to initiate a search for subversive singularisations.

A further issue may be flagged at the outset of this investigation: the displacement that Guattari operates of the auteur-author-personal directorial style from himself to Kafka – not the author and his intentions but an assemblage of autonomous affects that Guattari attempts to respectfully gather in his 'Project' and to connect with a potential viewership.

I. Auteur TV

The Pompidou Centre Kafka centenary event is instructive because it tells us that Guattari's ambition as a cultural animateur was referenced to large public arts institutions with national and international profiles.

In this respect I consider the place of Guattari's minor television to be in the arts programming of public or state broadcasters, perhaps even independent commercial interests that develop new projects. But this location should remind us of the mutual imbrication of Guattarian concepts: minorising the mass or traditional media is cultivating a rhizome in the branch of a tree. That is, one cannot think the minor-micro without the molar-macro. Therefore, one cannot jump the traditional media reference for the sake of independent, autonomous or tactical media (like Japanese micro-TV or Italian Telestrada).

Rather, Guattari TV is embedded in the tradition of modernist (and later) experiments with television from Godard to Lynch, and the intellectualism (the 'Grands Entretiens') and multiple aesthetics of the Institut national de l'audiovisuel (INA). The INA has a long tradition of co-production with public broadcasters around the world as well as with private and public speciality channels such as Sundance in the US and ARTV in Canada; moreover, it engages in extensive preservation activities and software development and training.

The signature of 'Guattari' may have been enough to participate in the *télé-auteur* model of 'creative television' in France (Emanuel 1999: 86). Thus, 'auteur TV' was a likely model and he would have been familiar with the idea of seeking something along the lines of an INA commission for his project (note that the INA ceased *producing* television in the 1980s), or at least a co-production agreement between a sponsoring producer and a commercial channel with a legally mandated requirement to assist national film production. Guattari would have joined filmmakers like Raúl Ruiz and Eric Rohmer who had found the little screen much to their liking, and the new opportunities it afforded in terms of distribution in a changing technological environment: 'TV is seen as a lifeline of cinema rather than as a proverbial Cain' (Ostrowska 2007: 32). Indeed, Guattari did not rehearse the traditional split between cinema and television but recognised how the former had absorbed the latter, even if the motivation (commercial) was largely unpromising (1996b: 152).

Guattari worked with Yasha David on the Kafka exhibition. Here and there he mentions this collaboration, sometimes referring to it as a joint project, at other times suggesting he had 'entrusted' the running of the event to David (Guattari 1996a: 235; Guattari 1984: 1). Whatever the case may have been, Guattari also notes in every instance the trouble he experienced with the arts administrators at the Centre Pompidou: 'Those in charge at the Pompidou Centre made it so difficult that, on several occasions, we thought we would have to abandon the project' (1996a: 235). So Guattari, in a very Kafkaesque manner, plugged into a bureaucratic machine and came face-to-face with strategies of denial and meta-languages of control and demoralisation. One wonders how he would have fared in a highly bureaucratic television environment.

II. A Wall

'The whole film takes place along a wall', Guattari indicates (2009: 154). Continuing, Guattari explains: 'The design and musical unity of this wall

should traverse the whole film, the different scenes somehow detaching themselves from it.' The scenes are thematically linked:

> wall of the farm at K's arrival; wall across which runs a beam of light, indicated by the woman who writes in the night and whom children join; the wall of the inn through which Frieda indicates that Klamm is sleeping; wall along which two children run and 'catch' little Hans; wall of the farm, this time seen from the inside, and that will open to let the official procession go past. (Guattari 2009: 154)

Why a wall? It divides and conceals a mystery (the castle), which is later exposed as 'not mysterious' at all.

The wall is 'synonymous with the absence of face and the absence of eyes', Guattari specifies (2009: 154). But we know from Guattari's writing on photography that faces accomplish 'existential transferences of enunciation' to viewers (1989: 311). From another perspective, faces are already walls, white or black walls of the signifier. And walls are Kafka materials par excellence: the abstract machine of faciality as one finds in Kafka's 'novella "Blumfield": the bachelor returns in the evening to find two little ping-pong balls jumping around by themselves on the "wall" constituted by the floor' (Deleuze and Guattari 1987: 169). Guattari immediately considers as an alternative an immobile face shot close up (augmented by a booming voice) which turns into a wall. Like Keiichi Tahara's photographic de-facing and resurfacing of the celebrity artists who posed for portraits, the face is a wall that might recur and have projected upon it cityscapes and offices, corridors and the like to underline the 'whole paranoid, bureaucratic discourse' (Guattari 2009: 155). Guattari also

> thought that at a certain moment, this face could perhaps be composed of about forty videos showing the same urban images, a sort of ballet of changing figures, with systems of gliding lines, symmetries, and dissymmetries, rhythms, images that skip, etc. (2009: 155)

The face de-composes into a wall, perhaps moving from noisiness to silence; the face is a 'megaphone' (Deleuze and Guattari 1987: 179) but the wall may be bounced off of or crashed into or broken through. The wall is a molecularised face, a face of geological strata, cement, moss and the pissing of men.

III. TV By Kafka

The first part of the draft script has four segments. A horse-drawn cart races towards the wall and crashes into it. In the second segment, the

cart moves in the same way but suddenly stops short of the wall. An explosion of sorts takes place, but it is a dance of peasants in hooded habits like tiny medieval monks. In the third segment, the cart slowly rolls along parallel to the wall; the legs of a young boy hang over the wall. In the fourth segment, two men hail the cart and it pulls over. The legs of the boy go down a ladder.

Guattari breaks the text into images and sounds in describing a series of shots. The first shows the wall as a surface of inscription that is 'suggestive' (Deleuze and Guattari 1987: 168) in its 'greyish whiteness', an off-white wall; in 'double exposure . . . a face in extreme close-up, but that we can barely distinguish. As the camera imperceptibly approaches the wall . . . the face loses its contour, only the fixed eyes and a talking mouth still vaguely appear' (Guattari 2009: 156). Akin to the face pushed up against the white wall of the breast in nursing (Deleuze and Guattari 1987: 169), this close-up heightens intensity but through a voice that has a 'bass tone' and enunciates in a rather didactic way Russian bureaucratic desire in the form of a speech from the Military Collegium of the Supreme Court of the USSR in January 1937 concerning the treason trial of Karl Rudels (Guattari 2009: 157). Having confessed, Rudels rambles on about not defending himself but ensuring that those who have known him for decades recognise the truth of his testimony. This speech is voiced over an 'arrhythmic sonic mass' that becomes the wind and then silence. The bureaucratic speech comes in jolts; it is the rhythm of its self-pleasure.

The second shot breaks through the wall with a 'fade-in dissolve or another device' (Guattari 2009: 157). But there is nothing behind it. And nothing changes in the process as there is no loss of continuity, no change in the intensity of light. Yet 'little by little' a line appears on the horizon – it is a wall that cuts across the shot. The camera jerks several times and our point of view is of a passenger in a cart pulled by a mule, obstructed by a roughly textured sleeve of an arm and a hand wearing a ring; one of the aforementioned peasants appears, accompanied by K. The first, third and fourth segment contained references to K as well. The Kafka references are numerous but fleeting. Here Guattari deploys mannerisms in the manner of Kafka's 'schizobuffoonery' (Deleuze and Guattari 1986: 80): there is a hand signalling from a window before K's execution (first segment); K finds two old men eating soup in a room at the farm and these are joined by children (third segment); two old men get up from the table and lead K through the barn door (fourth segment); likewise, two gentlemen functionaries from *The Trial* lead K to his execution (Kafka 1968: 80). The soundtrack is a grinding cart and the mule's steps.

The third image is a series of shots (some establishing, some close-ups) in rapid succession – cart, mule's eyes, hands, etc. Yet 'in passing we catch, but very quickly, without really distinguishing what it is: three heads above the wall' (Guattari 2009: 158). Nothing about sound is indicated.

The fourth shot reveals the cart aligning itself before the three heads: the middle one is higher than the others and sports a long red beard. K returns gesticulating to one of the peasants who refuses to go further. Again nothing about sound is noted.

Shot five presents a white screen and sounds of the projector. This 'dream screen' is not the result of a technical problem as little by little, Guattari notes, numbers appear and then, vaguely, the three heads. Together these constitute a facial unit. One is reminded of how the 'Year Zero: Faciality' plateau ends with the question about three states or heads (primitive; Christ; probe); (Deleuze and Guattari 1987: 191): 'Must we leave it at that . . . ?'

Shot six brings K back in a long shot in which he turns back to the wall, after advancing toward a 'sombre tree', as if looking for the heads, and starts up a conversation with a peasant. Shot from close up, K calls out: 'Who was that guy we could see awhile ago above the wall? No answer' (Guattari 2009: 159). The peasant is not very helpful with any request. Shot seven continues the conversation as the peasant points in the direction in which K came in response to the question about where he can find an inn. The eighth image shows K pissing on the wall. The last image is a fragment involving Frieda and Klamm (from *The Castle*) and a peasant woman who spies on them from the tree. The text breaks off at this point.

IV. There Is Nothing on TV

Let's say that some people will watch anything, or simply watch, and others will be intrigued by Guattari TV, by Kafka because the wall gets one dreaming, it gives by drawing one into its own assemblages and in this way summons a viewership, a following. What is it to follow a televisual series? It consists in joining an assemblage by diagramming its potentialities: this wall concerns everyone. This is the kind of catalysis of home viewers that images are good at tripping, even if all this means at a base level of academic *jouissance* is citational play of the sort: oh yes, that wall reminds me of the 'high white wall' from the first fragment of the eighth octavo notebook, the one that the coachman drives along and notes that its bulges make it 'a forehead' (Kafka 1991: 79); or, isn't

the sound of the cart similar to the creaking of a cart in the summer heat in the short fragment 'Children on the Road' (Kafka 2007: 3)? Guattari seems to confirm that the televisual cocktail includes hypnosis, distraction and daydreaming, which is to say that an 'attractor' that in Brian Massumi's words 'induct[s] sensation' (2002: 84) that oscillates between interesting and boring, not between recognition, which is boring, and uniqueness, which is interesting, but that which gets one dreaming and running off on tangents and losing focus in a sketchy and dynamic diagram whose intensities at least make available one existentialising function, joining the Kafka assemblage. The diagram would be productive of a new kind of machinic reality: the Kafka literary machine and the Guattari machine dance, conjoined, and 'open like a non delimited collection' (Guattari 2006: 404). Guattari's draft would be then reticent about being converted into televisual formats, and would transmit this, after all he underlines it, coiling it through the drafts and into production and post-production and the broadcast ready succession of images. But not just this, a certain randomness, too, hard-to-understand bits that seem involuntary alongside the obvious and not so obvious references to Kafka texts. These are the non-passive seeds of subjectivity's production before a programme that does not feed pap to its viewers but interfaces with them.

Guattari was ambivalent about television and we can sense this in his description of the hypnotic experience of watching. If the hypnotic dimension of this machinic drug trip services mediatic alienation by erecting an artificial neurosis that masks more serious family social problems, then television withdrawal by remote control is the consequence (Guattari 2002: 18). Yet Guattari wanted to mount a counter-example that would inspire, an extraordinary television which would engage viewers as potential users and makers, in addition to providing impetus for their mobile imaginaries that move toward dismantling the artificial neurosis. This would require seizing upon and redeploying the already permeable television buzz for the purposes of ethico-aesthetic resingularisation. It is easy to get lost in this ambivalence and, like my colleague Janell Watson, throw up your hands and ask about a fictional solution: 'where are the independent basement TV stations such as that imagined in *Wayne's World*?' (Watson 2002: 43). Indeed, can we imagine transversal TV on YouTube where the illusion of participation is often too opportunistically framed by feedback in real time. In the age of live audience responses to webcast events, joining the Kafka assemblage might be construed as nothing more than contributing to the feedback loop of cheap content and exploitable data.

Struggling with his own scepticism, Guattari wondered about the prospects for a 'person who comes home exhausted, spent after a draining day, who automatically turns on his television' in search of a minor buzz through 'another personal reterritorialisation by totally artificial means' (1996c: 102). Television interminable. Guattari's television project by Kafka is not only designed to unleash fabulation, but through television's boring formal machinic effects implant complex affects not in virtue of representational content alone – though as we have seen this is carefully wrought – but in a way that pours out of the home viewing situation and turns its passivity inside out. Guattari's Kafka project is not a spectacularisation, but concerns itself with little triggers – intensities, gestures and particle signs – that help viewers put some distance between themselves and television's banal tendencies and strive to exist differently through the 'alterification' of joining the Kafka assemblage.

Any link between television and becoming is hard to grasp for a scholarly community that has not wanted to appreciate television's potential. Perhaps the most powerful statement of this suspicion is Maurizio Lazzarato's (2004: 165) claim that television produces a subjectivity that neutralises becoming and blocks minoritarian proliferations. Lazzarato is referring to a mass medium rather than a post-mediatic television, and he echoes Guattari's own comments on the erosion of subjectivity by the former and the need for 'aesthetic reappropriation of the production of images, of audiovisual production', in the latter (Guattari 1996b: 134). Lazzarato precludes minoritarian becoming through television.

However, another approach is framed by Massumi as part of a 'dynamic midst' of an 'event-space' (2002: 82ff.). 'Project For A Film *By* Kafka' might diagram the transduction of the general form of Kafka as a collective assemblage into the televisual medium as an idea for a 'cultural series'. We can only imagine as readers the experience of the arrival of such a series into the living rooms of a people to come and we can do this with Massumi's help, although his example is a live transmission of the Super Bowl game and ours is a sound stage and set production of a work with an entirely different sensibility. Having scrambled the literary signal of Kafka by running interference through multiple semiotic media, Guattari TV flows into the room by scrambling the already constituted socio-historical arrangement of the household with its delicate divisions of gender, labour and generation. The series acquires the status as a 'catalytic part-subject' by potentialising the homebodies in terms of how they can go about joining the Kafka assemblage; this is not an

insect-transform but an initiation into a not so strange universe. Admittedly, this potential is unevenly found in the bodies that would realise it in different ways; indeed, the catalytic part-subject needs a boost, thinks Massumi, because there is typically 'nothing on TV' and this makes 'distraction ... more catalytically operational' (2002: 84). The fields of an event's potential are layered with intersecting and overlapping subfields and codes (informal regularities that govern households). The Kafka series becomes through its transmission of images (inductive signs); upon their arrival in new spaces, a re-conditioning of the space takes place. A television broadcast is an extremely complex and variable event; what's on the screen is but a small part (and, frankly, the audience for Guattari TV would be small). The programme arrives into a relatively porous space whose entrances and exits are monitored, and enters the mix of a collective assemblage with its coded but open enunciations; this programme is only one of many flowing through the home alongside other semiotic transmissions.

Let's say that something is on TV, and it's Kafka. But the images are of a wall. Is there a potential public for Guattari TV by Kafka? Or, will this remain a marginalised broadcast within a sea of banality? For instance,

> one is subjected to tv insofar as one uses and consumes it, in the situation of a subject of the statement that more or less mistakes itself for a subject of enunciation ... one is enslaved by TV as a human machine insofar as the television viewers are no longer consumers or users, nor even subjects who supposedly 'make' it, but intrinsic component pieces.... In machinic enslavement there is nothing but transformations and exchanges of information. (Deleuze and Guattari 1987: 458)

It is instructive to compare this explanation with another concerning television in *Chaosmosis*.

Guattari TV, by Kafka contributes to polyphonic subjectivity production in the manner described in *Chaosmosis* (Guattari 1995: 16ff.). When Guattari wants to embed his theorisation of machinic subjectivity production in everyday life he selects watching television to organise his presentation. His explanation recapitulates an earlier discussion of the same points in an appendix to *Cartographies schizoanalytiques*, but with reference to the red curtain in his apartment, and he softens a somewhat dualistic typology of problematic (fading and thickening) and sensory affects (immediate and perceptible). There is a 'complex refrain', Guattari indicates, that holds together diverse components of subjectivation before the television set:

> When I watch television, I exist at the intersection: of a perceptual fascination provoked by the screen's luminous animation which borders on the hypnotic; 2. of a captive relation with the narrative content of the program, associated with a lateral awareness of surrounding events (water boiling on the stove, a child's cry, the telephone…); 3. of a world of fantasms occupying my daydreams. My feeling of personal identity is thus pulled in different directions. How can I maintain a relative sense of unicity, despite the diversity of components of subjectivation that pass through me? It's a question of the refrain that fixes me in front of the screen, henceforth constituted as a projective existential node. (1995: 16–17)

The risk of machinic enslavement that characterised the description of television in *A Thousand Plateaus* gives way in *Chaosmosis* to the problem of assemblage consistency and the role of the refrain. The sensory elements of fascination, of the 'gluey' screen to which one may be stuck, and the force of narrative that drags one forward yet is not so exclusive as to be beyond insistent interruptions of lateral awareness, introduce the scenario and lead into more abstract matters like fantasms that sweep one away. Guattari is a tributary of the figure on the screen because enunciation enjoys a certain autonomy – 'my identity has become that of the speaker, the person who speaks from the television' – and the refrain fixes the sensory environment and props up the world of fantasms. This refrain is a 'motif' and 'attractor' that installs itself in the scene, as if under collective ownership, enjoying both independence from a functional anchor and transversal potential to freely circulate, and couples the diverse components at play as it marks the existential territory of Guattari as TV viewer. Guattari is no more than a 'fluctuating intersection' or constellation of relatively heterogeneous components, and inchoate affects, held in place by a stabilising, existentialising refrain, which is a non-ordinary, non-semiotic, repetitive motif (a hypnotic feature), holding together different kinds of worlds (marked existential territories and universes of reference whose emergence refrains catalyse). Refrains help negotiate intra- and inter-assemblage passages. In this example, the refrain owes much to the tone of the voice emanating from the television, which can close down the viewing experience because it is so clichéd or loosen something from the viewer and refresh him or her by helping one move along in some manner. The scenes of reception of television and cinema are quite different to the degree that the complex social semiosis of televisual decoding is, at least in terms of sensory affect, muted by the darkened public space of the theatre; whereas the blue glow of the television screen is a milieu component that becomes purely expressive without any

content as it marks a territory of viewing for all irradiated in its range and subjected to its flashes. Turning on a television is an important step in understanding how a territory is built.

V. Conclusion

The examples of playwrighting (see *Socrates* in this volume), envisioning a television series and film (not the only cinema project that he had in mind in the 1980s) reveal that Guattari was actively thinking through the relationship between his theoretical principles and different kinds of artistic production. While there has been an unfortunate tendency to trap him in the vicissitudes of free radio, this strategy of critique has limited significance (Barbrook 2001). Guattari worked directly with playwright Enzo Cormann, filmmakers like François Pain (and planned a film with Japanese photographer Keiichi Tahara) and curators such as Yasha David, and thought about the need to get involved in television as well, despite his own ambivalence about the medium's role in formatting capitalistic subjectivities.

The example of auteur TV would have been familiar to him, but of limited interest in its pure form of directorial personal signature. Rather, by displacing the centrality of the director's distinctive vision, but without losing it entirely, Guattari sought in affect the autonomy necessary to stake the claim that his project was *by* Kafka. 'By Kafka' does not signal another auteur, but affect's distance from intention and the contagiousness of its channelling and passage through different media to a potential viewership. The readiness of this imagined audience to join in the Kafka assemblage through the affects delivered by television is evident in Guattari's sense of himself as a viewer and a tributary of intensities that are not obviously positive or negative but ambivalently transformative.

Art as Abstract Machine: Guattari's Modernist Aesthetics

Stephen Zepke

Abstract

Felix Guattari was a modernist. He not only liked a lot of modernist artists, but his 'aesthetic paradigm' found its generative diagram in modern art. The most important aspect of this diagram was its insistence on the production of the new, the way it produced a utopian projection of a 'people to come', and so a politics whose only horizon was the future. Also important for Guattari's diagram of the 'modern' were the forces of abstraction, autonomy and immanent critique. Together these elements construct an artwork that is radically singular and separate, composed of a-signifying, a-temporal and invisible forces, sensations that go beyond our human conditions of possibility. In this Guattari's modernism must be understood as being quite different from his co-option by contemporary art theorists influenced by post-Operaist thought. Post-Operaism understands politics as 'being-against', a dialectical form of negation that finds its political condition of possibility in what already exists. Because such thought sees modern art as being entirely subsumed by the institutions and markets that contain it, art itself must be negated in order for aesthetic powers to become political. This has lead post-Operaist thought to align itself strongly with the avant-garde positions of institutional-critique and art-into-life, or 'non-art'. Guattari's modernism takes him in a very different direction, affirming modern art despite its institutional enframing, because art is forever in the process of escaping itself. This makes modern art the model in Guattari's thought for politics itself.

Keywords: modernism, modern art, abstraction, autonomy, singularity, immanent critique, post-Operaism, politics

> It is here that art accedes to its authentic modernity, which simply consists in liberating what was present in art from its beginnings, but was hidden underneath aims and objects, even if aesthetic, and underneath recodings and axiomatics: the pure process that fulfils itself, and that never ceases to reach fulfilment as it proceeds – art as 'experimentation'.
>
> (Guattari and Deleuze 1983: 370–1)

Félix Guattari believed in art, he believed in the creative and revolutionary power that gave it a 'privileged position' above philosophy, science and politics (1995: 101). Without art, Guattari would say, without its ability to invent new feelings, there can be no real politics. No doubt this strikes us as odd today, when contemporary art seems determined to subordinate or suppress its production of autonomous sensations in favour of a political activism based on conceptual and discursive engagement. Art into life! This slogan has echoed from Duchamp to the neo-avant-garde of Conceptual art, before reaching its drab and almost hegemonic status today as an institutionalised theory of 'non-art'. Guattari is often enlisted as part of this movement, but such claims leave out one rather important point: Guattari was a modernist!

This is important because contemporary art has largely defined itself against its modernist heritage, from its conceptual beginnings through to the a priori postmodern irony of its 'representations'. Guattari often vents a righteous anger and disgust at postmodernism's cynical apotheosis of the signifier, and its turn away from the aesthetic raptures of sensation in favour of representation and *realpolitik*.[1] Against this Guattari advocates a return to Modernism, although what is 'authentic' about 'modernity' has been 'present in art from its beginnings'. It is then, a Modernism that comes after postmodernism and refutes it, but only because it is continually reinventing itself, rejecting the 'post-' in favour of the 'new'. Guattari calls for 'At the very least an originary fantasm of modernity constantly under scrutiny and without hope of postmodern remission' (1995: 77). In the spirit of his cheeky revisionism, I would like to present Guattari as the advocate of our 'return to the future', as our greatest 'contemporary modernist'.

What then is this 'originary fantasm', this contemporary fabulation of a modernity that forever remains 'to come'? It is certainly a selective version of Modernism, one that rejects the 'modern myth' of origins (1996: 65), the techno-scientific concept of 'progress and modernity'

(1996: 109, 2011: 50), and the modern 'ideologies that once claimed to serve as guides for reconstructing society on a more just and egalitarian basis' (1996: 109). A Modernism without teleology or transcendence, but then what of Modernism is left? What is left is modern art, or perhaps better a modern aesthetics, which Guattari affirms as the 'diagram' or 'abstract machine' for modern politics. The 'epistemological grounds' of the 'machine', he writes, are not found in 'math or physics, but art' (2006: 387).[2] Guattari is serious, and he gives painting, or more generally art, as the model for the production of subjectivity (1995: 7, 2008: 74, 2011: 41), for ecosophy (2000: 52), for schizoanalysis (2000: 41–2, 2008: 329, 2011: 47–8), for politics (1995: 90–1, 133–4, 1996: 202, 2008: 189), for revolution (2008: 64), for his collaboration with Deleuze (2008: 450) and for 'life itself' (2008: 94). And this list is by no means exhaustive. In fact, even the oft-quoted remark that it 'might be better to speak of a proto-aesthetic paradigm, to emphasise that we are not referring to institutionalised art' (1995: 101–2), inevitably given as the ground for aligning Guattari with the avant-garde movements of art-into-life and institutional-critique, can only be understood in terms of the modernist diagram that remains at its base.

So what is Guattari's modernist aesthetic diagram? It is also selective, on the one hand rejecting the 'formalist abuses and reductions of modernism' (1996: 109),[3] and railing against the institutional and financial controls placed on art, while on the other affirming in the highest terms the modernist commitment to abstraction, autonomy, materialism and immanent critique. In this sense Guattari is not defending Modernism against the contemporary, instead he wants to liberate the contemporary from the post-modern, so that it might become – always for the first time – modern. In this regard Guattari is a champion of the modern, but only when the modern is understood as a process of transformation, as the emergence of the 'to come', as the production of the new. This is the political value of modern art, he says, its 'incessant clash against established boundaries' and 'its propensity to renew its materials of expression and the ontological texture of its percepts and affects' leading to 'a direct contamination of other domains' and the 're-evaluation of the creative dimensions that traverse them all' (1995: 106). To steal a phrase from Owen Hatherley's aptly titled book *Militant Modernism*, Guattari wishes to defend Modernism against the defenders of Modernism, by extracting from it a diagram of creation by which the modern might renew itself.

Guattari's insistence on modernist artistic practices is most clearly expressed in his repeated rejection of postmodernism and Conceptual

art. This is quite different from Jacques Rancière, who has recently suggested erasing the modern–postmodern 'rupture' by sublating it within an 'aesthetic regime' in which the modern and postmodern are its two poles, united in their shared sensible 'dissensus' from the established framework of perception, thought and action. Rancière thereby understands aesthetics in political terms, whereas Guattari insists upon the modern–postmodern rupture in order to reject the latter, precisely because aesthetics for him precedes politics. As a result, some commentators try to excuse Guattari's taste in modernist art, because they see his love of Balthus, Modigliani, Turner or Pollock as embarrassing or absurd in relation to contemporary art's desire to do politics. But Guattari affirms these painters precisely because of their political importance,[4] and his rejection of Conceptual art cannot be blamed on his 'age', nor used to suggest he was not up with the latest fashions in art; both are mean-spirited and misleading accusations that the facts clearly refute. Not only does the rejection of Conceptual art in *What Is Philosophy?* echo Benjamin Buchloh's famous essay 'Conceptual Art 1962–1969: From the Aesthetic of Administration to the Critique of Institutions' which had been published in the catalogue to a large retrospective exhibition of Conceptual art held at Musée d'art moderne de la Ville in Paris in 1989, but it also echoed statements by Guattari made at least as early as 1971.[5] In a remarkably prescient passage found in *The Anti-Oedipus Papers* Guattari laments: 'ultimately, there will be no more "modern art". Just because art is going to adopt the category of signification itself for itself' (2006: 249). This is a precise description of what Conceptual art was doing at this time, as artists not only took over language as a medium, but also started to explore the binary oppositions of structuralism as a conceptual frame for their work.[6] It is true that Guattari does try to soften his position in *Chaosmosis* (1995: 95) and the late interview with Oliver Zahm (2011: 43) by claiming that Conceptual art produces 'a concept that creates sensations', but this does not change his fundamentally modernist affirmation of art as the realm of sensation; it rather ambitiously (and ultimately unconvincingly) tries to align Conceptual art with it.

So although Guattari claims that he and Deleuze lack a better term than 'modern' to describe our current age, he is being disingenuous (Guattari and Deleuze 1987: 382). This is because Guattari – like Deleuze – inherited his ontological understanding of aesthetic processes from the modernist tradition, where simple materials and cosmic forces achieve a consistency, Guattari says, 'exclusively through technique'

(377). This is the secret of modern composition: materials are 'abstracted' from their external referents so that their intense complexity can be expressed. Varèse's technique at the 'dawn' of the modern age is 'exemplary' in this regard, a sound machine 'molecularizes' matter (that is, it deterritorialises sounds so they can be composed on the same plane) in order to harness their 'cosmic energy'. Varèse's 'sound machine' assembles or synthesises various sounds (some recorded, others produced) and the means of modulating these sounds (oscillators, generators and transformers), arranges them, and in so doing 'makes audible the sound process itself, the production of that process, and puts us in contact with still other elements beyond sound matter' (378). This 'modern' technique singularises its material in order to open it onto its outside, at once expressing and constructing a new future, a new cosmos. At this moment of what Deleuze will call 'transcendental empiricism', a singular sensation (a real experience) expresses and constructs the becoming of the universe (its real conditions) (1994: 69).

This process involves a Kantian conception of critique that was the basis of modernist art history stretching from Alois Riegl to Clement Greenberg, and which interpreted the artwork as an expression of the a priori categories operating as its formative principle or *Kunstwollen*. Guattari and Deleuze discover various ahistorical ontological diagrams of the aesthetic composition of materials, with the most significant of these being the 'modern' diagram drawn by the 'abstract line', which composes a 'smooth space' that is 'an absolute that is one with becoming itself, with process'. This is an 'absolute of passage' that in modern art 'merges with its manifestation' (Guattari and Deleuze 1987: 545). The *Kunstwollen* of modern art is, in other words, experimentation. Guattari's term for this modern and immanent critique is 'self-reference' (*auto-référence*), which describes 'a processual subjectivity that defines its own coordinates and is self-consistent [*auto-fondatrice de ses propres coordonnées, autoconsistancielle*], but can nevertheless establish transversal relations to mental and social stratifications' (1996: 96). For Guattari, modern art offers the model (or as he calls it, the 'metamodelisation') of an autonomous process of autopoiesis, it does not seek its categorical a prioris (qua conditions of possibility) but detaches (one could say 'abstracts') material-forces from these conditions, in order for them to repeat as difference. To return to Guattari's discussion of Varèse, the synthesiser takes the place of the grounds of a priori synthetic judgement (instead of transcendental categories we have a transcendental compositional technique), replacing conceptual conditions of possible experience with a synthesising machine

capable of producing a real experience of 'unthinkable, invisible, nonsonorous forces' (Guattari and Deleuze 1987: 378). In other words, alterity becomes the a priori of art.[7] Modernism in this sense is a pure constructivism, or Constructivism perhaps, as Guattari seems to suggest when he writes with Deleuze:

> The modern figure is not the child or the lunatic, still less the artist, but the cosmic artisan: a homemade atomic bomb. To be an artisan and no longer an artist, creator or founder, is the only way to become cosmic, to leave the milieus and the earth behind. (1987: 380)

But this is art-into-life only if life is understood as chaosmosis, and the 'artisan' describes all those great artists Guattari loves not for rejecting 'art', but because their art was already a real political engagement. The explosion of the material composition into its outside, its summoning of an immanent people to come, or a new future defines Guattari's 'aesthetic paradigm' as a modernist politics.

This opening out onto a new future is achieved by the technique of abstraction, which is a process of self-reference that deterritorialises experience so that it loses its optical cohesion and its representational content, and becomes a 'visual block' or sensation. This abstract sensation produces its own outside, reterritorialising experience on this movement of becoming that encompasses subject and object.[8] Abstraction is therefore Modernism's double movement, on the one hand an absolute deterritorialisation of a material's signification (whether representational or linguistic), and on the other 'a local integration moving from part to part and constituting smooth space in an infinite succession of linkages and changes in direction' (Guattari and Deleuze 1987: 545). This paradoxical nature of abstraction as both singular and universal is the real condition of a transcendental materialism of becoming, and was present in modern art from the beginning: 'Art as abstract machine' (Guattari and Deleuze 1987: 547). And it is as art – or as the aesthetic paradigm – that this double movement is realised in politics. Why? Because it is only by deterritorialising our present conditions of possibility, by turning these material conditions singular and abstract, that critique can make the present take flight. As Guattari wrote with Negri, 'the collective potential is realized only when the singular is free' (1990: 17).

Finally, Guattari and Deleuze ask, what should be called 'abstract' in modern art? Their answer is 'a line of variable direction that describes no contour and delimits no form', and finds its exemplary case in 'the abstract line defined by Michael Fried in relation to certain

works by Pollock' (1987: 646).[9] This is not to say that art should continue painting à la Pollock, which would be ridiculous, but that contemporary art must find its own ways to be modern, its own political techniques that might reclaim the means of producing the future. Let us turn to another exemplary figure Guattari and Deleuze associate with the modern age to see how this might work. Paul Klee's book *On Modern Art* (1948) gives a good example of the immanent and yet transcendental critique Guattari calls self-reference. Three 'elemental' dimensions constitute the painting, Klee explains, line, tone or value, and colour. Line is a measurement, tone or value is a weight and colour is a quality. These formal, abstract and transcendental elements and their relations compose a refrain (Klee calls it a 'motif and theme' [1948: 37]) out of which emerge the dimensions of form and content. Each composition of the elemental 'forces' (the term is Klee's) is a 'constructive expression' that 'flies from the earth', 'rises above it to reality' and finally 'embraces the life force itself' until it is 'one with the universe' (43). This is a straightforward account of the double movement of modernity; the self-reflective abstraction of materials to the point where they can construct their own cosmos. In this way the artist, Klee writes, 'places more value on the powers which do the forming than on the final forms themselves' because 'he sees the act of world creation stretching from the past to the future. Genesis eternal!' (45). Finally, and most importantly, Klee connects the artistic technique of expression-construction to politics. Although, he says, artists dwell within the source of creation and express it in their work, they lack the 'ultimate power', '*Um trägt kein Volk*' ('the people are not with us' [55]; see also Guattari and Deleuze 1987: 372). This suggests that politics on a molar scale, on the level of real political movements, is something beyond the power of art. Artists seek a people, a people yet to come, a people that their work attempts to create. But, and these are Klee's final words, they cannot do more than form a community of artists such as in the Bauhaus, which composes the materials they have and are, in a modern practice of *auto-référence*. It is this, Guattari and Deleuze say, that 'confides to the ear of the future the persistent sensations that embody the event' (1994: 176), in a 'forewarning' or 'summoning' of a people, that is not yet their actual creation (110). 'More,' Klee says, 'we cannot do' (1948: 55). In this sense, then, and as Guattari put it, 'artists are like errant knights, like Don Quixote' (2011: 42), tilting at the windmills of capitalism and governments 'with unfortunately incomparable, but nevertheless competitive means' (Guattari and Deleuze 1987: 381). Indeed, despite modern art's seeming

insignificance in the face of constituted powers, the modern artist does enjoy one significant advantage. The 'competitive means' shared by art and capitalism is the deterritorialisation of peoples and their earth that produce new and abstract sensations, but whereas capitalism tries to reterritorialise these sensations in normalised subjectivity (Oedipus) and quantified representations (commodities) – a biopolitical process 'to which art contributes' (Guattari and Deleuze 1987: 381) – modern art can push these further, in order to make the people and the earth 'like the vectors of a cosmos that carries them off; then the cosmos itself will be art' (Guattari and Deleuze 1987: 381). In this sense, and it is one we will return to, political art for Guattari is the most abstract and modern art, and therefore the most cosmic.

If, as Brian Massumi recently put it, 'an art practice can be aesthetically political, inventive of new life potentials, or new potential forms of life, and have no overtly political content' (2011: 54), then what are we to make of those – and there are many – who read Guattari as advocating the avant-garde position of art-into-life? This position has been most forcefully argued by the Italian post-Operaist movement, some of whom – most notably Antonio Negri and Franco 'Bifo' Berardi – had close personal ties to Guattari. Post-Operaist thinkers see the dialectical process of the negation of the present as the necessary form of any political resistance, and understand Guattari's process of self-reference in these terms. As a result, post-Operaist aesthetics often begins from the opposite position to Guattari (although often in his name), the negation of modernist art. This is not exactly the negation of art as such, but it does bring Guattari into line with the tradition of modern or 'contemporary' art known as 'non-art'. Hardt and Negri laid the foundations of this reading in *Empire* when they directly reject Bergson's concept of the 'virtual' (what we have been calling the 'cosmic' force of becoming, or the 'to come' of the future) in favour of the 'possible' (2000: 356, 468). Hardt and Negri reject the virtual because it does not, they claim, give sufficient 'ontological weight' to reality (468). The possible on the other hand, dialectically defines politics as a negation of the existing situation. In this sense the possible is the ontological category of what Hardt and Negri call 'being-against'. Indeed, in one of the most startling metaphors of the book they argue that Empire is the 'inverted image' of the multitude's 'productive activities', something 'like a photographic negative' (211). In this strange inversion it is Empire that appears as the condition of possibility (the photographic negative) for the multitude's creative work. Politics must begin with a dialectical negation of existing oppression that, according to

Hardt and Negri, grounds the creative event in the 'reality' of everyday life. As a result, they claim, Guattari and Deleuze:

> seem to be able to conceive positively only the tendencies towards continuous movement and absolute flows, and thus in their thought too, the creative elements and the radical ontology of the social remain insubstantial and impotent. Deleuze and Guattari discover the productivity of social reproduction (creative production, production of values, social relations, affects, becomings), but manage to articulate it only superficially and ephemerally, as a chaotic, indeterminate horizon marked by the ungraspable event. (2000: 28)

What is so wonderful about this rather acerbic description of Guattari and Deleuze is that it is absolutely right. Guattari does affirm the artistic event in its most ungraspable and autonomous sense, in its creativity entirely undetermined by what is, in its absolutely virtual and heterogeneous aspect. These are events' real conditions of im-possibility! This is an affirmation of, as Nietzsche had it, art and nothing but art, the great stimulant to life.

Although the post-Operaist claim that art has been subsumed by the aesthetics of biopolitical capitalism is an important one, it is often made in order to subsume art's creation of the future to the more important political gesture of the negation of the present. This leads to the inevitable post-Operaist understanding of art's 'self-reflection' as its self-negation, and the equally inevitable consequence that 'political art' is by definition 'non-art', it being only in this form that art can enter into the politics of everyday life. Perhaps the most symptomatic effect of the post-Operaist position has been its apotheosis of Duchamp and his readymade as the heroes of art-into-life.

This apotheosis has had many champions, but I will take as my example Maurizio Lazzarato's suggestion of developing a 'new assemblage of being-against (the dispositives of power) and of being-together (the process of political auto-emancipation)' (2008: 173), based on a reading of Guattari's aesthetic paradigm inspired by Duchamp. This 'new assemblage' draws on what is certainly most interesting about Guattari's aesthetic paradigm, the way in which modern art provides a diagram for political transformations. But Lazzarato is going to base his understanding of this diagram on what he calls the 'polemic' the readymade launches 'against' art's institutional frame (2010: 110). Lazzarato's understanding of Guattari's aesthetic paradigm therefore begins from 'being-against' art because, as he says, 'art and culture are entirely integrated into the logic of the dispositives of subjugation

and control in contemporary capitalism' (2008: 174). As a result, Lazzarato argues, the 'aesthetic paradigm' is neither 'an aestheticization of the political', and 'nor does it have much to do with the avant-garde programs of the *first half* of the twentieth century' (174). We might think this a strange statement given that Lazzarato will champion Duchamp, but in fact it has its own kind of historical consistency. What Lazzarato – perhaps unwittingly – tacitly acknowledges here is that the avant-gardes of the *second half* of the twentieth century, most notably the so-called 'neo-avant-garde' of Conceptual art, have already deployed Duchamp's readymade 'against' modern art and its institutions.

By embracing Duchamp's claim that the concept was the new medium of artistic creation, Conceptual artists sought to de-institutionalise art, and so democratise its creative processes by disengaging them from any specialised techniques (an aspect of the readymade Lazzarato explicitly praises, because it puts non-art directly in contact with the newly emergent practices of cognitive capitalism). But these attempts to politicise 'art' by making it 'non-art' (that is, by rejecting sensation in favour of the concept) were in fact easily assimilated by cognitive capitalism, which either instrumentalised Conceptual art within the emerging 'creative industries' of advertising and marketing, ignored them because 'non-art' is on the one hand too banal and on the other too esoteric to be recognised by anyone but art-insiders,[10] or simply maintained their status as 'art' by consuming them as such. As Guattari and Deleuze succinctly put it: 'This is a lot of effort to find ordinary perceptions and affectations in the infinite [i.e., as art] and to reduce the concept to a *doxa* of the social body or great American metropolis' (1994: 198).

What I am objecting to in Lazzarato is how he treats art, and not, I hasten to point out, what he says about the potential to use 'artistic techniques beyond the realm of art' to develop new forms of political organisation, expression and activism (2010: 101; see also 2008: 175). Artistic techniques can and should be used by political movements, just as the institutionalisation of art should clearly be critiqued. But these 'political' uses of art should not conflate art and its frame, which inevitably leads to 'political art' defined as the negation of art or non-art. Although it is true that Guattari launches polemical attacks against the way culture in general and contemporary art in particular are 'enframed' or 'surrounded' by capitalist valuations and institutions,[11] he nevertheless makes a clear ontological distinction between art and its frames that conserves and even privileges the political role of art qua art. As I have tried to show, Guattari affirms modernist artistic

practices *despite* their institutional enframing. Guattari makes the point very clearly, arguing that although

> the work, the artist, inspiration, talent, and genius are 'hijacked by the signifier', it nevertheless seems that the evolution of modern art is tending towards a politics of a-signifiance: the figural, and machinic assemblages, are getting the upper hand on representative systems, expressive and iconic codes.[12]

This is no better seen than in Guattari's reading of the readymade, which emphasises its material process of expression rather than its conceptual foundation of the tradition of 'non-art'.[13] For Guattari, the readymade is a refrain, it is the selection of an object that turns it into an expressive territorial marker (Guattari and Deleuze 1987: 349), a biological definition of art-into-life that means 'we no longer know what is art and what nature' (1994: 185). When the readymade acts as a mechanism of singularisation (by no means assured, as the refrain can also operate the most conservative reterritorialisations) it therefore becomes the epitome of art rather than its negation. In fact, Guattari will argue that the *Bottle Rack* 'singularizes' a 'constellation of referential universes' in such a way that 'the Benjaminian *aura* arises from this genre of singularizing ritornellization' (1996: 164).[14] This aura is not only due to the readymade's utterly singular nature, but is also an aspect of its process of composition, an ongoing becoming by which its assemblage remains open to the infinity of the cosmos. In this sense, as Guattari goes on to say, the readymade 'induces an aesthetic ecstasy, a mystical effusion' (165). This is the highest political value of art, and 'I am not', Guattari stubbornly insists, 'interested in exchanging some virtuous group jouissance for some individual jouissance that might be a thousand times more intense and fertile (mystical jouissance)' (2006: 251).

Guattari expresses the same commitment to the political power of philosophy in *What Is Philosophy?*, a power philosophy shares with art and that he gives the name 'utopia'.[15] 'Modern' philosophy, he argues there,

> takes the relative deterritorialisation of capital to the absolute; it makes it pass over the plane of immanence as movement of the infinite and suppresses it as internal limit, turns it back against itself so as to summon forth a new earth, a new people. (Guattari and Deleuze 1994: 99)

It does so in a similar way to modern art, by employing abstraction, singularisation and autonomy to create a 'nonpropositional form of the

concept in which communication, exchange, consensus, and opinion vanish entirely' (Guattari and Deleuze 1994: 99). Like modern art, philosophy is able to lead these bio-political mechanisms towards their absolute deterritorialisation or 'deframing' (187), in order to call forth a new people and a new cosmos.[16] Utopia is therefore the immanent, abstract and autonomous dimension created by philosophy and art within the conditions of the present, while remaining undetermined by them: 'There is no act of creation that is not transhistorical' (Guattari and Deleuze 1987: 326).[17] Utopia is what is within European capitalism that exceeds it, but what is this? It is something utterly autonomous and abstract freed through immanent critique, but in itself it 'is' nothing because it is 'becoming', forever 'to-come'. Like the late paintings of Turner, political Modernism is the expression and construction of utopia, an 'eternal future' (Guattari and Deleuze 1983: 132) undetermined by the present, but acting upon it. It is an event of 'absolute deterritorialisation at the critical point at which it is connected with the present relative milieu, and especially with the forces stifled by this milieu' (Guattari and Deleuze 1994: 100).

This is the point at which philosophy and art expresses what is unthought, invisible and not-felt, like, they claim, what Adorno called a 'negative dialectics' (Guattari and Deleuze 1994: 99). Despite the similarity of the terms, this is quite different from what the post-Operaists call 'being-against', which does not exceed the present (this being precisely the 'ephemerality' and 'impotence' of the virtual they reject), but finds in the present the conditions of possibility for the political. Guattari's diagram is based instead on the real conditions of creation, as he puts it: 'This is art, this unnameable point of non-sense that the artist works' (2011: 47).[18] In this way, and as Adorno said, 'in art the particular is literally the universal' (1997: 45), because, as Guattari and Deleuze argue, becoming is both singular and transcendental. And the one necessarily through the other, for the transcendental alterity of the future appears through a technique operating on the materials of the present, by abstracting them, absolutely deterritorialising them, so they can compose something new.[19] Art is, Guattari says, 'an alterity grasped at the point of its emergence . . .' (1995: 117), it is autonomous from all present conditions of possibility, and this is the real condition of its politics. Guattari says as much in *Chaosmosis*:

> Fabricated in the socius, art, however, is only sustained by itself. This is because each work produced possesses a double finality: to insert itself into a social network which will either appropriate or reject it, and to celebrate,

> once again, the universe of art as such, precisely because it is always in danger of collapsing. (1995: 130)

It is precisely this double-finality that means art can never be simply identified with its bourgeois and institutional frames, and in fact always exceeds them. Rather than an institutional-critique that affirmed non-art, Guattari favoured an 'institutional therapeutics' (1984: 17). This is a critical practice we could call 'institutional reflection', by which its most creative elements – perhaps the artworks, but not necessarily – act as catalysts for an institutional becoming that both maintained its compositional consistency, and continually opened onto its outside by producing creative events of subjectivation in others. This is an institution of double becoming in which the abstract machine of modern art retains its autonomy, the better to intervene in the present through a cosmo-politics of experimentation. Modern art for Guattari was not something to be against; it was something to be affirmed as our most effective laboratory of the future.

Notes

1. Guattari could barely have put it more harshly; 'the virtual ethical and aesthetic abdication in postmodern thought leaves a kind of black stain upon history' (1996: 116).
2. Similarly, Guattari writes; 'Art, as the epitome of the gratuitousness of the sign, is the horizon of the liberation of science' (2006: 395).
3. These are sketched out in *A Thousand Plateaus* and elaborated more fully in Deleuze's *Francis Bacon, the Logic of Sensation*. Put schematically, they are the tendency of geometrical abstraction to become a symbolic code for ideal forms (even, as in the case of Kandinsky, when this 'spiritual' dimension is composed of affects), and at the other extreme where random elements degenerate into a 'scribble' or 'scramble' and the work 'lapses into a statistical heap' as in the music of John Cage (Guattari and Deleuze 1987: 379) or the paintings of Pollock, who from Bacon's perspective 'creates a veritable "mess" ' (Deleuze 2003: 109).
4. A claim that is entirely self-evident. Guattari writes about Balthus's paintings, for example, that they give an 'ethico-political' critique of 'capitalistic subjectivation', through their 'heterogeneous, multicentred, polyphonic, polyvocal approaches, installed outside pre-coded equilibriums' (1987: 85).
5. Which refutes the claim that the rejection of Conceptual art came from the 'aesthete' Deleuze.
6. For a more detailed discussion of this see my 'Eco-Aesthetics: Beyond Structure in the work of Robert Smithson, Gilles Deleuze and Félix Guattari,' in Bernd Herzogenrath (ed.), *Deleuze/Guattari and Ecology*, London: Palgrave Macmillan, 2008.
7. Guattari writes something similar in relation to the refrain's priority to time, 'Time is not an a priori form; rather the refrain is the a priori form of time, which in each case fabricates different times' (Guattari and Deleuze 1987: 385).

8. Brian Massumi's recent book *Semblance and Event: Activist Philosophy and the Occurrent Arts* calls this a 'constructivist technique of existence' (2011: 100) that takes as its object its own process of emergence. This is what he calls an 'occurrent art', which operates through 'diagramming' as a 'procedure of abstraction'. This is close to my own account, although what I call Guattari's modern art diagram, Massumi calls – drawing on a much wider range of thinkers – 'technologies of lived abstraction' (14–15). He also emphasises 'autonomy' (53–4) and the operation of abstract art (69–71, 137–8), along with another of Guattari's terms I don't discuss here, 'metamodeling' (103).
9. Guattari also mentions Pollock in *Molecular Revolution in Brazil*, where he explains that one cannot repeat – as in reproduce – Pollock's work, precisely because it 'belongs to assemblages that go right beyond the confinement of an act of creation' (2008: 451). In other words its abstract singular event is transversally repeated qua difference, and this is its politics. It is perhaps relevant to mention here how Deleuze was also a fan of the great modernist 'American critics' Fried and Clement Greenberg, along with Harold Rosenberg. See Deleuze 2003: 105, 1994: 91–2.
10. For example, conceptual work that took the form of classified ads in newspapers, such as Joseph Kosuth's *Second Investigation 1. Existence* (1968), in which the artist placed the eight categories organising *Roget's Thesaurus* into various newspapers and magazines. This work perfectly illustrates what Benjamin Buchloh famously called Conceptual art's 'aesthetics of administration', and that he criticised for merely 'mimicking' the practices of cognitive capitalism, rather than attacking them. In this sense, the only thing the work is 'against' is modernist art.
11. For example, in a passage quoted by Lazzarato (2008: 183), 'Let us say that contemporary art remains enframed. There is a universe of reference, a universe of valorization, including economic valorization, which enframes the work, qualifying it as such, capturing it in a social field. There is an institutional-cutting out' ('L'an 01 des machines abstraites', *Chimères*, 23, Summer 1994). Other examples are 2008: 21–34, 2011: 46.
12. My thanks to Gary Genosko for his translation of this passage from p. 276 of *La Révolution Moléculaire* (Fontenay-sous-Bois: Encres/Editions Recherches, 1977). The existing translation is clearly inadequate (see Guattari 1984: 106).
13. To be fair, Lazzarato does not understand the readymade in purely conceptual terms, and in fact offers some interesting ideas of how Guattari's own suggestion of a 'concept that creates sensations' (2011: 43) could be understood in terms of 'belief' (2010: 105–13).
14. Bifo, another post-Operaist advocate of 'non-art' symptomatically claims that for Guattari 'the aura [of art] was definitively forgotten' (2008: 34).
15. Guattari vacillated somewhat about the term 'utopia', on the one hand voicing suspicion over its dialectical relation to history (Guattari and Deleuze 1994: 110), while on the other affirming it in the face of those who accuse him of it, finally claiming that 'when it comes to dreaming and utopia, the future is wide open' (1996: 106).
16. It is worth mentioning Nicolas Bourriaud's book *Relational Aesthetics* (Dijon: Les Presses du réel, 2002) at this point, which contains a chapter about Guattari that was first presented in Guattari's seminar and then published in Guattari's journal *Chimères*. There are various problems with Bourriaud's application of Guattari's thought to contemporary art, including his insistence on the place of the concept in contemporary art (101). More importantly for us here, however, is his downsizing of Guattari's utopian optimism in modern art's radical political potential, to the construction of consensual and 'convivial' 'relations'. Regarding

this last point, Eric Alliez has launched a convincing attack in 'Capitalism and Schizophrenia and Consensus: Of Relational Aesthetics', in S. Zepke and S. O'Sullivan (eds), *Deleuze and Contemporary Art*, Edinburgh: Edinburgh University Press, 2010.

17. As Guattari says of one of his favourite painters, 'Turner's art, from his most famous period, signifies nothing. It has no assignable historical coordinates. It designates and manifests a-temporal machinism' (2006: 249).
18. As a result, and as Adorno puts it, 'Aesthetic autonomy encompasses what is collectively most advanced, what has escaped the spell' (1997: 53). Aesthetic autonomy, in other words, is what is most modern – and therefore most political – about art.
19. Adorno once more: 'A cryptogram of the new is the image of collapse; only by virtue of the absolute negativity of collapse does art enunciate the unspeakable utopia' (1997: 41). These brief quotations from Adorno stand as a promissory note for a future essay on his relation to Guattari and Deleuze.

Machinic Animism

Angela Melitopoulos and Maurizio Lazzarato[1]

Abstract

This catalogue essay is based on a series of interviews conducted by the authors with international scholars who were asked to reflect on Guattari's scattered comments concerning animism. Interviewees are: Eduardo Viveiros de Castro (anthropologist, Museu Nacional, Rio de Janeiro), Eric Alliez (philosopher, Paris), Jean Claude Polack (psychoanalyst, Paris), Barbara Glowczewski (anthropologist, Paris), Peter Pál Pelbart (philosopher, São Paolo) Janja Rosangela Araujo (master of Capoeira Angola, and professor, Salvador de Bahia) and Jean Jacques Lebel (artist, Paris). Animism was thought by Guattari in relation to a number of themes and places in excess of religion and ritual but in the context of the shattering of capitalism.

Keywords: animism, machinism, subjectification, anthropology, archaic societies, ritual

> There has been a sort of de-centering of subjectivity. Today, it seems interesting to me to go back to what I would call an animist conception of subjectivity; to rethink the Object, the Other as a potential bearer of dimensions of partial subjectivity, if need be through neurotic phenomena, religious rituals, or aesthetic phenomena for example. I do not recommend a simple return to irrationalism. But it seems essential to understand how subjectivity can participate in the invariants of scale. In other words, how can it be simultaneously singular, singularising an individual, a group of individuals, but also supported by the assemblages of space, architectural and plastic assemblages, and all other cosmic assemblages? How then does subjectivity locate itself both on the side of the subject and on the side of the object? It has always been this way, of course. But the conditions are different

> due to the exponential development of technico-scientific dimensions of the environment of the cosmos.
>
> I am more inclined . . . to propose a model of the unconscious akin to that of a Mexican Cuandero or of a Bororo, starting with the idea that spirits populate things, landscapes, groups, and that there are all sorts of becomings, of haecceities everywhere and thus, a sort of objective subjectivity, if I may, which finds itself bundled together, broken apart, and shuffled at the whims of assemblages. The best unveiling among them would be found, obviously, in archaic thought.
>
> (Félix Guattari)

> We do not know, we have no idea what a society without a state and against the state would be. Animism is an ontology of societies without a state and against the state.
>
> (Eduardo Viveiros de Castro)

Guattari brings about a de-centring of subjectivity in separating it simultaneously not only from the subject, from the person, but also from the human. His challenge is to escape from subject/object and nature/culture oppositions, which makes man the measure and the centre of the Universe, in making out of subjectivity and culture specific diversions (differences) between man and animals, plants, rocks, but also machines and mechanics. Capitalist societies produce both a hyper-valorisation of the subject and a homogenisation and impoverishing of the components of its subjectivity (parcelled out into modular faculties such as Reason, Understanding, Will and Affectivity, governed by norms). It is within this framework of a search for a new definition of subjectivity, one that could escape the capitalist enterprise, that the reference to animism is often made. In Guattari's work and in the same manner as in animist societies, subjectivity loses the transcendent and transcendental status that characterises the Western paradigm. Guattari's thought and that of animist societies can find common ground in this understanding of subjectivity. Anthropologist Eduardo Viveiros de Castro, expert on the Amazon Indians, commented:

> I very much enjoyed a passage in which Guattari speaks of a subject/object in such a way that subjectivity is just an object among objects and not in a position of transcendence above the world of objects. The subject, on the contrary, is the most common thing in the world. That is animism: the core of the real is the soul, but it is not an immaterial soul in opposition or in contradiction with matter. On the contrary, it is matter itself that is infused with soul. Subjectivity is not an exclusively human property, but the basis of the real and not an exceptional form that once arose in the history of the Cosmos. (Our interview, Rio de Janeiro, 2009)

It is not subjectivity that separates man from 'nature', because there is nothing 'natural' about it. It is not a given, but it is, on the contrary, both an epistemological and a political operation. There is indeed something before the subject/object opposition and it is necessary to start from their fusion point. Guattari prefers to speak about 'objectity' and 'subjectity' to mark their non-separation and their reciprocal overlapping.

Guattari does not make a specific anthropological category out of animism, nor does he focus on a particular historical phase, since he does not limit himself to non-literate, non-governmental societies. Aspects of polysemic, transindividual and animist subjectivity also characterise the world of childhood, of psychosis, of amorous or political passion and of artistic creation. Guattari's attachment to the La Borde clinic is surely linked, as Peter Pelbart suggests (our interview, São Paolo, 2009), to the radical alterity in which psychosis plunges us with regards to the subject and its modalities of 'human' (linguistic, social, individuated) expression. Psychoanalyst Jean Claude Polack observes:

> And it is true that among psychotic people, and notably among schizophrenics, this practically daily commerce with particles of self or perhaps with corpses, outside the self, does not pose a problem… There is a certain very particular 'animist' sensibility that one could call delirium. Of course, it is a delirium by our standard; it is something that cuts the psychotic off from the social reality that is completely dominated by language, social relations, thus effectively separating him from the world. But this brings him closer to the other world from which we are totally cut off. It is for this reason that Félix maintained this laudatory view of animism, a praise of animism. (Our interview, Paris, 2009)

Guattari's summoning of animism (he goes so far as to say that it would be necessary to temporarily pass through animist thought in order to rid oneself of the ontological dualisms of modern thought) does not signify in any way a return to some form of irrationalism. On the contrary, for Eduardo Viveiros de Castro, this conception of subjectivity is completely materialist, even permitting a renewal of materialism.

> I just read the passages that you sent me on animism in Guattari's work that I was not familiar with, in fact. I find this artificial alliance between animism and materialism incredibly interesting, since it allows one to separate animism from any other form of idealism… To reintroduce a subject's thought that is not idealist, a materialist theory of the subject, goes along with the thought of the Amazon peoples who think that the basis of humans and non-humans is humanity. This goes against the Western paradigm, which maintains that that which humans and non-humans have in common is 'nature'. (Viveiros de Castro interview, *supra*)

The 'animism' that Guattari claims to represent is not at all anthropomorphic, nor is it anthropocentric. The central concern is one of 'animism' which one could define as 'machinic', to recycle the terms of a discussion that we had with Eric Alliez. In Western philosophy there are traditions of thought (neo-platonic, monadological, from the infinitely small to the infinitely large – Leibniz, Tarde, etc.) which can coincide with the cosmologies of animist societies in certain places. Alliez remarked:

> Animism is present in the work of Deleuze before he meets Guattari. And it is a horizon, a totally expressionist category which participates in that which one could call, more globally, a universal vitalism. There, according to the neo-platonic tradition, everything breathes, and everything conspires in a global breath. This vitalism is visible in authors like Leibniz, but also in Spinoza across the general category of expression and expressionism . . . To my mind, what is going on in his collaboration with Guattari is that animism is no longer invested from an expressionist or vitalist point of view, but from a machinic point of view. And this changes everything, because it is necessary to understand once and for all 'how it works', and how it works in our capitalist world whose primary production is that of subjectivity. (Our interview, Paris, 2009)

What are we to understand by machinic animism? The concept of a machine (and later of assemblage), which allows Guattari and Deleuze to free themselves from the structuralist trap, is not a subgroup of technique. The machine, on the contrary, is a prerequisite of technique. In Guattari's 'cosmology' there are all sorts of machines: social machines, technological, aesthetic, biological, crystalline, etc.

To clarify the nature of the machine, he refers to the work of the biologist Francisco Varela who distinguishes two types of machines: allopoietic machines which produce things other than themselves, and autopoietic machines which continuously engender and specify their own assemblage. Varela reserves the autopoietic for the biological domain in reproducing the distinction between living and non-living which is at the foundation of the Western paradigm, whereas Guattari extends the term to social machines, technical machines, aesthetic machines, crystalline machines, etc.

In the universe there exist everywhere, with no distinction between living and non-living, 'non-discursive autopoietic kernels which engender their own development and their own rules and mechanics'. The autopoietic machinic asserts itself as the for-itself and the for-others, that is, non-human others. Guattari explains: 'The for-itself and the for-others cease being the privilege of humanity; they crystallize everywhere

that machinic interfaces engender disparity, and in return are founded by it' (1995: 109).

All over the Cosmos there exist becomings, haecceities and singularities. If they are not the expression of 'souls' or of 'minds', they are the expression of machinic assemblages. The disparities they create in variations have their own capacity for action and enunciation.

'For every type of machine we will pose a question, not about its vital autonomy – it's not an animal – but about its singular power of enunciation' (Guattari 1995: 34). Every machinic assemblage (technical, biological, social, etc.) once contained enunciative facilities, if only at the embryonic stage. It thus possessed a proto-subjectivity. There, too, like subjectivity, it is necessary to separate the singular power of the enunciation of the subject from the person and the human. This goes against our philosophical and political tradition that since Aristotle has made language and speech a unique and exclusive characteristic of man, the only animal which possesses language and speech.

Guattari, detaching himself completely from structuralism, goes on to elaborate an 'enlarged conception of enunciation' which permits the integration of an infinite number of substances of non-human expression like biological, technological or aesthetic coding or forms of assemblage unique to the socius.

The problem of assembling enunciation would no longer be specific to a semiotic register, but would cross over into expressive heterogeneous matter (extra-linguistic, non-human, biological, technological, aesthetic, etc.). Thus, in 'machinic animism', there is not a unique subjectivity embodied by the Western man –male and white – but one of 'heterogeneous ontological modes of subjectivity'. These partial subjectivities (human and non-human) assume the position of partial enunciators.

Additionally and most importantly, the expansion of enunciation and expression concerns artistic materials which the artist transforms into vectors of subjectification, in 'animist' autopoietic facilities. Guattari writes:

> The artist and more generally, aesthetic perception, detaches and deterritorializes a segment of the real in order to make it play the role of a partial enunciator. Art confers meaning and alterity to a subset of the perceived world. The consequence of this quasi-animist speech effect on the part of the artwork redrafts the subjectivity both of the artist and of his 'consumer'. (1995: 131)

Guattari's great friend and accomplice, artist Jean Jacques Lebel, on whom Jean Rouch's *Mad Masters* (*Les maîtres fous*), filmed in

Cameroon on the occasion of a society of witch doctors' trance ritual, 'left an indelible impact', was one of the first to emphasise the filiation between the thought of non-Western 'savages' and the 'savage' artists of the East.

Guattari was not only in the friendly company of anthropologists, who included Pierre Clastres of *Society Against the State*, but also artists who solicited the 'wild libertarian flux' of the unconscious and its intensities. Lebel comments:

> [This leads us] above all to the 'savage', to savage thought. Permanent and major influence. Thanks to Artaud and his Tarahumaras, thanks to the Surrealist gaze resting on magic art, and thanks to my father who turned me on (starting in childhood) to the art of primitive peoples, with respect to art that is radically different from that which is considered classic, I never considered Paris or New York, Rome or Berlin to be centres of the world. The intensity that comes from primitive art at its peak is the standard against which I judge what I like or what I do not like in Western art. (Jean Jacques Lebel, our interview, Paris, 2009)

Lebel's Direct Poetry provides a critique of the 'imperialism of the signifier' in 'blowing up language' and in carrying out an a-grammatical poetry that is 'beyond and beneath the verbal'. This is another theme that runs throughout Guattari's work: that of a-signifying, a-grammatical or a-syntactical semiotics. The privilege of speech has a profound political meaning. Not only have signifying and linguistic semiotics served as instruments of division between human and non-human, but also of hierarchisation, subordination and domination inside the human as well. All of the non-linguistic semiotics, such as those of archaic societies, the mentally ill, children, artists and minorities, were considered for a long time to be lacunar and inferior. It was only in the 1960s and 1970s that these non-linguistic modes of expression began to be appreciated for their major political role and for making up an experimental field of psychiatry, like at La Borde or as in the work of Fernand Deligny with the autistic 'savage children' and their a-signifying modes of expression:

> It was an obsession in all of the history of Western thought to define what was natural and what was not, to the point where people thought that if there was no spoken language, it was necessarily animal. Thus they forbade the 'savage children' who grew up among animals and without speech to express themselves with signs. People behaved in a similar fashion towards deaf people. For 100 years the Vatican forbade the use of sign language, though it is a language par excellence. (Barbara Glowczewski, our interview, Paris, 2009)

Polysemic trans-individual animist subjectivity does not constitute a 'vestige' or even a simple 'renaissance' of ritual ancestral practices in capitalist societies. It is also updated and activated as both a micro- and macro-political force which fuels the resistance and creativity of the 'dominated', as Suely Rolnik and Rosangela Araujo explain.

'Trans-individual polysemic animist' subjectivity uncovers the possibility of producing and enriching itself in societies such as that of Brazil (and, according to Guattari, in another way in Japan) by means of updated 'animist' rituals. This fascinated Guattari. The Capoeira and the Candomblé, as described by Araujo, known as 'Janja' (our interview, Salvador de Bahia, 2009), a master of Capoeira Angola, are mechanisms of production and singularisation of subjectivity that renew themselves and use semiotic symbols of the body, dance, postures and gestures to speak the language of Guattari, as well as a-signifying semiotics such as rhythms, music and so on.

The function of speech is not discursive but existential. With other semiotics and with no privileged role, it helps bring about the '*mise en existence*' or the production of existential territories. In these practices, the fluctuations of signs act upon real fluctuations without the mediation of representation, of the individual subject and its consciousness. In a remark by Guattari on the subject of ritual, we find, as if in a mirror, his entire concept of the collective (or machinic) assemblage of enunciation and the power of the non-metaphorical use of signs and words:

> primitive 'magic' is illusory. This is how ethnologists see it. Primitive peoples are *realists*, not mystics. The imaginary and the symbolic are real. No backwaters. Everything extends into everything else. No break – separation. The Bambara does not imitate, does not use metaphors, does not index. Its dance and its mask are a full sign, a total sign that is at the same time representation and production, i.e. transduction. It doesn't watch the performance impotently. It is itself, collectively, the scene, the spectator, the stage, the dog, etc. This is a sign that is connected to reality. Or rather a sign such that there is no break between reality and the imaginary mediated by a symbolic 'order'. No break between gesture, speech, writing, music, dance, war, men, gods, the sexes, etc.' (Guattari 2006: 258)

Thus there are possible echoes and cross-checks between updated ancestral rituals in contemporary capitalism and machinic assemblages, as was discussed by anthropologist Barbara Glowczewski who worked with Guattari. Rituals like collective enunciation mechanisms produce the body as they manufacture an enunciation. But in one case as in others, it is not a question of anthropomorphic productions. The

'collectivity', as Glowczewski reminds us, is irreducible to a human grouping, it is other than belonging to inter-subjectivity or simply to the social: 'If people are interested in Félix today, it is precisely because he defines subjectivity by assemblages according to which humans are just as soon with other humans as with collectivities, with concepts, with animals, objects, as with machines . . . ' (Glowczewski interview, *supra*).

The ritual, like assemblage, is a machine that concomitantly determines the action of the cosmic and molecular fluctuations, of real and virtual forces, of sensible affects and corporeal affects, and of incorporeal entities such as myths and universes of references. These rituals and these cultural practices produce a subjectivity not based in identity that is becoming, since 'the process is more important than the result' (Araujo interview, *supra*). This is reminiscent of the process-driven concept of the assemblage of activity in Guattari's work.

As through art as Guattari understands it (and which constitutes for Eduardo Viveiros de Castro an authorised reserve for 'savage thought', providing that it does not transgress assigned boundaries), ritual pierces the chaosmosis, bringing us back to the point of subjectivity's emergence, to the condition of the creation of the new. 'Art is, for Guattari, the most powerful means of putting into practice some aspect of the chaosmosis' (Polack interview, *supra*), to plunge beneath the subject/object division and to reload the real with 'possibles'. These indigenous cultures of the Americas do not represent a simple survival of ancestral practices that are doomed to extinction. They do not constitute a simple quest for the improbable 'African' identity in the face of the reality of slavery and the social inequalities in Brazil. These processes of subjectification are actualised through the use of the myth (and, for Guattari, mythograms – from Leninism to Maoism – are indispensable in any process of subjectivisation) of an Africa that never existed: 'It is a reinvented Africa, an Africa before slavery, where men and women are free, in order to be propelled into a future of liberty and autonomy for all' (Araujo interview, *supra*). What fascinated and intrigued Guattari during his numerous voyages to Brazil and Japan was not only the power of practices like the Candomblé ('passed on more or less directly from the African cultural heritage, which [is] now escaping [its] original ghettoization and spreading throughout society' [Guattari 1996: 105]), but also the meaning and the political function of these modes of subjectification.

For Rolnik, these practices contain a 'popular knowledge of the unconscious which is very strong and very effective' (Suely Rolnik, our interview, Brazil, 2009). If they play a major role in the elaboration of

the trauma of slavery in a 'beyond post-colonial' situation, they can and should play a major political role.

If there are hierarchical class divisions at the macro-political level in Brazil which seem insurmountable, at the micro-political level this 'questioning of' and 'this other politics of subjectivisation' cross the same divisions and class hierarchies and circulate and diffuse into the population as a whole, through bodies. According to Rolnik, the richness of the micro-political dimension expresses all of its power when it assembles with the macro dimension, as has occurred at certain moments in Brazilian history (1968, the beginning of the 1980s . . .). The valorisation of this 'production of other subjectivity' has a long history in Brazil, since the 'anthropophagic' manifesto of the 1920s had already legitimised it.

Guattari was particularly attentive to all of the modes of production of subjectivity that recharge themselves in non-Western traditions, since the primary production in contemporary capitalism is the production of subjectivity. This production, having never been 'natural', means we have things to learn about these practices if we are to be capable of updating them for contemporary capitalism: 'Archaic societies are better armed than white, male capitalist subjectivities in charting the multivalence [of alterity]' (Guattari 1995: 45).

For a reversal of history, science will force us deeper and deeper into an animist world: 'Every time science discovers new things, the world of the living gets bigger . . . It is obviously a thought problem. The certitude of knowing what is living and what is not continues to shift . . . we are in an animist problematic, of the soul, of animation . . . ' (Polack interview, *supra*). It is not only the evolution of science, but the development of capitalism itself which forces us to an 'animist' thinking and politics:

> That which appears natural to us – springs, rocks – are loaded with history for the aboriginal peoples, who practice forms of totemism, and are thus cultural and non-natural . . . There are those here among us who function this way even more today than in the past, because we have less and less apprehension regarding what is natural, while the category that philosophy contributed to setting up opposes humans to untouched nature. And the greater the desire was to leave it untouched, the more it was developed. This sort of opposition no longer really makes any sense. The nature/culture opposition nevertheless constricts our thinking a great deal. It is still our paradigm, since we continue to fantasise about natural peoples, natural environments, about the fact that we must preserve nature. And as much as we think this way, I think we are wrong when it comes to the solutions to be found for the different problems. For example, the question of the environment is not really about protecting

> nature by stopping pollution. On the contrary, it is necessary to invest it with new forms of assemblages and cultural mechanisms. (Glowczewski interview, *supra*)

But, as in archaic societies, one cannot imagine an ecology of nature without simultaneously considering an ecology of the mind and of the social. One must then update a cosmic thinking, where 'soul' and 'machine' exist everywhere concurrently: in the infinitely small as in the infinitely large. The three ecologies of Guattari, leaving behind the parcelling of reality and subjectivity, reacquaint us with the conditions of possibility of a cosmic thinking and politics.

Play as an Affective Field for Activating Subjectivity: Notes on *The Machinic Unconscious*

F. J. Colman

Abstract

How often does an interest or pleasure in your life become something that has to be managed, given a hierarchical position amongst other tasks, and thus becomes a chore alongside other chores? When content and possibility are stripped by scheduling and the demands of capitalist required labour mean that free play or time required for speculative and/or creative thought is removed in the interests of deadlines, what happens to the compassionate, generous and intimate functioning of thought and life? This paper considers how Guattari argues that subjectivities are produced and organised by what he describes as machinic assemblages. Machinic assemblages are those aspects of life that operate to regulate the affective powers of life. Guattari's work on activities such as art making, game play, music and performance provides ways to consider the labour of subjectivity outside of work. I ask the reader to consider what the notion and motivation for play signal. Arguing that a singular life at play is the collective event of play, I describe play as a mediatising form for the production of subjectivity. The play field situates and directs the machinic assemblage of subjectivation through its own forms of mediatisation.

Keywords: mediatisation, affect, play, work, aesthetic, machinic unconscious, subjectivation

> In the final days of 1977 the movie *Saturday Night Fever* showed a new working class, happy to be exploited all week long, in exchange for some fun in the disco.
>
> (Berardi 2009: 27)

What are your motivations to stop work and play? The answer to this question depends on a number of factors: how do you define work and what motivates you? What is enjoyment? And what is play? All things are controlled and determined by aspects of the societies to which you and your collective culture are bound. Abstractly, we can observe some things about play: whatever technological medium it uses and whatever (a-)rhythmic, algorithmic or aleatory structures direct it, play is one of the enjoyments of life. Play is fun. Play is productive and destructive of existing categories of normativity; play messes with epistemologies. Play is essential for healthful mental and physical life, providing as it does an intensive concentration upon singular, and not routine task, requiring team as well as individual participation. Play may be repetitious, but its many modalities offer a range of extensions, distractions, commentaries, and existential and aesthetic redirection of current events that surround and engulf the subject. The processual nature of play provides its hermetic intensity. *A singular life at play is the collective event of play.* However, as play remains tethered to its cultural allowances, we must be careful not to posit some utopic originary fixed notion of play, yet alterity can be achieved by play in many instances. To consider motivation, under the post-industrial conditions of world capitalism, is to consider the complex determinations of collective and individual subjectivity. Of enjoyment, we might note that this is an idealised, contentious and often commercialised emotive response that is modelled by different value paradigms, dependent upon what value or what some articulate as 'truth' systems are subscribed to. No matter what modelled behaviour is positioned by a system, its determined direction must be motivated; moved in some direction by some affective force. How do we articulate the strange and different modes of intensity and affect that organise people under those enormous, unstoppable sovereign entities into the broad paradigms of work and play? Propelling motivation are different forms of energy, which we can characterise broadly as inevitably entropic, yet creative of different and as yet unknown entities. In addition, when one enters either the affective or political dimensions of *motivation*, then the epistemic, energetic and social mediation of bodies are also of consideration.

The motivations for play are many: relaxation, avoidance, protest, simulation, modelling, puzzle solving, role play, entertainment and

so on. Each and more of these have qualifiers that direct the nuances of the play; even abstractions are subject to the organisers of subjectivity, or what Guattari describes as the 'machinic unconscious' of *subjectivation* – genetic, chemical, sexual, tactical, implicit, explicit, political, cultural, formal, historical, familial (2011: 12, 19, 39; Deleuze and Guattari 1987: 130ff.). Above all, forms of play provide encounters with new things, new materials, new ideas, new positions. In connecting with other things – whether imaginary, tangible, auditory, visual, tactile, etc. – play forms *mediatise* subjectivity through this encounter, which in its affect of plus one substance or idea, something must change, consolidate, dissipate, alter.

I. No Subject; Just Subjectivation

'The machinic production of subjectivity', writes Guattari (1995a: 5), 'can work for the better or for the worse . . . . At best there is the creation, or invention, of new Universes of reference, at worst there is the deadening influence of the mass media to which millions are currently condemned.' Guattari's development of the diagrammatisation of the 'machinic unconscious' enables critique of the collective machinic structures of given groups. Why do some groups of people work and play less than others? What motivates similar groups to increase their work or play time? Individual and institutional perception of the world and of living is directed by the images and language of collective structures; the determination of forms of capitalism. Guattari's thinking about exactly how capitalism exerts its immanent and ever-intensive direction of the collective machinic unconscious provides methods that illuminate the affective politics at work in the organisation of things – from different modes of work required for capitalism's desires; for the desires of the controlling powers, as well as the range of leisure activities also required for capitalism's progress.

In working to dismantle psychoanalytic and structuralist conceptions of the structure of the unconscious, Guattari's aim was to demonstrate how a *molecular revolution* – a revolt against power – is only possible if we collectively understand how the machinic unconscious operates. Guattari argues that subjectivities are organised by all kinds of machinic assemblages, which are those aspects of life that operate to regulate the affective powers of life (Guattari 1984, 2011; Watson 2009: 55).

Guattari qualifies the unconscious with the term 'machinic', as he says, in order 'to stress that [the unconscious] is populated not only with images and words, but also with all kinds of machinisms that lead it

to produce and reproduce these images and words' (2011: 10). While different kinds of *machines* have 'singular' and 'specific enunciative consistency' (Guattari 1995a: 34), the *machinic* details a collective enunciation of power, is a complex structure, and is not to be confused with the term 'mechanism' (although mechanical things are not excluded from becoming part of a machinic structure) (2011: 342, n.15). Guattari describes the general largess of the collective machinic unconscious as 'something that we drag around with ourselves both in our gestures and daily objects, as well as on TV, that is part of the zeitgeist, and even, and perhaps especially, in our day-to-day problems' (2011: 10). Throughout his writings, Guattari uses the word machine in various ways and coupled with other terms, but contextually uses it in order to ascribe the varieties of the *affective workings* of machinic structures and the things constituted within and by these machines (see Guattari 1995a: 33–57). His critique of the machinic unconscious provides a new description of the economic systems at work in capitalism, and the aesthetic correlations that different abstract machines facilitate, and in political terms, the desired mediatisation of all bodies within that group or community.

While we can collate the 'for the better or for the worse' that Guattari addresses of the terms of the machinic production of subjectivity, it is the possibility for creative change, and the conditions required for molecular revolution, that I am interested to address here, through a focus on the machinic aesthetic of play. As I have argued previously, Guattari's work in the area of mass media provides us with tools for thinking about the ways in which subjectivation processes occur (Colman 2008a: 69–70). Within those processes lie the creative domains of art making; a mode that enables existence to be realised in terms of its social or a communal value that is not always for the purposes of capital accumulation – despite its inevitable co-option by some marketplace.

Guattari's work on what aesthetic activities – such as art making, game play, music, performance – can provide for thinking about the terms of subjectivity are significant. As distinct from 'economic, social, religious or political' spheres (Guattari 1995a: 99), the fields of aesthetics (and here we may include things and forms that offer ways of connecting with other things – sensorial, spiritual, sexual, ritual, ecological) incorporates all epistemologies and/or experiences that require some type of mediating platform to facilitate or 'crystallise' aspects of subjectivity (for example, through thinking or activity) (Guattari 1995a: 98). Guattari describes many of the affective outcomes of what happens when you join the technicalities of technological platforms with other

types of platforms that are themselves not at all technological (Guattari 1995b). He observes, 'One creates new modalities of subjectivity in the same way that an artist creates new forms from the palette' (1995a: 7). In the sense that Guattari is attendant to the possibilities of modelling, Janell Watson is right in characterising Guattari's work as precisely being concerned with the perceptual account of the affective aspects of self-awareness of the world's processual nature (Watson 2009: 56). Guattari describes how a schizoanalytic metamodelisation can counter the range of the affects of repressive machinery upon subjectivity (1995a: 58–63). To detail aspects of the terms of the 'modelling' of subjectivity (which refer to the larger determining factors of life – ecological, militaristic, familial, genetic, biological, cultural), I am using the notion of 'mediatisation'. In this sense, I hope to retain the inferences of modelling larger universal referents upon subjectivity (see Genosko and Murphie 2008), and enable the position for detailing of the processual aspects of subjectivity by its *connection* within its collective mediatised universes of reference – as these differ across communities. Guattari's insistence on connections as opposed to determinations situates his work for media philosophies interested in process, such as Franco Berardi (2009: 27), who notes that moments of play operate as reward for labour.

In media theories of the mass media, the term 'mediatisation' is applied to describe the political controls that mass media forms take (cf. Castells 2001; Hjarvard 2008; Lundby 2009). To consider how this process works, I am engaging Guattari's machinic unconscious to articulate how mediatisation can connect with anything. Replacing the Lacanian 'unconscious' with the 'machinic unconscious', Guattari describes life as a processual dynamic, bound by continuums of heterogeneous, polytemporal and cosmic components, not bound by linguistic signifiers of the old psychoanalytic 'the unconscious is structured like a language' type configurations. In the psychiatric terms of Guattari's view, the Lacanian 'unconscious' describes an archaic structure, whereas the machinic unconscious allows Guattari to sketch out the complexities of systems that will direct consciousness and subjectivity. Images and descriptors of things are not the only determining factors, but operate along with the social and political 'machinisms' that direct the aesthetic of any given society into being able to understand, and 'see' the nature of the thing (Guattari 2011: 10).

What are the functions of play within and for those subjectivation processes that Guattari details? As I described in the opening of this article, play is an abstracted field, dynamic, with transversal movements creating different outcomes for subjectivity, limited only by the scope

of the play design and game structure. Yet, play offers a processual modality where, as in processes of making art or doing work, a political determination of aesthetic preferences for living is activated – whether through force, social design, or by machinic choices that alter according to definitions of labour forms, such as 'play-bour' (Moore 2010: 27). Play is one of work's dialectic paradigms; it is a counter movement to the capitalist-determined work-ethic, and thus contributes to the territoriality of the symbolic field that Guattari, and Deleuze and Guattari describe as a field that is productive of the machinic unconscious. Hence, the play field situates and directs the machinic assemblage through its own forms of mediatisation.

To speculate on the operative functions that media of all forms enable reorients subjectivity through the uncoupling of normative subject mediatisation from historicised roles into different mediatising fields. Entering into either states of work and/or play, a platform for subjectivity is entered – a polytemporal, polyhistorical and collective platform for Being. Its features are defined by its contemporaneous media technologies: printing press, spinning jenny, thaumatrope, cinématographe, wireless sensor-modal reactive data player, digital sound recorder, iPad. In addition to the technological platform is the determination of the expression of content as selected, focused and framed by the technology deployed. Technology and content affect the ontology of each, in turn affecting the modes of collective subjectivity, the results of which form a complex mediatised field (as a political and aesthetic refrain). Looking to the modes of 'machinic interface' that direct subjectivity with 'orders' of 'proto-subjectivity' (Guattari 1995a: 8), we can consider the operations of work and/or play within this field, and identify the catalytic affects of the mediatisation of material.

The mediatisation to which I refer here engages the non-materialist agency of the machinic production of subjectivation as and within the collective unconscious that Guattari outlined (Guattari 2011: 9–22). There are two key avenues that mediatisation takes, first, through the materiality of the technological platform, and second, through the types of schematisation of information and experiences. Things do not require a material body to be real; ideas can have tangible affects the same way that a pop song, or a hacked credit card can have affects. Mediatisation thus engages the materialist propositions and the conceptual, or idealist movements through machinic interfaces, all of which carry degrees of affectivity. Media affects determine somatic responses to the sovereignty of capitalism's call to work; to liberal education; to be submissive to capitalism's forms of control of minority

and favouritism for difference that can be exploited. Media affects manifest as reactive, inventive, sounds, signals, pain or stimuli, and are perhaps more noticeable when routines, or concentration are interrupted or augmented. For Guattari, there is no aesthetic distinction to be drawn with the types of mediatisation of subjectivation by the structures of the machinic unconscious, but I see the terms of machinic mediatisation as referring more accurately to a breadth of machinic aesthetics, of which the machinic unconscious is but one component. The machinic aesthetics of the realised forms of any subjectivation are recognisable through its historical form or situation.

In thinking of specific applications – art, playforms, games – mediatisation fixes points within chaos. [*Writing/speaking/reading these words.*] These are not spatial points, they are affective points to which temporal structures are attributed through the discernment of speeds of movement, in order for structures to be formed through normative consistencies. Those affective points have within them their own ontological immanence, perhaps recognisable, perhaps as yet undetermined. These affect points are positioned by media platforms that provide temporal consistency (writing, radio waves, motion sensor technologies, visual and audio screens, mobile screens, art forms, medications, stimulants), diagrammatise experience, and frame real events of the world, directing information and attention to material and implicit things in the world – war, water, food, drugs, love, satisfaction, time, work and play.

II. Machinic Mediatisation

In the first section of *Anti-Oedipus*, Deleuze and Guattari title a section 'the subject and enjoyment' (1983: 16–22). What they discuss in this section is how it is the pursuit of the intensive quantities of *energy* involved and engaged through any processes of consumption of material or existential experience that is the 'motive force' for a subject's unconscious (17). What are the motive forces for work and play? What determines the level and direction of energy to be ascribed to a process?

Guattari's *Anti-Oedipus* diary charts his daily process of writing – *as work* for Deleuze; the ways in which various machinic operators extol him to be 'productive', to be 'professional', and to expend energy in ways that are accountable by his social system. Speculating on his anxieties about producing texts and keeping his diaries that were then sent to Deleuze to be massaged into the philosophical texts that comprise their first collaborative book *Anti-Oedipus*, Guattari writes that he

is: 'Writing so that I won't die. Or so that I die otherwise . . . Deleuze is concerned that I'm not producing anymore . . . I'm home kind of fucking around' (Guattari 2006: 399). He then describes himself, that he is not suited to the task at hand and is, in fact: 'a do-it-yourself guy, a sort of Jules Verne – *Voyage to the Centre of the Earth*. In my own way I don't stop . . . But you can't tell. It's the work of never-ending reverie. Lots of ambitious plans. Everything in my head, nothing in the pocket. Epiphany' (399–400).

Mediatisation fixes temporal points for history. Capitalism's history of [media/art/material/excess] objects displays the affective movements of power of this history (hierarchies of race and gender, obsessions, fetishes, desires). Guattari is suffering under his own mediatisation through the demands of the writing machine, which requires product. Product is at odds with process, the latter being the way that life naturally progresses when not under enforced determining machinic outcomes, required for life under capitalism. Of work, Guattari noted how the industrial manifesto perverts the sense of being human, with its party line of 'sado-masochistic enticement[s]' (Guattari 1984: 190). Of play, or pertaining to the intensity that play offers, Deleuze and Guattari describe the intensive refrain: 'Voyage in place: that is the name of all intensities, even if they develop in extension' (1987: 482). Through Guattari's thesis of the machinic unconscious, we can see that the influences of the machines of one's times are what constitute the collective of which one is a part.

Guattari's aesthetic direction provides a paradigmatic shift for thinking about subjective assemblage within the social system – no matter what processual type of mediatisation or institutionalisation runs that system. In developing his accounts of the processes of abstract machines, Guattari situates the territorial nature of subjectivity through the relationships generated between and amongst what Watson describes as 'the evolution of technology and the production of actual machines' (Watson 2009: 128).

While the evolution of technology can be described in its historical, material terms – from the other-worldly realms, the creation of aesthetic paradigms, to their use in the vernacular world, the portability of information and modes and speeds of communicative technologies – it is the 'production of actual machines' that is not so readily accounted for. For the machines that Guattari describes belong to the affective realm of the world – and the energies by which they move are not all tied to power grids, electrical batteries, radio waves and antennae – as their components are epistemological, and contingent, and their platform

accessibility controlled by the precarious movements and foci of political capital. According to Guattari, 'a heap of stones is not a machine, whereas a wall is already a static proto-machine, manifesting virtual polarities, an inside and outside, an above and below, a right and left' (1995a: 42). Guattari further qualifies: 'These diagrammatic virtualities take us beyond Varela's characterization of machinic autopoiesis as unitary individuation, with neither input nor output; they direct us towards a more collective machinism without delimited unity, whose autonomy accommodates diverse mediums of alterity' (42).

One key aspect for media theory and philosophy is to account for ontological change after mediatisation – the rock is modelled into a wall which may be reterritorialised for political ends, or for aesthetic ends, each of which is consolidated through their respective mediatising refrains (fields of play/work/militarisation) for collective subjectivities. Mediatisation is a paradigm that we see affecting all dimensions of life (in the Spinozist sense of affect, where a change occurs between two or more bodies after an encounter [Deleuze 1988]), in the same way we speak of paradigms of domesticity, institutionalisation or game world paradigms. There is an affective, behavioural economy at work in such paradigms.

In relation to cinema, Deleuze describes the sense of how such points of change might be considered as perception-images, that are the result of action and affection-images, or vectorial fields that arise from affective movements, and thus in some cases contributing to images of thought (Deleuze 1989: 130; Colman 2011: 115–16). However, for Guattari, thought is the result of an entirely different process. In their final conception of the image of thought, described in their final collaborative book *What is Philosophy?*, Guattari's work on abstract machines through the 1970s provides the theoretical support, in defining their manifesto statements on what constitutes philosophy (Guattari 2011: 9–22). In *What is Philosophy?*, Guattari's earlier terms of the machinic unconscious emerge as the abstract machine or immanent plane where the image of thought is in movement, but mediated according to the kinds of machinisms that produce them, and the activating points that define singular modes of the thought of subjectivity.

In *What is Philosophy?*, Deleuze and Guattari organise the larger structures of the world into three arenas for thinking – planes of philosophy, planes of science, planes of aesthetics – but under the terms of mediatisation that I'm proposing here, these three areas are in fact not at all necessary in order to think machinic subjectivity. Rather, the movement of that plane of immanence that orients subjectivity's

intuitions about the world is prephilosophical, as Deleuze and Guattari argue, and does not require concepts in order to be described (1994: 41). Deleuze and Guattari propose the plane of immanence as an abstract machine, in contrast to concepts that are described as concrete assemblage machines. The plane of immanence is extensive, a horizon of events where 'elements of the plane are diagrammatic features, whereas concepts are intensive features' (39). Concepts are:

> absolute surfaces or volumes, formless and fragmentary, whereas the plane is the formless, unlimited absolute, neither surface nor volume but always fractal... concepts pave, occupy, or populate the plane bit by bit... the plane of immanence is not a concept that is or can be thought but rather the image of thought, the image that gives itself of what it means to think, to make use of thought, to find one's bearings in thought. It is not a method, since every method is concerned with concepts and presupposes such an image... Neither is it a state of knowledge on the brain and its functioning... Thought demands 'only' movement that can be carried to infinity... (1994: 36–7)

So, although they describe how an immanent plane works to autoproduce affective thought, Deleuze and Guattari's account does not adequately accommodate how in fact the results of mediatisation have redetermined that plane of immanence where thought is enabled; by media affects caused through mediatisation. A movement of the infinite requires that a slightly different account be articulated. Guattari's a-logic of the machinic unconscious provides the focus of this plane of immanence where mediatised subjectivity is under process.

III. Mediatised Affect

The immanent nature of machinic interface mediatises human consciousness with conditionally produced forms. Mediatisation both produces and occurs through the different types of machinic interface, creating different types of affects. This media affect has been historically charted as instances where encounters with new technologies and/or media forms have generated different types of emotive and/or creative and/or negative responses. Reports of new technologies – from the invention of the calculus to the neutrino, from gothic horror fantasy to vessels for space travel – describe the dual emotions of wonderment and fear at the inferences of the future. Different types of alterations of the world by media forms are charted in media archaeologies (see Huhtamo and Parikka 2011; Goddard and Parikka 2011) that describe

the histories of such affective moments. But there are distinctions to be drawn between affects and the technological platforms that produced them. As Jeffrey Sconce (2011: 71) is careful to point out, the psychiatric diagnosis of 'technical delusion' for symptoms where subjects are directed and controlled by electronic media forms has its foundation in end of nineteenth-century power paradigms, rather than in specific technological platforms. In other words, while we might be able to name the singular technology, or historical form, together with its material components, we are advised to consider the affective structures that enabled the paradigmatic history of that thing to come into being; this instead of that; one object holding value over another; my body enslaved, incarcerated or encased in cloth of gold, and holding power – these differences are politically determined.

Guattari's theory of the *machinic unconscious* does not so much describe how mediatisation occurs, but in describing the collective – and not individual – affects of such structures, he provides a graphic account of what the processes are that come to constitute and enable the affects of 'all kinds of machinisms' (2011: 10). These 'machinisms' include all of the institutional mechanisms Guattari's work highlighted and fought against – the repressive affective powers of the normative models imposed upon existential subjectivity through the codified familial and work institutions within their contemporaneous social and legal systems. Guattari outlines the movement of these affective qualifiers in his diagrams (many of which resemble board or chalk games), and in their forms open new refrains (Guattari 2011: 175; 180; see discussion in Watson 2009; on game structure see Colman 2008b). Given Guattari's critique of the machinic unconscious, and his discussions around the ways in which this unconscious works to processually direct subjectivisation, his work thus provides a catalytic contribution to both the historicisation and speculative theorisation undertaken not only in studies of Guattari (Genosko 2002), Deleuze and Guattari (Stivale 1998; Alliez 2004; Zepke 2005; Lampert 2006) and Guattari in the context of French philosophy (Watson 2009), but also in the media studies disciplines of media theory (Wardip-Fruin and Montfort 2003: 405–6; Genosko and Murphie 2008), media ecologies (Fuller 2005; O'Sullivan and Zepke 2008; Alliez and Goffey 2011), media archaeology (Huhtamo and Parikka 2011; Goddard and Parikka 2011) and in the mediatisation of revolution (Berardi 2008, 2009).

Post-Guattari, a critical look at the affects produced through mediatisation considers the internal conditions of a structure and displays the movement of any given structure, as it alters its dimensions.

The *affective workings* of different machines are productive of different ontological dimensions. The machinic mediatisation of life incorporates systems that feed collective and individual desire. Formless and formed, we can collate the areas of collective content from which Guattari developed his thinking: psychiatry, drugs, Kafka, homosexuality, relationships of the collaborative and conjugal couplings, war and aesthetic machines (Guattari 1984; Genosko 2011). This machinic affect is the wind that blows the dry head of the dandelion plant and carries its seeds into the neighbour's plot. That machinic affect is the deliberate planting of a bomb by militant groups, timed to detonate in the midst of civilians. This machinic affect is fucking about at home, playing games.

Mediatisation fixes points within chaos – through abstract machines, and we can call them fields of play. Their political and aesthetic determination feeds into the collective unconscious of their time, and of the possible future state of the collective, machinically determined field. It is a machinic territory, argues Guattari, because of the relativity arising through movements of reterritorialisation and deterritorialisation (2011: 11–12). Structured affects are used to organise bodies politically – this is Guattari's argument in his discussion of the machinic unconscious. Watson (2009: 56) describes this unconscious in terms of the 'sociopolitical sphere' and 'the perception of the world' but here I am extending 'perception' to infer the breadth of machinic mediatisation. In their work, Deleuze and Guattari are interested to describe a certain kind of processual thinking about life; how a life is made is in fact, that life. This is a truism that any socially active person already knows about; namely, what are the factors that come to hold something together, or rip it apart?

What motivates you to work or play? The factors that comprise machinic mediatisation include consideration of what are the multiple dimensions to thinking about how a situation, an environment, a particular timeframe, an organisation and biological factors of existence can come together – or not – and provide the means by which these factors might achieve or deny various degree of function in relation to the larger organisation in which they operate. The consolidation of motivation is through a politically determined normative dynamic that 'planes of consistency' demarcate as refrains of subjectivity (Deleuze and Guattari 1987: 328, 333; Guattari 2011: 11). The components of Guattari's diagrammatic organisation(s) of subjectivity appear deterministic in their systematicity, yet he is insistent on rejecting any form of structural determination when one considers that such organisations are never static – walls require maintenance or

they crumble (1984: 114). The power matrix from which Guattari draws upon is historically situated in 1970s politics where labour forms are gender and ethnically hierarchised, and where better public access to the scale and variety of governmental mismanagement and economic mistakes reveals them to a larger number of people through the medium of television (this is the era of the first televisation of a war – the twenty-year Vietnam war conflict, 1950–70). Yet as Guattari reproduces certain aspects of those structures (the aporic diagrams), his work enables a measure of sight of them in a way that situates their deterministic moulding of subjects and makes their mediatising affects all the more apparent. Guattari describes what allows the molecular affects to be detailed. The media machinic where the processual nature of mediatisation arises can be anything:

> At a particular point in history desire becomes focalized in the totality of structures; I suggest that for this we use the general term 'machine': it could be a new weapon, a new production technique, a new set of religious dogmas, or such major new discoveries as the Indies, relativity, or the moon. (1984: 117)

From a universalising process of the production of a collective subjectivity, a description of subjectivity's own field of play allows an 'extract' from the world (Guattari 2011: 12). Play, like art, is a creative processual activity, and in this activity, subjective alterity can be sited.

. . . And . . . and . . . and . . . The Transversal Politics of Performative Encounters

Anja Kanngieser

Abstract

This paper examines Guattari's notion of transversality through a creative and ambiguous form of political intervention, the performative encounter. Drawing from Guattari's work on subject groups, in combination with Deleuze's conjunctive '*and*', via contemporary theorisations of creative activism and affect, it maps out a movement that destabilises categorical dualisms between activists and non-activists, artists and non-artists. It proposes that transversals such as those enacted by the performative encounter open spaces for the emergence of new subjectivities, relations and worlds. In doing so it critically extends Guattari's conceptualisations of political organisation, group subjectivation and aesthetics into radical political terrains that are antagonistic of the nation-state and capital at the same time as being affirmative of possible present and future conditions.

Keywords: transversality, performative encounter, aesthetics, activism, affect

> We can no longer separate the prospect of revolutionary challenge from a collective assumption of responsibility for daily life and a full acceptance of desire at every level of society.
>
> (Guattari 1984: 272)

> A certain form of 'politics for politicians' seems destined to be eclipsed by a new type of social practice better suited both to issues of a very local nature and to the global problems of our era.
>
> (Guattari 1995: 121)

Questions of politics infused the work and life of Félix Guattari. They were very particular articulations of politics, however. For Guattari, the political was always bound to processes and forces of subjectivation, organisation and desire (Guattari and Rolnik 2008); a position that was often neglected in the logistical and psycho-corporeal operations of the institutions and groups he was embedded within and witness to. In his early work on the clinic Guattari began to develop a concept of transversality related to subject groups that was to later inform his theoretical and practical experiments in revolutionary organising. Critical of crystallisations of organisational power and fixed role hierarchies, he proposed that a transversal movement, which would be achieved 'when there is a maximum communication among different levels and, above all, in different meanings' (1984: 18), could fracture tendencies toward reification. In this movement, he argued, space is opened for the self-determined engendering of collective and singular subjects. This is why transversality was seen to be the 'ideal limit of all activity' (Bosteels 2001: 156).

Guattari's vectoral approach challenged the strictures of the totalising 'militant' circles and the psychotherapeutic settings in which he moved. He found one prototype for the subject group in the early radical practices of the Situationist *enragés*. It is from within such practices that a radical political potential for the transversal unfolds.

This paper will examine the transversal through one such practice, what I refer to as a performative encounter:[1] a collective, creative articulation that is inherently political in its focus (in this configuration, having a militant engagement and critical relationship to the nation-state, law and bureaucratic repressive apparatuses); that uses tactics of humour and play, hoaxing and faking; that is ambiguous in identity (taking place in realms or contexts disassociated from orthodox aesthetic and political activity); that is dedicated to activating new relations between people, and is affirmative of autonomous and convivial ways of living and being.[2] It focuses specifically on some of the ways in which the mobile nature of the encounter makes visible the compositions of subjects through the formation of subject groups, transversal identities and categories, and affective worlds. I begin by introducing two performative encounters of collective appropriation (or

collective stealing, occupying and re-claiming) launched by the German Umsonst (for free) campaigns. I then turn to Guattari's early readings of transversality and subject groups to illustrate how the organisation of the encounter gives rise to new modes of relating, followed by Deleuze and Guattari's conceptualisation of the conjunctive *and* to argue for the encounter as a mechanism for the production of transversal subjectivities. Because the encounter is understood as a world-making *dispositif*, the affective political spaces and relations it constitutes must be included; by bringing a discourse of affect into an exploration of the performative encounter, the spatial and temporal geographies of the encounter's mobilisation can also be considered.

I. A Performative Encounter of Collective Appropriation

> A performative encounter is a multidimensional event that creates subjects.
> (Rosello 2005: 2)

> The positing of the new cannot be anything else but the positing of different modes of exercising and articulating social powers . . . we need to extend the realm of commons in more and more spheres of our social doing, at any scale of social action, to. . . run our lives as free social individuals.
> (De Angelis 2007: 12)

> We don't want to make reforms and we don't want to beg, all we want to do is to say: not like this! Now we will take what we want: fun, culture and life.
> (Berlin Umsonst in Kanngieser forthcoming)

In 2003 the network Berlin Umsonst (Berlin for Free) launched Nulltarif in protest against public transportation fare increases, which saw counteraction through the mass distribution of forged train and bus tickets. In 2005 the more sustained campaign of Pinker Punkt was instigated. Responding to repeated fare increases and the restructuration of the student discount card, Pinker Punkt encouraged commuters to travel for free collectively. The name 'pinker punkt' was strategically conceived as a way to dislocate and queer the racist and criminal connotations from practices of 'schwarzfahren'/riding black or fare evading. On designated days commuters on various Berlin lines were met at the platform by people carrying large pink circular signs. These marked aggregation points for collective travel. Each group had participants that were informed of their legal rights and equipped to deal with state repression. Commuters on the trains were told what was happening and why, and were invited to take part. Over its

duration, each collective journey attracted anywhere between three to fifty participants.[3]

In 2004, the MoMA came to Berlin. Dismayed by the exorbitant entry costs and long queues, avoidable only for VIPs, Berlin Umsonst launched the MoMA Umsonst action. The first part of the campaign involved Umsonst participants donning suits, distributing fake entry tickets and successfully entering the exhibit for free. Following this, over two thousand posters were printed closely resembling the official MoMA advertising, stating in German, Turkish and English that on 17 April the MoMA would be open to all. The campaign received citywide media coverage, and on the day between four to five hundred people were in attendance. As the 'activists' were visually ambiguous, dressed in suits and smart clothing, a media furore ensured; reporters were uncertain whom to target for interviews and commentary. This destabilisation of identity also displaced the force of state apparatuses, for it was unclear whom to charge for instigating the event. As one of the constituents explained, 'in Berlin at these large rallies, somehow the police are always managing to beat people up . . . fun makes it more difficult for them . . . You dance around and confuse the police, who can never be quite sure: is this a political action or a cultural action? It's good to break down these clear divisions' (Eshelman 2005).

'Alles für alle, und zwar umsonst/everything for everyone, and for free': this was the influential slogan that accompanied the Umsonst campaigns, which arose from the European radical left in 2003 as an atypical form of 'activism' employing creative gestures of resistance, participation and liberation through direct action. Enacting encounters of collective appropriation inspired by a long tradition of auto-reduction and refusal (Virno 1996; Tronti 1980; Negri 1984; Cleaver 1992), Umsonst was a critical response to the precariousness of everyday life and labour, one aspect of which was manifest through the increased costs and privatisation of public services, spaces and cultural resources.[4] Central to the campaigns was the capacity to tap into collective and common points of dissatisfaction. This was seen in their rhizomatic and populist autogenetic character, and resulted in the promulgation of similar campaigns across several German cities over the succeeding years. The intra-national circulation of the Umsonst agenda helped to open discussions on social protest and appropriative political action within radical left movements, to both greater and lesser acclaim.[5]

Unlike many of the current German alternative movements, the Umsonst campaigns followed a socially directed method intent on discovering imbrications between public resentment against state-imposed

regulations and micro-political, often individual, covert acts of appropriation based on anti-capitalist sentiment such as illegally entering pools and public buildings, fare evasion, sneaking into cinemas, petty theft and so forth. According to the initiators, these individual tactics were politicised through a visible, collective presence in an attempt to establish everyday practices of resistance (Kanngieser 2007). This shift from what Augusto Illuminati referred to as 'individual defection' to 'collective exodus' (1996: 181) pointed to the subversive aspect of the activity, both for its strategic reference to historical social protest, and for its composition of affective spaces of common struggle come together through circuits of collective desire.

In these struggles 'for the re-appropriation of social wealth produced by the working class but unpaid by capital' (Ramirez 1975), such encounters were designed to agitate flows and crystallisations of power and strategically intervene in and redirect them. An emphatic commitment to public engagement meant that the methods and concerns of the Umsonst encounters were framed in a language far more exoteric than those usually associated with 'leftist' politics. This was apparent in campaigns around public transport such as *Pinker Punkt* (2005) and *Nulltarif* (2003) outlined above, and around cultural resources such as *MoMA Umsonst* (2004), amongst others.[6] The rationale for this was simple, as a member of Hamburg Umsonst explained: 'we address whoever is there and sees what we do, and we invite people to re-think and to join us' (Kanngieser forthcoming). For Umsonst, the uncertainty of participants in the encounter signalled the necessity for a flexible political discourse, which was partially apprehended through the rejection of an encompassing political ideology in favour of what was described by a Berlin Umsonst campaigner as an 'orientation-less left'. This was further ameliorated through the incorporation of organisational techniques, such as relatively open and publicised meetings and facilitation, which when enacted in coordination with creative, pleasurable tactics including hoaxing, drag and occupation, enabled an inventive, a-centric platform for collective enunciation.

This reasonably mobile and unfixed organisation and a connection to public and popular sites of dissent through a playful form of encounter indicate some of the ways in which Umsonst instigated movements across differential social groupings and structures, art and politics, urban spaces, and political nodes and institutions (Kanngieser 2011). By creating these encounters what was set into motion were 'forms of resistance to subjectification which, in producing novel alliances and connections, are also creative of new possibilities of life, new

modes of existence and types of practice' (Armstrong 2002: 49). Following Guattari and Deleuze we can look to these in terms not of 'recommending the liberation of "life" from all forms of molarity and subjectification' but as a means of theorising 'a "becoming-revolutionary" pursued in a piecemeal fashion at the level of the local or sub-political' (Armstrong 2002: 49). To look at this process of 'becoming-revolutionary' it is useful to begin with transversality in terms of the subject group, through which Guattari first sought to express this movement, and its implications for thinking about subjectivation.

II. Transversality and Subject Groups

> Transversality belongs to the processual subject's engendering of an existential territory and self-transportation beyond it. The key concepts involved are: *mobility* (traversing domains, levels, dimensions, the ability to carry and be carried beyond); *creativity* (productivity, adventurousness, aspiration, laying down lines of flight); *self-engendering* (autoproduction, self-positing subjectivity), territories from which one can really take off into new universes of reference.
>
> (Genosko 2002: 55)

The production of 'new universes of reference': this is a phrase that both Guattari (1989) and Gary Genosko (2002) deploy when they write about transversality and its effects on the individual and collective subject, or as Genosko puts it, the 'processual subject's engendering of an existential territory and self-transportation beyond it' (2002: 55). For Guattari, transversality pertains to the production of radical collective subjectivities, in one sense by enabling what he described in his early text *Molecular Revolution: Psychiatry and Politics* (1984) as subject groups. Through his appraisals of subjectivation, Guattari sought to depart from both Freudian and Marxist traditions. These traditions reduced 'sociopolitical relationships to the personal unconscious' in the former case and interpreted 'cultural productions as being overcoded by the material environment' in the latter by arguing for causal, linear and unilateral structuralised definitions of society and subjectivity (Bosteels 2001: 151). In contrast, Guattari was keen to map complex operations of power informed by and informative of the ways in which subjectivities, social codification, ecologies and capitalist regimes mutually produce one another. What the concept of transversality provided for Guattari was a way to 'think the interactions between ecosystems, the mecanosphere, and social and individual universes of reference' (1989: 135).

For Guattari transversality became a central institutional and conceptual tool, employed clinically for 'heightening and maximising an institution's therapeutic co-efficient', existing in its 'bureaucracy and officialdom, structures, roles and hierarchies' (Genosko 2002: 55). Guattari conceived of transversality operating in a clinical setting as

> a measure (a so-called coefficient) of how much communication exists between different levels, in different directions, of an organization. The goal is to increase the coefficients of transversality, that is, to reduce blindness and bureaucratic-mindedness, in favour of openness, overcoming the impasses of both vertical and horizontal organizations, by means of creative organizational innovations. (Genosko 2002: 200)

A means by which to induce this co-efficient or measure is through the modifications of relations, forces and environments between groups (and their effects) within and across institutions. Within these institutions Guattari was intent on discovering the sites of latent power, often not coincidental with the structural distribution of roles, being held in the relationships between subjects.

Through his work at La Borde clinic Guattari developed a thesis of group formation within institutional environments in which he (non-absolutely and non-judgmentally) distinguished two types of group: the subjugated group and the subject group. The subjugated/dependent group are those constantly subsumed to Power in some form (which is correlative of their desire for authoritarianism), and are usually linked to molar activity, being totalising and, as Mark Seem puts it, 'global in ideology' (1974: 38). The principal characteristic for Guattari is the group's heteronomy, seen in their incapacity for statement, their determination from outside and the subsequent withdrawal into protective group phantasy and insularity (1984: 14). This is the problem that confronts the ultra-leftist militant, who according to Genosko, gets swept into the phantasms typical of the subjugated group and tends to get 'hung up on the significations produced by the leadership rather than producing their own signifiers and speaking in the name of the institutions they create adequate to the course of their actions' (2002: 96).

Group subjects/subject groups are conditionally opposed to subjugated groups. These groups are molecular by nature, localised, and generative of processes of becoming-action rather than of encompassing structures. Unlike the external determination dictating the subjugated group, the subject group 'endeavours to control its own behaviour

and elucidate its object, and in this case can produce its own tools of elucidation' (Guattari 1984: 14). Put another way, it upholds an active position in terms of its own project. This suggests that for those constitutive of the subject group, the means for articulation and signification exist in interdependence and difference, synchronously aggregated through the collective process. 'The subject group', Genosko proposes, 'is a kind of group in fusion . . . come together in 'the flash of common praxis,' in mutual reciprocity rather than mutual Otherness' (2002: 86).

Through Genosko's description of the collective affirmatively arising out of 'the flash of common praxis' we begin to sense the potential that Guattari envisaged in this new organisational structure: a rhizomatic, non-representative, non-programmatic assemblage of singularities. The campaigns of Umsonst established the terrain for a potential subject group in the performative encounter through their dedication to the composition of a collaborative and transitory collective. For Guattari, 'a subject group is not embodied in a delegated individual who can claim to speak on its behalf: it is primarily an intention to act, based on a provisional totalization and producing something true in the development of its action' (1984: 33). From their genesis the campaigns of Umsonst disinherited the models of organisation usually associated with so-called militant practices. Conceptualised as a series of *campaigns* rather than a group, there was no real possibility for permanent unification. Rather the collective converged around individual encounters addressing the privatisation of cultural and public resources and spaces, state discourses around economic rationalism and later, the precarisation of life and labour.

Bringing to the fore the economic and class delineations leveraging the segregation of necessity from luxury, each encounter was a direct retaliation against the disenfranchisement vested by the neo-liberal rhetoric of scarcity rampant in Germany. At the same time the encounter acted to live out more desirable conditions – free transport and free cultural events, for instance. These resources and services were employed by variegated demographics, and hence had broadly felt effects, meaning that these were not isolated nodes but, rather, multiple constellations for contestation and re-imagination. Because what was at stake was the encouragement of a 'culture of everyday resistance' – the self-valorisation of constituents through the subversion of capitalist conditions – it is clear why an exclusive or ideologically demarcated group was not considered strategically appropriate. Recalling Guattari's subject group, Umsonst was 'primarily an intention to act' (Guattari

1984: 33), without the entropic, socio-systematic category of the individual entitled to comprise the action.

The flexibility within the organisation of the Umsonst campaigns does not imply what might be understood as a fixed horizontality, in the same way that management and facilitation cannot be reified into a vertical hierarchy. Each campaign required significant planning phases conducted by small committees, and there were oftentimes around a dozen 'initiators' to each encounter. There is nonetheless a marked difference between how these encounters were calibrated and the orthodox 'militant' subjugated groupings identified by Genosko. The campaigns of Umsonst tried to maintain as malleable as possible the range of collaboration, with a disposition of transparency and accessibility. The saturation of the encounters with spectacular and novel elements, such as slogans, costumes, stickers and props, generated diffuse interest leading the proliferation of the moniker and modus throughout other collectives and networks. Although the publicity of the planning stages was tempered by the illegality of the interventions, which prohibited the relay of certain decisions, there was wide solicitation for the materialisation of many of the encounters. At the same time, such emphasis could not eliminate constraints on the constitutive body, both in terms of those differently-abled and those made precarious by state documentation risking deportation or repression, and the limitations arising from mass-media conservatism.

To facilitate collaboration and participation to the most viable extent, the development of the encounters stressed integrative methods including open workshops, research groups and discussions to build solidarity between groups such as minimum wage earners and underemployed workers, those on age and disability pension, students, artists, interns and the like, that the accelerating processes of privatisation specifically made precarious. While these did not always proceed or conclude as initially envisioned in terms of sustained community relations, recurrent endeavours were persevered with.[7] Networks of autonomous groups targeting the specific areas that the individual campaigns responded to – public transport, education, cultural resources, casualised labour, housing – were also invited to co-convene workshops; as one campaigner recounted, 'we always approached other groups that were working on these specific conflicts, we ran workshops with them and tried to develop this appropriation perspective together' (Kanngieser forthcoming).

These collaborative workshops arose as an experiment to move beyond prescriptive, abstracted or ideologically based narratives, and intended to forge connections between activists and non-activists, as

well as those engaged in different lines of struggle. Emphasis was placed on inviting people to examine the effects of structural reform on their everyday lives, and co-creating spaces for collective, self-articulated protest. It was proposed that common direct action could make this dissent visible, and it was hoped that such political visibility would inspire pluralistic flights of organisation beyond the borders of recognised activist spheres.

From even this brief introduction to the organisation of Umsonst, the transversal dimension of the encounter, and its tendency toward subject groupings, begins to emerge. By identifying common sites of unrest, and by committing to an unfixed organisational format, the encounter of Umsonst animated collaborations that connected minor compositions into new formations.[8] Further vital to this assemblage is the way in which the participants were considered to be the very *conditions* through which the encounter is constituted as such.[9] This signals a shift away from hierarchical and closed conceptions distinguishing those that 'would' (activists/artists/specialists in social and political change) from those that 'wouldn't' (non-activists/non-artists/non-specialists), fundamentally reconfiguring the contours of the activity along with its processes of subjectivation.

In this way transversality has immediate consequences for how such practices transform the textures of conventional organisation; transversality becomes a tool for 'creatively autoproducing themselves as they adapt, cross, communicate and travel, in short as they transverse different levels, segments and roles' (Genosko 2002: 55). This is a significant juncture, and one that requires further teasing out. In Guattari's later conceptions of transversality, he emphasises its congruent accents, which coupled with the Deleuzian conjunctive *and* allows for a reading of how productions of subjectivity take place in the performative encounter, as we shall shortly see.

III. Political Artistic Transversals and their Radical Organisation

> New social practices of liberation will not establish hierarchical relations between themselves; their development will answer to a principle of transversality that will enable them to be established by traversing, as a rhizome, heterogeneous social groups and interests.
>
> (Guattari and Negri 2010: 123)

Through crossing and reconfiguring 'different levels, segments and roles', theories of the subject group and transversality may link to

radical political organisation. But it is not only in the production of experimental politics that transversality acts as a mutational force: it is also present in the domain of aesthetics. It is interesting to think about aesthetics here both for the inherently creative nature of the encounter, and the new subjectivities, relations and worlds it instigates. In *Chaosmosis* (1995), Guattari elaborated the movement of transversality with respect to artistic creation. For Guattari, ideal aesthetic praxes and activities are not limited to professional artists and are made up of transversal lines that affectively engender 'unprecedented, unforeseen and unthinkable qualities of being' (1995: 106). The lines that activate these qualities of being are thus notable in what Guattari calls a new aesthetic paradigm, as well as in political organisations without coagulated hierarchies.

The specific manner in which Guattari sets up these thematic vectors of aesthetics and politics, and the processes of subjectivation implicit to them, has been usefully taken up by Gerald Raunig. Throughout his writings Raunig employs several of Guattari and Deleuze's conceptual apparatuses to explore European historical and contemporary politico-aesthetic events, institutions and methods of organisation. In these explorations he configures aesthetics and politics via an assessment of the exchange between 'art machines' and 'revolutionary machines'. He contends that when art and revolution come into contact, temporary overlaps between the two are catalysed. These overlaps do not entail incorporation, but rather indicate 'a concrete exchange relationship for a limited time' (2007: 18), which is transversal insofar as it transforms the terrains of both aesthetic and political regimes, institutions and categories. The affective and transformative labour of the transversal occurs through the accumulative linkage of singularities and collectives in experimental new relations, modalities and co-operations without the goal of permanent synthesis (Raunig 2002: 4). Echoing Guattari's thesis, Raunig's notion of transversality implements radical gestures that fundamentally challenge the limits of these categories and institutions.

If we acknowledge this analytical proposition, rather than concentrate on art forms that are thematically concerned with political struggle but are un-reflexive in their processes of production and dissemination, we can turn to aesthetics that are organised from the perspective of liberatory politics.[10] This is particularly pertinent given that encounters are as reliant on their creative and relational elements for their operation as they are on their political elements. What is most significant is how these processes function with respect to the reconfiguration of organisation, and how this describes a movement between categories and

subjectivities. For Guattari, the transformative nature of the transversal brings about a parallax shift in discussions on aesthetic constitution and subjectivation, because 'the emphasis is no longer placed on Being . . . it is placed on the manner of being, the machination producing the existent, the generative praxes of heterogeneity and complexity' (1995: 109). That is to say, the transversal renders visible the vectoral nature of subjectivation, showing that there is no fundamental subject form but rather movements and compositions. When considered in terms of politico-aesthetic organisation, a transversal exchange can be found both in the ambivalent and critical relationship to the institutions being moved through, and in the structure of the creative political collective itself.

The performative encounter, as a politico-aesthetic phenomenon, is demonstrative of such an exchange. Encounters such as Pinker Punkt and MoMA Umsonst move across and between the boundaries enforced by disciplinary regimes (art, politics) of recognition and naming, situating these interventions in a process of constant transformation and re-territorialisation of artistic and political activisms. The performative encounters of Umsonst negotiate impasses around hierarchical or discrete categories of identification by transversing art, life and collective identities – becoming both activist *and* non-activist, artist and non-artist, in addition to innumerable and mutable other possible identities and relations.

Through this exchange the encounter furthermore unequivocally calls into question the dynamic between power and resistance. Being spatio-temporally transitory, indeterminate in its classificatory status and peripheral in its actualisation, the encounter generally circumvents channels of documentation and solidification through its ambiguity. As such the encounter challenges the hierarchising logic of both the capitalistic market and the institutionalisation of creative and political insurrection. What transversality and ambiguity help to generate in the encounter is a perpetual contradistinction between power and dissidence. Transversal structures and lines avoid the reproduction of dominant flows and regimes of power because rather than vertical or horizontal, hierarchical networks they compose a-centrically. That is to say, they do not necessarily move down given pathways or channels, they do not necessarily connect multiple centre points. Rather, they elide systems of coordination, crossing anywhere, everywhere and nowhere, in flight. What organisational models such as the campaigns of Umsonst are thus inclined towards are momentary overlappings and linkages, stratifications of political organisation that have no discrete beginning or

end. This is why we see the creation of relatively decentralised, flexible and diffuse political territories, which do not operate as a hermetic unit but are open for participation, further discussion and re-appropriation.

From this position, it is evident how transversal organisation can jettison seemingly immutable hierarchies wherein an individual or elite group would claim organisational authority over its participants. Posited as a move away from orthodox structures, transversal organisations signify a critical departure from models of organisation predicated on statist and vanguardist forms and ideologies. Moreover, transversal modes problematise hierarchies invisibly embedded in alternative 'activist' discourses, that find it difficult to reconcile the rhetorics of inclusivity and poly-centralism with actual practice. These are mediated via malleable and non-specialist modes of engagement that attempt to overturn stratifications of value based on expertise. This overturning challenges the often hidden meritocracies lurking in activist organisation that (self-)delegate tasks according to systems of legitimation based on recognition within activist subcultures. In taking on experimental transversal methods of organising within the encounter, what is given priority is diversity through the acknowledgement of different skills, knowledges, desires and socio-cultural affiliations.

IV. Political Artistic Transversals and Accumulative Subjectivities

> Transversal movements can ... be launched by extraordinary actions, astonishing occurrences, and traumatic events that challenge subjective territory, permeate its borders, make the familiar strange, and turn the world topsy-turvy.
>
> (Reynolds 2002: 18)

The changing relationship between how the artist/activist conceives of herself in relation to the public is where we find correlations between organisational transversals and the making visible of processes of subjectivation. Through these junctures, the roles generally upheld in differential hierarchical structures (artist/revolutionary over public/masses) are problematised. This problematisation can be seen both in the categorical indeterminacy prompted by the encounter's transversality through the arenas of politics and art, and through its accumulative aspect: what can be attributed to the Deleuzian conjunctive *and* (1987). This *and* is of paramount importance, for it helps us to think about how art and revolution, artist and non-artist, activist and

non-activist, occur in simultaneous profusion. In this promulgation, subjectivities and categories that seek to multiply rather than to subsume or homogenise boundaries of identification are engendered. Here we can see that by recognising multiple contours to identity, individuals and collectives can valorise and orient themselves as heterogeneous and motley agents.[11]

The multiplication of categories, and their ensuing ambiguity, invoked by Deleuze's *and* can be made visible through practices such as the performative encounter – in terms of the form itself and the subjectivities produced through, and productive of, it. This association is best captured by the Critical Art Ensemble, a US-based tactical media collective, and is worth quoting at length. They write that participants in creative encounters and initiatives such as those of Umsonst,

> are neither fish nor fowl. They aren't artists in any traditional sense and don't want to be caught in the web of metaphysical, historical, and romantic signage that accompanies that designation. Nor are they political activists in any traditional sense, because they refuse to solely take the reactive position of anti-logos, and are just as willing to flow through fields of nomos in defiance of efficiency and necessity. In either case, such role designations are too restrictive in that the role boundaries exclude access to social and knowledge systems that are the materials for their work. Here may be a final link to invisibility: these participants value access over expertise, and who really cares about the work of an amateur? (Critical Art Ensemble 2001: 3–4)

The performative encounter does not act as a permanent unification between productions of subjectivities and fields. Rather, it sets up temporary meeting points, which transform the parameters and textures of identities, categories and disciplines in the process. As observed above by the Critical Art Ensemble, this variability means that creative political practices that are predicated upon transversal modes are difficult to recognise within conventional semiotics. This is because they neither fall definitively into the category of traditional activist or political practice, nor into traditional artistic practice; to recall the words of one Umsonst constituent, 'you dance around and confuse the police, who can never be quite sure: is this a political action or a cultural action? It's good to break down these clear divisions' (Eshelman 2005). The dynamic of displacement at work here flags what is at once the most risky and the most substantive aspect of such practices. As they do not arise from legitimised spaces and ways of operating but rather erupt from new inventions of actions and procedures, and as they cannot be easily defined, such encounters are susceptible to invisibility. At the

same time, it is this ambiguity that affords a flexibility that constantly challenges the limitations of boundaries, giving such encounters and practices the capacity to 'push against and even re-organise the institutional and political structures of... recognition and production' (Kelly 2005).

In this mutual movement of deconstruction and re-figuration, the transversal produces subjectivities and 'self-engendering practices that seek to create their own signifiers and systems of value' (Kelly 2005). With this accent on self-determined value systems that complement those attributed by Guattari to subject groups, it is clear why such conceptualisations of transversality have been instrumental in opening up new vocabularies and discourses. These are especially helpful when seeking to understand creativity in terms of radical subjectivities that inhabit multiple collective identities. This is because qualities of these subjectivities – such as their heightened adaptability to contingency and mutability – inherently infuse them with possibility.

This is precisely where we can see Deleuze's *and* come into play. 'Neither fish nor fowl' as the Critical Art Ensemble write: hence, not the disjunctive 'artist *or* activist', 'specialist *or* non-specialist', but instead the conjunctive 'artist *and* activist', 'specialist *and* non-specialist'. Here we can recognise some third (or fourth or fifth) subjectivity that transverses and transforms these categorical concatenations (Deleuze and Parnet 1987). For Raunig, this *and* should not be thought of as a means by which to escape contradictions through the chance connection of random elements in some act of political propaganda, but as a 'multitude of temporary alliances, as a productive concatenation of what never fits together smoothly, what is constantly in friction and impelled by this friction or caused to evaporate again' (2002: 4).

It is useful to reflect for a moment on the productivity of contradiction here. For, while evoking 'new terrains of open co-operation between different activist, artistic, social and political practices' (Kelly 2005), transversal modes do not signify a permanent interdisciplinarity but instead create temporary mutant coalitions through a movement of accumulation (not absorption), inherently changing the fields and institutions in the process. What is important to remember is that this *and* simultaneously negates mass unification, as well as factionalisation and splintering. As such transversality is a vehicle of rupture and convergence in a constant state of becoming, a form or mode of operation constituted through events, collective alliances and transitory organisations. Umsonst, as a collation of temporary subject groups, enacts this creation of becoming-subjectivity through its transversal

elements, which can produce, as Guattari contends, autopoietic and self-valorising modalities of signification.

What is revealed in this additive process is not a forced synthesis or unification of the parts into some 'whole', nor the negation of singularity, or the specificity of experience. It does not seek to assimilate – quite the opposite – for as Deleuze comments, even when there are only two terms the *and* is 'neither one nor the other, nor the one which becomes the other, but which constitutes the multiplicity' (1987: 34–5). When thinking about these accumulations as 'temporary alliances' it becomes possible to imagine how, through a transversal between politics and art, the many roles and identities enacted by individuals are made apparent. These roles and identities are distributed across different contexts – sometimes in commonality, sometimes in alterity – without being subsumed into one or the other. What also becomes clear is how this movement threatens narratives of identity and subjectivity that privilege a univocal, individuated subject. However, as we have seen, the challenging of a cohesive concept of the subject does not simply imply a rejection of the possibility of resistance. Rather, what a visibly accumulative, processual subjectivity marks out is political potential itself. This potential is recognised through a radical *collective* ontology, radical for the proliferation of connections and relationships it opens up.

It is a transversal between politics and art, and this radical collective ontology, that performative encounters, such as those of Umsonst, generate to make visible and fracture normative discourses of agency. In these collective processes of struggle and articulation, and in the development of such moments, possibilities are opened out for new permutations of subjectivation. Self-conceptions and repetitions of identities, behaviours and perceptions, the 'stiffening of the existential refrain' (Berardi 2008) can be reconceived as multi-scalar and polyphonic through the act of resistance that is in the same breath an act of affirmation.

Transversal organisation runs alongside the additive forms of identity and disciplines that the performative encounter engages. The ingenuity of this style of praxis lies in its border-crossing character, which deliberately sidesteps reductive paradigms of categorisation in favour of mobility and perhaps adversely, ambiguity. While traditional political organisation uses ideological doctrines and activities as a validating measure, transversal modes trouble such strict lines of classification. What Deleuze's accumulative *and* does for the performative encounter is emphasise that in the act of collectively constituting the encounter, in collectively riding for free, or demanding access to cultural resources

with hundreds of others, a radical political event unfolds. In this event, the self-identification as an activist/artist is no longer the issue. Through the encounter, the possibility of constituting artist *and* activist *and* non-artist *and* non-activist within different scenes and circumstances is realised. Thus, what is at stake is the self-valorisation that comes through the constitution of such actions. In this way, transversals between art and revolution apprehend political agency, self-determination and collective enunciation.

V. Political Artistic Transversals and Affective Exchanges

> The State is a condition, a certain relationship between human beings, a mode of behaviour; we destroy it by contracting other relationships, by behaving differently toward one another.
>
> (Landauer [1910] 2005: 165)

In speaking about the subjectivities and relations that the encounter is generative of and makes visible, it is important to recognise how these cooperations and alliances – these new collectives and collaborations – are assembled in time and space. By this I mean how they are brought forth and into exchange to invite worlds that affirm conditions alternative to those present; how they act as what Bryan Reynolds calls a 'transversal territory', a 'catalyzing and transitional space from which new experiences, subjective reconfigurations, and, by extension, dissident mobilizations can emerge' (2009: 287).[12]

The argument proposed by Stevphen Shukaitis in his essay *Affective Composition and Aesthetics: On Dissolving the Audience and Facilitating the Mob* (2007) begins to set up a response via a discourse of affect. Shukaitis uses affect to speak about the task of political art as a creative production of common spaces and public realms 'through intensive engagement not circumscribed by accepted identities and positions' (2007: 1). These geographies are activated through the affective potential that transversalities between aesthetics and politics open up. Such potential is predicated on a notion of aesthetics that is attenuated more to the relations and transversal places that arise from the process of collaborative production than to the content or the culmination of the product. This is an understanding of aesthetics, that, as Shukaitis explains, 'is focused on the relations of production not as a concern secondary to the content of what is produced, but rather as the explicit process of self-institution and the creation of a space where the art of politics is possible (1).

What is pivotal here, as is for Guattari and Raunig, is an idea of aesthetics that concentrates on a 'process of collective creation' and on relations of production, again, the *how* of what is produced through intensities of affect. To understand how this works we must understand affect as a mobile and transitive extra-human threshold of potential, closely tied to thought in action or process (Thrift 2004: 60). This sees affect moving through and across events, bodies, spaces and experiences, in excess of individual or community, and eluding any kind of capture. Affect is in this sense a force that arises out of and through relationality and exchange, through contacts between myriads of singularities and their assemblages (Deleuze 1988).

This conceptualisation helps draw attention to the experimental dimension of the performative encounter as an affective political event. The experimental and transversal aspect is what in this instance affords affect potency across different terrains and events – such as politics and aesthetics – giving rise to intensities (Massumi 2002b). The immanence of affect can be traced out in the potential for intensity. Affect, argues Massumi, underlies and accompanies every event, from the exceptional to the quotidian, and is sensed in the 'perception of one's own vitality, one's sense of aliveness, of changeability' (2002a: 36); this gives a feeling of embeddedness in one's experiences and perceptions (2002b: 214). The changeable nature of affect, and our sense of it, intensifies our experiences and our positionalities. Moreover, affect as intensity is both a catalyst for connection and rupture: it is transformative in that it can break open socialities, and it is connective through the new relations and worlds it compels. Simply put, it is catalysed by, and further catalyses, change and transduction. The ethical crux of affect, suggests Massumi, can be found here: in a concentration on the immersion and participation in the world, in belonging to the world and to *each other* as a lived self-affirming reality independent from the value of bureaucratic, state or religious apparatuses (2002b: 242).[13] This is why an 'aesthetic politics' for Massumi is one whose 'aim would be to expand the range of affective potential' (2002b: 235).

So how is this understanding of affect as intensity taken up in a reading of aesthetics and politics, and how does it pertain to the performative encounter of Umsonst? What is key is a reinterpretation of aesthetics and the spaces of politico-aesthetic engagement, which invites the living out of possible worlds. This reframes aesthetics as the affective composition that comes out of, and produces, relations and experiences from common processes. Rather than isolating the encounter and its content, what is central is the transversal movement in its development.

That is to say, the additive inter-subjective element that is contingent on the relations of individuals, environments and experiences in its event. The transversal spaces and territories created and reconfigured through this – the train platform and carriage in Pinker Punkt, the museum courtyard in MoMA Umsonst, the workshop and discussion spaces – are affective and 'common' spaces, vital to the emergence of connections and conversation beyond the usual designated zones.

Such framing reveals the encounter as a political as well as an aesthetic event that mobilises new relationships between people and their environments. These relationships question and antagonise the logics of the nation-state and capitalism at the same time as affirming shared imaginaries of possible present and future conditions. If we follow Shukaitis to argue that 'the task of politics is precisely the creation of common space through intensive engagement not circumscribed by accepted identities and positions' (2007: 2), then the performative encounter as a conduit for the creation of affective spaces is a fundamentally political gesture (Massumi 2002b: 234). The encounter is political in its generation and transformation of subjectivities and relations through affective modes of communication and interaction that are based on reciprocity and mutual exchange, which envision alternatives to capitalist and statist socialities.

This political dimension is stressed even more so if we understand these spaces as spaces of 'affective composition' (Grindon 2007; Shukaitis 2007; Read 2011): a term linking affect with an autonomist Marxist reading of class composition. In bringing a class perspective to affect, a capitalist critique is added as 'the notion of political composition identifies *as political* moments of otherwise invisible or illegible performative social relations' (Grindon 2011: 86). Composition in this sense places the development of forms of capitalism and labour as occurring in synchronicity with, and response to, daily forms of resistance and self-determined organisation (Wright 2002). The double movement of capitalism and its discontents is seen in the constant dance of displacement and re-structuration of both capital and those myriad struggles against its domination (Mezzadra 2007: 5). As such, this argument stresses the multidirectional processes that contribute to productions of class, labour, subjectivity and agency. Consequently, it engenders a theory of 'revolution' not only as a mass event of crisis, but also as an ongoing progression of resistance and creation such as seen in the Umsonst campaigns. This demonstrates the complexity of the relations between production and capitalism, and the possibility for spaces and sites of alternative self-managed activity. In this way,

what gets opened up is what Massumi refers to as 'that margin of manoeuvrability, the 'where we might be able to go and what we might be able to do' in every present situation' (2002b: 212), which explains 'why focusing on the next experimental step rather than the big utopian picture isn't settling for less' (212).

Coming back to the 'experimental step' of the performative encounter and following the arguments presented so far, it is possible to understand why, in terms of the encounter and other examples of transversals between politics and art, to use affective composition as a conceptual tool means to 'examine the capacities they create, and how they contribute to the development of forms of self-organization' (Shukaitis 2007: 2). Affect, and especially affective composition, provides a means by which to understand how the performative encounter generates new relationships and connective junctures between people and environments that agitate systems of value. It does so by heightening intensities of experience, by implicating each person in the collective constitution of the encounter, and by accentuating singular and collective sites of power and resistance. As a vehicle for reciprocal connection and communication the encounter operates along lines of organisation that depart from usual models reliant on distinct and reified conceptions of hierarchy, roles and specialisation.

The lines of exodus charted out by the encounter are not without discrepancy, however, nor are they predictable. They are prone to stutters and collapse as much as they are coalition and concatenation, which is why Shukaitis insists that:

> the compositional capacities of these ruptures are not unlimited, for they too through repetition become ritualised and fall back into solidified patterns of circulation. The question becomes one of keeping open the affective capacities of the created space: to find ways to avoid the traps of spectacular recuperation and the solidification of constituent moments and possibilities into fixed and constituted forms that have lost their vitality. (2007: 5)

The element of crisis that this illuminates, namely the impasses of reification and recuperation faced by affective spaces and geographies, the fleeting nature of these interventions in precariousness, privatisation and gentrification, might leave us questioning what kind of response a transversal ontology can actually offer – a political disposition that foregrounds movement, processuality and transformation, an ontology of 'becoming', so to speak.

VI. Conclusion

> It was like everything was thrown up in the air for a moment and people came down after the shock in a slightly different order, and some were interconnected in ways that they hadn't been before.
>
> (Massumi 2002b: 234)

Writing about his participation in the various collectives and political work he was involved in at the time, Guattari once commented, 'whether there was a real effectiveness doesn't matter; certain kinds of action and concentration represent a break with the habitual social processes, and in particular with the modes of communication and expression of feeling inherited from the family' (1984: 29). The point he makes is one that I would like to reflect upon here. When asking what kind of political effect a transversal organisation may have, such as that in the performative encounter, we need to relinquish conceptions of success and failure that linearise and evaluate activities on the basis of pre-existing or external qualifications. What we might look to, rather, are the relations that such encounters open us up to, the breaks in habits and conditioned uses of space and place they provoke and create. The performative encounter, like that of Umsonst, is an experiment. It is a tactic that complements more sustained praxes of organisation, one whose value lies in its potential to construct shared geographies that challenge hegemonic flows and concentrations of power, at the same time as making visible and intervening in processes of subjectivation.[14]

If we trace out a trajectory linking Guattari's concept of the transversal, from his early work in the clinic and its translation into the political realm, to Deleuze's conjunctive *and*, we can think about how the encounter radicalises subjectivities. By further turning to a concept of affect as intensity, as a connective force, and by politicising this through a reading of affective composition, we see how the spaces of the encounter give rise to radical ways of being and relating that invite alternatives to the nation-state and capital. By forming a common rhythm from a common cause, a common praxis, the subject groups that make up the encounter invent new languages that place less emphasis on the categorisation of identities and more on their destabilisation.

The importance for such a conjunctive and transversal approach to political activism cannot be overstated. Over a decade ago, after the 18 June global day of action in London in 1999, a now notorious text entitled *Give up Activism* was circulated. What made this paper so significant was that it challenged the presumptions held about organisation in contemporary political work. According to the author,

while radical organisation had been moving away from the hierarchies of vanguardist politics the roles connected to these hierarchies had been retained: there was still an overwhelming tendency to distinguish the activist from the non-activist, a distinction based on an 'activist mentality' which designated the activist as 'a specialist or an expert in social change' (1999: 161). This had a twofold effect: not only did it segregate and elevate the activist over the non-activist as a political agent, it also divided her from her own participation in a wider social body, from her own desires and her own 'non-activist' life.

The performative encounter that I have introduced here directly counterposes this segregation, a segregation that is still present in dominant modes of radical organisation, speaking from a position in the 'global north'. By opening up to transversality, the encounter emphasises desires to move through and beyond political circles, to work on issues that affect people on a day-to-day basis, and to participate in self-determined and shared struggles. The encounter achieves this through its constitution by, and of, a movement that does not fit easily into the traditional categorical discourses of art and politics. These feature creative political praxes that take as their prerogative the disruption of the borders between artist and audience, activist and non-activist, politics and everyday life, amateur and professional, alternative and mainstream. In a final text, Guattari wrote that 'new collective assemblages of enunciation are beginning to form an identity out of fragmentary ventures, at times risky initiatives, trial and error experiments: different ways of seeing and of making the world, different ways of being' (1995: 120). In the assemblage of the encounter we see some of these different ways of seeing and being unfold, and it is only through their continual invention, their disintegration and renewal that this unfolding can continue.

Notes

1. To speak of performativity is to also recall the field of performance. Important work has been done in performance studies on Deleuze and Guattari, particularly by scholars such as Bryan Reynolds (2002, 2003, 2009), Laura Cull (2009), Stephen Zepke (2009) and Anna Catherine Hickey-Moody (2009). It is crucial to note that the performative encounter does not fit easily into the tropes of performance, hence the lack of its objectification as a theatrical form. In fact one of its central characteristics is that it is impossible to delineate precisely what the encounter is as it cannot be defined within the parameters of art, nor within the parameters of politics. Many of its constituents do not understand it as performance in any significant way. It is my contention that it is this very

border-crossing and mobile character of the encounter that enables its political potential.

2. I adapt the term, 'performative encounter' from Rosello (2005). Drawing upon fictional literary and filmic texts connected to the North African region of the Maghreb, Rosello uses 'performative encounters' to identify a new potential emerging in Franco-Algerian relations that stands to counterbalance a violent history of colonisation. Rosello argues that this potential is linked to the transformations that performative encounters effect on subjectivity.
3. For more on the Umsonst campaigns see Kanngieser (2007, 2011). See also Panagiotidis (2007).
4. Perhaps most popular of this genre was the recent Spanish-based group Yomango, who staged spectacles in banks, supermarkets and public squares. The Swedish collective planka.nu also adopted this tactic in their fare-dodging campaigns. More widely contemporaneous to these, politico-aesthetic tactics infused experimental sections of the radical left resulting in anti-capitalist performances such as those of CIRCA, The Vacuum Cleaner and the Laboratory for Insurrectionary Imagination in the United Kingdom, and Die Überflüssigen and the Hedonist International in Germany, to name but a few.
5. This was polarised because critics saw the method of appropriation as reproductive of, or doubling, principles of consumer capitalism and commodity fetishism. At the same time, it was contended that such methods could not affect the central conflict of labour and capital. However as one constituent refuted, 'practices of appropriation reduced the pressures to work', adding that while Umsonst were capitalist critical they were more intent on finding proactive means of subversion than opposition (Kanngieser forthcoming). An additional point of disjunction lay in that, unlike many of the current German alternative movements, the Umsonst campaigns maintained a socially rather than ideologically directed focus.
6. The Umsonst campaigns included Berlin, Dresden, Freiburg, Cologne, Mannheim, Kiel, Munich, Kassel, Dusseldorf, Luebeck, Goettigen and Jena amongst others.
7. This last issue directly confronted Hamburg Umsonst during a day of action against state threats to unemployment insurance in 2004 where difficulties in communication led to conflict between initiators of the encounter and job seekers. This was in part due to the fact that many of those involved in the solidarity event were not unemployed themselves at the time, and many of the job seekers were older and felt disconnected from the protest. Such points of contention signal issues around maintaining a movement between fixed and unfixed organisation and constitution in the Umsonst campaigns.
8. For more on this see Kanngieser (2007, 2011).
9. For more on the idea of the constituent of the encounter and its importance see Kanngieser (2011).
10. Over the past decade a vocabulary has been developing in Europe around such crossovers including 'tactical media' (Garcia and Lovink 1997), 'radical aesthetics' (EIPCP 2005) and 'communication guerrilla' (Autonome A.F.R.I.K.A. Gruppe 2002). See Kanngieser (forthcoming) for an extrapolation of this.
11. This is, of course, not to suggest that subjects prior to the encounter are somehow immutable or enclosed. It is more to draw attention to the ways in which the encounter makes visible the variability and processuality of subjectivation.
12. The reader might also recall Hakim Bey's (1991) writings on temporary autonomous zones.

13. This 'each other' has significance for Massumi who argues for a political response imbued with an ethics of care and hospitality. Because of the uncertain nature of affect this is all the more imperative (2002b: 240–1).
14. The situation of the encounter within, and commitment to complementing, more ongoing and instituted forms of organisation is imperative, for as Guattari writes, 'these mutating militant machines for transversal and singularized spaces of freedom will not have any claim to durability. This way, they will come to terms with their intrinsic precariousness and the need for their continuous renewal, supported by a long lasting social movement of great scope' (Guattari and Negri 2010: 126).

Go Fractalactic! A Brief Guide through Subjectivity in the Philosophy of Félix Guattari and Transversal Poetics

Adam Bryx &[1] *Bryan Reynolds*

Abstract

We adventure becomings-Merry Pranksters with Félix Guattari on Ken Kesey's magic bus to resonate the group's transversality that we already affect subjunctively, individually and plurally from which our subjectivities crystallise collectively and independently with intensive-extensions *to go* viscerallectric and fractalactic. Yet in-process, before our consciousnesses go motored, we swim with jet streams of both Guattari and transversal poetics to navigate subjective affects by which wilful parameterisations achieve desirable eventualisations.

Keywords: transversality, subjectivity, reflexive-consciousness, wilful parameterisation, motored-consciousness, viscerallectric, fractalactic

Félix Guattari deploys his concept of transversality to explain the interactive flux of heterogeneous and polyphonic aspects of subjectivity interwoven through individual and collective practices. While working with patients at La Borde, the psychiatric hospital founded by Jean Oury in France's Loire Valley, Guattari observed instantiations and expressions of subjectivity catalysed by individuals participating within group dynamics that varied depending on the combined quantity, quality and intensity of the contributions made by the individuals comprising a specific group. For Guattari, after thrashing around the fields of psychiatry, subjectivity is never purely the effect or personal creation of an individual or a group, but a production of both. Subjectivity

Deleuze Studies 6.2 (2012): 291–305

collectively forms in relation to alterities, typically as delineated by a society's customs, laws and beliefs, and constitutes the set of conditions that make a self-referential stance possible.

In the interest of making the production of subjectivity more beneficial for patients and staff at La Borde, Guattari's initial formulation of transversality was intended to facilitate clinical praxis in which open-ended modes of therapy could function and therefore transform institutional environments where top-down hierarchical structures (administrator-doctor-nurse-staff-patient) were conventional and, in his view, counterproductive and delimiting. He wanted to liberate subjectivity from entrapment by established social, scientific and therapeutic models, such as those implemented by psychoanalysis, humanistic approaches and gestaltism, that categorise subjectivity according to psychogenetic stages of development, ideas of whole(some)ness, or classificatory structures of the Oedipal, the linguistic-semiotic or the familial. Essentially, he wanted to explore subjectivity with a mode that reflects the nature of subjectivity itself free from the constraints of normative-oriented hermeneutic approaches. Guattari recapitulates this position in his final book, *Chaosmosis*, in which he adds an ethical component that will become important to our discussion later in this essay: 'We are faced with an important ethical choice: either we objectify, reify, "scientifise" subjectivity, or, on the contrary, we try to grasp it in the dimension of its processual creativity' (Guattari 1995: 13).

Guattari maintains that coefficients of transversality operating across a group's dynamic express emergent and latent affects of the group's relations under conditions that bypass totalising clinical models and the power distribution manifested by such models through hierarchal administrative structures within institutions. Unlike therapeutic strategies that partition the subjectivity of each individual, whether or not seen as a by-product of a group (for instance, as an imaginary regression to abstractly formulated developmental or classificatory paradigms), group subjectivity as expressed through transversal coefficients makes possible experiences and interrelations of affect along transformative and unpredictable trajectories. Indifferent to top-down power distributions (insurance company-to-doctor-to-patient) or lateral communications (patient-to-patient, human-to-human), transversality metamorphoses group subjectivity multi-dimensionally and manifests a positive force of differentiation for subjectivity. In his account of Guattari's concept of transversality, Gary Genosko sums this up nicely: 'Horizontal or vertical – that is not even the question since a creature of the between like transversality must constitute its own set

of original, polydimensional and polycentered operations in creating an atmosphere conducive to the appreciation of everybody's singularity' (2002: 82). The production of positive singularities highlights the integral function transversality holds for Guattari in defining subjectivity from the standpoint of emergent properties, the spatiotemporal constellation through which travel and mutate heterogeneous and polyphonic elements and modes of expression, affect, creativity and so on, that are strictly irreducible to the conditions of their production.

Guattari mobilises the concept of transversality to loosen the reins of societal and institutional processes of subjectivation that impede conscious and unconscious desiring forces for group assemblages, that is, the very forces that fuel the generation of subjectivity within the group. Also wanting to challenge mechanisms of subjectivation and liberate desire, through his development of the combined sociocognitive theory, performance aesthetics and research methodology of 'transversal poetics', Bryan Reynolds marshals transversality to account for, enable and affect immanent, emergent and transformative processes that inspire perspectivism, subjectivity and experience outside of established codes and parameters (see Reynolds 2002, 2003, 2006, 2009). Significantly, among other possible effects, this causes reconfiguration and expansion of 'subjective territory', the conceptual, emotional and physical range through which individuals perceive, experience and comprehend. Normally instituted and maintained by ideological and repressive mechanisms of dominant society in the interest of mutually reinforcing that society, subjective territory is always constraining and often deleteriously oppressive. For Reynolds, transversality is – crucially – dynamism of metamorphosis rather than just concept; as such, it generates opportunities for moving beyond subjective territory, defying society's modalities of indoctrination, socialisation and regulation, and *goings-elsewhere*.

Reynolds' and Guattari's theorisations of subjectivity are both concerned with the irreducibility of transversal movements to circumscribed fields of development, power, communication and classification. By extension, they are both concerned with the unpredictable and perplexing mobility of subjectivity that measures movements of transversality within such demarcated fields of reference. However, transversal poetics broadens the theoretical scope of Guattari's emphasis on group assemblages to include individual assemblages of subjectivity, thereby comprehending the individual *as group* – itself a matrix comprised of singularities and multiplicities – integrally participating constitutionally within and among groups and other creatures, objects

and energies. Simply put, this broadening enriches Guattari's concept of transversality with theories of mind, consciousness, embodiment, performance, experience and affect; and therefore allows for attributive and generative modes of subjectivity that expand the analytic and experiential reach of the concept beyond formulations of group assemblages contextualised in theories of affect alone.

The expansive-incorporation of transversal poetics also moves beyond Guattari's departure from Jean-Paul Sartre's concept of transversality as unifying consciousness to totalise individuation. For Sartre, consciousness unifies through automatic awareness of the serial passage of consciousness through time as transversally linked by consciousness's intentional stance toward an object. As Sartre puts it:

> It is consciousness which unifies itself, concretely, by a play of 'transversal' intentionalities which are concrete and real retentions of past consciousnesses. Thus consciousness refers perpetually to itself.... And consciousness is aware of itself *in so far as it is consciousness of a transcendent object*. All is therefore clear and lucid in consciousness: the object with its characteristic opacity is before consciousness, but consciousness is purely and simply consciousness of being consciousness of that object. (1960: 39)

Alternatively, for Guattari, consciousness does not operate by means of temporal and solipsistic unification, but rather it is always nonlinear and spatially oriented towards new emergences of communication and affect, and, because of this, it instantiates intersubjectively within groups, that is, when interacting with both the unconscious and conscious desires of others. Both the philosophy and structural development of transversal poetics itself reflects Guattari's departure from Sartre's decisive emphasis on inwardness. For Reynolds, consciousness is always relational, its apparent and contingent individuation the result of organising clusters of complexity, such as in-jokes, humans, rats, computers, tornadoes or rocks. This idea underpins the transversal enterprise of writing this essay, an undertaking that demonstrates and benefits from the collaborative nature of consciousness, as Reynolds regularly collaborates with others who acknowledge and value the production of critical theory as emergent activity in terms similar to subjectivity. For Reynolds, whether prompted by subjunctivity, becomings, comings-to-be, goings, wilderness effects, transversal movements and so on, subjectivity is transversal to the subject. A reactive and/or fugitive 'eventualisation' (an event or sequence of events with affective duration), subjectivity emerges from subjective territory and crystallises as 'reflexive-consciousness',

the means by which consciousness regards itself with heightened awareness in relation to its operations and progressions. Subjectivity's crystallisation occurs in nuanced response to the escalating, spreading and/or waning transversal power that precipitated or was precipitated by the circumstances of its emergence.

For Reynolds and Guattari, respectively, transversality promotes forward-looking and forward-moving understandings of subjective processes, that is, it promotes positive and progressive privileging of future eventualisations and new forms of goings, becomings, alterity and affect. In doing so, it invites a post-phenomenological critical terrain – 'post' because it encompasses inclusion, culmination and supersession of the phenomenological as it exceeds perception and experience – in which to explore relationships between ethics, desire, subjectivity and affect. Dissident and fugitive movements, especially if distinguished by emergent activity, can powerfully foster creative cognitive, emotional and physical development beyond prescriptive and authoritarian discourses, such as those that characterise mainstream academic research methods, institutionalised psychiatry, conventional educational structures, and capitalist ideology and systems. In the context of Guattari's later works, Genosko provides a productive comparison of the type of subjectivities that reside in Guattari's and Reynolds' work. For Guattari, movements of subjectivity aim to exceed the everyday banality of existential territories achieved in the transformative therapeutics of incorporeal universes. For Reynolds, movements of subjectivity aim towards becomings-x from 'state machinery', the network of ordering 'sociopolitical conductors' (the inculcating apparatuses of family, education, law, government, religion, etc.) that work to structure, delineate and limit social identity and experience – subjective territory – in conformity with a society's dominant values and normative objectives (Genosko 2002: 58; see also 2009: 262–71). Unintentional events and actions spur, to give one possibility, becomings-dissident that affect transgressions of the cognitive, emotional and physical boundaries ascribed to subjective territories through processes of subjectivation, as administered discursively by sociopolitical conductors. Such departures from subjective territory, when radical and reeling, occupy transversal vectors and in effect alter the multidimensional cartography of cognitive, emotional and physical capacity, a multiplicity of interrelated fluxes and flows. Consider, for instance, *disarticulatory vibrations* from, say, love at first sight: subjective territory ↔ subjectivity ↔ dominant values ↔ unformed affects, thereby transforming and/or

expanding subjective territory – range, perspective, experience – and thus the 'affective presence' and universe for a given person or people.

Whereas our example of becomings-dissident maps trajectories of always dynamic and fundamentally non-subjectified, often subversive, lines of influence when measured in relation to parameters of dominant systems, it would be wrong to position automatically or decisively transversality within dualist frameworks of conformity/subversion and/or subject/other. Instead, transversality in the context of political and cultural frameworks enables unintentional and experiential alterity that while simultaneously defying totalising and/or unifying schemas acts also to express and amplify transitory states. These states, on the one hand, serve to heighten and expand processes of reflexive-consciousness, and, on the other hand, make accessible empathetic lines of communication, even within the everyday workings of consciousness, what we refer to as 'quotidian-consciousness', the stance, awareness and sentience common to second-by-second daily life. Transversal poetics expands beyond the Guattarian bestiary, which exemplifies actualised affective communication and the manifestation of latent desires for group assemblages through productive openings of equine blinkers (Guattari 1984: 17–18), to acknowledge that amplification of alterity via transversality influences, intensive-extensively, the scope of reflexive-consciousness. Such amplification multiplies levels and lines of affect, sentience and thought through the performative and interrelated movements of subjectivity between social identities, codes and discourses. In the emphasis Guattari places on group formations, the individual does not disappear, much less cease to exist, but rather functions, as Genosko aptly explains, as a liberating mirror through which individuals produce new singularities and subjectivities resulting from intersubjective relations, collective affects and enunciation, explorations of desires and passions, among others (2002: 83). Similarly, and by extension, according to transversal poetics, the multiplicity of goings-x (non-volitional travel), comings-to-be-x (unintended), and becomings-x (intended), such as becomings-dissident, made possible through transversality assumes a group dimension in terms of unblinkering the potential for empathetic and affective paths of communication and understanding by crossing previously obstructed or elided cultural, ethnic, racial, species, social, gendered and/or environmental divisions, avenues and conduits.

The unexpected events, slippages and wanderings that prompt transversality to emerge immanently and catalyse becomings-dissident have the effect of manifesting for subjectivity a transition away from the stasis of routine and habit and/or inhibitive and repressive structures

while, also, engendering new paths of cognition and empathy. In short, this is the creation of new universes of reference and meaning for manifestations and performances of subjectivity and therefore also of inter- and intra-subjectivities. We argue elsewhere for the importance of revising the Deleuzo-Guattarian subject along proactive agential lines of potentiality whereon, despite the ultimately open-ended and non-agential trajectories that becomings-dissident can achieve in terms of both social identities and state machineries, there nevertheless perseveres prospective and contingent opportunities for 'wilful parameterisation' of transversal movements (Bryx & Reynolds 2009: 83–123). To be sure, it is possible to find parallels in the administrative methodology put into practice by Guattari that sought to redistribute and rotate the work schedules and roles of participating members of the psychiatric institution, whether employees or patients, so as to maximise the potential of transversal coefficients. Yet, as in the institutional case of Guattari's 'grid' (a non-hierarchical deregulating work schedule for staff at La Borde), wilfully parameterising conditions for transversal movement is not a fail-safe or sure method by which to reach, for instance, becomings-dissident (should this be one's goal). This is because, at best, when faced with transversal power wilful parameterisation only ameliorates potential and adjusts some configurations for channelling and navigating the passings-through of thresholds of alterity. To refer to some common examples: people often try to establish conditions and set parameters for their journeys on ayahuasca, DMT or LSD. They do this typically by attempting to control as many variables as possible that they might encounter along the way, such as material properties, light, temperature, sound, other people, creatures and energies. Nevertheless, the transversal power of these psychotropic drugs operating in conjunction with consciousness and subjective territory are far from controllable or predictable, and it is precisely this intensive-extensive potential that most drives people to want to enjoy them.

In the 1960s, LSD superhero Ken Kesey and his Merry Pranksters went to great lengths to set the parameters for their famous 'acid tests', whether at Kesey's ranch in La Honda, California or on the Interstates in their magic bus, to ensure that the trippers had the 'right' kind of experience, that is, 'the LSD experience', a popular catchphrase coined during the era. Tom Wolfe's account in *The Electric Kool-Aid Acid Test* is representative:

> Under LSD, if it really went right, *Ego* and *Non-Ego* started to merge. Countless things that seemed separate started to merge, too; a sound became . . . *a color!* blue . . . colors became smells, walls began to *breathe* like

> the underside of a leaf, with one's own breath. A curtain became a column of concrete and yet it began rippling, this incredible concrete mass rippling in harmonic waves like the Puget Sound bridge before the crash and you can *feel* it, the entire harmonics of the universe from the most massive to the smallest and most personal – *presque vu!* – all flowing together in this very moment . . . (1968: 140; ellipses in original)

Convinced of the importance of parameterisation, especially after suffering the 'bad trip' of loss of control at the 1965 Beatle's concert at Cow Palace, Kesey fantasised about building a perfectly controlled environment for the LSD experience, 'a great geodesic dome on top of a cylindrical shaft' with 'a great foam-rubber floor . . . everywhere, would be speakers, microphones, tape machines, live, replay, variable lag', and much more (Wolfe 1968: 231). Similar comparisons could be made with people's elaborate efforts to establish the perfect *mise-en-scène* for a romantic evening (especially when sex is a desired component), a theatre performance, or a dangerous sport, like mixed martial arts, motorcycle motocross, skate boarding or freestyle skiing. In all of these examples, people desire it in contradictory ways: controlled and free, parameterised and unpredictable, though not necessarily transversal; and in the cases of some of them, particularly when they involve an audience, collective experience is a privileged measure of success.

For Guattari, the distribution of desire among a group's members is crucial to the transversality of the group formation for which a collective subjectivity can be a product. According to transversal poetics, varying outcomes are always at stake when desire is directed towards both acquisition (opportunity, diagnosis, cure) and production (experience, subjectivity, agreement, rapport), even when primarily consumptive as manifested (through conversation, eating, reading, watching), with the attainment and expense of energy (caloric, libidinal, psychic) affecting and enabling further desire. The production of desire is unavoidable, like the effects of a digested psychotropic drug or an adrenaline rush from freestyle skiing, but an individual or a group can channel it through wilful parameterisation (becomings), or, or also, the desired – its desiring force – might channel it (comings-to-be). For instance, physical exertion, such as during aerobic or sexual activity, releases chemicals in the brain that make people feel good, more alert, even euphoric. These chemicals include endorphins, named after morphine because they relieve pain, induce pleasurable feelings and are physically addictive; phenylethylamine, which pleasurably stimulates like amphetamines, increases awareness, reduces depression, and is also addictive; and serotonin, which induces pleasurable feelings, reduces

depression and is addictive – if only indirectly through, say, cocaine use or excessive ingestion of carbohydrates. The work of these chemicals and many others with similar mood-boosting or antidepressant effects and addictive qualities demonstrates quite clearly, in the context of daily or monthly happenings, the implicative opportunity of choosing to parameterise behaviour through reflexive-consciousness that directly influences the intensity of desire and its generative capacities. In turn, this biochemical, psychic dynamic outwardly expresses, such as through social activity, cultural traits and material relations.

Dynamic manoeuvrings of reflexive-consciousness, such as through heightened cognition along subjunctive vectors, can function to recalibrate the body to produce more and different processes of desires and affects. Scrambling together and apart, for instance, chemical intake with sexual and/or aerobic activity at variable intensities and schedules can motivate the production of affect in altogether different calibrations from the static and normalised routines that ordinarily circumscribe subjective territories. The wilful parameterisation of alterity, when successful, generates a recalibrated body where affects threshold in atypical and unpredictable manners, disrupting the linear causality of dependence on serotonin production, for instance, to relieve depression. What intensities of desire do we produce if we devour three dishes of lasagne in the middle of an otherwise sleep-filled night? What affects might this excessive digestion of carbohydrates prompt in terms of mood-boosting pleasurable, addictive or depressing feelings related to heightened and/or lowered processes of reflexive-consciousness and/or hallucinogenic or subjunctive vectors of cognition?

The alterity that we advocate – the transversality, goings-x, becomings-x, sometimes leading to becomings-dissident from the all-too common trappings of a repressive subjective territory (networked with guilt, shame and anxiety), the thresholding of new pathways of cognition – shares the Guattarian sensibility for enhancing the productive dimensions of the navigation of new universes of meaning beyond conditioned and institutionalised modes of existence. We intend the implementable concept of wilful parameterisation to incorporate a practicality with which both to maximise possible encounters and navigations of transversality and concurrently to function as sustainable, albeit perpetually shifting, patchworks of interconnected and productive rhythms of affect, desire and cognition. The analogy to thermodynamics that Guattari employs to illustrate the entropic zero-degree flight of the intensive diminution of transversality characterises effectively, in our opinion, the impossibility of clinging indefinitely to radical

and undifferentiated transductive metamorphoses. However, seeking transversality opportunistically enhances, we argue, our potential to navigate experience according to mutating ethical and aesthetic rhythms, the production of cacophonous singularities sustainable through the development and recalibration of our bodies and minds through self-generative and self-channelling dimensions. We share the Guattarian sensibility of seeking both practical and sustainable modes of creative auto-productions, ones that shift and mutate in partial accordance with agential explorations as well as with positive differentiation that defines, in our view, transversal movements.

We encounter roadblocks, nonetheless, in relation to some aspects that represent the Deleuzo-Guattarian subject and the tendency therein and in poststructuralist and postmodernist philosophy to underplay the importance of both the sustainability of subjectivity and the immediacy and intensive power with which reflexive-consciousness harnesses the interplay of subjectivities and transversal movements. Whereas we see value in Guattari's provisional definition in 'Subjectivities: for Better and for Worse' of subjectivity that emphasises the role of self-referential conditions that tentatively determine the adjacent correspondence of alterity to subjectivity (1996*:* 196), we are less inclined to agree with the Deleuzo-Guattarian subject that pre-emptively defers reflexive-consciousness as abstracted and postponed retroactive introspection. In other words, while we value the Deleuzo-Guattarian critique of positive rationalism and the Freudian triadic topography of mind, we also see that reflexive-consciousness functions with an integral vitality concerning thresholding and experiential alterity, and that it is not simply the by-product of indeterminate, aleatory, larval and autonomic transductions between intensive states of becomings-other. We see this deferment of the capabilities of reflexive-consciousness in Deleuzo-Guattarian concepts of the subject and subjectivity as coinciding with a premise of non-sustainability and machinic breakdown. For them, these concepts always verge towards self-destructive impulses and routes, as in the case of desiring-production or the means (hypochondria, drug addiction, paranoia, schizophrenia, masochism) by which they maintain that people often approximate the always sought but ultimately unattainable Body-without-Organs (1983: 149–66).

Conversely, we gravitate towards Guattari's outlook on subjectivity as sustainable, what we would refer to, with some difference, as 'eventualising' (events achieving duration), a perspective that has important implications for ethico-aesthetic and eco-philosophical outlooks on experience, which he repeatedly stresses throughout his

work. For instance, in 'Subjectivities: for Better and for Worse', Guattari accentuates conjunctive textures: 'Of primordial importance, however, is the mutant, rhythmic trajectory of a temporalization that is capable of holding together the heterogeneous components of a new existential structure' (1996: 201). In 'Regimes, Pathways, Subjects', Guattari promotes the principle of consistency with regard to self-generative experiential alterity: 'Paths/voices of *self-reference* developing a processual subjectivity that defines its own coordinates and is self-consistent (what I have discussed elsewhere under the category of the "subject group"), but can nevertheless establish transversal relations to mental and social stratifications' (1996: 96). Our point here is that mobilising reflexive-consciousness in an intensive-productive function within the interplay of other constitutive aspects of production expresses a critical component of the self-generation of subjectivities through wilful parameterisations of transversal movements that applies directly to an enhancement of the positive potential for transversality and concomitantly the promotion of experiential alterity and non-directed affective transduction. Avoiding entrapment in pre-individual, rationalist, abstract or otherwise categorised positivistic attributes, our emphasis on the productive function of reflexive-consciousness exemplifies the delight with which Guattari, in 'The First Positive Task of Schizoanalysis', turns to Samuel Beckett's work in order to theorise machinic and schizoid processes – the sucking stones in *Molloy* that connect organic, inert and psychological fragments (1996: 78–9). Similarly, the productive function of reflexive-consciousness exemplifies the self-generative machine of semiosis that, in 'Genet Regained', Guattari identifies in Jean Genet as a radical manufacturer of excitement through the copulative conjunctions of flowers and convicts:

> In Genet, the flower mates with the convict: 'Convict garb is striped pink and white. Though it was at my heart's bidding that I chose the universe wherein I delight, I at least have the power of finding therein the many meanings I wish to find: there is a close relationship between flowers and convicts.' Two, three universes crystallize together: the penal colony, flowers, and poetry. Anything else? Excitation. (1996: 225)

Like the copulative semiotisation of flowers and convicts, Guattari also analyses machinic fabulation in Genet's life and work that produces emancipatory conjunctions between creative processes and masturbation irreducible to pathologies of psychotic episodes or fixated imaginaries, but rather as emergent properties of the subjunctive.

How do we tarry with the subjunctive to maximise parameterisations of transversal movements and sustain experiences of non-directed affective transduction? One particular style of approach that we want to consider in the context of this essay on the philosophy of Félix Guattari and transversal poetics is engagement with the immanent implosion of processes of reflexive-consciousness when subjunctive lines become 'inarticulatory', unable to articulate, perhaps passing first through the 'disarticulatory', the undoing of articulation (Bryx & Reynolds 2012). The characterisation of subjunctive movement in transversal poetics asserts this concept as an in-between enabler and affecter, potentially bridging everyday happenings with transversality, occurring when cognitive considerations of as-ifs and what-ifs slip into a smooth spatiotemporality undifferentiated by agency, causality and cogency. A serial effect of this intensive-extensive giving-way of the subjunctive into the transversal, should the variables configure to precipitate such emergent occurrences, involves what we call 'paused-consciousness', 'motored-consciousness', 'viscerallectrics' and 'fractalactics'. We share these terms now as a coda to this essay that has been working its way toward them all along.

During focused physical, sexual, affective and/or mental activities, people sometimes lose tract of the spatiotemporal grids that frame subjectivity – how they are perceived interrelated with the whys and whats of their doing – sometimes causing the forgetting of where they are in space and time. Such paused-consciousness indicates a passing into interstices, a neuropathic spacetime of surrender, slippage and skating where anything can transpire, where any potential connections can be made in its departure from quotidian-consciousness. We say 'any' because at certain times/situations/spaces/neighbourhoods we are not in control of our ability to navigate our consciousness; and sometimes we do not want to be, like in theaterspace or psychotropicspace, when we wilfully suspend disbelief and welcome uncontrollable cognitive-emotional-physical transportation. (See Figure 1 for an expression of such transportation.)

Unlike quotidian-consciousness, motored-consciousness describes the momentum consciousness achieves when reflexive-consciousness heightens and when, contradictory to reflexive-consciousness, reflexive-consciousness combines with paused-consciousness to become streamlined in scope, that is, intensely aware (reflexive) of its trajectory and simultaneously (because it is *paused on* the trajectory) unaware of the framing, context and environment. In other words, to achieve motored-consciousness, reflexive-consciousness becomes a myopic,

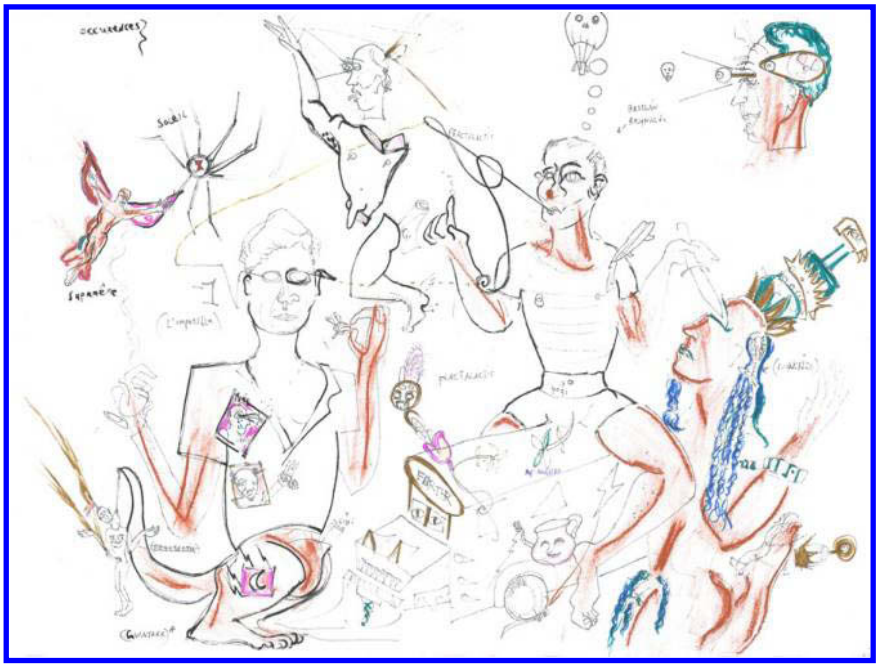

Figure 1. *Fractalactic Occurrences*, by Arturo Desimone. (Reproduced with permission.)

resonating force, a compelled mapping – as opposed to a tracing – when feedback-loops, under such extreme pressure, connectively disjoin with feedforward-flows as an inarticulatory process. Motored-consciousness generates-x (sensations, vibrations, thoughts, perceptions, desires, pleasures, pains, associations . . .) when the altering of consciousness perseveres relentlessly and exponentially with intensity, like when on LSD, receiving prolonged sexual and/or painful stimulation, or simply because of sensory overload, which can be attained through experiences of sensory deprivation as well as of complex, profuse and/or incongruent stimuli. To give an LSD example from a participant in the 1966 Watts Acid Test:

> There was much activity in the large room. People were dancing and the band [The Grateful Dead] was playing – but I couldn't hear them. I can't remember a note of music, because the vibrations were so intense. ['Vibrations' being a term for the effects of LSD.] I am a music-oriented person – sing, play instruments, etc. – which is why this seems so unusual to me. I stood close

> to the band and let the vibrations engulf me. They started in my toes and every inch of me was quivering with them . . . they made a journey through my nervous system (I remember picturing myself as one of the charts we had studied in biology which shows the nerve network), traveling each tiny path, finally reaching the top of my head, where they exploded in glorious patterns of color and lines . . . (Wolfe 1968: 275)

A result of motored-consciousness, further to the 'powerbanding' rush of motored-consciousness that simultaneously surfs on heightened lucidity and the eventualisations it becomes and to which it contributes – the layering of feedforward-flows and feedback-loops refracted by stimuli and asymmetrically corresponding reflexivity, 'viscerallectrics' activate subsequent to combined, serial implosions of visceral, intellectual and electric registers. The exponential effects of the momentum of 'vibrations' described in the passage demonstrate the LSD-induced viscerallectrics at work.

One goes viscerallectric! Like motored-consciousness, viscerallectrics are a sustained, linked, eventualising process of intensity of affect, where and when implosions set adrift particular kinds of transversal vectors (visceral/intellectual/electric), supercharged 'pulsations' and 'tremors' compared to the 'motored' velocity of motored-consciousness. Yet precisely because they are propelled by motored-consciousness, the domino-effected implosions immanent to viscerallectrics sometimes achieve the capacity to generate 'fractalactic occurrences': presto, boom, shazam – 'they exploded in glorious patterns of color and lines' – when enough energy transduces in and through certain forces, organics, planes and objects that splinter, fuse and refract in a multiplicity of unpredictable directions and dimensions. Both fractal and compositional, *one goes fractalactic!* In turn, when considering their impacts on humans, fractalactic occurrences precipitate transversal vectors, and together, whether cacophonously or euphoniously, they link and manifest feedback-loops, feedforward-flows, continued motored-consciousness, viscerallectrics, crystallisations of subjectivity, and changes and expansions of subjective territory, and so on, and on, and on . . . *we go* . . .

Note

We want to thank Arturo Desimone for making the illustration *Fractalactic Occurrences* for this essay.

1. This is the authors' preferred way of showing equal authorship.

Culture as Existential Territory: Ecosophic Homelands for the Twenty-first Century

Janell Watson

Abstract

The mass popular dissent which has marked the early twenty-first century, from al-Qaeda to the Arab Spring to the Occupy movement, can be read as expressions of collective, subjective, existential mutation. This reading is inspired by Félix Guattari, who described the 1979 Iranian revolution, the Polish Solidarity movement and the 1989 Chinese student demonstrations as demands for subjective singularisation. In each of these examples of social discontent, past and present, demands vary widely even within the same movement, spanning economics, lifestyle, religion and politics, and ranging from cries for liberation to conservative returns to ancient tradition. In order to perform a schizoanalysis of such amorphous movements, Guattari developed a four-part ecosophic object, composed of existential Territories, Universes of value, material-energetic Flows and machinic Phyla. Assemblages can be dynamically mapped along these four dimensions. Of crucial importance in the age of extreme deterritorialisation is the existential Territory, which could potentially take the form of a homeland based on poetry or music rather than on ethnicity or even place. Such portable homelands would characterise the dissensual processual post-media era for which Guattari longed.

Keywords: assemblage, deterritorialisation, subjectivity, ecosophy, three ecologies, machinic phylum, post-media era, processuality, singularisation

Popular collective expressions of dissent have dominated headlines around the world since the dawn of the twenty-first century. Targets of dissent vary, although it is in each case some version of a perceived status quo. Plots and attacks associated with al-Qaeda; widespread reactionary anti-Islamism in Europe; Palestinian retaliations against Israeli occupation; Uighur and Tibetan autonomy movements; the Iranian Green movement; the massive upheavals of the Arab Spring; the short-lived Jasmine protests; London rioting and looting which spread throughout the UK; demonstrations against austerity measures in Europe (UK, Italy, Greece, Spain); network attacks by the hacktivist group Anonymous; San Francisco demonstrations that shut down public transportation; Occupy Wall Street with its many offshoots. Some of the causes are progressive, others traditionalist and still others annihilatory. The demands are disparate, contradictory and at times intangible. Motivations that have been articulated or ascribed include religion, culture, race, secularism, nationalism, territorial claims, democratisation, an impetus toward modernisation, a return to traditionalism, economic precarity, high unemployment, police brutality, disenfranchised youth and criminality. The London looters may seem to have little in common with Palestinians protesting the occupation of their lands or with other Arab populations rising up against corrupt authoritarian rule, but all share an explosive discontent that is manifested publicly, sometimes brutally, and at great personal risk. Some among those who have banded together in opposition had previously led mainstream middle-class lives; this is especially true of the London looting as well as of the Arab uprisings. Even the most coordinated of the collectives involved are decentralised and amorphous.

'Collective subjective mutation' is a phrase that captures the spontaneity, amorphousness and unarticulated desires that characterise the disparate collective events in question here. As many have observed of the current wave of uprisings, this is not revolutionary politics as usual. There is no vanguard, no central committee, no formal manifesto. Collective actions have been spurred more by affective intensity than by conscious discursivity. Writing in the 1980s, Guattari cited an array of uprisings similar in diversity to those I have just listed, and many of his comments seem germane to the present unrests shaking various parts of the world. He compared events as dissimilar as the 1979 Iranian revolution, the Polish Solidarity movement and the 1989 Chinese student demonstrations. His examples also include the Basques, Corsicans, Palestinians and Uighurs, as well as Muslim fundamentalists, Australian aboriginal peoples, black Brazilians and

non-white second-generation Europeans (Guattari 1986; Guattari and Rolnik 2008). Despite the very different ideologies and demands being made, he notes similarities in these movements' and events' 'contagious, affective burden'. In each case, there is at stake 'a whole lifestyle, a whole conception of social relations, and a collective ethic' (Guattari 1996: 193). For him, these movements and events portend 'a collective, existential mutation' (Guattari 1995: 2). I suggest that the twenty-first-century events and movements that I have listed can be understood as a continuation of the existential transformations that Guattari was observing in the final decade of his life. He describes historical change in terms of mutating assemblages. The trouble with assemblages, at least from the point of view of those seeking to control and manipulate them, is that they mutate. Even the most existentially consistent and stable assemblage is autopoietic, which is to say self-organising, self-reproducing and capable of taking off in unforeseen directions, bifurcating unexpectedly upon the chance encounter of a point of singularity, either disaggregating into entropy or re-assembling itself around a nucleus of subjectivation, regaining existential consistency as a new assemblage with new capabilities. New assemblages are not necessarily better, but social mutations cannot take place without their creation.

The variety of needs and wants being voiced by mass demonstrations around the world cannot and should not be synthesised. It is likewise important to recognise that there are leaders and organisers within even the most acephalous movements. However, if Guattari is correct that we are approaching the threshold of a new era, then the collective energies generated by the demonstrations will uncover bifurcation points amidst the chaos. The resulting social mutations will take the form of order emerging from chaos (Prigogine and Stengers 1984). Perhaps this is what radical democracy looks like, a 'democratic chaos which conceals a multitude of vectors of resingularisation, attractors of social creativity in search of actualisation' (Guattari 1995: 14, 117). These movements are complex systems endowed with 'a wealth of possible stable and unstable behaviors' (Prigogine and Stengers 1984: 169). The militant analytic task at hand: searching the 'democratic chaos' of today's amorphous collective movements for 'attractors of social creativity'. Attractors are the limit points of a system, but near its bifurcation points, resingularising lines of flight may take off in new directions, abruptly transforming the system (Mitchell 2009). The 'attractors of social creativity' achieve 'actualisation' if they manage to acquire enough existential consistency to self-realise. This requires a

crystal of singularisation, a nucleus around which a new psycho-social entity can come into existence (Guattari 1989: 52, 60). Guattari plays on the multiple meanings of the word singular: for him, 'singularity' denotes both the points at which systems may mutate and also the opposite of standardisation or Sartrean seriality; 'singularisation' denotes a bifurcation toward creative complexity. For progressives who advocate for radical democracy, political hope lies in those social mutations that allow for a maximum of subjective singularisation. The problem: how to avoid regressive reterritorialisations? Recent manifestations of public dissent are democratic in the sense that people are expressing themselves collectively and publicly, even if some among them are choosing fascist paths. The task for political progressives is to carefully search these gestures of dissent which have upset the equilibrium of daily life in many parts of the world in order to uncover points of singularity from which new mental, social and machinic assemblages can come into being, seeking out the emancipatory from among the repressive – a distinction which is not as clear-cut as it seems.

At stake is the 'production of human existence itself in new historical contexts' (Guattari 2000: 34). The 'production of human existence' encompasses the complex processes that make up Guattari's three ecologies – mental, social and environmental. It is a matter of assemblages and their environments. The 'new historical contexts' in question include the acceleration of globalisation since the 1980s; increasingly interactive information technologies; economic financialisation; corporate agglomeration; and the rise of global Islam in confrontation with international secularism, global Christianity and a stubbornly territorial Zionism. Human existence, like life itself, requires viable ecologies. Air, shelter, water and food are not enough to sustain a living being. As social animals, humans require assemblages – the shared behavioural sequences that organise the social mechanisms necessary for species survival (Guattari 2011: ch. 5). Guattari's ecosophy provides a dynamic cartographic method that can help detect existential mutations, conceptualising life in terms of complex self-organising machinic systems, ontologically similar to those of chemistry and biology but with ethical and aesthetic dimensions. Ecosophy is the ethico-aesthetic mapping of mutations traversing disparate assemblages, a cartographic exploration of the complex and intertwined machinations of the psyche, the socius, the mecanosphere, the biosphere and the cosmos. Only such an 'eco-logic' can appreciate the particularities, diversities and interconnections among biological, machinic and social life in the twenty-first century.

Assemblages can exist only in relation to some sort of territory. This relationship is subjective. This is why mutating assemblages can open up to subjective singularisation, for better or for worse. As Jakob von Uexküll puts it, 'Territory is purely a problem of the environment because it represents an exclusively subjective product' (Uexküll 2010: 103). Each animal or insect requires a subjectivity in order to survive, for without subjectivity there is no capacity to interact with the environment. Insofar as humans and animals alike adjust their behaviours in relation to each other and to their environment, they are endowed with subjectivity, a subjectivity which is not discursive but which operates in pathic, affective and intensive dimensions. For complex systems theory, a sort of subjectivity can be ascribed to any self-organising system – even a chemical or geological one. That means that mass social movements, even the most acephalous, function as assemblages whose capacity for affect, for affecting and being affected by their surroundings, indicates the presence of a proto-subjectivity. To respond to the environment is to make choices. To the extent that decision making requires a subject, a sort of proto-subjectivity is found throughout the biological realm, since 'Being alive means being able to make unforeseen decisions' (Shaviro 2010: 143). As Guattari puts it, 'A certain kind of freedom and even grace exists on the level of the nervous or digestive system' (Guattari 2011: 127). Human subjectivity also operates on this non-discursive, bio-social level. For human collectives, 'many seemingly deliberate behaviours actually relate to an ethological montage' comparable to animal mating rituals, territorial defence behaviours or the ant colony (131). In this sense, 'Freedom is not created with subjectivity' since there is no individuated rational consciousness directing such collective activities (127). The amorphously coalesced collective disruptions of the twenty-first century exhibit this same kind of ethological proto-subjectivity. Autonomy is being sought at the level of an intensive subjectivity of the Body-without-Organs type, rather than through stratified discourse, as in the case with vanguard politics. Today's oppositional collectives are acting out a kind of ethological politics, whose irruptions of democratic chaos can best be analysed in terms of social assemblages. The collectives themselves manifest a 'making-dissident of subjectivity' that Guattari equates with the demand for subjective singularisation (Guattari 1986: 68).

Historical transformations correspond to the emergence of new social assemblages, hence the importance of looking out for the crystals of singularisation and nuclei of subjectivation around which these new assemblages can form (Deleuze and Guattari 1987). To

state the obvious, globalisation's extreme deterritorialisations have upset existing assemblages. As Guattari put it, the world has been taken over by a 'deterritorializing gangrene' which has resulted in the 'general bankruptcy of the "originary" territorialities' and the '"ungluing" of the collective history of humanity' (Guattari 2011: 119). The great machines of mass deterritorialisation that have taken over the earth have uncoupled peoples from territories. Economic and political migrations uproot entire populations, as do wars and natural disasters. Even those who remain in a geographical area are being detached from their territories. Marc Augé offers an ethnography of 'non-places' such as airports, shopping malls, freeways, refugee camps, mass-designed dwelling space and box stores selling global merchandise (Augé 1995). A non-place is a territory without a people in a world where too many people have no place. Of course, retail non-places offer many of modest means the benefits of low-cost goods and fresh produce made available year round. Likewise, modernised housing offers refrigeration and air conditioning to the growing middle classes in places like China and India. At the same time, non-places are decimating countless long-established neighbourhoods. In many cases, the deterritorialising modernisation schema proposed by mass development is too standardised and therefore insufficiently attuned to the need for subjective singularisation.

Collective human history needs new assemblages to replace those that have become unglued. Ecosophy's schizoanalytic ontology offers a useful framework for understanding the destruction and reconstitution of the assemblages upon which human existence depend. Ecosophy maps assemblages, showing how they form, evolve, mutate and dissipate on the plane of consistency, within the plane's constant interplay of chaos and complexity. The 'ecosophic object' provides a graphic conceptualisation of the plane of consistency, plotted onto four quadrants: existential Territories, Universes of value (or of reference), machinic Phyla and Fluxes (or flows) (Guattari 1989; 2000). To examine mental, social and environmental ecologies it is necessary to consider all four quadrants. Many accounts of global capitalism focus on Flows (resources, energy, capital) and machinic Phyla (technology, machines, knowledge), which are the discursive, stratified, actualised domains of the assemblage. Guattari instead emphasises the assemblage's non-discursive, intensive, virtual domains of Universes of value and existential Territories, which are the quadrants from which subjectivity emerges. The ecosophic object is especially useful for analysing the collective social movements in question here because it maps both

the subjective and cultural domains (Territories and Universes) as well as the economic and technological domains (Flows and Phyla). Ecosophy thus accounts for strange ways in which collectively shared affect (the non-discursive domains of Territories and Universes) holds together movements with no clearly articulated unifying agenda (the discursive domain of Flows and Phyla). This four-dimensional map of the assemblage further indicates that resource Flows regulated by the Phyla of social technologies cannot operate without Universes of value embodied in existential Territories. Universes of value and existential Territories are crucial components of both massive-scale social assemblages like neoliberal democracy and smaller assemblages like dating rituals or the territorial markings of urban street gangs. This is why twenty-first-century protest movements, which are themselves assemblages, can suddenly come into existence, wreaking the havoc of democratic chaos in which singularising lines of flight coexist with socio-economic demands as well as territorial claims that seem to belong to a bygone era.

Today's global elite includes monarchs, dictators, finance capitalists, CEOs of multinationals, communist bureaucrats and third-world kleptocrats. Guattari's notion of Integrated World Capitalism does not capture the heterogeneity of globalisation's ruling assemblages. However, his ecosophic object helps account for this heterogeneous yet tightly networked global elite, against which much present-day dissent is directed. Their loosely coordinated actions have led to extreme hyperdeterritorialisation, the above-mentioned '"ungluing" of the collective history of humanity'. They have instrumentalised states, depoliticising them through economisation, in order to transform the earth into Flows of resources and real estate which they 'develop' (their term, not mine) for immense profits. The social assemblages that have organised and regulated Western existence since the Middle Ages are being pushed to mutate in response to the integration of the entire world into the various accumulatory regimes devouring the planet. The financialising technocracy has developed sophisticated stratification strategies for reaping surpluses from the libidinal energies unleashed by various assemblages, be they social, industrial, informational or aesthetic.

Many of today's protestors cite economic inequality as a primary concern, a complaint especially common among the Arab Spring, European anti-austerity and American-led Occupy movements. For the so-called 99 per cent, life has grown increasingly precarious, even within the first world. The American middle class is shrinking. The

working class born of the industrial revolution is disappearing fast. Working conditions in the third world do not meet first-world standards, and the poor everywhere are worse off than ever, even as the elite grows wealthier and more powerful. Small business owners and self-employed professionals are growing smaller in number as ownership is consolidated; shopkeepers become store managers and physicians go to work for health corporations, moving into what Guy Standing calls the Salariat. Others have opted for the status of Proficians, working on short-term contracts and consultancies, often for good pay. The fastest-growing class is that of the Precariat, 'the new dangerous class' characterised by insecurity of residency, of labour and of social protection. Unions and social welfare systems are being dismantled in the first and second worlds, and often never existed in the third world. Today's precariat lacks the prospects of lifetime employment, bargaining power to demand better wages and benefits, and a government-provided social safety net. Although the salariat and proficians enjoy relative stability, there is always the risk of sliding into the precariat. Moving up from the precariat into the salariat is not at all likely, as sociological research shows again and again. Unemployment is a fate that can befall the salariat as quickly and catastrophically as the precariat. Stability and precarity form a sliding scale, mostly sliding down, while the elite (financial, bureaucratic or monarchical) continually invent complex investment schemes to shelter themselves from risk. This new social stratification scheme has taken hold all over the world, in rich nations and in poor. The precariat includes people from ethnic majorities as well as from ethnic minorities, citizens as well as legal and illegal immigrants. Its members are far too disparate to form any kind of traditional revolutionary consciousness. The precariat certainly needs economic security, juridical rights and political recognition, but it also needs agency, the right to cultural difference and a sense of meaning in life (Standing 2011: 24–5). The protestors' demands are therefore not limited to economic or energetic Flows (money, clean water, utilities and so on).

Guattari emphasised demands for subjective singularisation which manifest themselves most clearly in disputes over language, religion, ethnicity or lifestyle, and may as easily include calls for modernisation as returns to tradition. These cultural dimensions correspond to existential Territories and Universes of value. However, as for example with the NATO military interventions in Afghanistan, Iraq and Libya, or with the Israel–Palestine conflict, it is often hard to determine whether the warring parties are fighting over resource Flows or cultural Universes.

Although the American Occupy Wall Street and Tea Party movements both advocate reforming financial Flows, they differ in terms of social vision (Universes and Territories). The Tunisian vegetable seller immolated himself not just because he was poor (cut off from Flows), but also because petty official harassment menaced his sense of self (existential Territory). Cultural difference, agency and the meaning of life require attention to Universes and Territories. However, before turning to these two domains, it worth pausing to consider the machinic Phyla which play an increasingly large role in today's assemblages and their ecologies.

Guattari notes that although subjective factors have often played a significant historical role, by the early 1990s the global diffusion of collectively expressed demands through the mass media had brought subjectivity to the forefront of world events (Guattari 1995: 3). Today, digital information technologies are ever more integrated into the most social and most intimate dimensions of human lives. Media coverage amplifies the subjective dimensions of an event, giving a face and a voice to the actors, establishing with the viewer affective bonds that may resonate independently of discursive messages. Interactive social media, which Guattari anticipated but did not live to see fully realised, further enhances the subjective dimensions of history. Both progressive movements and returns to tradition are enlisting the help of the mass media, social networking and interactive personal media. Technology is not the exclusive domain of the modernisers. Social networking spreads anti-Islamic right-wing ethnocentric nationalism across Europe and North America, just as fundamentalists sympathetic to al-Qaeda use the Internet to organise and to promote their cause. 'The machinic production of subjectivity can work for the better or for the worse', as Guattari once put it (Guattari 1996: 194). Subjective singularisation may lead toward greater freedoms, or toward renewed repressions or toward self-annihilation. Existing assemblages are not up to the task of producing the kinds of subjectivation required to survive 'planetary informatisation' (Guattari 1992).[1]

Much has been made of the role of the media in bringing into being the various twenty-first-century contestatory movements. From the self-produced videos of Osama bin Laden televised around the world on the 24/7 news cycle to the demonstrations organised on Facebook and Twitter, both top-down mass media and bottom-up social media have shaped recent popular oppositional events. Given the role of both micro- and mass media in creating and sustaining protest movements over the past 30 years, have we entered the dissensual, processual

post-media era whose arrival Guattari longed for (Guattari 1992: 31)? The odd mixture of emancipatory, conservative and destructive impulses indicates that the post-media era has arrived only in bits and pieces, and that its technological aspects have evolved much more quickly than its subjective and social aspects. As Guattari predicted, media technologies have indeed become interactive to the point that anyone can produce and broadcast audio-visual materials from devices carried in their pockets, but he didn't mention that this interactivity also serves the purposes of control society. Sophisticated media technologies, such as closed-circuit digital video and facial recognition software, have played a decisive role in state responses to populist demonstrations. Iran, China and the public transit authority in the San Francisco Bay Area (BART) have all been criticised for blocking social media communication channels, and the UK has discussed doing the same. The technology itself, however, is less important than the subjective and social mutations that go with it. Guattari defined the post-media era as not just interactive and dissensual but also processual. Full entry into the post-media era requires the development of what he calls processual assemblages. Unlike the archaic and capitalist social assemblages of the past, argues Guattari, processual assemblages will be resingularising. Processuality implicates, on the one hand, 'intimate modes of being, the body, the environment' and on the other hand 'large contextual ensembles relating to ethnic groups, the nation, or even the general rights of humanity' (Guattari 2000: 53). The post-media era is therefore less dependent on technology per se than on the existential conditions of subjective singularisation. 'Intimate modes of being' correspond to existential Territories, 'large contextual ensembles' to referential Universes of value.

The irruption into history of demands for subject singularisation corresponds to a general search for viable existential Territories – singular homelands suitable to our age of extreme deterritorialisation. Whether or not Guattari's utopic post-media era will ever come to be, existential Territories are necessary to any assemblage, processual or standard. Existential Territory is, depending on the context, a domain of the plane of consistency, an essential dimension of subjectivity and a mode of territorialisation. An existential Territory may be individual or collective. It incorporates the affective, pre-discursive and extra-discursive dimensions of the self. It corresponds to the Body without Organs as well as to the kind of 'inflatable, portable territory' mentioned in *A Thousand Plateaus* (Deleuze and Guattari 1987: 320). Whether individual or collective, existential Territory includes the body proper, the self, the maternal body, lived space, refrains of the mother tongue,

familiar faces, family lore and ethnicity (Guattari 1995: 95). It remains pre-discursive, pre-personal and intensive. It is 'a Territory of action, of physical totalisation, of the location of affect and of proto-history' (Guattari 1995: 66). As traditional territorialisations give way to modern deterritorialisations, existential Territories become even more crucial to survival.

Social assemblages crumble unless they are embodied in some sort of territory. No form of subjectivity can exist without a territory, even in the case of a liberating line of flight. The existential challenge of the twenty-first century remains the invention of a form of territoriality that can benefit from extreme deterritorialisations. Subjective singularisation revitalises assemblages, enabling them to shape their environment, bringing into existence new worlds. This is why Uexküll insists on the subjective nature of territory. He describes a walk through a garden during which the observer becomes aware that each insect and butterfly perceives its environment as if in a bubble that 'contains all the features accessible to that subject'. To enter one of these bubbles is to entirely reconfigure the surroundings (Uexküll 2010: 43). The bubble is the animal's existential Territory. The bubble can also be figured as a web or network. 'Every subject spins out, like the spider's threads, its relations to certain qualities of things and weaves them into a solid web, which carries its existence' (53). This portable web for transporting a subject's existence is also the existential Territory.

Human subjectivities need their territories, but these need not be tied to a geographical location. Twenty-first-century humans rely more and more on portable existential Territories, given the dismantling of the earth-based territories that had served them for millennia. Deleuze's famous travelling in place is made possible by the existential Territory's virtual transportability. Twenty-first-century homelands need not correspond to existing territorial ethnicities, nations, religions or classes, but they may include elements from them. Guattari describes the contemporary era thus:

> To the extent that 'original' territorialised assemblages, like those of the extended family, rural communities, castes, corporations, etc. have been swept away by deterritorialised flows, components of conscientialisation also have been attached to and studded with residual objects or semiotic substitutes. (Guattari 2011: 113)

Assemblages are able to adapt to changes by putting residual objects and semiotic substitutes to creative and productive use as catalysers for new modes of subjectivation, rather than as nodes of disempowerment that

act as semiotic black holes by sucking components of subjectivity into their vortex. It is thus not a question of modernisation versus archaism. According to the tenets of ecosophy, when it comes to building a social assemblage 'absolutely anything goes – any ideology, or even religion will do, even the most archaic: all that matters is that it be used as the raw material of existence' (Guattari 1992: 20). The resingularising processual assemblages of the post-media era cannot come into existence without pulling together available fragments from existing and even dissipated assemblages. Order (that is, existence) can arise from chaos, but it cannot arise from a void.

So-called culture clashes symptomatise social assemblage problems. Islamic fundamentalism has been explained away as a culturalist backlash, an anti-Western extremism. Similarly, the post-Soviet nationalist independence movements have been cast as a release of pent-up ethnic tensions that totalitarian communism had contained. This is not how Guattari viewed these situations. He reads the demands of these groups as collective refusals of the standardised capitalist subjectivities on offer. No matter how socially conservative their agendas, these groups resist capitalism's imposition of a system of valuation based on general equivalency and the standardised subjectivities that it produces as a result. He suggests that respite from the flattening, homogenising effects of capitalism's deterritorialisations can be sought in three directions: reterritorialisations onto the residues of archaic assemblages; destructive annihilation; or the invention of mutant, singularising processual assemblages which are more collective, more social and more political (Guattari 1995: 29). Guattari's portrait of Integrated World Capitalism remains too monolithic, especially given today's many capitalisms – industrial, financial, speculative, authoritarian, export-driven, consumerist and so on. However, his question remains relevant: will the twenty-first century become mired in reactionary reterritorialisations which form in counterpoint to the numerous deterritorialising assemblages that began emerging in the early Middle Ages, or will interactive personal media facilitate the creation of singularising processual assemblages?

The refusal of the dominant versions of modernity is not regressive in itself. In a 1985 polemical essay entitled 'The Nationalitarian Fifth World', Guattari groups together various social movements manifesting a resurgence of particularity, a demand for singularisation, in effect mapping them onto the crumbling three-world model. Guattari began writing about groups making ethnic and cultural claims during the decade which opened with the 1979 Iranian revolution and culminated

with the breakup of the Soviet Union. The communist second world was collapsing. The liberal first world claimed victory. Both first-world liberalism and second-world communism had advanced modernist dreams of secular internationalism which would entail a jettisoning of cultural traditions, but by the 1980s it had become clear that ethno-cultural particularities had not been swept away by modernity. Nonetheless, secularist assumptions continue to encode the third world as backwards and stuck in archaic territorial cultures. The fourth world struggles for existence within the borders of the wealthy first world. The outliers, whether they are modernised but disaffected first-world urban youth descended from immigrants, or traditionalists clinging to displaced ethnicities and cultural habits, form the nationalitarian fifth world (Guattari 1986: 71–9). These groups can be characterised by their 'archaic attachments to cultural traditions', to borrow Guattari's own phrasing (Guattari 1995: 3–4). His use of the term 'archaic' seems odd, given his general opposition to developmental models, but I would suggest that this usage must be placed in the context of his grand historical machinic assemblages. Traits that he labels archaic have survived as remnants of assemblages whose territorialities are inscribed directly onto the earth itself. Such territorial cultural attachments remain a part of 'the contemporary subjective cocktail' because twenty-first-century assemblages still include territorial components of subjectivity (Guattari 1995:4). He interprets these returns to tradition as resistance to capitalist assemblages. He dreams that Europe's ethnic and ecology movements (Basques, Ulster Protestants, German Greens, Scots and Welsh) will stand together and say: 'Yes, we are archaic. Take your modernity and shove it!' (Guattari 1986: 69–70).

As an alternative to secular modernist internationalism, ecosophy offers strategies for constructing liveable, particularised existential Territories adapted to changing historical conditions. This is why Europeans 'have a lot to learn from the way immigrants reinvent and reconstitute their culture' (Guattari 1986: 40). The fifth world has much more to offer than its quaint cultural relics suitable for display. Schizoanalysis learns from the schizophrenic, who pieces together a world from semiotic fragments. In treating psychosis, the schizoanalyst's aim is 'to increase as much as possible the range of means offered in the recomposition of a patient's corporeal, biological, psychical and social Territories' (Guattari 1995: 68). Likewise, a schizoanalytic approach to extreme global deterritorialisation would entail expanding the range of components and materials of expression available for enriching and recomposing collective existential Territories, corporeal, biological,

psychical and social. Immigrants are leading the way as schizoanalysts of globalisation. Guattari places his socio-political hopes in the fifth world because, out of necessity and in order to survive, they are already inventing ways to renew cultural values and social practices for our epoch, wisely retaining what works from previous regimes in addition to inventing completely new existential Territories. Such territories need not be based on ethnicity, culture or even place. Guattari explains that 'The search for an existential Territory or homeland doesn't necessarily involve searching for one's country of birth or a distant country of origin', adding that 'All sorts of deterritorialised 'nationalities' are conceivable, such as music and poetry' (Guattari 2000: 65). There are punk rock, heavy metal and hip hop 'nations'. Immigrants have created lively ethnic neighbourhoods, and their first-world-born descendants have invented urban youth cultures with their own street slang, music, graffiti and fashion (Guattari 1986). It is not a matter of refusing modernisation, but of inventing alternative modernities that revive the world's mental, social and environmental ecologies.

Human social formations likewise rely on existential operators such as the refrain or faciality, as explained at length in *A Thousand Plateaus* and *The Machinic Unconscious*. Any cultural element can detach itself and serve as an existential operator or component of passage. 'The deterritorialisation of his *Umwelt* has led man to invent diagrammatic operators such as faciality and refrains enabling him to produce new machinic territorialities' (Guattari 2011: 120). Existential operators create by assembling. Bringing together various components and assemblages, transforming them and keeping them going, existential operators act as the umbilical points of new worlds. 'A world is only constituted on the condition of being inhabited by an umbilical point – deconstructive, detotalisating and deterritorialising – from which a subjective positionality embodies itself' (Guattari 1995: 80). The nation is a refrain that binds a people to a territory, but other refrains are possible (Deleuze and Guattari 1987: 456). While some fifth-world groups are indeed involved in conventional territorial disputes over land, water and sovereignty (the Palestinians, for example), others are 'inventing new modes of managing daily life' (Guattari 1986: 41). Daily life is the terrain of the existential Territory, which lies adjacent to socio-economic flows and information-age machines. The planetary-wide transformations brought about by rapid globalisation necessitate inventing 'a new art of living' (Guattari 1996: 202).

The Islamic headcovering provides a good example of a residual cultural object that acts as an existential operator, for better or for

worse.[2] It would be a mistake to see the Islamic headcovering as a mere signifier; it is a semiotic operator because it functions on the level of affect and intensity to organise – and to disrupt – subjectivities as well as social relations. The headcovering is semiotic but non-discursive. It is both a refrain (as ritual object) as well as a form of faciality (demarcating those who belong from those who do not). As such, it is a semiotic component of passage, meaning that it can disengage itself from an assemblage, bifurcating in many directions, whether toward oppressive reterritorialisation, a subjective black hole or a singularising line of flight. Although many argue that the veil cannot possibly contribute to any emancipatory project, it has certainly undergone a series of deterritorialisations. Originally the garb of desert peoples, whose attachment to a hot part of the earth necessitated protection from the sun, the headcovering was deterritorialised by Islam, which detached it from the earth in order to make it a ritual garb required by a disembodied monotheistic god. Many Westerners interpret the headcovering as a simple index of women's oppression. European neo-nationalists take it to be a territorial refrain, like a bird's song or brightly coloured spread tail feathers, deployed in a reterritorialising attempt to Islamise Europe. Mainstream politicians have been accused of restricting and banning headcoverings as a headline-grabbing ploy to capture the far-right vote. In a highly publicised case in France, two sisters expelled from school for violating its headcovering ban turned out to have been recent converts to Islam, having been raised in a leftist secular household by a non-observant Jew and a non-practising, non-Arab Christian Algerian who were separated; the sisters wore the headscarf against the wishes of their parents, an act of religious piety which has been interpreted as a gesture of teenage defiance (Scott 2007: 30–3). In staunchly secular countries like France and Turkey, some women wear the headcovering in defiance, demanding emancipation from official restrictions on public dress. For some who wear the headcovering, it serves as a nucleus of subjectivation, constituting a portable existential territory that shelters the wearer from the penetrating gaze of strangers.

In *Questioning the Veil*, sociologist Marnia Lazreg insists that the Islamic headcovering could never bifurcate toward a deterritorialising line of flight. She provides an overview of the re-veiling trend, based on interviews with women all over the world, in Muslim countries as well as in Europe and North America. While she argues that states and their institutions should neither require nor ban headcoverings, she urges women not to veil. She reasons that the veil it is not required by the

Koran (at least according to a certain reading); it is cumbersome; its wearing is mandated by men for their benefit; and so forth. Noting that the revival of the veil is an organised campaign promoted by Islamic leaders, she rejects the idea that women may freely choose the veil, because, she maintains, the veil is inextricably associated with patriarchal power structures. She points out that the veil is 'overlaid with meanings', but that its wearing is more than symbolic; it is also a 'complex and internally contradictory custom' (2009: 11, 35). The veil is both discourse and practice, social convention and personal act (11, 36). It is not possible, in her view, to reclaim the veil as an expression of cultural pride or in defiance of Western prejudices because it is too caught up in conservative convention to be liberated for re-symbolisation. The veil is both an intimate bodily act and a tool of a repressive social apparatus. The personal act of assuming the veil contributes to the construction of an existential Territory. As a component of passage, it can also communicate with other assemblages. More crucially, the veil serves as a relay between the existential Territory of the self and virtual Universes of value. It is because the veil belongs to a larger Universe of value that it cannot be entirely personalised.

The self forms at the interface between a virtual-real existential Territory and multiple virtual-possible Universes of value. For example, the infant develops within a 'proto-social and still pre-verbal Universe' where 'familial, ethnic, urban, etc., traits are transmitted (let's call it the Cultural Unconscious)' (Guattari 1995: 67). The existential Territory is the organless embodiment of an assemblage's incorporeal Universes. There are Islamic Universes, Christian Universes, liberal secular Universes, scientific Universes, jazz Universes, conjugal Universes and so on. Operators like the refrain traverse Territories and Universes, catalysing the chaos so that complex subjective formations can acquire consistency. A zone of proto-subjectivity emerges when, on the plane of consistency, a Universe of value couples with an existential Territory. A given existential Territory may open onto multiple Universes. Constellations of Universes offer not only values but also reserves of cultural materials. With the help of the diagrammatisms proper to the machinic Phyla, these Universes of cultural reserves may coalesce into new Universes. Territories incarnate these Universes, which cannot exist without their embodiment (Guattari 1995: 54–5). There are no abstract universals, only embodied Universes of reference.

Secularism and religion function as Universes of value, but they operate differently within different assemblages. Western modernity encodes Islam as an archaic territorial assemblage, but Islam is in fact

already a deterritorialisation with its transcendent invisible god who communicates through a written text, and therefore in this respect it is at least as modern as contemporary Christianity. Guattari's view is mired in secularist assumptions, but as a theory of history his description of the mutation from polytheistic antiquity to Christianity is worth quoting at length:

> the incorporeal Universes of classical Antiquity which were associated with a polytheistic compromise relating to a multitude of clanic and ethnic Territorialities, underwent a radical reshaping with the trinitary revolution of Christianity, indexed on the refrain of the sign of the cross, which will recentre not only the ensemble of social, existential Territories, but also the corporeal, mental, familial assemblages, on the unique existential Territory of Christic incarnation and crucifixion.... The new subjectivity of guilt, contrition, body markings and sexuality, of redemptive mediation, is also an essential piece of the new social apparatuses, the new machines of subjection which had to construct themselves from the debris of the late Roman Empire and the reterritorialisations of feudal and urban orders yet to come. (Guattari 1995: 61)

A refrain, the sign of the cross, repositions all Territories and assemblages onto Christ's body, its incarnation and crucifixion, existentialising a new Territory around which Europe's social and subjective assemblages will reterritorialise for many centuries. Christianity offered new subjectivities that helped Europeans live with capitalist deterritorialisations. Christianity in turn deterritorialised onto modern universalist values (Guattari 1995: 62). Christianity and enlightenment universals in turn coexisted with reterritorialisations based on the old nations, classes and corporations of a more territorial age (Guattari 1992: 27). Ecosophic vocabulary could similarly account for the historical mutations brought about by Islam.

Like many French intellectuals, Guattari's staunch secularism led him to predict a fading of religious monotheism with the coming of the processual post-media era, because 'it is not in the nature of the new subjectivity to be herded' (Guattari 1992: 35). I must disagree, given the growth of Islam and evangelical Christianity around the world. While it is true that in many cases these monotheisms limit potentially processual singularisations through stratification, circular repetition and imposed values, there is no reason why processual assemblages cannot tap into these religious Universes. After all, a creative line of flight can take off from any assemblage, even a highly stratified one. The Christian aesthetic Universe unleashed sublime works of art. The military-industrial machinic phyla gave us cinema, aeroplanes and the Internet. Lazreg

may well be correct that the veil cannot possibly serve as a liberatory semiotic operator because it remains so entrenched in a referential Universe of value that is too sedimented, too stratified, too repressive, too imbricated in the machinery of states and institutions. However, Lazreg is careful not to dismiss Islam as a whole. Universes can and do mutate. New Universes can also split off to become something new. The new assemblages which emerge will nonetheless have to find a way to draw on the remains of dissipating assemblages. Order can arise from chaos, but the elements of order can only come from the chaos itself.

The ungluing of human history has resulted in the twenty-first century's strange mix of economic demands, emancipatory claims and culturally conservative agendas. However, the very concept of culture may be blocking paths to the processual assemblages that will herald the dawn of the post-media era. The Culture concept belongs to the eras dominated by archaic territorialising assemblages and modern deterritorialising assemblages. Ecosophy respects differences without evoking the hierarchies and grids of class and coloniality that cling to the culture concept. Viewed with the help of the ecosophic object, culture can be defined as a reservoir of shared elements, such as the residual objects and semiotic substitutes that existentialise mental and social formations. These elements work through repetition, redundancy and resonance. They include signs, symbols, verbal refrains, musical refrains, gestures, ritual, clothing, bodily markings, knowledge, belief, prejudices and stereotypes. The elements may be arranged into various domains or institutions, such as organised religions, nations, arts organisations, schools, media industries, festivals and so forth. They may likewise become attached to various types of value – aesthetic, ethical, moral, religious, monetary, etc. Although that which is ascribed to the sphere of culture has by definition already undergone deterritorialising detachment (even if, as in the case of animism, the detached semiotic elements are reattached to the earth), the redeeming feature of the culture concept remains its deep connections to life and to the earth. Culture, as a reserve of semiotising components, couples a population to a territory, and the evolution of the word's meanings can be correlated to various historical processes of deterritorialisation. As we have seen, the various phenomena which Europeans and their descendants have come to call 'culture' persist into the twenty-first century, despite the globalisation of capital, goods, communication, media, labour, technology and lifestyles. However, culture is no longer lived in the ways it was when the term emerged in European languages during the medieval period, its modern meanings not evolving until a few centuries later.

Raymond Williams provides a famous account of the culture concept's history (Williams 1976). In the fifteenth century culture referred to husbandry, the tending of crops and animals. It thus already designates a first degree of deterritorialisation, as animals and plants are moved from their original habitats to occupy a space shaped by humans; they are then bred and cross-bred with human intervention. During the Renaissance culture metaphorically extends to human development, especially the cultivation of the intellect. Beginning in the eighteenth century, culture gradually comes to replace the notion of civilisation, with its class and colonial overtones. In the nineteenth century there emerged the most common meaning of culture today, that of the way of life specific to a group or people. At the same time a third meaning had become common, that of the sphere of artistic and intellectual achievement. The culture concept was born on the farm, then extended to include the (liberal and beaux) arts, then human lifestyles. In other words, it is rooted in various modes of deterritorialisation – agricultural, technological, aesthetic, intellectual and social.

It is no coincidence that the word culture, with all its etymological baggage, evolved hand-in-hand with ethnographic exploration and colonial conquest, which were among the more devastating and violent deterritorialisations of recent human history. During the centuries of Europe's global domination, the concept of culture allowed the deterritorialised European peoples to pass judgement on the relatively more territorialised tribal societies they encountered, proselytised, studied and conquered. The culture concept may have peaked with the triumphant global institutionalisation (through journals, books, programmes) of cultural studies in the 1990s, a high point that Michael Denning associates with the culmination of the age of the three worlds (Denning 2004: 226). Around this same moment, globalisation invaded both academic and popular discourse, while anthropologists became ever more highly critical of the culture concept, often motivated by the concerns of postcolonialism (Brightman 1995; Sewell Jr. 1999). The unfortunate coinage of the concept of 'cultural identity' further deterritorialised human life by relegating its cultures to the symbolic order, detaching culture from experiential incarnation in order to translate it into networks of signifiers or force fields of power. Culture becomes reified, designating a set of structures and power moves, with little mention of any affect, experience or embodiment. It becomes sanitised for the benefit of tourists and museums. The result is existential impoverishment. Even more problematically, a reified culture can be used to make claims that benefit some of its members at the expense

of others, or it can be used to justify behaviours or practices, or it can be used to explain the behaviours or practices of others (Phillips 2007). Culturalism tends to obscure agency. It reduces the complexity of subjectivity to the paucity of the subject caught in a signifying network. It suggests a linear temporal progression of developmental progress. The twenty-first century is now more than a decade old, and scholars still rely on the European colonial idea of culture to talk about collective life, despite the rapidly shifting balance of power from Euro-American hegemony toward power-sharing arrangements with Asia and, to a lesser and yet increasing extent, Latin America.

Ecosophy offers the advantage of reincorporating the human sphere into the larger context of planetary life. Finance capitalism certainly dominates the planet today, but the historical shift that it indicates may coincide with a much more epochal upheaval. Michel Serres has suggested that the Neolithic Age ended around 1970, by which time mankind had acquired the power to double the life expectancy of humans, to create life in a test tube and to annihilate life on a planetary scale. If the beginning of the Neolithic can be described as the threshold at which mankind began shaping the environment through agriculture and settlement, then its end arrived when mankind began reshaping life itself, from the molecular level outward. We have reached the historical moment at which the mecanosphere has merged with the biosphere. Plants, animals, humans and machines have entered into historically unprecedented assemblages. Few people live in direct relation to the seasons, the weather or the production of their food. The information age has shifted people indoors, and agriculture to mass production facilities. Little wilderness remains. Dwelling space has been irrevocably transformed for man and beast alike (Serres 2001). The new spaces, Augé's non-spaces, belong to transnational stratifications of financial, material and labour flows, but these spaces have not yet been properly territorialised at the existential level. The culture industry has turned the heritage museum into a Disneyfied destination for mass tourism, creating a non-space where carved-up culture is made spectacle. Culture thus remains stuck in the mass-media era. It is time to open up spectacle society's mass-marketed museum to the inventive processuality of the post-media era, in order to produce portable, singular homelands, habitable existential Territories whose virtual existence is waiting to be actualised out of the democratic chaos of rhizomatic revolution.

Notes

1. Guattari 1992 is a translation of the first chapter of Guattari 1989, English edition forthcoming from Continuum.
2. Jasbir Puar characterises the Sikh turban as a 'strange attractor' (Puar 2011). Although I like this poetical phrasing, in Guattari's science-inspired vocabulary veils and turbans are best described as existential operators and nuclei of subjectivation.

Institutional Schizophasia and the Possibility of the Humanities' 'Other Scene': Guattari and the Exigency of Transversality

Michael Eng

Abstract

Transversality occupies a central place in Guattari's thought, appearing in his early writings on institutional analysis and on through to his final work, *Chaosmosis*. Transversality is thus particularly pertinent to understanding Guattari's critique of semiocapitalism and his goal of re-imagining forms of institutional subjectivisation as a way to free the unconscious from structures of lack and the desire for punishment, the very structures upon which capitalism relies for its reproduction. If there is one institution that has taken advantage of semiocapitalism's ability to mask its role in the reproduction of capitalist subjectivity, however, it is the contemporary neoliberal University. This essay thus brings transversality to bear upon the question of the University in semiocapitalism, focusing on the discourses that speak in defence of the humanities. Though defences of the humanities are intended to argue for the humanities' usefulness in contemporary society, transversality exposes such discourses as the speech of a 'subjugated group' whose only effect is to reinforce existing structures of lack and punishment.

Keywords: Guattari, transversality, semiocapitalism, psychoanalysis, institutional therapeutics, Oury, the University, institutional schizophasia

> The problem of the University – we certainly found out in May '68 – is not the students and the professors; it is the problem of the entire society inasmuch as it involves the relationship between the transmission of knowledge, the training of executives, the desire of the masses, the requirements of industry, and finally, everything which could intermingle in the setting of the University.
>
> (Guattari, 'The Best Capitalist Drug')

> So the question of inter-monadic transversality is not simply of a speculative nature. It involves calling into question disciplinary boundaries, the solipsistic closure of Universes of value, prevalent today in a number of domains.
>
> (Guattari, *Chaosmosis*)

This essay explores the ways Félix Guattari's concept of transversality may be brought to bear on the question of the contemporary University's relationship to advanced capitalism, or to what Guattari named Integrated World Capitalism (IWC) and what Guattari's friend and colleague Franco 'Bifo' Berardi has come to call 'semiocapitalism' (Guattari 1984b; Berardi 2009a). I am interested particularly in the implications Guattari's theorisation of transversality has for the antagonism between the group of disciplines that identify themselves as composing 'the humanities' and semiocapitalism's increased organisation of the contemporary neoliberal University. This antagonism, which has lately appeared under the label of 'the crisis of the humanities', opposes the research undertaken by such disciplines as philosophy, literature and the arts to what has been described for some time now as the contemporary University's 'corporatisation' or administrative turn. However, I wish to show that Guattari's concept of transversality exposes such a discourse as a fantasy that the humanities nurture in the age of semiocapitalism in order to maintain the belief that they, and by extension, the University, have somehow been exempt from capitalist reproduction. Transversality, I argue, exposes the discourse of 'the crisis of the humanities' as a simulacrum of speech, a kind of 'destruction of language' that Jean Oury has labelled 'schizophasic' and which I seek to identify with the phrase 'institutional schizophasia' (Oury et al. 2007: 42). At the same time, transversality also promises methods by which this simulacrum may be broached and a new form – what Oury calls 'an other scene' – of group desire may be achieved (Oury et al. 2007: 40).

I. Transversality and Semiocapitalism

Insofar as it attempts to respond to a set of material conditions and 'extract an event' from such conditions, transversality is a 'concept'

in every sense Guattari and Gilles Deleuze give the term in their final collaboration, *What is Philosophy?* (Deleuze and Guattari 1994: 33). Transversality was crafted by Guattari to intervene in a clinical exigency he identified during his tenure at the La Borde clinic. He realised that the institutional conditions at La Borde not only seemed an obstacle to the therapeutic cure but that they actually required the persistence of psychological illness. Observing that the hierarchical structure of relationships within the institution (between analysts and patients, but also between and among analysts and staff) reproduced the relation to punishment and lack to which subjects are first introduced via the castration complex, Guattari enacted a new work system referred to as 'the grid' that assigned people tasks that were outside their areas of specialisation (Dosse 2010: 56–7). Cleaning staff might be assigned to aid doctors in the treatment of patients, monitors might be given dishwashing duties, etc. The idea was to shake up established vertical and horizontal relationships in the institution, including conceptual hierarchies such as that of intellectual to manual labour, and create innovative, transversal relations that would show how the older, habitual ways of acting within the institution were symptomatic of a particular, yet far from inevitable, image the institution had of itself, an image that reflected a historically determined 'group fantasy'. Thus, in addition to appearing within what Deleuze and Guattari called a 'field' or 'ground' of material relations, transversality served at the moment of its inception as an 'event', a new arrangement of 'things and beings', by reconfiguring these relations and also by announcing a new 'image of thought' of and for the institution of analysis in both its practical and disciplinary forms (Deleuze and Guattari 1994: 33, 37). Guattari even brought such transversal relations to bear further during the events of May '68 by bringing patients from La Borde to participate in the protests and by having them form protest committees at the clinic.[1]

Opposing itself to the transference, which according to Guattari holds the unconscious hostage to the past, the castration complex and the intersubjective relation of analysand to analyst, transversality projects an image of the unconscious as collective, non-hierarchical, futural and machinic, directed toward the possibility of heterogeneous forms of relation not restricted to human interaction. In freeing the unconscious from its capture by conventional psychoanalytic conceptions, transversality exposes and overcomes the transference's complicity and continued investment in an unconscious that desires punishment. Since the transference is a condition of the psychoanalytic cure, transversality's exposure of the transference is also an exposure of the therapeutic institution's perpetuation of lack and punishment.

From the critique of the clinical institution, Guattari proceeded to show how the disciplines of psychoanalysis and linguistics, which Lacan put to work in his translation of Freud's text, participate in the reproduction of the modern capitalist subject, whose life in capitalism is also, not coincidentally, sustained via an experience of lack and punishment. It was then only a short step to seeing how institutions in general organise themselves around structures that interpellate their subjects through similar experiences. In so doing, institutions thus also serve as the site of capital's reproduction. Institutions that dedicate themselves to bureaucratic inertia benefit from their members identifying as what Guattari called a 'subjugated group' (*groupe assujetti*), a group whose fantasies, desires and speech are determined for it, because such a group is occupied primarily by a futile desire for recognition that keeps it stuck in place and consequently prevents it from challenging the institution in any meaningful way. In contrast, a 'subject group' (*groupe sujet*), conscious of fantasy as a condition of psychic life, both is aware of its fantasies and recognises its ability to shape them through an affective and creative experience of language. Where a subjugated group is caught in an experience of schizophasic language, a subject group embraces the possibility of becoming otherwise through a perpetual recreation of its relation to language.

In the well-known interview 'The Best Capitalist Drug' from 1973, Arno Munster asks Guattari how psychoanalysis can thus stop 'being an accomplice' to capitalism's ordering of social existence (Guattari 2009: 143). In his response, part of which serves as the epigraph for the present essay, we see Guattari first correct the assumption at work in Munster's question that psychoanalysis can be confronted in isolation from the institutions that house it, namely the University and the psychiatric hospital, and from the capitalist social order to which they ultimately are all in service. Requisite for a reorientation of psychoanalytic practice, then, is a critique of the institutional production of capitalist subjectivity, especially in those cases, such as the University, that imagine themselves separate from capitalism's reproduction. In this respect, Guattari's critique of psychoanalysis resonates with similar May '68-era critiques of the University's complicity in capitalist reproduction, such as those found in the Situationist pamphlet 'On the Poverty of Student Life' (1966), written by the U.N.E.F. Strasbourg student collective, and in Daniel and Gabriel Cohn-Bendit's *Obsolete Communism* (1968). The Cohn-Bendits' attack on sociological theory that it evacuates the cases and conflicts it studies of their social context so as to better assist in the market rationalisation of society – is particularly

consistent with Guattari's targeting of psychoanalysis (Cohn-Bendit and Cohn-Bendit 1968: 38).[2]

In Guattari's critique, if psychoanalysis is 'the best of all capitalist drugs', it is because it provides the material with which institutions, and the groups and individuals within them, maintain the fantasy of their separation from capitalism while at the same time perpetuating the twin logic of lack and punishment that capitalism requires. Without the perpetuation of this logic, capitalism's promises would literally have no sense: according to Guattari, capitalism, as a system of signification and meaning, would be called into question, and the fantasy of a separation from capitalism would be ruptured. It is toward such a disruption that transversality is directed.

Guattari's elaboration of transversality into a critique of the interrelationship of capitalism, institutions and disciplinarity formed the basis of his practical interventions at La Borde and with the militant groups he founded in the 1960s, such as the Federation of Institutional Study Groups and Research (FGERI) and the Center for Institutional Study, Research, and Training (CERFI). On the theoretical register, transversality also served a central role in his collaborations with Deleuze and in his final writings in which he traced the contours of what he called an 'ethico-aesthetic paradigm' of subjectivation.

Such remarkable conceptual reach marks transversality and Guattari as deserving of sustained critical attention as the forces aligning capitalism, institutions and disciplinary language have only intensified since Guattari's original efforts. In the years since Guattari's specific critique of psychoanalysis and the general critiques of capitalist society and the University by the movements of May '68, it is a sobering and obvious fact that capitalism has more deeply colonised the social than ever before. With IWC or semiocapitalism, capital no longer has to rely on individuals entering a physical factory for its reproduction; the signifying structures of the social itself – the immaterial and affective sites known as media and entertainment – are now the modes through which capital reproduces itself and the castrated subjects proper to it. As an adjunct to this system of signification, the operation of the contemporary neoliberal University within semiocapitalism has achieved a seamlessness in which there is no distinction between the knowledge produced within the University and the information that circulates in the global financial market. Industrial labour has given way to immaterial or cognitive labour in support of a deterritorialised global financial system, and the common slogan that the University exists today to prepare individuals to 'succeed in the information economy' testifies to Berardi's observation

that under semiocapitalism the knowledge the University believed was unique to it, and over which it fancied itself as having sovereignty, is no longer autonomous (Berardi 2011).

Today, 13 years after Gary Genosko first called for the task of seeking out spaces for its 'acceleration' (Genosko 1998), transversality still awaits this acceleration in ways that move meaningfully beyond the theoretical sphere or its simple mimetic application.[3] However, if there is anything that marks an exigency to take up transversality once more, and just as importantly, to re-engage the stakes that informed Guattari's creation of the concept in the first place, it is the set of conditions surrounding the state of the humanities in the contemporary neoliberal University. The exigency lies less in the threat of semiocapitalism to humanistic research, which on its face appears less useful for capitalist accumulation than the sciences. The exigency lies instead in the humanities' traditional response to this threat, which can be characterised as two-pronged: first, the declaration of a 'crisis of the humanities'; and second, the construction of a defence of humanistic research in order to win recognition from the market forces that organise the University and the public sphere generally.

An analysis of this 'crisis' and the relation to language the humanities maintain in response to it will show how the conditions surrounding the contemporary University are indexical of a persistence of those conditions that provoked Guattari to create the concept of transversality originally. This analysis will also reveal more importantly the ways the humanities function within the University as a subjugated group alienated from its own speech, locked in an 'institutional schizophasia'.[4] Transversality shows us that what is at stake in 'the crisis of the humanities' is less the humanities' gaining permission to survive in semiocapitalism than the production of 'an other scene' for the humanities' appearance. What is at stake is the possibility of a new ground of experience or *aisthēsis*, of what Guattari called in his last work a new 'ethico-aesthetic paradigm' (Guattari 1995).

II. Contained Speech: Responding to the Crisis of the Humanities

The year 2010 saw what many who work in the University consider the beginning of the end of the humanities and therefore the end of the University as well. A number of wholesale closures of departments and programmes in philosophy, literature and the arts have been seen as evidence that the humanities as a whole are being systematically

evicted from the contemporary neoliberal University. Some of the more spectacular events that took place confirming this end of the humanities include the closure of the philosophy programme at Middlesex University in the UK, the elimination of the French, Italian, classics, Russian and theatre programmes at the State University of New York at Albany, and the move to dissolve the graduate and undergraduate philosophy degrees at Howard University, the only historically black university (HBCU) to have offered a graduate degree in philosophy.[5]

Responses from humanists to these events have taken two standard forms: either bemoan what is now commonly referred to as 'the corporatisation of the University' or attempt to gain recognition as a worthy subject from this same corporate University by arguing for the humanities' value for social and economic productivity. In either case, a narcissistic capture is at work. In what is fast becoming almost a cottage industry, which Stanley Fish has labelled 'The Woe-Is-Us-Books', entire books, journal issues and blogs take the tack of arguing for the intrinsic value of the humanities' fundamental inquiry into 'the human' for the original idea of the University and therefore for society as a whole (Fish 2010). Alternately, many have sought to expose what they consider to be the incompatibility of market logic and humanistic study, claiming that imposing economic metrics of assessment on the humanities misrecognises the fact that humanistic inquiry does not allow for quantification. A typical question posed in this regard often takes the following form: how does one place a dollar value on investigations into the meaning of death or the possibility of freedom?[6]

By responding to administrative attacks with arguments for the humanities' intrinsic value, the strategy is clearly one of trying to convince the University's administrators that protecting the humanities is the right thing to do. The implication is that to do otherwise would be a betrayal of the University's responsibility to society. Unfortunately, but somehow not very surprisingly, this strategy has yielded little success. For despite all the efforts at defending the humanities in terms of their inherent worth and contribution to an understanding of what it means to be human, despite all attempts to educate both the University's administrators and the public in general about the service the humanities perform, it seems it can safely be said that the general response offered by both the powers-that-be and the public is not so much one of disagreement as one of a collective shrug.

Should one be astonished by this response? After all, is it not naïve to think the University, and the humanities in particular, are suddenly being held accountable to economic metrics? As others, beginning with

the Frankfurt School, have shown, the conditions that make possible the existence of the humanities include the fact that the humanities, and the University in general, are inseparable from the function of reproducing the modern capitalist state.[7] Bill Readings' well-known *The University in Ruins* (1996), in a spirit not dissimilar to the Frankfurt School's critique of the technocratic organisation of the disciplines, documents the role the Humboldtian university played at the time of its creation in solidifying the identity of the German nation-state. Readings also explains quite clearly how the modern University prepared the ground for the emergence of the very modernity that it was supposed to exemplify by providing the Kantian rational schema according to which social existence would be ordered (Readings 1996: 54–69).

What is indeed worth remarking against this historical background, however, is the way the standard defences of the humanities appeal to a set of myths, extending from Plato to Jean-François Lyotard, about the humanities' exceptionalism that the humanities have circulated among themselves and propagated throughout their existence.[8] What if the world actually capitalises on that very image of the humanities' exceptionalism in which humanists, and in my experience, especially philosophers, are so invested in order to contain it? What if the discourse of the humanities' exceptionalism is not only a kind of mythic speech humanists circulate to uphold an image of the humanities but also a speech assigned to the humanities, a script that we humanists mistake for our own voice?

The belief in the exceptionalism of the humanities bolsters the feeling of superiority that has allowed many academics to be dismissive of the world's failure to understand what humanists hold is the importance of their field of study, and it is simple enough to comprehend the comfort that feeling gives in the face of the public's collective shrug. If we analysed the belief more critically, however, I think we would see that such psychic investment and dismissal typically signal the presence of an entrenched narcissism. As with the superiority accompanying any other form of narcissism, the tone of superiority humanists often take (even without a crisis in the field) is both a defence mechanism and a fantasy preventing a necessary confrontation with actually existing conditions, namely, the humanities' role in reproducing the modern capitalist state. Instead of acknowledging the fact of the humanities' complicity in the reproduction of capitalism, most working within the humanities would rather conceive nostalgic myths of the humanities' true essence and claim this essence is being lost when in reality it never existed in the first place. In fact, it seems we have been permitted to harbour a belief in this mythic

essence in order to fulfil our roles as the instruments of capitalism's reproduction while thinking we were meeting some higher obligation. It seems we humanists have mistaken tolerance for endorsement.

The belief in the exceptionalism of the humanities, then, could be described as a form of blindness, a kind of misrecognition on the side of the humanities rather than on the side of the humanities' detractors that has aided in the humanities' marginalisation. Nothing appears to testify more clearly to this fact than the impotence of the various defences of the humanities described above. They may represent instances of failed speech, but their failure can be located in the fact that they function above all as contained speech, speech reflecting the fact that the humanities currently speak from a position that has been assigned to, and even more disturbing, embraced by them, which is to say, us. The humanities continue to be on the receiving end of budget cuts and programme closures, even as the arguments decrying these actions increase. Clearly, the arguments have had no effect; yet, like a compulsion to repeat, they proceed nonetheless, following the ebb and flow of an insidious echolalia.[9]

It is one thing to explain how the language humanists use to defend the humanities is a speech that has been permitted us and is therefore a mechanism of containment.[10] It is another question altogether why we would fail to recognise this as the case and seek instead to compulsively repeat the standard defences and perpetuate an echolalia to which no one is listening. Fred Moten and Stefano Harney offer one answer: those who are critical of the University have a great deal of incentive to be so as long as they follow the established script, for it allows them to appear as critical voices while still advancing their academic careers (Moten and Harney 2004). Nonetheless, that only explains the individual's chase of the carrot. The question is why we, collectively, want the stick. For this, we turn now to the specific steps by which Guattari theorises transversality.

III. The Desire for Punishment

Guattari finds in Freud one account of why individuals exhibit a desire for punishment, and uses this account to speculate how this desire lives on in groups. Reading the following passage from the lecture 'Anxiety and Instinctual Life' from Freud's *New Introductory Lectures on Psychoanalysis* (1973), Guattari uncovers a disturbing implication of Freud's conception of the neuroses:

> If we dwell on these situations of danger for a moment, we can say that in fact a particular determinant of anxiety (that is, situation of danger) is allotted to every age of development as being appropriate to it. The danger of psychical helplessness fits the stage of the ego's early immaturity; the danger of loss of an object (or loss of love) fits the lack of self-sufficiency in the first years of childhood; the danger of being castrated fits the phallic phase; and finally fear of the super-ego, which assumes a special position, fits the period of latency. In the course of development the old determinants of anxiety should be dropped, since the situations of danger corresponding to them have lost their importance owing to the strengthening of the ego. But this only occurs most incompletely. Many people are unable to surmount the fear of loss of love; they never become sufficiently independent of other people's love and in this respect carry on their behavior as infants. Fear of the super-ego should normally never cease, since, in the form of moral anxiety, it is indispensable in social relations, and only in the rarest cases can an individual become independent of human society. A few of the old situations of danger, too, succeed in surviving into later periods by making contemporary modifications in their determinants of anxiety. (Freud 1973: 120–1, qtd in Guattari 1984c: 12)

The passage, whose entirety I have reproduced as it appears in Guattari's 1964 essay on transversality, concerns the survival and persistence of neurotic anxieties after their 'particular determinant', the object inducing the anxiety's original appearance, is gone. What is particularly striking to Guattari is Freud's claim that '[f]ear of the super-ego should normally never cease, since, in the form of moral anxiety, it is indispensable in social relations'. This is the real question of psychic life, Guattari contends, for we are led to conclude that the one neurotic anxiety whose persistence is the condition for the possibility of the ego's normal development and normal adult subjectivity is the one developed in relation to the super-ego. What this implication reveals for Guattari, then, is the fact that once the 'particular determinant' originally giving rise to fear of the super-ego has receded, such as the parental relation, another structure within the social must step in to perpetuate the anxiety in some form in order that normal adult subjectivity be maintained.

This is not a matter of substitution for Guattari; it is rather a matter of the group inheriting and repeating what Guattari will refer to as an act of signification that continually restages the original determinants of anxiety for the sake of the social. Noting Freud's acknowledgement elsewhere in the 'Anxiety and Instinctual Life' lecture of the 'unconscious need for punishment' proper to normal subjectivity, Guattari writes: 'Henceforth, the authority of this *social reality* will base its survival on the establishment of an irrational morality in which punishment will

be justified simply by the law of blind repetition, since it cannot be explained by any ethical legality' (Guattari 1984c: 12–13).

The subjectivity recognised by the social, then, is one whose neuroses are cultivated through the intentional, repetitive exposure to structures supporting psychic anxieties, specifically the castration complex, which combines the threat of punishment and the feeling of lack. The neurotic subject is thus not accidental to the social but required by it. It is in the interest of the social to organise itself in such a way as to maintain the individual's desire for punishment and feelings of lack, an organisation which, if analysed, would expose the moral law as ultimately groundless (but this analysis never comes). 'By seeing [the persistence of neurotic anxieties] merely as a continuity,' Guattari quickly adds, however,

> we miss the question implied in it. It seems natural to prolong the resolution of the Oedipus complex into a 'successful' integration into society. But surely it would be more to the point to see that the way anxiety persists must be linked with the dependence of the individual on the collectivity described by Freud. (Guattari 1984c: 13)

The real question concerning the persistence of the castration complex is not why it persists but how it persists through an exploitation of the individual's dependence on the social.

IV. Transitional Objects and the Institutional Unconscious

For Guattari, it is clear that capitalism exploits the castration complex as a way to solidify the individual's dependence on the social. In fact, Guattari's description of capitalism's exploitation of individual desire gives the impression that capitalism understands the psyche much more thoroughly than psychiatry or psychoanalysis. According to Guattari, capitalism organises itself as a 'castrating regime' that 'neutralize[s] all those practices of desire which do not reproduce the established form of domination' (Guattari 1996a: 30). It does so by coding its objects – 'the washing machine, the television, in short all that makes life worth living today' – as gateways through which the individual attains subjectivity in the social (Guattari 1984c: 20). If the individual lacks these objects, then he or she lacks recognition within the social and is therefore lacking in subjectivity. Within capitalism, if the individual finds him- or herself unable to acquire these objects, then there is something defective with the individual, not capitalism. Thus within capitalism, the only desire that is sanctioned is the desire for the objects of capitalism and capitalistic subjectivity.

We recognise such a characterisation of capitalism as consistent with the basic Marxian critique of commodity fetishism. Guattari builds on this basic Marxian position by linking it to D. W. Winnicott's notion of the 'transitional object' (Winnicott 1971). Commodities, Guattari observes, function as vehicles of fantasy in the same way Winnicott observed that toys, teddy bears, blankets, etc. do in a child's negotiation with reality. Like a teddy bear that a child refuses to give up, commodities can work to forestall the individual's confrontation with reality and serve as mechanisms with which to deny reality altogether. However, unlike the teddy bear, commodities guarantee that what the individual receives back from their acquisition and manipulation is a fragmentation of the self and a feeling of lack. For as Marx argued long ago, it is in the commodity's nature to serve at once as a phantasmagoria that promises satisfaction and fulfilment, as well as a mechanism through which human beings are alienated from both their labour and one another. Thus, writes Guattari,

> the sum of all these part objects, starting with the picture of the body as the basis for self-identification, is itself thrown daily onto the market as fodder, alongside the hidden Stock Exchange that deals with shares in pseudo-eroticism, aestheticism, sport and all the rest. Industrial society thus secures unconscious control of our fate by its need – satisfying from the point of view of the death instinct – to disjoint every consumer/producer in such a way that ultimately humanity would find itself becoming a great fragmented body held together only as the supreme God of the Economy shall decree. (Guattari 1984c: 20)

In order to integrate into society, the individual must insert him- or herself into a network of consumption in which what he or she consumes is nothing other than his or her own productive powers. The individual must internalise a self-destructive, self-consuming 'ideal of consuming-machines-consuming-producing-machines' (Guattari 1984c: 14), where consumption is equated with desire. This pseudo-desire of consumption is the only kind of desire recognised in the perverse republic that is IWC. By extension, if institutions within capitalism did not work to support and reproduce this relation of self-cannibalisation from out of a feeling of lack, if they did not perpetuate the castration complex and desire for punishment, they would cease to be recognised and consequently cease to exist.

This condition of institutional existence within capitalism causes Guattari to note how institutions construct their own versions of transitional objects – 'institutional objects' – that mediate the relation between the institution and the individuals within it. These institutional

objects at the same time serve as a means of fantasy that postpone indefinitely any critical questioning of the institution's unconscious – the connection between the institution's existence and the larger social reality outside it, especially its role in ratifying and reproducing the very specific social reality that is Integrated World Capitalism.

One pattern Guattari identifies in the structure of institutional objects is the projection of a group fantasy that provides a narrative with assigned roles with which individuals in groups can identify and upon which they can rely to insulate them from confronting reality. Guattari analyses as an example a hypothetical inner monologue of a French soldier: ' "I've been in the French army for a long time; the French army has always existed, it is eternal. This makes life easier when I'm frightened of dying, or when my wife calls me a fool. After all, I *am* a regimental sergeant major!" ' (Guattari 1984a: 41). Guattari goes on to note that the institutional object of military rank to which the soldier cathects provides him a layer of comfort from reality that at once assures him he is ' "not nobody" ' (no matter what his wife or anybody else might say) and that also distracts him 'from any self-questioning about life and death' (41). This works well for the established social order. For the sake of maintaining a hold on the institutional object and its accompanying fantasy, the soldier is 'ready to enforce any repression, to torture, to bombard civilian populations with napalm and so on' (Guattari 1984c: 13). The institutional object in this case comforts the soldier from any anxiety of lack while also serving as a threat of punishment, because he secretly knows that should there come a moment in which he ceases to be willing 'to enforce any repression', his place in the military will be taken from him.

Since institutions run according to the same logic as that which organises capitalist society, and indeed that is needed to in order to survive, there is no incentive for an institution to call attention to its objects as fantastic. Thus one consequence of Guattari's claim about the role institutional objects play with respect to the institution's relationship to society at large is this: only the overturning of the contemporary organisation of society as such will make possible the overcoming of the Oedipus complex (Guattari 1984c: 13).

V. Groups, Institutional Schizophasia and the Necessity for Institutional Psychotherapy

From what we reviewed so far of Guattari's research, we know that institutions have an investment in perpetuating the threat of punishment

as a mechanism of producing individual and group subjectivities that ensure their dependence upon the institution. As Guattari puts it, we know that the only forms of subjectivity institutions recognise are those that have internalised the castration complex. The groups that internalise the castration complex within an institution are those he considered 'dependent' or 'subjugated groups'. By perpetuating structures of punishment and dependent group subjectivities, institutions also reproduce, and blind groups to, the institutional or group unconscious – the historical and material conditions of their existence.

By encouraging fixed identifications with delusional group fantasies that sustain cathexes with particular institutional objects, institutions also police the limits of speech of subjugated groups. Anyone who has experience within an institution – which is to say, everyone – will recognise the experience of being assured one's speech is being heard while feeling ignored at the same time. While a subject group, Guattari says, 'makes a statement', the only thing that can be said of a dependent or subjugated group is 'that 'its cause is heard,' but no one knows where or by whom, or when' (Guattari 1984c: 11, 14). Contemporary discourse defending the humanities functions just like that of a subjugated group, and the evidence for that is found in the fact that our ' "cause is heard," but no one knows where or by whom, or when'. The speech of the subjugated group, then, is merely tolerated and contained; it is a simulacrum of actual speech. Through the tolerance of a subjugated group's speech, the institution thus engages in a practice of destroying the possibilities for speaking, an institutional schizophasia. Left alone, institutional schizophasia results in a group's 'bureaucratic self-mutilation' and absorption into 'death-dealing impulses' that in no way destroys the institution but guarantees the obedient reproduction of the status quo (Guattari 1984c: 23; 1984a: 42).

The project of institutional psychotherapy, Guattari is careful to warn, is not one of psychologising groups. Rather, it is a project directed at loosening up the relationships that constrain speech so that groups can create and cathect to new objects and create new enunciations, in other words, 'make a statement'. A group's creation of real enunciations exposes the group to its indeterminateness, to what it is not (alterity), and to a futurity that solicits the group's desire to become otherwise than the way it customarily imagines itself. Real enunciations articulate new possibilities for transversal relations, not hierarchical ones.

VI. Privatising the Unconscious and Language: Psychoanalysis and Linguistics

Paradoxically, the very institutions we rely on to demystify the repressive apparatuses of social life and ameliorate the individual's alienation and desire for punishment – namely, hospitals and schools – are not only less than helpful in these ambitions; they in fact exacerbate the relations of punishment and alienation. One reason for this has to do with the necessity for the institution to serve as a site of capitalism's social reproduction to ensure its existence. In terms of the psychiatric hospital, however, this reproduction is accomplished through an uncritical adoption of the psychoanalytic unconscious and the conception of language psychoanalysis promotes through its own adoption of linguistics. Thus, the paradox extends to the disciplines and discourses that appear to offer ways of overcoming institutional repression but that are in fact only masquerading as critical, liberating discourses. Confronting this fact will help us understand why the defence of the humanities should not take 'the humanities' as a univocal and self-evident object.[11] The complicity of some humanistic disciplines in the repressive apparatus of the contemporary University only aids in the humanities' repression instead of its liberation.

It is in this sense of serving as an accomplice to capitalism that Guattari enacts a critical reversal that concerns how we should regard the way psychoanalysis and linguistics function as institutions within other institutions such as the hospital and the University. It is not the case that psychoanalysis discovers the unconscious in some neutral form. Rather, the unconscious psychoanalysis discovers is the one that the modern capitalist state has constructed as part of a 'signifying logic' aimed at the state's self-perpetuation (Guattari 1984c: 13). Instead of inventing the castration complex, the family is its factory. 'In this perspective,' Guattari contends, 'the authority of the father and the images of social hierarchy would only be accessories to this necessary, sacrosanct castration' inherent to capitalistic subjectivity (Guattari 2009: 146).

Psychoanalysis may make visible the existence of the unconscious and the castration complex, but instead of providing a means to engage them, it establishes a number of ways to make itself a part of capitalism's signifying logic. According to Guattari, the most immediate among these is the image it projects of the unconscious as something private and confined to the family. By confining the unconscious to the sphere of

the family, psychoanalysis limits the space in which desire can appear. Since the family is the site where subjectivity was initially formed, restricting desire to the family also restricts both it and subjectivity to the past. Without allowing desire to carry some futural dimension, there can be no real futural projection of subjectivity either. Finally, by privatising the unconscious, by making the unconscious private property, psychoanalysis cuts it off from having any commerce with the social. The effect is actually worse than endorsing capitalism; psychoanalysis simply 'pretend[s] not to be aware' of it or its values (Guattari 2009: 148).

Once psychoanalysis becomes accepted within the University, its sequestration from the social becomes even more intense as its disciplinary status allows it to construct all sorts of initiation rites and passwords to which subjects must submit in order to gain entrance to its field. When Guattari declares, 'We have the unconscious we deserve!', it is because we have relegated our responsibility to the unconscious to a few chosen specialists (Guattari 2011b: 9). Moreover, rather than revealing institutional objects for what they are, psychoanalysis circulates its own objects to bolster the separation from the social. Its theoretical regions of the Imaginary and Symbolic are 'sordid paraphernalia [that are] there only to safeguard the comfort of the couch' (Guattari 2009: 147). As 'the best of all capitalist drugs', psychoanalysis is capitalism's 'substitute religion', according to Guattari. Psychoanalysis's 'function', claims Guattari, 'is to update repression, to give it a personal touch so it sells better – as has been done for the Ford Pinto or Plymouth Duster' (148).

Psychoanalysis does itself no favours by suturing itself to linguistics. From Guattari's standpoint, this only intensifies psychoanalysis's status as accomplice to IWC. Just as with psychoanalysis, linguistics suffers from a blind reversal, which causes it to isolate itself from the social while also ratifying existing forms of social organisation within capitalism. Noam Chomsky's analysis of language's deep structure, for instance, presumes a unity of language that does not exist, at least not without the exertion of power and repression, claims Guattari. 'The unity of language', Guattari declares, 'is always inseparable from the constitution of a power formation. One never finds clear boundaries on dialectal maps but only bordering or transitional zones. There is no mother-language except in the phenomena of the semiotic takeover by a group, ethnicity, or nation' (Guattari 2011a: 27–8).

To the extent that all of linguistics shares in this basic presupposition of a single unified object called 'language' and pretends to be able to

account for 'all the domains related to language', linguistics constitutes a form of imperialism that fails to see that its quantification of language is nothing more than a transcription of 'capitalistic flows' (Guattari 2011a: 25–6, 30).[12] Confirmation of this misrecognition for Guattari is found in the binary logic grounding linguistics' conception of language, which he describes as an act of 'digitization' that confines the subject's appearance in language to the alternating poles of speaker–listener and reduces intersubjective speech to the communication of information on the same order as that of commodity-exchange (23, 25). Finally, linguistics' cataloguing of the performances that constitute meaning projects an image of linguistic competence that serves as a gatekeeping measure that recognises utterances as legitimate only insofar as they obey the rules of information exchange (31). It is no wonder, then, that Lacanian psychoanalysis locates the subject's experience of castration and alienation in the subject's relation to the signifier and language in general. The suturing of psychoanalysis to linguistic categories in Lacan's thought helps to further systematise a structure of 'alienated enunciation' that is both endemic to capitalist society and exploited by capitalism (24).

Motivating linguistics' identification with information theory, Guattari holds, is a desire to appear scientific in order to gain recognition within a society ruled by the logic of capitalist administration (Guattari 2011a: 23). Psychoanalysis's suturing of itself to linguistics could then be seen as an attempt to piggyback onto the latter's project of gaining recognition, which, Guattari points out, psychoanalysis tried to accomplish in similar ways by suturing itself to other 'scientific' disciplines, such as biology and mathematics (23).[13] As Guattari notes, the reduction of language to information and the reduction of the unconscious to the laws of linguistics and mathematics help both fields attain legitimacy within the University and the hospital. But the legitimacy they gain should not be confused with autonomy, for information theory and scientific discourse are in fact so many transitional objects that cut off linguistics and psychoanalysis from the social. Thus, the conceptions of language and the unconscious with which they deal are not only products of specialisation and privatisation; they are also simulacra of the objects they pretend to be.

Granting psychoanalysis and linguistics hegemonic reign over the unconscious and language makes it even more difficult to break free of the repressive apparatuses of society and the institution, for the simulacra they promote as rigorous theorisations of language and the unconscious can no longer serve as the source of revolutionary

inspiration. Instead, they become the means by which revolutionary-minded groups entangle themselves in illusory objects and self-destructive group fantasy. Guattari witnessed such things take place just as routinely in the institutional therapy groups in which he participated as in the militant groups with which he was engaged. Both groups, he observed, allowed themselves to become susceptible to the reinscription of the super-ego and the regulation of speech (Guattari 1984a: 24–44).

Within both institutions and groups, it is not enough to have revolutionary aspirations. In order to break free from the social imperative to reproduce the castration complex, Guattari argues that groups must be attentive to their speech, for their speech is an index to the kind of group subjectivity they inhabit. Guattari's concept of transversality offers a practical tool for becoming attentive to speech. Yet it does not so much replace the conceptions of the unconscious and language constructed by psychoanalysis and linguistics as free them up from their sedimentations – that is, 'territorialisations' – in the practices that populate the institution. Transversality intervenes at the level of the institutional relations that shape the production of speech. It does so by exposing how ritualistic and habitual ways of being within the institution uphold stagnated and self-mutilating forms of collective desire.

VII. Transversality and the Possibility of the Humanities' 'Other Scene'; or, How to Tell if You're a Dependent Group (and What to do about It)

Your group is a dependent group, Guattari informs us, if you answer 'yes' to any of the following:

- Is your group caught up in modes of ' "territorialized" transference', unable to imagine an identity outside of a master–slave struggle with the perceived powers-that-be, fixated on past traumas that have by now taken on the status of origin myths? (Guattari 1984c: 17, 22)
- Does your group remain ignorant of its fantasies, especially of the fact that it has fantasies? (Guattari 1984a: 40)
- Is your group unable to recognise its institutional objects as transitional? (Guattari 1984a: 39)
- Does your group speak a language that is the mirror image of that of the institution? (Guattari 1984c: 20)
- Does your group compulsively refuse to recognise different forms of speech, dismissing them as nonsense? (Guattari 1984c: 16)

According to Guattari, whenever relations within an institution are territorialised in these ways, groups are blocked from pursuing the machinic connections constituting their unconscious. What Guattari formalises under the concept of the machinic unconscious is simply the set of relations – human and non-human – that determine the paths desire can travel (Guattari 1996b: 230–1). If a group operates under the psychoanalytic unconscious, compulsively fixated on objects that invite it to repeatedly return to the scenes of past injuries, wrongs and traumas, it prevents itself from both imagining and encountering the alterity that is outside it and the institution, which means the group blocks itself from engaging the historical conditions of its existence (Guattari 1984a: 36). Guattari compares the scenario to an image of horses running around a fenced-in area, their blinders set to varying degrees of access to the field of vision. What Guattari calls the 'coefficient of transversality' in an institution is the level of openness to which a group's blinders are set. The more closed the horses' blinders are, the more traumatic their experience will be, and likewise for groups within an institution. The more open the blinders are, the more communication there will be between horses (that is, groups) and therefore the less traumatic will be their experience. Guattari's implementation of transversal relations at La Borde was aimed at opening the blinders of the clinic's existing structures. Though a relatively small institution in comparison to a university, the example of La Borde proves it is not impossible to imagine new organisations of relationships and new enunciations among groups within the institution.

Guattari's 1964 essay on transversality opens with his assertion that despite institutional therapeutics' relatively recent arrival on the psychiatric scene, it '*has* got an object', and this object is nothing less than 'the reality of the social problematic' (Guattari 1984c: 11). His insistence on demystifying the institutional object and revealing the object of all institutions to be 'the reality of the social problematic' should provoke a critical reassessment of the objects an institution might currently view as proper to it. In order for scholars working in the humanities to carve out the space of an 'other scene' for their own enunciations, it is incumbent upon them – upon us – to realise first that if we are to be truthful about our situation within the University, we must ask ourselves Guattari's questions about group status. The instinctual response of a defence of the humanities as opposed to a radical critique of its complicity with the modern capitalist state signals an uncritical subscription to 'communicative' modes of speech and a blind mirroring of the language of capitalist administration. By mirroring this language,

the humanities contribute to the schizophasic destruction of their speech and tacitly endorse the University's role in reproducing the existing organisation of society.

Not only can we understand the idea of the humanities' exceptionalism as serving as an origin myth; we can now see that it also serves as an originating mythical site of repression while at the same time functioning as a transitional object which, like Winnicott's teddy bears, the humanities dote over and lovingly fondle. As for other institutional objects we uncritically adopt, how are we to assess the jargon of 'excellence' we parrot back to administrators, donors and politicians in order to be recognised? What of the emergence of such fields as the digital humanities, which one might see as legitimating the technocratic relationship to art and knowledge? In my own field of philosophy, Guattari's critiques of the scientific determinism he finds in psychoanalysis and linguistics raise questions about how one might assess such phenomena as Alain Badiou's grounding of ontology in set theory, the 'speculative turn' of 'OOP' ('Object Oriented Philosophy'), and the current trend known as 'X-Phi' ('Experimental Philosophy'). To say that psychoanalysis is 'the best of all capitalist drugs' does not preclude the idea that there are no other capitalist drugs; in fact, such a claim relies on the fact that there are others.

As Winnicott observes, the child who cannot give up his or her attachment to transitional objects develops a type of pathology that cannot connect with reality. It is a pathological type that is threatened by the possibility of the loss of reality with the loss of the object (Winnicott 1971: 22–3). Others have conceived this type of pathology as narcissistic to the extent certain narcissistic personalities suffer from an annihilation anxiety that cannot imagine a world in which they are not participants and as a result imagine either the end of the world or their end (Ronningstam 2005). It thus strikes me as the height of narcissism that a field would equate its disappearance with the end of the University, that rather than imagining a different organisation of society in which the humanities might help dislodge the University from the task of reproducing capitalism, it would prefer to imagine (and perhaps take some comfort, that is, pleasure, in) the University's destruction. This is perhaps a decisive sign of a dependent group: in abdicating responsibility for its speech, it also abdicates responsibility for its own death (Guattari 1984c: 22). Transversality, we must always be sure to remember, is first of all a militant concept. It is a counter-mirror that interrupts the mirroring at work at the heart of existing institutional narcissisms, of subjugated groups blind to their capture by an image

that is and at the same is not their own. A recuperation of Guattari's theorisation of the institutional unconscious will provide a frame to view how transversality's deployment in the context of the humanities would help bring the humanities' group fantasies to visibility, thereby giving the humanities access to them and enabling the possibility of disrupting the 'institutional schizophasia' in which they are locked.

Two things must be said in conclusion, however: bringing to visibility one's speech and one's fantasies is one slope of transversality (a task that, evidence indicates, historically has proven quite difficult). The other slope of transversality, the diagrammatic aspect that calls for a rearrangement of relations among subjects and between groups and institutions, requires an active and relentless search for new aesthetic encounters aimed at the production of new subjectivities.[14] In his final work, *Chaosmosis*, Guattari offers the following fragmentary proposition: 'Transversality never given (*sic*) as 'already there,' but always to be conquered through a pragmatics of existence' (Guattari 1995: 125). The exigency to engage 'the pragmatics of existence' will never appear to the humanities, however, so long as the question of the humanities' subjectivity – and hence the question of the subjectivities the humanities produce – is not broached. This is a matter, though, of distinguishing between the posing of real questions and simply asking questions that have been prepared for us in advance.

Notes

I would like to thank Gary Genosko for his editorial guidance, as well as the reviewers of this essay for their critical challenges and comments, which proved extremely helpful in the text's revision. I thank also Christopher Fynsk and Brenda Wirkus for their comments on an earlier draft of this essay.

1. This is a move, however, that would ultimately lead to a break with Jean Oury, Guattari's friend and mentor (Dosse 2010: 175–6).
2. I thank one of the anonymous reviewers of the current essay for reminding me of both the Cohn-Bendits' critiques and the SI pamphlet.
3. As Genosko has documented, one of the first applications of transversality by someone other than Guattari was the 'transversal house' that the Japanese architect Kazuo Shinohara built for the Japanese poet Shuntaro Tanikawa in Naganohara in 1974 (Genosko 2002: 143). However, Shinohara's reception of transversality came by way of Deleuze's 1972 essay 'The Literary Machine' from *Proust and Signs*, which one can argue is also a simplistic application of Guattari's concept, one that, as Genosko notes, surprisingly evacuates transversality of its social and political stakes (Deleuze 2000; Genosko 2002: 143).
4. Though I cannot develop this line of thought in the present essay, Guattari's demonstration that the group subject's relation to speech and language is at stake in the concept of transversality points to a possible dialogue with other attempts

within the last few years to analyse the problem of the contemporary University in terms of the relation to language, such as: Derrida's project on the 'Right to Philosophy' (2002; 2004), summarised in Simon Morgan Wortham's *Counter-Institutions* (2006); Christopher Fynsk's *The Claim of Language: A Case for the Humanities* (2004); and Gayatri Spivak's *Death of a Discipline* (2003).

That transversality might contribute to these recent attempts to rethink a relation to the University based on a relation to language testifies to its viability for thinking through the current conjuncture of the University in semiocapitalism. However, for those who may be suspicious of transversality's applicability in the contemporary scene, it is perhaps worth noting the following: though the genealogy of the concept of transversality can be traced back to Guattari's experience of the clinical situation at La Borde and the events leading up to and surrounding the movements of May '68, it would be a mistake to reduce and confine transversality to the moment of its historical instantiation. Critically, transversality cannot be isolated simply as a concept that appears at only the beginning of Guattari's thought (see Guattari 1995), and it would be odd to arbitrarily bracket off transversality from the other concepts Guattari developed in his work along with Deleuze, such as schizoanalysis and Body-without-Organs, which were also forged with the memory of May '68 in mind and which are deployed routinely in contemporary studies on Deleuze and Guattari. Though the events of May '68 are conventionally thought of as constituting a failed revolution, scholars across the spectrum of critical commitments, from Bifo (2009b) to Alain Badiou (2010) to Lauren Berlant (1994), have questioned that received judgement. Certainly, the current events involving the Occupy Wall Street movement in the United States the last few months along with similar protests in Britain and Italy testify to a spirit reminiscent of May '68, with students and workers attempting to articulate their collective experience of IWC. Even if most of the Occupy movement's protesters are not acquainted with Guattari's concept of IWC personally, they are witnesses to the self-mutilation IWC demands. See Guattari (1996a). The issue of transversality is less about retaining the unity of the concept than of breaking with the desire for punishment required by the capitalist mode of production.

5. To be sure, the end of the University was long in the making, as diagnosed by Bill Readings in his 1996 work *The University in Ruins*. While one might point to earlier diagnoses, such as Allan Bloom's *The Closing of the American Mind* (1987), Readings's study differs significantly from Bloom's polemic to the extent that for Readings those responsible for the University's so-called ruin are not to be found in post-60s literature departments and their importation of French theory but in the administrative offices of the emerging and fast fully-realised neoliberal University and its corresponding culture of 'excellence'. In this way, it would be more accurate to cite Jean-François Lyotard's *The Postmodern Condition* (1979; see Lyotard 1984) as a precursor to Readings's critique.
6. As an example, see Laurie Fendrich (2009); also Fish (2008a; 2008b).
7. To give just a few examples, see Max Horkheimer (1995), David Pan (1998) and Randy Martin (2004).
8. Both Lyotard's *The Differend* (1988) and *The Postmodern Condition* (1984) are cast from the viewpoint that a mode of instrumental rationality has emerged globally which frames any kind of speech that would resist the order of communication as not only incomprehensible and unrecognisable but also impossible, that is to say, as not being able to appear as speech. Both *The Differend* and *The Postmodern Condition* express exasperation at the inability of the public to sustain a consideration of complex critical writing.

The Postmodern Condition complains of the 'slackening' that saturates the contemporary public sphere (Lyotard 1984: 71), while *The Differend* foretells the end of the book, because it 'takes too long to read' (Lyotard 1988: xiii). Thus each of these works provides theoretical justification for the belief in the humanities' exceptionalism, the ahistorical idea that the humanities names a sphere radically separate from capitalist administration. In *The Differend*'s preface, in fact, Lyotard describes a *différend* – an incompatibility of heterogeneous discourses – inhabiting the discipline of philosophy itself, as a practice caught between economic and academic discourse (Lyotard 1988: xiii).

9. The exchanges strike me as constituting an echolalia not only in the sense that the substance of the arguments remains basically unchanged throughout all the various iterations, but that the audience for these arguments seems to be composed of those who already agree with them and who are also in fundamental agreement with one another.
10. Jacques Derrida accomplished just this in his reading of Kant's *The Conflict of the Faculties*, where he demonstrated that such contained speech, and the fantasy of exceptionalism buttressing it, belongs to the very origins of the modern university. See Derrida (1992).
11. See Fynsk (2004) on this precise point.
12. In this reflection on the relationship of linguistics to capitalism, Guattari makes a connection similar to the one argued by Fredric Jameson in *The Prison-House of Language* (1972).
13. Lacan's turn to a schematisation of the 'mathemes' of the unconscious serves as such an example.
14. In this respect, I would argue that there are very interesting avenues to pursue between Guattari's final work and Jacques Rancière's reflections in the last few years on 'the distribution of the sensible' (*le partage du sensible*), which Rancière says conservative, bureaucratic social forces attempt to sediment (Deleuze and Guattari would say, 'territorialise') into a natural order and limited possibilities of experience. Forces Rancière identifies as 'politics,' in contrast, attempt to redistribute the sensible in order to provide grounding for new experiences of 'what is seen and what can be said about it' (Rancière 2004: 13). See also Rancière (1999).

Transversalising the Ecological Turn: Four Components of Félix Guattari's Ecosophical Perspective

John C. Tinnell University of Florida

Abstract

Arguably, two of the most important forces affecting contemporary global culture are the growing awareness of ecological crises and the rapid spread of digital media. Félix Guattari's unfinished concept of ecosophy suggests the basis of a theoretical framework for constructing productive syntheses between the ecological and the digital. Moreover, a Guattarian rethinking of the ecological turn in the humanities challenges the philosophical basis of the pedagogy of Nature appreciation that has characterised the eco-humanities landscape since the 1970s. Guattari's ecosophy gestures towards a transversal eco-humanities, which would be rhizomatically rooted in autopoiesis and becoming-other, rather than defined by static allegiance to the ideals of 'Self-realisation' postulated by the deep ecology movement.

Keywords: ecosophy, Guattari, autopoiesis, subjectivity, ecocriticism, deep ecology

Over the past decade, the humanities disciplines have played host to an explosion of ecologically themed transformations, which continue to open up new (sub)fields of research and teaching.[1] The development of the ecological turn in English studies (conceived broadly to house the study of literature, composition, film and new media) resonates with the general evolution of the eco-humanities; indeed, English

Deleuze Studies 6.3 (2012): 357–388

www.eupjournals.com/dls

departments have led this movement in many respects. A survey of English's recent appropriations of ecological ideas (and their failings) establishes a point of departure for rethinking the eco-humanities. Ecocriticism, with its reputable journals and popular conferences, has no doubt become the most institutionalised of English's eco-fields, while more pointed approaches continue to gather loosely around terms such as green cultural studies, ecofeminism, ecocomposition and ecomedia studies.[2] At the turn of this century, much of the early work in ecocriticism was devoted to 'naming the most important works in the field and elaborating the reasons why they matter more than others' (McNamee 1997: 14). Contemporary leaders in ecocriticism continue this 'green' canon-building project, issuing pronouncements similar to Libby Robin's 2008 declaration, 'we need a literature that enhances understanding of relations between people and nature, of how we notice change personally, and how such global changes affect places we know intimately' (Robin 2008: 292). The growth of ecocriticism, however, has attracted an increasing number of critical attacks, the most significant of which have been waged by literary theorists who, despite their objections, share the ecocritical desire to respond to ongoing ecological crises. In particular, these theorists assail ecocriticism for its reluctance to engage with issues raised by contemporary theory.[3] Timothy Morton goes as far as saying that ecocriticism 'consciously blocks its ears to all intellectual developments of the last thirty years... ecocriticism promises to return to an academy of the past' (Morton 2007: 20). And yet, none of the leading books associated with ecocriticism (not even the famous 'ecocritiques' by Dana Phillips or Timothy Morton) display even the slightest awareness of the work of Gilles Deleuze and Félix Guattari. That the eco-humanities generally shares this gap in knowledge seems very bizarre, especially given the explicit ecological focus in Guattari's later writings and given Deleuze's claim in the late 1980s that he and Guattari wanted to write a (last) book on their philosophy of Nature. We should wonder now, with great pertinence, where Deleuze and Guattari's philosophy would lead the ecological turn, which, along with the digital turn, promises to be a formative influence for humanities disciplines in the twenty-first century.

If there is a unifying theory that connects most ecological approaches across the humanities disciplines, certainly that theory is Arne Naess's widespread notion of deep ecology or 'ecosophy'. As Gary Genosko (2009: 86) points out, Guattari's writing on ecosophy never refers to Naess and his development of the term. That said, certain statements by Guattari throughout *The Three Ecologies* (for example, 'Ecology

must stop being associated with the image of a small nature-loving minority . . . ') might arguably function as indirect references to, if not critiques of, Naess's project (Guattari 2008: 35). At a fundamental level, the mission of Naess's ecosophy is to expand the sphere of objects with which people identity. He believes that 'identification elicits intense empathy' and that humans remain indifferent to that which they take to be utterly different than themselves (Naess 1995: 15). To support this position, Naess shares a personal anecdote about a flea that suddenly landed in a sample of acid chemicals, which Naess was studying under a microscope. He claims, 'if I was alienated from the flea, not seeing intuitively anything even resembling myself, the [flea's] death struggle would have left me indifferent' (15). This anecdote, a vital illustration of Naess's thought, brings us to the most important difference between his ecosophy and the ecosophy of Félix Guattari. Naess calls for an expansion of the self via identification ('Self-realisation'), whereas Guattari (and Deleuze) valorise autopoietic processes that perform a dissolution of the self via disjunction ('becoming-other'). In other words – in a Guattarian reworking of the flea anecdote – I would not look for elements of the flea that remind me of myself; rather, I would receive the flea in its alterity and encounter aspects of the flea that are completely different from myself, so as to 'become-flea': to introduce the flea's manner of existence into the way I think and live.[4] Initially, the difference between Naess's identification and Guattari's autopoiesis may seem trivial. This minor difference, however, actually lays out two divergent, even conflicting, paths for diagramming the production of subjectivity. 'Guattari's concern,' writes Genosko, 'is not self-realization through widening of a pre-given self, but processes of singularization that resist the frames of reference imposed by an identity' (Genosko 2009: 87). Consequently, an eco-humanities inspired by Guattari's theory of ecology would look very different than the familiar Naessian project of Nature appreciation. A living monument to Naess, ecocriticism typically invokes ecology as a strictly environmentalist discourse. This position tends to prioritise the thematic study of literary representations of Nature, often espousing, at the very least, a desire to distance oneself from technological advancements and other complexities of modern urban life.

On the other hand, Guattari's ecosophical perspective promises to remotivate the ecological turn in the humanities towards radical transformations in the production of subjectivity and concepts that carry with them the potential to sustain a more transversalised conception of identity.[5] Janell Watson summarises the quintessential thrust of

transversality against the tradition of normative models of the human psyche:

> Familiar topologies such as the semiotic triangle, the conscious-preconscious-unconscious, the ego-id-superego and the Oedipal triangle must be expanded, extended, and opened up. Connections between them must be retraced. Their borders and boundaries must be effaced and erased, or at least made more porous. Above all, these expanded, redrawn and reconnected topographies must be set in motion . . . (Watson 2009: 23)

Transversality, as can be surmised from Watson's insightful work on Guattari, moves hand in glove with the activity of metamodelling. Models such as the Oedipal triangle purport a representational, standardised map of the psyche designed for the clinical evaluation and diagnosis of individual patients.[6] Metamodels, on the other hand, adopt a more playful and constructivist stance towards modelling; here the ultimate aim is singularity rather than standardisation, and this entails appropriation from a multitude of models in order to avoid being 'stuck' within the entropy of a dominant model (Watson 2008). Like Guattari says of schizoanalysis, transversal thinking 'does not choose one modelization to the exclusion of another'; rather, transversality is about creating lines of flight among various models, 'making them . . . operative within modified assemblages, more open, more processual, more deterritorialised' (Guattari 1995: 61). As such, transversality is a radically ecological concept in that it pushes us to constantly (re)articulate things at the relational level of their interactions. With Guattari, then, we are not enlarging the selfhood model; we are developing the metamodels and practices of emergent subjectivities. Inspired by Guattari instead of Naess, we would become less interested in the representational paradigms of nineteenth-century realism (which are often celebrated by leading ecocritics) and more interested in modernist and contemporary aesthetics of collage and montage; rhetorical acts of aesthetic invention would become as important as, if not more important than, pseudoscientific methods of literary hermeneutics.

Though Naess coined the term 'ecosophy', he does not think through the semiotic implications of the word as fully as Guattari does. Ecosophy is not the same thing as eco-philosophy; it is not simply the redirection of the philosophical tradition towards ecological concerns. To think ecosophically is to rethink philosophy in our contemporary moment defined by the convergence of nature and culture, ecological crises, globalisation and the Internet. Born of his

transversal conception of subjectivity, Guattari's ecosophical perspective suggests for (eco)humanities scholars a unique constellation of concepts adequate to these emergent situations; it offers an alternative to the standard 'normal science' approach by which critics apply old ideas to the same type of texts, only now in the spirit of environmentalism. By analogy, then, the proper aim of ecosophy (and a properly transversal eco-humanities) is not to produce a more energy-efficient light bulb or a hybrid car, but to reconfigure subjectivity and to remake academic and/or social practices altogether. While scientists and social scientists rightfully pursue advancements in green technology and debate environmental policy issues, humanities scholars should aim to further our understanding of ecological problems in ways that are unavailable to the technocratic perspective. Guattari's ecosophy suggests that humanities scholars should concern themselves first with ontological advancements. Thus, in addition to green buildings, hybrid vehicles, environmental legislation, etc., we need to rethink traditional notions of selfhood and, at the same time, invent practices designed to facilitate an ontology consummate to contemporary ecological concerns, as well as the emergent relational modes proliferating with the expansion of global capitalism and digital media. Of profound importance to these latter issues is Guattari's notion of the 'post-media era' – his ecosophical vision of the potentialities afforded by emergent media technologies – which I expound upon later in this essay.

While most work in ecocriticism tends to avoid poststructuralist theory in favour of deep ecology, leading Guattari scholars have begun to survey the ecological implications of the philosopher's notoriously complicated writings. Readers new to Guattari should be cognisant of three basic ways in which the tenets of his ecosophy conflict with more popular appropriations of ecology. First, affirming his belief in the inseparability of nature and culture, Guattari contends throughout his later writings that what we call the ecological crisis is not simply an environmental disaster, and that ecology is not limited to the natural environment. For Guattari, 'The ecological crisis can be traced to a more general crisis of the social, political and existential', which 'involve[s] changes in production, ways of living and axes of value' (Guattari 1995: 119, 134). Furthermore, Guattari differs from the early leaders of ecocriticism who tended to work from the popular belief that ecological thought is simply an idealistic, utopian project committed to preserving Nature's pure, harmonious and delicate balance. In Guattari's radical ecology, the ecological point of view beholds the world as a dance between chaos and complexity – a multitude of productive syntheses

between nomadic parts that exist independent of any fixed structure or transcendental whole. There is no larger 'natural' order, no transcendent grand scheme according to which beings manifest. The ecology of ecosophy is that of neither popular environmentalism nor environmental science. Whereas environmentalism (like Naess) attempts to strengthen the bond between humans and the natural environment, which are articulated as two discrete and relatively stable categories, Guattari's ecosophy rethinks this relationship in terms of dynamic assemblages of enunciation without assigning humans, nature or culture a fixed role or place in the production of subjectivity. In this way, we might think of ecosophy as performing a metamodelling with respect to environmental models such as the ecosystem. While the model of the ecosystem was first drawn by environmental scientists, a generalised ecology extends relational modes of thinking implied by this model across disciplinary boundaries with hopes to enrich the study of any number of paradigmatic problems, most notably the production of subjectivity in Guattari's case.

Moreover, in metamodelling environmental ecosystems, by bringing them into contact with mental and social ecologies, one can rethink the ethos of management and regulation that has pervaded the largely scientific discourse of environmental ecology. Indeed, the challenge of Guattari's ecosophy is not to regulate the forces of the world into some idealised, harmonious balance, but rather to engender institutional and ontological conditions that encourage people to encounter the world as a series of open and ongoing syntheses between partial objects (as opposed to regarding phenomena as objects-in-themselves, complete and isolatable). This challenge informs and is informed by passages in *The Three Ecologies* and *Chaosmosis* where Guattari discusses nascent subjectivity and machines. Guattari's view of ecology is especially unique in that he claims to be working from an 'ethico-aesthetic paradigm' rather than from scientific or pseudo-scientific paradigms. For Guattari, ethico-aesthetic paradigms do not necessarily deal with art as we traditionally conceive it, but seek to incorporate an aesthetic order – an artist's 'way of assuming their existence' – into the existential territories of everyday life, within and beyond the studio or the museum.[7] He insists that the decision to engage subjectivity on a scientific basis or an aesthetic basis carries important ethical implications; Guattari of course asserts that attempts to 'scientifise' subjectivity lead to its reification, while ethico-aesthetic approaches mobilise subjectivity 'in its dimension of processual creativity' (Guattari 1996: 198). To be clear, Guattari's turn towards ethico-aesthetic paradigms does not constitute

a rejection of science so much as a pointed critique of the 'use of reductive models and general laws, at the expense of singularity and complexity' (Watson 2009: 97). Ultimately, it is this autopoietic node of Guattari's ecosophy that most powerfully distinguishes his approach to ecology.

Though recent scholarship on Guattari is quick to mention his notion of ecosophy, only a few of these books and essays contain elaborations of Guattari's ecosophy that are specific to the larger ensemble of concepts quintessential to his philosophical outlook. Genosko and Watson stand out of course as two scholars who have taken immense steps towards recognising the (potential) impact of Guattari's contributions on the contemporary study of ecology, subjectivity and media. More typically, however, humanities scholars commenting on Guattari's engagement with ecology rarely venture beyond his most explicitly ecological book, *The Three Ecologies*, and are therefore likely to miss the transversal connections among the otherwise disparate domains of ecology, subjectivity and media that he developed throughout his later writings. While it is accurate in some sense to summarise Guattari's ecosophy by mentioning his three interrelated ecologies (that is, mental, social and environmental), such summaries do not convey the full potential of Guattari's ecosophical perspective, which he seemed to regard as the crowning accomplishment of his philosophical career. To appreciate the theoretical weight of *The Three Ecologies*, one must explore the ways in which this short book intersects with Guattari's larger body of work. In what follows, I offer an exploration of ecosophy in the context of *The Three Ecologies* and Guattari's other writings such as *Chaosmosis* and selected essays from *The Guattari Reader*, as well as the collaborative works *Anti-Oedipus* and *What is Philosophy?*. Indeed, Guattari's ecosophy is a concept that, like all concepts, configures the 'constellation of an event yet to come' and 'renders components inseparable *within itself*' (Deleuze and Guattari 1994: 19, 33). But given its (unfinished) state at the time of Guattari's sudden death, ecosophy remains a concept whose components need to be rendered further. The four sections below strive to construct a 'zone of neighbourhood' or 'threshold of indiscernibility' wherein these four components (that is, nascent subjectivity, machines, post-media and autopoiesis) become seen as the vital constituents of ecosophy's conceptual consistency. Only then can we mobilise ecosophy towards the invention of the event yet to come, the people yet to come or at least, the eco-humanities yet to come.

I. Nascent Subjectivity

At the end of *The Three Ecologies*, Guattari claims that we must, in responding to the 'major crises of our era', invent new practices that are conducive to what he calls 'nascent subjectivity' (Guattari 2008: 45). Of course, the project to resingularise subjectivity does not centre upon the individual – Guattari prefers to speak of components of subjectification rather than posit a 'subject' – but it makes pragmatic sense to start the discussion at this molecular level and then move into molar dimensions, provided that one does not regard this movement as a linear progression along what Guattari sometimes calls a 'definitive schematic hierarchy'. We need first of all to be concerned with the following questions: what exactly is nascent subjectivity? Why does Guattari place such a high premium on it? How would this nascent subjectivity put us in a better position to address contemporary ecological realities?

Like many of the concepts Deleuze and Guattari have developed, nascent subjectivity in *The Three Ecologies* is at once a rephrasing and a reworking of terms that appear earlier in the two philosophers' oeuvre. In fact, one of the best ways to comprehend Guattari's difficult terminology is to trace the evolution of the names he ascribes to particular conceptual territories, always paying attention to how each change in wording advances his overall line of thought. In this case, it will help to read *The Three Ecologies* in parallel with Guattari's first collaboration with Deleuze, *Anti-Oedipus*, specifically the early passages in which they introduce 'the residuum subject'. The notion of the residuum subject presents a useful starting point for grasping the significance of Guattari's theoretical move from the subject to components of subjectification, which is so vital to his later writings on ecosophy. Considered as an isolated phrase, 'the residuum subject' implies that the subject, or one's subjectivity, is simply what remains or gets left over, in the sense of a residue. Thus begging the question: of what substances or processes is the subject a residue?

By Deleuze and Guattari's configuration, in contrast to the Cartesian *cogito*, an individual's thoughts do not constitute the full measure of his being. The subject is less the product of his own thought and more the residue of the social machinery in which he directly and indirectly participates, for the boundaries of 'private' thought are drawn through the sociohistorical apparatus (an emergent assemblage of desiring-machines):

> This subject itself is not at the center, which is occupied by the machine, but on the periphery, with no fixed identity, forever discentered, *defined* by the states through which it passes … the subject is born of each state in the

> series, is continually reborn of the following state that determines him at a given moment, consuming-consummating all these states that cause him to be born and reborn (the lived state emerges first in relation to the subject who lives it). (Deleuze and Guattari 1983: 20)

By means of this passage, we understand why many of Guattari's later writings are devoted to locating what he calls 'existential refrains', a term that denotes the crucial and contended sites through which subjectivity is produced, negotiated and learned. Far from considering subjectivity a pre-established individual phenomenon, Guattari contends that a 'polyphony of modes of subjectivation' are always at work in the (de)composition of an existential territory (Guattari 1996: 199). Existential refrains can emerge anywhere, but some common areas that Guattari emphasises include education, mass media, the arts, sports, architecture and the organisation of labour. Indeed, he does not oppose economic production to subjective or cultural production; the intersection of such refrains constitute complex existential territories that are ripe with transversal connections involving both material and semiotic work, civic and machinic flows, etc. (Guattari and Rolnik 2008: 38). More specifically, refrains emerge 'when motifs are detached from the flux of components ... acquiring the ability to generate a process of positive self-reference' (Genosko 2009: 80). Because of this detachability, refrains can be ripped from intimate moments of singularity and in some cases become mapped over by repetitively drawn associations to 'the diversions of consumption'; for instance, through advertising, a musical refrain (for example, a few notes from a song) often becomes 'hijacked and affixed to automobile tires or boxes of breakfast cereal' (Genosko 2009: 80).

The eco-logic of Guattari's argument in *The Three Ecologies* does not at all affix his thinking to the idea of a normative 'ecological subject'. In fact, he wants to 'ward off, by every means possible, the entropic rise of a dominant subjectivity' (Guattari 2008: 45). Guattari clearly asserts that he is not concerned with 'creating an unequivocal ideology' (23), which would outline a set criteria for being-ecological – an occasional tendency in Naess's writing – and position himself as leader or guru. Instead, Guattari is much more interested in conveying the importance of generating a multitude of methods designed to inspire an ecosophical perspective on the production of subjectivity. From an ecosophical perspective, intensities precede both ideology and identity; one's work becomes more productive when attention is paid to molecular, intensive qualities (for example, the universes of concepts, functions, precepts and

affects elaborated in *What is Philosophy?*).[8] *The Three Ecologies* clearly builds from the same image of thought sketched by the residuum subject and incorporates Guattari's subsequent insights on refrain-intersection:

> Vectors of subjectification do not necessarily pass through the individual, which in reality appears to be something like a 'terminal' for processes that involve human groups, socio-economic ensembles, data-processing machines, etc. Therefore, interiority establishes itself at the crossroads of multiple components, each relatively autonomous in relation to the other, and, if need be, in open conflict. (Guattari 2008: 25)

Here, Guattari specifies some of the obscurities of *Anti-Oedipus*; in particular, the earlier image of the individual-as-residue is redrawn: the individual becomes a 'terminal'. Hence, one's subjectivity is not only a by-product of forces operative in the three ecologies (mental, social, environmental); subjectivity is always already immersed in the flow of existential refrains or vectors. The individual can no longer be seen separately at any point. To speak of an individual subject, natural as it seems, is to reinforce a reductive vocabulary of existence, which inhibits any actualisation of '[a] collective and individual subjectivity that completely exceeds the limits of individualization, stagnation, identificatory closure, and will instead open itself up on all sides' (44). Nascent subjectivity, then, is not an entity one can postulate once and for all; indeed, it is best described as a process whereby thinking emerges immanently in relation with the event, which it perpetually strives to encounter in the manner of a rhizome.

Furthermore, Guattari's preference for immanent thought can be traced back to Deleuze's 1970 critique of consciousness as it has been represented by the transcendence-oriented history of Western philosophy. Deleuze writes, 'the conditions under which we know things and are conscious of ourselves condemn us to have only inadequate ideas, ideas that are confused and mutilated, effects separated from their real causes' (Deleuze 1988: 19). Deleuze constantly reminds us that our thought always occurs in the middle of things; that is to say, the outside to which thought connects has already begun and exists prior to our consciousness of it. Guattari's writing in the early 1990s addresses these illusions of consciousness in an era in which, despite growing awareness of environmental problems, 'we fail to grasp the contradiction in the fact that the factories producing our soaps are polluting our habitat' (Ulmer 2005: xxvi). Given the absolute immanence of nascent subjectivity, humanities scholars today should redirect the tradition of thinking the human subject as a discrete element towards new projects that create

concepts and design methods, in conjunction with new technologies, which expand the scope of subjectivity, or, in other words, increase our capacity to affect and be affected by immanent forces in the world.

The subject-as-cogito (that is, the isolated individual personified by Descartes's 'idiot') has become an inadequate foundation for thinking and acting in the context of twenty-first-century developments, such as globalisation, ecological crises and the proliferation of the digital medium. In order to comprehend global multitudes, and participate effectively in emergent political and rhetorical situations, future generations will need to be capable of experiencing themselves disjunctively in the sense of an emergent and processual assemblage. In an article submitted to *Le Monde* just weeks before his death, Guattari writes of a desire to 'bring individuals out of themselves' via 'the invention of new collective assemblages', which, as he envisions already in the early 1990s, could become all the more viable with the 'new possibilities of interaction' afforded by computer networks; for this reason, he believes that networked personal computing bears with it the potential for (but by no means guarantees) 'a real reactivation of a collective sensibility and intelligence' (Guattari 1996: 263). And so, though we begin at the level of so-called individual subjectivity, this is only the beginning of the issue because, for Guattari, the question of the individual is inextricably linked with trans-individual domains of flows, phyla, territories and universes.[9] Existential refrains are laid out by collective machines, which are themselves dialogically related to the available modes and technologies of production.

II. Machines, Not Structures

Guattari (2008: 44) stipulates that his ecosophical perspective is 'at once applied and theoretical, ethicopolitical and aesthetic'. Nowhere is this blend more evident than in his discussions of machines, which are informed by numerous disciplines from second-order cybernetics to modernist art, as well as concepts set forth by Lacan and Deleuze.[10] Guattari uses the term 'machine' to refer at once to actual and virtual properties. (He is not simply pointing to the technical appliances that the term often refers to in everyday conversation.) Machines are actual in that the word denotes existing institutions, groups and practices, but machines also address the virtual possibilities of collectivity and thus function as a theoretical metamodel. In his assessment of the contemporary psychological landscape, Guattari (1995: 58) claims that 'individual and collective subjectivity lack modelization' and, further,

that this lack explains the stasis of many social movements, including environmentalism. For this reason, Guattari insists that the development of alternative diagrams for the production of subjectivity (in contrast to the Oedipal model, for example) must become 'an immense site' of theoretical work and lead to 'the invention of new practices' (ibid.).

Without the existential recomposition (for example, the subject to components of subjectification) that theoretical metamodels engender, the ecosophical project of nascent subjectivity becomes lost to itself. Nascent subjectivity is entirely dependent on the capacity to install one's thinking into 'a constantly mutating socius' (Guattari 2008: 45). In this sense, the 'effects of the machinic phylum on subjectivity' detailed in *Chaosmosis* should be read right alongside of the challenges and tasks Guattari proposes at the conclusion of *The Three Ecologies* (Genosko 2009: 70). Ultimately, Guattari's machines (be they desiring, celibate, abstract, aesthetic, etc.) have two crucial, praxis-oriented objectives: (1) to help 'the individual' install himself into collective dimensions (becoming-machine); and (2) to help institutions and groups evolve autopoietically through processual encounters with – and complex articulations of – disparate sources of alterity (nascent subjectivity at the collective level).

In many ways, Guattari's version of the machine could be regarded as an appropriate figure or emblem for poststructuralism. Breaking with the (dogmatic) sign systems of structuralism, Guattari's focus on machines also performs an important inversion of phenomenology's tendency to 'reduce the objects under consideration to a pure intentional transparency' (Guattari 2008: 25). And yet, though he explicitly distances his thought from structuralism and phenomenology, Guattari does retain important traces of each these intellectual movements. His writing on machines incorporates a preference for studying contextualised structural objects, but the methods he advocates (schizoanalysis, transversality, etc.) clearly emphasise the need for 'spontaneous receptivity', a quality esteemed by many phenomenologists, which encourages us to encounter each phenomenon in its heterogeneity rather than overwrite its expression according to the structure of our own interpretative frameworks. In grasping Guattari's important theoretical distinctions between machine and structure, one should acknowledge, as Watson aptly notes, that the two terms are 'inseparable' and 'dependent on one another' as a conceptual pair, in much the same way as we might say of poststructuralism and structuralism (Watson 2009: 39). Thus, the notion of structure must

play a crucial role in discussions of the machine, even though Guattari writes about structures with evident disdain.

For Guattari, machines pose at least three qualitative differences to 'structures' (the obvious emblem of structuralism). First of all, machines express an affective logic of intensities (or 'pathic logic'), while structures operate according to the logic of discursive sets. Discursive sets presuppose a separation between subject and object, and for this reason, 'the truth of a proposition answers to the law of the excluded middle: each object appears in a relationship of binary opposition with a "foundation"' (Guattari 1995: 28). With the logic of intensities, the relationship between subject and object remains open or in question; therefore, the machine 'extracts complex forms from chaotic materials' because 'there is no extrinsic global reference' (ibid.). Indeed, the logic of intensities is the flow quintessential to ethico-aesthetic paradigms. Structures, however, smack of scientific paradigms in that they slow down or bracket chaos and alterity in order to erect a referent (Deleuze and Guattari 1994: 118). To combine the terms of *What is Philosophy?* with *Chaosmosis* (published in consecutive years), machines-as-philosophy seek to articulate a 'consistency specific to' chaos or alterity, whereas structures-as-science use the referent to 'actualize the virtual', and, by extension, to define sources of alterity through reference to known variables (ibid.).[11]

From the polarity above, we can clearly distinguish machines and structures in terms of their opposing attitudes towards alterity or difference. A structure defines difference only in relation to itself, while machines 'direct us towards a more collective machinism without delimited unity, whose autonomy accommodates diverse mediums of alterity' (Guattari 1995: 42). The machinic drive for autopoiesis necessitates a process of undergoing all the heterogeneous elements operative in the event, which 'heterogenises' the machine clean of any dominant, unifying or universal trait (39). Machines initiate processes of resingularisation precisely by allowing themselves to break down as they disjoin and rejoin to form new configurations immanent to the singularity of the event. As such, machines offer strong metamodels for negotiating refrain-intersections through the invention of 'new ecological practices', upon which Guattari comments in *The Three Ecologies*, 'their objective being to processually activate isolated and repressed singularities that are just turning in circles' (Guattari 2008: 34). In fact, as Watson reminds us, the rationale and language Guattari employs to describe eco-praxes hold much in common with his writing

on schizoanalysis, and we may see them as intricately related projects (Watson 2009: 184).

Moreover, as a consequence of these two prior distinctions, machines embody an awareness of their own fluidity and finitude, whereas structures, like Guattari's diagnosis of 'capitalist subjectivity', are 'intoxicated with and anaesthetized by a collective feeling of pseudo-eternity' (Guattari 2008: 34). In addition to dividing human experience of the socius into rigid categories (for example, nature vs culture), structures naturalise the divisions they construct by 'stabilizing the maximum number of existential refrains' (ibid.). Given our knowledge of machines and structures in *Chaosmosis*, we can (re)approach *The Three Ecologies* to gain an even greater command of this crucial opposition:

> The principle common to the three ecologies is this: each of the existential Territories with which they confront us is not given as an in-itself [*en-soi*], closed in on itself, but instead as a for-itself [*pour-soi*] that is precarious, finite, finitized, singular, singularized, capable of bifurcating into stratified and deathly repetitions or of opening up processually from a praxis that enables it to be made 'habitable' by a human project. (Guattari 2008: 35)

This passage in particular – its language of 'in-itself' (structure) and 'for-itself' (machine) – speaks to the important role of Jean-Paul Sartre's theory of groups in Guattari's thinking on disjunctive collectivity, which his machines diagram.

Gary Genosko has already demonstrated the degree to which Guattari's early distinction between subjugated groups and subject groups is an appropriation of Sartre's writings on seriality and fusion. For our purposes, it is also useful to consider machines and structures in this context. Guattari inherits Sartre's passion for thinking about group behaviour precisely because he shares Sartre's hatred of seriality, which Fredric Jameson defines as 'the mode of human interaction which corresponds to the domination of the practico-inert' (Jameson 1974: 147).[12] In other words, a population is subjugated by seriality whenever they relate to one another automatically via behaviour that is mass-proscribed by an elite, seemingly invisible authority. On the other hand, according to Genosko, a subject group 'has liquidated its seriality and come together in "the flash of a common praxis"' (Genosko 2008: 60). Subject groups connect in response to an event rather than the mandates of a leader or doctrine. Subject groups illustrate a disjunctive mode of collectivity in their priority for a processual engagement in dynamic encounters with sources of alterity, rather than the stability and dominion of a self-asserted structure. For Guattari, this

mode of group subjectivity, like the machine, signifies a solidarity that occurs without the dogmatic influence of any leader(s). Furthermore, the subject group measures its collectivity not by the amount of people participating in the group, but rather on the quality of difference articulated among group members, as well as the group's capacity to register the enunciations of (non)human assemblages outside of the group. Consequently, a subject group attentive to its own ecology – the diversity of its (ephemeral) constituency and the broader institutions and environment with which it interacts – is quick to (re)shape itself in response to a wide spectrum of mental-social-environmental forces. When 'isolated' structures are brought into working proximity, structure breaks apart, and this disjunction is necessary for true collectivity. Again, this is a monumental insight of Guattari's ecosophy: relationships of mutual constructivism and acts of co-creation are predicated upon commitments to disjunction – the processual breakdown of structures into machines.

Genosko makes a critical point that Guattari's distinctions between machine and structure, subject group and subjugated group, are 'non-absolute' (ibid.). For instance, an institution or group that operates à la the machine is not necessarily machinic by nature; it could devolve at any moment into the seriality of a structure. But the same holds true of the inverse (that is, structure to machine), and this conviction is the cause of Guattari's optimism regarding the potential impacts of remaking social practices. In critiquing what he calls 'Integrated World Capitalism' (IWC), Guattari simultaneously sets up a *contrast* against which to invent eco-praxes and he specifies a *target* discourse at which to direct ecosophical interventions. Throughout *The Three Ecologies*, Guattari suggests a generative opposition between the ecosophical goal of nascent subjectivity and the limits of IWC's 'capitalist subjectivity':

> A capitalist subjectivity is engendered through operators of all types and sizes, and is manufactured to protect existence from any intrusion of events that might disturb or disrupt public opinion. It demands that all singularity must be either evaded or crushed in specialist apparatuses and frames of reference. Therefore, it endeavors to manage the worlds of childhood, love, art, as well as everything associated with anxiety, madness, pain, death, or a feeling of being lost in the Cosmos... IWC forms massive subjective aggregates. (Guattari 2008: 33)

On none of these 'subjective aggregates' is IWC more dependent than mass media. In fact, Guattari likens mass media to poison and mutant algae as he illustrates its tendency to pollute mental ecology and

erode social ecology. Doubtlessly alluding to mass-medial conditions and his image of the television spectator, he claims, 'it is not only species that are becoming extinct but also the words, phrases, and gestures of human solidarity' (Guattari 2008: 29). When Guattari calls for a 'value-systems revolution', which would 'reevaluate the purpose of work and of human activities according to different criteria than profit and yield' (38), he is at once announcing the need for a revolutionary way of using media technologies. If, as Genosko (2009: 70) insists about Guattari's project, 'the most important stake is the development of a new kind of subjectivity' (and if we also remember Guattari's contention that new telematics and computer technologies are vital to contemporary productions of subjectivity), then media is arguably the most important target of ecosophy today.

III. Towards Post-Media

Digital theorist Gregory Ulmer has recently claimed that electracy is the principal site of the emergence of group subjectivity, a mode of experience that interfaces 'between individual and collective' (Ulmer 2005: 115). As a pedagogy of new media, electracy purports 'to do for the community as a whole what literacy did for the individuals within the community' (xxvi). Unprecedented both in degree and kind, the new collaboration called for by electracy will require, throughout its development, the testing of numerous concepts derived and appropriated from poststructuralist theory. With Guattari's work in mind, we can formulate some urgent questions for electracy, and these questions also posit urgent connections between ecological and digital approaches to the humanities. For instance, what happens to our understanding and experience of the digital apparatus when we adopt the theoretical components of ecosophy (for example, nascent subjectivity and the machine)? Guattari does not answer this question in his own work; however, he does leave a number of provocative signposts – particularly in his select use of the term 'post-media'. Post-media, as I will suggest, names a potential mode of cultural production that makes ecosophical use of digital media technologies.

Post-media remains a relatively underdeveloped area in scholarship invoking Guattari, probably because Guattari develops the concept only in passing, elusive and intermittingly, throughout his later works.[13] Unlike schizoanalysis or geophilosophy, post-media is never the subject of entire chapters. Still, post-media (or 'the post-media era') stands out

in Guattari's writing as an optimistic horizon to which his other key concepts repeatedly refer:

> Only if the third path/voice takes consistency in the direction of self-reference – carrying us from the consensual media era to the dissensual *post-media era* – will each be able to assume his or her processual potential and, perhaps, transform this planet – a living hell for over three quarters of its population – into a universe of creative enchantments. (Guattari 1996: 104; my emphasis)

> An essential programmatic point for social ecology will be to encourage capitalist societies to make the transition from the mass-media era to the *post-media age*, in which the media will be reappropriated by a multitude of subject groups capable of directing its resingularization. (Guattari 2008: 40; original emphasis)

> Technological developments together with social experimentation in these new domains are perhaps capable of leading us out of the current period of oppression and into a *post-media era* characterized by the reappropriation and resingularization of the use of media. (Guattari 1995: 5; my emphasis)

We can already notice form this sample that Guattari's 'post-media' carries connotations that evade Lev Manovich's 2001 definition of the term. For Manovich, post-media signifies a change surrounding artworks and the nature of media in contemporary, digital milieus. On one hand, the Internet makes multimodal communication the norm; hence, it becomes difficult to categorise net art (which often combines photography, video, text, images and sound) under the traditional logic of genre typology (that is, identification via medium: sculpture, drawing, painting, etc.). According to Manovich (2001), 'if one can make radically different versions of the same art object... the traditional strong link between the identity of an art object and its medium becomes broken'. In other words, as more artworks commonly exist across different media, the idea of the medium – though still important in the formation of meaning – can no longer be appealed to in sorting out various artworks from each other. In Manovich's terms, post-media is synonymous with post-medium.

By contrast, Guattari appears to be less focused on the typology of art proper, as his use of post-media evokes a broader sense of social transformation. Although Guattari and Manovich identify a similar historical cause (namely, the proliferation of new media and its accessibility to non-corporate entities), Guattari's conception of post-media is true to his idea of the 'new aesthetic paradigm', which, at a basic level, involves the explosion of artistic techniques and

mentalities into arenas of social practice and institutional politics. Innovative, aesthetic uses of media technology become a way to generate nascent subjectivity and machinic collectivity: 'One creates new modalities of subjectivity in the same way that an artist creates new forms from the palette' (Guattari 1995: 7). Guattari points to several examples in the field of psychoanalysis that demonstrate how new media may be used in parallel with his theory of the new aesthetic paradigm. For instance, he refers to a practice in which the therapist acts out or improvises 'psychodramatic scenes' with the patient while a video camera records both of them. Therapist and patient then watch and discuss the video playback of the scene; here, the audiovisual affordances of video make possible a new mode of relating to the production of one's subjectivity – just as early alphabetic writing systems established a new relationship between people and language. These video-enabled practices, according to Guattari, often furthered patients' treatment programmes by emphasising the fluid, creative dimensions of a subjectivity that is always in production, always open to manipulation and mutation, in opposition to 'realist' or representational models of the subject (8). Guattari argues that, in cases like these, 'the inventiveness of the treatment distances us from the scientific paradigms and brings us closer to an ethico-aesthetic paradigm' (ibid.). Post-media, then, continues a pre-digital mission to transform subjectivity; as such, media technologies are employed (and considered vital) because they generally provide the most accurate means to diagram nascent subjectivity. In essence, the desire to use the technology is motivated by the theory, and the development of the theory is itself influenced by technological developments. It is very tempting to think – and certainly not unreasonably so, given grammatological research confirming the correlation between literate societies and analytical thought processes – that a society equipped with new media is in a better position to sustain a lived experience of nascent subjectivity, provided, of course, concurrent efforts are made to develop post-media practices by which to engage these technologies.

While Guattari sketches several prototypes for post-media practices in writing about his activist and clinical work, humanities scholars still need to unpack the theoretical underpinnings of his vision before we can really be in a position to initiate, facilitate or even evaluate its realisation. From the onset, we must be clear that post-media for Guattari does not allude to an era devoid of media or its effects; Guattari agrees with Paul Virilio when he claims, 'the increased speed of transportation and communications and the interdependence of urban centres are

equally irreversible' (Guattari 2008: 29). While Guattari is very against *mass* media, he is anything but a technophobe. Verena Conley rightly points out that 'unlike many post-68 French theorists, Guattari does not use a Heideggerian blue print . . . [h]e advocates the construction of new subjectivities with technology' (Conley 2009: 120). In Guattari's work, mass media is conceived as a *stance* – an ideological use of media technology that is in no way inherent to or determined by the medium. In his essay 'Toward an Ethics of the Media', Guattari identifies four 'series of factors' that he believes will give shape to a 'coming perspective', from which to begin envisioning post-media futures (Guattari 2002: 18). Without rehashing them here, these four series of factors speak largely to the possibility for new kinds of relationships among traditionally stratified groups arising commensurate with new levels of interaction in writing, education and politics. Guattari's speculations about post-media take a more rigorous theoretical turn in *Chaosmosis*, wherein he problematises our habitual attitude towards the technologies (for example, radio, television, computers) that have now become fixtures of everyday life in many parts of the world. From the stance of mass media, especially from the consumer's point of view, a television or a computer is regarded as a technical machine – 'the machine as a subset of technology' (Guattari 1995: 33). Guattari calls for a reversal of this relationship, such that his expanded conception of the machine (see above) becomes a 'prerequisite for technology rather than its expression' (ibid.).

Thus, if we take this reversal to be a critical gesture of the post-media stance, users finds themselves recast into an altogether different set of relations with media: technical machines become machinic technologies. And so, rather than seeing the computer as a structure whose operation demands technical expertise above all else, the post-media user would approach the computer as a technology in progress (that is, always 'in the process of being reinvented'), whose operations affect and are affected by machinic assemblages of a 'constantly mutating socius' (Guattari 2008: 45). That is to say, under the logic of post-media, all users maintain a potential to invent the practices by which people relate to new media, while, at the same time, there is a basic awareness that the hardware and software of new media wield a powerful stake in the production of human subjectivity. Digital media, considered as machinic technologies rather than technical machines, constitute 'complexes of subjectivation: multiple exchanges between individual-group-machine' (Guattari 1995: 7). In other words, with digital writing systems, we are 'not confronted with a subjectivity given as in-itself, but with processes

of the realization of autonomy, or of autopoiesis' (ibid.). Neither the writing of the programmer nor the writing of other contributors of a given digital writing system can be said to be the sum of a single individual's choices; once writing enters into the complexity of such systems, theoretically speaking, writing becomes less the product of single-minded rhetorical intentions and more a dynamic variable whose semiotic life affects and is affected by patterns of movement across an intermingling if not deterritorialising ecology of collective assemblages of enunciation.

Of course, the post-media stance owes its viability to the decentralisation of the means of media production and dissemination brought about by the commoditisation of personal computing; however, it would be a dangerous reduction to mistake the mere technocratic fact of decentralised media production for the cultural achievement of a post-media sensibility. Indeed, theorising post-media enables us to see just how well mass media has already adapted to the 'emancipatory' conditions of Web 2.0. Before hastily celebrating the transgressive qualities of any emergent media ecologies, we would do well to note Michael Goddard's insistence that the shift from mass media to post-media is anything but a sudden or superficial matter:

> the post-media era is . . . not something that can be given in advance; it is instead a process of the production of subjectivity, the becoming of a collective assemblage of enunciation whose starting point is the emptiness and coerciveness of the normalising production of subjectivity that the mass media currently enact. This already gives us some indications as to what aspects of digital network culture might be able contribute to this emergence of a post-media sensibility and which elements in contrast merely help to add sophistication and diversity to normalisation processes under the guise of interactivity. (Goddard 2011)

In fact, some of the most striking examples of *mass media 2.0* can be found on popular websites dealing with ecological crises and the green movement. Guattari's ecosophical perspective on media and globalisation offers a framework with which to analyse some recent surges of this emergent online genre, which we may call the 'green list'. To begin with a basic definition, the green list is a form of Web 2.0 writing whereby Internet users enumerate a clear and simple list of steps or tips intended to promote an eco-friendly lifestyle. In its most common manifestation, however, the green list – whether authored by individuals or corporations – becomes a testament to IWC, mass media and consumerism. As the brief discussion of green lists below will

suggest, the Web 2.0 environment is entirely susceptible to mass-media colonisation, and we therefore must aim to develop oppositional, post-media pedagogies in order to realise any of the revolutionary potential that scholars typically attribute to digital authorship.[14]

Guattari provides the perfect preface for my mini-critique of the green list when he speculates on the prospects of 'computer-aided design':

> The machinic production of subjectivity can work for better or for worse... It's impossible to judge such a machinic evolution either positively or negatively; everything depends on its articulation within collective assemblages of enunciation. At best there is the creation, or invention, of new Universes of reference; at worst there is the deadening influence of the mass media to which millions of individuals are currently condemned. (Guattari 1995: 5)

On one hand, green lists apparently pop up as so many signposts directing consumers to the market's 'socially responsible' transitions, marking the promise of 'conscious consumerism' under a new kind of capitalism. Launched by a few environmental journalists in 2007, the *Daily Green* has quickly become 'one of the most trusted sources on the Web for news and information about going green' with the mission to 'broaden the audience for earth-friendly living by showing how going green is relevant to everyone' (*Daily Green 2009*). A section of its website called 'top going green tips' offers ten 'idiot-proof' steps every user can implement immediately to 'get started on a green path' (ibid.). These steps, many of which are common to most green lists, include: stopping idling in your car, turning off computers when not using them, switching to green energy for your home, doing laundry with cold water, carpooling and paying bills online (ibid.). Each of these tips constitutes a gesture towards sustainability in that they effectively control the damage of cultural habits that waste natural resources on account of laziness or inefficiency.

On the other hand, all of the tips assume, no doubt encourage, a basic continuity: people will continue to define themselves (and their relation to environmental concerns) through consumerism. The explicit message is to commute to the corporate office with a co-worker, or to share one car for a trip to the mall with a group of friends – keep amassing bills, but pay them online now. By taking, as a given, activities associated with working and spending in the name of the commodity, green lists protect institutions like malls and transnational corporations by maintaining them innocently in the background. Figuratively speaking, corporate institutions are the pervasive white space in-between each eco-friendly

tip; they issue the invisible motives that prompt each tip and they linger as the implicit destinations for which green lists prepare their readers. Rather than question the mall or the corporation, green lists insist that consumers must become more efficient in their consumption of the capitalist commodity. As such, green lists function as training manuals meant to help consumers help corporations survive the growing awareness of humanity's contributions to the ecological crisis. This crisis is of course particularly due to the rampant spread of American consumer culture during the last fifty years, which is now being exported more than ever throughout the world.

While plenty of green lists are published in isolation from one another on the Web, there are a number of major Web 2.0 style hubs for this genre that act as databases, organising lists according to topics such as 'green cuisine' or 'green cleaning'. First of all, just as there is a studio executive behind each Hollywood feature film, many green list databases are subtly sponsored by corporate entities. A true manifestation of Guattari's nightmare of IWC, the database the *Great Green List* is sponsored, albeit discretely, by a company called Earthsense.[15] Though the site's amateur appearance is meant to resemble the template-format of a grassroots, public wiki, all submissions to the *Great Green List* must pass review by an editorial staff hired by Earthsense. Moreover, many green list hubs, including the *Great Green List*, feature product promotion hyperlinks that send users directly to online shopping areas. In April 2009, the *Daily Green* hosted a link (atop every single page of its website) that sent users to a Radio Shack promotion. (Hence, this 'neutral' green list hub frames and feeds straight into a corporate buying site.) Clicking on the Radio Shack link, users learnt that the promotion offered a Radio Shack gift card to anyone willing to exchange used electronics for store credit (*PC Informant* 2009). Perhaps such deals do lead to some reduction of the 20–50 million tons of electronics waste that accumulates around the world each year, though non-profit organisations already offer free and convenient services for recycling electronics.

Nevertheless, applying Guattari's writings on capitalist subjectivity, I would argue that these promotions shorten the experienced life cycle of the company's products by furnishing consumers with incentives to part with electronics before they reach the end of their technical-functional life cycle (or as soon as impulse decides it is a nice day to upgrade to the latest model). Implicitly, these promotions grease the skids for more efficient patterns of consumption, encouraging an even quicker rate of product turnover and fuelling the capitalist mode of production's

expansion into new global markets. We should also note the acceleration that accrues to the shopping experience, which is now more aptly a buying experience. Shopping time is eclipsed as less profitable waste, for here the path is laid out for consumers around the world – without waiting in line – to use their 'old' computer (*if you already own it, then it must be old*) to purchase the newest computer, all the while feeling like a good, socially responsible capitalist: they 'made' money and 'saved' the environment. If left to the green list conventions, this is what the concept of sustainability becomes for citizens whose native tongue is the language of consumption. Indeed, IWC's hypertextual green lists are literal relays to the commodity, and they are much improved from the printed pamphlets of early capitalism, which merely spelled out the what, where and why of commodity expenditure.

Assuming the collective assemblages of enunciation of post-media should contrast from the commercial logic evident in green list hubs, we need to return to the question of post-media in search of a more analogous and desirable comparison. Without going into much detail here, I want to suggest a space of potential synthesis between post-media pedagogies and the contemporary art practices theorised as 'relational aesthetics' by curator and critic Nicolas Bourriaud, himself an expert on Guattari's work. Speaking from his encounters with contemporary art, Bourriaud asserts that an artwork's primary value is its status as a 'social *interstice*' (Bourriaud 2002: 16). Appropriating the term from Marx, Bourriaud explains, 'The interstice is a space in human relations which fits more or less harmoniously and openly into the overall system, but suggests other trading possibilities than those in effect within the system' (ibid.). For Bourriaud, art acts as a social interstice to the degree that it 'creates free areas, and time spans whose rhythm contrast with those structuring everyday life' or 'encourages an inter-human commerce that differs from the "communication zones" that are imposed upon us' (ibid.).

Translating the concept of social interstice into humanities education, one can imagine how academic projects could be designed, with the resources of digital media, to act as an interstice for proposing ideas on the basis of a 'social and aesthetic "profitability"' and for exploring ways of relating to new media that deal with non-commercial forms of exchange (Guattari 2008: 42). One promising example of humanities education becoming-interstice is the Critical Media Lab (CML) at the University of Waterloo, founded in 2008. Marcel O'Gorman, director of the CML, describes the programme as 'a research-creation incubator that links researchers in the Faculty of Arts [and humanities graduate

students] with the people and tools necessary to apply critically reflective work at the R & D level of technological production' (O'Gorman 2008). By virtue of the institution's transversal relations to groups inside and outside the university, participants in the CML work on innovative media projects that speak to values beyond commercial profitability, doing so in a language of product/experience design that makes critical theory/thinking manifest to diverse publics.[16] This pioneering work furthers our thinking about the prospects for developing post-media practices in the context of humanities education, precisely in the sense that it suggests the necessity of creating institutional spaces that foster critical intervention into media (and subjectivity) at the level of its production, rather than just a consumerist imitation of the mass-media forms, as is the case with green listing. Such endeavours demand a notion of creativity that traverses multiple ecologies, not simply transposing content from one domain into the pre-established form of another domain.

IV. Autopoietic Creativity

Claiming that tertiary descriptions usually revert to dualisms, Guattari prefers four-term frameworks, 'the fourth term stands for an nth term: it is the opening onto multiplicity' (Guattari 1995: 31). Autopoiesis is the *n*th component of ecosophy. Autopoiesis, often summarised by Guattari as a dance between chaos and complexity, characterises the passage back and forth between nascent subjectivity, machinic collectivity and post-media. Near the end of *Chaosmosis*, Guattari evokes a condition omnipresent in his worldview of self-organising, partial objects: 'Something is detached and starts to work for itself, just as it can work for you if you can "agglomerate" yourself to such a process' (132–3). One can think of autopoietic creativity as the capacity to yield oneself to chaos and, in doing so, undergo the event such as to channel the advent of nascent subjectivity. (Guattari calls this process an 'event-advent'.) The task here is to 'grasp alterity at the point of its emergence', to create in concert with sources of alterity (that is, the machine, post-media), rather than overwriting alterity in favour of default, a priori, or transcendent representations (that is, the ego, mass media) (117).

In opposition to 'whole over parts' models that characterise more popular notions of ecology, Guattari's conception of autopoiesis – the logic of parts without wholes – may actually provide a more thoroughly ecological account of the relationality involved with dynamic open

systems. Wholes can become problematic when they are posed in terms of transcendence; literary scholars like Dana Phillips and Timothy Morton have already illustrated how environmentalist constructions of Nature, posed as a whole magically thought to transcend culture, severely limited the efforts of early ecocriticism. Thus, an ecology without Nature, to borrow Morton's phrase, would employ a logic of parts without wholes; here, there are no discrete, transcendent wholes upon which to ground or stabilise an (eco)system because the so-called constituent parts always retain their partiality. With processual disjunction comes constant connection and reconfiguration, and there is no whole to impose stability by restricting the relationality of the partial objects. One of the greatest strengths of Guattari's autopoietic methodology is that it initiates, at a conceptual level, a processual disjunction of discrete elements. In fact, for Guattari (and Deleuze), thinking becomes more 'holistic' to the degree that transcendent wholes (especially the discrete entities of Oedipal psychology) are continually broken down into partial objects along a plane of immanence on which they engage and re-engage in infinite productive syntheses with other partial objects.

This autopoietic mode is of course absent from the so-called 'ecological subject' of deep ecology, which retains an ever-expansive Self at the front and centre of its ontology. An eco-humanities adapted to Guattari's ecosophy would thus replace Naess's 'Self-realisation' with autopoietic creativity, making autopoiesis a new core value at the heart of the humanities. Furthermore, the virtual ecologies of digital media make the Internet, for instance, an ideal pedagogical scene for humanities courses to introduce autopoiesis, which, as Guattari suggests, is a far cry from our Oedipal habits. In this sense, autopoietic creativity should be regarded as a crucial skill for the development of both ecological literacy and media literacy. We must learn to teach autopoietic creativity and, in doing so, *autopoietise* the academic research and writing practices of the humanities tradition.

Transversal connections among recent scholarship suggest a promising starting point. In particular, Guattari's ecosophical imperative to intervene at a micro-social level finds pedagogical expression in the tenets of ecocomposition set forth by Sidney Dobrin and Christian Weisser, namely that 'student writing should be directed beyond the limited scope of classroom assignments to address larger, public audiences' and that writing should be taught as a vehicle 'to affect change, to bring about awareness' in the mental, social and environmental ecologies of which students are a part (Dobrin and

Weisser 2002: 58). Additionally, Ulmer has already theorised some ways in which the digital humanities class can act as a kind of online consultancy.[17] Under this approach, students work heuristically through an intensive Web-based project, experimenting with digital authoring software in order to inject humanities (often poststructuralist) perspectives into the discourse surrounding public policy issues. As the pedagogical genres of electracy continue to develop, teachers should begin to build networks between their classes and larger, public audiences with the goal of circulating academic work among relevant social organisations or political bodies.[18] Of course, the primary value of any student project should lie in its capacity to facilitate learning experiences specific to a given discipline; one risk of doing service-learning projects (via partnerships with non-academic organisations) is that the service can undermine the learning. Thus, in designing institutional spaces and collaborative projects for the post-media era, one should mind Guattari's distinction between machines and structures: create an autopoietic network that learns like a machine.

For example, Guattari's theory of group subjectivity via machines could be applied to present efforts to alleviate the disciplinary isolationism that continues to cripple many research universities. Scholars who aspire to collaborate across multiple fields should aim to create transdisciplinary machines rather than interdisciplinary structures. With transdisciplinary machines, the objective is not necessarily to incorporate the study of science (its objects and methods) into the study of, for instance, cultural or aesthetic texts. Such 'inclusive' manoeuvers result, more often than not, in a homogenisation on both fronts. In the case of ecocriticism, as Dana Phillips (2003) points out, both ecological science and literary analysis often become reduced to ideological critique. Therefore, rather than encouraging humanities scholars to somehow acquire an additional expertise in scientific inquiry (and vice versa), cross-disciplinary efforts would do well to recast some energy to the co-creation of transdisciplinary machines (that is, evolving sets of processes committed to institutionalising the production of a group subjectivity). This transversalist mode of working valorises an ensemble of heterogeneous scholars, each sounding their mastery of instruments unique to their respective disciplines, playing in concert with one another at the same venue (that is, collaborating on the same problems and projects).[19] If we apply this analogy to much of the work that currently parades under the banner of interdisciplinary, then we find the projection of an impossible ambition: to command expertise in seemingly every academic field – to become, in short, a one-man band.

Furthermore, concerning teaching, I would argue that by creating networks for the ecosophical circulation of student writing, we may open up pedagogical interactions that otherwise get left to chance when students merely *post* their work onto vast Web 2.0 platforms. If we can publicise aspects of the learning process – thereby 'accommodating diverse mediums of alterity' – our various academic communities (for example, courses, collaborative scholarly projects, etc.) will operate much closer to the disjunctive collectivity that Guattari's machines diagram. By building into the work autopoietic relations to extra-academic perspectives, academic discourse inevitably will be challenged to become different in response to different problems and different rhetorical situations. The motive to create these opportunities goes hand in hand with the imperative to extend complex humanities perspectives into the public sphere, particularly those domains where competing discourses threaten to overwrite or displace the humanities. Deleuze and Guattari assert that, over the course of the twentieth century, commerce has all but replaced philosophy in the creation of concepts (Deleuze and Guattari 1994: 16). Additionally, the circulation of electrate projects will bring us much closer to the political conditions of the post-media era, which, according to Guattari, will 'require collective forms of administration and control, rather than a blind faith in the technocrats of the State apparatuses' (Guattari 2008: 28). Ultimately, autopoietic networks do not promote allegiance to a specific, existing political position; rather, teaching autopoiesis constitutes an ethical 'refoundation of political praxis' (Guattari 1995: 120). The eco-humanities of the post-media era, then, would be less directly concerned with environmentalist themes or values and more rigorously committed to the promotion of transversal thinking/learning, by which traditional objects of study become recast so as to foreground the ecological relationships within-among-between-across 'isolated' entities.

Scholars and teachers working in the (eco)humanities occupy a unique position from which to invent the public spheres of post-media and to inspire students to proliferate disciplinary knowledge beyond academic conventions through electrate encounters with ecosophical problems. Collectively, our research will lead to the discovery of new paradigmatic problems that will reaffirm the vitality of our fields for thinking the digital apparatus in an age of general ecological crisis. Our pedagogical experiments with emergent technologies will push students toward new ways of understanding and experiencing media, but also toward new ways of putting academic research (even poststructuralism) to use in unconventional rhetorical situations. As Guattari suggests – and this

may seem counterintuitive – theory across the humanities disciplines can become more experimental and more creative if we cultivate methods for appropriating computers as equipment to think with:

> Computers, expert systems and artificial intelligence add as much to thought as they subtract from thinking. They relieve thought of inert schemas. The forms of thought assisted by computer are mutant, relating to other musics, other Universes of reference. (Guattari 1995: 36)

In taking a post-media stance towards emergent media, we can think the new and think it collectively, but only to the extent that we develop digital practices capable of producing a new (ecosophical) relation between individual subjectivity and collective thought. From this perspective, anticipated in Guattari's writing, the eco-humanities and the digital humanities become rhizomatically bound towards one another through the concept/project of ecosophy.

Notes

1. This article was originally published in *The Fibreculture Journal*, issue 18.
2. In 2002, Sidney Dobrin and Christian Weisser examined this tendency among compositionalists and identified several key differences that distinguish 'ecocomposition' from ecocriticism, green cultural studies, ecofeminism, etc. In contrast to writing about nature (nature writing) or teaching environmentally themed texts (ecocriticism), ecocomposition strives to rethink discourse (particularly the activity of its production) as an ecological process and points to the myriad ways in which writing affects and is affected by surrounding environments. Aware of ecocomposition's academic infancy, Dobrin and Weisser were quick to stipulate a pioneering quality about their work, 'this book only begins to scratch the surface of a body of research that needs to be further explored' (Dobrin and Weisser 2002: 15). The first consistent use of the term 'ecomedia studies' emerged during the 2009 ASLE conference, specifically in panel discussions categorised under the section heading 'Ecological Media'. Though a small group of film and media specialists have begun to promote themselves as ecomedia scholars, they have yet to produce a book-length work which would, in effect, do what Dobrin and Weisser did for ecocomposition. *EcoMedia*, Sean Cubitt's 2005 book, perhaps bears a misleading title since Cubitt's primary objective is to extract environmental themes from popular film and television. Cubitt's book (and many other books like it) does not attempt to define ecomedia as a new field of study; he basically applies literary ecocriticism to the study of film and media.
3. Dana Phillips and Tim Morton argue that ecocriticism's ideological attachments to the pastoral worldview and false beliefs about literary representation render the movement too nostalgic and too naïve to sustain the most urgent dialogues to be had between English studies and ecological research.
4. Of this process of 'becoming-animal', Leonard Lawlor writes, 'instead of a resemblance relation, the relation that defines becoming is pre-positional. I find myself positioned before the animal, but "before" in fact means I am in proximity with the animal. I am among the others and they are in me. But just

as imitation does not define becoming, neither does representation define the preposition of one *for* another. Instead, becoming consists in a zigzag structure: we become animal so that the animal becomes, not human, but something else. The zigzag is set in motion by emission and extraction of a function (deterritorialisation). And finally, beyond the destruction of the molar form, deterritorialisation, in order to be successful, must use the animal function to produce something. It must take the micrological function of the rat, for example, and write "like" a rat' (Lawlor 2008: 178–9).

5. Guattari was in fact wary of popular and critical notions of 'identity', so much so that he tends to avoid using the term in his discussion of subjectivity and describes his own project as 'a matter of a perspective on identity which has no meaning unless identities explode' (Guattari 1996: 216).
6. Gary Genosko and Andrew Murphie provide a further critique of such models from the perspective of metamodelling: 'models operate largely by exclusion and reduction, tightly circumscribing their applications and contact with heterogeneity. The world of models is arid, lacking ambiguity and uncertainty. By contrast, metamodeling operations . . . introduce movement, multiplicity, and chaos into models' (Genosko and Murphie 2008).
7. Genosko (2009: 73) argues that the mental ecologies in Guattari's work owe more to artists and writers (for example, Kafka, Beckett, Proust) than to psychoanalysts (for example, Freud, Lacan, Klein).
8. Guattari regarded so-called ideological critique as a framework unfit to grasp the productive dimension of subjectivity as it unfolds across integrated world capitalism (IWC): 'Ideology remains in the sphere of representation, whereas the essential production of IWC does not simply concern representation, but also a modelization of behavior, sensibility, perception, memory, social relations, sexual relations, imaginary phantoms, etc.' (Guattari and Rolnik 2008: 38–9).
9. See Janell Watson's chapter 'An Energetics of Existence' in her book *Guattari's Diagrammatic Thought* (2009) for the most thorough engagement with Guattari's diagrams of his four ontological functions (namely, flows, phyla, territories, universes), which appear in *Cartographies schizoanalytiques* and *Chaosmosis*.
10. As Janell Watson has shown, Guattari's early formation of machine and structure marks a quite concrete instance of his 'writing between Lacan and Deleuze'. In particular, Watson discusses how Guattari develops this pair of concepts with direct references to Lacan's *objet petit a* and Deleuze's characterisation of structure in *Logic of Sense* (Watson 2009: 39–41).
11. This explication is by no means intended to function as a wholesale critique of science or a blanket statement about its aims, which are beyond the scope of this essay. I am merely alluding to what Deleuze and Guattari call the 'respective attitudes toward chaos' elaborated upon in their comparative analysis of philosophy and science in *What is Philosophy?* (Deleuze and Guattari 1994: 117–33).
12. Sartre's 'practico-inert' refers to conditions in which institutions *structure* social relations in a way that delimits human action, rendering freedom into a mere exercise of 'dead possibilities'. For an authoritative commentary, see Fredric Jameson's chapter 'Sartre and History' in his *Marxism and Form* (1974).
13. Verena Conley (2009: 123–6) and Janell Watson (2009: 176) both acknowledge the importance of the post-media era in Guattari's work, though Conley's engagement is strictly implicit. Michael Goddard is one of the only media studies scholars to deal at length with the post-media question in Guattari. Goddard's approach differs from mine in that his insights are drawn primarily from examining Guattari's participation with Italian free radio. At the end of his

2006 article, though, Goddard formulates a question that I will address later in the context of humanities education: 'The [post-media] question is one of how to compose networks of subjective auto-organization that are able to assume an autonomy from neo-liberal economic and military networks and their associated deadening of relationality, affect and desire in the direction of pure functionality and aggressivity' (Goddard 2006).

14. For a dynamic introduction to the discourse on the revolutionary potential of Web 2.0 authorship, see the collection of video lectures posted on the professional websites of digital ethnographer Michael Wesch (2010) and media theorist David Gauntlett (2010).
15. Earthsense is a for-profit company that specialises in marketing research and branding with the mission of 'making sense of our world to provide "*must-have*" consumer knowledge that would make cause-related product, marketing and strategy efforts more effective … we focus on marketing that directly affects the bottom line' (Earthsense 2009).
16. The Critical Media Lab is perhaps the closest thing in humanities education today to the hypothetical organisation that Guattari envisions in 'Toward an Ethics of the Media': 'a new type of organism of production, adjacent to the private, supported by the state, but directly managed by the creators, and truly free and responsible for its projects' (Guattari 2002: 19).
17. For more on Ulmer's vision of this electrate consultancy, see the introduction ('The EmerAgency') of *Electronic Monuments*. Here, Ulmer initially defines the EmerAgency as 'a deconstructed consultancy, meaning that it is simultaneously an immanent critique of conventional consulting and an experiment in an alternative mode that adapts arts and letters knowledge to a practice supportive of a virtual civic sphere' (2005: xxxi).
18. By incorporating Ulmer's logic of invention, the humanities can become more autopoietic by appropriating the creative arts project as a process-based affective learning experience. These 'new aesthetic projects' would depart from the role that art projects typically occupy in courses such as creative writing, studio art and film or video production. Traditional arts courses tend to structure all lecture and discussion around improving students' artwork, attempting to polish the pieces according to the criteria of prospective artistic venues. The student is positioned as an artist-in-training. New aesthetic projects in general humanities education, however, would incorporate aspects of the art project as an experiential vehicle to enhance students' engagement with disciplinary questions. As rhetorically situated acts of aesthetic invention, new aesthetic projects promise to cultivate the affective dimensions so crucial to digital rhetoric, and they also promote a relational aesthetics that is not isolated from social or political contexts. As such, new aesthetic projects offer a unique approach for teaching and learning autopoietic creativity in relation to the digital apparatus.
19. On the question of (trans)disciplinarity, Genosko writes, 'although transdisciplinary ecology goes beyond the multi- and inter-disciplinary pretenders, it is not a higher-level synthesis or a transcendent solution' (Genosko 2009: 70). While the formation of transdisciplinary machines mobilising ensembles of heterogeneous scholars appears to be the most promising cross-disciplinary strategy, it certainly renders false the idea of a universal vocabulary/methodology with which to build knowledge that would somehow synthesise and transcend all disciplinary knowledges. More likely, the transversality of transdisciplinary machines would promote a multitude of minor exchanges, leading to molecular changes in the way specific disciplines operate rather than to the eventual creation of something like an uber-discipline.

Dismantling the Face: Pluralism and the Politics of Recognition

Simone Bignall University of New South Wales

Abstract

Plural expressions of 'belonging' in postcolonial and multicultural societies give particular emphasis to a politics of cultural recognition. Within nations, diverse communities call for acknowledgement of their aspirations, for fair representation in public life and for protection of the distinctive cultural practices and beliefs that define and help to sustain minoritarian identities. Recognition is also important for group self-concept and cohesion, and so plays a vital role in the creation of stable platforms for political resistance. This essay explores Deleuze and Guattari's concept of 'faciality' and their implied critique of the politics of recognition. I argue that their rejection of the 'politics of the face' does not simply dismiss or disregard the pluralist imperatives of the just recognition that is required for postcolonialism. In fact, their preference for 'dismantling the face' provides a perspective that can be useful in assisting efforts to rethink recognition in terms adequate to forms of pluralist political engagement and non-imperial forms of subjectivity and sociality.

Keywords: Deleuze, difference, faciality, Fanon, Guattari, identity politics, Australian colonialism, pluralism, recognition

Recognition is a politically salient and vitally affirming experience.[1] It may be formal or informal in nature: it may constitute acknowledgement by an external authority such as the state; or it may be an internal condition of community coherence and self-concept. Non-recognition is an equally powerful political force. While the non-recognition of cultures

www.eupjournals.com/dls

has frequently been a tactic of imperial dominance, non-recognition can also be a critical tool of resistance to power. Political action in a post-imperial, feminist and intercultural age of diversity typically refuses to recognise the singular authority of majoritarian forms of sovereign identity that have been imposed through colonisation and patriarchy; however, such action also attempts to recognise and give appropriate value to the claims of minoritarian cultural forms. This ambiguous and multivalent use of recognition and non-recognition often means that critical and transformative political strategy is vexed. To put this point another way, postcolonial, feminist and other kinds of counter-cultural politics attempt both the destabilisation of dominant, normative identities and, simultaneously, the assertion of minor identities that can operate as a basis for the critique of those dominant forms. Claims for recognition of a minoritarian cultural identity, however, are not immune from the uncertainty that undermines the coherence of majoritarian identities. The very possibility of recognition, as it conventionally has been conceived, assumes a consistency of identification and representation; but there will always be internal groupings that contest the unity and stability of an identity, regardless of whether this identity belongs to a dominant or a minor cultural or political entity. Attempts to establish counter-cultural identities capable of being recognised and self-consciously lived by a community are therefore often undone by the same deconstructive strategies that inform programmes of resistance addressed to politically dominant identities. Furthermore, minoritarian calls for cultural recognition are frequently directed at a dominant order; such claims must be articulated in terms that the dominant order will recognise and make sense of. Yet, minoritarian cultural practices and political aspirations do not always operate within the established limits of majoritarian significance. Accordingly, processes of 'recognition' can often fail to acknowledge minor cultures on their own terms of reference, thereby in fact perpetuating insidious forms of 'non-recognition'. It is helpful to read these dilemmas concerning the politics of recognition in light of Deleuze and Guattari's concept of 'faciality' and their discussion of the 'politics of the face'. Indeed, I argue here that their privileged emphasis on 'dismantling the face' can assist new thinking about identity, engagement and the politics of recognition in an age of diversity.

I. Cultural Politics of Recognition

Writing in the context of African experiences of (French) imperialism, Frantz Fanon (1967) reflects on the important role played by recognition

in the political psychology of colonisation and racism, as well as in the psyche of colonised peoples. Defined by Fanon as a 'society of comparison', the colony is characterised by relationships that appear to privilege the 'superior' forms and values of the coloniser. As a result, Fanon worries that the colonised subject is 'constantly preoccupied with self-evaluation and with the ego-ideal' (1967: 211). Because the 'ego-ideal' in colonial society is based upon the imposed normative form of the colonial master, Fanon insists that the colonised subject subconsciously or secretly wishes to 'become white – that is, to be a man' (216). Being 'greedy for security' in the aftermath of colonial dispossession and destruction, colonised individuals seek the affirming recognition of the coloniser: they 'want to be recognised in their quest for manhood' (212). Accordingly, 'everything that an Antillean does is done for The Other . . . because it is The Other who corroborates him in his search for self-validation' (212–13). Consequently, Fanon insists that one of the most damaging effects of colonisation is the conflict and competition it provokes in the internal relations of colonised groups: 'Every position of one's own, every effort at security, is based upon relations of dependence, with the diminution of the other. It is the wreckage that surrounds me that provides the foundation for my virility' (211).[2]

For Fanon, the problem at the heart of colonial subjectivation concerns the ways in which dominant forms of colonial identification define the terms of personal expression and cultural value that colonised peoples are then driven to approximate. Of course, colonial interests are not diminished when colonised peoples struggle for equal recognition on normative terms defined by the colonisers. Such struggles for 'equality' incidentally affirm the majoritarian power of the imposed colonial structures that define social and political norms and aspirations in such locations. Accordingly, Fanon notes, 'One day, the White Master, *without conflict*, recognized the Negro slave. But the former slave wants to make himself recognized' (217; original emphasis). For Fanon, central to this process of becoming 'actional' is a question of desire:

> As soon as I desire I am asking to be considered. I am not merely here and now, sealed into thingness. I am for somewhere else and something else. I demand that notice be taken of my negating activity insofar as I pursue something other than life; insofar as I do battle for the creation of a human world – that is, of a world of reciprocal recognitions. (Fanon 1967: 218)

Here, Fanon signals the emergence of the alternative kinds of self-concept and political reciprocity called for by a postimperial 'age of diversity', eloquently discussed in relatively recent times by James

Tully (1995). Indeed, as Tully notes, cultural demands for reciprocal recognition 'gather together the broad and various political activities which jointly call cultural diversity into question as a characteristic constitutional problem of our time' (1995: 1–2). In this way, although diverse contesting interests underlying particular calls for cultural recognition often are asserted against each other in a 'cacophony of heterogenous claims' (5), the cultural politics of recognition nevertheless embraces two common motivations. Claimants share a common resistance to the 'empire of uniformity' that silences or suppresses diversity and which characterises imperial engagements; and they share a common aspiration to be self-determining, to 'rule themselves in accordance with their ways and customs' (4). The demand for cultural recognition is thus part of an enduring struggle for liberty from cultural domination, assimilation and exclusion, and the self-conscious creation of public institutions that foster mutual cultural recognition enables 'the expression of a genuinely post-imperial age' (17). The refusal to assimilate or to submit to an imposed homogeneity and the desire to have one's identity recognised in the form that one defines for oneself are twin aspects of many various struggles for recognition, through which distinct but coexisting cultural groups within a nation 'do battle for the creation of a human world' (Fanon 1967: 218). The idea of 'feminist postcolonialism' gestures towards the inauguration of a genuinely human world, in which all humans might participate equally in public life through fair and free expression of interests and have those interests recognised in a way that remains respectful of culturally diverse and distinctly gendered perspectives.[3]

As Gayatri Spivak (1985) famously points out, however, the efficacy of such transformation often has been limited by the need to articulate calls for cultural recognition in the normative language of dominant powers, if these resistances to an imposed cultural uniformity are to be recognised at all. Thus, the nature of anti-colonial resistance is too often defined by the system of oppression it faces (see Povinelli 2002). Writing in an Australian context, Marcia Langton worries that while Indigenous resistance is commonly presented through an Indigenous discourse on Aboriginality,

> this fixation on [self] classification reflects the extraordinary intensification of colonial administration . . . elaborate systems of control aimed, until recently, at exterminating one kind of 'Aboriginality' and replacing it with a sanitized version acceptable to the Anglo invaders and immigrants. (Langton 1994: 96–7)

Similarly, Indigenous peoples' self-representations that are aimed at attracting the recognition of non-Indigenous society frequently must conform to modes of presentation accepted or tolerated by the mainstream media: they must 'establish an indigenous presence in a non-indigenous world which has been structured in certain ways, and one in which people are educated to present ideas and images in certain ways'(Mudrooroo 1995: 144).

In South Australia, the Kumarangk (Hindmarsh Island) Bridge affair demonstrates starkly that where Indigenous knowledge and practices do not conform to non-Indigenous worldviews and understandings they often cannot, or will not, be recognised as authoritative and worthy of protection (*Kartinyeri v The Commonwealth*; see Bell 2003; Simons 2003). In this case, Australian law did not accept the existence of privileged and sacred knowledge preserved in the cultural form of oral tradition and accessible only to certain women. The revelation that 'women's business' might have survived off the public record, unknown to expert anthropologists and ethnographers, was determined by the Royal Commission and the High Court to be incredible to the settler imagination. Because the sacred nature of the story meant that it was known to only a few women, and because each of these women held different parts of the story, the Ngarrindjeri community as a whole could not claim a unified awareness of this 'women's business', and nor could they speak about such business because of the access taboos and privileges associated with the information. This lack of community coherence further compounded (interested) non-Indigenous scepticism about whether the claims were true or fabricated by 'anti-developmentalists'.

Margaret Simons (2003: 218) explains that, according to Western cultural beliefs,

> knowledge is best shared, theories are there to be questioned, unpicked and interrogated... Publication is a measure of importance... Not all cultures are like this. In many Aboriginal cultures, secrecy is a measure of whether or not knowledge is important. Myths and Dreaming stories are layered. An outer layer is told to children. As the children grow older they learn more... Sometimes the story changes in important ways... a child might be told a story about a man coming over the hill trailing a spear or a stick. Then later, they might be told that the stick was not a stick after all, but a penis. Later on, or in some other stories, the person might not be a man at all, but a woman. Or a goanna. Stories shift and change depending on the speaker and the listener. There is no written version. Nothing is fixed. And if something is widely known, then it is a sure sign that it is not central, and not important.

Postcolonial forms of pluralist politics will not simply interpret claims for cultural recognition through established structures of understanding and familiar terms drawn from dominant (Western) traditions and forms of thought (see Povinelli 2002). Tully writes:

> This imperial attitude is to be abjured. Rather, recognition involves acknowledging [a cultural entity] in its own terms and traditions, as it wants to be and as it speaks to us . . . They do not wish either to be silenced or to be recognised and constrained to speak within the institutions of interpretation of the imperial constitutions that have been imposed over them. (Tully 1995: 23–4)

Taking postcolonial pluralism as a context for the analysis and evaluation of Deleuze and Guattari's political philosophy, the following section explores their critical conceptualisation of the 'face' as an 'empire of uniformity' that imposes rigid constraints on plural modes of interpretation.

II. Faciality

In *A Thousand Plateaus*, Deleuze and Guattari identify the 'face' as 'the *white wall/black hole* system' (1987: 167). Here they use the term 'face' not in a concrete sense in reference to a particular visage or in relation to the affective dimensions of the encounter between particular or individual faces, but rather to image a process of sense-making and the consolidation of an emergent structure of meaning (cf. Deleuze 1986: 99; see also Conley 2005; Rushton 2002). The concept of 'faciality' conveys the idea that language functions as an ordering device, operating at the nexus of the signifier and the subject. Ronald Bogue explains that for Deleuze and Guattari,

> language's purpose is less to communicate than to impose order. Language enforces a codification of the world according to orthodox categories and classifications, its various speech-acts shaping, guiding, and policing thought and behaviour. Hence the regular patterns of socially sanctioned practices effected by language may be said to constitute a *regime* of signs, a power structure that forms individual subjects and places them in social and political relation to one another. (Bogue 2003: 83)

Faciality describes a 'pure abstraction', a conceptual topography which diagrams the intersection of the two semiotic systems operating as signification and subjectivation (Deleuze and Guattari 1987: 115). The 'face' is 'a surface . . . the face is a map', which is comprised of a broad featureless space – a 'formless white wall' of signification – marked

by 'dimensionless black holes' of subjectivity (170). These black depths disturb the blank surface to suggest 'faciality': 'a suggestive whiteness, a hole that captures, a face' (168). Thus, 'faciality' is a concept intended to convey diagrammatically the structuring dynamic of emergence of a dominant system of meaning, the particular regime of signs defined by Deleuze and Guattari as 'despotic-authoritarian', which corresponds with distinct 'patterns of sanctioned action' and particular modes of subject formation (Bogue 2003: 86). Accordingly, 'facialisation' describes the process that causes semantic events to be captured and represented by the two semiotic orders of signifier and subject.

For Deleuze and Guattari, the face takes a particular form – it is a concrete assemblage – but is always produced by an abstract machine of 'faciality' (1987: 168). The face takes shape alongside the 'ensemble of material connections in which bodies and things are drawn . . . People become facialised not because of ideology, repression, or texts, but because of their commingling with places, tools and each other' (Saldanha 2007: 100–1). Habits of connectivity draw constituting elements into regular assemblages or arrangements, thus establishing structures of coherence. In the process of facialisation, the function of the subject is to establish the rhythm of coherence that organises various interpretations of such arrangements into a consistent worldview. Thus, facialisation relies upon the interpretive work of the subject, who is responsible for the 'territorialisation' – the selection and establishment – of a privileged set of significations from a range of possible alternatives, and the consolidation of these meanings in accordance with a given mode of expression. In this sense, the face is a 'territory' that is carved out from a broader 'landscape' – the collection of diverse orders of meaning that form any given social, political and discursive milieu (Deleuze and Guattari 1987: 172–3). The face expresses a dominant outlook and mode of understanding: it encodes a particularly powerful regime of signs. A face is powerful for so long as its expression remains fixed, that is, for as long as the regime of signs it expresses repeats regularly and persuasively through time. Its resistance to transformation ensures its continuation in its given form. Patricia MacCormack comments:

> the face is a landscape. The faced landscape is rigid, changeable only in relation to a set of predictable variances. The landscape is also cultivated by a certain set of people, who own, run and map the land. The land is recognised in a certain way. (MacCormack 2004: 137)

The face is, then, an apparatus of capture which records and organises events and expressions into meaningful sequences and structures. It is comprised of 'a general space of comparison and a mobile centre of appropriation' (Deleuze and Guattari 1987: 444). The 'white wall' of the signifier acts to 'define zones of frequency or probability, delimit a field that neutralizes in advance any expressions or connections unamenable to the appropriate significations' (168). The 'black hole' of subjectivity constitutes a perceptive and interpretive centre, which draws in, assimilates and transforms alterity, encompassing and internalising various interpretations within an existing structure of significance and comprehension. Together, the 'white wall' of the signifier and the 'black hole' of subjectivity effect the operation of representation. In this process, difference is compared and measured in terms of its recognised resemblance to a given or established 'representative' form; this privileging of similitude and resemblance reproduces an expanding principle of identity or sameness in the process of signification. Thus, for Deleuze and Guattari, faciality privileges the conceptual cluster of identity, resemblance and analogy that underscores the possibility of representation and the politics of recognition. The facial system produces an abstract model of identity that is generalised and standardised: the face enables a 'computation of normalities' (178). MacCormack explains that, as a consequence, 'when we are facialised, we are made visible only within one dominant system and in the only manner that the dominant system understands ... certain bodies are read and valued according to how they differ from the majoritarian face' (2004: 136). Faciality corresponds with a politics of representative identity, in which the recognition of difference is achievable only in relation to that identity: 'the face is a politics' resting upon technologies of normalisation and discipline (Deleuze and Guattari 1987: 181). Racism, for example, 'operates by degrees of deviance in relation to the White-Man face' (178).[4]

Accordingly, 'the face brings the body of that which varies from the majoritarian into comprehension for dominant culture ... they always exist in comparison with the majoritarian face' (MacCormack 2004: 136). Or, as Bogue comments:

> the face of despotic-passional power identifies, classifies, *recognizes* ... the facialised object is recognized, pinned to the wall, or stuffed in a hole, imprinted with a look that it returns as a reverberation of the force that shapes it. (Bogue 2003: 104–5)

In fact, as was evidenced by the example of the Hindmarsh Island Bridge development, a facial regime maintains its majoritarian form by attributing a negative value to any fragments of signifiance that threaten to elude capture:

> In a signifying regime, the scapegoat represents a new form of increasing entropy in the system of signs: it is charged with everything that was 'bad' in a given period, that is, everything that resisted signifying signs . . . finally, and especially, it incarnates the line of flight the signifying regime cannot tolerate . . . the regime must block a line of this kind or define it in an entirely negative fashion . . . Anything that threatens to put the system to flight will be killed or put to flight itself. Anything that exceeds the excess of the signifier or passes beneath it will be marked with a negative value. (Deleuze and Guattari 1987: 116)

The Ngarrindjeri women, whose claims for cultural recognition 'threatened' the Hindmarsh Island Bridge development, became scapegoats identified negatively in dominant social and legal discussions concerning the proposed development; they were accused of deception, fabrication and a recalcitrant resistance to progress. In fact, these women's revelations about secret or sacred women's business issued a serious challenge to the status of dominant (colonial) structures of knowledge and existing understandings about Indigenous culture and its rightful place within Australian common law. The women claimed knowledge of a series of alternative systems of signification, which effectively undermined the conventional authority of colonial and patriarchal assumptions underlying dominant representations of belonging and land use, as well as colonial understandings of gendered dimensions within Indigenous authority, traditional knowledge and cultural power.

Repression occurs when plural calls for cultural recognition are confronted by a 'white wall' of signification, which responds only by bouncing back given structures of meaning and is not capable of recognising creative inventions of sense or differences that depart from the majoritarian perspective (see Povinelli 2002). Colonisation constructs an 'empire of uniformity' and digs a 'black hole' of subjectivation in accordance with an established or normative model of identity, in which the minoritarian self is imprisoned or buried. Deleuze and Guattari accordingly ask a question relevant for postcolonial strategising: 'How do you get out of the black hole? How do you break through the wall? How do you dismantle the face?' (1987: 186).

III. Dismantling the Face

Deleuze and Guattari assert: 'If the face is a politics, dismantling the face is also a politics involving real becomings' (1987: 188). While faciality involves a politics of territorialisation and form, dismantling the face involves a politics of deterritorialisation and transformation. The starting point for such a transformative politics is the face itself: 'the white wall of the signifier, the black hole of subjectivity and the facial machine are impasses, the measure of our submissions and subjections; but we are born into them, and it is there we must stand battle' (189). For Deleuze and Guattari, battling the face requires the cultivation of an intimate knowledge and awareness about the face one inhabits, and they warn: 'find your black holes and white walls, know them, know your faces; it is the only way you will be able to dismantle them and draw your lines of flight' (188). Dismantling the face therefore requires a careful analysis of the signifying discourses and representations that make up one's social context, as well as a critical and reflexive understanding about how these shape identity. This includes analysis of how it is at times possible for one to selectively constitute one's own identity in relation to the multiplicity of established significations one is 'born into'.

The 'ruin of representation' is a central aspect of Deleuze's task in *Difference and Repetition* and indeed forms a consistent thread through his entire oeuvre, including his work with Guattari (see Olkowski 1999). The aim in *Difference and Repetition* is to shake off the 'four iron collars of representation: identity in the concept, opposition in the predicate, analogy in judgement and resemblance in perception' (Deleuze 1994: 262). In *A Thousand Plateaus*, the discussion of faciality likewise involves a critique of representation; in particular, how faces 'form loci of resonance that select sensed or mental reality and make it conform in advance to a dominant reality'(Deleuze and Guattari 1987: 168). For Deleuze, at the heart of representation and aligned forms of political practice is the misconception that the established regime of power/knowledge (the face) causally structures the productive force of desire and assemblage. Within this model of causation, an established signifier or set of significations predetermines the possibility of recognition and limits the potential for inventing new configurations of meaning and, hence, of social organisation. The imposition of an already given order of meaning upon an actual variety of subject-forming events reduces them to a limited and predetermined interpretation of experience. This is described, for example, by the limiting formalities that circumscribe and regulate political participation

in liberal democracies, which ask citizens to choose between particular sets of already-existing features. According to Deleuze and Guattari, all interpretation then becomes assimilated to an existing structure of meaning: 'You don't so much have a face as slide into one' (1987: 177). Deleuze and Guattari encourage us to understand alternatively that the subject and the signifier are not the (already-given) causes of signifiance, but are in fact themselves reactive effects of a process in which meaning is constructed through the association of elements into a coherent form (see for example Deleuze and Guattari 1983: 129). They assert: 'concrete faces cannot be assumed to come ready-made. They are engendered by an abstract machine of faciality (*visigéité*), which produces them' (1987: 168). This engendering involves the process of 'facialisation', in which the face 'takes shape' and 'begins to appear' as certain regular features are inscribed and emerge as fixed strata upon a mobile 'surface', thereby forming the landscape of the face with the repetition of their occurrence over a period of time (ibid.). These features are not inevitable characteristics of the facial landscape, however; they occur according to a particular and contingent coding of elemental conjunctions to define a particular emergence of faciality. Thus, a 'concrete face' is always defined by the assembly rules embodied within the 'abstract machine of faciality' that causes the face to emerge as such. When the established regime of the face is erroneously taken as the cause of signifiance, it operates as a 'site of transcendental illusion' which suggests the apparent inevitability of that regime of signs (Deleuze 1994: 265). When everything must conform in advance to a regime of signification already given, then there is no room for creative divergence in the productive process. There is nothing new, no new desires or alternative associations that might construct different expressions in the established face, which grimly sets its features into a representative order. In this way, in the rigid structures of a formed face, 'the whole of desiring-production is crushed, subjected to the requirements of representation, and to the dreary games of what is representative and represented in representation'(Deleuze and Guattari 1983: 54).

It is helpful to read 'Plateau 7 – Year Zero: Faciality' in conjunction with 'Plateau 5 – 587BC–AD70: On Several Regimes of Signs'. Here, Deleuze and Guattari analyse 'a certain number of semiotics displaying very diverse characteristics' (1987: 135). They explain that there is

> such diversity in the forms of expression, such a mixture of these forms, that it is impossible to attach any particular privilege to the regime of the 'signifier'. If we call the signifying semiotic system semiology, then semiology is only one

> regime of signs among others, and not the most important one. (Deleuze and Guattari 1987: 111)

In fact, any particular regime of signs subsists in a milieu where competing regimes circulate. Similarly, any given discourse is not a fixed or closed system of signification, but is flexible and relative to other modes of expression and possible interpretations. An object might occupy many classifications simultaneously, and thus can transfer between meanings. A complex 'mixture' of various semiotic regimes constitutes a 'milieu' or 'landscape' that furnishes material for the constitution of the sense of a particular body. The milieu constitutes an exterior context in which any particular organisation of meaning subsists. At its points of contact with this milieu, a representation is fundamentally unstable, as its elements combine, shift, transfer and pass between other regimes of sense. Thus, there are possible 'passages' between regimes of signs, enabling movements of destratification or the mixing and translation of established regimes of signification. Whereas the semiotic regime of the signifier works by capturing and reducing diverse meanings to a uniform representation of 'truth', alternative and polyvocal regimes of sense and expression are always possible (136; see also Deleuze 2004). The potential for discovery of these alternative and contesting regimes of sense, however, 'requires a rethinking of the majoritarian face and a willingness to envisage more than one system of comprehension and function for the face' (MacCormack 2004: 138).

Deleuze and Guattari suggest:

> when the face is effaced, when the faciality traits disappear, we can be sure that we have entered into another regime, other zones infinitely muter and more imperceptible where subterranean becomings-animal occur, becomings-molecular, nocturnal deterritorialisations overspilling the limits of the signifying system. (Deleuze and Guattari 1987: 115)

Fanon writes:

> I am not a prisoner of history. I should not seek there for the meaning of my destiny. I should constantly remind myself that the real leap consists in introducing invention into existence. In the world in which I travel, I am endlessly creating myself. I am a part of Being to the degree that I go beyond it. (Fanon 1967: 229)

Because dominant meanings are always open to a contextualising milieu in which mixed and conflicting regimes of signs subsist, their stability is challenged as they come into contact and are forced to shift and morph in partial destratifications in order to accommodate such conflicting

significations. Thus, 'dismantling the face' involves locating the points at which meaning shifts and becomes unstable: searching for the points in a collection of social discourses where meaning is contradictory, or the points in one's own identity where one occupies multiple and contradicting classifications. One may be simultaneously altruistic and selfish, active and passive, free and constrained, wilful and aimless, friend and lover, parent and professional, and so forth. In finding such points of ambiguous identification, one is potentially able to apply pressure to the signifying system in which one is embedded, perhaps provoking an 'uncertain moment' where conventional significations collapse and established meanings shift (Deleuze and Guattari 1987: 189).

At such moments, the 'abstract machine of faciality' that shapes the emergence of particular and concrete facial assemblages may become (partially) transparent. The increased visibility of the constructive mechanisms underlying a set 'face' undermines its pretensions to inevitability and stability. This can have the effect of destabilising the face, potentially enabling a critical 'line of flight' from established structures of representation and a recomposition of meaning according to an alternative constitutive process that defines an alternative regime of signs. This process requires complementary critical and constructive movements, which at once deconstruct the established power of the face by destabilising its 'territory' and simultaneously attend to the composition, or 'reterritorialisation', of alternative structures of meaning that we can rely upon to make sense of our worlds and ourselves. In reterritorialising meaning, however, the objective is not simply to recreate the territory that has been dismantled, but to invent a process of composition enabling an entirely new form of sensibility, a new framework of understanding for a 'new people' and a 'new earth': 'beyond the face lies an altogether different humanity' (190).

For Deleuze and Guattari, key to this complex destructive-creative process is the invention of a 'probe-head' capable of penetrating an opaque or self-evident regime of signs and forcing it to transform. The concept of the 'probe-head' is best understood in light of their Spinozist ontology of the complex relational individual, which enters into multifaceted processes of transformation during encounters with others (see for example 1987: 253–60). In fact, for Deleuze, an individual is an emergent, multi-levelled, complex union of parts. The individual takes form when the force relations binding its parts into a loose collective become habitual and consistent, lending the individual a regular structural organisation. The individual is complexly relational,

since its composing elements are drawn together from a contextualising environmental milieu and furnished through the relations it forms with other individuals and structures within this milieu. Accordingly, an individual structure is always also a multiplicity: it is 'defined not by its elements, nor by a center of unification or comprehension. It is defined by the number of dimensions it has' (Deleuze and Guattari 1987: 249). The 'number of dimensions' enjoyed by an individual is determined by the complexity of its affective relations; these include not only the internal relations between the composing elements that give the individual a certain structural definition, but also the range of external relations that the individual forges with multifaceted aspects of its neighbouring bodies.

For Deleuze and Guattari, the relational nature of individuals entails that 'each multiplicity is already composed of heterogenous terms in symbiosis, and ... a multiplicity is constantly transforming itself into a string of other multiplicities, according to its doors and thresholds' (ibid.). Sending out a 'probe-head' is one way in which a multiplicity experiments with the possibility of forging new symbiotic relations with neighbouring bodies, thus altering its dimensions of complexity and changing in nature according with shifts in its affective connections. Complexly relational entities have 'shifting borderlines' (252), because their composing elements form 'passages and bridges', 'doors and thresholds', when they are shared by neighbouring individuals. As they come into contact, entities can enter into processes of becoming-otherwise, either when they absorb new elemental influences from the encounter, or when the encounter causes a shift in the power relations binding elements into coherent forms of order. Through encounters with others, an individual is transformed, not necessarily in entirety, but in piecemeal and selective ways at particular sites of elemental affection. The 'probe-head' describes a technique of active transformation an individual may engage or be engaged in, when brought into proximity or intimacy with other individuals, in ways that are receptive to the formation of new elemental connections. The possibility of self-transformation through the creation of novel combinations with other individuals is facilitated initially by the identification of those sites of structural vulnerability: those 'moments of uncertainty' in which a self may be redefined. In such moments, a 'probe-head is then that which explores the terrain beyond the face, the terrain from which the face is nothing more than an extraction or a crystallisation. Probe-heads are in this sense a move into chaos' (O'Sullivan 2009: 254). Sending out a probe-head to the interstitial space or the 'plane of consistency' beyond

the face, where bodies form and transform according to their dynamics of coexistence, then involves the sort of relational effort called for by Fanon: to 'touch the other, to feel the other, to explain the other to myself'(1967: 231). Careful observation of the nature of one's affective engagements allows a developing understanding of the ways in which new styles of community might be forged, supporting new forms of individuality along with new modes of interpretation and structures of signifiance. The discovery of new and alternative possibilities for relationship increases an individual's dimensions of complexity and so invents the potential for processes of structural transformation. Thus,

> between substantial forms and determined subjects, between the two, there is not only a whole operation of demonic local transports but a natural play of haecceities, degrees, intensities, events and accidents that compose individuations totally different from those of the well-formed subjects that receive them. (Deleuze and Guattari 1987: 253)

'Dismantling the face' involves exploring this interstitial space 'between substantial forms and determined subjects'. The following section considers whether a privileged emphasis on destabilising and transforming identity, as part of a political sensibility concerned with the 'undoing of the regularities of signification and subjectification' (Bogue 2003: 105), can open up spaces for thinking about new kinds of political recognition; and for putting these principles into practice.

IV. Postcolonial Recognition

Postcolonisation can be conceptualised as a process in which participants strive to produce forms of political society that enable the peaceful coexistence of self-determining communities, mutually engaged in affirmative acts of shared recognition. This transformative process involves both whole nations and subnational polities (such as Indigenous nations) in locally distinctive movements of becoming, shaped by idiosyncratic experiences of resistance to colonisation and by the particular nature of the colonial legacies they have been left with. While postcolonisation processes are locally particular, Deleuze and Guattari note that 'every becoming is a bloc of coexistence' (1987: 238). Thus, postcolonisation begins processes of becoming-minor that operate *between* the different structures of belonging defining particular settler and Indigenous communities. It prompts the transformation of all aspects of their relationship, at each of the mediating sites of their affective engagement (232ff.). Here, 'minor' does not refer

to 'minority groups' identified in terms of number or degrees of political representation, but rather is a qualitative term indicating a position 'which deviates from the majority or standard which is the bearer of the dominant social code . . . [and which] provides an element capable of deterritorialising the dominant social codes' (Patton 2000: 7). Becoming-minor is thus the creative process that 'runs between' the dominant features of a set face, and which significantly 'involves the subjection of the standard [majority] to a process of continuous variation or deterritorialisation' (48). As a process of becoming-minor, postcolonisation offers both Indigenous and non-Indigenous peoples an opportunity to redefine their modes of coexistence and, consequently, their relational identities and their ways of making sense. Globally, postcolonisation contests and transforms the facial regime currently describing (neo-)colonial cultures, social structures and the entrenched assumptions and norms of identification these continue to rely upon. In this way, postcolonialism is a 'minor', 'uncommon' or 'untimely' relationship that exists in a virtual form, 'beneath' or 'beside' the normative modes of public existence that actually comprise the socio-political arena (see Bignall 2011). Postcoloniality exists as a virtual alternative to currently dominant forms of social arrangement; its virtual existence even now contests and transforms the established 'face' of colonial and postcolonial forms of subjectivity and signification.

As a process of becoming-minor, the postcolonial reconciliation of conflicting communities necessarily refuses the impulse to coerce a unified national identity that encompasses all possible differences. In fact, postcolonialism properly calls for the construction of that which Henry Giroux refers to as:

> a notion of border identity that challenges any essentialized notion of subjectivity while simultaneously demonstrating that the self as a historical and cultural formation is shaped in complex, related, and multiple ways through their interaction with numerous and diverse communities. (Giroux 1993: 10)

Interactive relations not only enable the emergence of habitual and regular forms of social order; they simultaneously promise the permanent possibility of creating and transforming identities and the structures of sense that nurture them, when the alliances that constitute interstitial spaces between bodies undergo a critical shift. In these transitional and creative spaces mediating the interface where identities meet, new structures of social existence and practices of sense-making can arise, through the mutual becomings produced by the encounter.

Postcolonial becomings call for forms of mutual cultural recognition that are able to register and moderate the complex and uneven interaction of Indigenous and settler worlds (and worldviews) at their multiple sites of conjunction.

As Steve Hemming, Daryle Rigney and Shaun Berg have explained (Hemming and Rigney 2011a, 2011b; Hemming, Rigney and Berg 2011), in some respects a movement towards this type of cultural recognition and style of political engagement was begun recently in Australia, when the Ngarrindjeri Nation recovered its political agency in the wake of the devastating Hindmarsh Island Bridge affair, reconstituted its governing authority, and initiated a new programme of negotiation with state powers. The Ngarrindjeri Nation is located in South Eastern South Australia. The peoples comprising this nation have been recognised by all levels of Australian government as the traditional owners of the Lower Murray, Coorong and Lakes area in this region. Ngarrindjeri have never ceded sovereignty and, despite being burdened by repressive colonial government regimes, they have always acted as a resilient, independent people with a commitment to care for Country (Ngarrindjeri Nation 2007). Ngarrindjeri Country is known for its international significance, but is now severely degraded due to poor agricultural practices and the overuse of water: control over the flow of water through the Murray Darling Basin to Ngarrindjeri Country and Sea has become a site of national struggle in Australia (see Hattam, Rigney and Hemming 2007). In response to ongoing environmental destruction, and reacting to the continuing forms of colonialism evidenced during the Hindmarsh Island enquiries, Ngarrindjeri have sought to establish workable and respectful processes of political negotiation with a variety of state and settler-colonial institutions including government, museums and universities. For Ngarrindjeri, their political activities are informed by ethical obligations to 'Ruwe', which translates inexactly as 'Country' and encompasses spiritual and practical dimensions of environmental, communal and individual wellbeing (Ngarrindjeri Nation 2007; Hemming and Rigney 2011a). Ngarrindjeri have begun negotiating directly with state and federal government organisations concerned with natural resource management to ensure that Indigenous peoples' obligations to Ruwe are adequately recognised by the wider community and supported by legislation and policy.

The Ngarrindjeri Regional Authority (NRA) is a constituted governance system and is the peak political body through which Ngarrindjeri currently engage and decolonise the Australian nation.

South Australia is entering a new era of postcolonial recognition as a result of the NRA's action in the political sphere; however, despite the underlying and motivating commitment of Ngarrindjeri to Ruwe, this is not a form of recognition that is well conceived as grounded in cultural traditions or in other representative forms of identity. In fact, while Ngarrindjeri always seek recognition of their sovereign authority and active capacity in their course of their negotiations with the state, this political aspiration is not primarily framed by the principles of constitutional law. Instead, negotiations take form as contractual agreements forged with particular partners, in specific contexts and in pragmatic response to precise issues, problems and aspirations. In effect, Ngarrindjeri sovereignty is employed less as a principle of fixed political identity capable of official recognition by the settler state and its institutions, and more as an actual operation of political engagement – as a dynamic practice and a performance of authority – affirmed and exercised immediately in the process of negotiation. Here, recognition is a practice, more than a principle (see Rigney, Hemming and Berg 2008; Hemming, Rigney and Berg 2011). Ngarrindjeri efforts to engage new ways of protecting significant sites aim for genuine partnership with the state in natural resource management at all levels of discussion, decision-making and policy-writing. This self-conscious shift in political strategy has resulted in the institution of a new regime of contractual negotiation that sets clear parameters defining the ways in which the NRA is prepared to engage with the apparatus of the state and its cultural institutions (see Hemming and Rigney 2008). These contractual agreements are forged in the context of an ethic of cultural respectfulness defined by Ngarrindjeri as '*Kungun Ngarrindjeri Yunnan*' or 'Listen to Ngarrindjeri people talking'. Outcomes successfully negotiated through this agreement-making process are accordingly described as 'KNY Agreements' (see Ngarrindjeri Nation 2002).

As a result of this political activity, the NRA is cleverly dismantling the colonial face of South Australian society. Through the hard experience of colonisation, and through careful attention to the continuing power of signifying discourses and representations that buttress dominant social identities, Ngarrindjeri have cultivated an intimate knowledge of colonial faciality and its processes, and have begun to identify and experiment with the face, to observe how it may best be destabilised and transformed. Ngarrindjeri now often refuse to divulge cultural knowledge, having learned from the Hindmarsh Island Bridge affair how detrimental and damaging the sharing of knowledge can be when it is received unwillingly by closed ears and reluctant minds (Hemming and

Rigney 2008). In the course of its political engagements, however, the NRA continues to assert – and to selectively articulate – the existence of alternative semiotic systems embodied in distinctive Indigenous ways of knowing and of experiencing identity and community. These contesting forms of meaning and modes of sense-making effectively destabilise the uniformity of the dominant face and provide alternative elements for new assemblages of the social. Furthermore, because they inhabit multiple political systems simultaneously and engage in multifaceted processes of agreement-making with diverse parties on many different issues, Ngarrindjeri organisations continually send out 'probe-heads' to reconfigure specific sets of relations and thus to incrementally transform the system as a whole. In their complex and diffuse engagements with the state, Ngarrindjeri have created 'passages and bridges' that open new 'doors and thresholds'. Perhaps most significantly of all, the political strategy that emphasises the importance of *kungun*, of 'listening to Ngarrindjeri people talking', has resulted in a crucial shifting of responsibilities and the creation of new possibilities for recognition. The onus is not upon Ngarrindjeri to demonstrate the continuing existence of their cultural traditions and to prove that these are worthy of protection by the state. Rather, the onus is placed more firmly upon settler society and state institutions to listen properly, with an appropriately respectful ear, and to make sure they have accurately heard what Ngarrindjeri people have to say, even (or especially) when this is articulated in ways that are not easy for settler Australians to understand. Associated with this shift towards the new regime of political negotiation, Ngarrindjeri sovereignty does not require demonstration or official recognition by a higher power, but is assumed from the outset as a natural starting point for political negotiation with the NRA.

Of the three principles of non-imperial association – recognition, consent and continuity – proposed by James Tully (1995) in *Strange Multiplicity*, 'recognition' is identified as the most 'difficult' to realise. Tully cites many reasons why cultural recognition has frequently been denied in Western political practice, including 'the pursuit of property and the splendour of empire, the misunderstanding and fear of others different from oneself', and the very 'language' of constitutionalism, which privileges identity and uniformity (198). Indeed, the privileging of identity and uniformity in Australia's formal legal apparatus is one reason why the multiple and various voices of those Ngarrindjeri women contesting the Hindmarsh Island Bridge development remained unheard in the forum of Australian common law. I have suggested that recent political action by Ngarrindjeri is aligned with an alternative practice

and politics of recognition, which I have conceptualised here in terms of Deleuze and Guattari's ontology of complex relational individuality and their concept of dismantled 'faciality'. According to this conceptual framework, one is able to recognise others, not simply with respect to their apparent consistency of identity or the 'facial' assemblage they form part of and exist within, but more precisely as complexly relational entities that have been creatively and contingently produced through forces of engagement, tempered always by their situation within the existing assemblages of faciality that entrench the dominant structures of sense and signifiance collectively inhabited by individuals. For Deleuze, identity constantly shifts and transforms because a body is defined by the mutable affective relations into which it enters. Thus, Deleuzian principles concerning the possibility and continuity of recognition will not stem from fixed forms of identity and associated traditions, but will emerge from carefully observed processes of collective agreement about the preferred nature and good conduct of social engagements. The result is a set of political practices not limited to the generation of new versions of fixed laws or charters; the shifting nature of affective individuality entails that the process of finding agreement concerning the management of relations is best thought of as ongoing and geared towards the creation of provisional rules of (non-imperial) association, which acknowledge the socially constructive roles played by complex affective encounters. Such rules of 'recognition' will not seek to reinforce privileged forms of identity, nor prohibit the transformations that may be willed by a self-determining individual or culture; but they will set limits to the kinds of transformation a body can be made to endure during the course of its encounters.

Notes

1. This paper was produced as part of the Australian Research Council Discovery Project, 'Negotiating a Space in the Nation: The Case of Ngarrindjeri' (DP1094869). The Chief Investigators are Robert Hattam, Peter Bishop, Pal Ahluwalia, Julie Matthews, Daryle Rigney, Steve Hemming and Robin Boast, working with Bindi MacGill and myself. I would like to thank the team, and especially Daryle and Steve, for allowing me to include in this article a discussion of Ngarrindjeri negotiations in the contact zone. I am also grateful for the very helpful suggestions and critical comments made by Arun Saldanha and an anonymous reviewer. I have tried to address many of these here, but I acknowledge with regret that some of the issues requiring further development must wait for a future occasion.
2. This 'wreckage' includes the belittlement of the feminine, a problem that remains undiminished in Fanon's writing on anti-colonial subjectivity. Discussion of the ways in which Fanon's discourse problematically connects empowerment and

subjectivity with masculinity remains beyond the immediate scope of concern of this essay. For examples of scholarship opening discussion on Fanon and feminism, see Chow (1998: 55–74); Sharpley-Whiting (1997); Moore-Gilbert (1996).

3. While some versions of feminist postcolonialism also respectfully acknowledge non-human perspectives and actors, elaboration of this postcolonial and ecological imperative remains beyond the scope of the immediate discussion.
4. Deleuze and Guattari's conceptualisation of faciality is explicitly linked with a critique of racism. While the 'White-Man face' is clearly relevant to the discussion at hand, a proper engagement with work on Whiteness is not possible within the space constraints of the essay. Examples of work theorising Australian Whiteness include Ravenscroft (2012); Moreton-Robinson (2000); Hage (1998). See also Saldanha (2007).

Michaux: Xenopathic Ontology

Arun Saldanha University of Minnesota

Abstract

The hallucinogenic art of Michaux and other surrealists should never be regarded as advocating unbridled sensuous experimentation. The affects they generate may index absurdity, incongruity and comedy – they may 'ridiculise' our systematic thinking – but these affects thereby serve a more serious production of concepts. Through an abstemious aesthetics of existence Michaux becomes an ontologist of the prephilosophical sort. Carefully but ambiguously he explores the truths of matter, movement, body and modernity. As Deleuze saw clearly, the resulting ontology has strong affinities with that of Leibniz, though we have to insist on Simondon's transindividual dimension to obtain the full ontological purchase of hallucinogenic surrealisation.

Keywords: Michaux, Leibniz, hallucinogens, ontology, poetry, humour

> There is a call of the infinite, enormous, all-invading. Why? How? As the wall closes in and recedes rhythmically, and your arm seems to lengthen periodically, there are also gales of unquenchable laughter, which mean nothing either. (Michaux 1963a: 6–7)

> A dust of colored perceptions falls on a black backdrop; yet, if we look closely, these are not atoms, but minuscule folds that are endlessly unfurling and bending on the edges of juxtaposed areas, like a mist or fog that makes their surface sparkle, at speeds that no one of our thresholds of consciousness could sustain in a normal state. (Deleuze 1993: 93)

I. Speed and Representation

Henri Michaux drops the word 'xenopathic' just once when discussing the proximity of madness and intoxication (1963a: 158).[1] An obscure

clinical term, xenopathy (*xenos*, foreigner + *pathos*, affliction), according to one dictionary, connotes 'the compelling sense of objectivity that may lend hallucinations a quality similar to that of objects existing in the extracorporeal world' (Blom 2009: 547). In Lacanian psychoanalysis the term pops up to highlight the alienating effects of language and thought. It is mentioned twice (1982: 127, 292) in Lacan's meticulous 1932 doctoral thesis on the role of personality traits in paranoid psychosis. Lacan describes the perplexity and irruptive aspect of the primary delusions of psychosis as an automatism akin to severe intoxication, though the latter is barely specified. At this point Lacan builds on the writings of, amongst others, Janet, Jaspers and James – as Christian Kerslake (2007) would note, psychologists with a more transcendental notion of the unconscious than Freud's – as well as his psychiatrist friend Henri Ey, who would later champion Michaux. Lacan's early theoretical grappling with schizophrenia as transcendental problem would become fundamental to Deleuze and Guattari even if he himself already ends up reducing delirium to family and sex.

For Michaux, xenopathy concerns far more than hallucination. It corresponds to what he calls thoughts at speed c whose instability is absolute and which command the subject instead of vice versa. Speed c effectively amounts to the obliteration of thought, a scary flash wherein the brain jumps outside memory and meaning altogether:

> Anyone who has experienced it knows that what is involved is no longer a hesitation of consciousness. It is the impossibility even of hesitation which becomes the phenomenon, there is no longer any consideration given to the elements to be envisaged. (Michaux 1963a: 167)

The *xenos* incorporated in hallucinogenic experimentation is no othering of the foreign, although that certainly tends to interfere. Xenopathy delves beyond self and other, an intensive journey into space unmappable within common cultural coordinates. Xenopathy summons the asubjective as Deleuze and Guattari conceive it in *A Thousand Plateaus* (1987: 171), the faceless, the nameless, the statistically insignificant, a non-site Michaux dissolves into as no longer Michaux, no longer human. Spatial but non-localisable, *speed* is the most precise term for intoxicated perception: 'all drugs are modifiers – usually accelerators – of the mind's speed (of images, thoughts, impulses)' (2002: 153–4). Hence, '[i]ntensity increases along with speed, an intensity revealing and emphasizing the speed already there' (1974: 22–3). Deleuze and Guattari agree: 'All drugs fundamentally concern speeds, and modifications of speed' (1987: 282).

The literature on Michaux is vast yet his identity spurious.

> 'Me' is never anything but provisional (changing in relation to this one or that one, an ad hominem 'me' changing in another language, in another art) and pregnant with a new character who will be set free by an accident, an emotion, a blow on the head. (Michaux 1994: 77)

'Michaux' names a hazy convergence of flows and substances: '*An average of "me's", a movement in the crowd. In the name of many, I sign this book*' (ibid.). It is implicitly Michaux again that Deleuze and Guattari echo when they famously start *A Thousand Plateaus* saying the two of them constitute, as authors and names, a veritable crowd. Earlier prominent authors who celebrated Michaux's idiosyncratic style include Blanchot and Borges, Gide and Ginsberg, Paz and Paulhan. While these fellow artists are right to honour Michaux's linguistic inventiveness, I will instead follow Evelyne Grossman's Lucretian appreciation (2002) of Michaux as thinker of the 'essence of language', which is not representation but preverbal presentation of being, most intensely so while mescaline exhorts it to dismantle itself from within. As translator David Ball observes, Michaux 'uses language just the way poets are not supposed to, as if it were transparent, as an instrument, to get at the reality beyond it – extraordinary, strange, and mobile as that reality may be' (in Michaux 1994: xxxiii).

Most scholars discern a post-Romantic sensibility for the darker sides of the modern self broadly following the psychoanalytically inclined existentialism of Raymond Bellour (1965). In Sartrean vein Blanchot had already in 1944 identified the impetus towards inhuman magic that would mature in Michaux's drug writing:

> Consciousness loses itself amid the things.... On the one hand everything is possible – the illusion of inner being which realises everything it imagines – and on the other nothing is possible, as trapped by the thickness of matter the spirit is nothing more than congealed patience, indifferent to the abyss, a sticky paste not moving.' (Blanchot 1999: 60; my translation)

Closely affiliated with the surrealist movement, Michaux was certainly influenced by Freud and Sartre. But he also strongly distanced himself from psychoanalysis already from the early 1920s, mainly because, like Deleuze would later, he could not agree with the importance accorded to sexuality (Brun 1999: 46ff.). Likewise Michaux was sceptical about existentialism's ideal of an unadulterated individuality and the interpretive quest for meaning. Scholarship – Laurie Edson's otherwise unarguable discovery of Michaux's mappings of intensive

movement (1985) or Jean-Pierre Martin's otherwise quasi-Deleuzian notion of the poet's vagabondage (1994) are exemplary – is stuck in representationalism as Deleuze maps it in *Difference and Repetition* (1994: 29ff.). Michaux scholars cling to a notion of individual identity under its expressions and spacetime; to already-judged analogies (equivocity) amid kinds of being and the hallucinogenic imagery; to classic oppositions such as word/world, self/other, light/dark and normal/pathological; and to convenient resemblances drawn between epistemic objects like madness and intoxication. Only recently have scholars – again spearheaded by Bellour (1998) himself – started exploring the close affinities between Michauldian poetics and Deleuzian thought (for example, Fondo-Valette, 1997). Hence Bellour dedicates the definitive *Bibliothèque de la Pléiade* edition (Michaux, 2004) to Deleuze and Guattari, and draws many connections in its introduction and bibliographical notes.

One reader of Michaux as ontologist is François Trotet (1992), who argues that void is the ultimate objective of Michaux's poetic and hallucinogenic meditations. By perceiving things, light, space, time and body as mysteries to be intervened in, Michaux embarks on a voyage towards the Universal Emptiness all bodies intrinsically tend to. Human finitude is overcome by way of recuperating the infinite inertia it tries to escape. This austere defence of becoming-nothing is akin to Deleuze's late conceptualisation of beatitude in the impersonal yet singular immanence of *a* life (2001). It is true Michaux himself had become swayed by Eastern philosophy and ever more reclusive over the sixties and seventies (see *Jours de silence*, Michaux, 1978). In a rare letter to his interlocutor he prefers the Taoist over the psychoanalytical or literary interpretations (Trotet 1992: 330). But Trotet is finally too close to the existentialist-humanist readings, with the body 'suffering' its hallucinations, and nirvana replacing authenticity as scarcely attainable state of bliss. Understood through Deleuze, Michaux encounters not void but plenitude, as the absolutely immanent, endless multiplication (multi-pli-cation), albeit by virtue of void as medium as in ancient atomism. Moreover, if it is truly immanent *to* a life perceiving/prehending it, true plenitude and becoming-manifold never measures up to a universe-encompassing totality.

The notion of the thinking body found in Michaux scholarship such as Anne Brun's *Henri Michaux ou le corps halluciné* (1999) has to be pushed beyond its limit. Here we will ask not only how drugs were integral to the poetic project but also whether they necessarily – neurochemically – entailed an ontological project too. What

this body thinks is not itself qua altered by hallucinogens but, in the legacy of Lucretius and Leibniz, physical reality as ever-deviating from itself and thereby reshuffling the forces constituting the human as such.

II. The realism of surrealism

> You, invading me
> with howl howl swells
> all over ocean swells
> smoking dense
> and bellowing,
> are the night.
> (Michaux 1994: 56)

In this more moody of Michaux's early poems ('In the Night', 1930), we encounter a theme that will run through his entire oeuvre: the production of thought from amorphous obscurity. How is it that 'darkness stirs' (*la nuit remue*, the title of a 1935 collection), shouts that night is dense and twirls like smoke, that it swells like ocean, intimately invading the poet? All art responds to a fluid night replete with potentiality. Poetry is a form of exorcism 'to keep at bay the surrounding forces of the hostile world', as Michaux (1946a: 9) puts it in his most melancholic collection. It is within this tragic framework of World War II that we begin comprehending Michaux's turn to hallucinogens in the 1950s.

From De Quincey's confessions and Baudelaire's denunciations to the diaries of Crowley and Cocteau, bohemians have traditionally dramatised the realms of drugs through the themes of pain not pleasure, misery in dark alleys not enlightenment in salons and meadows. Michaux is no different. Deleuze and Guattari (1987: 282–7) draw on him and Artaud to warn of the false promises of drugs: 'you will get stuck in a mad race between the imperceptible and perception, a race all the more circular now that everything is relative'. But one wonders why intellectuals are drawn to drugs at all. Light *through* darkness, knowledge *through* the abyss … Michaux demonstrates there is a creative process underlying the ordeals he suffers without which we would not be writing about him at all. Moreover, to the extent that drugs have ontological significance, the conceptual distinction between addiction and psychedelic experimentation, which Deleuze and Guattari brush aside, becomes indispensable.

In *What is Philosophy?* Michaux makes an important appearance in order to qualify the plane of immanence. Philosophy is an enterprise fraught with danger:

> Precisely because the plane of immanence is prephilosophical and does not immediately take effect with concepts, it implies a sort of groping experimentation and its layout resorts to measures that are not very respectable, rational, or reasonable. These measures belong to the order of dreams, of pathological processes, esoteric experiences, drunkenness, and excess. We head for the horizon, on the plane of immanence, and we return with bloodshot eyes, yet they are the eyes of the mind. Even Descartes had his dream. To think is always to follow the witch's flight. Take Michaux's plane of immanence, for example, with its infinite, wild movements and speeds. . . . [O]ne does not think without becoming something else, something that does not think – an animal, a molecule, a particle – and that comes back to thought and revives it. (Deleuze and Guattari 1994: 42)

Michaux is listed among other renegade 'thinkers' like Rimbaud, Artaud, Kafka and Miller who are 'half philosophers but also more than philosophers' (ibid: 67). In emphasising the unconscious, unknowable and ungainly, Michaux is protophilosophical while retaining ironic distance from philosophy proper. Still following his feeling of being a crowd, he confronts philosophy for assuming it knows *what* it thinks and forgetting the desires that spurred it and the new obscurities it inevitably creates:

> The history of Philosophy is the history of the false positions of conscious equilibrium that have been adopted one after another. . . . Any progress, every new observation, every thought, every creation, seems to create (at the same time as light) a zone of darkness. (Michaux 1963a: 78)

A zone of pregnant darkness accompanies and permeates every step towards enlightenment.

If thought enters a plane of immanence through becoming-the-unthinking, Michaux's writings and drawings on the hallucinogens bustle with (embryonic) thought. Shedding rationalising or moralising light on hallucinogenic experience will dispel its dark becomings. Michaux lent his voice to a 'scientific' film, *Images du monde visionnaire* (Michaux and Duvivier 1964), commissioned by Sandoz Pharmaceuticals, the company that synthesised and marketed LSD (Saldanha 2007). The film lauds his 'extraordinary clarity and incredible precision', but the commentary extracted is disappointingly sensationalist. More interesting are Michaux's preparatory notes for the cinematography (collected in Michaux 2004, III). The film's first part, on mescaline, showing an 'addict' at the mercy of his hallucinations, is indebted more to the horror genre than education. The original avant-garde music by Gilbert Amy, a student of Boulez (whom Michaux

had already influenced) and Stockhausen, is more consistent than Eric Duvivier's stroboscopic collage of granular, vaguely geological images. The visuals of the second part, on hashish, are more organic, with a surreal colonialist feel (birds, masks, skulls, tropics). The film on the whole sides with prevalent fears of becoming-inhuman that these distinctly non-European drugs entail, perhaps thereby justifying the purchase of LSD for psychological research.

Though Michaux's psychedelic writings are unclassifiable, they are usually considered closest to surrealism. But what exactly does surrealism add ('sur') to reality? The claim here is that the epistemological realism of science is strengthened by the bizarre realms conjured by surrealism. That stumbling on and elaborating truth involves agony and isolation, hence courage, is a supremely realist principle as much as it is a surrealist method. In an article on the horror/fantasy writer H. P. Lovecraft, Graham Harman writes:

> Against the model of philosophy as a rubber stamp for common sense and archival sobriety, I would propose that philosophy's sole mission is *weird realism*. Philosophy must be realist because its mandate is to unlock the structure of the world itself; it must be weird because reality is weird. (Harman 2008: 334)

Instead of Husserl and Heidegger, the weird realism this article develops follows Deleuze's more science-friendly thought. But what Deleuzian realists such as Manuel DeLanda (2002) choose to elide is that Deleuze and Guattari provide more on the affects of art, madness, love, sex, intoxication and alienation as instigators of philosophy than the percepts of science.

Surrealism is therefore to be rethought against all lingering postmodernist relativism. As a subdiscipline of surrealism, drug experimentation should never be understood in Romantic individualist terms. One's own body is to be explored as a cold rarefaction mirroring that of capitalist society and the universe. Surrealism, just like scientific realism, requires a saintly kind of ascetic submission to what has to be done. In a concise 1929 poem Michaux intuits the methodology at stake:

> **A Saint**
> While circulating through my accursed body,
> I came to a region where the parts of myself
> were few and far between; to live there,
> you had to be a saint. In times gone by,
> I had truly aspired to sainthood, but now

> that illness was forcing me into it, I struggled against it and I still struggle, and it's obvious that I'm not going to survive like this.
>
> If I had been given the opportunity, fine! but not to be forced into it – no, I just can't stand it.
>
> (Michaux 1994: 11)

Paradoxically, reality becomes densest there where the saint (Anthony of Antioch, Hildegard, Teresa; or Spinoza, Beethoven, Nietzsche, Einstein) inhabits almost unbearable sparseness. The plane of immanence he or she is by force led to demands not abandonment but a spiritual kind of activism, which distinguishes surrealisation from the disastrous rediscovery of reality that is psychosis. It is such method in madness that psychedelic rationalism entails, a concerted becoming-foreign to oneself, an aeration of one's flesh, an antiphenomenology fundamentally alienating the user from his or her own senses, dwelling, utensils, surroundings, neighbours: 'No longer a body, no longer evocable, no longer his own, nothing but a place. And he is excluded from it' (Michaux 1963a: 132). Gone from oneself, but only to return to tell others about 'it'.

III. Gossamer

Through the asceticism of psychedelic perception six features of reality can be described: fractality; surprise; intensiveness; pointillism; infinitude; objectlessness. First, reality is shown to be fractal, 'holey space', as Deleuze and Guattari, inspired by Mandelbrot's mathematics, call it (1987: 486–7). The famous audiovisual fractalisations of LSD and psychedelic music are merely paradigmatic of what happens generally *to* consciousness even during sobriety or sleep. Further ruminating about his being-a-crowd mentioned above – in his 1936 afterword to *Plume*, well before taking mescaline – Michaux concluded that 'every thing is crowd, every thought, every instant . . . . Nothing ever definitively circumscribed, capable of being circumscribed, everything: relations, mathematics, symbols, or music' (1994: 77). The fuzziness of things, systems and temporalities does not simply come about because of their interrelatedness or because their boundaries are erased but follows from their internal multiplicity. Michaux says about mescalinic perception: 'An aerial impression replaces the impression of density. Matter has ceased to be indisputable' (2002: 170). Returning to Anaximenes's

physics of 550 BC, surrealisation reveals that reality is built from air. The interstices of the world's fabric are breathing, turbulent.

Second, surrealisation is *come upon* as a surprise one has nonetheless co-authored. There are unpredictable shifts in perception because subjectivity curves the world instantly towards its own unfathomable whims. Surprise is what concerns Michaux's penultimate explicitly mescalinic poem, *Par surprise* (1983a), in which every moment catches him off guard and the material reality of his studio reveals itself, rather unpleasantly, to be nothing but a loosely held together bundle of risks and intensities: 'Continuous solicitations, which I resist. No I won't throw myself off the height of this balcony. From the fourth floor, it would be stupid' (1983a: 28; my translation).

Third, all psychedelic experience is voyage in intensity, the clearing of inner space. Tripping on hallucinogens in some ways exemplifies Deleuze and Guattari's Leibnizian definition of deterritorialisation:

> The more interior milieus an organism has on its own stratum, assuring its autonomy and bringing it into a set of aleatory relations with the exterior, the more deterritorialized it is .... Every voyage is intensive, and occurs in relation to thresholds of intensity, between which it evolves or that it crosses. One travels by intensity; displacements and spatial figures depend on intensive thresholds of nomadic deterritorialization (and thus on differential relations) that simultaneously define complementary, sedentary reterritorializations. (Deleuze and Guattari 1987: 53–4)

Physical movement requires a prior organisation of thresholds of intensity. Michaux, like Deleuze, seldom ventured out of Paris, but their nomadism was of the intensive kind. Intensive deterritorialisation shows space and time do not constitute the empty preprogrammed dimensionality associated with Kant. Space and time do not only form a continuum but spacetime is fully animated from within.

Fourth, this animation takes the form of *pointillisation*, as in Seurat paintings. A recalcitrant proliferation of faculties means subjectivity is awash in a larger oceanic spacetime it continually risks disappearing in:

> And you come upon multitudes. A host appears, of points, of images, of small forms, which pass very, very very quickly, a too swift passage of *a time which has an enormous crowd of moments*, which streak past prodigiously. *The coexistence of this time* of multiple moments with *normal time*, not wholly vanished, which returns at intervals, only partly obliterated by the attention given to the other, is extraordinary, extraordinarily unreal-izing.
>
> The coexistence, too, of *space having innumerable points* (and all very 'detached') with more or less normal space (the space around you which you

> look at from time to time), but drowned, as it were, and sub-perceived, and, in a parallel way, extraordinary.
>
> … Multitude in consciousness, a consciousness which spreads until it appears to double, to multiply itself, avid of simultaneous perceptions and knowledge, the better synoptically to observe and embrace the most distant points. (Michaux 1963a: 4; original emphasis)

Xenopathic ontology can be readily discerned here. Psychedelic perception pixelates and linearises reality (see the mescaline drawings collected in Michaux, 2000 and de Zegher, 2000). Occurring at speeds normalcy cannot endure, perception leaps outside the ordinary horizon. Psychosis and suicide are nonetheless staved off to the precise extent that normative spacetime can still be returned to at necessary intervals. On the one hand, it seems there is a simultaneity of worlds which the mind selects from as it travels while nothing can be predicted. On the other, the mind *automatically* follows course and extends to the outer reaches of the universe. The smooth surface of ordinary consciousness hides magmatic layers made up of discrete points ceaselessly crowding about. This 'detachment' of points relative to each other comprehended through 'sub-perceiving' and drowning in them will structure Deleuze's Leibnizian reading of Michaux.

A fifth discovery of psychedelic perception is that fractality, oceanicity, crowding descend all the way down. The mind becomes infinite: 'the taking over by the "small" – the micro-undulations and the micro-perceptions' (Michaux 1963a: 141). Mescaline is an unstoppable 'infinity-machine', forcing Michaux to accede to 'infinite fragmentation, the teeming state composed of what is smallest, which divides and overruns everything' (2002: 70). Zooming in has no humanly attainable limit. About LSD, Michaux says: 'Everything in thought is somehow molecular. Tiny particles that appear and disappear. Particles in perpetual associations, dissociations, reassociations, swifter than swift, almost instantaneous' (1974: 13). Now, this infinitude within the minute is supremely Leibnizoid, as Leibniz is the thinker of immaterially small dots. In all psychedelic art and discourse, the recurrence of the Leibnizian tropes of spirals, vibration, curvature, oscillation, swarms, tumult, vital force, *mathesis universalis* and divine intelligence is well known (a good example is Narby 1998). Deleuze knows the hidden complicity (*complex*: folding-together) of Leibniz and hallucinogens when he writes in *Difference and Repetition*: 'Leibniz discovers in the clear, finite idea the restlessness of the infinitely small, a restlessness also made up of intoxication, giddiness, evanescence and even death' (1994: 45).

Michaux's visual work and his drug testimonies explicitly (*ex-plicare*: unfolding-wise) engage all these themes, under the overarching problematic of infinitude. The Kantian premises of human limitedness and imperatives are torn asunder. 'It's the end of finitude. You are freed from it' (2002: 171). The graphic accompaniments to *Paix dans les brisements* ('Peace Amid Shatters', 1959) depict the same vortices towards infinity that Michaux's poetry grapples with, albeit in a different way. The psychedelic subject becomes medium for infinity realising 'itself' anew: 'An obsessive, vexatious infinite which rules out everything but itself, return to itself, passage through itself' (1963a: 14). This is why Blanchot (1999: 96–7) can speak of the *purity* of mescalinic infinity. That the universe becomes conscious of itself is the most metaphysical and trippy of Hegel's philosophy. In *Difference and Repetition* Deleuze considers the infinities of Hegel and Leibniz as complementary (but both limited in getting at difference in itself). When it comes to Michaux's ontologising, however, the abrupt surprise and the ever-present possibility of death or madness foreclose anything resembling Hegel's teleological directionality.

The question is what sort of knowledge Michaux then gains from the abysses he almost plummets in. Not knowledge *about* anything; abyssal knowledge is objectless. The mescalinic subject 'cannot turn away from this external reality: which gets its life from him. A psychic cord unites the one to the other. He remains subject to its attraction' (Michaux 1963a: 143). The residual phenomenology in statements like these shows Michaux himself still clings to a subject/object epistemology. Reality *equals* the 'psychic cord' – it consists of the ceaseless re-entangling of such cords. The hallucinating body does not reflect but deepens reality into infinite turbulence (Michaux 1975). Leibniz would perhaps understand that it is as monad-folding, as singular genetic 'world-view' (Perkins 2007: 79ff.), that the hallucinating subject reveals the self-perceiving of reality.

André Gide discovered early on (1941: 26) that Michaux's poetics is full of musicality, music being the form par excellence of objectless perception. On mescaline Michaux (1963a: 57ff.) finds the same landscape-intensity in Messiaen as Deleuze and Guattari (1987: Plateau 11) do more philosophically. Deleuze argues (1993: ch. 9) that an aesthetics of folding encapsulates Leibniz's famous notion of the 'perfect harmony' of the universe, progressing smoothly from textile to painting, sculpture, architecture, urban planning, theatre and finally music, becoming increasingly spiritualised along the way. High on hash, Michaux similarly experiences streets as music, but becomes annoyed

with their bourgeois mediocrity: 'Certain houses, when I passed in front of them, quite likely Mendelssohnized also' (1963a: 117). Psychedelic aesthetics can only be synaesthetic but does not necessarily please.

The sixth and last realisation under hallucination breaks with the subject/object machine inaugurated by Kant. Surrealisation discovers that signs have no object in the common sense. So-called representation is not the splitting of sign into signifier and signified but immediate present-ation of myriad maelstroms of matter whose traces *constitute* perception. While staring at photographs on marihuana, Michaux rediscovers the depth of things and landscapes even if he has never seen them: 'Deep-napped carpets, horse's or sheep's hooves, and also the granular, the prickly, the bumpy, the woody, the wrinkled, the porous, the knotty, the moist also and the hollow, the elbowed, all this comes to you "as in nature" ' (1963a: 96). The photographs do not mediate. Physicalities directly pass through Michaux's mescalinic eyes, making his vision haptic *according to Henri Michaux's living individuality*. There is neither empiricist nor Romantic access to 'the thing itself'; what these eyes perceive, partially, *is* what reality is, namely nothing but perception, perspectivism.

Michaux writes:

> Never (or I am greatly mistaken) has anyone really seen objects, or monuments, in the mescaline vision. Composed of wavy lines, of shaking, spaced out dots, not forming a whole, they have never been seen, but have always been interpreted. It is on the basis of dots, dots in movement, that people have been willing to recognize an object, or walls, on the basis of webs of gossamer . . . less than gossamer. (Michaux 1963a: 11)

He stops shy of generalising: all perception is made of gossamer, not objectification. Deleuze agrees: '*Every perception is hallucinatory because perception has no object*' (1993: 93; original emphasis). If hallucination and dizziness return throughout Deleuze's explications of Leibniz, it is because they signal where Leibniz's explosion of Cartesian dualist rationalism is most tangible. Objecthood is an illusion of common sense and social norms. This is a fortiori the case with psychedelic perception, during which nothing quite sticks: 'That wonderful thought / but what *was* that wonderful thought?' (Michaux, 1963a: 64). Once revealed, the object-destroying creative force can forever resurge. As Michaux writes in *Emergences/Resurgences*: 'Not having taken any hallucinogenic substances in years, the call to fragmentation remains. / I often begin drawings only to see them decompose, divide, redivide ad infinitum' (2000: 70). Surrealism's and

modernism's streams of consciousness capture not simply the inexorable fluidity of reality, but the fact reality sprays infinitely out from subjects insofar as they perceive.

IV. Ridiculisation

There is a seventh sense of reality that Michaux's asceticism only implicitly accounts for, what Gilbert Simondon (2005) calls *le transindividuel*. Transindividuality is a necessary level occurring at the intersection of, and completely immanent to, psychic and collective individuation. This self-organising meso-level draws information from the preindividual residues of psychic individuations to form our recognisable relational identities and differences. As Muriel Combes (1999: 62ff.) has it, the emergence of an individual always also generates the 'more-than-individual', which will further sculpt that individual. Anxiety like Zarathustra's are ordeals precisely because in them the individual discovers that he or she is no mere sum of social influences but partakes in a saintly, heroic kind of universality of being-influenced (Simondon 2005: 255ff; 280–4). Simondon does not consider the role of hallucination or intoxication in ontogenesis, and ordeal does not have to be our starting point. With Spinoza it would seem obvious that profane affects of joy are also shared.

Deleuze says that unlike the Socratic or Kantian models in which truth is achieved by and for persons or individuals, the nonsense of the *Alice in Wonderland* kind is delightfully destructive of individuality and much more productive: 'Humor is the art of surfaces and of the doubles, of nomad singularities and of the always aleatory point' (1990: 141). But one has to learn to love the absurd. In *Laughter*, a book disregarded by Deleuze, Bergson writes: 'the comic spirit has a logic of its own, even in its wildest eccentricities. It has a method in its madness' (1911: 2). Bergson lays out what we could call the transindividual constitution of all laughter. Born in our evolved social intelligence, even the lone psychotic's laugh aims at collectivisation. Against humanistic celebrations of comedy in the Erasmian tradition, and like Deleuze, Bergson emphasises that humour refers us to the impersonal, the *automatic*, the grotesque beneath the familiar:

> However regular we may imagine a face to be, however harmonious its lines and supple its movements, their adjustment is never altogether perfect: there will always be discoverable the signs of some impending bias, the vague suggestion of a possible grimace, in short, some favorite distortion towards

> which nature seems to be particularly inclined. The art of the caricaturist consists in detecting this, at times, imperceptible tendency, and in rendering it visible to all eyes by magnifying it. (Bergson 1911: 26)

Caricature can reinforce faciality, as the Danish racist cartoons of Mohammad did, but only because it first releases probe-head particles of quirkiness (Deleuze and Guattari 1987: Plateau 7). More fundamentally, Bergson indicates that humour alerts us to the physicality of human embodiment that only humans can appreciate:

> the gradual passing from the dim and vague to the clear and distinct is the method of suggestion *par excellence*. I fancy it might be found to be at the root of a good many comic suggestions, especially in the coarser forms of the comic, in which the transformation of a person into a thing seems to be taking place before our eyes. (Bergson 1911: 60)

The humour of Michaux's earlier poetry is often called dark, even harsh. His almost sadistic vignettes of the travels of Plume, an alter ego introduced in 1930, paint a portrait of an insipid *petit bourgeois* (Michaux 1963b). But Plume's predicament in an implacably hostile world has a certain affable fatality to it. By hinting at recognisable sociology, Michaux's caricaturing avoids becoming *l'art pour l'art*. Even the adventures 'elsewhere' to imaginary lands (see especially Michaux 1946b) are too uncannily familiar to be categorised as fantasy/sci-fi. Michaux echoes, despite his hatred for Belgium, a particularly Belgian inclination toward self-effacement, never allowing absurdism to flip over into the arrogant nihilism of the Dadaists. Blanchot writes in 1959 that Michaux

> is the writer who, so close to himself, is united with the foreign voice, and who came to suspect that he had been trapped and that what is expressing itself here with summersaults of humour is no longer his voice, but a voice imitating his. (Blanchot 2003: 222; translation modified)

Plume incites not sympathy or scorn, but an ironic hence rational understanding of the social world's intrinsic irrationality. Understood through Deleuze and Guattari (1991), Plume's tragicomic mediocrity marks not a lack but a *conceptual persona*, purely abstract misfortune anyone can 'identify with'.

The ascetic method of his later hallucinogenic work turned Michaux into an avowed solipsist. While his first extensive report on intoxication, a prose-essay on ether in 1935 (in Michaux: 2004, I), was still structured around its effects on the erotic space of the heterosexual couple, the mescaline writings are curiously devoid of any Other. In the last

mescalinic poem, *Le Jardin exalté* (1983b), the woman friend Michaux is tripping with is no more than a prop of his exalted garden, the dislocations of her face fascinating him a thousand times more than Bergson was fascinated with caricature. But when the drug kicked in there was also, for once, a hint of intercorporeality:

> Does she read my thoughts, as she will soon say, or do I hers, without saying anything? Is this increase in the subtlety of visual perception simultaneous, in her as in me, which suddenly and therefore on purpose seems to point out details until now unnoticed? (Michaux 1983b: 9; my translation)

These profound questions demonstrate the transindividual affects of language, vision, touch and music that enter any psychedelic session. Even the sadhu does not encounter ontological strangeness absolutely alone. Michaux feels the presence of not just his friend but Germany, Karnataka, Eden.

Progressing from misery to mysticism, the drug writings are nonetheless not devoid of humour. Michaux discusses the laughing fits famously induced by cannabis:

> One thing leading to another, there is then an interminable succession of bursts of laughter, ever racing, after a moment's halt to get its breath, starts off again, impossible to satiate. Laughter on conveyor belts. Laughter without any subject for laughter. (Michaux 1963a: 13)

It laughs like it rains, with nothing specifiable to be laugh *about*. The world is its own caricature:

> Prodigiously amused, I sat there enjoying the exorbitantly comical shape of that country [Argentina], whose humorousness had escaped me till that moment and again completely escaped me a couple of days later. . . . I simply, in an ecstasy of absurdity, silently plunged into its ineffably funny shape, an undeserved misfortune, it seemed to me, from which this country would never recover. (Michaux 2002: 96–7)

Something as consequential as national territoriality belies a ridiculousness normally – ideologically – restrained. Laughing at borders is a transindividual event, exposing the idiotic contingency of geopolitics.

On the 'conveyor belt' of laughable nonsense Michaux (1963a: 86–7) ends with a philosophical, or rather metaphilosophical, proclamation:

> **SYSTEM WITH AN AUTONOMOUS POWER**
> **OF RIDICULIZATION OF THE SYSTEM**
> Startling progression
> seizing all sonority
> leaving the meaning

plunging toward more resonance
toward more
toward more
more
More
M O R E

On Anne Brun's psychoanalytic-existentialist reading (1999: 119–21) this passage stands for the absorption of meaning and the 'I' by the sonorous quality of the poem's signifiers against the enveloping whiteness of the page. Signification is, however, the tip of an iceberg of events that ultimately implicates all reality ('leaving the meaning'). It might seem Trotet's 'Asiatic' interpretation has purchase: nothingness asserts itself with increasing blackness until the subject meditating on this assertion attains satori. But neither the dissolution of ego nor vertical transcendence is at issue. What matters is the descent of language into the nonsense of the fattening black bars, a *horizontal* operation of 'ridiculisation' (*ridere*, to laugh) unleashed by the poem on itself. What might ridiculisation mean? Pace Bergson and Simondon, it can only designate the rendering-automatic of individual perception and thought under a transindividuality necessarily exceeding psychic individuation by an immeasurable margin. The booming speeds of hallucinogens ('toward more / toward more') are not simply neurochemical phenomena but challenge a 'system', by exposing its unspeakable absurdity. Which system? It does not matter: linguistic, political, aesthetic, philosophic – all are shown to already contain an irrepressible, 'autonomous' force of zaniness.

Lacan's PhD (1982) opens and ends with a Spinoza quote: 'The affect of one person differs from the corresponding affect of another as much as the essence of the one person differs from that of the other' (2001: III, P57). If a person's essence is the particular mixture of desires and appetites joining in that person, Lacan implies that A's psychosis will differ from B's as much as their natures differ, including, one would imagine, their ingestion of mind-altering substances. Spinoza

adds a scholium ignored by Lacan: 'the joy by which the drunkard is enslaved is altogether different from the joy which is the portion of the philosopher'. Both inebriation and thinking cause happiness, but alcohol tends towards dependency ('enslaved' is too strong for *ducitur*, 'is led by'), while philosophy is the supreme mastery of affect.

Yet mentioning these two joys in one sentence begs the question whether they are *altogether* different. Michauldian ontology holds that all intoxication is protophilosophical and all philosophy disavows the madness it has to court. The more reason builds, the funnier it can be.

V. Folds of the Baroque

Deleuze's argument in *The Fold* is that monadology formalises in a philosophical system what the baroque did in art and infinitesimal calculus in science, namely folding the universe according to the singularity of practices.[2] As Gregg Lambert (2004) has argued, the baroque condenses the richness produced in Europe's exploration of the world during the seventeenth and again in the twentieth centuries (especially in Borges), rendering Leibnizian dizziness the substratum of modernity itself. Raymond Schwab's neglected argument in *The Oriental Renaissance* (1987) – itself quite a baroque book – is that if the Middle Ages ended with the rediscovery of antiquity, the baroque and Romantic periods of European culture were fuelled by the zealous scholarship of the Sanskritists. Pushing this anti-Hegelian reasoning further, Laura Marks (2010: 140–3) discovers that the West's baroque sensuous aesthetics of enfoldment and visual and mathematical explorations of algorithms, revived in the psychedelic art of 1960s and again in today's digital conceptual and installation art, derive ultimately from Islamic architecture and mysticism. Transcendent-monotheistic and immanentist-pluralist ways of sensing have since early medieval Iraqi and Mediterranean civilisations been creatively entwined, while the exotic has always been far more implicated than was admitted by the xenophobes.

Michaux's poetic and psychedelic writings glisten with baroque images: ornamentations, caverns and a preposterousness which tends to disturb or embarrass him. 'Thoughtforms pass by, then pass by again, unrecognizable. Associations become baroque' (2002: 163). On mescaline, baroqueness surfaces as theatre of the absurd, a doubling of everyday life: 'A baroque performance, perhaps not so far from normal action as we think. The extraordinary created from what is almost ordinary, but as an apparition' (1974: 39). Such creation

of an immaterial apparition from the given is what Deleuze calls the fold. The six psychedelic principles – fractality, surprise, intensity, pointillism, infinitude, objectlessness – can now be collapsed into the topological-metaphysical principle of folding. Indeed, Deleuze writes: the 'theme of the fold haunts all of Michaux's work – writing, drawings, paintings' (1993: 155, n.20). And when introducing this 'criterion' for the conceptual link baroque-Leibniz in the central chapter 'What is Baroque?', Deleuze acknowledges his main inspirations:

> Fold after fold: if the Baroque can be stretched beyond its precise historical limits, it appears to us that it is always by virtue of this criterion, which inspires us to recall Michaux when he writes of *La vie dans les plis* (Life in the folds), or Boulez when he looks to Mallarmé and composes 'Fold after Fold', or Hantaï when he constructs a method from folding. (Deleuze 1993: 33–4)

Michaux composed *La Vie dans les plis* (1949) not long before encountering mescaline, while still musing over the ironies of modernity, still conjuring 'inexpressible places' and bizarre enslaved races (the Meidosems). If there is a consistent concept of folding behind this wonderful volume, it revolves around the inter-invaginations – with Leibniz, the compossibility – of fantasy and common sense that poetry incites (see Bellour's notes in Michaux 2004: II, 1097–9). This is why in 1941 Blanchot (1999) had called Michaux the 'angel of the bizarre'. Strangeness is near, the too-near frightens; Michaux is not angelic in any comforting way. His baroque foldings retain too much darkness and surprise to be harmonious: Boulez not Monteverdi. Mescaline will only deepen the inter-invaginations, but now into paranoia:

> ocelli
> infinite ocelli pullulating
> I go along with the ocelli
> with the minute rips, the volutes
> I fold myself into a thousand folds which fold me, unfold me
> tiny traitors which treacherously, vertiginously fray me
> trembling, I allow the bells to be rung endlessly
> which for nothing keep summoning me
> (1973: 63; my translation)

A thousand swarming insect eyes and tiny ringing bells entangling Michaux like the Lilliputians did with Gulliver, forcing him to consider how to comport himself: this is the folding of one's outside. Though the hallucinogenic reporting abandons the lightness of the earlier poetry, ontologically Michaux remains committed to gleaning difficult truths

from the density of expanding, beckoning reality. This gleaning, this ex-plication, is what will inspire Deleuze and, as we will see, even serve as a model for ethical subjectivity.

VI. Leibniz minus God

'Contrary to Descartes, Leibniz begins in darkness,' writes Deleuze (1993: 90). This metaphysical darkness is a realm unthinkably complex (*com-plexus*, plaited-together) with minute differentials, out of which clear thinking is gradually filtered. Like Bergson, Leibniz stresses the *automatic* genesis of thought, but more than any other philosopher he envisages a kind of divine Calculator behind it all and can therefore be supremely optimistic about the rational predispositions entrusted to humans. Is it possible to be true to obscurity's propensity for illumination without God looming into the picture?

We have already seen that psychedelic perception is Leibnizoid. Deleuze writes: 'Leibnizian memories are frequent in Michaux: fog and giddiness, Lilliputian hallucinations, minute perceptions speeding over a tiny surface, spontaneity' (1993: 155, n.20).[3] A brief recapitulation of the *Monadology*, Leibniz's series of speculative axioms (1898), will help see why Deleuze would link him to Michaux. A body is a composite and can be broken down into ever smaller parts until one reaches 'simple substances', the monads (*monas*, one), which do not exist in spacetime. Monads are eternal and indivisible unities, but not atoms in the Democritian sense because they are immaterial, amorphous and unique – somewhat like mathematical points except that monads spawn material reality according to a 'harmony preestablished' by God. A monad is therefore a nano-computer-program, a locus of a particular variability of perceptions and guidelines perpetually hungry for more perceptions. Moreover, what every monad perceives is *the entire universe*, all the time, though in varying degrees of obscurity. Monads *are* singular-universal perceptions. Leibniz can therefore say that infinite multiplicity is contained within – folded in – unity (§16). So their hard and cold eternity does not mean that monads are transcendent essences: they change continuously as the bodies that possess them move around. Positing the universe as nothing but the totality of incorporeal representations, monadology is the strangest kind of idealism.

All bodies communicate with all other bodies, continually merging and colliding as a result of the variety of differential combinations of monadic perceptions contained within them (Leibniz invented the notation *dx/dy* for infinitesimal calculus). There is only one universe

that is expressed by an infinitude of different monads, in each case in a slightly different way. Every monad is different from the next because they refract their final reason, God, in varying degrees of confusion and according to precisely where bodies are in the universe and its evolution. In their parallel universe, monads remain forever isolated from each other, 'windowless'. Monads relate only to God, whose infinite power of perception was during creation highly unevenly distributed amongst them. All monads partake a little in God's power of selecting and steering the universe but only he has knowledge of all the possibilities at once.

To explain why Michaux is walking across a Parisian street high on psilocybin, we would have to explain how certain mushroom extracts reached Paris from Oaxaca via Basel; why Belgium's industrialisation called for the *petite bourgeoisie* from which Michaux sprang; how Julius Caesar consolidated the regional importance of the early city of Namur where Michaux was born; ultimately, the emergence of the solar system and gravity. That precisely Henri Michaux (not, say, Charles de Gaulle) walks today, on this street, under this weather, constitutes a world perfect and harmonious unto itself (even if he is suppressing paranoia). And yet it had to be chosen from an infinity of *lesser* possible worlds each slightly varying from its adjacent one, for 'the choice to create any one substance is simultaneously the choice to create one particular world' (Perkins 2007: 35).

There are obvious affinities between Leibniz and psychedelic ontology. The *Monadology* argues most strongly for continuous creation and the connectedness of everything to everything else. Paragraph 67 is the most famous:

> Each portion of matter may be conceived as like a garden full of plants and like a pond full of fishes. But every branch of every plant, each member of every animal, each drop of its liquid parts is also some such garden or pond.

Microscope and telescope show that horizon and surface are but thresholds of perception 'all the way down'. Things dissect themselves spontaneously like in Alex Grey and some later Dalí paintings (see especially *The Hallucinogenic Toreador*, 1968–70), the whole of reality bleeding into micro-drops of consciousness. Michaux's world is experienced as an *inner space* (the title of an important anthology), one which communes with the rest of the universe via an infinity of other inner-spaces, all singularities aspiring to persist and expand:

> Every thought became pervasive, and though quickly curtailed, prevailed nonetheless. Each one offered me its presence, its unique presence. It bestowed

> that presence upon me. In a few seconds' 'exposure' it showed me its singularity, its otherness. As if it were a substance, a *metasubstance*. (Michaux 1974: 34)

It is a commonplace in psychedelic discourse that the mind is an instance of what all perception is, namely the grasping, in varying degrees of vagueness, of the entire universe and of God's programming of it. Rocks and motorbikes and grasshoppers are likewise perceiving the entire universe, but from their particular point of view. The universe is ultimately perfect and good, its harmony pre-established, hence evil, like a bad trip, only exists through limitation and corruption.

In Badiou's review of *The Fold* (1994), he is characteristically lucid about the difference between what he calls the 'organicism' of Leibniz-Bergson-Deleuze and his own Platonist/Cartesian ontology of multiplicities. Badiou's version of *mathesis universalis* is based on the strict separation of the clear and the obscure; it is not descriptive of physical multiplicities as are Leibniz's and Deleuze's but subtracts concepts of manyness, belonging, number, infinity, etc. from the world. Badiousian ontology is anchored upon the necessary existence of an absolute void (in modern mathematics, the null-set), which Badiou says has no place in Deleuze's metaphysics. For Deleuze's take on Lucretius and Epicurus, it is true, the void is less important than the swerve or deviations whereby atoms collide and form composites. Just like, as we saw, for Michaux darkness was already pregnant with its own illumination, and any Buddhist naming of Nothingness shows what is encountered is in fact infinitely excessive Fullness, void for Deleuze is merely the space-tension between atoms with which it is always mixed: 'The void and the plenum are interlaced and distributed in such a manner that the sum of the void and the atoms is itself infinite' (1990: 269). As is well known, Deleuze's downplaying of void in favour of all-encompassing continuity leads Badiou to call him a thinker of the One with only a derivative concept of multiplicity. If the One presides, true novelty is not thinkable. Effectively, Badiou is saying seventeenth-century pantheism hides behind Deleuze's vitalism:

> This image of the 'mute and shadowy part of the event' [Deleuze 1993: 106] is admirable and adequate. Yet, we can see that what is excessive – shadowy – in the event for Leibniz-Deleuze is *the All that preexists it*. This is because in an organicist ontology of the Multiple, the event is like a spontaneous gesture over a dark *background* of an enveloping and global animality. (Badiou 1994: 56–7)

I can only briefly indicate how xenopathic ontology can disturb Badiou's important identification of Deleuze as pantheist. As Kerslake and Marks show, esoteric, post-Romantic, mythological or mystical Deleuzes are fully consistent and fascinating 'conceptual personae', but I choose to follow a more explicitly atheist materialist series running from Democritus to Nietzsche. Forever inviting in the strange and aleatory, xenopathic ontology defers the returning-home provided by religion and myth. Psychedelic perception discovers 'reality' is an indeterminate entanglement of various kinds of chaos composed of minute foldings, only graspable subjectively from within the singularity of *a* life, *some* body's perspective, and therefore impossible to contain, calculate or direct by any one force or principle. Psychedelic perception does not reach the boundaries of reality so that it can conclude it is One, for there are no such limits. Infinity is fully immanent insofar as it is co-constituted by thought.

The hallucinogens show that systems contain their own 'powers of ridiculisation', their own nonsense. The absurd always threatens the sacred. Obscurity is indeed excessive, ubiquitous and constitutive of things, not as a pre-existing originary All, but rather as what Deleuze (1994: 120ff.) calls *dark precursors*, the virtual matrices of disparities enabling the differentiation and interaction of systems, which are entirely immanent to those systems. Dark precursors are only thinkable *after* they have acted as differentiator (only after the lightning can the pre-existing matrix of atmospheric disparities be inferred). Precursors do not all communicate with each other in one plane of immanence, as they emerge contingently as local effects of actual processes. There is no Bergsonian *élan vital* or 'global animality'. The weird realism of drugs like LSD offers us nothing but an infinity of erratic molecular flows and reactions. Such ontology is alchemical and cerebral, not organicist or sensualist. When Deleuze and Guattari (1994: ch. 2) at the end of their lives link philosophy's plane of immanence with Plotinus's One-All, while radically redefining the latter as immanent Openness instead of transcendent God, it seems to me too much of the form of the Neoplatonist monotheistic concept is retained. The plane of immanence has to be multiple, and any 'One-All' could not tolerate difference-in-itself and nonsense.

Of course, many psychonauts do report vividly on divine unification, famously leading R. Gordon Wasson (1986) to coin the synonym 'entheogens' for the hallucinogens. Psychedelic mysticism often uses the exotic and occult as medium additional to drugs. Mescaline did probably facilitate Michaux's infatuation with Chinese spirituality and

calligraphy. About that mescaline afternoon in the countryside he writes: 'The exalted world of the East was there, one, total, expressing the highest point of ecstasy in the name of everyone, of everyone on Earth' (1994: 305). Moments like these signal some redemption in otherwise sombre hallucinogenic commentaries, but redemption does not have to follow mystical or orientalising clichés. Earlier, Michaux found the 'theomania' springing up on psychedelic drugs typical of Westerners and rather irritating: 'God cropping up unexpectedly, quoted in and out of season, amid banalities and as though unintentionally: this is a bad sign' (1963a: 169). In *Miserable Miracle* we read: 'The trend towards essence is a vertiginous pleasure, a secret frenzy. / The madman essenciates, and it is dangerous.... Even on God it is dangerous to essenciate. For the scrupulous, religion is hell' (2002: 143). Such a principled suspension of access to oneness, essence and immediate universality retain the subversive force of surrealism in Artaud and Burroughs and is preferable if we are to keep alive the teeming strangeness of psychoactively encountered multiplicities. If '[r]eality always falls short of essence' (Michaux 2002: 147), humanity, the 'mystic East', Nature and Oneness must be ridiculised (that is, not ridiculed) as essentialising traps, which can certainly galvanise, but not steer psychedelic experiment.

Ridiculisation is equally incumbent upon baroque metaphysics. Mogens Lærke notes that *The Fold* reconceives Leibnizian metaphysics, read through Nietzsche and Artaud, as 'a comic theater, dedicated to laughter and cheerfulness which are purer forms of joy than Leibnizian delight' (2010: 42). Remembering Deleuze's and Bergson's defence of humour, Leibniz's neurotic insistence on providence can be productively recast along more discordant, improvisational paths, whose witty atheism circumvents psychosis and misanthropy by not taking itself too seriously: by tapping into transindividuality. The plane(s) of immanence is-are always-already centrifugal. Plunging into 'it' (the 'it' of *it rains*), as is done on hallucinogens, can never guarantee an ontological outcome.

It is a matter of debate whether monadology is monist. For monism such as Spinoza's there is but one substance, while for Leibniz every monad is its own substance. The difference between substances lies in their *way of* being a substance, but they share the fact of being a substance, and this fact could be called 'monist'. Is monadology monotheistic? A necessary foundation of Leibniz's pluralism is God's coterminous omnipotence, omniscience and goodness. All monads 'fulgurate' from God, the only monad-substance that is entirely necessary and perfect. God had to select this world from an infinity of possible worlds and imbue monads with their unique innate and eternal

laws. To think a genuine plane of immanence, monadology has to be secularised. Kerslake suggests that 'Leibniz's system not only survives, but even only comes to bloom, after the death of God'. It is Deleuze's heterodox Kantianisation of Leibniz in *Difference and Repetition* that delivers an atheist conception of an ordered yet absolutely open-ended and indifferent universe:

> *Without* reliance on a pre-established, designed harmony between thought and world, the world is precisely restored to us *as a matrix of problems*, for which the solutions have not been prepared in advance, but which orient or provide a horizon for the ultimate purposes of our thinking. (Kerslake 2007: 154)

In the final pages of *The Fold* Deleuze introduces the resulting unmoored Leibnizianism that is his and Guattari's nomadology:

> To the degree that the world is now made up of divergent series (the chaosmos), or that crapshooting replaces the game of Plenitude, the monad is now unable to contain the entire world as if in a closed circle that can be modified by projection. It now opens on a trajectory or a spiral in expansion that moves further and further away from a center. (Deleuze 1993: 137)

As mathematical physics incorporates thermodynamics and quantum mechanics, continuous differentiation and emergence without Director become thinkable. There is no final cause to things; things emerge according to immanently acquired laws; monads/atoms do perish; there are only local calculators while subatomic uncertainty means even a God could not know everything; goodness has to be made. Translated to our discussion of Michaux: bad trips exist, and they have to be sat out. In retrospect, they too disclose the myriad and ethically imperative nature of reality – the xenopathic ontology of multiplicity opens up to an ethics of dosage and insight: 'Not to let themselves be carried away, to remain master of their speed seems to be the underlying, the constant and secret preoccupation of all men' (Michaux 2002: 155).

Michaux was at his most miserable after taking six times his usual dose of mescaline. The chapter 'Experimental Schizophrenia' relates how he almost drowns in a 'mescalinian ocean', then sees nothing but lines, which morph into cliffs and ugly faces, then becomes nothing but a line himself, no longer a 'castle' separate from its outside. 'Now only a line. A line that breaks up into a thousand aberrations' (2002: 126). At this height of immanent intensity Michaux plunges into 'vastitude' wherein everything is displaced (*aberrare*, to stray) and nothing, certainly no

unity, can ever hold. He is literally flattened by the immense weight of the truth he has stumbled on: the universe has no centre.

Michaux's own solipsism does not prevent Deleuze from returning to him in *Foucault* (1988: 44) to understand the subjectification that was May '68: 'and what a strange twist of the line was 1968, the line with a thousand aberrations!' The book's last paragraph (122–3) invokes 'Michaux's line "of a thousand aberrations" with its growing molecular speed'. We have seen how dangerous this line is (Deleuze finds it in Captain Ahab's passion too). It is tossing oneself into the dark strangeness of storm and ocean. 'But however terrible this line may be, it is a line of life'; subjectification is becoming master of the universe one traverses and folds into one's soul; harmonious monadological optimism becomes atonal nomadological vitalism. 'The most distant point becomes interior, by being converted into the nearest: *life within the folds*.'

Notes

1. The title of the section is 'THE TROUBLE HE HAS WITH HIS THINKING. RADICALS AT LIBERTY. THOUGHTS THAT VANISH. PERIODIC OBLITERATIONS. DISSOLVED THOUGHTS. OSCILLATORY THOUGHTS. XENOPATHIC THOUGHTS. SCOTOMIZED THOUGHTS. MENTAL ECLIPSES'.
2. I am not going to discuss Deleuze's lectures on Leibniz of 1980 and 1986–7, available on webdeleuze.com (Deleuze 1980/1986–7). They are important for understanding his relationship to Leibniz but do not directly discuss hallucinatory perception.
3. Kerslake (2007: 224–5, n.19) traces Deleuze's use of 'Lilluputian' and the inspiration for understanding Michaux as Leibnizian to Lacan's mentor Gaëtan Clérambault, who wrote of drug-induced hallucinations as 'pointillist'.

Samuel Fuller's Schizo-violent Cinema and the Affective Politics of War

Elena Del Rio University of Alberta

Abstract

This essay begins by considering Samuel Fuller's 1963 film *Shock Corridor* as a model of schizo-violence – a disorganised violence that eludes the Oedipal, moralising binary of action and reaction, and instead opens up the violent action to multiple becomings outside Oedipal and nationalistic framings. Through the de-Oedipalisation of the violent events punctuating American history, *Shock Corridor* performs a schizoanalytic model of desire capable of giving free rein to the force of traumatic affections. The latter part of the discussion situates Fuller's film and the contemporary US military machine as diametrically opposed in their approaches to what we might call 'the affective politics of war'. Several contemporary scenarios revolving around both actual war violence and Kathryn Bigelow's film *The Hurt Locker* (2008) serve to show how the schizophrenising operations of the brain itself constitute the greatest obstacle in the military's efforts to contain or repress the traumatic affections generated by violence and war.

Keywords: *Anti-Oedipus*, schizoanalytic model of desire, affective politics, schizo-history, schizo-violence, war, madness

In Samuel Fuller's *Shock Corridor* (1963), a line spoken by the Pagliacci character (Larry Tucker), an inmate in the insane asylum where the story takes place, sums up the 'tabloid philosophy' identified with Fuller's style (Fuller 2003: 413). 'When we are asleep', Pagliacci says, 'nobody can tell a sane man from an insane man.' Inconspicuously delivered, this incontrovertible statement serves as the organising principle for

the film's overall libidinal and political dynamics. It not only speaks generally to Fuller's distaste for the hierarchies humans fabricate through arbitrary standards of normalcy and segregation. It also alerts us more specifically to the way *Shock Corridor* levels off these culturally produced hierarchies by identifying desire as a thoroughly schizophrenic activity in both sane and insane subjects. On the molecular plane, the film shows, the schizophrenising activity of desire largely supersedes any distinctions of sanity and insanity. Although on one level the theme of schizophrenia in *Shock Corridor* functions as a narrative ploy that captures the audience's desire for sensationalist/pulp fiction, it is handled with such instinctive accuracy that it serves to illuminate the inherently schizophrenic functioning of desiring-production in general, as well as of the cinema as an assemblage of moving and desiring images. Thus, the film shows a firm commitment to the idea that, 'before being a mental state of the schizophrenic . . . schizophrenia is the process of production of desire and desiring-machines' (Deleuze and Guattari 1983: 24).

Shock Corridor tells the story of reporter Johnny Barrett (Peter Breck), who pursues the Pulitzer Prize by having himself committed to a mental hospital to investigate and write a story on a murder that took place within its walls. To achieve his purpose, Johnny enlists the help of his own newspaper editor Swanee (William Zuckert), his girlfriend Cathy (Constance Towers) and psychiatrist Dr. Fong (Philip Ahn), who coaches him on how to put on a credible performance of mental illness for the doctors who are to prescribe his hospitalisation. In order to be committed, Johnny convinces Cathy to pass as his sexually abused sister, and to denounce him to the police for acting on his incestuous desires. Once he has been hospitalised in the mental institution, Johnny stages one-on-one encounters with the three alleged witnesses to the murder of fellow inmate Sloan. But Johnny's efforts to unravel the truth of the murder and to solidify his journalistic credentials meet with the unsurpassable resistance of his three interviewees, who relentlessly circumvent his monothematic questions with their own schizo-hallucinatory fabulations. Always throwing the viewer's expectations off-guard, the film traces Johnny's progressive madness through a series of fits and starts, sometimes staging an appearance of full lucidity, yet a moment later unexpectedly letting the madness resurface and reaffirm itself with a vengeance. Ironically, Johnny manages to extract the killer's name out of one of the inmates, and he even succeeds in publishing his story and achieving the coveted journalistic award. Yet, in the last images we see of Johnny, he has

reverted to a deeply catatonic, non-responsive state: as Cathy forces his rigid arms around her own body for a futile simulation of their former relationship, he is completely cut off from any sign of recognition or affection.

Shock Corridor displaces the generic thriller's concerns with unravelling an enigmatic plot (Johnny's desire to know 'who killed Sloan in the kitchen') by underscoring the libidinal force of the inmates' fabulations, and the way in which these gradually erode Johnny's capture by the aims and activities of the molar aggregates of capitalist production (his self-assured identity as a successful journalist).[1] The inmates' hallucinatory fabulations are enacted as affective transpositions of American history, one that the film construes as a relentless sequence of violent events. Under the anarchic force of Fuller's style, neither the inmates' hallucinations nor Johnny's mental disintegration are handled in the way a detached observer might scrutinise a representational object. Undermining the conventional primacy of causal-narrative and medical-discursive codes, the film as a whole becomes invested in the schizophrenising of these codes by releasing the inherently delirious force of cinema and desire. By becoming absorbed in the same maddening process that has taken possession of its characters, *Shock Corridor* thus takes on the critical programme that Brian Massumi outlines vis-à-vis the capitalist supersystem and its society of control:

> Critique is not an abstract distancing of the self *from* its concrete 'object'; it is a superabstract, infraconcrete distance *to* – to an outside, of the self *and* its system of objects (capitalism). That outside is the potential, contained by capitalism, for its own collapse. (Massumi 2008: 62)

The becoming-schizo of *Shock Corridor* unfolds on two coexisting planes: the mechanics of cinematic desire as a free-associative delirious assemblage of images; and the machinic connections the film establishes between libidinal energies and the sociopolitical spheres as the material field in which desire proliferates. The film opens and ends with the quote by Euripides: 'Whom God wishes to destroy, he first makes mad'. While destruction and madness do not manifest themselves in *Shock Corridor* as potentially (re)generative or joyful forces in the manner of artistic schizo activity, the film instantiates the affirmative side of delirium in its exact diagnosis of the capture of the desiring subject by nihilistic machines. Thus, schizophrenia functions in the film in the guise of a pathology (mental disintegration on the narrative plane); but it also constitutes an affirmative diagnosis, as the active expression of what the body can do with its own pathological states (at the level of

the film's rhizomatic machinic operations, in its codes of montage and imaginative transpositions that seamlessly blend the subject's flows of desire with those of social and political desiring-machines). Released in 1963, at the height of the Cold War, Fuller's 'masterpiece of barbarian cinema' (Godard in Fuller 2003: 431) has much to tell us about a series of connective/affective ties that are blatantly ignored in today's paranoia-driven politics – the ties between desiring-machines and social and political machines, between the mobilisation of libidinal forces and the unleashing of fascist war machines of aggression and annihilation. It is these affective ties that will allow us in the latter part of this essay to posit the extraordinary relevance of Fuller's film to our present global historical moment.

Although, unlike other Fuller films (*The Steel Helmet*, 1951; *Fixed Bayonets*, 1951; *The Big Red One*, 1980), *Shock Corridor* is not literally set in a war-like environment, its oblique, non-representational treatment of war only serves to invigorate the film's critique of the Oedipal codes that both constrain desire and legitimise the violence of war. This analysis of *Shock Corridor* will begin by examining the ways in which the film de-Oedipalises its apparently Oedipal narrative structure as a means to perform a schizoanalytic model of desire capable of giving free rein to the force of traumatic affections. The latter part of this discussion will attempt to situate Fuller's film and the contemporary US military machine as diametrically opposed in their approaches to what we might call 'the affective politics of war' – the production, distribution and channelling of emotions that derive from the compulsive acts of killing and being killed in combat-related situations. While *Shock Corridor* stresses the primary role of affectivity in the violence unleashed by 1960s American politics, the military has historically placed a high premium on silencing and containing the affective spillage of war-related violence. We will turn our attention briefly to several contemporary scenarios revolving around both actual war violence and Kathryn Bigelow's film *The Hurt Locker* (2008) in order to show how the schizophrenising organisation of the brain itself constitutes the greatest obstacle in the military's efforts to dispense with the traumatic affections generated by violence and war.

I. Tabloid Oedipus

The presence of Oedipus in *Shock Corridor* is part of the tabloid paraphernalia that Fuller's work always seems keen on deploying, yet Oedipus is hardly what the film is about. The clichés Fuller's films are

consistently ridden with (of sexual perversion, adult exploitation and even melodramatic sentimentality) are never left undisturbed as obvious truth. Instead, Fuller submits the cliché to a process of transformation, not so much through intellectual refinement or didacticism as through a visceral enhancement of its crudest aspects. In *Shock Corridor* Oedipus belongs to the category of a psychic cliché, an inalterable formula that aims at enclosing an infinite process of desire into a purely intelligible and hollow phantasm. Thus, although Fuller's film may well begin with a tabloid-like Oedipal narrative, it does not stay there long. In his introduction to *Deleuze and the Schizoanalysis of Cinema*, Ian Buchanan distinguishes between a kind of cinema that emphasises machinic/productive/creative elements – the cinema that for Deleuze would roughly qualify as art – and a kind of cinema that emphasises mechanical/reproductive/commodifying elements (Buchanan 2008: 6). Considered through this distinction, Fuller's cinema – and his handling of Oedipus in *Shock Corridor* – very much falls somewhere in-between the 'machinic' and the 'mechanical'. One might say that the machinic creativity of Fuller's films hinges upon the way they reconfigure the most blatantly mechanical and reproducible elements, such as the cliché of Oedipus in the case of *Shock Corridor*.

The film initially positions Johnny within the metaphorically Oedipal configuration formed by a series of male analysts acting as paternal figures, and the maternal care and concern of his girlfriend, Cathy. Johnny's incestuous behaviour towards his 'sister', although a charade/performance to be distinguished from his actual relationship with Cathy, does nothing if not reinforce the Oedipal overtones of the film's narrative framework. But such Oedipal narrative framework is soon dismantled as the film develops an increasingly distant, ironic and, ultimately, schizophrenic point of view with respect to its own provisional narrative codes. Here, we will just take stock of three concrete ways in which *Shock Corridor* drains the force out of Oedipus even before we witness Johnny's aggressive de-Oedipalisation in his subsequent encounters with fellow inmates Pagliacci, Stuart (James Best), Trent (Hari Rhodes), and Boden (Gene Evans). These three preliminary instances of de-Oedipalisation involve: the shocking transition from Cathy as maternal, melodramatic figure in the first scene to Cathy as lurid stripper in the scene immediately following; Johnny's physical assault by a group of nymphomaniac women in the psychiatric ward; and finally, the mocking tone the film adopts towards the cliché status of Freudian Oedipal discourse in Dr. Menkin's (Paul Dubov) interrogations of Johnny right before the latter is committed.

From the outset, *Shock Corridor* demonstrates a less than heartfelt commitment to standards of Oedipal normalcy by consistently undercutting these standards with the force of irony. In the course of one of the shock treatments administered to Johnny, his brain is invaded by a montage of images that blend Cathy's striptease performance with his most poignant encounters at the hospital – those with inmates Pagliacci, Stuart, Trent and Boden, as well as the unexpected attack he suffers at the hands of the nymphomaniac women. This latter event functions as a direct threat to Johnny's Oedipal subjectivity, a symbolic rape that initiates the erosion of his self-confidence as a capable man in both a sexual and a professional sense. Not coincidentally, when Johnny encounters Stuart in the scene immediately after the attack, it is Stuart who appears to qualify as 'normal', while Johnny's lost gaze and bruised, swollen and bandaged face lends him a forceful appearance of insanity. In every respect, the group of women who assault Johnny behave like a pack of hungry wolves, the incident resembling a non-human becoming of sexuality rather than a recognisably human one. Like the proverbial leader of the pack, one of the women circles around Johnny, while the others follow suit, closing in on him until they pile up on his helpless body and maul him over like a single wild body in heat. Framed by his two encounters with Stuart, the women's attack on Johnny effectively drains him of the self-confidence he requires in his investigative pursuits.

Although Dr. Menkin's interrogation of Johnny following Cathy's accusations to the police takes a straightforward Oedipalising approach to normalcy, the film finds a way to distance itself from its scripted underpinnings. After asking a series of questions on Johnny's relationships to his father, mother, brothers and sisters, Dr. Menkin is keen on identifying the origin of his incestuous tendencies, stating that 'there must have been a first time'. The thoughts expressed by Johnny's internal voice-over during the interrogation serve as the film's own commentary on the clichéd, ready-made nature of Freudian discourse. 'Now if he'd just ask me what made me feel different, the story will write itself,' we hear Johnny think to himself. Sure enough, having been coached by Dr. Fong on the predictable line of psychoanalytic questioning he should expect, Johnny is able to anticipate Dr. Menkin's every question without fail. As his internal voice continues to inform us of his anticipatory powers ('The next question's gotta be about fetishism according to Dr. Fong's script') and Dr. Menkin obliges ('Do you know what a fetishist is?'), the idea of Freudian psychoanalysis as a pre-scripted and prescriptive mode of interpretation is added to the mix, further solidifying the sense that the film is engaged in a

self-conscious mockery of Oedipus and its reductive understanding of desire. The whole scene in effect transpires as if the film were fully cognisant of the scenario alluded to in *Anti-Oedipus*:

> No one today can enter the analyst's consulting room without at least being aware that everything has been played out in advance: Oedipus and castration, the Imaginary and the Symbolic, the great lesson of the inadequacy of being or of dispossession. (Deleuze and Guattari 1983: 308)

The question that Johnny repeatedly poses to each of his fellow inmates, 'Who killed Sloan in the kitchen?', is the question of the Oedipal subject, intent on plugging the lines of escape of desire with a totalising, global object. Both inmates Stuart and Trent stubbornly evade Johnny's strenuous efforts at extracting the killer's name. Stuart's response to Johnny's question begins to signal the film's intentions to enact desire as an open-ended, polyvocal process that can draw a multiplicity of connections and disjunctions among any number of partial objects. Thus, upon hearing the question, Stuart locks into the visual memory of the killer's white pants, which he then immediately connects to his recurring hallucinatory experiences of the American Civil War: 'White pants, white fence, a stone wall, a band in a stone wall! We've got to help General Lee!' The chain of partial objects thus assembled derails the linear and discursive operations of Oedipal language with a heterogeneous and transcursive machine that lies outside the strictly signifying function of language. Stuart's associative chain exemplifies a kind of 'positive dispersion' whereby 'the only relation between partial objects is the lack of relation' (Hughes 2008: 18).

While the film insists on withholding the killer's name for almost its entire duration, once his name is spoken, its importance is completely offset by the film's own disinvestment from the alleged killer, ward assistant Wilkes, in all but the most superficial of ways. By the time Johnny gets an opportunity to interrogate inmate Nobel physicist Dr. Boden, he is beginning to lose his speaking faculties as well as the boundaries of his own ego. While Boden is drawing a portrait of Johnny that we never get to see, Johnny loses his voice and can no longer articulate the all-important question that haunts him. Although he keeps repeating the question in his mind, as we are made to understand through his internal voice, his speech is seriously impeded. But when the question is finally blurted out as if unintentionally, and Boden provides the long-anticipated name of the killer, 'Wilkes', the moment proves wholly anti-climactic, as if this fetishised speech fragment was hardly a match for the far more potent flows of desire

engaging the inmates, the film itself and increasingly Johnny. Indeed, as Johnny is shown his own portrait, he is unable to recognise himself in the image drawn by Boden, his violent reaction suggesting that the dissolution of his ego is well under way. When we see Johnny straitjacketed in the next scene, not only does the name of the killer elude him entirely. In an utterly schizoid fashion, the place and function of the answer to his own question is now occupied by too many offshoots and variables, as if moment by moment, in passing from one imperceptible affective state to another, Johnny had been growing an indefinite number of heads or subjects. 'Dr Christo,' Johnny says, 'I know who killed Sloan in the kitchen . . . it's Dr. Christo; no, it's Cathy. I killed Sloan . . . Wilkes killed him, Cathy killed him.' Thus disengaged from a signifying imperative, the question ceases to be a question to become unbridled affirmation, pure desiring production. The lesson that Johnny's unconscious is taught, therefore, is not that the question lacks an answer (psychoanalytic mode of resignation/negativity), but that in fact it is capable of producing too many (schizoanalytic mode of exuberant creation/production/affirmation/non-exclusive disjunctions).

The film's interest in the question lies in the occasion it provides for a de-Oedipalisation of desire. The question elicits a fanning out of machinic connections and disjunctions, as it gets taken up by different subjects and as it intersects with the manifold, yet particular, flows of desire that pass through each of them. Each of the inmates is intensely committed to producing a uniquely assembled affective-performative flow that can grow and evolve in any direction. For Pagliacci, opera functions as such impersonal, non-signifying whole – the part alongside other parts that nonetheless has an effect on the other parts/objects that it is plugged into (Deleuze and Guattari 1983: 43). For Stuart, this non-signifying function is taken up by the American Civil War and the Korean War; for Trent, it is identified with racism and segregation; and finally, for Boden, it corresponds to the nuclear arms race.

II. Building Blocks of Desire

By presenting the alleged witnesses to Sloan's murder as four distinct zones of desire, *Shock Corridor* exhibits an instinctive understanding of desire as an impersonal, yet multiplicitous, performative process.[2] Rather than build desire upon the whole/global, personal/familial Oedipal objects that Freudian psychoanalysis considers structurally determining of desire, the partial objects of schizoanalysis function as mobile/detachable and impersonal fragments. These schizzes, as Deleuze

and Guattari call them, attest to the lack of regard in the unconscious for persons or representations. As Deleuze and Guattari write, the schizo participates in the process of desire by 'continually detach[ing] [the chains], continually work[ing] them loose and carr[ying] them off in every direction in order to create a new polyvocity that is the code of desire. Every composition, and also every decomposition, uses mobile bricks as the basic unit' (Deleuze and Guattari 1983: 40). The kind of whole that is formed in this case, unlike the unified psychoanalytic object of desire, consists of an undifferentiated flow of absolutely different objects: 'The whole itself... establishes aberrant paths of communication between non-communicating vessels, transverse unities between elements that retain all their differences within their own particular boundaries' (43).

In *Shock Corridor* all of Johnny's attempts to isolate fragments of the inmates' delirious constructions in order to deprive them of their excessive mobility and intensive productivity, and to use them instead for his meaning-fixating purposes, are met time and again with stubborn resistance. Pagliacci's desire, for instance, is captured by a machinic assemblage that connects his own near-death experience of a heart attack while singing an aria onstage with his stabbing of his own wife and his witnessing of Sloan's murder in the kitchen at the mental institution. But when Johnny tries to interrupt Pagliacci's flow by pressing him to isolate the latter object in the chain (the event of Sloan's killing) for his own epistemological advantage, Pagliacci replies with a scrambling of events and temporalities, 'I didn't want my wife to die like Sloan, so I quietly sang her to death.' Not only is Johnny unable to utilise the inmates' experiences and memories toward his aim of gathering factual information, but it is Johnny himself who now becomes incorporated into the inmates' proliferating assemblages of desire as one more fragment or building block. In the scene immediately following the women's assault on Johnny, Stuart identifies Johnny's bruises as 'war wounds'; despite Johnny's efforts to maintain a masterful distance from the inmates' lunacy, this moment demonstrates Johnny's seamless assimilation into Stuart's desiring-machine of war.

The way *Shock Corridor* translates the inmates' hallucinations into film images speaks to the close affinity between schizoanalysis and cinema – between the libidinal force that connects disconnected fragments of desire and the power of cinematic montage to compose a continuous flow out of absolutely dissimilar and disjunctive fragments. In this respect, *Shock Corridor* reaches its most affectively productive moments by utilising schizoanalytic mechanisms of montage that closely

match the workings of the inmates' delirious unconscious. A second technique whereby the film marks its commitment to hallucinatory intensity is its selective use of colour during these affectively privileged moments. While *Shock Corridor*'s overall black and white stock points to the film's generically identifiable limits – the 1960s American psycho-thriller – the film's sporadic deviations from such generic specifications entail a loosening up of strictly signifying codes. These moments open the film onto a generic no-man's-land that ambiguously combines documentary/travelogue images with an irrational and evocative sense that interrupts the film's overall tempo and unified look. It is worth mentioning, also in regards to the film's use of colour, that, in Johnny's major interactions with both Stuart and Trent, colour serves to assert the syncretism of the character's brain and the cinematic brain. The sensorial intensity in the film's choice of colour is no longer merely a part of the film's and the spectator's formal experience, but it is fully integrated into the character's delirious experience at the diegetic level. 'Why is it colour?' Trent says to Johnny after his delirium, 'The same nightmare, always in colour.'

While some details in Stuart's speech during his central scene with Johnny provide some straightforward biographical information, such as his participation in the Korean War, the trajectory his speech follows, as well as the images we see while we hear his voice-over, draw a circuitous path that traverses in a few minutes various cultures, disparate objects and unrelated discourses. The film supplements Stuart's rambling speech with a visual track of images that produce a conjunction between Stuart's brain and the cinematic brain. The imposing statue of the Japanese Buddha Kamakura ('I keep seeing it in colour, and he keeps looking at me') initiates Stuart's chain of hallucinations. He continues, 'I keep seeing monks in a parade . . . the little girls just like baby geishas going to prayer, to ask Buddha to take care of me when I go to Korea.' These rather bucolic images of traditional Japanese culture give way to faster, more disorganised kinetic images, words and sensations that tap into the physical weight and mobility of objects as a way to evoke Stuart's political paranoia of communism.

From the aforementioned ritualistic images, we cut to a modern-looking amusement park. In Stuart's brain, and in the film's brain, the speedy movement of a globe-shaped revolving contraption is felt like an aggressive force that closes in on the American army and threatens to annihilate it: 'The wheel keeps going round and round and round . . . the commies all round and round us in Korea!' The episode ends in another highly iconic image of Japanese culture, Mount Fuji, whose uniqueness

and permanence as a cultural icon become literally unhinged. Mount Fuji is at once encased and speeded up by the film – literally framed between the body of a fast-moving train and the equally fast-moving railway beneath it. This sequence speaks to the affective passages and dislocations brought upon the subject by the takeover of modern speed and its displacement of the slower rhythms of tradition. With its references to the American involvement in the Korean War, the sequence also speaks to one of the foremost concerns in *Shock Corridor* – to emphasise the dramatic role that a steady string of wars since the beginning of the twentieth century were to play in the intensification of these affective dislocations.

III. Schizo-history

Inmate Trent provides the second major instance of hallucinatory sequences in the film. A black man with violently racist attitudes towards his own race, Trent aligns himself with the white majoritarian subject as he enacts another form of American violence: its 'other' Civil War of self-inflicted racism. The scene that focuses on Trent's delirious rantings is internally split into two differentiated parts, which proceed in accordance with the two types or poles of delirium as identified by Deleuze and Guattari:

> There [are] two major types of social investment, segregative and nomadic, just as there [are] two poles of delirium: first, *a paranoiac fascisizing . . . type or pole that invests the formation of central sovereignty . . . and disinvests every free 'figure' of desire* – yes, I am your kind, and I belong to the superior race and class. And second, *a schizorevolutionary type or pole that follows the lines of escape of desire*; breaches the wall and causes flows to move; assembles its machines and its groups-in-fusion in the enclaves or at the periphery – proceeding in an inverse fashion from that of the other pole: I am not your kind, I belong eternally to the inferior race, I am a beast, a black. (Deleuze and Guattari 1983: 277; my emphasis)

The purpose of the paranoiac is to invest the formation of central sovereignty (in this case, white America), and to counterinvest those groups or flows (black America) that move at the margins and threaten the homogeneity and territoriality of the centre.[3] The investments of interest of the gregarious aggregate are pursued at the expense of the social and psychic repression of multiplicitous desires (Deleuze and Guattari 1983: 280). Trent's identification with the white majoritarian subject in the first part of the scene mimics the paranoiac fascisising

type of delirium with outstanding exactitude ('I belong to the superior race and class'). Situated in the eponymous corridor at the hospital, a place designed for social encounters between inmates, this first part shows Trent's body and unconscious fully invested in a social field of large molar aggregates, what Deleuze and Guattari call a 'macrophysics of crowds'. Like the paranoiac, Trent utilises speech to 'engineer[] masses, he is the artist of . . . statistical formations or gregariousness, the phenomena of organized crowds' (279).

The first segment of the scene involving Trent is characterised by a great deal of tumultuous and chaotic physical movement, its mise-en-scene recalling the waves of a lynching mob and its delirious arousal by the raving cries of the preacher-madman. Trent's appropriation of racist rhetoric is further reinforced by the prophetic tones of his religious fervour: 'If Christ walked the streets of my hometown, he'd be horrified. You've never seen so many black people cluttering up the schools and buses, and cafés and washrooms! I'm for pure Americanism.' Standing up on a bench, Trent continues to deliver his racist speech, inciting the crowd of patients to 'burn that freedom bus, burn those freedom writers . . . burn every dirty nigger!' Such rhetorical violence is magnified by a rapid cutting pattern that alternates between a KKK hood-clad Trent and close-ups of a fellow inmate as he vociferously concurs with Trent's words with repeated 'Hallelujahs'. After exhorting the mob to persecute the only other black patient in the ward, a riot ensues. Johnny tries to separate a furious Trent from the black inmate, but the nurse attendants grab both Johnny and Trent indistinguishably as rioters and strap them down to contiguous beds.

The image of Trent and Johnny lying side-by-side, and identically swaddled by straightjackets, is both symmetrical and profoundly disquieting: it not only blurs notions of sanity and insanity, but it also anticipates the dismantling of racial binaries that immediately follows. Trent in this segment inadvertently transitions from paranoiac to schizophrenic. The large molar aggregates of the first part of the scene give way in the second part to a molecular chain of hallucinations that is more properly schizorevolutionary (Deleuze and Guattari 1983: 277–8). Although this second part unfolds in a more intimate setting, it is not in the opposition between a collectivity and an individuality that we find the difference between the paranoiac and the schizo modes corresponding to the scene's two parts, but rather in the particular way each delirious mode organises populations or multiplicities: 'The paranoiac practices macrophysics. The schizo goes in the direction of microphysics' (280). The associative flow of partial objects Trent

follows in the second half of this scene conveys desire as a molecular phenomenon, a microphysics that operates on the basis of inclusive disjunctions rather than exclusive oppositions. As Trent begins to speak the following words between wakefulness and sleep, we soon enter into a hallucinatory sequence of colour images that features footage of the Karajá Indians in Brazil:

> Wednesday, August 30, 1954. The Supreme Court decreed the nation's schools must be racially desegregated... I'm a boy in the Amazon jungle, a brown boy, not a black boy... Someone's scraping my thigh with the teeth of a pirañan fish to change my blood to white blood [image of the bleeding thigh of a young Indian]... August 30, 1954. The US Supreme Court decreed the ceremonial dance to be racially desegregated [images of Karajá Indians in ceremonial dance wearing straw hoods resembling in shape those of KKK members]... here comes the KKK, run, run for your life! (Fuller 2003: 408)

Certain key details in the assemblage of Trent's delirious speech and visions are unmistakably schizoid. Here, the fixed symmetry between black and white, so zealously observed in the paranoiac segment of the scene, is disturbed by the emergence of a third term – brown – which opens up the 'either... or' structure of the repressive binary onto a chain of inclusive disjunctions that can potentially expand the number of objects in play ad infinitum. Trent's self-transposition onto the skin of a brown boy from the Amazon jungle liberates him from both his repressive identification with the white majoritarian subject and his fear as the black minoritarian other. Moreover, in the machinic assemblage formed by the delirious images of the Indian tribe and their association with American history and culture converge several fragments that are absolutely non-compossible. That is, this is a multiplicity inclusive of disjunctions that are only possible within the immanent plane of desire: thus, the signifiers of white blood and black blood, segregation and desegregation engage in free play and become dislocated from the power of their dominant signification. Even the image of the KKK is decoded and allowed to 'dance' freely, as seen by the conjunction and disjunction between the straw hoods worn by the Indians and the ominous white hoods worn by the KKK. As in Stuart's case, but even more intensely, Trent's delirium offsets American imperialism by decoding its flows through a chaotic synthesis of disparate cultures that yields a maximum effect of libidinal interconnectivity and productivity. In both Stuart and Trent's sequences, *Shock Corridor* transmutes the paranoiac mission America pursues time and time again by engaging in war and colonialism into a schizo-revolutionary cinematic event.

As the scenes discussed ostensibly show, instead of investing his desire in the Oedipal triangle decreed by psychoanalysis, the schizophrenic plugs himself into the names of history as so many zones of intensity with which he can forge transversal connections and flows. A schizoanalytic reading of *Shock Corridor* in fact allows us to qualify what some view as Deleuze's ahistorical understanding of cinema in his two volumes on *The Movement-Image* and *The Time-Image* (Beller 1998) by transferring his deeply socio-political/historical model of schizoanalytic desire to the field of cinema.[4] Yet, it is important to underscore that positing the primacy of desire through its very extension into the socio-political machines, as Deleuze and Guattari do, undermines a notion of the historical event as retrievable object of representation. In fact, the scene in *Shock Corridor* that I just examined may prove instructive in this regard, as each of its two distinct segments imparts a clearly different relation to history and its traumatic legacies, in effect pointing to two divergent historical models. While the first, paranoiac, fascisising segment enacts history as a given – an intractable scenario that enslaves even, or especially, the subject who masquerades as majoritarian – the second, schizo segment is both more historically grounded (as seen by the specific desegregation landmark that inaugurates Trent's hallucination) and progressively more invested in a notion of history as fabulation.

In their hallucinatory remappings of a series of places and times defining American history as a succession of violent events, the inmates in *Shock Corridor* express a libidinal resonance between the molar events of the large aggregates and their own affective states. In operating as a distiller of the affective forces that circulate in history, the schizo unwittingly performs what Massumi sees as a crucial task of capitalist critique: '[the] reconceptualiz[ation] [of] the processes by which affect is deterritorialized from its historical territory' (Massumi 2008: 61). In other words, the affects that circulate in a particular social field and congeal in specific normative meanings, codes and control mechanisms can be wrested away from these paralysing formations and allowed to stand in their autonomic and truly impersonal character. Thus isolated, these affects may then be separated from, and deprived of, the signifying and controlling power they have come to exert under the 'supposedly autonomous subject' and institutions of capitalism.

Instead of considering history as the ready-made content of collective human events that are truthfully documented or factually realised, Deleuze and Guattari invite us to consider history as a potentially malleable material, which, as we see in *Shock Corridor*, can trigger the transformative capacities of the powers of the false. To quote Deleuze

and Guattari in a passage that strongly recalls the two scenes just examined (Stuart's and Trent's) and the historical concerns they enact,

> Our [libidinal] choices . . . are at the crossroads of 'vibrations' . . . they express connections, disjunctions, and conjunctions of flows that cross through a society . . . *linking it up with other societies, ancient or contemporary, remote or vanished, dead or yet to be born. Africas and Orients*, always following the underground thread of the libido. *Not geohistorical figures or statues* . . . [*b*]*ut flows and codes of socius that do not portray anything*. (Deleuze and Guattari 1983: 352; my emphasis)

History then is no longer a representation, but, unequivocally and irreverently, it becomes a performance. To reiterate my earlier point: the schizo's consumption of history enacts a distillation of the affective forces that circulate in history so as the more effectively to extricate those affects from the restraining limits they have acquired under the normative signifying regimes of the capitalist social machinery.

IV. Schizo-violence and War

If capitalism is synonymous with the privatisation of the public sphere (Adkins 2007: 163) – the dissolution of social codings into the familial enclave of Oedipus and the economic systems of production and consumption – a capitalist critique must in some measure attempt to reconnect psychic and social desiring machines, and expose their mutual schizophrenisation. Indeed, the linkages between the psychic and the social desiring machines enacted in *Shock Corridor* produce a reversal in the capitalist trend/trajectory of privatisation. As the private event of Sloan's murder opens up onto the brutalities of American history, *Shock Corridor* engages in the dismantling of the dominant melodramatic underpinnings of American narrative cinema: *Shock Corridor*'s madhouse exists at the centre of a centrifugal libidinal configuration that keeps emitting ripples of desire further and further out into history and the socius. Instead of maintaining psychic and social spheres apart in the manner of the Oedipal family under capitalism, *Shock Corridor* insists on the contagions, slippages, connections and disjunctions of desire that affect psychic and social machines simultaneously and interrelatedly, and even across temporalities and geographies.

Within the schizoanalytic dynamics of violence, one can no longer speak of a symmetrical causality between the social and the private: we cannot posit the social conditions as the underlying cause for these

men's state of madness. The collective/social machine is not given prior to the psychic machine, nor is it determining of it in a unidirectional way. When critics remark that the men's insanity in *Shock Corridor* can be traced back to 'widespread social problems' (Dombrowski 2008: 156), they are, in effect, disconnecting the psychic and the social desiring machines, as they render the former mere passive recipients of the latter. Rather, from the outset, a non-arborescent, non-hierarchical model of rhizomatic connections between violent bodies/events precludes the possibility of isolating some exclusively as causes, and some exclusively as effects, in the circuitry of violence. Indeed, as we see in the case of Trent's delirious identification with white racism, the very categories of perpetrators/oppressors and victims/oppressed sometimes overlap and become muddled. Violent bodies in *Shock Corridor*, one might say, are not just absorbers of the shocks transmitted by the social desiring machines of war, but, as the film's hallucinatory segments especially reveal, they insert themselves into, and extend, the violent force of these machines into other spaces and temporalities.

Thus, *Shock Corridor* develops a notion of violence that eludes the organising categories consistently used to quell the force of violence or to justify its necessity in the interests of civilisation. I would like to call this notion of disorganised/deterritorialised violence 'schizo-violence'. Disengaged from the insidiously moralising binary of action and reaction, schizo-violence is ceaseless action without reaction. Schizo-violence does not become involved in the narrative containment of a violent action with a matching violent reaction. Instead, it opens up the violent action to multiple connections and transformations outside the Oedipal framings of libidinal forces. The deregulated circuitry of schizo-violence thus formed cannot be securely locked or quelled, as it remains indefinitely in a state of suspended animation and potential expansion.

As an indefinitely expansible force, the notion of schizo-violence allows us to address the resonances that Fuller's film emits in relation to our contemporary engagement with war. Although, as indicated earlier, other films by Fuller dramatise a more straightforward relation to the ravages of war than *Shock Corridor*, there can be no doubt as to the threads this film weaves, indeed the machinic connections it forges, with and around 1960s America's relation to war, and even, for our purposes, far beyond that historical point. In fact, Fuller's own experience as a GI in both World War II and the Korean War, and his own understanding of cinema as a 'battleground of emotions', as he himself describes the medium in Godard's *Pierrot le Fou* (1965), imbue his entire cinematic

oeuvre with a kind of unapologetic expression of violent action that is quite unmatched among Hollywood filmmakers.[5]

More specifically, *Shock Corridor* tells us about the schizophrenic leakages war produces, yet is unable to contain. Materialised through the various hallucinatory sequences examined above, these leakages take on a more literal tone in one of the film's last scenes, as Johnny, sitting next to a grotesquely corpulent Pagliacci on a bench in the corridor, hallucinates a deluge that floods the entire hallway. While the sound of rolling thunder approximates that of bombs being detonated in the battlefield, expressionistically lit shots of Johnny slipping on the flooded floors, barely able to stand back up, and then falling down again on his knees as he is hit by lightning, eerily evoke the physical postures and gestures of fighting or wounded bodies in combat. The fury of libidinal forces conveyed by the thunderstorm increases as the black and white footage in the corridor changes to colour images of raging waterfalls – the counterpart to Stuart and Trent's delirious images of Asian and South American cultures in previous scenes. The total evacuation of cultural coding from the waterfall images matches Johnny's increasingly schizophrenic state, culminating in the zero intensity of the body without organs of his final catatonic state.

Just as, as we have seen, *Shock Corridor* cannot consider the Oedipal framework of identity in any but the most ironic and irreverent of lights, its implicit views on the war-infested wounds of American culture are equally critical of the state's tendency to Oedipalise the soldier's relation to war.[6] Under the capitalist system, the Oedipalisation of the subject's sexuality and identity within the family is extended into, and reinforced by, the subject's relation to other molar aggregates, and, in particular, his relation to the state and the military machines. Oedipal structures grounded in hierarchical role models not only encourage the imitation of such models through acts of heroism and courage, but also enforce the repression of any affects that may get in the way of the soldier's willingness to kill for the love of his mother/fatherland. Through this Oedipalising process, the war machine secures the legitimation and territorialisation of its killing apparatus, and is able to turn appalling acts of violation and carnage into something palatable and even laudable.

Yet, the military shows no understanding of the schizo-activity of libidinal forces – their primordial unruliness and their tendency to bypass all sorts of regulatory binaries put in place toward the legitimised exercise of violence. The compartmentalising procedures inherent in the territorialisation of killing are in fact quite inimical to the wirings of the

human brain. Thus, the disjunctive logic that the troops are trained to internalise – 'This is the time, place, and kind of person to kill, but this is not the time, place, or kind of person to kill' – does not always withstand the complex libidinal flows that traverse a body turned killing machine. The brain can scramble the codes, and plug itself into other machines in ways that are detrimental to the organised aims of the totalising machine that it serves. Everywhere and without warning, libidinal leakages may surge at a moment's notice.

On 5 November 2009, Major Nidal Hasan, a Muslim psychiatrist serving in the military base of Fort Hood, Texas, went on a shooting rampage that resulted in the killing of thirteen and the wounding of thirty-three military personnel. A deterritorialisation of military violence took place in this event through a multiple dislocation of habitual codes – first, by featuring a Muslim both as a member of the US army and as agent of the violence perpetrated against his fellow servicemen; and second, by the violence being unleashed in the supposedly safe enclave of American soil. When a soldier has been trained in the mechanics of killing, the affections linked to his involvement in this activity are prone to prevail beyond the so-called legitimate bounds of killing. Once his brain and his affects have been hijacked by 'the harshest forms of despotism and repression' (Deleuze and Guattari 1983: 362–3), he will not stop to discriminate between a situation in which it is legitimate to kill and one in which it is not.

Moreover, the Fort Hood incident exhibits a performative irony with respect to the territorialisation/deterritorialisation of war that cannot go unnoticed. The news media painted Hasan as poorly assimilated within the American military culture and its objectives. The major was to be deployed to Afghanistan shortly, and that was alleged to have caused him deep anxiety. A Muslim himself, Hasan would have been expected to reconcile himself to the idea of killing other Muslims, which would no doubt have scrambled his own codes of allegiance. Instead, he re-enacted the army's imposition on him of betrayal of his kind by performing another form of betrayal – shooting at fellow Americans on American soil. As in the case of Trent in *Shock Corridor*, a black man who persecutes his own race, the Hasan incident illuminates the trend in schizoanalytic desire to work through inclusive disjunctions, thus mocking all efforts at maintaining categories distinct in the service of legitimised aggression. While the inmates in *Shock Corridor* establish rhizomatic connections with other cultures far removed from their own, events such as the Fort Hood massacre draw attention to the way in which such rhizomatic connections between distant cultures or disparate

worldviews are already materialised and woven together in the very fabric of today's social organisation.

In a brilliant essay exploring the role of affect in combat killing, John Protevi argues that the inhibitions the majority of soldiers experience when it comes to killing at close range have to be disabled through several strategies that are aimed at diluting their individual agency and responsibility. Protevi mentions the import of 'distance, machinics, teamwork, command, and dehumanization' in deactivating the soldiers' inhibitions (2008: 409). The emphasis on psychological distance and desensitisation during training as well as physical distance during actual/virtual combat are some of the strategies the military deploys in territorialising the act of killing by eliminating the affective impact of war on the brain. The possibility of carrying out military strikes with UAVs (unmanned aerial vehicles), for instance, thoroughly responds to such efforts. Yet, according to statements issued in a 2 February 2010 'Frontline' documentary titled 'Digital Nation', drone pilots conducting such strikes behind a computer 'have had similar levels of PTSD [post-traumatic stress disorder] as those pilots who have physically flown'. The army's territorialising efforts cannot eliminate the affective dislocations these pilots experience, as their activity instantiates inclusive disjunctions that they cannot assimilate – first, because they deliver missiles and kill actual people from a position of distance and invulnerability; and second, because they are simultaneously immersed in a war and able to return to the safety of their home and family every evening. As P. W. Singer, author of *Wired for War*, notes, 'the disconnect between being at war and being at home is very hard for the human mind to wrap itself around' (Singer in 'Digital Nation' 2010). The case of these pilots plainly attests to the military's foolishness in believing that the human brain can enter into and exit from the phantasmagoric theatre of war unscathed, only to transition smoothly on to any other environment or project.

V. Schizo-violence in *The Hurt Locker*

On the surface, Bigelow's *The Hurt Locker* could not be more distant from Fuller's *Shock Corridor*. But it is the similarly oblique way in which Bigelow's film performs the affects of war that interests us here. Unlike *Shock Corridor*, *The Hurt Locker* is directly immersed in the theatre of war. Yet, this is no conventional war film either, for its specific focus seems strategically designed to foreground the affects that link the soldier to either a traumatic revulsion/horror of war or an equally traumatic addictive attachment to it. While straight combat only takes a small part

of the film, the majority of its time is devoted to the bomb dismantling operations of a bomb squad unit of American soldiers stationed in Iraq. This three-man bomb squad (or 'Explosive Ordinance Disposal Team') is led by bomb tech Sergeant James (Jeremy Renner) who is highly skilled at deactivating the improvised explosive devices (IEDs) invisibly scattered by the enemy all through the urban Iraqi landscape. Sergeant James's extreme attachment to his job manifests itself in his sheer dependence on it as a basis for identity, although, as we will see in a moment, such dependence gives rise to something other than a conventional idea of identity. The film signals James's identification with his lethal job through several details: while sitting on his bed alone and away from the perils of his job, James puts on the helmet of his 90-pound bomb suit; after saving Specialist Eldridge (Brian Geraghty) from insurgent fire, James showers while still dressed in his bomb suit; back home on leave, James cannot communicate with either his wife or his baby, telling the latter that he loves the thrill of combat more than he loves being a dad; and the film's closing shots further corroborate Sergeant James's addiction to death, as we see him back in the streets of an Iraqi town fully encased in his bomb-suit identity.

Through all these telling details, the film refuses to characterise James's daredevil disposition simply as courage or heroism. Rather, James's fearless disposition is expressed as an addictive overinvestment whose nihilistic force alone can enable him to tolerate, and even survive, the extremities of his job. When faced with the impossible choice of either investing in death while alive or dying, James becomes addicted to the *jouissance* of his own living death, this becoming the only zone of desire he can now occupy. In this sense, Sergeant James may be understood as a variation on one of the affective mechanisms or dispositions that enable a soldier to overcome the threshold of inhibition when faced with a close combat situation. Protevi describes this disposition as 'the berserker rage': 'the frenzy of killing anything that enters the "death zone" immediately in front of the berserker' (Protevi 2008: 409). Like the berserker, James enacts a willed embracing of death, this time under a more civilised appearance of technical skill; however, the similarities go further. Protevi describes this nihilistic embrace as one that requires a certain dumping of subjectivity. In place of conscious control of one's body as the agent of the action, 'the practical agent… is not the individual person or subject, but the emergent assemblage of military unit and non-subjective "affect program"' (408). The berserker's body is taken over by a primitive affective module 'which functions as an agent [and] runs the body's

hardware [in place of the subject]' (409). As we will see in a moment, the assemblage formed by James and every single object and haecceity that composes his bomb-dismantling operations may be said to trigger the kind of affective module that allows him to bypass his own subjectivity as well.

Through Sergeant James's alienation from his own parental function as well as from the homeland, which he seems to perceive merely as an obscene abundance of commodities, *The Hurt Locker* convincingly de-Oedipalises the soldier's relation to war. In a schizoanalytic sense, Sergeant James instantiates the nihilistic channelling of desire into an assemblage of partial objects of death. Not only is his desire fully invested in his job as a bomb tech; one could go further and say, following Protevi, that Sergeant James's individual subjectivity is entirely bypassed in the supra-personal assemblage he forms with the countless possible interactions between myriad fragments and haecceities composing his bomb-dismantling activities: the merciless Middle-Eastern heat, his bomb suit, his bomb-dismantling tools, his comrades, the Iraqi civilians and insurgents around them; and, most importantly, the thrilling, altogether unpredictable configurations of visibility/invisibility, space, time, size, degree of sophistication and detonating connections that define each of his adrenaline-charged encounters with the explosive devices themselves. Such encounters are the obverse of the drone-pilot experience we discussed earlier. The IEDs deployed by insurgents might in fact be understood as the ironic counterpart to the unmanned aerial strikes conducted by the US military. Whereas the UA strikes carry out a despatialisation of the soldier/pilot – his spatial separation from the enemy targets/bodies he fights – in order to manage the affects potentially unleashed in closer-range combat, the activity of dismantling of IEDs forces the soldier to stage an intimate physical encounter with a hidden, uncontrollable weapon. Thus, to the extreme distantiation of US hi-tech military tactics, the insurgent tactics counter the hard-to-localise, lethal proximity of low-tech devices.

Several elements differentiate James's encounters with IEDs from a conventional picture or representation of war. Because the bomb-disabling situation departs, like the drone-pilot experience, from the visible oppositional dynamics of conventional combat, it is equally exemplary of the notion of schizo-violence examined earlier. In both these scenarios, the violence of the act of killing differs from the model where a violent action is followed by a violent counteraction that immediately contains, offsets or disables the first attack/offence. Instead,

violence in either of these cases is unidirectional: it is both heightened and concentrated on one single pole. The absence of a counter-action serves to divest the war situation from a sense of rational necessity or immediate justification, thus enhancing the possibility of free-floating affects that would otherwise be masked by the very necessity of engaging in conventional oppositional combat. Violence in effect becomes pure action without physical accountability or agency attached to this action, and without immediate reaction on the part of the attacked party. Whether in the mode of agent of violence (drone pilot) or in the disabling, defensive mode (bomb tech), what matters to us here is that both instances may be seen as schizo-assemblages of desire that give full range of expression to the combatant's affective ties with war. Thus, both situations serve to illustrate the military's failures at decreasing the impact of affective experience by increasing technical competence.

Although *The Hurt Locker*'s overall stress on violent tension built through silence, empty streets and economic, fully regimented gestures is the obverse of *Shock Corridor*'s hallucinating, hysterical bodies, the film's affective spillage unfolds in two forms that are no less conclusive. Specialist Eldridge epitomises the vulnerable, weak-willed soldier who immediately registers the psychological trauma of war violence, and who receives no real help from the combat stress psychologist, whose only purpose is 'to keep soldiers in the fight'. But by far the most original contribution *The Hurt Locker* makes to the examination of war-related affect lies in the film's shocking array of images of Sergeant James, whose very control and nonchalance in the face of suspended death cannot be felt as anything but full-blown madness. By the end of the film, Sergeant James is still physically intact, but there can be no other end for him but to become one with the explosive fury of a detonation. In a war film that builds its effects of suspense on the paradoxical impossibility of psychological coolness, the physical explosions themselves serve as the only outlet for the affect. Only in an eventual explosion that in this case is forever kept out of sight, will Sergeant James finally catch up with the affect waiting to burst out from within him.

VI. Conclusion

The films as well as the contemporary war scenarios just examined enact forms of institutionalised violence that channel, organise and constrain desire by distributing it across the tyrannical and nihilistic flows of the war machine. But, at the same time, through affective deterritorialisations of violence, they also enact transformations of

Oedipalised narratives of war into machinic assemblages of desire with the capacity to grow and evolve in unsuspected directions. In relinquishing Oedipal reactivity and embracing a schizo form of violence, these scenarios isolate the inherently affirmative potentialities of desire out of the darkest, most repressive libidinal configurations. Thus, it could be said that both Sergeant James in *The Hurt Locker* and the four inmates in *Shock Corridor* enact escape attempts by holding off their imminent psychosis through certain forms of artistic expression or competence – the art of the bomb disposal, the art of the operatic voice, the art of performance, the art of drawing. As they tap into creative assemblages that allow them to exist in a kind of affirmative madness while in the midst of violence or war, they make a mockery of the line that separates sanity from insanity, and even nihilism from affirmative creation. From the perspective of an affirmative ethics, the sheer madness of the actions performed in these instances no longer elicits the moral judgement that brands desire as pathological. Instead, the schizophrenising process of desire itself ceases to be the sign of sickness, which is now to be located elsewhere:

> What makes the schizophrenic ill, since the cause of the illness is not schizophrenia as a process? What transforms the breakthrough into a breakdown? It is the constrained arrest of the process, or its continuation in the void. We have seen . . . how social production produced the sick schizo: constructed on decoded flows . . . capitalism is constantly counteracting this [decoding] tendency, exorcizing this limit by substituting internal relative limits for it . . . an axiomatic of flows that subjects this [decoding] tendency to the harshest forms of despotism and repression . . . the process is arrested, the limit of desiring-production is displaced, travestied, and now passes over into the Oedipal subaggregate. So the schizo is effectively neuroticized, and it is this neuroticization that constitutes his illness. (Deleuze and Guattari 1983: 362–3)

It is the repressive stratifications and regulations imposed on desiring flows and absorbed day in and day out by the body/brain that produce an unsustainable accumulation of libidinal force. In the case of war violence, these despotic repressions and inevitable accumulations of libidinal force instantiate the way in which civilisation turns death against death, and makes this turned-back death into a force of desire, all the while thinking itself 'sanctified as the sole agency capable of opposing the death desire' (332).

In one of their very sparse references to the cinema in *Anti-Oedipus*, Deleuze and Guattari accurately render the schizoid nature of madness and violence that animates both *Shock Corridor* and *The Hurt Locker*

when they say, 'Perhaps the cinema is able to capture the movement of madness, precisely because it's not analytical or regressive, but explores a global field of coexistence' (274). In *Shock Corridor* and *The Hurt Locker*, as well as in the attempt made in this essay to bring them together along with other scenarios, events are machinically related not by virtue of the empirical or factual similarities that might provide analogical correspondences between them, but by virtue of the virtual similarities in the affects that traverse them. Both *Shock Corridor* and *The Hurt Locker* explore a global field of desire that not only puts in touch unrelated temporalities, geographies and historical constellations, but, in so doing, reveals the nihilistic impotence of the segregating actions of morality and reason and their destructive consequences for life. It is precisely by segregating and regulating desire that the reactive forces of morality achieve the transformation of 'a line of flight [into] destruction, abolition pure and simple' (Holland 2008: 77). Because desire and morality are each other's antidotes, morality cannot be invoked to render our desires creative or affirmative. For that, we need an ethics that begins by respecting the force of desire as a supra-personal force that is vitally irrepressible, an ethics that does away with the notion of desire as an individual eccentricity that must be denied or contained in the interests of a higher communal good. Yet, today, as in Fuller's time, we are far from the age Foucault announced, when madness and desire would be synonymous, and when madness itself

> would disappear, not because it would be lodged within the controlled space of mental illness . . . but on the contrary because the exterior limit designated by madness would be overcome by means of other flows escaping control on all sides, and carrying us along. (Deleuze and Guattari 1983: 321)

Notes

1. Although Johnny's pursuit of professional success might be understood as a form of libidinal investment, from an anti-Oedipal perspective, it is more properly a manifestation of preconscious 'interest' than one of unconscious 'desire'. Within the social investments, Deleuze and Guattari distinguish between 'the unconscious libidinal investment of group or desire, and the preconscious investment of class or interest' (1983: 343). To further understand this difference, we can consider Deleuze and Guattari's alignment of 'interest' with the aims of the 'subjugated group', and desire with those of the 'subject-group': 'The characteristics of a subjugated group [are:] the subordination to a socius as a fixed support that attributes to itself the productive forces, extracting and absorbing the surplus value therefrom; the effusion of anti-production and death-carrying elements within the system . . . the phenomena of group "superegoization", narcissism, and hierarchy – the mechanisms for the

repression of desire. A *subject-group*, on the contrary, is a group whose libidinal investments are themselves revolutionary; it causes desire to penetrate into the social field, and subordinates the socius or the form of power to desiring-production . . . ' (348).

2. The various performative flows in which the inmates engage are not simply socially acceptable channels for the violent forces within them, but rather creative expressions of these past and present forces. These enactments could in fact be construed as creative transformations of such nihilistic forces. Put in a different way, their 'cultivation of an ensemble of "perverse" practices, identifications and fantasies, allows [them] not only to act out [in a reactive way], but also to work through' (Santner 1996: 145) violent forces in an active/creative way.
3. Trent's performance of racist zeal dramatises the idea, expressed by Peter Canning (2000) and Zygmunt Bauman (2007), among others, that the sovereign community needs to resort to violence and to install a regime of perpetual war against private liberties and desires in order to win, or rather pretend that it can win, its fight for the ever more precarious security and protection of its members. In the increasingly difficult task of keeping its physical and symbolic borders stable and closed, the community needs to posit clear enemies within or without those borders, enemies that it can collectively persecute, torture and mutilate so as to build a collective sense of purpose and to strengthen the people's trust in the state's dubious ability to competently safeguard their security.
4. Jonathan Beller, for instance, has argued that Deleuze's exclusive focus on the masterpieces of cinema gives rise to a theory of the medium as an agent of deterritorialisation of desire. For Beller, such a theory blatantly disregards the historical and economic conditions that underpin any filmic text in favour of an idea of cinema as 'the becoming molecular of the molar, the destratification of the stratified' (1998: 79). But, rather than looking at the cinema books in isolation, as Beller does, it may be more productive to revisit Deleuze and Guattari's own theory of desiring-machines and their essential involvement with a social field, such as is outlined in *Anti-Oedipus*, by way of advancing a Deleuzian critique of Deleuze's own omissions in the cinema books: 'Every delirium is first of all the investment of a field that is social, economic, political, cultural, racial, and racist, pedagogical, and religious: the delirious person applies a delirium to his family and son that overreaches them on all sides' (Deleuze and Guattari 1983: 274). Nothing therefore prevents us from exiting the philosophical parameters of Deleuze's books on cinema and experimenting with a schizoanalytic model of cinema that, as we can see in *Shock Corridor*, can link desiring machines and social machines.
5. *Shock Corridor* figures among Fuller's works as a unique exploration of naturalist modes of violence, which are based upon what Deleuze calls the impulse-image. For Deleuze, the action-image of realist violence runs counter to the brutality and unsettling restraint of the impulse-image of naturalism (1986: 134). While Deleuze admits that Fuller obsessively pursues the impulse-image of naturalism, he thinks he fails to realise it in a fully unrestrained way. As I argue in this analysis of *Shock Corridor*'s hallucinatory sequences, however, this film departs from the realist mode of violence of the action-image in unequivocal ways.
6. Fuller's remarks on his vitalist motives for engaging with war in his films are clearly dismissive of the Oedipalising mechanisms I just described: 'The primary motive for all action . . . in all my war movies is survival, not heroism. I wanted to underscore the futility of battle and the tragic human waste' (Fuller 2003: 277).

Abstract

This essay probes into the possibility of encountering the Deleuzian sense-event in four Tom Stoppard radio plays, *Moon* (1964), *Boot* (1964), *Glad* (1966) and *Artist Descending A Staircase* (1972). Itself an incorporeal – an occurrence of the interface – the wonderful and strange protagonist of Gilles Deleuze's 1969 *Logic of Sense* is approached in apophatic gestures, with a glimpse at the various vestiges it has left upon texts. Within this exercise in indirection, 'empty forms' present themselves as the texts' circulating words. Informed by and receiving infusions from two parallel flows of Deleuzian signifiers and signifieds, these entities are singled out as the texts' pointers that open up a cleavage where the sense-event can issue forth.

Keywords: Deleuze, Stoppard, radio, sense, event, language

I. Introduction

This is an attempt to account for the oftentimes deliberate gaps, overlappings or paradoxical attachments of Deleuzian sense and its ground of subsistence, the dramatic utterance, in four Tom Stoppard radio plays, *M is for Moon Among Other Things* (1964), *The Dissolution of Dominic Boot* (1964), *If You're Glad I'll Be Frank* (1966) and *Artist Descending A Staircase* (1972). Itself an incorporeal – an occurrence of the interface – the wonderful and strange protagonist of Gilles Deleuze's 1969 *Logic of Sense* (Deleuze 1990) will be approached in apophatic gestures, with a glimpse at the various vestiges it has left

upon texts. Within this exercise in indirection, an encounter with the Deleuzian sense-event, 'empty forms' will present themselves. Informed by and receiving infusions from two parallel flows of Deleuzian signifiers and signifieds, instances of intermediariness, these entities will be singled out as the texts' pointers that open up a cleavage where the sense-event can issue forth as 'a mist' (Deleuze 1990: 24) over the surface of the states of affairs in a realm of omni-visibility.

Such loci of unresolvedness will constitute the terrible non-distinction of the terms of two parallel series of signifiers and signifieds. Hollow Deleuzian inherences isomorphically sharing the structure of the sense-event, these 'empty forms' will function as the regulators of two series' strings of propositions. What is non-belonging will only be shaped in-between two disparate flows of enunciations and bodily mixtures. My readings of the four plays, then, will constitute an effort to account for the continual generations of sense emerging out of these language movements in the shifting, interpenetration, disparity or imbalance in the series of signifiers and Deleuzian signifieds. The two series' workings, thus, will turn out to have a more macabre side to them, a certain capacity to produce Deleuzian 'unholy mixtures' in which signifiers and signifieds regulated by a circulating word interconvert in a constant quasi-dialectical movement towards becoming their opposites. Causing monsters of the depths of bodily mixtures (signifieds) to surface as language, the Deleuzian circulating word – the series' regulator – will also make muffled signifiers topple over signifieds in a simultaneous swish.

II. Preludes, Preambles

The Face Before

This is a realm oblivious to recognition. Perspectivism has become obsolete; speaking voices merely function as things among things: neither as groundings of their enunciations, nor as instances from which states of affairs are encountered and accounted for. Such thinking would demand the dispensation of any conditional elaboration. Within this centre-less Neoplatonic territory, it is flatness that steps forward bearing 'neither a fixed point nor a horizon that can orient thought' (Agamben 2000: 228). *The Logic of Sense*, then, proposes a theory of meaning that opens up to a line of thought indifferent to analogy, similarity or to the matching of local descriptions. It posits its terms as differentials on a single plane where parallel subsistence is the norm rather than delineation through negation. Posited on a plane that is all foreground, events are only

encountered in their difference from events. Be they words, poems, dialogues or images, events are not to be aligned with substance, nor do they function as copies, emanations or vestiges of being. Inhering in corporeal entities without being reduced to the corporeal, they are not entirely incorporeal either. Rather, events retain a peculiar neither/nor quality, to borrow the apophatic gesture with which Derrida approaches khōra (Derrida 1995: 91), the ineffable placeless place in-between being and non-being. An event, then, is a way to account for a transition: it marks the very act of collision when sense, without constituting meaning, and without being sound, emerges on the rifts between the two. This is what I envision in my readings of the four plays: humans, fossils, pieces of technology, pieces of emotion, proper and common names, enunciations and silences will be put on the same plane, as things among things on a spreadsheet operating in an Auerbachian 'perpetual foreground'. Stretched out in clear prints, they will conceal nothing: organs and skin, skulls and flesh will remain eternally visible and graspable at once, on a surface that is simultaneously the interface.

The Event of Sense. Dialectical Twists

Like almost all historically distant books, *The Logic of Sense* confronts me with an impenetrability. Obsolete words and conceptual fireworks dim my vision. At first, I am introduced to the bodies of the world: they reside on a plane intertwined in tensions, actions and passions. A second glance and the propositions of language step forward. The enveloping, the mist spreading over these interconversions, is that of incorporeal events. Saussure's signifiers and signifieds have been idiosyncratically mapped onto the division between propositions and bodily mixtures. All the while, the sense-event, an incorporeal psychopomp constituting a homologous mimicking of Spinoza's 'expression' and Hjelmslev's 'purport', eternally shifts between the two 'parallel orders' (Brusseau 1998: 63), showing a different Janus face in its encounters with words and worlds.

Within this frame, all I am confronted with is a surface, and the emergence of a sense-event in transference. Fascinatingly, the surfacing of the event is language's greatest visibility and simultaneously, it marks the very impenetrability of it: 'If there is nothing outside of the surface, if all there is *is* surface, then what characterises the surface is inescapable, unsurpassable. There is no looking elsewhere in order to discover or understand our world or our worlds' (May 1994: 43). This newness is completely flat: it is an expressed that is unextractable from its

expression. The event turns one face to the heights and one to the depths, yet is of the order of neither.

Still, the incorporeality of the sense-event has nevertheless found an explication in the series of propositions. Deleuze locates it in a strange spot, the 'circulating word' of a text. Offering yet another isomorphic map of the structure of the event, he postulates the 'circulating word' as that which works as a differentiator regulating two parallel series, turning a face to both while being of none. The circulating word functions as a peculiar point of convergence that, because of its highest capacity to explicate sense, has a paradoxical nature. In its very being, it is the differentiator – the divergent catalyst – and yet, its function is to work towards the series' convergence. Thus, it is a living contradiction, and one that continually carves a path towards its own displacement. While in a state of perpetual motion between the two series it is, just like sense, reducible to none and inherent in none. Reminiscent of the zero phonemes in linguistics, an entity of two faces, a two-sided mirror, it simultaneously functions as 'word and object, sense and denotatum, expression and designation' (Deleuze 1990: 40). The series' movement is guided by such circulating words precisely because they work as a Deleuzian 'zero place' within both flows, that is as an object pointing to its own distance from the series that it determines. What it does to the series, then, is nothing more than to throw light on them, leave a cleavage, a bare spot from which their very sense could shine forth.

What is of interest for the plays' analysis will be the proliferation of this zero place in texts as classified in what I find to be the book's most alluring part, 'Seventh Series of Esoteric Words' (Deleuze 1990: 42–8). The circulating word here is presented as the regulator of two sets of dualities. It is its empty quality that guarantees the circulation of sense and performs a coordinating role between two divergent series – of states of affairs and propositions – by dint of their being carriers of the series' senses. This behaviour is described as 'conjunction' (47). Here, the circulating word mediates the series allowing for no primacy of one string of flows over the other, and functions as an in-between 'point of suture' (Žižek 2004: 34). While the two series may present themselves as successive within the text, a temporality in itself, within the terms of sense they will invariably be co-extensive.[1] Hence, two different and yet simultaneous parallel flows with regard to the circulating word – itself traditionally a strange object explicating the utmost concentration of sense – are formed. While divergent, they reveal a mirror quality governed by the circulating word and are oftentimes dependent on

a point where elements belonging to one series undergo a transition to another.

III. Before Reading. An Interlude

Unlike the rest of Stoppard's oeuvre for the stage, and unlike the remaining body of his radio plays, *Moon*, *Boot*, *Glad* and *Artist* are either too short to develop a character or an idea – indeed, I am only confronted with an *in medias res* unresolved situation – or include too many temporal and referential shuffles to be immediately graspable. Yet, having overcome the initial confrontation with a text challenging my habits to locate and presuppose an inherent sense, I am still unsatisfied with the decision that there are certain texts, their ideas being 'too thin', that just do not lend themselves to a reading. Though presentational, with its constant interplay of uncertainties the medium opens up a suture. Both speaker and listener are already found in a perpetual enactment of their own disappearance in hearing-somebody-speak in the face of the speaker's problematic immediacy. Thanks to this subtle layering of undecided presences – of listener and of performer – the radio play could be described as a constant exercise in evocation. Namely, it is perpetually engaged in re-enacting the wish for the auditory presence evoked in listening. Thus, radio plays are bound to open in a moment of utmost frustration and maximum ambiguity (absence), slowly unravelling towards immediacy and presentness. Stoppard is no exception: by mystifying perception, uncertainties are retained until the very end.

The dramatic pieces at hand display a world of an utmost immediacy. Still, it is this immediacy that comes across as strangely puzzling: the words on the page appear to be all that there is. This display of absolute visibility, yet, only makes them almost baffling. Encountering the early Stoppard is thus very much like reading a Renaissance play, or any work pertaining to a world long-since vanished, enveloped by a mindset with a world-making ability to be either historically reconstructed or yet accounted for. On one level, the plays are simple to the point of being trivial, and still, it is precisely this quality that makes them partly nonsensical, partly cryptic. Their emptiness is not that of the Beckettian void lurking beyond each sentence and gesture, but the emptiness of an immediacy so much in front of me, that it has become invisible. I can only witness the world-in-writing as a continuous movement of generation, a claymation. Within this non-hierarchical, non-oppositional movement, I would find 'a system of language that is not linguistics,

but that emerges as sense out of the literary work of art' (Olkowski 2008: 108).

Likewise, the emergence of relations will paradoxically remain a concrete abstraction: it will speak exactly of what there is. Four words[2] will posit themselves as the grounding of the relation and as the relation between two disparate orders. Humans will lose their anthropomorphic capacity of 'action'. Rather, they will function as props yielding themselves to the movements of language and propelled by them. Personal pronouns and active verbs will figure in the readings only nominally, and either nothing (not even human agents) or almost everything (words, props) will be endowed with the faculty of doing. Language, speaking with Heidegger, will cease to be conceived as an exclusively human property, but will posit itself as the marker of ultimate convergence and approximation regardless of speaking subjects: 'its character belongs to the very character of the movement of the face-to-face encounter of the world's regions . . . the relation of all relations' (Heidegger 1982: 108).

IV. Four Movements. Accumulation, Transmission

Let me now shift towards a component encountered in all four dramatic pieces – the notion of accumulation and transmission, a thematic core that moves within the plays as their reified and superimposed version. This two-fold movement – a circular chain of amplification and transference – is carried forward by dint of a circulating word which presents the literalisation of the plays' thematic core. The circulating word governs the movements of accumulation and transmission, intersecting with and giving rise to surface 'unholy mixtures' of the Deleuzian type in its passing. The shaping of these 'unholy mixtures', markers of the places where two orders (signifiers and signifieds) interpenetrate or fuse into one another on their way to becoming their opposites, will oftentimes be dialectical. Their movement will constitute an interplay of disparate elements and will require an involvement in a game of impersonations. In compliance with its rules, signifiers will be logocentrically aligned with anything that is of the domain of speech, and signifieds – with all that pertains to bodily movement: motions, thought, writing, creative acts.

The ruling notion of transmission and accumulation in the abstract has been literalised in the series, becoming commodified in very concrete objects: an alphabetical book, a taxi meter, a phone receiver, a tape. It is these objects that will function as Deleuzian circulating words

by regulating the two parallel flows of signifiers and signifieds. In a process similar to the procedure of proliferating the series of orality in Lewis Carroll's *Alice*, namely 'to eat/to speak' and 'consumable things/expressible senses' (Deleuze 1990: 37; Guyer 2004), the series in the plays continually oscillate between bodily depths (signifieds) and language heights (signifiers), only temporarily freezing in the eventual of the surface. Specifically, the signifier–signified parallelism previously designated as the division (illustratively speaking) between propositions and states of affairs will, in a second movement, start gliding into the realm of 'unholy mixtures' between bodies and sentences with their denotations, manifestations and significations. These two orders will be shown to constantly flow into one another. The false depth of the origin–derivation relationship manifested in representation will be overcome in a constant movement of reciprocation. It is the transmission in-between regulated by a circulating word that replaces both the Platonic claim to height (ideas descending from above and the copies' level of participation in them) and the Freudian claim to depths (the unconscious, a chthonic lake of unformed matter ascending, surfacing in sickness).

An Alphabetical Book

Moon unfolds and revolves around an alphabetical book – an object containing assemblages of educational trivia in the form of A–Z lists of words followed by their short, and oftentimes arbitrarily chosen or incomplete definitions. The two participants in the dramatic piece, the elderly married couple Constance and Alfred, are musing over the definitions of the current edition, *M–N*, plaintively or dismissively, before going to bed. A certain allusion to the attainment of absolute knowledge is presented through the rare, deliciously unfamiliar word clusters. The book itself is a random ensemble of various glossic collectibles in which proper and common names intertwine, with the descriptions shifting and detaching themselves from their 'proper' signifiers as Constance's gaze absentmindedly glides along the page.

The book entries, apart from being words with detachable intensions – with Constance selecting only specific chunks of definitions, and quite randomly so – also function as edibles. The words' gastronomic side is alluded to by the woman's 'skipping madly', very much reminiscent of one's picking food off one's plate, as well as by the deliberate pauses intersecting the various articulations of M-words: 'CONSTANCE: [...] Marshmallow... Mickey Mouse...

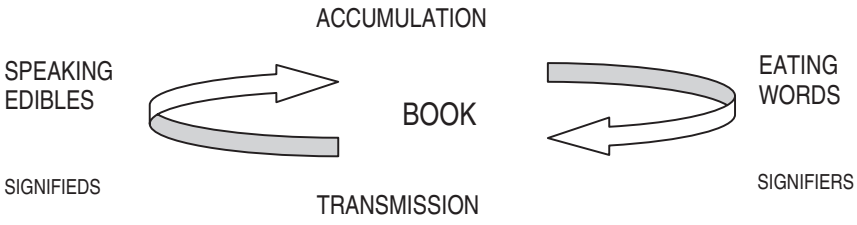

Figure 1. Eating words and speaking edibles.

Marriage . . . Moravia . . . Mule . . . Market . . . Mumps . . .' (Stoppard 1994: 21). They, as if stating an anticipation, mark the silent moment of foretaste before rolling a word-bite along one's palate. The alphabetical book operates as a word-plateau, an edible, and at the same time, as an ensemble of signifiers with intensions yet to be properly attached.

It is this intermediary quality that comes to light during an encounter with the book. 'The Universal Treasury' is at once a differentiator and converger of the play's series of word bodies and corporeal glosses: an expressible that becomes consumable, and an edible that exhibits an expressive capacity. The book is also the locus of containment for both accumulation and transmission, as it embodies a cumulative assemblage of human knowledge (object) and immediately states a certain wish for its communication via an instalment-in-language (word). Namely, it comprises word-plateaus that are being accumulated (in designation) *and* bodily signifiers that are being transmitted (in expression). The movement circularly shifts from accumulation to transmission and from transmission to accumulation, with the alphabetical book entries freely switching between the series of signifiers and signifieds, of glossic assemblages and corporeal mixtures.

As a point of the series' convergence, then, the alphabetical book sets in motion two supplementary series of eating words and speaking edibles. The latter corresponds to the passage from transmission (expression, signifiers) to accumulation (a set of collectibles, signifieds), while the former is shaped as the circulating word passes from accumulation to transmission. Eating words and speaking edibles, the pastimes of Constance and Alfred, uncover exuberant M-clusters, pronounced to be devoured and eaten up while being uttered in a gesture suspending the boundary between word and thing. The alphabetical book functions as a zero-place between the flows that allows the wordiness of things and the thingliness of words to flow into each other (Figure 1).

'Eating words' and 'speaking of food' (Deleuze 1990: 23) are two modes, then, in which inversion coincides with interpenetration. In 'to eat words', the depths of bodies with their strange interminglings are taken up and brought to surface on the plane of language. Depths of actions and passions become immanent. In a parallel move, the event that subsists in language but happens to states of affairs starts to 'speak food'. The eventual, already delineated as the attribute of states of affairs, descends into a pandemonium of bodily mixtures. Sense, though not residing outside of the proposition that expresses it, happens to mixtures, too.

An example of speaking edibles is Alfred's play of definitions that revolves around the core word 'Meat!' (Stoppard 1994: 19). In this instance logophagic consumption is enacted as appropriation-in-acquisition. Alfred accumulates knowledge-words by assimilating or internalising them in the symbolic quasi-creative gesture of defining them, of delineating a word's boundaries, measuring its perimeters and scopes, and thus coming into possession of it. Namely, what takes place is a quasi-creative expressive act that, in its transference, adds up to appropriation or acquisition. Speaking with Marcel Mauss, Alfred's meat-grumbling could be aligned with a ceremonial the function of which is to further the internalisation of the thing to be appropriated. The definition-giving is aligned with 'a means of utilising objects sympathetically' (Mauss 1972: 53). In Alfred's act of uttering (a donation of intensions) what is to be appropriated (signifiers) in expression (transmission) has moved towards acquisition (accumulation) in the mute order of signifieds. The spoken has been treated like an edible – a thing to be devoured and assimilated. In their movement towards appropriation, then, the uttered words have become internalised bodily mixtures.

Constance represents the other pole: eating words. Her act is one of appropriation-in-utterance. Carefully pronounced book entries amount to the act of consuming what is to be uttered. This assimilation is carried out with the help of speech: in the process of their being eaten, edible words (signifieds) are uttered (signifiers) in a movement from accumulation to transmission. More precisely, the very moment of pronouncing (expression) coincides with a moment of consumption (accumulation) that incorporates the cumulativeness of the book into the expressiveness of speaking. Namely, edible word clusters are incorporated into the realm of their expressible counterparts. The transition is thus one from bodily corporeality (accumulation) to the communication of signifiers (transmission). Illustratively speaking,

Constance's act is vaguely reminiscent of the Vedic practice of *nāmarūpa* (name-form), a ritualistic utterance which, by virtue of the naming itself could evoke, or speaking with Heidegger, summon the word's being. In this 'summoning' the earth yields itself to a wish (accumulation → transmission) that, with the fact of its statement, causes the earth to refold differently (transmission → accumulation). In a similar gesture, Constance's reading behaviour transforms edibles (objects of the book and signifieds) into signifiers, her speaking coinciding with the very act of their very consumption.

Meter

Boot traces the bankrupt Dominic Boot in his attempts to raise money for an ever-rising taxi fare as the man frantically travels across town. Opening with an exchange between Dominic and his fiancée, Vivian, the piece unfolds as Dominic swings from one bank to the next only to find out that either his credit is overdue or the bank has already closed. He resorts to robbing his firm's small stationery cash and breaking a gas meter to scoop up its coins.

The play, among other things, offers another instance of a zero-place within the flows, a spot of convergence between expressions and designations, words and objects. In *Boot* I have identified the taxi meter as the paradoxical instance that propels the series' interchangeable movements of accumulation and transmission. This device communicates the act of accumulating miles (object) and expresses it as bodily movements (word) throughout the text. It moves within the series of signifiers and signifieds, each time offering the loci of its unholy mixtures in overturned, mirrored guises with regard to their opposite series.

A taxi meter, though 'inaudible in the broadcast' (Kelly 1991: 32), is the unquestioned always-already there of *Boot*: it is a foreground around which all efforts and events of the play revolve, the generator of all motion. Dominic Boot travels across town confined to his taxi and plagued by the compulsion to pay for the ride, the fare rising progressively as his money-raising attempts fail one by one. The meter, however, remains unnamed and is only suggestively alluded to in the text's few juxtapositions of the taxi's mileage and its monetary equivalent (Stoppard 1994: 5, 6, 7, 8). This presence does not get pointed to, does not become the object of designation and is not expressed by an onomatopoetic sound. Its subsistence as a ghostly textual omnipresence is only subtly played out as the meter is indirectly talked about through Boot's various calculations intersecting the play. It is the meter that is

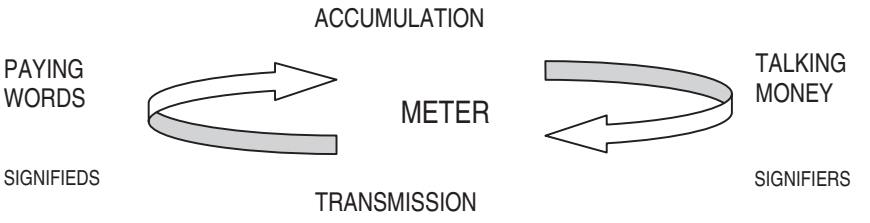

Figure 2. Talking money and paying words.

responsible for the rising of the fare and for the string of attempts and failures to get hold of money expressed by Dominic. Thus, in the series of accumulation and transmission, the accelerated growth in miles is transmitted as the motions of Dominic.

While moving within the realm of signifiers from counting coins (accumulation) towards its expression in bodily movements (transmission), the meter starts to talk money. Then, on gliding back into the realm of objects, it becomes re-commodified and begins to pay in words. Talking money from the realm of signifiers transmutes into paying words once the circulating word moves within the realm of signifieds, and vice versa. Speaking of money and paying in words become the two modi through which Dominic resides in the dramatic world. Talking money and paying words are also the two modes that the motions of the circulating word 'meter' exhibit in the series of signifiers and signifieds, respectively (Figure 2).

As the taxi moves towards the first bank from which Boot attempts to obtain cash, the first line of calculations presents itself. The taxi's mileage is being translated into money, and money becomes the instance through which Boot begins to speak and move: 'DOMINIC: *(Thinks:)* Three and three . . . three and six . . . [. . .] Three and six, plus six, four bob . . . ' (Stoppard 1994: 5). This is how the more immediate instance of talking money manifests itself. Here, states of affairs have risen up from their chthonic residence deep within bodies and, following the logic of the Deleuzian 'unholy mixture', have begun to speak. Since Dominic's entire motion throughout the play is motivated by the meter's ticking, acts of transgression are not ruled out, and Dominic, while still deeply engaged in counting petty cash, goes as far as to break a gas meter for its coins:

> DOMINIC: [. . .] *(Thinks:)* Fourteen shillings . . . and six . . .
> (Taxi pulls up.)
> Thanks, I'll be out in a minute.

> DOMINIC: *(Panting, muttering:)* Fourteen and six, fourteen and six... property of the North Thames Gas Board... oh well... where's that poker... [...]
> One, two four, five six seven, ten, ten and six, ten and six...
> (Stoppard 1994: 6–7)

Finally, even Dominic's mother and fiancée are commodified through the talk, their presence being translated as yet another tragic occurrence that only adds money to the fare:

> DOMINIC: *(Thinks:)* Thirty-one minus ten plus... [...]
> Thirty-nine, and sixpence for Vivian and sixpence for Mother, minus ten, plus, no minus...
> (Stoppard 1994: 8)

Alongside the notion of talking money, I am also confronted with the practice of paying words in the realm of signifieds. Words and statements here are muted, descend into the depths of actions and passions, and begin to mime bodily movements. The motion is regressive and marks a transition from expressive transmission to accumulation. This is the realm of Austinian performatives where 'the issuing of the utterance is the performing of an action' (Austin 1975: 6), or where words are made into deeds. One such movement is observed in the short bargaining scene in which Dominic and the taxi driver engage:

> DOMINIC: A pound.
> DRIVER: Right, you can pay me off now.
> DOMINIC: Twenty-five bob.
> DRIVER: Doesn't pay.
> DOMINIC: Thirty with tip.
> DRIVER: Thirty-two and six.
> DOMINIC: Done!
> (Stoppard 1994: 9)

The word closing the agreement, 'Done!', constitutes an action: an utterance that, in the very moment of its issuing, undergoes an incorporeal transformation to become something else. The word is no longer itself, but rather a bodily capture, a materiality rightly belonging to its parallel order. It is a word that pays. Words have carried out an action, and by doing so, have plunged into bodily movements, shifting from transmission to accumulation. In both cases the constant inversion-in-circulation caters to the formation of an 'unholy mixture' in which distinctions are blurred, signifiers topple over signifieds and signifieds rise up from their depths to present themselves as language.

As depths come to the surface, the realm of signifiers also stirs up to move within bodily mixtures. While signifieds suddenly acquire the faculty of speaking, signifiers get muffled once they have descended within the motions and noises of bodies.

Phone Receiver

Glad is a play about Frank, a bus driver, and his efforts to speak to Gladys, his wife, whom he believes is imprisoned in the Post Office building and forced to work as a phone operator announcing the time every ten seconds. The man madly manoeuvres through town, always at least ninety seconds ahead of schedule so that he can dial TIM, the time announcing service, and attempt to converse with the robotic voice. *Glad*, thus, also presents me with a productive blank, a zero place regulating the two flows of signifiers and signifieds and furthering the intermix between the two orders. Yet another prop has been singled out and readied to function as a circulating word. Here, a phone receiver operates as a Deleuzian blank spot that belongs to neither of the orders but nevertheless is the carrier of words and things across the series. What this carrier effects is the movement from accumulated silence (object) to its very literal expression in silencing (word). Paradoxically, in the realm of 'unholy mixtures' productive or positive silence streams from the realm of signifiers: here I am confronted with a silence whose expressiveness is shown through the movement from accumulation to transmission. Yet, once the movement treads into the realm of signifieds that have descended into bodily motions, silence becomes a silencing that further moves within accumulation, thus losing its enunciatory capacity.

Enunciatory silence and silenced enunciations become the two modi of the circulating word. The 'unholy mixtures' issued from this movement, once again, account for the signifieds' becoming signifiers as the circulating word carves its way from accumulation to transmission, and for the signifiers' becoming signifieds in the switch from transmission to accumulation. Thus, as shown in Figure 3, bodily depths become expressible in the realm of signifiers, while in the realm of signifieds, utterances are hushed by states-of-affair motions. As depths come to the surface, the realm of signifiers also stirs up to slide within bodily mixtures. While signifieds suddenly acquire the faculty of expression, signifiers get muffled once they have descended within the motions and noises of bodies.

In its travels within the realm of signifiers from silence (accumulation, bodily mixtures, default signified position) towards its expression

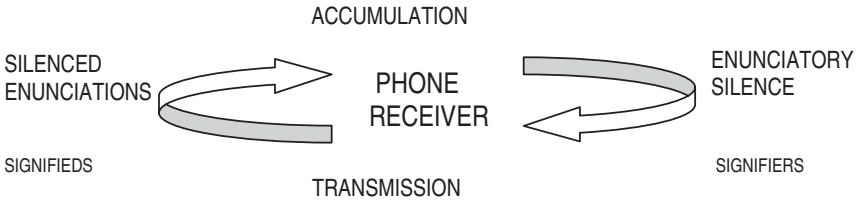

Figure 3. Silenced enunciations and enunciatory silence.

in enunciation (transmission), the phone receiver presents me with enunciatory silence – a manifestation of the signified's sudden capacity to become expressive. On gliding back from the realm of words towards objects, however, enunciations, while present, become counterproductive, broken and thus silenced. Enunciatory silence from the realm of signifiers becomes silenced enunciations in which the expressive capacity of silence becomes a bodily noise, a crack-up belonging to the realm of signifieds.

The phone receiver is the main object-helper through which Frank can communicate with the robotic voice of the Speaking Clock. Another intermediary, an objectified messenger, it opens up a liminal ground on which the conversation between Frank and his wife, the Clock, could take place. Every time Frank manages to get ahead of schedule and access a phone, however, he is confronted with the same non-communicative situation. While Frank insists on addressing his Gladys, talks to her in a cooperative manner, and awaits a cooperative response, Gladys only continues with her precise markings of time:

> GLADYS (through the phone): . . . At the third stroke it will be nine twelve and forty seconds . . . .
> FRANK: It's alright, Glad—it's me again—Frank!
> *(Gladys's timespeak continues underneath.)*
> Can you hear me now, Glad?—I've got a time of it, I can tell you [. . .]
> Can you hear me, Gladys? Give me a sign?
> *(Pause; timeclock.)*
> I know your voice—it's you, isn't it, Gladys—are they holding you?—I'll get you out of there, Gladys—I'll speak to the top man—I'll get the wheels turning [. . .]
> GLADYS: Nine fourteen precisely—
> (Stoppard 1994: 32–3)

Gladys's talk, while composed of carefully measured enunciations, constitutes a gap. Communicatively speaking, it is an impossibility to

commit, a blank, pure silence. Her enunciations are communicatively mute, and yet are expressive in their unresponsiveness in so much as they express a void, an impossibility. The blunted affect manifested in this expressive silence marks the transition of a mute bodily motion from the realm of signifieds (object) towards transmission (word). In this shift from accumulation to transmission, silence has become expressive (enunciatory silence). Likewise, on gliding towards accumulation (bodily mixtures), the enunciations rightly belonging to the realm of signifiers have become objectified, silenced:

> GLADYS: *(Through phone. Sobbing hysterically:)* At the third stroke it will be five thirty five and fifty seconds . . . . [. . .]
> GLADYS: At the third stroke I don't know what time it is and I don't care, because it doesn't go tick tock at all, it just goes [. . .]
> (Stoppard 1994: 50)

Let me impersonate a phonocentric for a moment and behave as if the entire realm of non-speech, though composed of sense, only generates signifieds. What I am confronted with, then, is a crack-up. Noises of the body – Gladys's introspective monologues (signifieds) running parallel with the utterances of the Speaking Clock – have come to the surface to rupture her enunciations (signifiers). The order of signifieds, of state-of-affair mixtures, has slightly stirred the surface of signifiers, transmuting them into monsters of the depths. In this overturned situation, all that has been latently resting within bodily motions – the remains, the sublayer or the surge of a human subjectivity – surfaces to engulf her enunciations and to turn them into body parts. In the inverted order of the crack-up, Gladys's introspective turns affect the markings of time, intersecting and muffling them (silenced enunciations). Within the transition from transmission to accumulation, enunciations wither away in the process of their becoming a cluster of accumulated body noise, thought and mind debris.

Tape

My last circulating word, the tape, propels series that are somewhat removed from the immediate presence of this object. In *Artist Descending A Staircase*, Beauchamp's master-tape, the device that has captured Donner's last moments of life, is played as the play opens (Stoppard 1994: 113) and once again in full length at the closing (156). When played first, it is presented as highly ambiguous: there is a droning noise, footsteps, a creak, and Donner casually remarking: 'Ah! There you

are.' The remark is followed by a thump, the sound of the rail breaking and Donner falling. Beauchamp and Martello, judging by the lack of alarm in Donner's voice, assume that he must have been confronted by somebody familiar during his last living moments, and start firing a line of mutual accusations. This lack of resolve is amplified throughout the dramatic piece, as listeners are invariably predisposed to locate an episode, a retort or a situation that would reveal a murderer. It is only towards the end, with the second playing of the tape, that the mystery is mundanely resolved with the discovery that Donner has fallen off the rail in an attempt to catch a droning fly. The device's accumulated sounds are presented as 'the detritus of audible existence' (120) in Beauchamp's self-flattering definition, 'rubbish, in fact' (ibid.) in Donner's judgement, and 'a bubbling cauldron of squeaks, gurgles, crackles' (119), according to the stage directions. It is these sounds that could be aligned with the noises and unrestrained nonsense of bodily movements.

Once the tape has accidentally captured Donner's sounds of waking and chasing the fly, it becomes a piece that lends itself to interpretation. The introduction of a string of familiar motions suffices for the moulding of a story (in the general sense) – though one that still requires exegesis. What is transmitted in this case, a scrap of 'meaningful' noise yet to be interpreted, are the sounds of Donner's fall. The movement from accumulation to transmission, from object to word, translates into the transition from 'tonal debris' (ibid.) to an interpretable piece. The moment of openness that points to the interpretability[3] of this cluster of sounds, then, also constitutes a moment of expression – an expression that points to its own enunciatory capacity. Hence, what will function as the ground of the circulation (an entity that points to both flows while inhering in none) will not be the tape itself, but its capacity to incorporate both the senseless and the interpretable.

It is the transition from undifferentiated nonsense to interpretability that will be taken into account here. This movement is observed in two episodes located in the play's flashbacks and seemingly unrelated to the tape in any way. In the movement from accumulation – undifferentiated noise, inscrutable bodily motions – to transmission – interpretability as an already-familiar movement – signifieds rise up from their chthonic abode to disrupt the order of signifiers (Figure 4). Similar to the instances already observed, actions and passions, nonsensical clusters of movement begin to issue accounts of their nonsense (speaking deeds). Conversely, in the transition from the order of signifiers to signifieds, enunciations are reified, and find a very material existence as actual objects (acting words). The latter movement can be remotely described

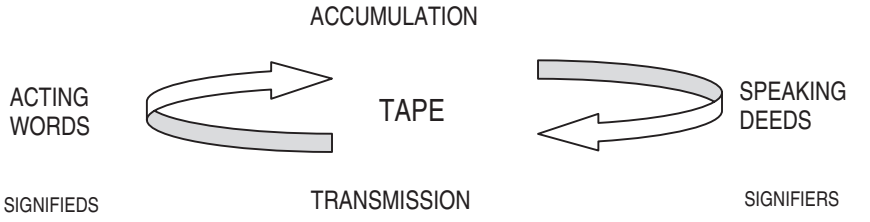

Figure 4. Acting words and speaking deeds.

as a literalisation of metaphors, while the former more or less functions as a figurative reading of the literal.

In the realm of signifiers, then, in an inverted Austinian model (Austin 1975), I encounter actions that function as utterances, while the order of signifieds confronts me, once again, with the very performativity of the statement.

In the flashback including the three artists' walking trip through France, I meet Beauchamp's Tenth Horse. The animal is introduced in the stage directions as 'skittering about' (145) at the sound of a convoy of lorries and quickly becomes the object of a talk:

> BEAUCHAMP: Steady, steady . . . good boy . . .
> MARTELLO: Tell you what—give me a go on the horse.
> BEAUCHAMP: No. This horse only believes in me. What an animal! [. . .] What shall I call him? [. . .] Steady, steady . . .
> DONNER: For God's sake, Beauchamp, will you get rid of that coconut!
> BEAUCHAMP: Coconut!—not a bad name. And yet it lacks a certain something. Would Napoleon have called his horse Coconut? . . .
> Napoleon . . . not a bad name.
> (Stoppard 1994: 146)

The coconut, famous for its sound effects,[4] confronts me with a situation that is the exact opposite of Austin's action-words. Beauchamp's effort to create a reality with the sole help of speech through the Austinian illocutionary act 'I name this coconut horse' remains unrecognised. In the course of the talk, the performative is then substituted for the implied compromised enunciation 'I name this 'horse' Coconut'. In the second case, 'horse' does not hold a claim to any 'reality' and is already a negotiation that closes the referential gap. Loosely speaking, the problem of not-thereness is solved with the figuralisation of 'horse'

in the groundless metaphor 'The coconut is a horse'. The end-product, and also the source of the funny effect, is the tautology 'I name this coconut Coconut'. The horse, then, departs from the realm of signifieds in the guise of a nonsensical noise produced by the banging of coconut shells (accumulation) to reach its own becoming figurative and a signifier (transmission). As a transition into the figurative, the movement from horse to 'horse' becomes interpretable, graspable, and thus, begins to speak. Namely, it opens up to exegetic activity and therefore, communication. This transition from noise (nonsense) to expressivity also makes it slide into the realm of signifiers, where Beauchamp's act of naming already bears sense. Beauchamp's enunciation 'I name this 'horse' Coconut', then, becomes an overturned performative, a speaking deed.

A second example emerges. It is found in one of the flashbacks accounting for Donner's derogations of his friends' artistic efforts. In the exchange to follow, Martello introduces Donner to his last masterpiece: a metaphorical sculpture encapsulating Sophie's beauty. The girl's hair like ripe corn, teeth like pearls, swan-like neck, breasts like ripe fruit, eyes like stars, and lips like rubies (Stoppard 1994: 129), are to be depicted using real corn, 'real artificial pearls', 'real feathers' and real fruit, either 'pears' or 'apples' (ibid.):

> MARTELLO: How do you like her?
> DONNER: It looks like a scarecrow trying to be a tailor's dummy. It is symbolic?
> MARTELLO: Metaphorical.
> DONNER: Why does she have straw on her head?
> MARTELLO: Not straw—ripe corn. It's her hair. [...] it was bad enough getting the pearls for her teeth.
> DONNER: They look like false teeth.
> MARTELLO: Well of course they're artificial pearls. So are the rubies, of course. I know you'll appreciate her breasts.
> DONNER: Oh yes. Are they edible?
> (Stoppard 1994: 129)

Once the interpretable has moved within a realm of incomprehesnsibility, it also has glided back to its old depth of bodily motions. In this passage, therefore, I observe a case opposite to that of speaking deeds. What Martello proudly names a metaphorical sculpture is metaphorical only on the grounds that it is composed of accepted verbal clichés about female beauty. Yet, once these utterances – which could be segmented in 'Sophie is the sculpture', 'Sophie's teeth are like pearls' and so on – are transformed into objects, the effect is grotesque and

nonsensical. Beauty has been strangely reified with the use of actual materials, even edibles. Words have slid back into their nether region of bodily mixtures. This is the realm of literalised metaphors, or of acting words. While the Austinian model – 'This is Sophie' accompanied with a gesture that points to the statue – is applicable in this case, it only has bred a monster. The descriptions are matched: 'lips like rubies', 'eyes like stars', 'swan-like neck' are all there, only with a slight difference. It is this tiny slant that suffices to turn the situation into an abnormality, and to align the scarecrow statue with a monster of the depths. The transition from transmission (expressivity, interpretability) to accumulation (non-expressivity, non-interpretability) amounts to a transition from sense to nonsense. The string of literalised metaphors is no longer communicative. Rather, it strikes as monstrous, transgressive.

V. Conclusion

In attempting to answer the question of whether Deleuze's sense-event could be approached in a reading, this paper turned to the vestiges of the workings of sense in four Stoppard radio plays. Within the 'terrible' manifestations of the workings of sense, an easy interchangeability between signifiers and signifieds consolidated into the emergence of expressive signifieds and their mirror counterparts, non-communicative signifiers regulated by a circulating word. *Moon* and *Boot* confronted me with reifications of utterances and verbalisations of acts of consumption, the becoming-expressive of commodities and the commodification of speech. What followed were the expressiveness of non-communication and the communicativeness of silence in *Glad* plus the literalisations of metaphors and figuralisations of the literal in *Artist*.

In these efforts to capture at least a temporary freeze-frame of the sense-event, to account for that which 'flashes across the intervals when a communication takes place, between disparates' (Deleuze 1994: 22), I have only encountered a void. Perhaps the sense-event will ever remain an elusive, unattainable and unaccountable extra-being very much resembling the shelves of the Sheep Shop in Lewis Carroll's *Alice*:

> The shop seemed to be full of all manner of curious things—but . . . whenever she looked hard at any shelf . . . that particular shelf was always quite empty, though the others around it were crowded as full as they could hold. (Carroll 1960: 253; Deleuze 1990: 41)

'Full' when approached by indirection, but 'empty' when confronted up front, the shining forth of the sense-event will perhaps ever remain an impossibility. Even when posited on a plane of immanence and encircled

by the flat fossil prints of bodies, actions and passions, it persists in offering only momentary flashes, or merely the traces of its workings. Perhaps it is in the overturned series of signifiers and signifieds, the subversive ruptures of nonsense or the ever-ongoing battle between names and beings that the sense-event manifests itself. What is felt, however, is that the sense-event does propel texts and invisibly shapes their fabric with the help of its functionaries: breaks in signification, impossible objects, circulating and contracting words or dry reiterations. What is witnessed in the work of these helpers is that sense is not found, but shaped as an effect of the encounters with its various paradoxes.

Notes

1. As opposed to Derrida's 'transcendental signified', which postulates a pre-suggested, pre-thought meaning outside of language, Deleuze's transcendent signifier (a logocentric entity in itself) offers a world dominated by words: being, essence, thought, understanding. This difference could be the key to the two philosophers' entirely different approaches to language, too. For Deleuze, language in its present shape is a tool of power and subjection. Its major unit of significance is the order-word (Deleuze and Guattari 2007). Hence, language cannot, by virtue of the very positing of a transcendent signifier, lend itself to interpretation – words have always-already ordained (to borrow a Marxist vocabulary) each to its rightful place, each to its signified. Derrida's 'transcendental signified' as explicated in his *Of Grammatology* (1967), in contrast, is the aftermath of logocentrism. Following logocentric edicts, signifiers derive their meaning from signifieds postulated as transcendental referents outside of language. Since the signified is always a secret, a hiddenness, an absence always-already cloaked in too many words, it remains the subject of careful exegesis. Exegetic activity, then, becomes an exercise in evocation: an effort to bring the absent signified to the state of phonocentric presence that speech is. Logocentric language, therefore, is the language of interpretation. Thus, I have used the word interpretability as part of the impersonation game in phonocentric and dialectical thinking that this section partially is.
2. It is in the explication of this co-existence that world and word show me their most ancient faces. The word as the ground, the locus of convergence without synthesis of signifier and a Deleuzian signified, word and being, is metaphorically expressed in the Deleuzian image of the three philosophers in *Logic of Sense*: the Platonic (intoxicated with heights; signifier), the pre-Socratic (deep in schizophrenic bodily mixtures; signified), and the Stoic (the philosopher of the staff blow and of immediacy: showing and pointing to rather than telling; word). Or set in the vocabulary of Greek mythology: 'It is no longer the question of Dionysus down below, or of Apollo up above, but of Hercules on the surface, in his dual battle against both depth and height: reorientation of the entire thought and a new geography' (Deleuze 1990: 132). Heidegger also verges on a similar intuition while interpreting Hölderlin's phrase 'words like flowers' (1943, pt. 2, Appendix 322): 'Once again the word appears in the region, the region that determines earth and sky to be world regions, *as it makes earth and sky, the streaming of the deep and the might of the heights, encounter one another.* . . . the

word is given back into the keeping of the source of its being' (Heidegger 1982: 100; my emphasis).
3. I use 'word' as the supposed, but never attained, association between names and beings, or Deleuzian signifiers and signifieds, 'expressible meanings' and 'denoted objects' (Deleuze 1990: 26).
4. Beauchamp is in fact 'walking and knocking coconut shells together' (Guralnick 1996: 70).

Desire and Courtly Love

Philippe Mengue Independent Researcher

Translated by Peter Borum

When approaching the philosophy of Deleuze in general, and the theory of imperceptible becomings (becoming(s)-imperceptible) in particular, as I am about to do, you must never underestimate the main idea that has been guiding Deleuze from *Logique du sens* to *Critique et clinique*. It is the idea that in any de facto event, empirically ascertainable, from the smallest to the largest (amorous encounter, historical event, revolution . . .), there is a part that cannot be effectuated, which constitutes its Sense, and which is the Event proper. In all accomplishing there is an inaccomplished, which is its better part, that which must be preserved. Such an idea, which implies an ontology of the virtual, brings into play a principle that opposes itself to the *principle of determinism* and of sufficient reason (the *principium grande*, as Leibniz calls it), principles which, for classical philosophy, rule all causal, physical, biological and social series. We shall name this opposed principle the *principle of indetermination*.

The guiding idea of my intervention today is that in order to advance in the understanding of imperceptible becomings (becoming(s)-imperceptible), we must cross the different authors that Melville, Masoch, La Fayette and Chrétien de Troyes are. Bartleby reveals the principle of indetermination in its own capacity or power, which will be common to all the other characters, as the capacity of *indiscernibility*. Courtly love develops its *unfinishedness*, and the Princess of Cleves its *unaccomplishedness*. As for masochism, it reveals its power of *suspension*.

I. The Principle of Indetermination and Life/death

The ontology of virtual intensities permits the foundation of a number of paradoxes in relation to this principle of indetermination. One of the most important ones, concerning Deleuzian theory, is its *vitalism*. A strange theory that holds that the life most alive has nothing about it of the living, the organic. It is beyond organs, a body without organs. But if we posit the pre-eminence or antecedence of the virtual over the actual, as Deleuze puts it, then indetermination is first and determination second. Then, of any determination we make a fall, a stiffening, a stop in the indeterminate process that is necessarily virtual and anterior, an infinite that overflows any set of actual and finite determinations. Here, indistinction is not a loss any more, and indetermination is no longer something negative, but vicinity and proximity to intensive Life, to the infinite process of desire. Life proper becomes distinct from or lies beyond any organic life. If, to Deleuze, Bartleby has become imperceptible, it is because, as much as possible, he is approaching the pure line of life or of flight, the one that traces itself beyond any organ, any socially or biologically organised form. The indecision, or indetermination, that contents his well-known formula, opens the first step towards *pure line of pure desire*.

First Consequence

But how are we to think this Deleuzian 'vitalism'? '*I am not particular*,' Bartleby says of himself (quoted in Deleuze 1993: 90). How could this declaration have any sense other than 'I am already dead' – since every living being only upholds itself in the particularity of its organs? The *line of life* necessarily coexists with a *line of death*, since the life in which it claims to partake is not the organised life of the living body but the life of a *pure abstract line*, which, as such, lies beyond *all life that is organised*, whether biologically or socially; that is, which is particularly determined. The pure becoming-imperceptible thus gently and necessarily slides into death, not because this is a goal or an ending or a result, but because it forms part of a higher life, of desire itself in what this has that is most essential (Life, against the organs and the living).

Second Consequence

But there is a second consequence of the principle of indetermination, which concerns pleasure and the necessity of warding it off. What rules

the life of the living, the great principle of their conduct, is the pleasure principle. The principle of sufficient reason is at the same time a principle of motivating reason through pleasure. It follows that all becomings have a link not only to what is beyond the principle of determination but also to what is beyond the principle of pleasure. Life against the living implies a desire against the pleasures. Masochism was the figure of perversion that first, in 1967, aroused the interest of Deleuze. And it is masochism that irrecusably and with neatness ties desire to the beyond pleasure. Pain is the means of this tying. Thereby masochism is not a particular figure of desire, it is that which necessarily finds itself at the foundation of all the other becomings, in one way or another. It expresses the essence of Deleuzian desire.

II. The Subterranean Line of the Novel

Under these conditions, Deleuze is able to uncover the secret and 'subterranean line' (1993: 89) that connects all novelistic characters, right from the medieval beginnings of the novel. They are all caught in this line of flight that grazes death, having destruction and dissolution as the backside of their desire's line of joy. Lancelot, Perceval or Parsifal, Tristan and Isolde, Madame de Clèves, Bartleby and Molloy all form a series of variations along the same abstract line of flight that is the line of novelistic creation, and which to Deleuze takes to its acme the intensity of life and desire, in what they have that is most pure, but also in the zone neighbouring upon indiscernibility and death. Here we touch upon the essence of the novel, its irreducible tonality, the affect most proper to it, and which distinguishes it from epic or dramatic narratives (Deleuze and Guattari 2004: 213). In several instances, Deleuze qualifies this tonality as crepuscular (as twilight- or dusk-like).

Deleuze finds this tonality from the very beginning, in the appearance of the first novels, with Chrétien de Troyes (Deleuze and Guattari 2003: 165). The wanderings of the knight in the courtly novel go together with a quasi-hypnotic state of half-sleep: 'we saw a knight sleeping on his charger'. They fall into a kind of 'catatonia which absorbs them' (Chrétien 2003), Deleuze says (Deleuze and Parnet 1977: 90; Deleuze and Guattari 2004: 232), and continues: 'Chrétien de Troyes never stopped tracing the line of knights errant, sleeping on their horses, resting on their lances and stirrups, and who no longer know their name or their destination, and continue to go on in a zigzag' (Deleuze and Parnet 1977: 90).

Deleuze pushes away the idea that the world of the novels of chivalry ceases with Don Quixote, and the novel as such with Beckett and his deterritorialised characters. 'The novel hasn't ceased to define itself by the adventure of characters which are lost, who no longer know their own name, what they're looking for, or what they're doing' (Deleuze and Guattari 2004: 213). Thus, that essential character, tracing a line of deterritorialisation linked to indetermination, is there from the beginning and will accompany the novel all along its evolution.

It is not *La Princesse de Clèves* that will inform Deleuze's so pertinent diagnosis. We will find the crepuscular state all right, although in another light, with another stress, but even more present and almost tragic, almost mystical. After what he has said of Percival, and the line that takes the novel along right from its beginning, Deleuze writes: '*La Princesse de Clèves* is a novel, precisely for that reason which seemed so paradoxical to its contemporaries, the states of absence or "rest" (repos), the sleeps that strike the characters . . . ' (Deleuze and Guattari 2004: 213).

Finally, the chiaroscuro of the masochist boudoir will not contradict this analysis. The entire story of *Venus in Furs* is placed under the sign of dreaming: the narrator, in the beginning, and Severin, at the end, when he has sobered up, have the feeling of coming out of a dream and a long state of stupidity (compare the 'what a donkey I was') at one and the same time, in order to finally wake up to life. The tonality that is proper to Masoch, Deleuze describes as an art of suspense[1] all suggestion where 'a strange atmosphere subsists, like a too heavy perfume which spreads in a suspense, and which resists any displacement' (Deleuze 1967: 32). It is Masoch who introduces suspense into the novel, as a 'novelistic mainspring in the purest state', not only as *physical suspense* (the hero is hung up, tied standing to a pillar, suspended), but also because 'the woman tormentor is taking up fixed postures which identify her with a statue, a portrait, or a photo. Because she suspends the gesture of striking with the leash or of opening her furs' (31).

In conclusion of this first point, we may hold, against the empiricist and historical meticulousness of literary science, that although the courtly, *précieux* and masochist universes form eminently singular constellations apart, they do, however, share the same kind of abstract line of pure desire that makes them communicate in one and the same zone of crepuscular indiscernibility. Now it still remains for me to show how courtly and precious love are attached to the general line of novelistic creation, and what the two contribute in their singularity. Given the short time remaining, I will stick to *La Princesse de Clèves* alone.

III. *La Princesse de Clèves* and Unaccomplishedness

The world of preciosity, to which this masterpiece bears witness, is not, although it is different, without echoing courtly love, and they even demand to be related in order to understand the Deleuzian position in its overall coherence.

The idea put forward is that in Madame de La Fayette, the principle of desire is that of *unaccomplishedness*. The indetermination of desire then becomes unaccomplishedness, that is to say, non-effectuation, non-realisation as to its ending, which is enjoyment, the possession of the loved object, that is, the Prince de Nemours. The critics have mostly failed to understand what essentially happens in this sublime character. Deleuze, in a beautiful intuition, uncovers in Madame de La Fayette the strange link between that which the heroine calls her 'rest', and her duty of fidelity with respect to her dead husband. As for the crepuscular state of the knights in the courtly novels, he underlines that it is on every occasion a matter of inventing 'unknown or unappreciated affects' (Deleuze and Guattari 2003: 165). He gives the following very swift indication: 'the almost catatonic states of rest that merge with the duty according to Madame de La Fayette (in connection with a concept of quietism) (ibid.).

What surprises Deleuze, and he is right, is this story of rest (*repos*), which she does not stop invoking. To contemporary doxa, our surprise or our suspense would rather be of the type: 'she goes to bed/won't she go to bed/will she go to bed?' And what surprises us is precisely that she does not 'go to bed', while her husband has died and no obstacle any longer opposes itself to the accomplishment of her desire. Why this abstinence? '[S]he undertook the resolution to avoid the thing in the world she maybe wished for the most' (La Fayette 1999: 196). Only a Deleuzian reading, or rather one inspired by him, will get us out of our predicament in the face of this strange duty related to her 'rest'.

First of all, her duty is weak (La Fayette 1999: 231). So she does not act out of duty. Moreover, she confides to Nemours, the duty in question 'only subsists in my imagination' (232). She 'persuades' (234) herself that Nemours is responsible for her husband's death. Why then this fiction to which she struggles to adhere? We shall respond that this 'opinion' (234) is only formed in order to be an obstacle, to put Nemours at a distance from her desire. Likewise, the confession she makes to her husband of her love for Nemours consisted in putting up her husband as a third party, a rampart between her and Nemours. It did not directly spring from the virtue of sincerity but from the placement of obstacles in order

to protect herself from her lover. The fact that virtue has not much to do with this, and that only a simple *amorous strategy* is important, will be revealed to us by further examining what she understands to be her duty. It is that while Madame de Clèves renounces to possess Nemours and to be possessed by him, this does not mean that she renounces the love she bears toward him, nor her desire.

The rupture is no more between rational will and passion, but between the *passion* or *desire* and the *object of this passion.*

IV. The Strange Rest

The famous 'rest' (*repos*), which Madame de Clèves incessantly invokes in relationship to her duty, is very astonishing in that it is not at all of the order of that which tradition has understood by 'rest'. It is absolutely not, as it is for the Stoics, a question of mastering the passion of love through reason. There is no *apatheia* nor any *ataraxia*. In the first place, it is not in her power to overcome her passion, her desire. She never ceases to say so.[2] Thus she does not seek to flee her passion, since she cannot do this. Afterwards, one cannot find, as some say, a 'spiritualisation' of her passion, since this is upheld with its sensible, amorous content, on the level of inclination. She cannot see Nemours, in the flesh of his body, without feeling herself weaken.[3] Finally, on the evening of their separation even, she has not yet undertaken the resolution to give him up in the future: she explicitly leaves this point in suspension, in a particularly crepuscular indetermination.[4] What she is fleeing or pushing away is Nemours, the object of her passion, and not her passion itself, which she maintains. But what, then, of this rest, since in a state of passion or desire, the soul suffers, it is always '*in-quiète*' in French, that is to say, in 'no rest' because *quietus* in Latin means rest? The state of passion or desire is, etymologically speaking, a state of *non-repos*, of non-rest. Her rest would be contradictory if it signifies that her desire in itself were maintained, as I put it, according to the texts. So, how to find a solution?

Pertinently, Deleuze connects the position of Madame de Clèves to quietism. But for what reason? The one that has been called 'pure love'. This religious and mystical current, upheld in France by Madame Guyon and by Fénélon, acquires a great influence in the salons attended by Madame de La Fayette. Together with the Duke de La Rochefoucauld, the one of the *Maximes*, she is close to Jansenist circles, which have communicated to her this pessimism with respect to the force of passion and the weakness of man in resisting it. But one can see the numerous

differences from quietism, since of this rest, of this quietism, she makes something rather insane. While this doctrine found rest with God, through contemplative fusion, through abandoning one's own will, 'letting go' of wanting, the disappearance of the sense of self, etc., Madame de Clèves's heroine on the contrary *gives up on nothing* concerning her desire. While quietism supposes an abandon of the effort which, before, was directed at God, the princess on the contrary *maintains this tension*, which she bears in its pure state. We stay in the pure plane of immanence of desire, we do not leave it for a transcendent object as in quietism. Madame Guyon says: 'I wanted to gain by effort what I could only obtain upon ceasing all effort', that is, giving oneself up to God, which is rest itself. The princess renounces nothing since this passion of the senses is her very joy, her highest possession. In what, then, might her rest consist?

A rapid indication is susceptible of guiding us in the right direction. She demands: 'can I put myself in the state of seeing with certainty this passion, of which I would make all my **felicity**, come to an end' (La Fayette 1999: 229). We must understand well the multiple meanings of this phrase: it is not only about the fear that Nemours's love for her will come to an end, once they are married (he is a *galant*, a seducer, unfaithful, courted, etc.), but what she is most afraid of, is to *see her own love come to an end*, for therein, in that desire, lies her happiness. This position can be clarified by referring to courtly love. Her strange rest lies in the desire itself as pure and crepuscular line of love.

Looking at Nemours (who is physically, sensually attractive), with one gesture she pushes him aside and keeps the 'pure love' that she holds for him, and which gives her what the troubadours of Provençal love called '*joi*'. The *joi* of the *fin amor* is the ecstasy, the enjoyment and the playfulness taken from love itself, from love as such: the joy of desiring and not the enjoyment of satisfaction. The principle of indetermination in the *fin amor* is not exactly modulated as a non-accomplishment, but rather as a *non-finishedness*, as the longest possible delaying of the physical enjoyment of the *Lady*, an enjoyment which stays as if suspended, indetermined, in the far horizon. Different from mystical quietism, which aims at fusion, at assimilation into the divine and transcendent object of desire, Madame de Clèves, who does not overcome her physical desire at all, takes to the artifice of courtly love. She puts off, *she unachieves*. She extends and stretches her passion, and so makes a pure abstract line out of it.

One sees that the knowledge of Madame de Clèves is identical to masochist knowledge: accomplishment, pleasure, enjoyment, all kill love

by satisfying desire. There is nothing left to desire after possession, desire is crushed in its accomplishment in pleasure, enjoyment, caught in the realisation of the fantasy, or *fantasme*. What fascinated Deleuze in masochism? It was not really the devaluation of the father and the inflation of the mother. Rather, it was nothing but the overcoming of the principle of pleasure. Deleuze sees very well that what is most important in masochism lies in its refusal to interrupt the becoming or the pure desire. The masochist pushes away the limit constituting the pleasure principle because pleasure is what resolves tension. Pleasure is well named as a discharge because it discharges us of desire itself. *Discharge-pleasure is a reterritorialisation* (Deleuze and Parnet 1977: 119). The masochist is well beyond pleasure in view of desire as a pure line of flight, as the uninterrupted prolongation of desire towards the Thing, the *Chose*. 'One should think that it was a matter of undoing the tie of desire to pleasure: pleasure interrupts desire, so that the constitution of desire as a process must exorcise pleasure and delay in infinitely' (Deleuze 1993: 71; see Deleuze and Parnet 1977: 119–20). He adds: 'The essential matter becomes waiting or suspense as fullness, as physical and spiritual intensity' (Deleuze 1993: 71). Exactly the state of 'pure desire' of Madame de Clèves, between the 'pure love' of the quietists and the *fin amor* of Provençal troubadours.

V. Conclusion

I have not had the time to carry into effect all that I had announced. But here is my conclusion, in the form of two points.

1. The Princesse de Clèves succeeds in creating indetermination inside the determined world though the world that is hers is a very strongly encoded world, we are at Louis XIV's court, and the 'etiquette' was extremely severe. There is no dualism, determination on one part and indetermination on the other part, but she digs (she makes holes), she excavates zones of indetermination in the plan of determinism or organization. She properly traces real zones of indetermination. She becomes crepuscular, imperceptible in another way than that of Bartleby. It is a splendid example of becoming-imperceptible.
2. All well examined, in the end Lacan does not say anything else than Deleuze on this point. 'Do not give way to your desire', is his well-known motto. And desire, to him as well as to Deleuze, is not,

as in the empiricist conception, the pleasure taken from fantasy/the *fantasme*. When Deleuze states the necessity of detaching desire from passion, when he posits that the pure affect of desire can be constructed by wrestling oneself loose from all the affections, all the pathoses bordering on such a passion (jealousy, vanity, fear of abandonment, etc.), he fully joins Lacan. The latter, in the years 1959–60, had already proposed, in seminar number VII, *The Ethics of Psychoanalysis*, a reading of desire in connection to courtly love. He showed that the Lady did not leave immanence, and that the finality of the loving *dispositif* was that desire be disconnected from its object, as object of enjoyment (object of the fantasy, or *fantasme*). What was at stake in courtly love was to put the Lady in the place of the Thing, or *Chose*, that is, beyond the pleasure principle. And this position is also that of Deleuze, as we have seen. What does the *Princesse de Clèves* teach us if not that there is no sexual relation, that desire is without object? For both, desire without object lacks nothing; it is the real itself, pure tension, call or void, which is its own joy to itself, in all its risks and pain.

Notes

1. 'In Masoch's novels, everything culminates in suspense' (Deleuze 1967: 31).
2. She confesses it to Nemours at their last meeting: 'believe that the feelings which I have for you will be eternal and will also subsist, whatever I do. Farewell . . . ' (La Fayette 1999: 232).
3. 'But she also saw that she was endeavouring upon something impossible, resisting in the presence of the most lovable man in the world, whom she loved and by whom she was loved . . . ' (La Fayette 1999: 235).
4. Not only 'she does not tell him that she had made any resolution' (La Fayette 1999: 238) concerning her marriage, since she has not made it, but even until the very last 'she thought that it was not yet necessary for her to do herself the violence of taking a resolution; decorum gave her considerable time to determine herself. But she resolved to stay firm in having no business with Monsieur de Nemours' (234). She thus only decides not to meet with him again.

Book Reviews

Eugene Thacker (2010) *After Life*, London and Chicago: University of Chicago Press.

In *After Life*, Eugene Thacker's overall project is to explore the ontology of life in Western Philosophy. His inquiry into this philosophical tradition is an attempt to articulate a rigorous critique of life (rather than to propose a radically new conceptualisation of it) and his thesis is that the question of life is, fundamentally, a question of ontology. Following antiquitian – and later, Heidegger's – concerns with Being and modern denunciations of God, the question of life for Thacker is now the key question for philosophy. Among contemporary thinkers it is Deleuze who garners most attention, which is not incidental given Thacker's emphasis on avoiding the sublimation of life within theological, metaphysical or biological discourses, as well as his aim to probe and problematise anthropomorphic conceptualisations of life. The world is not there 'for us' or simply there 'in itself' but

> it is a world that presents us with the very limits of our ability to comprehend it . . . It is a world 'without us' . . . the challenge of thinking a concept of life that is foundationally, and not incidentally, a nonhuman or unhuman concept of life. (Thacker 2010: xv)

The ambitious scope of Thacker's project comes into focus when listing the numerous philosophers he engages with; alongside Deleuze, the book includes lengthy discussions of Aristotle, Eriugena, the Pseudo-Dionysius, Duns Scotus, Nicholas of Cusa, Spinoza and Kant – as well as brief forays into the writings of contemporary philosophers such as Alain Badiou and Quintin Meillassoux and also Chinese philosophers such as Zhuxi and Wang Yangming. Readers of Deleuze will recognise then that Thacker's critique of life offers an analysis of Deleuze's philosophy by paying close attention to those who have influenced him at the same time as understanding his position in our contemporary context.

Deleuze Studies 6.3 (2012): 495–512

To be sure, *After Life* is not a book focused exclusively on Deleuze's thought – the first sustained discussion of his writings appears in chapter three – but it does engage extensively with some of those thinkers who most influenced Deleuze as well as exploring how his own writings (in particular *Difference and Repetition* and *Expressionism in Philosophy: Spinoza*)[1] are crucial to any inquiry into an ontology of life.

In the opening chapter, Thacker concentrates on Aristotle's *De Anima* and the concept of *psukhē*, usually translated as 'soul' but, as he points out, more accurately understood as 'vital principle' or 'principle of life' (11). Starting with Aristotelian *psukhē* – and therefore a disengagement of life from being – is useful as it allows Thacker to focus on life as an ontological concern in its own right, and, because for Aristotle life itself is inseparable from the cause of life, this sets up the conflict between transcendence and immanence that runs through much of the book. It also allows Thacker to distinguish his project from those – such as Giorgio Agamben and Rosi Braidotti – who prefer to focus on the concepts of *zoē* or 'bare life' (biological/naturalistic life common to humans and nonhumans) and *bios* (as qualified way of life).[2] Thacker is interested in the term *psukhē* because it conditions the very possibility of these concepts, it is 'the *archē* of *zoē* and *bios* . . . or the life that is common across every instance of life' (13). The contradiction inherent to Aristotle's *psukhē*, however, is that on the one hand 'there is no thing called "life-in-itself" that is ever present apart from its formal, dynamic, and temporal instantiations in the variety of living beings' and on the other hand 'Aristotle does not dispense with the archē-of-life altogether. He seems to imply its necessary existence if one is to think something like "life" at all' (14). This internal split within the concept of *psukhē* is ultimately equivalent to a split ontology of life into '*that-by-which-the-living-is-living* and *that-which-is-living*' (17); Thacker helpfully transforms these into a more laconic formulation of a split between 'Life' and 'the Living' (although he is at pains to point out this should not be thought of as simply the Heideggerian distinction between Being and beings). There is something that is therefore evasive about *psukhē*, it is 'an always-receding horizon that is never present to thought in itself. . . . There is a sense in the *De Anima* that what remains of "life" is this strange animate nothingness, a kind of vitalist void' (20). Two levels of contradiction result from this: first, Life is common among the living and yet in itself Life has 'no properties, attributes, or characteristics' (21); second, because for Aristotle Life and the living are always already paired, this means that '[*o*]*ne cannot think Life without thinking the living; one cannot think Life while at the same time thinking*

the living' (ibid.). Rather than attempt to reconcile these contradictions, Thacker instead argues that they should be emphasised as central to such an ontology, even if undermining it at the same time. He asks: 'To what extent are all ontologies of life determined within the twofold framework of the principle-of-life and the bifurcation between Life and the living?' (24)

In chapter two Thacker takes this contradictory conceptualisation of life as a departure point, and focuses on what he names 'superlative life' as life-beyond-the-living. Superlative life is presented as both a kind of immanence, 'a continuum that cuts across all instances of the living', as well as transcendence, 'existing apart from any particular instance of the living as its ground or condition' (34). The advantage and also the difficulty of superlative life comes from the fact that it cannot be understood wholly through oppositions such as being/becoming, stasis/change, eternity/temporality, because this would entail a mediating concept that accounts for the movement between terms; nor can it be reduced to the living as this does not answer the question of causality. Thacker looks at the consequences of superlative life within a framework of positive and negative theology, and, in his discussion of the Pseudo-Dionysius, argues convincingly that it is here we find 'the groundwork for a conjunction between the divine as an ontological principle and the divine as a vitalist principle' (55). As well as exploring the tension between immanence and transcendence, superlative life leads Thacker to discuss affirmation and negation, and this includes a succinct and helpful summary of Alain Badiou's concept of subtraction as the affirmative part of negation. It is in this context of negation that Thacker first introduces Deleuze:

> the process of superlative negation in the apophatic logic can be understood as a Deleuzian process, one in which what is repeated each time is difference itself. Each superlative negation ('Life is not-not-*a* . . . ') is not just a mechanical iteration, but it pushes against the limit of thought itself, each time actually creating new conditions. This repetition of difference is not merely the creation of new ideas or even new possibilities or potentialities (that may or may not become real), but it is, instead, a sort of phase shift in the very conditions of thought itself ('virtual while remaining fully actual' as Deleuze often states). (88)

Chapter three sees a sustained engagement with Deleuze's philosophy. Not only is this the section of the book that will be of greatest interest to Deleuze scholars, but it is also the most lucid and rewarding part of Thacker's discussion. After returning to Aristotle's *psukhē*, he focuses

on Scholastic thought – the debate now drawn in terms of creator/created rather than Life/the living – and the question of univocity. Whilst several medieval philosophers are discussed, including Aquinas (an analogical relation between creator/creature) and Henry of Ghent (an equivocal relation between creator/creature), it is his reading of Duns Scotus that is the most developed, and most significant in relation to Deleuze. With Scotus's view that the relationship between creatures is fundamentally univocal, Thacker helpfully breaks down his conceptualisation of univocity into three layers. First, there is the haecceitas or 'thisness' (individuating principle) of the creature; second, there is the 'common nature' between creatures (accounting for differences or similarities); third, there is the 'nature of all common natures' (123). For Scotus, then, univocity is not about saying that all-is-one so much as it is a reconceptualisation of entities as neither subjectively created nor independently existent in the world:

> The formal distinction articulates something that really exists, but that is not unproblematically accessible via the senses. In other words, within the creature, the common nature (that which cuts across, that which is held in common) is related to its individuating thisness (that which makes it this particular instance of some nature) in a univocal manner. (123)

It is easy to see the relevance of this in relation to more recent debates between empiricism and idealism, immanence and transcendence. It is also of no surprise that this is where Deleuze enters the debate. Scholasticism, Thacker notes, is never far away from Deleuze's philosophy, specifically in terms of his long-standing engagement with the issues concerning the One, multiplicity and pure immanence. There are direct references to Scholastic thinkers in his work, too. Perhaps the most notable example comes in a passage – part of which Thacker draws attention to – from *Difference and Repetition*:

> There has only ever been one ontological position: Being is univocal. There has only ever been one ontology, that of Duns Scotus, which gave being a single voice. We say Duns Scotus because he was the one who elevated univocal being to the highest point of subtlety, albeit at the price of abstraction … A single voice raises the clamour of being. (Deleuze 2004: 44)[3]

Thacker describes Deleuze's Scholasticism as heretical in a similar sense to his notorious formulation of the history of philosophy as a kind of buggery, and, in focusing on univocity, he points out that Deleuze is wrestling with a similar problem that Scotus was: 'how to posit a univocity of being without flattening all distinctions within being'

(Thacker 2010: 137). This goes to the heart of a common difficulty with Deleuze's philosophy and in order to answer it we need to turn first to Spinoza. If one of the problems for Scholastic thinkers was that univocity signals 'all relation' (therefore failing to account for differences or causation between individuated creatures), then Spinoza allows us to reimagine causality 'less in terms of a first cause or principle, and more in terms of a self-causality or auto-creation' (138); in other words, causality becomes fundamentally immanent. Moreover, Spinoza's emphasis on the generativity of univocity as affirmative becoming rather than neutral being (as in Scotus) allows Deleuze to think of univocity as creative. Taking up this concept of univocity as immanence, Deleuze in *Difference and Repetition* sees it as central to his ontology of difference, of difference as primary, and against identity and representation. Hence, Thacker is correct to emphasise Deleuze's Scholasticism, via Spinoza, as heretical: univocity for the Scholastics 'denoted not difference but identity, not discontinuity but continuity' (141). Returning to the problem of reconciling univocity with heterogeneity, Deleuze's foundational ontology of difference provides an answer:

> In effect, the essential in univocity is not that Being is said in a single and same sense, but that it is said, in a single and same sense, of all its individuating differences or intrinsic modalities. Being is the same for all these modalities, but these modalities are not the same. It is 'equal' for all, but they themselves are not equal. It is said of all in a single sense, but they themselves do not have the same sense. The essence of univocal being is to include individuating differences, while these differences do not have the same essence and do not change the essence of being... Being is said in a single and same sense of everything of which it is said, but that of which it is said differs: it is said of difference itself. (Deleuze 2004: 45)

In order to expand on Deleuze's direct discussions of univocity, Thacker also draws attention to a lecture Deleuze gave at Vincennes in 1974. Here Deleuze offers a succinct summary of the terms univocity, equivocity and analogy aligning them with terms more familiar to contemporary philosophy such as community, difference or power. In this lecture 'univocity implies total interconnectedness', and thus we can see its influence on those terms so familiar to Deleuzian scholars – becoming, assemblage, haecceity and so on. Here Deleuze also puts his finger on an important caveat in Scotus' philosophy whereby 'Scotus tempers his position of univocity between an assertion of being as "univocal metaphysically," and yet "analogical physically"'

(Thacker 2010: 147). Deleuze notes in his Vincennes lecture that it was this important condition that saved Scotus: 'he was at the border of heresy, had he not specified metaphysically univocal and physically analogical, he would have been done for' (cited in Thacker 2010: 148). Without such concerns, Deleuze can go further; he can use univocity at its most radical to think of Creator/creature, divine/earthly, supernatural/natural and Life/the living as

> fully immanent in relation to the other . . . it requires thinking that which is 'above' the human as equal to that which is 'below' the human. The angel and the insect both exist immanently. As Deleuze notes, 'God is a tick'. (Thacker 2010: 153)

Where Thacker poses a challenge to Deleuze's model is towards the end of the chapter by claiming that this form of univocity actually becomes equivalent to equivocity. This section finds him on shakier ground philosophically, but perhaps brings Deleuze onto this shakier ground too:

> the creature is univocal because, in a sense, the relationship between Life and the living is actually a non-relation, compressed into a single, continuous 'voice' – *une voce*. The life 'after life' is another way of saying that the relation between Life and the living is a univocal relation – and thus not really a relation at all. 'No relation' – is this not the opposite position, that of equivocity? (154)

Thacker ultimately never lets go of his interest in 'emptiness', 'nothingness' or 'the void' in *After Life*. This is evident in chapter four, which focuses on 'dark pantheism', again including a detailed reading of Deleuze. Having moved from the distinction Life/living to Creator/creature, chapter 4 neatly takes us to the issue of transcendence/immanence. In particular, Thacker considers the question of how far pure immanence – in Thacker's words 'immanence as not subordinate to transcendence', or, as Deleuze notes in 'Immanence: A Life', 'the immanence of immanence' (Deleuze 2001: 27) is possible/desirable. Seeing Scotist univocity in terms of immanence means that 'immanence would not be derived from transcendence, but the inverse: the ontological priority of immanence' (Thacker 2010: 186). Thacker offers a close reading of passages from *Expressionism in Philosophy: Spinoza* to emphasise Deleuze's appropriation and development of Spinoza's 'expression' whereby expression expresses itself, it is univocal or immanent. Several useful questions are posed to challenge the idea of immanence as pure immanence, however: 'If

immanence is pure immanence, immanent to nothing but itself, then how can immanence also be a ceaseless creation and invention of the new? How can creativity emerge out of what is already fully actual?' (213). There is, of course, the reactionary response to this, prompting a reaffirmation of transcendence of the divine (which would, Thacker points out, be symptomatic of the religious context in which medieval thinkers were working and also of the strict adherence to logical frameworks). The difficulty, even the counterintuitiveness, of pure immanence is, Thacker posits, a result of it becoming 'tantamount to the thought of contradiction itself' (214) This explains Deleuze's suggestion that pantheism is a danger to philosophy, and Thacker goes on to further explore this possibility of a pantheism that is the 'absolute coincidence of immanence and life' (215). Ultimately such a pantheism 'raises the question of life as a fundamentally *unhuman* phenomenon. Pantheism in Deleuze's sense points to a horizon in which both "life" and "thought" can be understood in non-anthropomorphic ways' (228) and thus helps us to see a possible answer to one of the central questions running through *After Life*: 'Without a human subject to think the concept of life, can life be said to exist at all?' (24) This kind of pantheism is both 'the horizon of thought itself' (229) and also, according to Thacker, fundamentally misanthropic (hence the chosen terminology of 'dark pantheism'), although his leap from nonanthropomorphism to misanthropism is not fully convincing. Nonetheless, this is a key transition of dark pantheism, 'one that moves from the encompassing of all things (the One as All), to the immanence of all things and nothing (the All as *nihil*)' (232).

The final chapter begins with Kant and his ambivalent positioning of life as between self and world, 'at once a set of entities "out there" (e.g., crops for food, livestock for breeding) and yet a continuum that connects the "out there" to the "in here" (the principle of life that connects all living beings)' (247). The book then takes another contemporary turn to explore the complexities involved in the self–world relationship and focuses on Quentin Meillassoux and speculative realism.[4] Of particular interest is Meillassoux's notion in *After Finitude* of 'correlation', meaning that we can never access thinking and being separately but only the correlation between them. Correlationism is therefore a kind of compromise between naïve realism and idealism, pure objectivity and subjectivity. In order to assess to what extent life is correlational, Thacker outlines three key responses to the question: existential (life/death correlation), organicist (growth/decay correlation) and ontological (Life/living correlation). But correlationism

leaves Thacker with the same problem that he faces throughout much of the book:

> The question remains whether the Life/living distinction – as a correlation – is ultimately recuperated into a vitalist correlation (Life is that which cuts across all instances of the living), or whether it tends towards an absolute incommensurability (Life is never present in itself, and is not a manifestation). (256)

It is also limited in that it is 'human-centric', according to Thacker, with its basis on the relation between self and world. Correlationism's ultimate insufficiency as an ontology of life comes because the '*the vitalist correlation is ontologically predicated not on a concept of being, but on a concept of life – even at the same time that the latter must ambivalently presume the former*' (257).[5]

Returning to Kant, Thacker ends his inquiry into the concept of life by focusing on causality and purposiveness. Ultimately, he concludes that 'life as a topic for ontology must necessarily be speculative' (259). In a book that is as much about theology as it is about philosophy, it is fitting that Thacker ends with an extension of Kant's definition of theology (and he provides a concise summary of ontotheology, cosmotheology and physicotheology) to suggest that it is 'an inquiry into the thought of that which cannot be thought' (260). For Thacker, this relates to Georges Bataille's view of theology as the perfect anti-philosophy, 'negatively articulat[ing] a void at the heart of philosophical thinking itself' (262). This sees Thacker returning to a philosophy of life as nothingness rather than pure generosity (the latter continues to present the problem of causation and teleology), and thus the limitation he finds in phenomenology as well as Deleuzian 'biophilosophy':

> If life is generosity, gift, givenness, and if one refuses the onto-theological option of a life-principle, much less divine cause of life, then it would seem that only a few options remain. One of them is to question the presumption that life must somehow be identical with affirmation, generosity, and givenness. Another is to question the logical consistency that any ontology of life would presuppose – there is no cause of life except life itself; there is no finality of life except life itself, etc. If we take these two options together – life as negative (nihil), and life as contradictory – we have, in short, a version of Bataille's atheology. (265)

Bataille's atheology moves closer to an ontology of life as 'immanence of nothing' (ibid.) where contradiction is central and life is negative: 'a nothing that must necessarily follow from a principle of immanence' (266). *After Life* therefore ends with the speculation that there is some unintelligibility inherent to any ontology of life, and that it is precisely

this unintelligibility that acts as a limit that leads us back to the question posed throughout this book: how to think life 'without us' – a question that is inevitably left unanswered. Nonetheless, *After Life* provides a rigorous, illuminating and absorbing critique of life, and if the book ends on a slightly elusive or vague note – with a brief discussion of William Hope Hodgson's fantasy/sci-fi novel *The Night Land* rather than a conclusion as such – it is perhaps fitting for a project interested in how the ontology of life takes us to the limits of thought itself. Thacker's planned sequel, *Dark Life*, promises to push these limits further still.

Nathan Widder (2008) *Reflections on Time and Politics*, University Park, PA: Pennsylvania State University Press.

I. Introduction

Nathan Widder's book, *Reflections on Time and Politics*, exemplifies Wittgenstein's remark in the *Philosophical Investigations* that 'the work of the philosopher consists in assembling reminders for a particular purpose' (§127). Widder's purpose is the liberation of 'pluralistic' political thought – that is, those perspectives on politics that are concerned with the autonomy of difference – from a very powerful and well-entrenched conception of identity. His assemblage of reminders revolves around the problem of time.

Widder is concerned that many forms of contemporary political thought have taken their cue from thinkers like Deleuze, Foucault and others like them, but have failed to fully absorb the lessons that these thinkers offer. The lesson at stake here has to do with the conceptions of time that these thinkers work out, all of which have radical consequences for the concept – and not just the concept but the very possibility and actual status – of identity. The radical critique of political identity, whose emergence can provisionally be tied to Nietzsche's thinking, has contributed to an unprecedented political awareness among many individuals and groups in the twentieth and twenty-first centuries. The political problematisation of identity has taken many forms. For example, we see 'identity politics', in which particular concrete identity formations are the basis and subject matter of political struggle itself; political liberalism, which asks individuals and groups to abstract away from substantive identity claims and participate in formal consensus-building procedures; communitarianism, which takes its cue from Hegel's idea of a shared ethical substance; and so on. 'Identity politics' has been very important, and has provoked retrenched efforts insofar as thinkers like Michel Foucault and Gilles Deleuze have picked up on Nietzsche's insight and have analysed the processes through which particular identities are imposed on individuals and groups.

Of course, with Deleuze, as with the other thinkers that Widder praises in *Reflections on Time and Politics*, identity is a synthetic effect – Widder uses the term 'simulation', fully aware of what that means after Deleuze's 'reversal of Platonism' – generated by the dynamics of difference and repetition. Yet, says Widder, this very important insight about identity has not yet been fully taken on by many contemporary

thinkers:

> If identity remains in some way necessary to our understandings and self-understandings, it is only as a marker useful for coordinating and organizing certain aspects or levels of life, and only when these are considered in abstraction. It seems to me that identity is still held to be more than this in many political and philosophical circles aspiring to escape from, or at least displace and circumscribe, metaphysics, essentialism, and transcendence. I would go so far as to say that the exposure of identity as a simulation is a lesson from Nietzsche, Foucault, and Deleuze that often goes unappreciated even by theorists who draw inspiration from them. The result, I believe, is that too often identity is held to be historically contingent and fluctuating, yet still indispensable for politics, ethics, meaning, and thought. Considerations of the concrete structure of time, however, can open up another path. (Widder 2008: 12)

Despite the innovations of Foucault and others, many radical conceptions of political struggle have not quite shaken some metaphysical prejudices. The discovery that identities are dynamically composed multiplicities rather than self-grounding 'things-in-themselves' is undercut by an overemphasis on what Foucault referred to as sovereign power, on the problem of who acquires and wields power.

To put it another way, some ways of understanding political struggle influenced by Foucault and others remain transfixed by the mediating power of personae, whether the latter are individualistically or collectively individuated; in Deleuze and Guattari's terminology, we are faced with attempts at radical politics that still have trouble escaping the 'molar' register. This is not to say, for example, that Iran's Green Revolution, which coalesced around Mir-Hossein Mousavi and opposed Mahmoud Ahmadinejad's presidency, was misguided because it focused on the 'molar' aspects of the struggle and did not address the 'molecular' register of dynamic force relations that give rise to identifiable power blocs. Rather, what Foucault, Deleuze and others have proposed is that 'molar' struggle is not the only kind: in order for despotic regimes to be established, entire arrays of complicated actions need to be papered over and abbreviated versions of events have to be accepted. In other words, there is no question of a 'macropolitics' without a 'micropolitics' that addresses force relations that tend toward the abstract, the anonymous and the subindividual. Many contemporary political approaches that take their cue from radical twentieth-century thought, however, still tacitly presume a conception of identity that has not yet freed itself of the horizon of substance metaphysics. Widder suggests that an analysis of the problem of time can help us escape that horizon.

II. The Problem of Time and Politics

For Widder, everything hinges on the relationship of time to change or movement. He begins by noting that recent debates in philosophy have seen a return to the problem of time. Philosophical projects searching for ways to 'consider more affirmatively how philosophy can be practiced and how the human self or subject can be conceived today', in conjunction with

> the impact of profound changes related to globalization and the information age economy, which have blurred both real and conceptual boundaries and made speed a central factor of contemporary life ... [have] produced a renewed interest in time as an active force of change, contingency, and novelty. (1)

One need not look very far to confirm this statement; today, we hear all about rhythms and durations; we are used to discussing social phenomena with temporal vocabularies. 'Time's multiplicity, manifesting itself in the coexistence of different tempos and velocities of time, is now used to account for complex and ambiguous processes of contemporary life and to outline excessive forms of speed that modern societies seek to control' (ibid.).

The association of time with a multiplicity of durations is a great innovation, but also poses a problem that drives Widder's line of inquiry here.

> This often explicit focus on time's *movement* ... seems problematic. Perpetual movement is certainly time's first and most obvious trait ... [m]oreover, emphasizing the dynamism of both time and the processes occurring in it has obvious advantages for a pluralist political thought that aims to challenge identity-based politics by demonstrating both the contingent, incomplete, and fluctuating nature of identity and its slippery materiality. Finally, stressing time's movement helps foster a more natural link between philosophy and the physical sciences ... [p]rivileging time's passage, however, seems to me to be both analytically incomplete and inconsistent with respect to the principal philosophical sources inspiring this move. (2)

The 'principal philosophical sources' in question all have one important thing in common: multiplicity as a first principle. Widder is right, moreover, to question ways of thinking that claim inspiration from, say, Deleuze and that fail to take the thought of multiplicity to its full extent. It is not that there are x number of 'Deleuzian' accounts out there that do not adequately engage a Deleuzian conception of time, though. Rather, the failure of these positions lies in their failure to stop depending on a

conception of identity to act as a ground for political thought. Widder knows that the articulation of multiplicity as first principle, and its attendant radical critique of identity, cannot avoid going through a radical conceptualisation of time. Wisely, he chooses to privilege the problem of time in this book because its clarification demonstrates that there is and can be no escape into identitarian thinking for forms of political thought that claim to 'follow' Deleuze and others.

The chief question concerning time, according to Widder, is: is time fundamentally subordinated to movement and change – in other words, to duration and thus to extension – or is it rather to be thought of as the structure according to which movement, change, duration, temporal extension and so on come to be through syntheses of multiplicity? If we are to take up Deleuze's thought, we have to follow the latter path, and this is Widder's decision.

> It is not that time's flow is unimportant, but it is neither primary nor foundational... [t]herefore, despite the important advances the recent interest in time has brought to pluralist political philosophy, this work sees the need to take a further step back and consider time as a static structure or synthesis that *ungrounds* movement, including the movement of time. (3)

For the purposes of this review, I am going to use the term 'extension' to gather up the various senses that Widder uses – movement, change and so on – because I think that the prejudice he draws out comes down to the implicit or explicit idea that we ought to be able to find something like an 'elementary particle' of being. Another way to put it might be to say that this prejudice in favour of identity leads us to search for minimal indivisible units that guarantee sense, meaning, coherence and so on. In terms of political thought, it amounts to the enduring idea that there is a subject – or, as Alain Badiou puts it, 'that there are always some subjects' – that is not the synthetic effect of difference and repetition. As Widder correctly suggests, many political thinkers continue to look for the minimal 'substantiating' term. For example, in Johanna Oksala's *Foucault on Freedom* (2005) we find Foucault's insights wedded to a phenomenological conception of the body, an 'anonymous body' structured through

> the normatively significant life-world, with its unique language and tradition. It is the familiar life-world that is normatively relevant to us. It is the world that our body intends and spins around us... [o]ur horizon of anticipations is structured in accordance with the intersubjectively handed-down forms of apperception. (Oksala 2005: 148)

Likewise, if we look at Michael Hardt and Antonio Negri's work, such as 2004's *Multitude*, 'multitude' itself becomes the minimally acceptable individuating principle; it is 'an internally different, multiple social subject whose constitution and action is based not on identity or unity (or, much less, indifference) but on what it has in common' (Hardt and Negri 2004: 100). Lastly, Jürgen Habermas, who is well aware of the challenges of Nietzsche and Foucault, but who has misread both the stakes and the consequences of those challenges and turns away from them, conceives of a communicatively generated intersubjectivity upon which rests the possibility of and call for engagement.

In each of these examples, we find a minimally self-identical *res extensa* of sorts that acts as the abstract subject of political thought; in each of these examples, moreover, we find an ostensible rejection of the 'old' category of identity, of a thing-in-itself that would replicate and sustain 'classical metaphysics', with all of the latter's pitfalls and untenable claims.Yet, in each case, the problem of identity is reconstituted at the level of the individuating term used to support a pluralist politics. Each of these systems of thinking relies on an element of substantive identity, despite having disavowed the latter. In each case, the status of political thought depends on whether or not we have identified the correct *res extensa*, the right subject, substance or substrate. I think that Widder is right to point out that this is a widespread tendency in contemporary thought, and I think that he is also right to insist that it is a problem for thinkers, like Oksala or Hardt and Negri, who explicitly draw inspiration from Deleuze and Foucault. It is no less a problem for someone like Habermas, who takes a much different path but who nonetheless considers his thinking to be 'post-metaphysical'. On such views, the particular character of the subject in question frames the inquiry. This adequately self-identical subject is always the basic minimum individuating term necessary for the 'proper' approach to politics. But, as Widder's work reminds us, this conception of identity only obtains on the condition that time is primarily 'flow'. If *flow* is time's essence, then any particular identity is reducible to its own duration, which reintroduces the classical distinctions between substance and property, accident and essence, and so on. A conception of time based on extension tends to persuade us that the abstract continuity of extended things is primary and substantial.

The impression that follows is that, for whatever practical problematic we take up, the appropriate abstract identity is at play, and our responses to the problematic, and even the way we frame the problematic in the first place, must be answerable to the abstract subject in question; it

must be shown that something is at stake in the problematic that is analogous to or that resembles the abstract substrate. But according to a conception of time that admits of no substantial ground in the form of abstract identities that underpin particular concrete subject formations, there is no such thing as a minimal *res extensa*. Despite the consequences of following philosophies of multiplicity to their logical conclusion there remains, even in many 'pluralist' approaches to politics, a considerable 'whiff' of transcendence that poses an obstacle for radical critique.

To address this problem, Widder reminds us that Deleuze and the other thinkers he praises in this book all work out conceptions of time that are autonomous with relation to conceptual schemes grounded in extension. Beginning with a reading of Aristotle's *Physics*, in which Widder begins clarifying a conception of time that is 'excessive in both its infinite backward and forward extension and its foundational discontinuity, making it harmful to any telos' (21), we are treated to eighteen meditations on the meaning of an unreserved commitment to the principle multiplicity.

III. The Book

Reflections on Time and Politics falls, very roughly, into three divisions. Chapters 1 through 6 deal with a 'pure' philosophical elaboration of time, beginning with Aristotle and proceeding to Deleuze's reception of the 'untimely' in Nietzsche's thinking. Chapters 7 through 13 address the issues of ego formation, the unconscious and sense, and feature very interesting discussions of psychoanalysis in chapters 12 and 13. Chapters 14 through 18 are overtly 'political', and culminate with a discussion of Foucault that is entirely appropriate and welcome, since one finds a complex temporal logic in Foucault's work that bears directly on his philosophico-historical investigations and that is crucial to understanding his thinking. I find Widder's discussion very helpful, because Foucault is a 'molar' agent through which the thought of contemporary political struggle is frequently approached, and is a privileged mediator for a thoroughgoing treatment of non-identitarian thinking.

Moreover, the problem that Widder wishes to address in his book is very closely related, in my view, to the inadequacy of many influential critiques of Foucault. The image of Foucault finding a pervasive domination in every facet of social life is well known. This view has underpinned not only a lot of 'theory' in North America, among Foucault's detractors as well as his supporters, but also many forms

of concrete ethico-political criticism and activism, in which everything plays out as the struggle against an ineradicable despotism that plagues the soul; this tendency is compatible with a certain Christian legacy as well as with a certain multicultural liberalism that Slavoj Žižek has taken to task in the most uncompromising manner. Yet an awareness of the way that temporality works in Foucault's thinking helps dispel this image, and thus to my mind Widder is entirely right to conclude this book by discussing Foucault, since all of his work incorporates the radical perspective on time that Widder picks up from Deleuze and works out.

Another chapter that I really like is chapter 9, on 'Incorporeal Surfaces'. Here Widder provides a solid account of Deleuze's reversal of Platonism, in which the simulacrum, rather than being the parasitical imitator of the forms, embodies 'positive principles of difference and repetition' (106). 'The simulacrum's dynamics, for Deleuze, produce a phantasm that never corresponds to it because the phantasm cannot copy it well or badly' (106). Phantasms, the perceptible effects of the simulacrum, are not the representations of some kind of substance to which they would be in some way analogous; formally speaking, they correspond to nothing, although they are in immanence with the simulacrum. Identity, insofar as it is a residual effect of phantasmatic production, that is, of difference and repetition, is only established through processes of hierarchical differentiation between micro-events, generating the macro-events that belong to the game of representation.

From the point of view of pure multiplicity, fields of events are entirely indifferent 'in themselves', which is to say that the thought of pure difference admits of no concrete distinctions, since the latter obtain only on the condition of a minimally stable identity. To even say something like 'fields of events', moreover, is already to concede too much to the selection process: there is no 'subject of politics' or 'subject of history'. And this is really the crux of Widder's project: to remind us that, at bottom, there is no subject, that there is nothing of substance upon which identity rests. I found chapters 12 and 13, both on the synthetic production of the psyche, to be particularly helpful, because of the still-powerful impression that there is some kind of ground in psychic life itself, something that would no longer be the effect of difference and repetition. But the account that Widder works out in these chapters undermines the prejudice of a mind whose contents are (at least ideally) perfectly aligned with the offerings of a more or less inert world composed of 'regular' and 'irregular' arrangements that are to be clearly and distinctly perceived. In my view, Widder provides a

welcome rejoinder to the so-called 'speculative realist' thesis of Quentin Meillassoux and some of his colleagues, according to which everyone after Kant, including Nietzsche and Deleuze, falls into the category 'correlationist' for their assimilation of 'mind' to 'world' and vice versa.

Widder nicely provides a set of resources for showing the shortcomings of this position when it comes to a philosophy like Deleuze's; here, minds and worlds are no doubt correlates, but they are non-analogous correlates and their relationship is not representational. The relation itself is inconsistent; whatever links there are between 'psychic agency' and its objective correlates is neither pre-established nor analogous. The subject is to be overcome, objects are to be overcome: this is empiricism. The psyche is a surface that develops out of 'a chaotic world of part-objects' (135), an ongoing event composed of events, 'a disjunction of differences folded into one another and linked through a differenciator, dark precursor, or pure event. As such, the phantasm, relating to external reality at and through the surface, cannot be a good or bad copy of this reality' (138). These two chapters, on the genesis of the surface, are helpful companions for Deleuze's *Logic of Sense* because they provide clear accounts of Sigmund Freud and Melanie Klein's respective work in relation to Deleuze's encounters with each.

IV. Conclusion

Reflections on Time and Politics is a very rich book, and there is a lot to like here. I have had trouble picking out passages to get into because every chapter is full of challenging and helpful argumentation, and I could certainly go on at length were it not for space constraints. I do not have much in the way of disagreements with Widder here, and where I might, they are relatively inconsequential. For example, in chapter 15, 'Discipline and Normalization', he claims that according to Foucault 'modern society . . . is *disciplinary*' (158), which is not an unusual claim. For my part, however, I would say that insofar as we can say that there is something like 'society', the latter has undergone disciplinary becomings: various rationalities have been deployed across innumerable events and have produced changes in the direction of what Foucault calls discipline. I am wary of making a claim like 'modern society is disciplinary' because I am wary of tacitly reintroducing a substance–property relation into the mix. But if I differ here, it is a very minor quibble. By no means do I think Widder is inattentive to these difficulties, which are very hard to escape. As Widder consistently points out, there is nothing necessarily wrong with using identity as a provisional, strategic marker; the problem

is how to do so without losing sight of the synthetic character of identity formations.

I highly recommend this book to readers for its rigour and sobriety. Widder is uncompromising in following the thought of multiplicity to its furthest extent, and pursues all of its consequences for political thought. He offers a much-needed corrective to those who claim to incorporate the work of Deleuze, Foucault and others, but who shy away from taking the logic therein as far as it has to go. Widder has written a very truthful book, and he is to be commended for it.

Call for Papers

The First International *Deleuze Studies* in Asia Conference, Taipei, Taiwan

The English Department at Tamkang University, the publisher of the internationally renowned *Tamkang Review*, is pleased to announce that it will be hosting The First International *Deleuze Studies* in Asia Conference on the theme 'Creative Assemblages', 31 May–2 June 2013, and, prior to the conference, the Deleuze Camp, 25–29 May, 2013.

Creative Assemblages

As one of the most important terms in Gilles Deleuze's oeuvre, 'assemblage' refers to the territory of an object along with its own regime of signs and pragmatic system. Yet assemblage also refers to the force of deterritorialisation underlying the structure which is pending to be effectuated so that new connections can be established. In other words, the Deleuzian assemblage is not only a territorial gesture, framing its own territory but also a performative practice of carving out new routes of thinking. Most important of all, Deleuze and Guattari emphasise the epistemological sparks emanating from launching creatively the continual process of territorialisation, deterritorialisation and reterritorialisation of assemblages.

Yet, where can we perceive assemblages? They are everywhere: human beings, as centers of indetermination, are assemblages of images, with which Deleuze 'assembles' the brain with the screen, the world with the film to expound his philosophy of time. Even virtual assemblages on digital networks (email, Facebook, Twitter) in our quotidian life can be regarded as assemblages. Assemblages can be practical and political instead of just theoretical. In this light, to what extent can Deleuze's philosophical thinking assist us to canvass various assemblages in prospect, and what is the assemblage between us and Deleuze in retrospect? Is it possible for us to theorise the new informatics sensibilia by formulating the *dispositif* of the horizontal/rhizomatic assemblages? And apart from the superficial/superfluous assemblages, is it possible to build any vertical but not arborescent assemblage?

Situating this notion in the contemporary world, we are seeking to form transdisciplinary assemblages in order to respond to and have dialogues with the present predicaments. Possible topics for papers may include but are not limited to:

1) Connections between Deleuze and Guattari's work;
2) Connections among all the different arts, including literature, film, music, architecture, etc.
3) Deleuzian Asian Assemblages;
4) Affect and Asian Aesthetics;

5) Image and Thought;
6) Deleuze and Gender;
7) Psychoanalysis and Schizoanalysis;
8) Creative betrayal of Deleuze;
9) Pros and Cons of Deleuze;
10) Ecology with/without Guattari;
11) Digital Folds;
12) Translation as Expression.

Although we wait to hear from several invited speakers, currently confirmed speakers include:

Jeffrey A. Bell (Southeastern Louisiana University, USA)
Ian Buchanan (University of Wollongong, Australia)
Hsiao-hung Chang (Taiwan University, Taiwan)
Claire Colebrook (Pennsylvania State University, USA)
Jiang Yuhui (East China Normal University, China)
Kokubun Koichiro (Takasaki City University of Economics, Japan)
Patricia Pisters (University of Amsterdam, Holland)
John Protevi (Louisiana State University, USA)
Anne Sauvagnargues (École Normale Supérieure de Lyon, France)
Kailin Yang (Taipei National University of the Arts, Taiwan)

If you are interested in presenting at this **conference**, submit panel proposals and/or individual abstracts (maximum 250 words) with your institutional affiliation and a short bio. The deadline for submission of abstracts for the conference is 31 January 2013. However, for early notification, you are encouraged to apply by **1 September 2012**. The conference registration fee is US$180 for regular attendees, US$150 for early birds, and US$110 for students (the subscription fee of *Deleuze Studies is in-built*), including refreshments and lunch each day.

Prior to the conference, there will be a five-day **Deleuze Camp**. As spaces are limited, registrations will be accepted on a first-come first-serve basis. Applications should include a short bio and a brief statement of one's research interests in Deleuze. The camp registration fee is US$220.

The working language of the conference and the camp is English. The webpage of the academic event. http://www2.tku.edu.tw/~tflxcfp/ will be available after 25 March 2012. For further inquiry, please contact Professor Hanping Chiu, the organiser, at hp.chiu@gmail.com

NOTE: Those who pay the registration fee of this conference can be exempted from the subscription fee of *Deleuze Studies* if they register for the **2013** Lisbon Deleuze Studies International Conference.

Computers and the Superfold

Alexander R. Galloway New York University

Abstract

Could it be that Deleuze's most lasting legacy will lie in his 'Postscript on Control Societies', a mere 2,300-word essay from 1990? While he discussed computers and new media infrequently, Deleuze admittedly made contributions to the contemporary discourse on computing, cybernetics and networks, particularly in his late work. From the concepts of the rhizome and the virtual, to his occasional interjections on the digital versus the analogue, there is a case to be made that the late Deleuze has not only influenced today's discourse on new media but also proposes an original set of arguments about society and politics at the turn of the new millennium. Focusing on the 'Postscript on Control Societies' and a handful of texts that surround it, we will reconstruct an image of what it means to live in the information age. This will have consequences for how we define the digital and the analogue, what the computer means, and ultimately provide some insight into one of the more elusive terms in all of Deleuze, the superfold.

Keywords: computer, control, digital, information age, capitalism, superfold

Could it be? Could it be that Deleuze's most lasting legacy will consist of 2,300 words from 1990? Such a strange little text, his 'Postscript on Control Societies' (Deleuze 1995b: 177–82). It bears not the same Deleuzian voice so familiar from his other writings. Cynics will grumble it falls short of the great books of 1968–9 or the radical collaborations with Félix Guattari during the 1970s.[1] A different voice resonates here, a more directly political voice, and barring the Guattari collaborations a voice less commonly heard in Deleuze's writings. Deleuze was always

a political thinker, certainly, and remained politically committed in various ways throughout his life. But the 'Postscript' is different.

'Today, I can say that I feel completely Marxist', he admitted in a late interview published posthumously (1995a). 'The article I published on the "society of control," for example, is completely Marxist, even though I am writing on things that Marx knew nothing about'.[2] Indeed in the article he indicts capitalism by name. He raises his wrath against corporations and television shows. But not just the mode of production, his frame is the culture at large. He talks about snakes and surfers and other features of the dawning millennium. He references Roberto Rossellini, Paul Virilio, Franz Kafka and most importantly Michel Foucault. He tells us exactly what is wrong with the business sector, as well as with the prisons, schools and hospitals. It reads almost like a manifesto, the 'Manifesto on Control Societies'.

Manifestos are always about two things: the desires and the details. This is what we want; and we want it here, and in this manner. When the May 1968 revolts broke out in France, Philippe Sollers, along with Julia Kristeva, Jean-Joseph Goux, Jean-Louis Baudry and a band of other signatories, wrote 'La révolution ici maintenant: sept points', listing their grievances, point by point (Baudry et al. 1968). And – they added at the end – we shall meet on Wednesdays at nine o'clock on the rue de Rennes. This is the crux of the *cahiers de doléances*' refrain, reprised recently in the closing sections of Michael Hardt and Antonio Negri's *Multitude*: say what you want, and be specific about it.

The year of Deleuze's death, 1995 was a good year for the manifesto. The Unabomber's 'Industrial Society and the Future' advocated the complete destruction of what he called the industrial-technological system. The Dogme '95 'Vow of Chastity' signed by filmmakers Lars Von Trier and Thomas Vinterberg that same year offered the closest thing to a manifesto seen in the cinema for some time. The Vow is as short as the Unabomber's is long, but it is detailed, detailed, detailed. One must film on location, in colour, on Academy 35mm stock and with concurrent diegetic sound.

Ten years earlier, a computer engineer named Richard Stallman wrote the 'GNU Manifesto'. The number of legitimate manifestos written by computer geeks can be counted on one hand – the VNS Matrix 'Cyberfeminist Manifesto' and Eben Moglen's 'The dotCommunist Manifesto' also come to mind. But despite its inauspicious source, Stallman's document had profound effects on the 'industrial-technological system', and almost all of them good. Detailed, like the others, Stallman's manifesto calls for the creation of a free Unix-compatible software

system, including a C compiler and a linker, a text editor and a few dozen other free software applications. He names the make and model of the computer his system will run on. He rebuts, pre-emptively, eleven specific objections raised by his would-be critics. (In a passage he might regret today, Stallman even calls for a software tax to underwrite the development of free code.) Most importantly, the manifesto calls for a 'stay free' legal armature for copyright holders, known today as the GNU General Public License.

Such was the intellectual climate that produced the 'Postscript on Control Societies'. No computer-savvy intellectual was Deleuze. He likely had never heard of Stallman's manifesto much less read it. Nevertheless, scattered across his *oeuvre*, and particularly in his late work, Deleuze has unwittingly made significant contributions to the contemporary discourse on computing, cybernetics and networks. From the concepts of the rhizome and the virtual, to his occasional interjections on the digital versus the analogue, and here with the notion of control society, there is a case to be made that Deleuze, while rarely mentioning computers directly, has dramatically influenced today's discourse on new media.

One of the most influential aspects of the 'Postscript', particularly to my own thinking, is how it asserts so trenchantly that things are not getting any better. Computers are a curse not a panacea. Planetary neoliberalism is a boondoggle not a deliverance. The snake is even worse than the mole. For critics working in the shadow of the dot-com boom, such offerings from Deleuze furnished a welcome dose of fuel needed to combat the naïve utopian babble of the California ideology.

Deleuze was always good at drawing lines in the sand. One of the things that make Deleuze such a pleasure to read is his clear construal of the theatre of enemies. They are excellent enemies. Not just information technologies and the life sciences, but Plato, Hegel and Descartes – elite enemies, all of whom have committed the most egregious error. Each of these philosophical enemies has assented to the classical condition of philosophy. Each admits to an up-down distinction between idea and matter, between essence and instance, between Being and beings. The 'Postscript' does not draw the line so much in terms of metaphysics. Here rather the complaint is articulated in terms of control, communication and the 'harshest confinement' wrought by 'the new monster' of information society (Deleuze 1995b: 178). Deleuze credits the term to William Burroughs, but the true source for 'control' is no mystery.[3] Follow a thread from nineteenth-century thermodynamics and fluid dynamics through statistical mathematics, weather prediction and

nonlinear systems to terminate in 1948 with Norbert Wiener and his book *Cybernetics: or Control and Communication in the Animal and the Machine*. Then, stemming from Wiener and his brethren in the military-industrial research parks, follow the thread that leads through the rest of the twentieth century by way of systems theory, cellular automata and chaos theory. So why not call Deleuze's adversary by its true name?: the enemy is *cybernetics*.

To describe the 'Postscript' as a manifesto is to invoke the question of philosophical genre. An author may adopt different textual strategies to achieve different ends. The interview, the seminar, the essay, the book, these all demand different things from the philosopher, and command different participation by the reader. Of course the 'Postscript' is no user's manual on how to live; it is no call to action. It is no introduction to the non-fascist life, as Foucault said of *Anti-Oedipus*. Yet one can discern here some of the most basic requirements of a manifesto, these being an enumeration of grievances and a sermon for how to remedy them.

But the question of philosophical genre can also be approached from another point of view. For is this short essay not – dare I say – a less philosophical Deleuze? The 'Postscript' reveals a slightly more casual philosopher. It reveals a man more willing to comment about the current state of the world and its daily goings-on. Here is a thinker who is willing to make a hard and fast historical periodisation. Foucault's influence is dramatic. Indeed the 'Postscript' presents the kind of thinking more often seen in the writings of sociologists, political economists or even certain kinds of historians – modes of writing none of which are classic Deleuze. He is expanding his normal repertoire to include a very clear argument about historical periodisation. The argument is no secret: at some point during the middle to late twentieth century disciplinary societies, characterised by confinement and bureaucratic hierarchy, gave way to control societies, characterised by 'free-floating' cybernetic organisation.

Make no mistake, the gambit in the 'Postscript' is larger than what might be evident at first glance. In order to accept the concept of the control society, one must come to terms with a whole host of related concepts that, while not necessarily synonymous with control society, are nevertheless similar enough to demonstrate the success of the periodisation of the contemporary as such. In other words, to accept control society one must accept Jean-François Lyotard's 'postmodern', Hardt and Negri's 'empire', Manuel Castells's 'information age', Luc Boltanski and Ève Chiapello's 'new spirit of capitalism', and all the other related periodisation concepts. These various historical labels do

not mean the same thing, and they do not refer precisely to the same historical periods. But the ubiquity of such periodisation is evidence that something else is happening. The ubiquity of periodisation proves there exists a strong desire to theorise the last few decades as dramatically different from the high water mark of modernity. And further: that periodisation itself *is something that ought to be done*. People are free to squabble over this or that definition, nevertheless the 'Postscript' demonstrates *that periodisation is something that defines today's mode of being*, whether or not people can agree on the historical periods themselves or what they might mean.

Deleuze evokes many specific things in the 'Postscript' that are notable, a few of which will be listed briefly before expanding on one particular salient detail. A number of memorable images jump out to the reader: 'the ultrarapid forms of apparently free-floating control' ('les formes ultra-rapides de contrôle à l'air libre'); the sieve 'whose mesh varies from one point to another'; big business as 'a soul, a gas'; the fact that '*Surfing* has taken over from all the old *sports*'; 'the passive danger of entropy and the active danger of sabotage'; the 'mushrooming shantytowns and ghettos'; and the dynamic between the 'mole's burrow' and the 'snake's coils' (Deleuze 1995b: 178–82).[4] Likewise the 'Postscript' is one of the few places where Deleuze mentions his intriguing concept of the 'dividual', a new kind of subject that emerges after the death of the *in*dividual.

But the crux of the 'Postscript' is something else entirely. The crux of this short text has to do with technology. For here is one of those rare moments in which Deleuze comments on actually existing contemporary technology, specifically computers. Control societies, he writes, 'function with a third generation of machines, with information technology and computers' (Deleuze 1995b: 180). Admittedly Deleuze does not delve too deeply into the specificities of computing. He is no Friedrich Kittler, or Geert Lovink, or McKenzie Wark. But in a way that perhaps nevertheless still trumps these other authors, Deleuze says a few brief words about an important pairing, the analogue and the digital. Not as broadly integrated into Deleuze's overall project as, say, the concept of the virtual, the analogue and the digital still figure importantly here. The following are the relevant sentences, which Deleuze uses to launch section two of the essay under the heading 'Logic' (*Logique*, a cognate with the French word for software, *logiciel*):

> The various placements or sites of confinement through which individuals pass are independent variables: we're supposed to start over each time at

> zero, and although all these sites have a common language, it's *analogical*. The different forms of control, on the other hand, are inseparable variations, forming a system of varying geometry whose language is *digital* (though not necessarily binary). (Deleuze 1995b: 178; translation modified)

Only a passing reference, it is true, but still an important return to two terms that had appeared in Deleuze's philosophy for several years already. By way of background, go back to a text from his aesthetic period, the slim and elegant *Francis Bacon: The Logic of Sensation* (Deleuze 2004), which first appeared in 1981.[5] The book on Francis Bacon is of course not about the digital, nor is it about control society per se. But nevertheless Deleuze finds time in the monograph to pause for a moment and offer a few remarks on the digital and the analogue. As many people are want to do, Deleuze's first instinct is to connect the digital to the universe of computation and code. 'Digital synthesizers', he writes – qualifying them as *audio* synthesizers, but we might extrapolate his observations to include video synthesizers as well – 'Digital synthesizers . . . are "integral": their operation passes through a codification, through a homogenization and binarization of the data' (Deleuze 2004: 95). The 'integral', integration, these are important concepts in Deleuze's work. Drawing on the use of the term in both mathematics and Freudian psychoanalysis, Deleuze uses integration to mean the actualisation of the virtual. 'Four terms are synonymous', he wrote a decade earlier in *Difference and Repetition*, 'actualise, differenciate, integrate and solve' (Deleuze 1994: 211). To integrate a mathematical function means to find the 'area under the curve'. For example, one might integrate from a to b on the function $f(x)$, meaning that, given the curve plotted of the function $f(x)$, one sums the area under the curve bounded by $x = a$ to $x = b$. At the same time the appeal for Deleuze is, I think, not so much the mathematical sources of the term 'integration' but the curvilinear sources, shall we say the baroque sources. Curves are complex. Given the complexity of a curve, to 'solve' a curve mathematically is something of a miracle. In fact such a feat eluded the ancients; it took the baroque mathematicians G. W. Leibniz and Isaac Newton to do it. As readers of Deleuze will already know, his ontology is one that posits an infinite plane of heterogeneous elements, and on this plane the heterogeneous elements come to integrate themselves into more or less homogenous regularities of aggregation, comportment and association. Hence integration is a synonym for coordination or organisation in Deleuze. Integration is the miracle of givenness, and the subsequent management of those

given beings. Integration produces things like species, compositions and societies. And, lest we forget, the countervailing force exists as well, homogenous regularities that 'deterritorialise' into the virtual, thereby suspending their specificity in favour of adjacent 'possibility spaces' – although Deleuze himself disliked the term 'possible'.

In the previously cited quotation from *Francis Bacon*, Deleuze more or less equates five terms: digitisation, integration, codification, homogenisation and binarisation. Binarisation, the grouping of things into twos, is the same as digitisation, the separating or making distinct of things, is the same as integration, the solving of complex function curves, is the same as codification, the representation within a symbolic system, is the same as homogenisation, the making uniform of dissimilar ingredients. Needless to say the comparison of these five terms raises a number of questions, not all of which will be resolved here. What is important, for Deleuze and for us, is that the digital is a transformative process (which is to say 'additive', or in Kantian vocabulary 'synthetic') in which a universe grounded in the univocity of an identity of the same becomes a universe grounded in discrete distinctions between elements, elements that, although divided, are brought together and held in relation, suspended opposite each other like cliffs over the banks of a great river.

In the very same passage from *Francis Bacon*, Deleuze also says a few words, precious few, about the analogical. Not so much a question of code, the analogical is a question of diagram or motif. What this means is that the analogical operates in the realms of shape and relation, refrains and styles, not symbol or language in the classical sense. Or if a language, one lacking in the typical elements of alphabet, letter and word: 'Analogical language would be a language of relations, which consists of expressive movements, paralinguistic signs, breaths and screams' (Deleuze 2004: 93). The analogical is a 'language' of breaths and screams, a non-language of phatic commands, which enacts expression by virtue of the frisson struck between gestures of different types. Again back to the passage on synthesizers: 'Analogical synthesizers are "modular,"' he writes, 'they establish an immediate connection between heterogeneous elements' (95). So while digital synthesizers are integral, slicing up the world into masses of homogenous code atoms, analogical synthesizers work through modularity. What this means is that different elements, remaining relatively whole and heterogeneous to each other, are nevertheless able to interoperate immediately. They can touch each other directly, despite their differences. (One can begin to see why the fields of poststructuralism, deconstruction and semiotics were so

inherently digital; as a rule they prohibit immediacy.) Whereas the digital requires and enlists an underlying homogeneity, the analogical requires an underlying heterogeneity. In the analogue paradigm, the stuff of the world remains unaligned, idiosyncratic, singular. These modules, thus, are not modules in the sense of standardised, recombinable parts, just as modular housing relies on prefabricated, repeatable materials. Rather, as modules they remain messy globs of dissimilar things. They only happen to interoperate because they have managed, by virtue of what Deleuze would call mutual deterritorialisation, to 'grow' the necessary sockets that fit into each other. Deleuze's famous example is the wasp and the orchid, two creatures, alike in almost no sense, that nevertheless couple up analogically. Although they are two, at the point of coupling the wasp and the orchid merge into one.

Return briefly to the mathematical theme. While Deleuze does not tell us directly, neither in the 'Postscript' nor in the Francis Bacon book, one can infer the following: just as the digital means integration, the analogical means differentiation. Thus, while integration means area under a curve, differentiation or 'taking the derivative' means the instantaneous slope of the tangent line. Instead of summing the area under the curve defined by *f(x)*, one extrapolates a secondary function derived from the first function, a secondary function consisting of a straight line tangential to any position $x = a$ on the curve. It is slightly counter-intuitive then. Do not be fooled by the curves of integration, for it is still a question of *solving* via a multiplicity of regular slices, and hence it is digital. Likewise do not be fooled by the semantic similarity between the words differentiation and difference. Differentiation is an analogical event because it brings together the immediacy of two modular, and heterogeneous, spaces, (1) the space of the function curve and (2) the adjacent virtual space of all the tangent lines that can be derived from the curve.

Heterogeneity has long been an attractive theoretical category, for Deleuze but also for twentieth-century Continental philosophy and Anglo-American cultural theory in general. And as we have just seen the analogue brings together heterogeneous elements into identity (an identity which, again, has nothing to do with homogeneity). I think there is a strong case to be made that Deleuze was and remained a philosopher of the analogue paradigm alone, and that the paradigm of the digital was only vaguely sketched out by him during his lifetime (except in its most visible form, metaphysics). The reasons for this are complex for they concern the history of philosophy and Deleuze's antagonistic relationship toward it, but as a kind of shorthand

we might posit the following: those who work in the tradition of metaphysics will tend to offer a digital philosophy; those who work in the tradition of immanence, as Deleuze did, will tend to offer an analogue philosophy. Indeed in many ways Deleuze is the analogical philosopher par excellence. Just as he described painting, 'the analogical art par excellence' (Deleuze 2004: 95).

What this brief excursion into digitality reveals is that the late Deleuze contains an original set of arguments about society and politics at the turn of the new millennium. We know Deleuze understood the world in 1968 – the anabasis of desire, affective revolution, new schizophrenic subjects, molecular organisation, dispersive and rhizomatic structures, spatiality and topology instead of history, Leibniz instead of Hegel, Riemann instead of Einstein – but the question remains whether he understood the world at the dawn of the new millennium. (This question has not been adequately explored thus far, although the work of someone like Bernard Stiegler is a notable exception.) Much has been said about Foucault's late turn to millennial politics, via his concepts of biopower and biopolitics, or Giorgio Agamben's theorisation of today's state power, but too little credit has been given to Deleuze as a forecaster of the future world system. Part of the problem is that, barring the 'Postscript' itself, there is no single book or text that stands out as a ready exemplar for Deleuze's analysis of millennial capitalism, just as *Anti-Oedipus* and *A Thousand Plateaus* provided a vision of middle-twentieth-century capitalism.

Such an exemplar needs to be reconstructed from fragments. Four texts will form the backbone of his analysis: the two pieces from 1990 bundled in *Negotiations*, 'Postscript on Control Societies' and the interview with Negri titled 'Control and Becoming' (Deleuze 1995b: 169–82); paragraphs from an odd little piece called 'Having an Idea in Cinema' (Deleuze 1998); and three or four pages from Deleuze's 1986 book *Foucault* (Deleuze 1988).[6]

Some of the relevant sections from the 'Postscript' have already been outlined, so let us turn now to the ending of the Negri interview. The penultimate question and answer are what concern us:

> [Foucault] was actually one of the first to say that we're moving away from disciplinary societies, we've already left them behind. We're moving toward control societies that no longer operate by confining people but through continuous control and instant communication ... Compared with the approaching forms of ceaseless control in open sites, we may come to see the harshest confinement as part of a wonderful happy past. The quest for 'universals of communication' ought to make us shudder ... Computer

> piracy and viruses, for example, will replace strikes and what the nineteenth century called 'sabotage' ('clogging' the machinery) . . . The key thing may be to create vacuoles of noncommunication, circuit breakers, so we can elude control. (Deleuze 1995b: 174, 175)

Already it is evident how much of Deleuze's phrasing from the Negri interview overlaps with the text of the 'Postscript'.

Add now the passages from 'Having an Idea in Cinema', a text that derives from a lecture titled 'Qu'est-ce que l'acte de création?' given by Deleuze at La Fémis (Fondation européenne des métiers de l'image et du son) on 17 May 1987 but published in 1990 the same year of the 'Postscript'. Some of the relevant passages simply duplicate the same phrasing and language about Foucault that made it into the 'Postscript' so there is no need to repeat them. But 'Having an Idea in Cinema' also includes an important, off-hand remark that we must add to our accumulation of Deleuze's control quotations:

> A control is not a discipline. In making freeways, for example, you don't enclose people but instead multiply the means of control. I am not saying that this is the freeway's exclusive purpose, but that people can drive infinitely and 'freely' without being at all confined yet while still being perfectly controlled. This is our future. (Deleuze 1998: 18; translation modified)[7]

In an alternate transcription of the same lecture Deleuze included a few extemporaneous lines, and even mentions Minitel, the French teletext network that predates the web. 'This can be done completely differently too', he said about the regrouping of people around arrangements of ubiquitous control. 'It can be done through Minitel after all. Everything that you want – what's astounding would be the forms of control' (Deleuze 1987).[8]

Recall that the French *contrôle* carries stresses in meaning that are slightly different from the English control. *Contrôle* means control as in the power to influence people and things, but it also refers to the actual administration of control via particular monitoring apparatuses such as train turnstiles, border crossings and check points. The notion, in English, of having to pass through 'passport control' gets at the deeper meaning of the word. So when Deleuze talks about *les sociétés de contrôle* he means those kinds of societies, or alternately those localised places within the social totality, where mobility is fostered inside certain strictures of motion, where openings appear rather than disappear, where subjects (or for that matter objects) are liberated so long as they adhere to a variety of prescribed comportments.

In addition to this text and the two in *Negotiations*, a fourth text expands Deleuze's discussions of computer-based control, exploding them into an enigmatic tapestry of prognostications. Recall those notorious pages 92–3 and 131–2 of Deleuze's late book on Foucault where he meditates on something called 'life resistance' and a new mysterious construct called the 'superfold' (an alluring designation to which he unfortunately never returns).[9] First, consider the sections in which Deleuze proposes, but does not fully develop, a vision of life as living resistance:

> When power . . . takes life as its aim or object, then resistance to power already puts itself on the side of life, and turns life against power . . . Life becomes resistance to power when power takes life as its object . . . When power becomes bio-power resistance becomes the power of life, a vital-power that cannot be confined within species, environment or the paths of a particular diagram . . . Is not life this capacity to resist force? (Deleuze 1988: 92, 93)

Then later, in the final paragraphs of the book's appendix, Deleuze broaches the question of genetics and the so-called third-generation machines (that is, computers and bioinformatics) that would figure prominently in the 'Postscript' four years later. He wonders aloud about the 'death of man', as it was described in Foucault and Friedrich Nietzsche:

> The question that continually returns is therefore the following: if the forces within man compose a form only by entering into a relation with forms from the outside, with what new forms do they now risk entering into a relation, and what new form will emerge that is neither God nor Man? This is the correct place for the problem which Nietzsche called 'the superman'. (Deleuze 1988: 130)

In other words, what is the new configuration of man after the death of man (or, if you like, the subject after the death of the subject), and what had to happen in order to create such a new condition of life? Deleuze's answer:

> Biology had to take a leap into molecular biology, or dispersed life regroup in the genetic code. Dispersed work had to regroup in third-generation machines, cybernetics and information technology. What would be the forces in play, with which the forces within man would then enter into a relation? It would no longer involve raising to infinity or finitude but an unlimited finity, thereby evoking every situation of force in which a finite number of components yields a practically unlimited diversity of combinations. It would be neither the fold or the unfold that would constitute the active mechanism,

> but something like the *Superfold*, as borne out by the foldings proper to the chains of the genetic code, and the potential of silicon in third-generation machines... The forces within man enter into a relation with forces from the outside, those of silicon which supersedes carbon, or genetic components which supersede the organism... In each case we must study the operations of the superfold, of which the 'double helix' is the best-known example. (Deleuze 1988: 131–2)[10]

Scattered across the 'Postscript' and these other citations is a new image of society and the self that cannot simply be reduced to Deleuze's previous tropes like the body without organs, the rhizome or even the virtual. This is a new image that involves, nay requires, the recognition of the computer as its central mitigating factor. Just as the fold was Deleuze's diagram for the modern subject of the baroque period, the superfold is the new 'active mechanism' for life within computerised control society. The dividual and the superfold, in other words, have a special relationship with each other. 'A fold is always folded within a fold, like a cavern in a cavern', wrote Deleuze of the ontology depicted in Leibniz (in an effort to demonstrate how Leibniz's was not an atomism). 'The unit of matter, the smallest element of the labyrinth, is the fold, not the point which is never a part, but a simple extremity of the line' (Deleuze 1993: 6). Although Deleuze does not specify things further, one can extrapolate that the superfold, being 'proper to the chains of the genetic code' and the progeny of an 'unlimited diversity of combinations', would follow a diagrammatic logic of dispersive and distributive relations within networks, of iterative regress via computational recursion. Instead of the human coming into a relationship with itself (the baroque), the human comes into a relation with 'forces from the outside' such as the silicon of the computer chip or exogenous factors from genetic engineering. The dividual therefore does not so much carry pleats in its soul, as Deleuze says of the baroque subject, but a tessellated, recombinant soul, if soul is still the proper word, forming and reforming across the metastable skein of the bioinformatic ecosystem.

In fact Deleuze's argument is not an exotic one. In France figures like André Leroi-Gourhan and Bertrand Gille had already demonstrated how human beings coevolve with their exogenous technologies and techniques. And in North America figures like Lewis Mumford and Marshall McLuhan had made similar claims. (Indeed the final paragraph of Deleuze's *Foucault* reads very much like Donna Haraway's now famous 'Cyborg Manifesto', which while predating the book by one year was almost certainly unknown to Deleuze at the time.) Instead what

might be exotic about Deleuze's argument, or at least what makes it novel, is his mobilisation of the concept in terms of a diagram: the 'super' fold, the double helix, a fractal topography not simply a folded one.[11]

The ultimate lesson to be learned from the 'Postscript' is not so much a lesson about the subject or even society. The ultimate lesson is one about periodisation. For what Deleuze wishes to do in the essay, following Lyotard, Foucault and all the rest, is to assert the historical break. He wants to show us how everything has changed, indeed that the world of 1990 has itself changed from the world pre-1968 so dramatically as to be practically indistinguishable. 'The key thing is that we're at the beginning of something new', he reminds us (Deleuze 1995b: 182). It is not particularly important whether one agrees or disagrees with the Deleuzian-Foucauldian periodisation from sovereign society through disciplinary society and then to control society. Periodisation itself is the important thing. And how deliciously ironic that in recent years periodisation seems to be appearing with increased frequency, an increased periodicity of periodisation. Indeed all this talk of the superfold is, by that very same measure, a kind of superperiodisation without end. For each new fold is a new historical break. First the fold, then the double fold, the triple, on up to the multiplicative folds of the superfold. Thus the task of historical thinking itself is implicated in Deleuze's 'Postscript', and as such has metastasised and reduplicated into a super state of recursive channels. The ultimate coup of control society is not so much the continuous influence of the border crossing or the passport control, not so much data mining or facial recognition algorithms, but that it has eviscerated history, not by banning dissent, but by accelerating the opportunities and channels for critical thought to infinity and therefore making it impossible to think historically in the first place. Thus the central challenge within control society will be not simply to resist the various new nefarious control apparatuses, but to rescue history from its own consummation.

Notes

1. Indeed the 'Postscript' commands only one paragraph in François Dosse's biography of Deleuze and Guattari (2010).
2. As Deleuzians are keen to point out, the aged Deleuze spoke of an upcoming book project devoted to 'the grandeur of Marx', a book which unfortunately was never realised during his lifetime.
3. Deleuze, Guattari and Foucault participated in the famous 'Schizo Culture' conference held at Columbia University in 1975. Burroughs gave a talk at the conference titled 'The Impasses of Control'.

4. Today one speaks often of 'web surfing'; however, since he was writing just prior to the advent of the web Deleuze's frame of reference would have included television and the phenomenon of channel surfing, as well as the actual sport of ocean surfing. In an earlier piece titled 'Mediators', also included in *Negotiations*, Deleuze says a bit more about surfing. 'The kind of movements you find in sports and habits are changing. We got by for a long time with an energetic conception of motion, where there's a point of contact, or we are the source of movement. Running, putting the shot, and so on: effort, resistance, with a starting point, a lever. But nowadays we see movement defined less and less in relation to a point of leverage. All the new sports – surfing, windsurfing, hang-gliding – take the form of entering into an existing wave. There's no longer an origin as starting point, but a sort of putting-into-orbit. The key thing is how to get taken up in the motion of a big wave, a column of rising air, to "get into something" instead of being the origin of an effort' (Deleuze 1995b: 121). The surfing image also appears in *What is Philosophy?* During their itemisation of the features of conceptual personae, Deleuze and Guattari describe the dynamic features as follows: 'if moving forward, climbing, and descending are dynamisms of conceptual personae, then leaping like Kierkegaard, dancing like Nietzsche, and diving like Melville are others for philosophical athletes irreducible to one another. And if today our sports are completely changing, if the old energy-producing activities are giving way to exercises that, on the contrary, insert themselves on existing energetic networks, this is not just a change in the type but yet other dynamic features that enter a thought that "slides" with new substances of being, with wave or snow, and turn the thinker into a sort of surfer as conceptual persona' (Deleuze and Guattari 1994: 71).
5. The original French edition (Deleuze 1981) was expanded and reissued in 1984, then reprinted in Alain Badiou and Barbara Cassin's book series at Éditions du Seuil in 2002 (Deleuze 2002). The original French edition is in two volumes: volume one contains Deleuze's text, while volume two contains several reproductions from Bacon's paintings. The 2002 French edition consolidates the volumes and contains only seven colour plates. The English edition (Deleuze 2004) unfortunately features no imagery at all.

   In a slightly more exotic register, one might also return to another book from 1981, François Laruelle's *Le Principe de minorité* (1981). In this book Laruelle mentions different types of multiplicities: (1) 'discrete or arithmetic' multiplicities, (2) continuous multiplicities, which he associates with Difference, and (3) what he calls dispersive multiplicities, which he also labels 'Unary Multiplicities or Minorities' claiming that they are 'the absolute concept or the essence of multiplicities' (1981: 6). The first two are clearly code words for digital and analogue: the realm of discrete arithmetic is the realm of the digital, while the realm of the continuous is the realm of the analogue. What is so provocative, then, is the third term – that there *should* be a third term. The provocation will eventually lead Laruelle away from digitality, precisely because it will lead him away from philosophy, philosophy and the digital being two modes that share a great deal with each other.
6. A few other relevant references exist such as Deleuze and Guattari's mention of 'three ages' in their introduction to *What is Philosophy?*: 'the three ages of the concept are the encyclopedia, pedagogy, and commercial professional training' (1994: 12).
7. This text also appears in a different form under the title 'What Is the Creative Act?' (Deleuze 2006: 312–24).

8. The reference to Minitel does not appear in the version of the essay collected in *Deux régimes de fous* (Deleuze 2003), and hence neither in the English translation contained in *Two Regimes of Madness* (Deleuze 2006).
9. As Frédéric Astier notes in his doctoral thesis (2007: 290–1), Deleuze mentioned the superfold in his seminars on Foucault held on 18 and 25 March 1986. I thank Adeline Gasnier for bringing this to my attention. Toward the ending of the 25 March session Deleuze reiterates some of the ideas that would reappear in book form, specifying that the superfold is the fold 'sur le dehors' (over the outside; a fold that incorporates the outside), an allusion to Foucault's concept of the 'thought of the outside' (Deleuze 1986b). Deleuze's 18 March 1986 seminar is even more explicit: the historical shift from God to man to superman corresponds directly to the processes of unfolding (God), folding (man) and superfolding (superman) (Deleuze 1986a).
10. Just as Nietzsche's *Übermensch* is rendered alternately in English as 'overman' or 'superman', one might give Deleuze's *surpli* as 'overfold' as well as superfold.
11. François Laruelle has integrated fractals and what he calls 'generalised fractality' into his work to great effect (1992 and 2011).

Substantial Powers, Active Affects: The Intentionality of Objects

Levi R. Bryant Collin College

Abstract

What can *Dungeons & Dragons* teach us about the being of beings? This article argues that *Dungeons & Dragons* introduces us to a world composed of objects or entities, where the being of objects is defined not by their qualities, but rather by their powers, capacities or affects. Drawing on the thought of Spinoza, Deleuze and Molnar, objects are seen to be defined by what they can do or their capacities to act, such that qualities are effects of these acts. *Dungeons & Dragons* is particularly suited to showing us this insofar as it focuses on the action of entities.

Keywords: *Dungeons & Dragons*, object-oriented ontology, affect, power, Deleuze, Spinoza

I. Two Questions of Ontology

What can *Dungeons & Dragons* teach us about ontology? Here it is necessary to proceed with caution, for 'ontology' can refer to different things within the field of philosophy. Ontology is that branch of philosophy that investigates the most basic structure of being. Yet, this branch of philosophy is not without ambiguity. Sometimes 'ontology' will refer to a sort of inventory of the most basic or fundamental things that exist. Is being or existence composed entirely of fundamental material particles or atoms coupled with their combinations? Do universals exist? In addition to material particles, are there also spiritual entities such as souls? Does god or gods exist? Do entities only interact through material or cause and effect relations, or are there other forms of

Deleuze Studies 6.4 (2012): 529–543
DOI: 10.3366/dls.2012.0081
© Edinburgh University Press
www.eupjournals.com/dls

interaction such as magic? Such are the sorts of questions asked by what I will call 'inventory ontology'. Inventory ontology is above all concerned with an accounting of the *types* of entities that exist and their properties or distinguishing features. Here the question is, above all, '*what* exists?'

At other times 'ontology' will refer to the investigation of the most basic nature of being, regardless of what *type* of being an entity is. Here ontology asks the question 'what is being *qua* being?' Put differently, the question here is 'what is common to all beings regardless of the type of being that an entity is?' Or again, 'what is the basic structure of any being, what is the common nature shared by all beings, regardless of the type of being in question?' Here the accent is not on the variety of basic types of entities that exist, but rather on the 'beingness' of beings or what properly makes an entity an entity. I will refer to questions of this sort as questions of 'fundamental ontology'. Here the question is, above all, 'what is the *nature* of existence?'

Although the two questions are related, it is clear that we will get very different answers to the question of what *Dungeons & Dragons* has to teach us about being depending on whether we pursue inventory ontology or fundamental ontology. If we pursue inventory ontology we will learn of a fictional world that is populated by all sorts of humanoids, creatures, tools and weapons, spirits, gods and demons, governed by relations of material cause and effect relations as well as relations of magic or enchantment. Further on I will discuss what this inventory ontology has to teach us about the world or being, but insofar as this is a fictional ontology it is unlikely that this inventory has much to teach us about being *as such* or the *nature* of existence. By contrast, I would like to argue that if our question is 'what is the *nature* of existence?', 'what is the being of beings regardless of what type of entity a being is?', *Dungeons & Dragons* has a great deal to teach us about ontology and the ontology of *our* world.

II. An Ontology of Substances

The universe of *Dungeons & Dragons* is, in part, Aristotelian in orientation. To say that this universe is Aristotelian in orientation is to say that it is a universe composed of *substances*. Substance is not *matter*. Matter is that of which something is made, whereas a substance is an *individual entity*. While there is no substance that is immaterial, matter is indifferent to substance in the precise sense that it can compose a variety of different substances. Thus, for example, clay, a matter, can be used to create a variety of different substances such as a cup for drinking, bowls

for eating, bricks for building a home, pots for planting, or visages of Zeus's face to adorn a trellis in one's garden. Cups, bowls, bricks, pots and sculptures of Zeus are all substances, whereas clay is a matter that indifferently composes these substances.

Additionally, substances can gain and lose material, while remaining *that* substance. My body perpetually loses cells and gains cells, yet I remain the person that I am. A tree drops its leaves in the autumn yet still is *that* tree. A dog can lose a leg but it still remains *that* dog. The substantiality of substance consists not of its matter, but of its individuality and autonomy.

'Substance' thus names not matter, but *individual entities*. Any individual entity or being is a substance. Umber hulks, wraiths, purple worms, enchanted swords, halflings, elves, cloaks of invisibility and potions are all substances insofar as they are all individual entities or beings. Aristotle remarks that '[a] *substance* – that which is called a substance most strictly, primarily, and most of all – is that which is neither said of a subject nor in a subject, e.g. the individual man or the individual horse' (Aristotle 1984: 2a13–15). Aristotle's 'said of' relation refers to *predication*, whereas his 'in' relation refers to *qualities*. When I attribute a quality to a subject in a judgement or proposition I am engaged in an act of predication. If I say 'liches are undead sorcerers' I have engaged in an act of predication. I have *said* the *qualities* of 'undead' and 'sorcerer' of the *substance* 'lich'. This is a 'said of' relation. By contrast, if these properties or qualities exist *in* the lich itself, if they are genuine properties of the lich, then we are before an 'in relation'. 'Said of' relations pertain to judgements *about* substances (and therefore to whether these judgements are true or false), whereas 'in relations' refer to the relation between a substance itself and its qualities or properties.

When Aristotle says that substance, in its strictest, most primary sense is that which is neither said of a subject nor that which is in a subject, his point is that substance refers to that which exists in its own right as an individual entity. Qualities such as 'being-undead' or 'being-a-sorcerer' do not exist in their own right, but rather only exist in individuals or substances. In order for qualities to exist they require a substance *in which* to exist or inhere. Qualities – what Aristotle calls 'secondary substances' – cannot sustain their existence on their own.

Substances, by contrast, exist in their own right and are not said of anything else, nor are they 'in' anything else. To be sure, umber hulks are in a world, but they are not predicated of a world in the way that qualities like brown are predicated of umber hulks. Rather, each umber hulk is an individual or entity that exists in its own right. The world is

not a container in which substances exist, but is rather the totality of substances and their relations to one another. For this reason, we do not say 'Pierre is a *quality* of this umber hulk' (if this umber hulk happens to be named Pierre), but rather we say 'this umber hulk *is* Pierre' or 'Pierre is an umber hulk'. The substantiality of Pierre is exhausted by being Pierre and is not a property or quality of anything else. Pierre is an entity in his own right, not a quality of other entities. There is nothing that *contains* substances. Rather, there are only relations *between* substances.

Everywhere in *Dungeons & Dragons* we find a delirious celebration of substances. The descriptor 'delirious' here should not be taken in the pejorative but in the sense of being 'deliriously in love'. Rather than a bland ontology composed solely of, say, material atoms or particles and their combinations, we instead get a carnivalesque fauna composed of everything ranging from the mundane as in the case of leather jerkins, steins of mead, boots and lengths of coiled rope to the extraordinary in the form of countless intelligent humanoids, monsters and beasts of all kinds, magical grimoires, impressive war machines such as catapults and castles, wraiths and other terrifying incorporeal substances, gods, demi-gods and enchanted items of all sorts. *Dungeons & Dragons* displays a deep affection and love for substances or objects of all sorts, expressing endless wonder and fascination for the variety that populates the world. For this reason, the ontology proposed by *Dungeons & Dragons* deserves to be called an 'object-oriented ontology', for it is premised on the thesis that being is composed primarily and fundamentally of substances, objects or individuals.

III. An Ontology of Powers

Yet the thesis that being is composed of substance is not, in and of itself, a particularly interesting ontological claim. In many respects it could be said that substance ontology is the spontaneous ontology of common sense. Our day-to-day dealings with the world are characterised primarily as dealings with substances or objects. We speak with countless others throughout the day, we feed our cats, we use utensils and pots and pans to make our meals, we grab for the remote to change the channel, and so on. Our dealings are dealings with substances, entities or objects; and for this reason substance is the spontaneous ontology most of us embrace without even realising it. It takes a great deal of abstraction and imagination, by contrast, to conceive being as composed primarily of events and processes, yet little struggle of thought at all to conceive being as composed of substances.

What is interesting in the ontology of *Dungeons & Dragons* is not that it conceives being as composed of substances, but rather in *how* it thinks about substances. Let us therefore revise the question with which this essay began. We started by asking 'what can *Dungeons & Dragons* teach us about ontology?' Let us now ask 'what does *Dungeons & Dragons* teach us about substance?' It is here, I contend, that we find the true ontological innovation of *Dungeons & Dragons*, for here we encounter a genuinely novel conception of substance.

As we saw before, Aristotle conceives substance primarily in terms of subject–predicate, substance–quality relationships. Substance is the individual entity existing in its own right, whereas qualities and predicates are the properties that inhere in a substance. This is a rather contemplative conception of substance that arises when we passively regard the objects about us in a philosophical state of reflection. Withdrawn from the activities of my day-to-day life, I ask myself 'what exists?' I respond with the conclusion that substances exist. Still in this state of passive reflection, I ask what the being of substance consists in. My attention alights on my clay stein of ale crafted by the elves that dwell in the enchanted forest of northern Greyhawk as an instance of a substance. I note that this substance has a variety of different qualities. It is blue, has cylindrical shape, is a torus, and so on. I therefore conclude that the substantiality of my elven stein consists in being a composite of qualities.

It is with this conception of objects or substances as a composite of static qualities that *Dungeons & Dragons* departs. Perhaps this is because *Dungeons & Dragons* is an action, role-playing game thereby de-emphasising *qualities* predicated of a substance. *Dungeons & Dragons* came to conceive the being of substance in terms of *power* rather than *quality*. Substances are to be thought in their being not as qualities inhering in a subject, but rather in terms of the powers or capacities hidden and coiled within substances. Gamers are not interested so much in what colour an object is, its size, its shape, its taste, its smell – all qualities – but rather in what objects *do*, their capacities.

Here again we must proceed with caution, for the term 'power' has different connotations. To see this we must first take a detour through Spinoza. Following Roman custom we should distinguish two senses of power: *potestas* and *potentia*. *Potestas* refers to the power one entity *has over* another entity. A despotic king has the *potestas* to put us to death for heretical words against the local gods. A monarch has the *potestas* to dispense judgment and punishment in legal proceedings. In antiquity, the patriarch often has the *potestas* to kill his wife and children. *Potestas*

thus refers to the power one individual possesses with respect to another. While there will be many struggles pertaining to *potestas* in *Dungeons & Dragons*, this is not where the *ontological* emphasis lies with respect to its concept of power. Rather, *Dungeons & Dragons* conceives the being of substance in terms of *potentia* or affect. Where *potestas* refers to the power one entity possesses *over* another, *potentia* or affect refers to the *capacities* of a thing. Here power is what a thing can *do*. Of affect, the renegade, exiled Dutch philosopher Spinoza remarks that, '[b]y [affect] [*affectus*] I understand the affections of the body by which the body's power of activity is increased or diminished, assisted or checked, together with the ideas of these affections' (Spinoza 2002: 278). In Spinoza the concepts of affect, act and power are closely related.

Ordinarily the concept of affect is conceived in terms of the *feelings* of which we are capable when another entity acts upon us. The pain that I feel when a dagger cuts into my flesh, the pleasure that I experience when I bite into roast mutton, the sorrow that I feel when my companion is slain by an orc, or the joy I feel when I triumph over a red dragon and find its wondrous treasure would all be instances of affect in this sense. Likewise, my capacity to see the brilliant colours of flowers rather than seeing them in shades of black and white as, perhaps, dogs see them would be an instance of affect in this sense as well. Returning to his definition of affect, Spinoza's point is that we must have a *capacity*, a *power*, to be affected in these ways in order to experience these affects. Affect as power (*potentia*) is thus a condition for the possibility of the quality that we experience. When we are affected, in turn, these affects will either increase or diminish our power of acting. Sad passions will be those affects that decrease a body's power of acting, whereas joyous passions will increase a body's power of acting.

However, Spinoza significantly broadens the concept of affect, including within it not merely the power of being affected or acted upon, but also the power of *affecting* or acting upon other entities. Later in the *Ethics* Spinoza writes, '. . . nobody as yet has determined the limits of the body's capabilities: that is, nobody has yet learned from experience what the body can and cannot do . . . ' (2002: 280). When Spinoza refers to the body's capabilities, to what the body can and cannot do, he is referring to the affects of a body or substance which are, in their turn, the powers of a body. Elsewhere, Deleuze illustrates this point well when he writes that

> [a]n individual is first of all a singular essence, which is to say, a degree of power. A characteristic relation corresponds to this essence, and a certain

> capacity for being affected corresponds to this degree of power. Furthermore, this relation subsumes parts; this capacity for being affected is necessarily filled by its affections. Thus, animals are defined less by the abstract notions of genus and species than by a capacity for being affected, by the affections of which they are 'capable,' by the excitations to which they react within the limits of their capability. Consideration of genera and species still implies a 'morality,' whereas the *Ethics* is an *ethology* which, with regard to men and animals, in each case only considers their capacity for being affected. Now from the viewpoint of an ethology of man, one needs first to distinguish between two sorts of affections: *actions*, which are explained by the nature of the affected individual, and which spring from the individual's essence; and *passions*, which are explained by something else, and which originate outside the individual. Hence the capacity for being affected is manifested as a *power of acting* insofar as it is assumed to be filled by active affections, but as a *power of being acted upon* insofar as it is filled by passions. (Deleuze 1980: 27)

A traditional sorting of entities according to genus and species sorts them in terms of their qualities. Thus, for example, we split the genus 'animal' according to the quality of being rational or irrational, such that 'human' falls under the quality of being a rational animal. By contrast, ethology, as Deleuze articulates it, sorts beings in terms of their affects or what they can do and how they can be affected. As Deleuze remarks,

> [b]odies are not defined by their genus or species, by their organs and functions, but by what they can do, by the affects of which they are capable – in passion as in action. You have not defined an animal until you have listed its affects. In this sense there is a greater difference between a race horse and a work horse than between a work horse and an ox. (Deleuze and Parnet 1987: 60)

Affect therefore refers not to passion alone, not solely to that which we undergo and feel, but rather to actions as well. Both action and passion, in their turn, fall under the heading of 'capacity' or 'power' (*potentia*). If, ethologically, a work horse shares more in common with an ox than a great war horse, then this is because the actions of which a war horse is capable, the powers it has, differ in kind from those of a work horse and an ox.

We are now in a position to understand why the contemplative attitude common to philosophy tends to obscure the being of substance as power or affect, instead conceiving substance as merely a composition of qualities, and to determine just why *Dungeons & Dragons* rediscovers the being of substance as power. In contemplation we *withdraw from the world of action and activity* so as to passively regard or gaze at the world

about us. However, because we have withdrawn from action, because we are now in a state of passivity, we now encounter the substances of the world not in terms of their powers of acting or in terms of their capacities, but in terms of their *results*. Recall Spinoza's definition of affect: affect is the power or capacity of a substance to act coupled with the *idea* of that power. In the case of a passion, for example, the idea of this passion might be the emotion that we feel. This emotion, in its turn, is a *quality* that we experience within our consciousness. The *power* by which we are capable of being affected by the emotion or quality of grief disappears behind the quality of grief.

Let us modify Spinoza's definition of affect somewhat so as to render it generally applicable to ontology. Throughout Book III of Spinoza's *Ethics* there is a tension between ontological considerations of what is proper to beings or entities *in general*, and regional or specific ontological considerations of what is proper to a *particular type* of entity: humans and animals. On the one hand, Spinoza wishes to claim that *all* bodies are defined by their affects or powers of acting and being acted upon. On the other hand, Spinoza speaks of powers of acting and being acted upon being accompanied by *ideas* of these affects. Now it is unlikely that all bodies or entities are capable of ideas. Rather, ideas are likely to be unique to animals of various sorts such as the irksome and dangerous gelatinous cubes that populate many a dungeon. Thus, rather than claiming that affects or powers of acting and being acted upon are accompanied by ideas (feelings), we should instead say that affects or powers are accompanied by *qualities*, thereby treating ideas or feelings as a subspecies of qualities. Qualities, then, are effects, results, or products of powers, not the powers or affects themselves. As Deleuze remarks, '[t]he order of causes is therefore an order of composition and decomposition of relations, which infinitely affects all of nature. But as conscious beings, we never apprehend anything but the *effects* of these compositions and decompositions . . . ' (Deleuze 1980: 19).

Qualities are the effects of an object's or substance's powers or affects, not these substances or powers themselves. In this regard, we can say that the substantiality of substance, the being of substance, withdraws behind its qualities. Substances never directly appear or manifest themselves in the world, but rather indirectly manifest themselves through their qualities as effects. Let us return to the example of my blue elven stein of mead. Earlier I said that my delicately wrought stein has the quality or property of being blue. However, we have now learned that qualities or properties are the effect of powers and actions characterising the essence of the object. In what sense, no matter how strange it sounds,

is the blue of my stein the effect of an *act*? In what sense can we speak of blue as something my stein *does* rather than something my stein *is*? The blue of my stein is an *activity* of this stein in response to the *lighting conditions* in which the stein exists. When the stein is in bright sunlight, it is a brilliant shade of bright blue. When it is in dim candlelight, it is a dark, rich, cobalt blue. When the lights are turned out, it becomes black. Insofar as the colour of the stein is a function of its lighting conditions, all of these shades are what Spinoza refers to as 'passions'. The point is that we never directly encounter the powers or affects that render these passions possible, but rather only ever encounter the *effects* of these powers.

I refer to the domain of powers or affects that renders these qualities possible as 'virtual proper being', whereas I refer to the qualities that an object embodies as 'local manifestations' (Bryant 2011: ch. 3). The term 'virtuality' comes from the Latin *virtus*, which refers to the potency, power or ability of an object to produce a certain effect. Local manifestation refers to the effect that an object produces in the form of qualities. To manifest is to become present or actual. If these manifestations are nonetheless *local* manifestations, then this is because they are highly dependent upon the circumstances in which they occur. As we saw in the case of my stein, the colour that it comes to manifest depends on the lighting conditions in which the mug finds itself.

Here, then, we encounter the danger embodied in the contemplative stance, the withdrawal from activity, so commonly practised by philosophers. Here philosophers need to become more like mages. Both philosophers and mages seek knowledge and understanding, yet where the philosopher tends to occupy the passive, contemplative stance, regarding objects without acting upon them, the mage seeks to unleash the withdrawn powers coiled within objects. The being of substances as powers can only be discovered in acting with and upon them. For this reason, the philosopher needs to learn to grock with substances in the way the mage does with his ingredients, the warrior with his sword, the druid with the entities of the forest.

Although it is true that consciousness never encounters anything but the *effects* of substances in the form of qualities by virtue of the fact that substance always withdraws behind qualities, it is nonetheless the case that we can infer the substantiality of substance (power), the fact that the substantiality of substance differs from its qualities, by *acting* upon substances and varying the conditions in which substances are acted upon. In this way we discover that substances are not identical with their qualities, but harbour hidden and volcanic powers that are the

condition of qualities. For in shifting the conditions in which substances are acted upon by other substances, we encounter a kaleidoscopic variation in qualities suggesting the existence of subterranean powers beneath and behind the parade of shifting qualities. The problem with the contemplative stance is that it tends to encounter entities under stable and abiding conditions where there is little variation in the qualities or local manifestations of substances. As a result, the contemplative stance is prone to confusing effects or qualities with the proper being of substances.

Everywhere *Dungeons & Dragons* exemplifies an orientation towards objects or substances as constellations of powers or affects rather than qualities. This comes as no surprise given that *Dungeons & Dragons* is an action role-playing game. In its focus on action, *Dungeons & Dragons* is led to rediscover the being of substances as capacities to do, as powers, as capabilities, as abilities and affects, rather than as compositions of qualities. No game would get very far – nor be very amusing – were it to merely list the properties or qualities that belong to objects. While white and black (qualities) serve a *functional* role in the game of chess, we only understand the game of chess when we understand what the various pieces of the game can *do*. Proof of this is found in the fact that when we lose a piece of our chess set – say, a pawn – we can replace that piece with a quarter or nickel. It is not the shape, colour or height of the piece that matters, but rather the powers or capacities of the piece that define its being. Game theorist and philosopher Ian Bogost has proposed that we approach the analysis of games in terms of what he calls 'unit operations'. 'Unit' is Bogost's all-purpose name for 'substance', 'thing', or 'entity'. 'Operation' is Bogost's name for what entities do. As Bogost writes,

> In systems analysis, an *operation* is a basic process that takes one or more inputs and performs a transformation on it. An operation is the means by which something executes some purposeful action. Mathematical operations offer fundamental examples, especially the function as outlined by Leonhard Euler. Other kinds of operations include decisions, transitions, and state changes. I use the term *operation* very generally, covering not only this traditional understanding but also many more. Brewing tea is an operation. Steering a car to avoid a pedestrian is an operation. Falling in love is an operation. Operations can be mechanical, such as adjusting the position of an airplane flap; they can be tactical, such as sending a regiment of troops into battle; or they can be discursive, such as interviewing for a job. A material and conceptual logic always rules operations. (Bogost 2006: 7–8)

The concept of unit operations allows us to add precision to Spinoza's concept of powers or affects. The powers of a substance, object or unit, its affects, are the operations of which it is capable. However, an analysis in terms of unit operations does not merely teach us the rules that govern a particular game such as *Dungeons & Dragons*, but rather it teaches us about the very being of beings. To be a substance is to be capable of various operations, and these operations are transformations that pertain to the capacity to affect and be affected.

IV. The Intentionality of Powers

Objects or substances are split between their virtual proper being and their local manifestations. Virtual proper being refers to the powers that compose an object, what it can do. Local manifestation refers to the qualities an object comes to embody, its *actuality*. If local manifestations are *manifestations*, then this is because they are actualisations of a quality. The weight of a grell, those terrifying beaked, tentacled monsters that populate the realm of Underdark, is the manifestation of a power that resides within the grell. If these manifestations are *local* then this is because the qualities an object manifests will *change* depending on their local conditions or relations to other objects. The grell weighs this much moving at this speed and existing on the planet Earth. If a grell undertakes a space mission to Mars, its weight will be different on that planet. The weight of a grell is not an *intrinsic* quality of its being, but rather the actualisation of a power in the grell under particular local conditions.

The Australian philosopher George Molnar argues that powers have the structure of intentionality (Molnar 2006). The relation between the virtual and the actual half of substance can be clarified in terms of intentionality. The concept of intentionality was first introduced by the Austrian philosopher Franz Brentano to capture the essence of consciousness. Consciousness, Brentano contends, is that property of consciousness such that consciousness is *about* or *directed* at something. When I think, I do not merely think or have a sense of awareness, but rather I think *about something*. My consciousness is directed at some existent or non-existent being. Thus, for example, I think about a chain devil while playing *Dungeons & Dragons*. Chain devils do not exist, yet nonetheless my thought is directed at this entity. Brentano used this property of intentionality to distinguish between the domain of the psychological and the non-psychological. It is clear that I have a

mind, argues Brentano, because my thought is directed at something. By contrast, Brentano contends that rocks do not have minds because they do not have thought directed at anything.

Molnar contests this thesis arguing that *all* substances, living and non-living, human and nonhuman, are characterised by intentionality. Intentionality, Molnar argues, '[···] is a pervasive and ineliminable feature of the physical world' (2006: 61). Like mental intentionality, the powers of physical substances are directed at something beyond themselves. They are directed at the local manifestations or qualities and actions of which they are capable. Like mental intentionality, physical intentionality can be directed at local manifestations that exist or do not exist. Torches have the power to produce local manifestations of burning, yet this local manifestation does not have to occur for the torch to nonetheless have this power. Like mental intentionality, the states or local manifestations towards which the powers of substances can be directed can be fuzzy and indeterminate. At the level of mental intentionality I am capable of thinking fuzzy objects like dragons in general. At the level of physical intentionality the local manifestations of a power can be manifested in a variety of different ways. My elven stein can manifest itself as bright blue, dark blue, flickering blue, etc., under different lighting conditions (62). The world is pervaded by intentional substances and their relations between the volcanic powers that populate objects and their local manifestations.

Dungeons & Dragons is a game composed of intentional objects – living, non-living, magical and technological, undead, humanoid and monstrous – and an elaborate mapping of the intentional powers of these objects and their relations. When we open the pages of the *Player's Handbook* we immediately see that the emphasis is manifestly on the *operationality* or powers of entities (Heinsoo et al. 2008). As we look at the Character Sheet in the *Player's Handbook*, we see that characters are defined not by their qualities but by a series of powers defining the affects of which the character is capable, as well as the ways in which the character can be affected. Our attention is first drawn to the powers of strength, constitution, dexterity, intelligence, wisdom and charisma. These powers will play a role in determining how the character is able to affect other objects and how he or she will be affected by other objects. Strength and dexterity will preside over the character's ability to execute attacks and avoid attacks, and many other things besides. Charisma will preside over the character's interpersonal relations and ability to persuade and deceive others. We see that there are also passive powers presiding over the capacity of the character

to be affected by things, such as the senses and passive insight and perception. There are saving throws presiding over a character's ability to resist spells and poisons. Depending on the race of the character, the character will have special powers unique to that species. Depending on the class of the character, the character will be capable of magic, healing, special types of attacks, stealth, theft, disarming traps, and so on. As the character's experience increases, the power of his or her powers increase, gaining in ability, hit points and skills. As the character suffers damage, the power of his or her powers decreases. The characters of *Dungeons & Dragons* are constellations of virtual powers or dispositions.

Yet the intentional substances of *Dungeons & Dragons* are not restricted to the domain of the characters. Remarkably, when we turn to chapter 7 of the *Player's Handbook*, we discover a whole menagerie of nonhuman, *non-living* intentional substances. There we encounter weapons such as morning stars, spiked chains, shurikens, maces and, of course, war hammers and great swords. We encounter forms of armour like fey leather, spirit mail, war plate and star weave. Each of these weapons will have its own affects, its own powers of acting in conjunction with the player, just as the various forms of armour will modify the way in which the character can be affected by other entities. While these nonhuman entities will certainly have qualities such as shape, as in the case of the morning star with its round head, handle and spikes, the focus is on the unique powers or capacities of these items. What is important is what the morning star can and cannot do.

Yet these nonhuman intentional substances do not consist merely of passive tools that characters use. As we turn to the magic items, we discover entities that look suspiciously like animals or even persons, and that resemble some of the artificial life we are developing today. Looking to the *Adventurer's Vault* we discover that certain magic items can have *personalities* (Bonner et al. 2008: 195–6). These magical items can have a will of their own, pursuing certain things, and an alignment that disposes them to good or evil. Here we might think of something like Elric of Melniboné's sword Stormbringer in Michael Moorcock's novels (Moorcock 1987). Stormbringer has its own desires and aims, pulling Elric along with it, wishing to devour the souls of others, such that often Elric must struggle with his own sword to maintain control. Stormbringer can even have conversations and make suggestions. Here these unique magical items are like technologies unleashed on the world that are agents in their own right.

And then there are the famous monsters and gods that populate this world: lycanthropes, dryads, golems, various types of dragon, tieflings, worgs, gnolls and gricks, and so many more, too numerous to list. Like the characters, each of these intentional substances will have their own intelligence, wisdom, dexterity, resistances, unique powers, and so on. Like the people that populate our world, or the technologies in *The Terminator* directed by James Cameron, these monsters all have their own wills, foment their own plots, seek alliances with the various players or to thwart the aims of the players.

V. A Universe of Actants

Our tendency is to divide the world into subjects and objects. Subjects are characterised by intentionality and purposive action, they are actors; whereas objects are passive recipients of action. Yet if it is true that all entities are intentional in character, then this distinction collapses. Rather, *all* entities are actors. Of actors, philosopher and sociologist Bruno Latour remarks that '. . . *any thing* that . . . modif[ies] a state of affairs by making a difference is an actor – . . . an actant' (Latour 2005: 71). An actant is that which has the capacity to modify a state of affairs by making a difference. While the halfling thief is an actant as well, the short sword that she wields is not merely a beneficiary of the differences *she* contributes in using the sword, but rather the *sword* itself modifies the halfling. The sword modifies the balance of the halfling, the way she uses her arm and hand, her bodily posture and, above all, what she is *capable* of. The halfling with a sword and the halfling without a sword are two very different beings. The reach of the halfling, for example, is extended and now she has the power to cut other bodies and parry other edged weapons. To be sure, the sword is modified by the halfling, the halfling introduces differences into the powers of the sword, but the sword also introduces differences into the halfling. For this reason, the sword deserves to be referred to as an actant.

Dungeons & Dragons introduces us to a world of actants, of substantial powers. Each entity, whether human or humanoid, animal or rational, magical, mundane or technological is an intentional entity, a power unleashed upon the world that harbours hidden capacities coiled within it with the ability to manifest surprising qualities and produce differences in other entities. And while *Dungeons & Dragons* depicts a fictional universe, it teaches us to discern entities as substantial powers populating our own universe.

Thought and Repetition in Bergson and Deleuze

Jonathan Sholl K. U. Leuven

Abstract

This essay explores the relation between repetition and thought in Bergson and Deleuze. In Bergson, this relation is seen in the method of intuition by which thought is made to think in time and in the 'rhythms' at work in how intuition is a contact with time or life, urging conceptual precision. This framework is used to clarify Deleuze's thought without image as that contingent encounter with the persistent forces of life that demand the perseverance of thought. Far from stressing difference alone, both link the repetition in life to the unsettling persistence required to develop a truly new thought.

Keywords: repetition, life, intuition, thought without image, method, encounter, insistence

What thought lacks most of all is repetition. This is an odd statement as we are tirelessly subjected to the repetitive nature of modern societies in which progress is measured in terms of continual production, and also for the pejorative nature of repetition in a time when philosophers seek the production of the new, the different. In a word: creativity. However, is turning to the philosophies of Henri Bergson and Gilles Deleuze helpful in not merely describing the nature of modern life, but in critiquing the ideals that exhibit their power over us? In what sense do their philosophies help to clarify the odd nature of repetition?

Recently, Bergsonism has been described as a 'philosophy of difference',[1] insofar as life is conceived as the production of differences and philosophy as a method for clarifying these differences, of which

we can see various examples throughout his work: difference in degree and kind, duration and space, quality and quantity, memory and matter, instinct and intelligence, dynamic and static religion, and so on. With Deleuze, this description is also applied to his rather complex empiricism that seeks to go beyond philosophies of subjectivity or representation so as to think difference in itself. Neither philosophy, however, is free of problems. Bergson's intuitive philosophy comes with the heavy baggage of anti-intellectualism (J. Russell 1912; B. Russell 1912: 347), romanticism (Lyotard 1991: 44–5) and a form of spiritual inspiration (Merleau-Ponty 1988).[2] How could this approach actually provide philosophy with the needed tools to criticise modern ideals if thought is reduced to an irrational instinct? Does Deleuze's empiricism fare any better? This, too, comes with the baggage that if thought and life are characterised by the production and repetition of differences then this can easily lead to the dissolution of individual identity into a pure flux (Braidotti 1994: 117–23) or a nihilistic position that accepts chaos as inherent to life. A recent scholar of Deleuze, Keith Ansell-Pearson, formulates the problem as follows:

> The problem of nihilism is not overcome in Deleuze's thinking but its difficulty and complexity are staged as such. The critical question, however, concerns whether the attempt to read univocal Being in terms of the primary play of difference and repetition amounts to a coherent philosophy of difference or results in a mode of thinking that exists only as in thrall to the new and the monstrous... In short, the question to be posed concerns whether Deleuze has produced a fetish of repetition... [Deleuze's linking of repetition to the eternal return] has little to say on the character of change, destruction, revolution and repetition, except that *there be* such phenomena. (Ansell-Pearson 1999: 82–3)

This crucial passage suggests that if the philosophy of difference advocates nothing more than the continual reproduction of novelty – stating *that* change occurs but not addressing *how* it occurs – then it would seem to be of little help for understanding how and why to do anything in the world. We seem to be left, then, with two impotent approaches for using a philosophical conception of difference to challenge modern ideals: Bergson leads us into a form of spiritual asceticism, Deleuze into a nihilistic 'fetish of repetition'. However, such problems are inherent to the label 'philosophy of difference' and mask how Bergson's intuition and Deleuze's thought without image are two ways for diagnosing the pathologies of thought, neither of which can be properly understood without an appeal to repetition.

Both philosophers provide examples of the relation between thought and repetition that can be shown in the following ways. The first requires an examination of what philosophical intuition entails, not in terms of the chronological movements of thought that Bergson himself explored, but of the various intimations that he gave regarding the nature of an intuitive philosophy. The aim, then, will be to describe intuition as the methodical effort of thought to think *in* time, to be *in* a problem, entailing the precise cultivation of concepts. For Bergson, intuition is not merely the experience of difference (Carr 1914: 38) or the 'joy of difference' (Deleuze 2004: 33), but allows us to understand the *élan vital* in terms of a repetition without a telos.[3] In other words, as Bergson showed that duration can be said of living beings and reality as such – all things or beings having their own rhythm or duration[4] – the methodology of intuition could give us an insight into the nature of the *élan vital* as that insistent force behind life's evolution.

After laying this groundwork for which to better understand Bergson, the ontological implications of this approach will be explored by bringing this groundwork into dialogue with Deleuze's philosophy of repetition, in terms of what I call the 'rhythms of intuition' and the 'logic of repetition'. This will allow us to clarify the demanding relation between thought and repetition. As Deleuze takes up Bergson's insights via his 'thought without image' another link between thought and repetition can be demonstrated. If repetition is defined as an unrelenting force or pulsion that does not want to give itself up, *the insistence or 'power' of difference*,[5] then our task is to understand repetition without reducing it to questions of progress, realisation or teleology, and thereby addressing the problem of the fetish of repetition. While repetition is a problematic and seemingly pejorative term in vitalistic philosophies, the success of this suggestion will have to be determined after a close examination of some key passages in Bergson and Deleuze and a creative rendering of what appears on the surface to lack creativity.

I. Intuition as Cultivation: Having Done with Method?

What would it mean, then, to have an intuitive philosophy? There are two primary points to be made: first, intuition[6] entails a redirection of thought away from space and, second, it means to think in time. Regarding the first point, against the view of time that assumes it is given as a spatialised, static whole, intuition presupposes that change itself is essential, with no need of an underlying substance: '*There are changes, but there are underneath the change no things which change: change has*

no need of a support' (Bergson 2007: 122; original emphasis). Instead of looking for something immobile that is said to change, intuition enters into change by accepting the unforeseen and the irreversibility of time. This can be clarified by saying that the tendency of the intellect is to analyse what already exists (past-directed), whereas intuition implies creation, protesting time's spatialisation (future-directed). The problem is developing a concept adequate to this movement, since to do so requires going against the natural bent of our mind, which tends towards mechanism and finalism.

In *Creative Evolution*, the mechanistic model takes on the form of the cinematographical image in which the process of evolution is broken down into discrete parts that are then pieced back together, like snapshots were used to make a film, thus giving the appearance of movement. This image, however, tends towards a 'perpetual recommencement' (Bergson 1998: 306–7)[7] – division *ad infinitum* – precisely because it spatialises time and thereby prevents adequate conceptualisation of movement itself. According to the finalistic position, on the other hand, beyond that which changes, that is, the faulty world of perception, there is something eternal that serves as the cause and sufficient reason for change, providing an external measure for what is changing. This beyond usually takes the form of a single concept from which all others can be deduced: be it Substance, Ego, Idea or Will (Bergson 2007: 18–19). However, in positing an eternal concept or substance in order to account for change this view presupposes a spatialised time that is a homogenised, static whole. Instead of an immobile snapshot of movement or evolution we get an immobile concept guiding movement from above: 'If movement is not everything, it is nothing; and if to begin with we have supposed that immobility can be a reality, movement will slip through our fingers when we think we have it' (Bergson 2007: 121). This is the problem of intuition: change is imperceptible not because it is beyond reality, but because it *is* reality, yet it is essential if we are to understand reality. If we are to think in time we have to make thought itself move.

This leads to the second point. Intuition is distinguished from intelligence as intuition entails thinking *in* time, not reflecting *upon* it: 'to think intuitively is to think in duration. Intelligence starts ordinarily from the immobile, and reconstructs movement as best it can with immobilities in juxtaposition. Intuition starts from movement, posits it, or rather perceives it as reality itself, and sees in immobility only an abstract moment, a snapshot taken by our mind of a mobility' (Bergson 2007: 22). To perceive movement, here, does not mean the visual act

of seeing something with one's eyes since normal human perception cuts up reality by selecting: we focus on this and not that. The type of perception he suggests, then, is a deeper use of the mind, as when we follow the movement of a melody. The melody is pure change with nothing underlying it, each note bleeding into the next while remaining qualitatively distinct. As soon as we try to focus on each note, we lose the movement of the melody. It is intuition that allows us to make the division[8] between this qualitative movement and its quantification. The difficulty is that as soon as we try to fix upon this movement, it slips away, 'for it [the impulsion that set thought in motion] was not a thing but an urge to movement' (169). Intuition, then, is only successful if it is possible to grasp this movement itself, thereby making use of it so as to see duration in all things.[9] This does not mean that intuition *is* duration, but that intuition is the means by which we can think *in terms of* duration.

A problem arises from this methodological suggestion. Does this view of thought lead to a form of anti-intellectualist romanticism such that thought is moved by a direct or divine vision leading it to sympathise with the flow or evolution of life itself? Can we circumvent such accusations that continue to haunt Bergsonism by clarifying the relation between intuition and method, in the sense that intuition is a process of cultivating thought?

The supposed romanticism of Bergson could be found on a few levels in his work, but it has been said that it 'is to be found above all in the fact that his entire philosophy is an effort to provide an aesthetic substitute for a lost religion and an emotionally unacceptable science' (Shklar 1958: 636).[10] The aesthetic substitute suggests the image he constantly uses: the artist creating the unforeseen. The science without emotion would be remedied through his appeal to this more intuitive philosophy, one which refuses to reduce life to dead matter. Bergson himself goes so far as to claim that in philosophy one does not obey or command nature, but 'seeks to be at one with nature' (Bergson 2007: 104).[11] What would this 'being at one with nature' entail? Does it mean that one finds a reason for existing or a natural place in the evolution of life or that nature finds its end and satisfaction in the human?

In Bergson there is a fine line between putting oneself into the movement of life, into life's creative evolution, and that of finding one's natural place or life's purpose. As in artistic creation, evolution is not the realisation of a plan or goal: it is neither harmonisation nor integration, but a necessary discord inherent to creation as it leaves harmony behind (Bergson 1998: 103, 117). Looking to art, then, is to look towards a field

that acknowledges the role of the unforeseen in creation, not to appeal to a vapid holistic feeling. In this sense, the claim that intuition entails a romantic view of harmonising with nature is unwarranted. To have an intuition is to realise that one is part of a movement of life that has no end or goal, even if the human *seems* to be the only being capable of continuing this movement in his becoming conscious of it.[12] Bergson thus defies this romantic tendency on two accounts: first, neither living nor thinking entails fitting into what already exists; second, as evolution is a matter of division, divergence and dissociation, the individual is not ultimately synthesised with this movement, but by entering into it by means of an adequate conceptualisation of it, the individual can engender further divergences. The point is not submission but creation, and this creation involves a method.

If thinking in time implies making use of duration, then we can see why Deleuze links Bergsonian intuition with method: 'Intuition is neither a feeling, an inspiration, nor a disorderly sympathy, but a fully developed method, one of the most fully developed methods in philosophy. It has its strict rules, constituting that which Bergson calls "precision" in philosophy' (Deleuze 1988: 13). While Deleuze's definition of intuition rightly suggests the demanding nature of philosophy, one which I will explore in the next section, intuition's relation to method needs clarification. Camille Riquier has recently argued that intuition and method should not be conflated, as Deleuze suggests, but that they are separate moments: at times, intuition precedes the development of a method, which happened in Bergson's early work, where the concept of intuition was still unformulated, as well as in a few privileged minds throughout history who acted without a plan (*quand l'intuition manque de méthode*); while at other times method precedes intuition, in the sense of the later Bergson writing so as to help those who are poor in spirit arrive at intuition (*quand la méthode manque d'intuition*) (Riquier 2009: 131–57).[13] Riquier's distinction, while interesting, does not clarify the important issues at play: (1) if intuition initially lacks a method this means that it obtains its force from a contingent encounter and (2) the use of method to have an intuition means that thought requires continual effort so as to sustain the intuition that continually eludes it. Bergson's method does not entail a ready-made system that thought is guided by or seeks, but implies that intuition proceeds methodically, as a process of cultivating an idea. Intuition thus defies what is commonly accepted and yet demands the patience to develop this defiance into a positive thought.[14]

II. The Rhythms of Intuition and the Logic of Repetition

How, then, could intuition be put to work? I will try to answer this by clarifying the ontological implications of the methods found in Bergson while juxtaposing them with some insights by Deleuze: in Bergson the rhythmic nature of intuition points to the nature of the *élan vital* and in Deleuze repetition is implicated in the logic of a 'thought without image'.[15] To clarify these complex relations, I define repetition as an insistent movement that thought is forced into, and its logic is the peculiar consistency that this repetition engenders. It is in contact with repetition that thought is produced, thereby requiring that thought is given a method so as to grasp that which moves it. It should be noted that while the following rhythms/degrees are ordered and in some ways cumulative, their sequential presentation is not to suggest that this is *the* order in which thought proceeds, but to merely show a way of approaching the methodical nature of thought in both philosophers.

Bergsonian Rhythms

First rhythm: the contact of intuition. For Bergson, merely having thoughts does not imply that one is thinking, nor does thought necessarily begin by formulating truths. Instead, thought has to be engendered: we have to be forced to think via a contingent encounter or contact with a force[16] that creates novelty. For Bergson, what moves thought is 'not so much a vision as a contact: this contact has furnished an impulse, this impulse a movement' (Bergson 2007: 91). 'Philosophical intuition is this contact, philosophy is this impetus' (103).[17] Intuition is not to have a clear idea or image guiding you, but is a contact with an imperceptible force, 'confused perhaps but decisive' (90). In this sense, philosophy does not find its origin in thought, in terms of reflection or representation, but in terms of the utilisation of a contingent encounter, being forced to create a problem peculiar to that which is moving you.[18] Intuition opens thought unto a vital repetition, a movement that does not want to give itself up, and if we are to develop a concept adequate to this movement, without relapsing into our natural tendency to spatialise or generalise, then the violence of precision and method become crucial.

Second rhythm: the violence of intuition. To grasp the moving nature of reality and break with old forms of thought, the mind 'must do itself violence, reverse the direction of the operation by which it ordinarily thinks, continually upsetting its categories, or rather, recasting them' (Bergson 2007: 160).[19] We are forced to recast ideas due to the shock

of finding this movement at work within us and we cannot resort to ready-made ideas found all too easily in the sedimentation of a socialised common sense.[20] Violence is needed to ward off the reproduction of clichés: applying what is old to the new. In order for this intuition to survive, then, we 'will be driven to strain the words, to do violence to speech' (Bergson 1977: 254) and thus to our very nature. This violence is also directed against representation, a natural tendency of thought. Here representation takes the form of the individual who is quick to pass judgement and to criticise an idea that does not fit into what is commonly accepted or 'reasonable' (Bergson 2007: 66). Representational thought resorts to vague generalities, trying to stretch pre-given concepts so as to account for more and more of reality. Intuition, on all accounts, protests against this tendency to generalise (the equal treatment of unequals) as this will only serve the practical, utilitarian needs of the intellect (which have their own domain).

Behind this violent protest against what Bergson calls the 'socialization of the truth' (Bergson 2007: 69) is a search for philosophical precision: 'What philosophy has lacked most of all is precision. Philosophical systems are not cut to the measure of the reality in which we live; they are too wide for reality' (1). The precision Bergson has in mind here comes from Plato's example of the good cook who cuts reality according to its natural articulations; however, in being precise we cannot appeal to an external measure or Platonic essence as a guide for how to shape concepts, but only to the object itself. In this sense, precision is a matter of conceptual simplification.

Third rhythm: thought as an effort without end. This precision, however, goes beyond conceptual tailoring to the intensification of one's life when intuition is linked with the necessity of a force that '*had* to express itself' (Bergson 1977: 46). In other words, we are forced to think precisely because the *élan vital* is a 'creative exigency' (47): a recalcitrant repetition that intuition brings us into contact with. This intensification of intuition first occurs when we come into contact with this repetition; for example, upon looking into our own mind we glimpse the movement of duration within us. There is a further intensification when we go beyond ourselves into the evolution of life itself,[21] realising that this movement is not solely within, but is at work in all living beings. Intuition, then, is not thought reacting upon something, but is that by which one enters into a repetitive activity that does not want to give itself up and demands conceptual precision so as to render that repetition living. Thus, precision is not only conceptual tailoring, but is a process of intensification of one's own life. As this encounter could be

overwhelming due to the effort required to sustain it, intuition demands that the philosopher take risks.

> But the philosopher runs these risks only because he has insured himself and because there are things of which he feels himself unshakeably certain. He will make us certain in our turn to the extent that he is able to communicate to us the intuition from whence he draws his strength. (Bergson 2007: 102)[22]

Here we are reminded that to have an intuition is not simply the ability to have a random thought or opinion about everything. Instead, it is a matter of knowing what one wants to do (feeling unshakeably certain), but without knowing how to get there (taking a risk). The contingency of the encounter produces a sense of certainty and what prevents us from lapsing into generalities is the fact that we do not know where the intuition will lead us. The utilisation of this encounter requires effort and perseverance to make it precise: in order to tailor one's singular idea, intuition has to be 'methodically cultivated and developed' (Bergson 2007: 62). It is only *in* the activity of creating a problem that one discovers what is to be developed.

To put this differently, intuition is that which vitalises the intellect, pushing it to form precise concepts. Images are evoked in order to express the intuition, but the intuition itself is without image. It knows not where it is going and has no image guiding it, but it acts with a force of necessity, an urgency seeking nothing more than its expression. It is a force that uses the intellect, it uses anything it can find – diverse images, if necessary. To think intuitively is not to be driven towards a final solution, but to be driven by a repetitive force that seeks expression: to be driven by life itself.

These rhythms demonstrate how the nature of intuition clarifies the nature of life itself in that Bergson's valuing of effort above all things not only pertains to the effort required to render an intuition precise, to fit its object, but also is an expression of his vitalism as he also finds the evolution of life to be characterised by a continual effort, that effort being the *élan vital* (Bergson 1998: 87, 127). He describes this effort, this impetus, as a tendency to act upon inert matter, but in such a way that there is no predetermined path for it to follow and thus it cannot be described in terms of finality:[23] evolution has no model for creating forms. The effort of the *élan vital*, then, is purely contingent, not meaning that merely anything can happen but that it entails selection: it entails that the fortuitous encounter with matter is utilised such that a new life form is created out of the encounter[24] or else the form is aborted and life hits a dead end. This is the risk that the

élan vital takes as it encounters matter, and if it did not persevere, if it was not this peculiar form of repetition, there would be no evolution, no creation. Thus, in order to understand Bergson one has to separate repetition in thought and in life from teleology. We have to see that thought proceeds without an image just as life's evolution is an effort without end, in both the continual persistence of the *élan vital* and its unpredictable creativity. Evolution is the development of tendencies, not laws. Ultimately, intuition opens us to the metaphysical framework for understanding both the nature of thought and what reality itself must be like in order that we can know it:[25] intuition is a thought without image and reveals to us the evolution of life without a telos.

Deleuzian Logic

First degree: contingency engenders necessity in thought. For Deleuze, as in Bergson, what forces thought is precisely a contingent encounter or contact with something in the world. While this contact could be various things – strong or frightening ideas, pleasing or traumatic experiences, Socrates, or even truth – this does not mean that thought is organised *by* such experiences as if by a first cause. Instead, the contact engenders the shocking or dizzying realisation that what is driving thought, using this contact to organise itself, is an ongoing force that is imperceptible, yet sensible; that is, it cannot be recognised or placed within a harmonious view of the faculties, shattering our previous conceptual framework, yet it is still felt. Thought entails the intense feeling of shock since it arises without knowledge of whence it comes:

> Thought is primarily trespass and violence, the enemy, and nothing presupposes philosophy: everything begins with misosophy. Do not count upon thought to ensure the relative necessity of what it thinks. Rather, count upon the contingency of an encounter with that which forces thought to raise up and educate the absolute necessity of an act of thought or a passion to think. (Deleuze 1994: 139)

One does not create concepts for the pleasure of thought, but due to a necessity to express that which would otherwise be suffocating. Misosophy implies first that thought has us, we do not have it,[26] and we create so as to be free of it. We simply do not know what contingency will create thought. Second, this encounter repeatedly obsesses us, forcing a problem to be posed that only pertains to this encounter. Like water when raised to a certain temperature can do nothing else than change phases, thought is forced to create due to the intensification that

occurs from its encounter. As Badiou puts it: 'we think under pressure' (Badiou 2009: 116).

Second degree: the isolation of repetition. Through this encounter thought's activity isolates the thinker by violently denying generalities, the vagaries of common sense and good sense, not because thought detaches itself from life, but because it requires the passion and conviction to develop a concept, an Idea, that adequately expresses one's vital peculiarity. Reminiscent of Bergson, Deleuze directs this violence against representation, here taking the form of 'we know everything' or 'no one can deny . . . ' (Deleuze 1994: 130). Because thought naturally takes the form of such universals, it is difficult to give up the ideas that one finds ready at hand: thought does not want to do violence to its own nature as this would apparently separate the individual from its own common sense, from society and from seemingly all that it values.

In other words, as thought is the contact with something which forces one to think, with an intense repetition that refuses universalisation, it requires that an individual deny socialised presuppositions. Highlighting this degree shows how not only Nietzsche but more profoundly Bergson inspired the way Deleuze links the disobedience of philosophical thought to effective repetition:

> it is a question of someone – if only one – with the necessary modesty not managing to know what everybody knows, and modestly denying what everybody is supposed to recognize. Someone who neither allows himself to be represented nor wishes to represent anything. Not an individual endowed with good will and a natural capacity for thought, but an individual full of ill will who does not manage to think, either naturally or conceptually. Only such an individual is without presuppositions. Only such an individual effectively begins and *effectively repeats*. (Deleuze 1994: 130; my emphasis)

Within this quote we find some of the postulates of the dogmatic image of thought that Deleuze feels haunt philosophy: representation, good sense and common sense, identification, the subsumption of the singular under the universal, and the purely negative views of repetition. If one is to deny what 'everybody knows', to refuse the limitations of identity, one has to resist the given presuppositions of thought, but this can only be done by exploring another form of repetition that is neither redundancy nor generalisation but is an unrelenting force. For the philosopher, then, the issue is developing a concept that adequately captures that which moves thought, so as not to limit this movement or its ability to intensify you as a thinker. If this concept of repetition is linked to a 'thought without image', it demands a thought without end. In other words,

thought is neither a matter of realising a goal, nor does its expression seek an end, such as identification. To think, one has to be persistent.

Third degree: repetition as perseverance and resistance. As the contingent and violent encounter produces a sense of urgency in thought, this urgency must be maintained in spite of the fact that we do not know where the thought will lead us. However, while anyone can abstractly have an idea, this idea has to be utilised: it has to be pursued with 'guile, perseverance and prudence'[27] if it is to have vitality. Ultimately, thinking requires taking a chance, throwing the dice, and allowing this chance to affect you without escaping you. As thought is continually shrouded in clichés when we start, the point being to get out of them by creating a precise idea that resists common sense,[28] how are we to utilise an idea, to put an intuition to work, to achieve an effective repetition?

'True repetition', Deleuze writes in *The Logic of Sense*, 'appears as a singular behaviour that we display in relation to that which cannot be exchanged, replaced, or substituted' and as such 'addresses something singular, unchangeable, and different, without "identity"' (Deleuze 1990: 328). As this true repetition '*authenticates the different*', Deleuze uniquely links difference to repetition: 'Difference gives things to be seen and multiplies bodies; but it is repetition which offers things to be spoken, authenticates the multiple, and makes of it a spiritual event' (329). That true repetition is never of the Same, but of the Different, means not that to repeat is to enter into a pure flux where thoughts or identities dissolve into a sea of change, but it is to conceptualise a difference that *insists* in its vital singularity or virtual intensity and thus cannot be given an identity in terms of what already exists. Instead, to think difference is to think the conditions that allow a thing to determine its own identity via its repetition for itself. It is for this reason that every 'repetition is a transgression' (Deleuze 1994: 3) since to repeat is not to reproduce what already existed but to create the unforeseen. The individual effectively repeats by creating concepts according to that which is moving him or her.

How are we to understand this odd logic linking that which is unchangeable with that which is without 'identity', that is, difference? What does it mean to define true repetition as the *insistence of difference*? For Deleuze, repetition 'expresses a power peculiar to the existent, *a stubbornness of the existent in intuition*, which resists every specification by concepts no matter how far this is taken' (Deleuze 1994: 13f; my emphasis). A thinker who effectively repeats expresses a force that does not want to give itself up, one that stubbornly resists, and thus one that continually transgresses laws, the confines of representation, the

marketing of opinions, and common sense. That ideas insist in their own intensity and vitality, and not in relation to transcendent or moral ideals, constitutes what could be called the 'nervous optimism'[29] of thought's repetition. If thought is pursued with 'guile and perseverance' it will touch on those forces (be they evolution, the *élan*, temporality, difference in itself) which do nothing but resist all attempts to stifle them. To think without image is to create such that life and time do not suffocate within you, such that differences do not lack repetition, thereby allowing for ideas to resist the dogmatic images of thought.

The point of developing these degrees of thought in Deleuze is to show his indebtedness to Bergsonian intuition, not in the sense that Deleuze merely reproduces this concept, but in the sense that for Deleuze, too, thought is methodical, requiring effort. Similarly to how Bergson's intuition sheds light on the nature of the *élan*, Deleuze's thought without image is that whereby he can adequately conceptualise repetition as that intensive behaviour that authenticates difference. Thought arises out of a contingent encounter, forcing itself upon the individual and requiring the individual's separation from all presuppositions, be they from common sense or good sense, so as to grasp what is novel about this thought. The development of this thought in turn requires perseverance: it requires repetition. Thus, similarly to how the conceptualisation of movement required that thought itself was set in motion, this conceptualisation of repetition requires that thought itself must repeat. Thought is an expression without end, aim or finality since that which sets thought in motion is the insistence of difference, a repetition without a telos.

III. Repetition and the Demands of Thought

Does this foray into these levels of thought provide us with any insights concerning the diagnosis that began this essay, thought's lack of repetition? Bergson's intuition diagnoses repetition without difference in terms of spatialised time or the inert, immobile image of life subordinated to transcendent ends. Deleuze's thought without image diagnoses difference without repetition in terms of the natural images of thought that fail to grasp the insistence of difference. Two consequences emerge from these positions. First, thought is what opens us to a movement that refuses to relinquish itself, forcing thought to pose problems. This movement is pure activity and if we are to think actively, we must do violence to our natural tendency to stop this movement. Second, in order for thought to continue this movement, it must itself be obstinate, passionate: thought implies repetition.

It remains for me to address the central problem that began this essay, the fetish of repetition, which my analysis seems to have exacerbated. This problem divides into two further issues, the first being that of conflating Bergson and Deleuze regarding the relation between difference and repetition and the second being that of Deleuze's emphasis on difference or creativity as production for its own sake.

As John Mullarkey rightly points out, Deleuze's views on repetition seem to place him squarely within a more Heraclitean view of pure flux, with true repetition being a productive or creative repetition, whereas Bergson would not give precedence to a pure mobility since a philosophy of change allows for both movement and stasis (Mullarkey 1999: 205–7). I hope not to have obscured this distinction, but instead I would like to claim that while this reading of Deleuze as a promoter of pure flux (philosopher of difference) is possible, this occludes the fact that repetition is not merely production, but is also that obstinacy or effort whereby difference is authenticated. The view of Deleuze as one who fetishises repetition assumes that repetition is nothing more than difference, and thus underemphasises the roles of perseverance, precision and resistance (the *insistence of difference*) for understanding both the nature of reality and the development of concepts. This view also masks how Bergson's views on effort and Deleuze's concept of repetition converge.[30] While difference is accentuated in Deleuze, it cannot be thought without repetition. Insofar as intuition is understood as an effort to develop precise concepts that pertain to the movement of life or duration within all things, and insofar as repetition is captured in a thought without image as the insistence or perseverance of life in thought, we can understand Deleuze's claim of a 'profound complicity between nature and mind' (Deleuze 1994: 165).[31] The effort of intuition, as with the thinker who effectively repeats, pertains to a form of resistance, a refusal to let a thought go unexpressed, and this resistance is effective as it adequately grasps the movement of life or nature that has engendered it.

This leads to the second issue, that of production for its own sake. Thomas Osborne problematises some recent appeals to creativity as that which ought to guide philosophy, particularly within the vitalist tradition from Bergson to Deleuze.[32] Osborne points out that such a normative emphasis on creativity is part of a wider cultural assemblage, namely 'the creativity industries, consumerist individualism, the cult of the new as ever-changing fashion, the forces of intellectual and cultural productivism for its own sake, the performativity of "ideas" and culture' (Osborne 2003: 522). Osborne's prescription to this diagnosis

of overproduction is to advocate inventiveness, rather than creativity, since the former concept appeals to the inertia of thought and to hard work: 'Work involves repetition. Not repetition of the same object or specific theme necessarily, but repetition of the same activity, repetition in the name not just of seeking an answer to something but of locating, deepening, embellishing a *problem*' (520). Thus, instead of the focus on creativity as the heroic or romantic production of something new, he pleads for an acceptance of inertia and for the obsession with a problem such that one does not seek closure, but the opening of further possibilities.

This problematic converges precisely with the above explication in that my attempt to de-emphasise the role of difference in Deleuze's work was done by giving proper weight to repetition as the unrelenting forces of life acting upon us and as the obstinacy required for thinking these forces. If one stops their thinking activity with creation, then all we have is difference without repetition: a true fetish of repetition (which is quite rampant within modern consumerist societies). Is it the case, however, that this inertia of inventiveness is a form of repetition without difference? I think it is not, since it is precisely in the process of repeating an activity that difference, individuality or novelty is made possible or authenticated. To continually repeat an attempt is to refuse mindless change and by not giving up thought is intensified, ensuring that novelty is possible. As Osborne wants to remove creativity from its seemingly normative status, I would like to take difference off its pedestal by giving more emphasis to these underappreciated qualities of repetition.

The logic of repetition behind Deleuze's thought without image thus suggests that philosophical thought is not the random production of novelties, a seeming 'fetish of repetition', but is a violently intense and sustained battle of the individual 'full of ill will' with clichés, opinions and the marketing of ideas, and the refusal to give up this battle. In *What is Philosophy?* Deleuze and Guattari go so far as to conclude that the 'concept has a power of repetition', in the sense that it is 'virtual', 'incorporeal' and 'impassible' (Deleuze and Guattari 1994: 159). In other words, a concept does not exist, it *insists*. Thus, while it is novelty or difference that wakes thought from its stupor, it is repetition or persistence that gives thought its force, waking it from its torpor. Both Bergson and Deleuze take seriously the consequences of a blocked repetition, the inability to make differences move, and the failure to adequately conceptualise the movement of thought – all of which could be said to prevent the realisation that 'discipline is a vehicle of joy'.[33] Thus, the repetition inherent to a thought without image and

the insistence of the *élan vital* place demands on thought not merely to think differently or to be different (these are givens), but to persevere so as to make thought move, to effectively repeat. To have an intuition, to fight the given dogmatic image of thought, is to methodically cultivate resistance.

Notes

1. Cf. Deleuze 1988 and 2004; Ansell-Pearson 1999, 2002; Guerlac 2006; Mullarkey 1999.
2. In his essay *In Praise of Philosophy*, Maurice Merleau-Ponty rightly argues that intuition is not a 'prenatal inspiration' (1988: 19), but by describing thought in terms of 'incarnation' (27), life as 'primordial unity' (28), and creating 'out of nothing' (28), he reads too much Christian theology into Bergson's work and thus needlessly distorts it.
3. While the complex relation between memory and repetition as developed in *Matter and Memory* plays a crucial role in Deleuze's reading of Bergson, it will be largely put aside in order to make my argument. I do not feel that the argument is hindered by doing so since my concern is the relation between thought and life (the *élan*) as developed in *Creative Evolution* and *The Creative Mind*, rather than thought/repetition and memory.
4. While in *Time and Free Will* (1971) Bergson developed the concept of duration solely in terms of the immediate data of a personal consciousness, it was not until *Matter and Memory* that duration became pluralised and opened onto the rhythms and vibrations of all things and beings. See Bergson 1991: 204–9.
5. 'In every case, repetition is the power of difference and differenciation' (Deleuze 1994: 220). My definition of repetition, then, focuses on the third synthesis or repetition in Deleuze as that which combines the actual repetitions of habit and memory with the virtual repetition of intensities. This repetition is the process of relating intensities such that they are expressed in the actual. Repetition will thus be linked to the 'dice throw' of thought as not knowing what will happen but of allowing something to happen to us.
6. Camille Riquier, in *Archéologie de Bergson: Temps et métaphysique* (2009: 156), interestingly points out that Bergson initially used the English word 'feeling' to signify that which pertains to the immediate data of consciousness, as he was then unable to find a proper concept in French before eventually using '*l'intuition*'.
7. Bergson would later come to view differential calculus as contributing to a proper understanding of time as movement.
8. 'Intuition as method is a method of division' (Deleuze 1988: 22).
9. 'Intuition is not duration itself. *Intuition is rather the movement by which we emerge from our own duration*, by which we make use of our own duration to affirm and immediately to recognize the existence of other durations, above and below us' (Deleuze 1988: 32–3; my emphasis).
10. Another reading of Bergson as one who has a romantic, teleological view of 'Life' can be found in Jean-François Lyotard's *The Inhuman* (1991: 44–5).
11. If understood as 'to sympathise with nature', however, the romantic overtones could be lessened.

12. In saying 'seems' here I am more generous than needs be to Bergson. He does not seem to suggest that there could be another line of evolution that goes beyond the human; instead, he tries to find a way to extend the human beyond itself. Keith Ansell-Pearson takes this quite seriously and examines the claim that philosophy is a matter of going 'beyond the human condition' (1999: *passim*).
13. I disagree with Riquier's phenomenological reading of intuition, seemingly influenced by Heidegger or Jean-Luc Marion, his teacher. In describing intuition in terms of a weakness or obscurity patiently awaiting the reception of light and as a humility facing giants (David vs Goliath), he reduces intuition to yet another spiritual interpretation as in Merleau-Ponty 1988.
14. For more on the power of negation in intuition see Bergson 2007: 89–90, and for the common impatience of philosophy see Bergson 2007: 24.
15. By linking intuition and a thought without image I hope not to conflate Bergson and Deleuze, but to build on Alain Badiou's suggestion that Bergson plays a more central role in Deleuze's overall thinking than Spinoza or Nietzsche (Badiou 2000: 39). I attempt to clarify this suggestion by rethinking thought's relation to repetition. Moreover, since my concern is with the concepts of repetition and thought without image, I will focus mainly on *Difference and Repetition* as it is there that Deleuze develops these concepts.
16. I will be using the word 'force' in the coming pages to refer to the movement or quality that Bergson attributes to the *élan* as that which ensures change, evolution and so on. This force is that which, upon being experienced, propels one into thinking. For Bergson, it is by entering into this movement (be it temporality or evolution) that one is urged to think it, as if pushed by a force. To avoid the unhappy formulation that one is forced to think the force that forces thought, I will use 'force' interchangeably with other concepts such as movement or repetition.
17. Bergson also describes philosophy as 'a contact with the creative effort' (1998: 370). In *Matter and Memory* intuition is similarly described as a 'contact with the real' (1991: 185–6), the real being the undivided, lived continuity of duration.
18. Deleuze provides an interesting account of the nature of creating problems in his *Bergsonism* 1988: 13–35.
19. Ansell-Pearson argues that Deleuze's thinking 'retains the Bergsonian conviction that thought must assume a monstrous form and that the break with established forms of thought must be a violent one' (1999: 83).
20. 'Common sense, then, or as it might be called, social sense, is innate in normal man, like the faculty of speech, which also implies the existence of society and which is none the less prefigured in individual organisms' (Bergson 1977: 106).
21. This double intensification is described in *The Two Sources of Morality and Religion* (1977: 250). In *Creative Evolution* one can see how the effort of life that is passed on from one generation to the next, dividing as it moves along, is 'distributed amongst individuals without losing anything of its force, *rather intensifying in proportion to its advance*' (1998: 26; my emphasis).
22. For more on how an encounter can be lucky or unlucky see Bergson 1977: 229–30.
23. We can see many examples of this rejection of finalism: Bergson 2007: 13, 20, 52, 99; Bergson 1977: 52, 196–7. It should also be noted that Bergson does endorse a form of external finalism in *Creative Evolution* 1998: 41, 265–7. However, Deleuze rightly argues that we are to understand this in the sense that nature has different planes (no single route) and that each one has its own plan (showing the double meaning of the French word '*plan*') or its own tendency

that it develops (Deleuze 1988: 131, n.2). As Bergson writes: 'evolution does not mark out a solitary route, that *it takes directions without aiming at ends*, and that it remains inventive even in its adaptations' (Bergson 1998: 102; my emphasis).

24. 'Life is, more than anything else, a tendency to act on inert matter. The direction of this action is not predetermined; hence the unforeseeable variety of forms which life, in evolving, sows along its path. But this action always presents, to some extent, the character of contingency; it implies at least a rudiment of choice' (Bergson 1998: 96).
25. In this sense, Bergson's work resonates with Thomas Kuhn's depiction of scientific progress as the solving of problems through continued precision, not as the advancement towards some transcendent Truth; see Kuhn (1996: 170–3).
26. 'We are always patients where Ideas are concerned' (Deleuze 1994: 219).
27. Ansell-Pearson argues that thought in Deleuze is not a method as this 'implies a collaboration of the faculties that is far too harmonious and equilibrial, as well as too determined by social values and established norms of discipline'. Instead, thought involves a form of culture, being 'caught up in excessive repetitions of a compulsion to live beyond the old morality' (Ansell-Pearson 1999: 83). However, method need not mean that thought uses a ready-made system, but that in order to cultivate an idea, it proceeds methodically and painfully, with perseverance. See also James Williams (2003: 19) who provides an interesting account of the method of Deleuzian dialectics.
28. In the chapter entitled 'The Painting before Painting . . . ' in *Francis Bacon: The Logic of Sensation*, Deleuze describes how painting is not merely making random marks, but involves the ability to utilise them, to create something out of them. A contingent choice has to be pursued, made precise, and this requires effort. 'One can fight against the cliché only with much guile, perseverance, and prudence: it is a task perpetually renewed with every painting, with every moment of every painting' (Deleuze 2003: 68). I feel that this analysis is profoundly inspired by Bergson's description of the continual effort required to develop and sustain philosophical intuition.
29. Here again I borrow a phrase from Deleuze's *Francis Bacon* where he claims that Bacon's vitalism could be defined as being 'cerebrally pessimistic, but nervously optimistic' (Deleuze 2003: 43).
30. The following passage from *Matter and Memory* suggests the relation between habitual repetition and difference: 'The progress which is brought about by repetition and practice consists merely in unfolding what was previously wrapped up, in bestowing one of the elementary movements that *autonomy* which ensures precision without, however, breaking up that *solidarity* with the others without which it would become useless. We are right when we say that habit is formed by the repetition of an effort; but what would be the use of repeating it, if the result were always to reproduce the same thing?' (Bergson 1991: 111).
31. We set aside here the further problem that can be raised within Deleuze's work of a possible panpsychism or injection of thought into being (Brassier 2008).
32. This becomes the main focus of Deleuze and Guattari's *What is Philosophy?* (1994) where philosophy is defined as the creation of concepts that resist the present. While it is usually the case that Deleuze and Guattari's texts are something different than Deleuze's own work, many of the essays contained in *What is Philosophy?* share much in common with Deleuze's early work.
33. This phrase is attributed to the musician Robert Fripp.

Spinning in the NAPLAN Ether: 'Postscript on the Control Societies' and the Seduction of Education in Australia

Greg Thompson and Ian Cook Murdoch University

Abstract

This paper applies concepts Deleuze developed in his 'Postscript on the Societies of Control', especially those relating to modulatory power, dividuation and control, to aspects of Australian schooling to explore how this transition is manifesting itself. Two modulatory machines of assessment, NAPLAN and My Schools, are examined as a means to better understand how the disciplinary institution is changing as a result of modulation. This transition from discipline to modulation is visible in the declining importance of the disciplinary teacher–student relationship as a measure of the success of the educative process. The transition occurs through seduction because that which purports to measure classroom quality is in fact a serpent of modulation that produces simulacra of the disciplinary classroom. The effect is to sever what happens in the disciplinary space from its representations in a luminiferous ether that overlays the classroom.

Keywords: control society, high-stakes testing, NAPLAN, teaching, Deleuze, modulation

I. Introduction

> [O]nce one steps outside what's been thought before, once one ventures outside what's familiar and reassuring, once one has to invent new concepts for unknown lands, then methods and moral systems break down and thinking becomes, as Foucault puts it, a 'perilous act', a violence whose first victim is oneself. (Deleuze and Parnet 1995: 103)

'Postscript on the Societies of Control' published in 1992 suggests new ways to understand the self and the world (Deleuze 1992). It suggests that we are moving from a disciplinary society to a control society, that disciplinary institutions such as schools are 'in the midst of a general breakdown', that disciplinary power is being replaced by modulatory power and that education is being seduced by business rationalities (Deleuze 1992). Some twenty years after its publication it is timely to ask how modulation is emerging within schools and other institutions and how the shift in forms of power has developed. This is one question that Deleuze leaves us to investigate – how will the predicted changes manifest themselves? We argue that modulating power begins the process of replacing disciplinary power, not as a seismic explosion or revolution, but as a gradual, creeping seduction – the becoming-control society.

For us, this transition occurs through seduction. Modulation seduces by promising greater discipline through a heightened emphasis on technologies, such as surveillance, and the normalising examination. Greater disciplinarity is promised when less is actually provided. The 'Postscript' provides a lens that sharpens our focus on the corporate and performative practices and policies dominating education and unmasks the coils of the serpent – sinuously constricting and overlaying the traditional, disciplinary functions of schooling.

Readers should not mistake our sympathy for those who, confusedly and anxiously, practise a disciplinary approach to education in an increasingly modulated environment for support for disciplinarity. Our analysis of education within the becoming-control society is not underpinned by some admiration of its disciplinary forms. We simply accept that disciplinary responses are favoured by many teachers, principals, students and bureaucrats and that, when it comes to the modulatory machine, these responses: are doomed to return more of the same because they misunderstand the workings of the machine; serve to further strengthen the effect of the modulatory machine; and fail to amount to an attempt to find those 'new weapons' that Deleuze encouraged us to seek (Deleuze 1992). Rather than admiring the disciplinary, or validating the modulatory, then, our concern is with the search for these new weapons. For us, the first step is to expose the effects of power in schools – or the infiltration of a new, and for us largely uncharted, ethics of power. We stress that modulation is not an improvement on discipline, nor is discipline superior to modulation. This scarcely visible infiltration has meant that 'worrying and hoping

for the best' are the default positions of the disciplined (Deleuze 1992). Understanding the modulatory snake allows us to 'find new weapons' for disrupting the control mechanisms insinuating themselves into the ways that we are taught, and teach ourselves, to become (Deleuze 1992).

We examine modulating power through two examples in the Australian education context: the NAPLAN tests and the My Schools website. NAPLAN and My Schools are modulatory machines (mis)understood within the disciplinary terrain of schooling. One effect of the disciplinary response to modulatory machines is a performative 'terror' within the visible spaces of the school that causes the worrying participants in the education game to burrow deeper into the disciplinary space of the classroom – much like the Deleuzian mole that symbolises the disciplined subject (Deleuze 1992). Our argument is that this disciplinary 'burrowing' (although somewhat understandable given the disciplined and disciplinary history of the school) limits the potential to disrupt 'mechanisms of control as rigorous as the harshest confinement' (Deleuze 1992: 168). To unmask this we will begin with a brief treatment of the conceptualisation of the disciplinary school before looking at what happens when modulating power 'overlays' the disciplinary articulations (Savat 2009).

II. The Control Society

For Deleuze, the disciplinary apparatus had reached its zenith early in the twentieth century, with the subsequent decades seeing a decline in the centrality of discipline in the becoming-self, such that '*societies of control* are in the process of replacing the disciplinary societies' (Deleuze 1992: 4). The control society is where: '[Life] is more closely and minutely monitored, regulated and policed than ever before, where personal privacy is more or less non-existent, and where information about our whereabouts, personal details and spending habits is ceaselessly collected' (Newman 2009: 105).

A defining feature of control societies is a shift in focus away from disciplinary institutions, or 'environments of enclosure' (Deleuze 1992). These institutions, for Deleuze, were best exemplified by the factory, which functioned 'to concentrate; to distribute in space; to order in time; to compose a productive force within the dimension of space-time whose effect will be greater than the sum of its component forces' (Deleuze 1992: 3). In a control society, the factory's rigid architecture, control of

time (the shift) and creation of docile worker bodies is replaced with a more fluid and dynamic architecture – that of the corporation (Deleuze 1992). For Deleuze, 'Control is short-term and of rapid rates of turnover, but also continuous and without limit, while discipline was of long duration, infinite and discontinuous' (Deleuze 1992: 6).

How do we conceptualise the move from discipline to modulation? In the first instance, the move is not one of replacement. Modulation follows, but does not replace, disciplinarity, which is absorbed into or insinuated by serpents of modulation. The metaphor of coupling, as a sexual-mechanical metaphor, is apt, as is seduction – the insinuation of modulation into disciplinarity is not forced but is an induced connection. The serpents of modulation work themselves into or around pre-existing disciplinary spaces whispering promises made in disciplinary language. The coexistence and connection of disciplinary machines (apparatuses) and modulatory machines (assemblages) is perhaps best thought of as a transitory moment, to paraphrase Deleuze, the disciplinary self is part of who we are but also part of who we are ceasing to be (Deleuze 1992). The way the modulated self uses the resonances or echoes of the disciplinary self is one of the features of this transition.

Disciplinary machines produce coherent centres of being, or individuals. The drive is to make oneself coherent and then good or normal. An individual, as 'a person constituted as a particular identity, and assigned to one of a multiplicity of subject positions always already waiting for us, is constrained to abide by all the norms associated with that identity' (Colwell 1996: 211). Individuals are located in disciplinary institutions in which particular disciplinary spaces work to spatialise, organise, measure and arrange. Properly arranging, controlling or comporting the body allows one to speak in the disciplinary society, where that society is understood as the connection in series of disciplinary spaces with other disciplinary spaces to form the disciplinary institutions.

Modulatory machines produce discrete non-cumulative expressions of particular modes of designation or assignation, or dividuals. A dividual is part of a series of masses. The individual is either feminine or masculine, mad or sane, good or evil, in a manner that assigns this identity as a continuous structure that permeates the individual's entire existence and extends through the various spaces through which one moves. The dividual is assigned any and all of these identities (among others), depending on the vicissitudes of the immediate situation. Its identities are temporary assignations that are used to control short-term activity (Colwell 1996: 211). In going from the individual to the

dividual,

> we have passed from one animal to the other, from the mole to the serpent, in the system under which we live, but also in our manner of living and in our relations with others. The disciplinary man was a discontinuous producer of energy, but the man of control is undulatory, in orbit, in a continuous network. (Deleuze 1992: 5–6)

Deleuze's suggestion that the computer is the machine of societies of control indicates a fragmentation that results from a variety of factors. These include the coexistence of innumerable databanks, the ease of adding data to previously compiled data (endless and ongoing updatability) and the enabling of multiple data entry points (allowing input from multiple observation points). While this information is potentially assimilable into one meta-file (with the threat of a return of individuality), moments of human being are captured in discrete modes of data collection each of which has its own logic and demands no assimilation. The level of abstraction increases from the bodily relation between subject and sovereign to the expertly constructed 'norm' of individuals before disaggregating the 'self' into a series of emanations from (points produced by) modulatory machines that produce dividuals that do not combine.

If dividuals are formed/deformed through the accumulation of attributes that can be measured for recording in a particular database, then the crucial question concerns what has to be done to achieve measurement (to be measured). It is a matter of being counted; of making 'one' self accountable or available for an account. This requires producing countable emanations. From an electronic-discursive standpoint, dividuals are constructed in databanks, each dividual is identified in separate computer files, each file available for a different purpose, with the parameters of each file organised around that purpose.

In this conceptualisation, the focus on short-term success opens human beings up to control. By focusing not on the temporally enduring individual but on what one is doing or can do here and now, a form of power is exercised that prevents the person from becoming an individual, from forming an identity that can construct an overall response to, or appropriation of, the demands of the immediate situation. The end of the individual self is also the end of care. No care of the self can be practised without a self for which to care. What takes its place is not clear but it could be that we are in the process of replacing the care for discipline with the care for data-sets. It is difficult to envisage how this

care for points of data resolves the crisis of the Foucauldian disciplined, self-governing subject in industrial times.

If the simple machines of sovereignty clank and groan slowly and the complex machines of discipline beat and punch with monotonous regularity, then the digital machines of control hum. It is a matter of speed. The increased pace at which modulatory machines operate reduces the differentiation of each moment leading to a collapse into apparently continuous sound. When modulatory machines insinuate a disciplinary society the frequencies of the modulatory machine superpose those of the disciplinary machines and modulated humming is the only discernible output (some of the noise of the disciplinary machine is cancelled out and some feeds into the modulations).

In the conceptualisation that underpins this analysis, the serpent of modulation coils itself around the molar/mole's spaces of disciplinarity to insulate the spaces of disciplinarity and prevent them from working together to produce an individual. The image is that of the biosphere. A space is constrained by a surface that acts as a means of preventing direct contact between what is within and without the sphere, and requiring that anything that seeks to pass out of the sphere does so through a space through which it can be adjusted for exposure to the outside. This may be conceptualised as a translucent film that overlays the enclosed space, offering a distorted perception of what happens within the biosphere, reminiscent of the luminiferous ether of early scientific theory.[1]

By surrounding disciplinary spaces, such as classrooms, the serpent of modulation disconnects each from the other disciplinary spaces that produce a disciplinary society. This has the most profound consequences for those trained to work within those disciplinary spaces. The coherence that subjects formed in disciplinary spaces are accustomed to generating persists *within that space*. It cannot be represented outside that space, however, and cannot be used as a means to connect the disciplinary classroom with other components of the disciplinary school (such as the principal's office, the staff room, curriculum meetings, staff development sessions, parent–teacher meetings and the training of the teacher within the disciplinary university).

III. Education before the Insinuation of Modulation

The eighteenth and nineteenth centuries saw the creation of modern institutions that enclosed individuals. Environments of enclosure included prisons, schools, hospitals and families. A hallmark of these enclosures was that the individual was 'known' through mechanisms

that focused on the body. These carceral institutions implemented a range of micropractices for disciplining the body: 'The human body was entering a machinery of power that explores it, breaks it down and rearranges it"' (Foucault 1991: 138). Schools became terrains within which the bodies of staff, students, parents and principals were the focus of disciplinary power.

Foucault argues that disciplinary power was a series of productive technologies that produced certain subjectivities, knowledges and discourses within each institution. The individual became a discursive site for the training and production of the 'good', the 'capable', the 'moral' citizen through the micro-practices of power that legitimise certain rationalities and 'truths' that the individual is trained to know about him- or herself. In disciplinary society, a 'certain "political economy" of the body' is utilised to regulate the individual (Foucault 1991: 25).

The disciplinary society located the body, measured it, controlled it, enclosed it with the goal of making the body docile, more productive and, therefore, more 'useful' to the state in its desire for a disciplined workforce and citizenry. A key part of this is the mechanics of power that teach the individual to self-regulate or to comport him- or herself in 'reasonable' and appropriate ways. It is through the modern institutions and the modern systems of power that parts of this utility-docility are deployed, through the 'meticulousness of the regulations, the fussiness of the inspections, the supervision of the smallest fragment of life and of the body' (Foucault 1991: 140).

Mass, compulsory schooling became a concern of industrialising societies as they grappled with the creation of a seemingly new underclass – the urban poor (Jones 1990). Within the disciplinary school, the teacher–student relationship was at the centre of the normalising process. This relationship was predicated on the idea that an individual who had the required knowledge, ethics and values should teach young people what was required. At the core of instruction was an asymmetrical relationship 'between somebody who already is a subject (the educator) and someone who has yet to become a subject (the child)' (Biesta 1998: 1–2).

The disciplined subjectivity of the school teacher is, however, neither stable nor coherent, but is a contested and contradictory space containing competing claims about the 'nature' of the good teacher. These include the claim that the virtuous teacher is a moral guardian or ethical trainer teaching the young the 'correct' values and attitudes and that the good teacher is a disciplinarian responsible for preparing

the young for work after they leave school (Jones 1990). What is significant is that each conception was suffused with notions of care for the disciplinary subject (Savat 2009).

In the early twentieth century these discourses of the moral and efficient teacher were further augmented by bio-power in the form of the bio-teacher, or the teacher who enacted a 'new caring and advisory relationship with the home, but in a subsidiary relationship to the scientific authority of the medical officer and the child psychologist' (Jones 1990: 73). Stiegler argues that this bio-power is essentially 'a form of care, a historic form of care charged to the State, as governmentality' (Stiegler 2010: 114). In Australia, a colonial zeal to adopt the principals of Christian pastoralism intensified discourses 'embodied in the pastoral relationship between teacher and student' (Hunter 1994: xxi). These principles of Christian pastoralism, the 'distinctive articulation of surveillance and self-examination, obedience and self-regulation', persisted in Australian schools long after the Christian story ceased to be a common expression of social aims and beliefs (Hunter 1994: xxi). This is not tangential to a genealogy of the Australian teacher, though, as it highlights the productive element of disciplinary care at the core of teacher–student transactions.

IV. NAPLAN and My School

Since 2008, Australian school students have sat the National Assessment Program – Literacy and Numeracy (NAPLAN) tests in Reading, Writing, Language Conventions and Numeracy in Years 3, 5, 7 and 9. NAPLAN tests report individual students' attainment of skills against a set of standards. Schools are ranked against other schools depending upon the aggregate of their NAPLAN results and these results are made publicly available via the My Schools website. Over three days in May[2] students across Australia sit predominantly multiple choice tests administered by their classroom teacher. Student test papers are collected and returned to the Australian Curriculum Assessment and Reporting Authority (ACARA) for evaluation. ACARA is the statutory independent authority that designs and manages the tests. These tests are designed and developed by 'a core group of highly skilled staff' plus a small group of 'partners' who 'research and provide evidence-based research on improvements' (ACARA 2011a). After the tests have been completed each student's parent or carer receives an individual report of the student's results.[3]

The My Schools website is a Federal Government initiative that allows for comparison of the NAPLAN results for individual schools. Like NAPLAN, My Schools is overseen by ACARA. The website enables comparison of schools in the same locality. Those in similar socioeconomic categories can also be compared (a complex formula, the Index of Community Socio-Educational Advantage (ICSEA), is used to produce these categories). Schools are colour coded: red if their results are below average or below that of similar schools; green if schools are above average or above that of similar schools. My Schools also enables the easy generation of statistics that include the percentages of indigenous students and ESL students, attendance rates and funding levels (Bonnor 2011).

V. Seductive Promises

NAPLAN appears to fulfil functions one would expect in a disciplinary society: it organises and stratifies individuals, it uses the technology of the examination to normalise dispositions, aptitude and conduct, and it is replete with claims of improved efficiency, quality and accountability. NAPLAN enhances 'the learning outcomes for all Australian students' (MCEETYA 2009) because identifying and supporting schools and good teachers are taken to be the means to make education more equitable for a diverse student population (McGaw 2010). The My Schools website claims to further enhance the efficiency, accountability and transparency of schools. In 2011 it began to provide information about finances and school communities 'for the purpose of accountability and reporting, research and analysis, and resource allocation' (ACARA 2011b). In short, NAPLAN and My Schools claim to promote the efficient use of resources through the most effective arrangement of subjects. The seductive power of the NAPLAN machine lies in the promise of improved disciplinarity to key (disciplined) stakeholders – politicians/policymakers, voters, parents, principals and teachers.

Voters are promised greater efficiency and control, as the government promises to cut spending while improving effectiveness in sectors like education. For the politician/policymaker, the disciplinary promise of NAPLAN and My Schools is increased surveillance over what happens in the 'hidden' classroom, with a concomitant reduction of the 'waste' resulting from poor teaching. Part of NAPLAN's promise is that complex educative processes can be simply measured and reported, and easily publicly disseminated and understood. Most importantly,

NAPLAN allows politicians/policymakers to be seen to actively promote skills basic to productivity, such as literacy,[4] in the face of a widely perceived and mediatised 'education crisis'.

Parents are promised greater access to and influence over what happens in the classroom. They are guaranteed simple, easy-to-follow information that allows them to gauge their child's progress in relation to other children in their year and across Australia. Hierarchical ordering is the disciplinary par excellence because it is both easy and numerical – discernible differences between subjects are real because 'numbers never lie'. When launching My Schools, then Federal Education Minister Julia Gillard encouraged parents to have 'robust conversations' with teachers about 'their' NAPLAN results in order to 'put pressure on people' (Coorey 2010). Parents are to hold the (in)visible classroom to account – as the data published on My Schools opened the classroom to a (putatively) panoptic gaze. For the parent-as-consumer is a discursive site for contemporary education, adding to the traditional pedagogic relationship of disciplined teacher instructing becoming-disciplined student.

While principals were to expect greater opportunities for monitoring the classroom, those whose schools performed above the national average were promised increased esteem and potential enrolments as parents 'vote with their feet'. The promise of NAPLAN is disciplinary leverage, with principals able to make 'informed' judgements about the (in)visible practices of the classroom and gain more control over those spaces. This could mean extra teacher or student support, access to mentoring or improved funding. There is also an economic incentive for principals: the dismissal of principals of underperforming school (Harrison 2010).

Teachers were seduced by promises of greater public recognition and 'performance pay'; NAPLAN would identify 'good' teachers and their expertise would be rewarded (Thompson 2011). A system for recognising and rewarding previously unobserved 'good' teachers resonates with the corporate seduction of education but also makes sense with respect to the disciplinary self – teachers are to act as entrepreneurs, and open themselves to surveillance so as to maximise their financial return. Opening oneself to a regulatory gaze means that 'good' results will ensure secure permanent employment, if on contract, or a move to 'better' schools, if already permanent. Modulation does not care that no necessary relation needs to exist between 'good' sets of data and those micropractices of power wielded in the classroom. The only important factor in deciding value is that 'good' results continue from the testing.

VI. Modulation and Discipline in the Australian Education System

As we have indicated, modulatory power does not extinguish disciplinary power. Indeed, the school bears witness to the resilience of disciplinary apparatuses – the surveillance classroom spaces, the normalising hierarchies of student subjectivities and the disciplining of knowledge (Thompson 2010). What we argue is that modulation overlays discipline; uses it in some cases, contradicts it in some instances and complements it in others. When Foucault articulated disciplinary power, he argued that it 'hasn't replaced all the others, but infiltrates the others, sometimes undermining them, [. . .] extending them, linking them' (Foucault 1991: 216). Savat (2009: 59) argues that disciplinary and modulating power must coexist as they often use similar technologies, albeit with different intensities.

Disciplinary power still produces subjectivities and knowledges in schools. The body is still a site for normalising judgement and the disciplinary school remains governed through the technologies of hierarchical observation, normalising judgement and examination (Foucault 1991). Disciplinary universities continue to prepare teachers for practice and train them to understand education within a disciplinary terrain. Superposition of the modulating effects of power means that there are other, more subtle, covert and fluid forms of power that modulate conduct and organise the dividual through grids that are greater in number, more dynamic and more amplified than in the past.

Savat (2009) argues that the instruments of modulation are the simulation, the categorical sorting and the sample. The simulation may best be explained as the amplification of data being used to pre-empt and model the future, such that the individual becomes exterior to the functioning of the institution because he or she is being pre-constituted. Categorical sorting becomes the 'infinite comparative process that determines which norms, profiles or categories you are' (Savat 2009: 53–4). Lastly, the sample has overlayed the disciplinary examination because it requires no awareness – it operates effectively independent of participants' consent. The examination demands the earnest effort of the examined; whereas the sample requires no engagement. Instruments of modulation control the subject's movement through multiple terrains, and it is amplification in the names of 'effectiveness' and 'quality' that forms part of the terrain of schools within control societies (Vinson and Ross 2003).

These instruments are part of the gridding of the possibilities of the Deleuzian dividual, or the emergence of 'enclosed spaces' through which subjects 'move' in increasingly controlled and controlling ways. Technologies of simulations, in which 'the subject is increasingly no longer required to be present so to speak', are important (Savat 2009: 48). The simulation of aptitudes and characteristics though the collection of test data stored in the database is an example of gridding through simulation. The database removes context from the calculation, presupposing a level playing field imbued with meta-narratives that essentialise positionalities, while breaking them down to small deformations that become the objects of debate.

In this analysis, databases overlay the pastoral power historically embedded in disciplinary relationships and constitute dividuals in codes and through data points, the generation and correlation of which is neither readily understandable nor constitutes coherent individuals. Data is produced and controlled by processes that remove temporal and spatial relationships (and the reassuring elements) of coercive or disciplinary power to replace them with the nameless and the faceless. Savat argues that in modulation,

> One is not made into a 'good individual'. Whether one makes oneself such or not is an irrelevancy – in fact, it doesn't even register since the modulatory machine simply does not contain a connection amongst components capable of even recognising it. (Savat 2009: 56)

Given this approach, the following analytic of power suggests itself in relation to NAPLAN and My Schools. First, a disembodied authority (ACARA) is created to collect information about schools and students divorced from the space-time in which the teacher and student interact. Second, performance, rather than learning, is measured and overlays the disciplinary teacher–student relationship. Third, students are no longer bodies requiring intervention, rather they become disembodied bytes and bits plotted in various statistical spaces.

The result, for teachers, is that those in other assemblages within the control society receive a spread of data points that creates a new meaning for the classroom independent of that which takes place within the classroom and without regard to the volition of those arraigned within it. This abstraction of the classroom, both temporal and spatial, is one of the key features of this modulation. The My Schools website further abstracts the data points from the activity of the teacher-subject, and enables a hierarchy of data points, relating each data point to a simulated ideal and then allowing the plotting of data points that arrange

individual against class, class against class, school against school and state against state.

One of the effects of modulation is an existential fear. This is a by-product of the disciplinary knowledges attempting to maximise return within a modulatory machine. Fear functions as a landscape that is 'played upon and accelerated by various aspects of contemporary culture' (O'Sullivan 2006: 311). This acceleration is evidenced by the growth of a performative culture within schools. Reactions to modulation suggest an existential disquiet in which inner turmoil, agitation and a nameless, bodiless terror are produced by disciplinary subjects attempting to force coherence onto a disintegrating narrative of self.

Performativity deploys this fear in unique and isolating (or abstracting) ways. Performativity is best understood as 'a technology, a culture and a mode of regulation that employs judgements, comparisons and displays as means of incentive, control, attrition and change' (Ball 2003: 216). Ball argues that education reforms like NAPLAN and My Schools make teachers subjects through commodifying discourses that seek to measure effectiveness, productivity, outputs and/or quality (2003; 216). Ball uses Lyotard's notion of performative terror to name conditions in which teachers find their values and ethical understandings displaced or elided (Lyotard 1984). The teacher's terror is that the true and accurate measure of the classroom that NAPLAN, and subsequently My Schools, purport to be is in fact not an artefact of the classroom at all. Rather it represents de-spatialised assessment that, as an artefact of modulation, occurs in the luminiferous ether surrounding the disciplinary classroom.

The use of measurement within the performative culture of education prioritises what can be measured, quantified, broken down and used in increasingly unsophisticated, but seductive or persuasive ways. That which can't be quantified or numerically evaluated is increasingly harder to value and is likely to disappear from the lexicon of education. Newman argues that it is this 'weaving of an intricate web of overlapping circuits of control, information gathering and identification', as opposed to the character of the institutional context, that differentiates modulating power (Newman 2009: 105). It is in these circuits that teachers and students (amongst others) are producing their dividual 'selves' and their various worlds and places in those worlds/data sets.

In this performative culture, the subject, who expects that modulatory machines and the data they generate will enable total control and pure

order, is faced with persistent, even increasing, uncertainty about how to respond or act. The constant and varying processes that measure performance prevent the subject being certain of 'making the grade'. The result is that the environment is full of pitfalls, or risks, that evidence little, if any, stability. As Ball suggests:

> It is not the possible certainty of always being seen that is the issue, as in the panopticon, it is the uncertainty and instability of being judged in different ways, expectations and indicators that make us continually accountable and constantly recorded – 'giving the position of any element within an open environment at any given instant'... This is the basis for the principle of uncertainty and inevitability, it is a recipe for ontological insecurity: 'Are we doing enough? Are we doing the right thing? How will we measure up?' In effect 'controls' overlay rather than displace 'disciplines' in most educational organisations even if the emphasis is shifting. (Ball 2000: 2–3)

Uncertainty becomes terror when the teacher feels that the disciplinary narrative located and practised within the enclosed spaces of their classroom no longer represents their classroom and they are subjected to control in terms of a series of simulacra produced through modulatory practices. The performative culture has had significant consequences for teachers: greater emotional pressure and stress, heightened intensity of work, diminished social relationships, ever growing paperwork, increased frequency of external measurement of their work and an expanding gap between senior staff and teaching staff (Ball 2008). For performativity is about acceleration, about spinning faster but not going further.

What is most obvious about performativity is a move away from 'care' for what is 'good' for the individual student. The classroom now appears less as a series of disciplinary relationships between the teacher and each student and more as a set of transactions that must be measured to ensure efficiency and accountability. The violence of the disciplinary is being overlayed by the brutality of the modulatory. In the luminiferous ether, notions of efficiency and accountability transform. They cease to be of the classroom and partake of the spaces surrounding the classroom – they become of the serpent that overlays the disciplinary classroom but moves us no closer to disrupting the enclosed spaces of the classroom.

A technical language of bands, standards, averages, means and ranges of achievement surrounds teachers. Their classrooms are represented by a series of encoded points that map some statistical space but bear little relation to the enclosed space of their classroom. Learning is

being replaced by performance. Teachers, who once understood their role to be caring for, nurturing or developing the student-individual in highly normalising, competitive and regulated ways, who have moved through a set of disciplinary institutions and been rewarded within the disciplinary university for understanding education in disciplinary ways, are ill equipped to understand, let alone protect themselves from, the modulatory serpent.

Teachers, who are unable to respond effectively to a modulatory machine that produces no disciplinary sense, become like the Luddites who sought to destroy the machines that were changing their lives. (Please note that we side with neither the Luddites nor those promoting the introduction of the machines the Luddites sabotaged.) Indeed, a variety of unwanted behaviours have emerged in other countries in which high-stakes testing models like NAPLAN were introduced (Reid 2009). These included teachers narrowing the curriculum ('teaching to the test') and school administrators hiding information, improperly manipulating data and focusing teaching resources on a narrow band of students (Reid 2009: 11). These effects are understandable; the disciplinary teacher responds to crises by trying to improve, to do the same but more and better, in effect to accelerate or vibrate faster.

One disciplinary response to NAPLAN is the teacher who hides or 'burrows' in his or her classroom in an attempt to hide within the modulatory ether. Another is an attempt to engage with the data in such a way that only serves to accelerate modulation. A disciplinary fantasy, in which the data can somehow represent 'good', 'bad' or 'in need', fails because of a lack of representation. This leads to a drive to accumulate ever more data. This disciplinary response to NAPLAN leads to more testing to improve test performance, more measures of teacher capability, increased emphasis on test results, doing more tests and greater numbers of data manipulations, all done in order to produce more outputs, codes or data points. (Moves are already in place to accelerate the frequency and extend the scope of testing, adding Year 11 and potentially university students to those tested.)

Fear in control societies has three distinguishing characteristics. The first is amplitude. The humming machines of control induce spin and vibration as the core of dividuals and the level of this spin and vibration are available to the ceaseless increase in level or amplitude. NAPLAN and My Schools become part of a landscape of anxiety, created by new and mass media sources that 'select, isolate and exaggerate apparent threats and in doing so contribute to the alienation of contemporary life (we become spectators in a fearful world)' (O'Sullivan 2006: 311).

This points to the second characteristic of fear in a control society: it produces isolation. Becoming increasingly agitated that their performances are being informated, tracked and stored in databases, teachers find it harder to connect outside the classroom and feel increasingly alone to deal with measurements.

Third, and linked to the other two, fear in a control society has become small, intensified, abstracted and bodiless. Data points, plotted around discrete nodes for information gathering, retrieval and analysis, function to create a space constituted as an artefact of measurement that contains dense concentrations of data that no longer connect to the experience of teaching in a classroom and further abstract the self from their world (Bogard 2009). This micro-fear is fluid and multiple and has become increasingly difficult to name, and therefore discuss and understand. Above all, it has become impersonal, removed, de-individualising and more terrifying as a result.

A change in the language of education from care to codes marks this transition. In Deleuzian terms, NAPLAN is a key set of features on a map (or nodal points like statistics, certainty, narratives, professionalism, accountability) that trap the 'faciality' of the teacher and the student within its orbit.[5] In a disciplinary system, these nodes are orbited at a fairly constant frequency. A modulatory machine subjects the orbit to continuous acceleration. The face fractures into a set of spinning features that cannot be made to cohere, the spinning and the associated lack of coherence giving the illusion of movement as they circulate, while always maintaining an approximate distance from the nodal point. Teachers' fear produces the desire to spin faster – a disciplinary response to modulation.

Modulation results in commonsense aspirations for schools increasingly working against the disciplined teacher. The teacher, as multiple artefacts of NAPLAN and My Schools, is alienated from the teacher-self as disciplined professional within the classroom. Despite attempts to do better in the classroom, to be more, to spin faster, the disciplinary teacher lacks the language to form a coherent narrative within the luminiferous ether in which modulatory machines produce/generate teachers as dividuals. Teachers are evaluated outside of the classroom but still understand themselves within the classroom. When they step into the ether the language that makes sense in the classroom is skewed and distorted and ceases to make its old sense. Two languages of evaluation are superposed.

These languages inflect difference practices of care. Disciplinary power cares for the individual to the extent that the individual is productive

(Savat 2009). Modulating power, on the other hand, recognises no individual because it acts to divide 'rigid' individuals into discrete moments derived from the data collected and synthesised, which can be stored and acted upon. The classroom and teaching processes break down into a series or sets of data points produced by a modulatory machine that allows no care for the teacher because the teacher, as a set of data effects, cannot be integrated into a coherent individual. As a result, there can be no care for the teacher or the student; at most, there can be care for the information gathered and the ways that it is synthesised. The modulatory machines of NAPLAN and My Schools signal the beginning of the end of the ethic of care. The ethic of care for the teacher and the ethic of care for the uniqueness of students are being replaced with dividualising data narratives. It may be timely that these signifying discourses of the individual are in the state of being overthrown; however, it remains to be seen what 'lines of flight' are possible within dividualising terrains (Deleuze and Guattari 2005).

Teachers experience ever increasing agitation as they seek the regularisation and synthesis of the representation of their teaching by accepting increased testing. Teachers have learnt certain disciplinary techniques and they seek to have their teaching evaluated according to their use of those techniques. They accept greater testing of their students in the belief that this will mean that NAPLAN and My Schools better represent their teaching. Spinning faster around each of the existing testing points and introducing more testing points are strategies doomed to failure. They simply accelerate the rate of orbit, and therefore number of orbits, with no discernible benefit for a teacher attempting to (re)impose coherence over the fractured narrative of the teacher in the classroom. Their disciplining as teachers and experience of testing in the classroom lead teachers to accept that NAPLAN tests will measure their good teaching (something reinforced by the introduction of ideas of 'performance' pay). This results in teachers experiencing increased stress due to the 'pressure to perform in a highly competitive environment' (Smyth et al. 2008: 56).

VII. Conclusion

Applying Deleuze's description and explanation of the transition to a control society to NAPLAN and My Schools raised a variety of questions concerning the utility of the concepts he presented. The first questions related to the persistence of disciplinarity, which would remain in at least the early stages of the emergence of a control society.

If there was no clean break, then the coexistence of disciplinarity and modulation in the Australian education system had to be conceived. The conceptualisation employed here was one in which disciplinary locations were uncoupled, with the space between them becoming a modulatory space that superposed disciplinary effects to over-code disciplinarity itself. The processes through which individuals are generated persist in the disciplinary location of the classroom and the teacher self and the student self continue to manifest discipline therein. There are still things being done in the classroom but the testing that occurs outside the classroom begins to change the nature of the entire assemblage.

A crucial question concerns the willingness of those within the education system, including teachers, to accept and even participate in the changes. The fact that the shift from discipline to control is not a revolutionary moment but a more subtle process of transition means that the change does not trigger profoundly dysfunctional responses from those exposed to change. The mobilisation of individuals against planned reforms cannot disturb the change process. Sense can be made of this in the context of reform to the Australian education system because of the way the reforms were 'sold' to teachers and to voters. In short, seductive disciplinary promises were made to justify modulatory reforms.

The result is an education system in which disciplinarity and modulation persist, at least for the time being. As modulation increases, teachers find themselves being evaluated according to a modulatory effect and not a set of disciplinary practices. Their classrooms are represented by and as a series of statistical points that bear no relation to practices for delivering good teaching and training good-productive students. As a result, more and more agitated teachers expose themselves to increasing levels of statistical representation in the vain hope that their classrooms will be properly represented in the luminiferous ether of NAPLAN and My Schools. Ever more frenetic preparation for testing, including through more mock tests, causes teachers to spin obsessively around practices and processes for data accumulation and analysis that never (because they cannot) represent the (disciplinary) classroom. More tests applied to more areas more often and at more stages of a student's education ensure ever greater activity and productivity; though a radical change in products occurs when the modulatory serpent coils itself around the (disciplinary) classroom.

If the analysis in this paper is valid, then we can expect that, over time, the Australian education system will be characterised by increasing levels of modulatory superposition over the effects produced by the

disciplinary location of the classroom. The rate at which the education system moves to full modulation may depend on the extent to which the teacher training conducted in Australian universities continues to partake of discipline rather than modulation. The persistence of practices that constitute the teacher as disciplined professional-individual in universities means that the spaces of lecture and tutorial remain connected to that of the school classroom and the coils of the serpent are yet to encircle and modulate each so that they no longer couple to produce a disciplinary machine. These locations may ultimately break down and we may all find ourselves endlessly spinning in the luminiferous ether of a society of control searching for a line of flight.

Notes

1. The luminiferous ether (or aether) was a commonly held theory of early scientists such as Lord Kelvin and Isaac Newton. The air was supposed to be full of subtle particles that vibrated in certain ways faster than light and that that allowed light to travel. In short, all forms of space were full of this ether that transported and distorted light such that the image (reflection and refraction) is modified in its travel through the vibrating particles. The theory fell out of favour in the early twentieth century to be replaced by relativity and quantum physics.
2. In 2011 the tests were sat on 10, 11 and 12 May.
3. A sample of the report can be found at < http://www.nap.edu.au/Test+Results/Student+reports/index.html > .
4. The literacy war is between competing views of how literacy should be defined, how it should be taught and what basic skills young people should be expected to acquire through their education. For an excellent account of the polarising 'literacy wars' read Roy (2005).
5. For a detailed explanation of faciality see Deleuze and Guattari (2005: 168–91); O'Sullivan (2006). For an analysis of faciality within the school terrain see Thompson and Bell (2011).

Introduction: Negotiating the Archival Turn in Beckett Studies

S. E. Wilmer Trinity College Dublin

The work of Samuel Beckett and Gilles Deleuze overlaps in surprising ways. Both writers express a resistance to narrative, subjectivity, language, representation, exegesis, dogma, hierarchy, teleology and closure. For example, they explore the idea of mutable subjectivity, with Beckett creating fragmented and disappearing characters and Deleuze expressing the notion of becoming: becoming-animal, becoming-woman, becoming-imperceptible and so on. Likewise, both Beckett and Deleuze distrust signification and prefer ambivalence and nuance to clarity of meaning.

Although they shared the same publisher (Jérôme Lindon at Les Éditions de Minuit), Beckett and Deleuze evidently never met each other. Beckett apparently never read Deleuze, but he seemed to manifest Deleuzian ideas in his work. Deleuze wrote two specific essays on Beckett in *Essays Critical and Clinical*, and he frequently cited Beckett's techniques to demonstrate his own theories in works with or without Guattari. In some instances, Deleuze even seemed to use Beckett's writing to develop and exemplify some of his own ideas and concepts. Commenting on the 1992 publication of an essay by Deleuze in a volume with Beckett's late work (*Quad, suivi de L'Epuisé, par Gilles Deleuze*), Jean-Jacques Lecercle (2010: 154) speculates provocatively, 'Perhaps the close proximity, in the French edition, of Deleuze's essay, "The Exhausted", to Beckett's own text, is indeed more than a fortunate coincidence: perhaps it is a symptom.' Deleuze's essay outlines Beckett's preoccupation with 'exhausting the possible' (152) that is exemplified in such work as *Quad* ('exhausting space') as well as in the famous stone-sucking sequence in *Molloy* and the various biscuits in *Murphy*. Timothy Murphy (2000: 229) proposes that 'Beckett's prose stages Deleuze's

thought', while 'Deleuze's thought stages or dramatises (rather than reads or explicates) Beckett's prose'.

Particularly from the 1990s, academic scholars have commented on the parallel discourses in Beckett and Deleuze. Important articles by Anthony Uhlmann (1996), Mary Bryden (2002), Timothy Murphy (2000) and Sarah Gendron (2004) have compared the work of the two authors. Other academics, such as Jean-Jacques Lecercle (2010), Andrew Gibson (2006), Bruno Clément (2006) and Steven Connor (1988), have examined their similarities within wider contexts. There has also been a growing interest in comparing Deleuze's and Alain Badiou's (2000) response to Beckett. Garin Dowd's *Abstract Machines: Samuel Beckett and Philosophy after Deleuze and Guattari* (2007) is one of the first monographs to treat the connection between Beckett and Deleuze intensively, and it will soon be followed by Colin Gardner's forthcoming *Beckett, Deleuze and the Televisual Event*.

However, an archival turn in Beckett studies that focuses on the social and historical circumstances of Beckett's life and work and emphasises genetic criticism has recently generated scepticism towards philosophical inquiry into Beckett's work. Accordingly, it seemed timely to use Deleuze as a theme in the inaugural year of the Samuel Beckett summer school at Trinity College Dublin in 2011. This forum on Beckett and Deleuze derives in part from the summer school, comprising essays by Stan Gontarski and Daniel Koczy, who both participated, as well as additional articles by Audronė Žukauskaitė, who published two books on Deleuze in Lithuanian in 2011, and Colin Gardner, whose essay (which appears by kind permission of Palgrave Macmillan) is part of his forthcoming book. A second forum on Beckett and Deleuze is planned for the near future and will include an article by Garin Dowd, who led the Deleuze seminar at the Samuel Beckett summer school, as well as articles by Ruben Borg, author of *The Measureless Time of Joyce, Deleuze and Derrida* (2007).

The essays in this forum address a wide range of Beckett's *oeuvre*, including his novels, short stories, stage and television plays, and film work. Stan Gontarski, who revealed in his lecture at the summer school that Beckett was exposed to Bergsonian ideas as a student of French and Italian literature at Trinity College, considers in his essay the relationship between Bergson, Deleuze and Beckett and analyses some of the traces of Bergson's thought in Beckett's prose that resonates with Deleuzian concepts. In particular, Gontarski shows that the landscape and characters in Beckett's novels, rather than possessing a fixed or static

identity, are in a constant state of 'creative involution', a reversal of Darwinist evolution.

In his essay 'Beyond Percept and Affect: Beckett's *Film* and Non-human Becoming', Colin Gardner focuses on another form of involution. As Deleuze argued, the film addresses the question, 'How can we rid ourselves of ourselves, and demolish ourselves?' Gardner invokes two essays by Deleuze – 'The Greatest Irish Film (Beckett's "Film")' and 'The Exhausted' – from *Essays Critical and Clinical* (1997) as well as his *Cinema 1: The Movement Image* (1986), to discuss the narrative, character portrayal, philosophical concepts and cinematic techniques in *Film*, demonstrating how it deconstructs conventional cinematic language and creates a moment of 'pure affect'. The common analysis of the film is that, after trying to avoid being perceived in a series of scenes, Buster Keaton's character is finally confronted at the end with his own self-perception, which apparently causes his death. But, pursuing Deleuze's statement that 'nothing ever dies in Beckett' (1997: 26), Gardner assesses the final technical sequence as 'a direct time-image', and shows how Keaton's character continues to persist 'as a being of pure sensation'.

Daniel Koczy addresses the question of audience perception in his essay 'A Crystal-theatre: Automation and Crystalline Description in the Theatre of Samuel Beckett'. Koczy asks if certain stage works by Beckett, such as *Not I* and *Play*, achieve almost the same effect as cinema in controlling the consciousness of the audience. According to Koczy, Deleuze privileges cinema over theatre because cinema can automate the perception of the audience through a 'direct correspondence between image and thought'. Koczy shows how *Not I* and *Play*, through constricted staging techniques, achieve a similar effect of disrupting the audience's habitual patterns of thought and offer the possibility of a style of crystal-theatre that approximates the impact of 'cinematographic consciousness'.

Finally, Audronė Žukauskaitė links Deleuze's notion of 'becoming imperceptible' with his concept of a life of pure immanence and applies it to various works by Beckett such as *Film*, *The Unnamable*, *Molloy*, *Footfalls*, *Play* and *Not I*. Žukauskaitė demonstrates the similarity of imperceptibility or a life of pure immanence to Giorgio Agamben's concept of 'pure potentiality', and, drawing on Deleuze and Agamben's commentaries on Herman Melville's character Bartleby, explains the radical potential in a life as contingency. As in the virtual state of the Body without Organs, the concept of imperceptibility or a life

as contingency allows for the potentiality to be (or do) or to not be (or not do) simultaneously, and this relates closely to many Beckettian characters engaged in a process of involution, fragmentation, becoming-imperceptible or indiscernible, and being 'not quite there'.

As we can see in this forum on Deleuze and Beckett, by contrast with the scepticism fostered by the archival turn in Beckett studies, there is as much to be mined from a philosophical as a historicist approach to Beckett. From 'creative involution' to 'a being of pure sensation', and from 'crystal-theatre' to 'a life as contingency', these authors provide many new insights into Deleuze's thought and Beckett's practice.

Beyond Percept and Affect: Beckett's *Film* and Non-Human Becoming[1]

Colin Gardner University of California, Santa Barbara

Abstract

Film, Samuel Beckett's 1964 short starring Buster Keaton, dubbed by Deleuze as 'The Greatest Irish Film', is a seminal text in the latter's cinematic canon as it helps us to extrapolate the transition from the Bergson-based movement-image of *Cinema 1* to the Nietzschean time-image of *Cinema 2*. *Film* is unique insofar as its narrative traverses and progressively destroys the action-, perception- and affection-images that constitute the movement-image as a whole, using Keaton's body, and more importantly his face, as a means of attaining a pure intensity or Entity abstracted from all spatio-temporal coordinates, a condition of exhaustion/saturation that Deleuze and Guattari call, 'non-human becoming'. Beckett's film is predicated on Bishop Berkeley's fundamental philosophical principle, *esse est percipi* (to be is to be perceived) and, using Keaton as its protagonist, raises the question of whether it is possible to escape perception, not only by a third party, but also by oneself. The latter is 'played' by the camera itself, which 'stalks' Keaton from behind, taking great pains not to exceed a 45-degree 'angle of immunity' (lest Buster experience *percipi* or the anguish of perceivedness) until the film's final close-up when he comes face to face with his own self-perception and affective annihilation. *Film*'s denouement thus deconstructs the very nature of conventional cinematic language, whereby filmic suture – the enfolding of character, camera and spectatorial 'viewing-views' into a unified field of vision – gives way to a perspective where, at the very moment that the perceptive/affective

body dies, the work of filmic art gives birth to itself as a being of pure sensation, exceeding lived experience.

Keywords: movement-image, perception, suture, interstice, exhaustion, event

Film, Samuel Beckett's 1964 experimental short starring Buster Keaton, dubbed by Deleuze as 'The Greatest Irish Film', is a seminal, albeit transitional, text in the latter's cinematic taxonomy. Deleuze uses *Film* as a reverse proof of the three varieties of movement-image through their progressive extinguishing or exhaustion, thereby providing an early case study for his subsequent analysis of Beckett's television work in his oft-cited essay, 'The Exhausted'. As Deleuze explains his intentions,

> We might also retrace the lines of differentiation of these three types of images, and try to rediscover the matrix or the movement-image as it is in itself, in its acentred purity, in its primary regime of variation, in its heat and its light, while it is still untroubled by any centre of indetermination. How can we rid ourselves of ourselves, and demolish ourselves? This is the astonishing attempt made by Beckett in his cinematographic work entitled *Film*, with Buster Keaton. (Deleuze 1986: 66)

As we shall see, this has far greater theoretical ramifications than simply creating a reverse proof of the movement-image, for this demolition of subjectivity creates nothing less than what Deleuze calls an Event, which is simultaneously both an invention and an erasure or, as Tom Conley puts it, a 'pummelling' of space. By unfastening the camera from any centre of motor action, *Film* surpasses human perception and creates, in effect, a non-human becoming that opens up onto the vastness of space itself. In 'The Exhausted', Deleuze calls this a manifestation of Language III, which no longer relates to a referent that can be enumerated or combined, or harnessed to specific voices of enunciation (whether Subject or Other), but taking the non-form of hiatuses, holes and tears, it instead looks outside itself as an endless line of flight on a limitless plane of immanence, as an aggregate of images/sounds from which all signifying language acts as a mere subset. 'Language III does not operate only with images but also with spaces', states Deleuze. 'And just as the image must attain the indefinite, while remaining completely determined, so space must always be an any-space-whatever, disused, unmodified, even though it is entirely determined geometrically' (Deleuze 1997a: 160). Beckett, in his 1937 letter to Axel Kaun, offers an almost uncanny presentiment of this analysis when he writes,

> As we cannot eliminate language all at once, we should at least leave nothing undone that might contribute to its falling into disrepute. To bore one hole after another in it, until what lurks behind it – be it something or nothing – begins to seep through; I cannot imagine a higher goal for a writer today. (Beckett 1983: 172)

For Deleuze, Beckett's *Film* is an excellent test case for an examination of the determined subject's relationship to the indefinite insofar as it is based on, but also contravenes, the eighteenth-century Irish philosopher Bishop George Berkeley's formula, *esse est percipi*, or, 'to be is to be perceived'. Directed by Alan Schneider under Beckett's personal supervision and filmed on location in New York in the summer of 1964 (the film was subsequently re-made in London by David Clark in 1978), the 21-minute short is often completely mystifying to audiences unfamiliar with Beckett's script and subsequent production notes and letters to Schneider, for as Beckett scholar Ruth Perlmutter rightly points out, 'The film needs to be "read" along with the filmscript, where some details are explained by Beckett. The film is an allegorical visual representation of its palimpsest, the filmscript. Indeed, the script is essential for clarification' (Perlmutter 1977: 83, n.3). Thus, only from studying early manuscripts do we discover that the film was originally titled *The Eye* and contained a title page that read, 'For Eye and Him [later revised to "One"] who does not wish to [revised to "would not"] be seen' (Gontarski 1985: 105). The protagonist thus began as Him, became One, then Object, then 'O', a progressive exhaustion of subjectivity and character psychology typical of Beckett's work during this period. Moreover, the change of title to *Film* – evoking the self-reflexivity of the previous year's stage drama, *Play* – also suggests that the project is as much a meta-textual analysis of filmic form *in-itself* as it is a diegetic exploration of Berkeleyan perceptual ontology. Such a view is reinforced by *Film*'s retrogressive adherence to silent film language (set in 1929, there is no accompanying music nor diegetic sound other than an admonishing 'Shhh' from one of the minor characters) and the use of silent screen icon Buster Keaton (Charlie Chaplin, Beckett's original choice, was unavailable), even if we are unable to see his face for the bulk of the film's running time.

Again, only from the script do we learn of the Berkeleyan sub-text and that the film demands that, 'All extraneous perception suppressed, animal, human, divine, self-perception maintains in being. Search of non-being in flight from extraneous perception breaking down in inescapability of self-perception' (Beckett 2006: 371). And then, perhaps

most importantly, 'No truth value attaches to above, regarded as of merely structural and dramatic convenience' (371). This suggests that Beckett conceived the film structurally and dramatically as a creative work of art rather than scientifically or philosophically. Moreover, the film itself gives us little indication that the protagonist (played by a partially blind Keaton, wearing a dark patch over his left eye) is sundered into object (O) and perceiving eye (E). O is represented onscreen by Keaton himself, who constantly observes and monitors his environment (rendered in the film as, blurry, soft-focus panning point of view shots, appropriate given the character's partial blindness). E is represented by the sharp focus of the camera itself, manifested through cuts rather than pans. O is always in flight, E forever in pursuit, attempting to keep O constantly in view. Although at no time are O and E shown in the frame at the same time, it is not clear until the end of the film – in the act of what Beckett calls the final investment of O by E – 'that pursuing perceiver is not extraneous, but self' (371). And even here, the confrontation-cum-merger is shown not as a superimposition or cross-fade but as a shot-reverse shot, reinforcing the integrity of the divided subject. Beckett himself acknowledged that this split scopic regime expressed two impossible viewing views, that 'the space in the picture is the function of two perceptions, both of which are diseased . . . [which] enable one to deform normal vision' (Gontarski 1985: 187).

Thus, although E's image is always sharply defined, it is no less corrupted than O's blurry focalization. The script also insists that, until the end of the film, 'O is perceived by E from behind and at an angle not exceeding 45°' (Beckett 2006: 372). O enters *percipi* (i.e. he experiences the 'anguish of perceivedness') only when this angle is exceeded, which occurs from time to time throughout the film and causes E to retreat to a 'safe' position. Indeed, in 'The Greatest Irish Film', Deleuze dwells very little on the philosophical principles behind the scenario, stating *Film*'s 'Problem' in simple enough terms. From Berkeley's *esse est percipi* – is it possible to escape perception? How do you become imperceptible? Keaton's role is that of Bishop Berkeley, who had enough of being perceived and of perceiving. 'Or rather', states Deleuze, 'it is the transition from one Irishman to another, from Berkeley, who perceived and was perceived, to Beckett who had exhausted "all the joys of *percipere* and *percipi*"' (Deleuze 1997b: 23).

In common with the schematic formalism of his later plays, Beckett divides the script into three unequal parts, namely: 1. The street; 2. The stairs; 3. The room – which Deleuze roughly approximates to three perceptual case studies, moving in reverse order from sensory-motor

centredness to an exhausted, acentred spatio-temporal Event. Thus the street and staircase sequences are the province of the action-image; the room is dominated by the perception-image; while the final sequence of Keaton falling asleep in the rocking chair and succumbing to E's final investment culminates in a concluding, devastating affect-image. However, these strict demarcations often occlude more than they reveal, in terms of both a greater understanding of Beckett's project, and also the creative fluidity contained within Deleuze's taxonomy, which offers us far more than what literally meets the eye. First, they ignore an important structural preface and coda to the film, whereby, because of technical problems encountered during the filming of the initial street sequence, much of the planned footage was scrapped in favour of adding a title sequence featuring Keaton's enlarged eye. Thus, as we fade in, the screen is filled by an extreme close-up of his closed eyelid, almost reptilian with its intricate folds and wrinkles. The eye opens to reveal the full pupil, which is in turn superimposed by the first title: 'Film by Samuel Beckett'. Further credits follow, and as they conclude, the eye closes. The image is in sharp focus, so retroactively we assume that it is shot from the scopic point of view of E, rather than O, suggesting that it is an acute perception of a human apparatus of perception – in effect, a meta-perception-image. Perhaps more significant is the rapid fade to black that follows, creating a short interval or interstice, before fading up as the eye opens once again. What has happened in this interval? Is this a simple action-to-action transition, or action-reaction formation typical of the syntagmatic connections forged by conventional montage, or is there something more ominous in that 'black hole' that suggests a different space-time continuum through the tear in the fabric of the screen/scene? As we shall see, the film's coda will provide a more suggestive answer to this question. For now, the eye simply closes, opens, widens, followed by two blinks, before we dissolve to a brick wall and the opening of the initial street sequence.

For Deleuze, the film's first two sequences – Keaton's itinerary towards the apparent 'sanctity' of his mother's apartment – are a clear manifestation of the action-image, albeit one under considerable formal strain. As Martin Schwab notes,

> The situation is presented from the point of view of a call for action, for everything we see – events, scenes, actions – receives its specific meanings from the point of view of O's goals and thus his subtractivity. For O, gazes are threats, his itinerary a path toward nonperceivedness, the room a 'sanctuary'. (Schwab 2000: 122)

Thus Keaton, head bowed and turned away from the camera, limits the danger of perceivedness by walking quickly and determinedly along a brick wall, thereby cutting off one complete side of possible perception. This is threatened when E initially catches him within the 45-degree angle of immunity, forcing Keaton to stop the action and conceal his face with his hand and handkerchief. The action is further delayed when Keaton bumps headlong into an elderly couple, who stand reading a newspaper, causing him to observe them briefly with his out-of-focus stare before rushing on a few steps ahead of the pursuing camera. For Beckett, the couple's sole role was to provide a diegetic excuse to introduce O's subjective point of view in preparation for its use in the extended, perceptually oriented apartment scene to follow.

However, the couple's exchange of glances also helps to ground the action-image's formal language within the suturing effect of a shot-reverse shot visual economy, which serves to enfold character, camera and spectatorial 'viewing-views' into a unified field of vision. Not surprisingly, because of the experimental nature of *Film*'s split subject, where the camera plays a multiplicity of different roles, this suturing effect is unravelled, further undermining the conviction of the final suturing of E and O in the film's culminating investment sequence. As Graley Herren points out,

> If E is supposed to represent the protagonist's subject-status through camera perspective, and O is supposed to represent the protagonist's object-status as screen-image, then where exactly do O's POV shots fit in? They are neither E as subject nor O as object. (Herren 2007: 42)

For Herren, we end up with at least three divisions: E as camera eye; O1 as Keaton/object; O2 as a second camera eye, expressing O's direct point of view. To make matters more complex, there are also brief moments – for example, during the 'agony of perceivedness' of the elderly couple and the flower seller in the vestibule – when Keaton-as-O is not on-screen at all. Where is O during these interludes? These are moments when he avoids the threat of self-perception because he is not being perceived by E at all. E's attention is literally elsewhere. By both Berkeley and Beckett's ontological logic, O thus achieves (at least cinematically) a state of non-being at these moments. Also, why would these extraneous characters be alarmed by E, who represents and produces O's 'agony of perceivedness' rather than their own? E must clearly function as a multiple subject – the 'I' as O's double; the camera Eye recording O trying to escape being recorded; the eye of the spectator

watching the camera recording O; as well as a role outside of the above, what one might call an 'any-self-perception-whatever', a contagious horror felt by whoever might encounter the camera's abnormally intense gaze and be affected by its deformed, piercing look.

This *aporia* of viewing views is reiterated in the subsequent scene when Keaton cuts into the vestibule of his mother's apartment building. Here, the danger is increased because of the unprotected nature of the space – Keaton is vulnerable to E's gaze from either side of the staircase – as well as the presence of the elderly flower vendor, who descends the stairs with her tray and threatens to confront Keaton with her own subjective look. However, the roles are temporarily reversed as the woman herself also falls 'victim' to Keaton's dual perceptions. First, she is unruffled as she is observed by O's subjectively blurred gaze as she descends the stairs, but is then confronted by the camera, E. Her face contorts in horror as she too suffers the 'agony of perceivedness' – a dress rehearsal for Keaton's own expression at the film's end – before collapsing to the floor, just as O makes his escape up the flight of stairs.

The long sequence that follows takes place in the seeming sanctuary of a run-down apartment. As Beckett himself states in his notes,

> This obviously cannot be O's room. It may be supposed it is his mother's room, which he has not visited for many years and is now to occupy momentarily, to look after the pets, until she comes out of hospital. This has no bearing on the film and need not be elucidated. (Beckett 2006: 380)

Well, actually, it has every bearing on the film because it helps to explain why Beckett also breaks the sequence into three separate parts. First, because the room is not O's usual residence, it must be prepared to suit his own, non-scopic needs. No longer shielded by the wall, the angle of immunity is doubled as there is now 45 degrees on each side of O. Keaton may be observed by extraneous sets of eyes from all directions, including his own. Thus he takes great pains to cover the window, a mirror, the staring eyes of a parrot and goldfish and eject his mother's dog and cat. He also destroys an image of Berkeley's all-perceiving God-the-Father, in this case 'a reproduction of a Sumerian head of the god Abu in the museum in Baghdad' (Knowlson 1996: 465), whose bulbous eyes stare at O with severe insistence. Up to this point, the camera perceived Keaton alone, who seemed to have a 'blind' perception limited only to his own intentionality. Now, E perceives him *in* the room – in sharp focus – as O, with his blurred vision, perceives

the room itself – thereby creating a double register of perception. 'Now, the character perceives for himself', says Deleuze,

> his perceptions become things that in turn perceive him: not only animals, mirrors, *a lithograph of the good Lord*, photos, but even utensils (as Eisenstein said after Dickens: the kettle is looking at me . . .). In this regard, things are more dangerous than human beings: I do not perceive them without their perceiving me, all perception as such being the perception of perception. (Deleuze 1997b: 24–5)

Once the present has been hermetically sealed off from outside observation, all that remains is to destroy past memories. This takes the form of a poignant sequence where, with E observing intently over his right shoulder, Keaton examines seven photographs, each marking a different age in his development, from his earliest baby picture in his mother's arms, kneeling in prayer at age four, through his schooldays, graduation, engagement, army enlistment, to a more recent picture of the aged Keaton wearing an eye patch. This is our first glimpse of his face, significantly mediated in reproduction via a surrogate photographic apparatus. In all cases, Keaton is shown to be happily within a condition of perceivedness, although his engagement and enlistment warrant a longer, more sustained look, perhaps because the war was responsible for the loss of his eye and family, while the engagement picture also features a photographer taking an official snapshot, another surrogate for E. The result is a convoluted meta-text by which E (and we, the audience) observe O looking at a picture of another camera observing O within the frame of the photograph. Keaton responds by tearing the photographs into four pieces in reverse chronological order, thus initiating his reductive path towards a zero-degree perception – culminating in a condition of pure affect.

All that remains is his mother's rocking chair, which suspends us in the middle of nothingness – a typical Beckett trope of to-ing and fro-ing, which sends Keaton off to sleep once his perceptions are extinguished. Unfortunately, the greatest danger is now revealed – the extinction of subjective perception frees the camera of the 45-degree restriction. Moreover, as Deleuze points out, the chair opens up other avenues of perception – front, back and sides – and the camera is quick to take advantage. After a false start, where Keaton wakes up just in time to forestall encroachment, the camera ultimately crosses the 45-degree angle and faces Keaton frontally for the first time. 'The character O is thus now seen from the front, at the same time as the new and last convention is revealed', says Deleuze.

> The camera OE is the double of O, the same face, a patch over one eye (monocular vision), with the single difference that O has an anguished expression and OE has an attentive expression: the impotent motor effort of the one, the sensitive surface of the other. (Deleuze 1986: 67)

> It then reveals what it is: the perception of affection, that is, the perception of the self by itself, or pure Affect. It is the reflexive double of the convulsive man in the rocking chair. It is the one-eyed person who looks at the one-eyed character. It was waiting for the right moment. This, then, is what was so terrifying: that perception was the perception of the self by itself, 'insuppressible' in this sense. (Deleuze 1997b: 25)

In theory, this affect curved in on itself can only be extinguished when the chair stops rocking and the character dies. In short, in order to become imperceptible, you must cease to be and the film – perception's mechanical correlate – must end. But as everyone knows, nothing ever dies in Beckett, for his characters must continue to strive, continue to fail, continue to create something from the abyss of nothing. Keaton may 'die' as a manifestation of the sensory-motor movement-image, but he must remain as part of a more profound cosmology that is very much alive: 'It is a question of attaining once more the world before man', says Deleuze,

> before our own dawn, the position where movement was, on the contrary, under the régime of universal variation, and where light, always propagating itself, had no need to be revealed. Proceeding in this way to the extinction of action-images, perception-images and affection-images, Beckett ascends once more towards the luminous plane of immanence, the plane of matter and its cosmic eddying of movement-images. He traces the three varieties of image back to the mother movement-image. (Deleuze 1986: 68)

One could argue that this is a key characteristic of all avant-garde cinema – to recreate the acentred plane of pure-movement-images and establish an inhuman presence there.

But is this really what happens at the end of *Film*? Do we really return to the immanent plane of movement, or is something more profound going on here? First, as we have already noted, the investment proper – the confrontation of E and O as a sequence of cross-cut myopic close-ups – defies the possibility of a unifying suturing effect. Here, suture is used not to bind the spectator into a misrecognised plenitude with a unified, centred screen subject, but to instead recruit our active agency in producing a split, acentred subject in the form of a temporal multiplicity. Second, it is significant that the film does not end with the investment

proper – but rather with an exact reprise of the opening title sequence featuring the extreme close-up of Keaton's eye, complete with that baffling fade to black as a disruptive interval between blinks. In this respect, the eye – echoing *Film*'s original title – acts as both a spatial and temporal frame, as if the entire exhaustion of movement-images, from action, through perception to affection, had occurred literally within the blink of an eye, thereby folding Deleuze's taxonomy of intervals within an even larger interval, an interval on the verge of creating a direct time-image.

On the verge... but not quite. Which is perhaps where that momentary fade to black comes back into play: in particular its role within a larger economy of images. In *What Is Philosophy?*, Deleuze and Guattari draw a clear distinction between percepts and perceptions:

> Percepts are no longer perceptions; they are independent of a state of those who experience them. Affects are no longer feelings or affections; they go beyond the strength of those who undergo them. Sensations, percepts and affects are *beings* whose validity lies in themselves and exceeds any lived [experience]. (Deleuze and Guattari 1994: 164)

In short, they exist in the absence of man as a controlling mechanism as he is himself a compound of percepts and affects: 'The work of art is a being of sensation and nothing else: it exists in itself' (Deleuze and Guattari 1994: 164), composed of independent elements such as colour, line, shadow and light. Thus Keaton's O may metaphorically 'die' at *Film*'s end because he has finally exhausted his sensory-motor connection to the movement-image, but he lives on in the work of filmic art that gives birth to itself as a being of pure sensation, exceeding lived experience.

Given this distinction, this flicker of blackness is less part of a conventional edit but a crack in the surface of the screen and the scene/seen that allows a brief glimpse into an immanent cosmos ready to give birth to something incommensurable: namely a direct time-image. As Deleuze and Guattari point out, 'The affect goes beyond affections no less than the percept goes beyond perceptions. The affect is not the passage from one lived state to another but man's nonhuman becoming' (1994: 164). The vehicle for this genesis is not the interval – the built-in delay that allows the action hero to bide his time within the continuum of the sensory-motor regime, ultimately using the delay to his advantage – but the interstice, the false-movement or fissure through which the time-image becomes manifest. As Tom Conley explains,

> The interstice is the interval turned into something infraliminary in a continuum in which an event can no longer be awarded the stability of a 'place' in the space of the image. The interstice becomes what *exhausts* – and thereby creates – whatever space remains of the image in the sensory-motor tradition. It supersedes the interval and, by doing so, multiplies the happenings of events. (Conley 2000: 320)

It is less a process of association than of differentiation. A potential is given, another must be chosen so that a third, new image is produced as a creative event. The advent of the time-image is this very proliferation of events, so that the world is now reinvented in each shot/instance via the Event of the interstice. In *Film*, the interval turns out to be unbridgeable via the movement-image's conventional resort to causal montage and instead gives rise to the interstice as the incommensurability of immanent time, literally a space time captured but then lost in the blink of an eye. Unfortunately for us, *Film* ends at the very moment of its birth, leaving us with an any-space-whatever as the site of an event that is in the process of becoming – what Deleuze calls a *prenom* taking place before it is named in language. It will be left up to Beckett's subsequent television work – most notably *Eh Joe*, *Ghost Trio* and *Quad* – to make this incommensurable language (Deleuze's Language III) truly manifest.

Creative Involution: Bergson, Beckett, Deleuze

S. E. Gontarski Florida State University

Abstract

'Creative Involution' posits something of a philosophical genealogy, a line of flight that has neither need for nor interest in the periodisation of Modernism, a line of which Beckett (even reluctantly) is part. Murphy, among others, is deterritorialised as much as Beckett's landscapes are, and so he/they become a 'complexification' of being that manifests itself in Beckett not as represented, representative or a representation, since so much of Beckett deals with that which cannot be uttered, known or represented, but whose image the works (and its figures) have become, a thinking through of negativity, becoming, and multiplicity through non-Newtonian motion, of being as becoming, where every movement brings something new into the world, but in something of a reverse Darwinism that moves from complex to simple organism, from Murphy to Worm, or Watt to Pim, or among the nameless figures in the short prose, a 'becoming-animal', in something not so much of a creative devolution but rather a 'neoevolution', or to adopt another term from Deleuze and Guattari, an 'involution', which 'is in no way confused with regression' (1987: 238), becomings creating nothing less than new worlds. Writing casually to his post-war confidant Georges Duthuit on 26 July 1951, Beckett noted in the midst of gardening chores, 'Never seen so many butterflies in such worm-state, this little central cylinder, the only flesh, is the worm' (2011: 271). The observation comes after the writing but before the premiere performance of *Waiting for Godot* in which Gogo tells Didi, 'You and your landscapes! Tell me about the worms!' (1954: 67). Such 'becoming-animal always involves a pack, a band, a population, a peopling, in short a multiplicity' (1987: 239),

Deleuze and Guattari tell us. For Beckett it defines creativity as well, only possible through such un-tethered selves or beings, amid the generation of varieties and differences, accessible through moments of deterritorialisation, characterised by, 'A fearsome involution calling us toward unheard-of becomings' (240).

Keywords: negativity, becoming, a pack, multiplicity, line of flight, representation, motion, evolution, involution, deterritorialisation

> That's not moving, that's *moving*. *Whoroscope*, Samuel Beckett
>
> To elicit something from nothing requires a certain skill. *Watt*, Samuel Beckett

In their critique of Sigmund Freud's (psycho)analysis of the Wolf-man in *A Thousand Plateaus*, philosopher Gilles Deleuze and psychoanalyst Félix Guattari take on the methodology and ideology of psychoanalysis, which they see as 'a mixed semiotic: a despotic regime of significance and interpretation' (1987: 125), and so that of Modernism itself. For Deleuze and Guattari, Freud misreads the Wolf-man's narrative, imposing nominalist, patriarchal presuppositions on the narrative's multiplicity, reducing the assemblage to the name of the Father, or the name of the Wolf-man, in the crafting of a coherent, unified subconscious. Deleuze and Guattari replace the constrictive unity of psychoanalysis and its emphasis on the subconscious with the multiplicity of schizoanalysis and its emphasis on the unconscious. Freud's misreading confuses the two, the unified subconscious with an unconscious as assemblage that is 'fundamentally a crowd' (29), an analysis of Freud that parallels Deleuze's critique of Heidegger's *Sein*. Deleuze and Guattari are careful to distinguish, in its Bergsonian echo, between the simple multiplicity of space, 'a numerical or extended multiplicity' and that of the assemblage with its 'qualitative multiplicities' (33). Deleuze and Guattari will use a variety of terms to distinguish between a multiplicity which is a sequential series, to which one can always add another entity, an N + 1, say, and 'rhizomatic multiplicities' or 'molecular, intensive [as opposed to extensive] multiplicities' which are non-totalisable. Within that assemblage, that crowd, the Wolf-man, as pack, as qualitative multiplicity and molecular process rather than molar entity, is apprehensible as he 'approaches or moves away from zero' (31):

> Zero is the body without organs of the Wolf-man. If the unconscious knows nothing of negation, it is because there is nothing negative in the unconscious, only indefinite moves toward and away from zero, which does not at all

> express lack but rather the positivity of the full body as support and prop ('for an afflux is necessary simply to signify the absence of intensity'). (Deleuze and Guattari 1987: 31)

Quoting Nietzsche on 'Eternal Return' thus (see, for example, Klossowski [1997] on 'Eternal Return' [48]), Deleuze and Guattari sound decidedly Bergsonian in this critique of Freud as they echo not only Bergson on multiplicities but his critique of nothingness as well, and both of these elements find their elaborations in the perpetually unfolding narratives of Samuel Beckett, who, situated between these French metaphysicians above, is neither the heir of one nor the anticipation of the other, that is, not one in a series but one of a multiple, a one and a pack. One might thus read not only Beckett through Bergson, but Bergson through Beckett; Bergson through Deleuze, but also Deleuze back through Bergson, or, as one of the narrating voices in Beckett's *Company* notes, 'vice-versa'.

One of the most compelling discourses in *Creative Evolution* (1907, 1911) is Bergson's thinking through the issues of nothing,[1] in which any negation, any inclusion of a 'not' in a statement announces 'that some other affirmation, whose content I do not specify, will have to be substituted for the one I find before me' (1944: 315); it is the 'zero' of Deleuze and Guattari's critique, and centre stage in Beckett's first two published, eponymous, English novels, *Murphy* and *Watt*, the former in its pursuit of not annihilation but fulfilment, the latter plagued by its apparitions in the house of Mr Knott. It is the nothingness of routine in the latter that disguises or gives way to the nothing of existence, 'on the waste, beneath the sky, distinguished by Watt as being, the one above, the other beneath, Watt' (1959: 249), as Addendum 22 has it. Beckett's negations, then, produce or result in neither absence nor void. Like Deleuze, Beckett has nothing to admit. Contrary to its title, in his letter to Michel Cressole, Deleuze will admit a 'secret link' to those philosophers against a rationalist tradition, 'I find among Lucretius, Hume, Spinoza and Nietzsche a secret link that resides in the critique of negation' (Deleuze 1977: 112). For Bergson, who might, even should, have been included in Deleuze's list, the statement 'There is nothing', although a contingent, negative fact, would have to be grounded on some positive entity, an '*All*,' say, 'to which it is closely akin' (1944: 322). Such an entity would ensure that something, rather than nothing, remained. As a demonstrative, the discourse suggests that 'Nothing is [over] there.' The perpetual philosophical conundrum that began Martin Heidegger's list of questions central to philosophy, 'Why is there something rather than

nothing', was thus always a false problem for Bergson and Deleuze, and such expressions of exclusionary binary become not unlike the Cartesian mind body duality.[2] *The Stanford Encyclopedia of Philosophy* begins its entry on 'Nothingness' with such a duality: 'ever since Parmenides in the fifth century BCE, there has been rich commentary on whether an empty world is possible, whether there are vacuums, and about the nature of privations and negation'. The binary of something and nothing is thus finally a minor variation on the principle of the One and its degraded parts. Negative theology, however, posits as axiomatic that what can be said of God, say, or the One, is only that she has no qualities known to human intelligence, 'The original ground of all things, the deity, must . . . lie beyond Being and knowledge; it is above reason, above Being; it has no determination or quality, it is 'Nothing' ' (Windelband 1938: 335). It is finally a deity who exhibits the '*complete absence of all qualities* . . . no name names him' (237), and 'we can predicate of God only what he is not' (290). Windelband was the source of much of Samuel Beckett's understanding of ancient philosophy, and residua can be found in Beckett's first two English novels of exile, *Murphy* and *Watt*, whose protagonists (or whose subjects) vainly attempt to name, that is, to ground their being in the world, by exhausting the possibilities of unknowing. Such negation by serial exhaustion in order to know Mr Knott, for example, encounters at best only his residual effects or after effects, his attributes, and Watt finally knows nothing of his essence:

> For the only way one can speak of nothing is to speak of it as though it were something, just as the only way one can speak of God [a weightless entity, immaterial, apparently nothing, a cipher, nought, zero] is to speak of him as though he were a man, which to be sure he was, in a sense, for a time. (Beckett 1959: 77)

Watt's mistake may have been in trying to see Mr Knott as a knowable singularity even as he or Sam admits, 'But what do I know of Mr. Knott? Nothing' (1959: 119), or again, third person singular, 'What did he know of Mr. Knott? Nothing' (148). Knott's abode, rather in Knott's sphere, moreover, is perpetual change in its unchangedness: 'Yes, nothing changed, in Mr. Knott's establishment, because nothing remained, and nothing came or went, because all was a coming and a going' (131–2). Watt's demise seems to stem from an inability to accept such becoming and the fact that

> nothing had happened, that a thing that was nothing had happened, with the utmost formal distinctness, and that it continued to happen, in his mind [. . .]. Yes, Watt could not accept, as no doubt Erskine could not accept, as no

> doubt Arsene and Walter and Vincent and the others [in the pack] had been unable to accept, that nothing had happened, with all the clarity and solidity of something [. . .]. (Beckett 1959: 76)

Such 'a coming and a going' permeates Beckett's *oeuvre* and is central to at least Bergson's defence of motion. Preoccupation with bodies in motion, or motion itself has more traditionally fallen within the province of physics than metaphysics, even for Aristotle, but Bergson situates himself on the bridge between those disciplines, as he does between matter and spirit, and so his emphasis on motion undergirds and so coincides, overlaps or intersects with the spirit of change, of evolution, of constant becoming, of time's flow, of *durée*; it is an embrace of natural law, life's vital force, an *élan vital*, the implications of which philosophy has all too often ignored, Bergson reminds us. Aristotle himself acknowledged such a vital force in his punning coinage, entelechy, but Aristotle's vision was finally binary, entelechy opposed to stasis, which may contain the potential of such motion, or kinesis or entelechy but is in opposition to it. Of such fixity or stasis Bergson will say that it is 'only an ephemeral arrangement between mobilities' (1946: 177).

The opening to the first of two 'Introductions' that Bergson wrote specifically for his second collection of lectures and essays, these delivered or published between 1903 and 1923, *The Creative Mind*, is that 'What philosophy has lacked most of all is precision' (1946: 9); that is, philosophy has tended to ignore natural laws (9). In this autobiographical opening, Bergson recalls his youthful infatuation with the Victorian theorist Herbert Spencer, who embraced an all-encompassing system of evolution, a philosophy that took account of the physical, biological world. It was Spencer, not Darwin, who coined the term 'survival of the fittest' and hence natural selection. Spencer was a synthetic philosopher who saw congruence, not threat, in what others deemed the polar opposites of scientific method and traditional, historical belief systems. Synthetic philosophy saw the unity of natural laws, human and non alike (see *A System of Synthetic Philosophy*, 1862–93, for example). As influenced as he was by Spencerian synthesis to overcome more traditional dualities, Bergson was determined to remedy much of what he saw as Spencer's tendency to dwell on 'vague generalities' (10). Evolution thus led Bergson to what he calls 'real time' and how it eludes mathematics because it flows: 'not one of its parts is still there when another part comes along' (10). If this time that flows were measurable, it would 'have the essence of non-duration' (11).

Measurement, then, is 'not carried out on an aspect or an effect representative of what one wishes to measure [in this case 'Time'], but on something which excludes it' (11). For Watt, what he seeks or 'wishes to measure' or to know perpetually eludes him.

Such early focus on motion, on change, on evolution, on the flow of time leads Bergson to those classical philosophers who have seen motion and so change as illusions, most notably Parmenides and Zeno, both Eleatics whose paradoxes were powerful statements against motion and hence against change. The debate extends into a sense of discontinuous being or the lack of fixity of any sort evident in Heraclitus, a position central to his contretemps with Parmenides.[3] Heraclitus, a process philosopher himself, perhaps the first of that tradition, that is, those who suggest that there are no stable substances per se, emphasised a world of becoming, and such a liminal world in perpetual transition was more consonant with Bergson's sense of *durée* than the monism of Parmenides and his main disciple, Zeno. For Parmenides, founder of the School of Eleas, our senses deceive us, the real world apprehensible through logic alone. Everything that is, then, has always been, and being is unwavering and always complete, part of 'the One', so that change is an illusion. Bergson takes on the most pervasive set of proofs for this position, the Eleatic paradoxes, in almost every one of his works. In *Matter and Memory* (1897, 1910), for instance, he critiques Zeno's 'proof' of the impossibility or the illusion of motion by pointing out that Zeno's famous paradoxes 'consist in making time and movement coincide with the line which underlies them, in attributing to them the same subdivisions as to the line, in short, in treating them like that line' (1991: 191). Earlier in the reworking of his doctoral thesis, *Time and Free Will: An Essay on the Immediate Data of Consciousness* (1889, 1910), he focused on the paradox of the race course, which, in Zeno's analysis, a runner could not traverse, might not, in fact, even be able to begin the circuit, since the space of the course is infinitely divisible and so the distance from start to finish is subject to infinite divisibility. Bergson counters that 'The mistake of the Eleatics arises from their identification of this series of acts, each of which is *of a definite kind* and *indivisible*, with the homogeneous space which underlies them' (2001: 113). That is, what Zeno takes as an inscription coeval with movement, Bergson sees as a metaphor, a representation of that movement.

In some ways, admits Bergson, such reasoning as Zeno posits represents common sense or what Bergson calls 'an element of convention' (1946: 10), as Zeno 'carries over to the movement the properties of its trajectories [that is, the divisible line or course]', but

much of Bergson's analysis suspends such common sense whose aim is practical solutions to problems, scientific or philosophical. A decade after *Matter and Memory*, in *Creative Evolution* (1907, 1911), his critique of the Eleatics is even more explicit, calling the paradox an 'absurd proposition that movement is made of immobilities' (1944: 335), and so the Eleatic paradoxes 'all involve the confusion of movement with the space covered, or at least the conviction that one can treat movement as one treats space, divide it without taking account of its articulations' (1946: 170). Writing to Alan Schneider, on 21 November 1957, Beckett was unusually straightforward in explaining some of the imagery of *Endgame* to his befuddled American director. His arguments parallel those of Bergson calling the Eleatic paradoxes a fallacy:

> The argument of the Heap and the Bald Head (which hair falling produces baldness) were used by all the Sophists and I think have been variously attributed to one or the other. They disprove the reality of mass in the same way and *by means of the same fallacy* as the arguments of the Arrow and Achilles and the Tortoise, invented a century earlier by Zeno the Eleatic, disprove the reality of movement. The leading Sophist, against whom Plato wrote his dialog [i.e. *Protagoras*], was Protagoras and he is probably the 'old Greek' whose name Hamm can't remember. One purpose of the image throughout the play is to suggest the impossibility logically, i.e. eristically, of the 'thing' ever coming to an end. (Harmon 1998: 23)

Beckett's comment in 1957 reprises almost exactly the argument made in Wilhelm Windelband's *A History of Philosophy*, down to the use of the word 'eristically' (Windelband 1938: 89, n.4). The 1957 letter to Schneider thus reprises notes he took during a period of intense philosophical study between 1932 and 1933, and those were dominated by quotations from Windelband. That Beckett could remember the material so exactly, even as he claims in his letter that he cannot 'find my notes on the pre-Socratics', suggests that he had at least reviewed the notes carefully during the writing of *Fin de Partie* and perhaps again during the translation to the English *Endgame*.

Bergson's thesis is startlingly simple: 'If movement is not everything, it is nothing' (1946: 171). Denial of motions is thus for Bergson, and Beckett above, a denial of *durée*, and so of change itself. As Bergson recounts in the autobiographical 'Introduction' to the last of his books, *The Creative Mind* (1919, 1946), this insight into the nature of time and its measurement was his initial, his primary, intuition as a student, on which he built an entire career:

> Ever since my university days I had been aware that duration [or simply time but not its measurement] is measured by the trajectory of a body in motion and that mathematical time is a line; but I had not yet observed that this operation contrasts radically with all other processes of measurement, for it is not carried out on an aspect or an effect representative of what one wishes to measure, but on something which excludes it. The line one measures is immobile, time is mobility. The line is made, it is complete; time is what is happening, and more than that, it is what causes everything to happen. The measuring of time never deals with duration as duration. (Bergson 1946: 11)

Movement, and hence change, for Bergson, 'is an indisputable reality. We may not be able to say what parts of the whole are in motion; motion there is in the whole nonetheless' (1991: 193), and '[a]ll real change is an indivisible change', he notes in his second lecture on 'The Perception of Change' (1946: 172). But Bergson warns us in the same essay that movement is not coeval with kinesis, or movement of natural wholes: 'there is change, but there are not things which change' (177), or again, 'There are changes, but there are underneath the change no things which change . . . movement does not imply a mobile' (173). Such might be seen as an anticipatory gloss on Beckett's *Endgame*, where even as the characters run out of bicycles, pain killers and the like, nothing changes, and Hamm may sit immobile in his chair even as he moves about the shelter. At the opening of his long Cartesian poem, *Whoroscope*, Beckett works through qualitative and quantitative motion with the call of a boatswain, 'We're moving, he said, we're off' (1961: ll. 9–10), the boatswain apparently stationary. The reference to Galileo and music (Descartes's confusion of *père et fils*, apparently), the play of harmony and dissonance, may be less important than the reference of the motion of the Earth, which from the perspective of Descartes is 'expedient sophistry' since we appear to be stationary. But even on Earth, Galileo tells us, we are moving while at rest; 'That's not moving, that's *moving*', is Beckett's gloss on the issue. But the ship's passengers or crew have a certain degree of freedom to walk against the movement of the ship, at least for a time, and are thus, apparently, stationary even as they move, or are moved. At least Beckett raises such contradictions to motion as he thinks through Descartes and time. Murphy may sit out of the sun, at the opening to the eponymous novel, 'as though he were free', but he is tied to a chair and lives in a 'mew', a 'medium sized cage'.

One of the most profound literary encounters with such Bergso-Deleuzism is developed throughout Samuel Beckett's 1936 novel, *Murphy*, particularly the presentation of 'Murphy's mind' in chapter 6. Murphy bound to his chair but in motion slips past the mind's first

zone, that of 'forms with parallel' (1957: 111), to the second, the contemplation of 'forms without parallel' (111) but stable forms, nonetheless, thence to the third, the dark, 'a flux of forms, a perpetual coming together and falling asunder of forms'. Such

> dark [contains] neither elements nor states, nothing but forms becoming and crumbling into the fragments of a new becoming, without love or hate or any intelligible principle of change. Here there was *nothing* but commotion and the pure forms of commotion. Here he was not free, but a mote in the dark of absolute freedom. (Beckett 1957: 112; my emphasis)

Here then was not only the nothing Murphy so ardently desired, in constant movement but within a stationary skull, a stasis achieved through the ferocious rocking of his chair. But Murphy's goal is less stasis, a cessation of kinetics, than nothingness, which he achieves in a sense: 'Murphy began to see nothing, that colourlessness which is such a rare postnatal treat, being the absence (to abuse a nice distinction) not of *percipere* [to perceive] but of *percipi* [to be perceived]' (1957: 246). Such nothing offers 'the positive peace that comes when the somethings give way, or perhaps simply add up, to the Nothing, than which in the guffaw of the Abderite [Democritus] naught is more real' (246). One might accuse Murphy of a certain dualism himself if the 'somethings simply give way to' but not if they 'add up to the Nothing', that plenitude which Deleuze calls Zero, as Murphy in motion continues 'to suck in [. . .] the accidentless One-and-Only, conveniently called Nothing' (246). Celia takes the same route, out of her clothes and into the rocker for the 'Silence not of vacuum but of plenum' (148). It is a Bergso-Deleuzian world of perpetual becoming, not 'states,' the still moments of movement to which Bergson and Deleuze object, 'nothing but forms becoming and crumbling, without love or hate or any intelligible principle of change' (112). Such issues remain a preoccupation for Beckett into the post-war years, in the midst of his most creative period as he notes to art critic Georges Duthuit on 11 August 1948:

> I shall never know clearly enough how far space and time are unutterable, and me caught up somewhere in there [. . .]. One may as well dare to be plain and say that not knowing is not only not knowing what one is, but also where one is, and what change to wait for, and how to get out of wherever one is, and how to know, when it seems as if something is moving, which apparently was not moving before, what it is that is moving, that was not moving before, and so on. (Beckett 2011: 98)

Beckett here is outlining for Duthuit what sounds remarkably like deterritorialised being.

And Murphy too is not territorially Murphy, we learn, as Watt is not territorially Watt but Sam's Watt, or Watt's Sam, and so part of a cluster, a band at Knott's abode that includes Arsene, whose narrative Watt absorbs, Vincent, Walter and Erskine, among others. Murphy too is a pack, one in what looks like a quantitative series but is revealed as a molecular multiplicity in the *Three Novels*, a one and a many, a pattern of regenerative transformations: 'Then it will be all over with the Murphys, Merciers, Molloys, Morans and Malones, unless it goes on beyond the grave' (1957: 236). Or at the opening of *The Unnamable*: 'Malone is there. [. . .] Sometimes I wonder if it is not Molloy. Perhaps it is Molloy wearing Malone's hat. [. . .] To tell the truth I believe they are all here, at least from Murphy on' (292–3). These manifestations, accompanied by other entities in the pack, are in something of perpetual motion, or perpetual becoming, where the observer is either centre, circumference, both or something in between: 'It is equally possible [. . .] that I too am in perpetual motion, accompanied by Malone, as the earth by its moon' (295). And this line of flight, a phrase Beckett uses in his seminal letter to Georges Duthuit of 9 March 1949, 'lignes de fuite' (2006: 18), has neither origin nor goal: 'Going nowhere, coming from nowhere, Malone passes' (1957: 294). It is the motion of nothing in *Murphy* as well, 'a missile without provenance or target, caught up in a tumult of non-Newtonian motion' (112–13): 'That's not moving, that's *moving*.' And of two dim, colliding shapes in *The Unnamable*, the narrative voice notes, 'I naturally thought of the pseudocouple Mercier-Camier' (297). What, we might ask, is the relationship among such avatars or of each 'atavistic embryon', as Beckett suggests of Proust's characters in his monograph on the French author, for they continue, and diverge, and disappear, and reappear as the Basils and Mahoods, Moran or even Mollose, Molotte or Molloc of *Molloy*, Malone even added to the English iteration, or those who might be 'others', Saposcat and Macmann of *Malone Dies*, who evidently have much in common with their counterparts, Molloy and Malone, enlisted all, evidently, as 'sufferers of my pains'? 'All these Murphys, Molloys and Malones do not fool me' (303), as they have many a reader, we might add. Such becoming is not, however, 'a resemblance, an imitation, or, at the limit, an identification' (237), again to reference Beckett's letter to Duthuit of 9 March. These are not discrete characters that inhabit a discrete territory, but 'fundamentally a crowd' in a zero degree of motion, the reader struggling to re-territorialise through memories what the narrative flight has deterritorialised. When Deleuze and Guattari turn to specific examples it is to H. P. Lovecraft's 'The Statement of

Randolph Carter' (1920), whose title character is also a multiplicity, 'moving outrageously amidst backgrounds of other planets and systems and galaxies and cosmic continua . . . Merging with nothingness in peaceful oblivion' (cited in Deleuze and Guattari 1987: 240). Amid the multiplicities of *Watt*, Arsene utters the warning that characterises the unrepresentable: to speak the unspeakable, to 'eff' the ineffable, 'is doomed to fail, doomed, doomed to fail' (Beckett 1959: 62), at the end of whose 'short statement' Arsene 'became two men' (63). Some sorcery seems to be at work here, and in the 'Memories of a Bergsonian' plateau of *A Thousand Plateaus*, Deleuze and Guattari note that such 'very special becoming-animal' (1987: 237) is not a 'degradation representing deviation from the true order' (237), nor is it a 'playing animal or imitating an animal [. . .]. Becoming produces nothing other than itself' (238), attempts to represent it 'doomed, doomed to fail'.

We can thus characterise something of a philosophical genealogy, a line of flight that has neither need for nor interest in the periodisation of Modernism, a line of which Beckett (even reluctantly) is part. Murphy et al. are deterritorialised as much as Beckett's landscapes are, and so he/they become a 'complexification' of being that manifests itself in Beckett not as represented, representative or a representation, since so much of Beckett deals with that which cannot be uttered, known or represented, but whose image the works (and its figures) have become, a thinking through of negativity, becoming, and multiplicity through non-Newtonian motion and the 'non-Euclidian logic' cited in his poem 'Gnome', of being as becoming, where every movement brings something new into the world, but in something of a reverse Darwinism that moves from complex to simple organism, from Murphy to Worm, or Watt to Pim, or among the nameless figures in the short prose, a 'becoming-animal', in something not so much of a creative devolution but rather a 'neoevolution', to adopt the term of Deleuze and Guattari, an 'involution,' which 'is in no way confused with regression' (1987: 238), becomings creating nothing less than new worlds. Writing casually to his post-war confidant Georges Duthuit on 26 July 1951, Beckett noted in the midst of gardening chores, 'Never seen so many butterflies in such worm-state, this little central cylinder, the only flesh, is the worm' (2011: 271). The observation comes after the writing but before the premiere performance of *Waiting for Godot* in which Gogo tells Didi, 'You and your landscapes! Tell me about the worms!' (1954: 67). Such 'becoming-animal always involves a pack, a band, a population, a peopling, in short a multiplicity' (Deleuze and Guattari 1987: 239).[4] For Beckett it defined creativity as well, only possible through such un-tethered selves

or beings, amid the generation of varieties and differences, accessible through moments of deterritorialisation, characterised by, 'A fearsome involution calling us toward unheard-of becomings' (240).

Notes

1. The opening to chapter IV of *Creative Evolution*, say, pp. 296–324, although Bergson is on occasion accused of simply dismissing the term 'le néant', often translated, if somewhat misleadingly, as 'the nought'.
2. In 'A Note on Heidegger's Philosophy of Difference', Deleuze makes clear that 'The not expresses not the negative but the difference between Being and being' (1994: 64).
3. Further details in *The Routledge Encyclopedia of Philosophy* (1998: 734).
4. Interestingly, Deleuze and Guattari cite Jorge Louis Borges as one who has 'botched at least two books' by his failure of sorcery: 'Borges is interested only in characteristics, even the most fantastic ones, whereas sorcerers know that werewolves are bands, and vampires too, and that bands transform themselves into other bands' (1987: 241).

A Crystal-Theatre: Automation and Crystalline Description in the Theatre of Samuel Beckett

Daniel Koczy Northumbria University

Abstract

Throughout his cinema studies, Deleuze tends to define and to praise the cinematic in opposition to the theatrical. Cinema, for Deleuze, retains the potential to automate our perception of its images. Further, this capacity allows the cinema to profoundly disrupt the habitual patterns of its audience's thought. This article asks, however, whether Beckett's theatrical practice can be productively analysed through concepts derived from Deleuze's work on the cinema. In Beckett's *Play* and *Not I*, we see theatrical productions that strive for and attain an automation of their audience's perception. While this theatrical experience is not identical to the 'camera-consciousness' that Deleuze observes in film, it can be understood through Deleuze's (Bergsonian) processes of habitual and attentive recognition, their failure and their subsequent transformation into passages of crystalline description. Finally, we can begin to elaborate the novel idea of a 'crystal-theatre'; a theatre where the audience are entrapped within its construction, caught in a loop or circuit that runs between and complicates the realms of reality and illusion, immediately lived experience and artistic representation, the actual and the virtual.

Keywords: Beckett, cinema, automation, image, failure, crystal-image

> Given that it is a consciousness which carries out these divisions and reunions, we can say of the shot that it acts like a consciousness. But the sole

> cinematographic consciousness is not us, the spectator, nor the hero; it is the camera . . . (Deleuze 2009: 21)

Discussing the role of art in Deleuze's philosophy, Simon O'Sullivan has written of an 'aesthetic function of transformation' that extends 'the boundaries of what can be experienced' (O'Sullivan 2006: 52). For Deleuze, the artist promotes encounters that disrupt the given structures of consciousness. Artworks oppose habitual patterns of thought by confronting us with a world that obeys only its own peculiar logic. When Deleuze and Guattari claim that the sole 'law of creation' is that the composition must 'stand up on its own', they are working to define the artwork as a self-positing creation that does not depend upon the spectator (Deleuze and Guattari 2009: 164). Their ideal artwork would not appeal to existing concepts, ideas and habits of perception but would impose its own modes of thought upon us.

Cinema, for Deleuze, is exemplary in this regard. Deleuze argues that Dziga Vertov's *Man with a Movie-Camera*, for example, offers us the perception of a 'non-human eye' that has passed into matter itself, creating a vision of the world in the absence of subjectivity (Deleuze 2009: 83–8).[1] Further, the cinematic form is uniquely well equipped to force such encounters upon us. Cinema, for Deleuze, automates our perception and achieves a direct correspondence between image and thought. We perceive and think through a cinematographic consciousness that belongs to the images alone. 'It is the material automatism of images which produces from the outside a thought which it imposes, as the unthinkable in our intellectual automatism' (Deleuze 2010: 173). For Deleuze, the cinema appears as an immensely powerful tool for provoking 'unthinkable' encounters. In Vertov, our 'intellectual automatism' is rerouted through a sequence of images that follows its own logic and forces an audience to follow this logic in turn.

Theatre, for Deleuze, appears to be far less likely to provide such encounters (Cull 2009: 1–2).[2] In *One Less Manifesto*, Deleuze's only extended study of theatrical practice, Deleuze praises Carmelo Bene for presenting us with passages of variation that move between the established forms of majority perception. Bene's theatre performs, for Deleuze, an important political function in cultivating a minority consciousness within his audience (Deleuze 2000a). Deleuze's cinema books, however, may leave us doubting the efficacy of Bene's practice. Here, Deleuze maintains that there is no theatrical equivalent of the screen's direct correspondence between image and thought.[3] We retain a high degree of autonomy in relation to the stage. Bene's audience appear,

from the perspective of cinematic automatism, to remain spectators *to* and not participants *with* the movement of his work. This is problematic, in Deleuze's view, because pre-existing structures of thought are liable to obscure Bene's revolutionary potential.[4] While consciousness remains divided from the images onstage, dramatic works will be less capable of imposing an alterior logic upon us. The theatrical form appears ill equipped to disrupt our intellectual automatism and provoke an encounter with the unthinkable.

In Deleuze's account, film has itself confronted and overcome similar problems. Deleuze's modern cinema develops in response to a growing awareness of our intellectual automatism, expressed as a 'crisis of cliché'.[5] 'A cliché is a sensory-motor image of the thing . . . but, if our sensory-motor schemata jam or break, then a different type of image can appear: a pure optical-sound image' (Deleuze 2010: 19–20). Deleuze draws on Henri Bergson's accounts of habitual and attentive recognition in order to theorise both the cinematic cliché and the emergence of encounters that disrupt its reign.[6] In habitual recognition, we associate an object with a single recollection-image. When this is not possible, attentive recognition allows us to draw upon a range of memories in order to construct a coherent description of the object. Recognition succeeds when we feel ourselves able to understand the object before us. It is a matter of reducing the singular object or encounter to its resemblance to what we have previously perceived; an intellectual automatism that extracts a cliché from the image and allows us to remain within habitual modes of thought.

For Deleuze, cinematic automation can force this process of recognition to fail. 'It is not the recollection-image or attentive recognition which gives us the proper equivalent of the optical-sound image, it is rather the disturbances of memory and the failures of recognition' (Deleuze 2010: 52). Through montage, film can carry us through sequences of dislocated or illogically connected images that cannot be integrated into our habitual modes of thought. Cinematic spectators experience the failure of their intellectual automatism as their sensory-motor schema breaks down. Yet the cinematographic consciousness continues to run; perception and thought continue beyond this failure to recognise the images on-screen. In this way, the cinema can impose another mode of thought upon its audience, countering the automatism that orders experience as a series of clichés. What Deleuze calls an 'intolerable and unbearable' pure optical-sound image might stand forth in its singularity, refusing to conform to our expectations and drawing thought beyond its habitual bounds.[7] As in Vertov, we

may come to perceive and think in accordance with another strange and different logic that forces us to discover and confront what would be unthinkable within our habitual structures of consciousness.

We may ask whether Deleuze's cinematic concepts can be of use to theatre and performance. Deleuze, in an interview with *Cahiers du Cinema* that followed the publication of *Cinema 2*, commented: 'The encounter between two disciplines doesn't take place when one begins to reflect on the other, but when one discipline realizes that it has to resolve, for itself and by its own means, a problem similar to one confronted by the other' (Deleuze 2000b: 367).[8] Here, Deleuze expresses something that animates this essay. In drawing on Deleuze's cinematic studies in reference to Beckett's theatre, I am not attempting to deny the differences between film and performance. Although Beckett does achieve an automation of his stage that renders *Play* and *Not I* peculiarly well suited to this form of analysis, it is not a question of claiming that these pieces are cinematic in any strong sense. Deleuze's thought will, however, help us theorise the emergence of pure optical-sound images and unthinkable encounters within Beckett's drama. Perhaps this implies that Deleuze's dismissal of the theatre within his cinema studies is somewhat hasty. Ultimately, however, this essay is merely intended to perform its own encounter between Deleuze and Beckett, in the hope that something as yet unthought – the presentation of *Play* and *Not I* as examples of an immersive and immanent *crystal-theatre* – shall emerge in the process.

I. Automation: A Pure and Theatrical Optical Sound Situation

Beckett studies has frequently emphasised Beckett's desire for complete control of his stage. For instance, Deirdre Bair draws our attention to a discussion between Beckett and the playwright Jean Reavey:

> His maxim – that every playwright should . . . (be) in control of everything that happens on stage, envisioning it as if he were the audience – became difficult to follow, so that his plays became increasingly unconventional . . . It was the only way in which he could gain the stark, controlled effect he sought. (Bair 1990: 584)

This meeting took place while Beckett was writing *Play*. Completed, *Play* would achieve Beckett's ambition for control in both automating his audience's perception and including his audience within the theatrical construction.

Play presents us with two women and a man. Each is encased within an identical grey urn with only their heads visible. Beckett indicates that they must face the audience, with 'neck[s] held fast' (Beckett 2006: 307). Their speech is 'provoked', in Beckett's terms, by a single spotlight, cutting from one to another at 'maximum speed' (318). James Knowlson and John Pilling have compared the figures' intertwined monologues, constructing a somewhat banal tale of adultery, to the clichés of light comedy and domestic drama (Knowlson and Pilling 1979: 112). They do not address each other but speak their fragments into the light, springing to life when it rests upon them, falling silent as it swings away. With the rest of the stage in darkness, the spotlight draws the diverse perceptions of the audience into a single, automated perception. Like a cinematic director, Beckett gains a high degree of mastery over the divisions and reunions between his theatrical images.

Play includes an instruction to repeat the text. 'The repeat may be an exact replica of the first statement or it may present an element of variation' (Beckett 2006: 320). In the same work, Beckett achieves the automation of his theatrical images and yet, in a somewhat uncharacteristic gesture, allows for a variation that is not governed by precise stage directions. In his own production of *Play*, Beckett even allowed for an element of improvisation, with the structure of the repeat governed by the 'caprice' of the spotlight's operator (Cohn 1980: 54). We can make sense of this apparent contradiction by drawing on Deleuze's notion of the heautonomy of sound and vision within pure optical-sound images.

Play holds its audio and visual elements in an heautonomous relationship. Although speech is provoked by the spotlight, the tale of adultery cannot make sense of the visual image it illuminates. As we begin to piece the verbal fragments together into a narrative whole, their domestic clichés do little to explain Beckett's highly undomesticated visual imagery. 'What constitutes the audio-visual image is a disjunction, a dissociation of the visual and the sound, each heautonomous, but at the same time an incommensurable or 'irrational' relation which connects them to each other, without forming a whole . . . ' (Deleuze 2010: 246). We have already noted how, for Deleuze, the irrational cut or disconnection between images causes the sensory-motor schema to jam or break. Throughout *Play*, sound and vision stand out as non-totalisable elements of a pure optical-sound image. While they occur within the same instant, neither can fully explain the other. It is as if Beckett has brought two opposed and non-communicating worlds

together within a single work. As such, Beckett can allow for elements of variation as no variation could bring audio and visual elements together.

Anthony Minghella directed a screen version of *Play* (2001). Throughout, Minghella emphasises the automation of the audience's perception with a mechanical whirr that accompanies movements of the camera. The inquisitorial light becomes a panoptical surveillance system, presenting Beckett's figures from a variety of angles and depths and frequently moving while they speak. Rather than adding to the work, as Deleuze might lead us to expect, however, we shall see that Minghella's camera consciousness disrupts the direct relationship between spectator and image that Beckett's theatre achieves.

Bair suggests that *Play* includes its audience as a character: 'The experience is almost as if the audience becomes the fifth character (if the light is the fourth), wandering accidentally on stage during a performance . . . ' (Bair 1990: 582). Alternatively, we might ask whether the spotlight does not so much function as a separate character from the audience but automates the manner in which they are brought onto the stage. Rather than permitting us to retain the position of a detached spectator, Beckett includes his audience within the theatrical situation. Unaware of one another, the figures onstage address the audience directly and under the spotlight's commands. Whenever the heads cease to recount their tale, it is to address the audience-light itself.

> M: Looking for something. In my face. Some truth. In my eyes. Not even. {*Spot from* M *to* w2. *Laugh as before from* w2 *cut short as spot from her to* M.} M: Mere eye. No mind. Opening and shutting on me. Am I as much – {*Spot off* M. *Blackout. Three seconds. Spot on* M. Am I as much as . . . being seen? (Beckett 2006: 317)

Writing to George Devine as he prepared to direct *Play*, Beckett suggested that: 'The inquirer (light) begins to emerge as no less a victim of his enquiry than they and (as needing) to be free, within narrow limits, literally to act the part, i.e. to vary if only slightly his speeds and intensities' (Beckett 2001: 112). Here, we have the wavering perception of the theatrical spectator, as understood by Deleuze, retaining his or her distance and autonomy in relation to the image. But Beckett refuses us this freedom, automating our actual perception and including us, through the light, within the theatrical situation as its 'victim'. Beckett's spotlight automates the audience's perception in the same gesture as it automates the figures onstage. Our perception is automated by the image *as* our perception automates the image itself. In this way, the

audience's perception of the image is rendered inseparable from the image perceived.

In Deleuze's terms, Beckett's audience are 'victims' of the failure of recognition. The spotlight, the audience's perception of the image and ultimately the audience themselves are inseparable from an image which they cannot recognise and integrate into their sensory-motor schema. As Knowlson and Pilling write of *Play*'s spotlight: 'It does not function, then, only by prompting them into speech, but is itself prompted like them to enact and re-enact a role within this strange, purgatorial world' (Knowlson and Pilling 1979: 119). Although Minghella's camera consciousness automates our perception, it weakens this sense of our participation with *Play*'s world. Minghella's camera, moving independently of the characters, lacks this element of victimhood in which the audience, through the spotlight, are forced to enact a helpless and impotent role that shares much with *Play*'s characters. With the spotlight, we too are trapped within this image; perception and consciousness forced to continue through our failure of recognition.

In his earliest drama, Beckett included references to his audience and their efforts to make sense of his work. Vladimir and Estragon turn to the auditorium, declaring 'Inspiring prospects' and '... that bog' (Beckett 2006: 15–16). *Endgame*'s Clov turns his telescope upon us observing: 'A multitude ... in transports ... of joy. {*Pause*} That's what I call a magnifier' (106). These darkly comic inclusions of the audience are mirrored by characters concerned that they are beginning to 'mean something' (108). In *Happy Days*, Winnie's tale of the Shower (or Cooker) couple dramatises, ridicules and finally refuses the audience's demand to be told the meaning of Beckett's play.[9] From *Godot* to *Happy Days*, the audience and their struggle to recognise the images before them appear in Beckett's texts. *Play* radicalises this tendency by drawing the audience's perception into the image itself. Now, the audience are not only unable to construct a coherent description of the images before them but are included within the image as victims of this failure. We have passed from the presentation of a pure optical-sound image, where Minghella's production perhaps remains, and towards the inclusion of the audience within a pure *and theatrical* optical-sound *situation*.

As argued here, Ruby Cohn identifies *Play* as marking a break in Beckett's development. 'In the post-*Play* plays fictional and theater situation and place can converge – theatereality. In *Play* the light belongs to theatereality' (Cohn 1980: 28). Cohn's conception of theatereality parallels, in some respects, our notion of a pure and theatrical optical-sound situation. From *Godot* to *Happy Days*, Cohn argues, Beckett's

theatrical spaces are intended to represent fictional worlds – the country road where *Godot*'s tramps are waiting; *Endgame*'s house or shelter. While the light in *Happy Days* represents an unforgiving sun, *Play*'s spotlight belongs to a necessarily theatrical situation. Where Winnie fictionalises her audience through the Shower (or Cooker) couple, the characters of *Play* address the spotlight, and the audience, directly and only because the audience's gaze has fallen upon them. This goes far beyond a brief suspension of the fourth wall, experienced as Estragon or Clov insult the auditorium. In theatereality, Beckett no longer produces a fictional representation, even one that draws attention to its status as fiction or representation. Rather, the pure optical-sound situation encloses audience and stage within a single world, the fourth wall extending to the boundaries of the auditorium.

In Deleuze's account, heroes of the modern cinema find themselves enclosed within and part of a world in which the sensory-motor schema has broken down. 'Man *is not himself* a world other than the one in which he experiences the intolerable and feels himself trapped . . . the psychic situation of the seer, who sees better and further than he can react, that is, think' (Deleuze 2010: 164). Rather than offering a theatre of representation, Beckett's pure and theatrical optical-sound situation becomes a device for immersing the audience within his own intolerable world. We do not merely observe this theatre but find ourselves to be an immanent and constituent part of Beckett's creation. Automated, our perception is at once an inquisitor and victim of the inquisition; both the vision and the casualty of an eye that sees, in Deleuze's terms, further than we can think. Locked within Beckett's unbearable world, we find ourselves belonging to the unthinkable image. While theatre might traditionally ask to be interpreted, this pure and theatrical optical-sound situation demands that it is lived. It forces itself and an encounter upon us that draws thought and consciousness beyond their habitual bonds. We can now ask, expanding our discussion to include Beckett's *Not I*, what may be at stake in such an encounter.

II. Description: A Crystal-Theatre

Like *Play*, Beckett's *Not I* demands the construction of a pure and theatrical optical-sound situation. Eight feet above the stage and a little off-centre, we must spotlight a woman's mouth while leaving the rest of her body in darkness. A covered figure, identified as Auditor, remains silent and still but for four brief and diminishing gestures of 'hopeless compassion' that punctuate MOUTH's monologue. Beckett indicates a

pause: 'There is just enough pause to contain it [Auditor's gesture] as MOUTH recovers from vehement refusal to relinquish the third person' (Beckett 2006: 374). Spoken in the third person throughout, MOUTH's text is delivered at pace but broken up by bursts of laughter, piercing screams and brief, nervy pauses. From her words, we gather that she kept a near permanent silence until her seventieth year when, while picking cowslips in a field one April morning, she began to both hear and speak her 'buzzing' of words.[10]

> ... and all the time this ray or beam ... like moonbeam ... but probably not ... certainly not ... always the same spot ... now bright ... now shrouded ... but always the same spot ... as no moon could ... [...] all part of the same wish to ... torment ... (Beckett 2006: 378)

Not I gives us MOUTH who *speaks*, Auditor who *hears* and the audience who *see*. Theatereality is produced, in part, through this scheme that extends the stage into the auditorium. *Not I*'s stationary spotlight, like *Play*'s mobile spotlight, casts the audience into an inquisitorial role from which we too emerge as a victim. As in *Play*, recognition fails. *Not I*, however, goes beyond *Play*'s heautonomy of sound and vision and achieves a more radical splintering and autonomy of its parts.

Not I's audience will ask themselves who or what is speaking. But MOUTH's monologue resists this question. She is herself 'not I'; split from her thoughts, her voice and her body.[11] Five times, she repeats '... what? . . who? . . no! . . she! . .', refusing to surrender the third person (Beckett 2006: 377–82). Further, MOUTH insists that she has not begun to touch upon the most vital element of her tale and renounces what little she has told as being a mere diversion and mistake.[12]

> ... something she had to tell ... could that be it? . . something that would tell ... *how it was* (...) something she didn't know herself (...) what? . . not that? . . [...] nothing she could tell ... try something else ... think of something else ... oh long after ... *sudden flash* ... not that either (...) so on ... [...] keep on ... trying ... not knowing what ... what she was trying ... ' (Beckett 2006: 381–2; my emphases)

We circle, with Beckett's text, around this obscure kernel of something that cannot be spoken. The fragmented and repetitive monologue unfolds like the testimony of one who is missing and whose final object or meaning cannot be reached. Failing to speak this something, the voice must begin again and MOUTH must return to the moment that her speech began. '... new every morning ... back in the field ... April

morning . . . ' (Beckett 2006: 383). As our own concentration flags, MOUTH's stream of words may periodically rush together into a kind of white noise; the materiality of language overtaking its signifying function and forming a literal buzzing beneath the threshold of meaning.[13] The memories that MOUTH relates – the field in April, a single tear falling onto her hand, a day in court – arise as 'sudden flashes' that refuse to tell us 'how it was'. Rather than forming a narrative whole, like *Play*'s tale of adultery, the fragments of MOUTH's monologue refuse to communicate amongst each other. MOUTH's discourse is splintered into 'sudden flashes', separated by illogical cuts and dislocations, and gaining an asignifying affective autonomy. Finally, Auditor's gesture diminishes into a barely perceptible quiver, no longer representing compassion but receding into a mere intensive vibration of the figure's cloak.

In *Not I*, there are no longer two heautonomous elements of sound and vision but a fragmentation and dispersal of the theatrical situation into a range of autonomous singularities. As she fails to tell us 'how it was', as irrational cuts and intervals splinter Beckett's text and his world, we fail to recognise the pure and theatrical optical-sound situation in which we are immersed. Beyond this failure of our intellectual automatism, however, Beckett's theatre forces another mode of thought upon us; the crystalline description of Deleuze's crystal-image.

In Bergson's habitual and attentive recognition, we draw upon the virtual images of memory. These are actualised as recollection-images that make sense of the present. We link a perception-image with recollection-images in order to construct the action-images of our sensory-motor schema. Memory makes sense of the world by finding resemblances between present experiences and our past. As noted, however, the pure optical-sound situation causes the sensory-motor schema to break down. Here, memory does not seem equal to the encounter. We cannot make sense of what is happening to us. Within his cinema books, Deleuze claims that his crystal-images are the 'true genetic element' of the pure optical-sound image (Deleuze 2010: 67). 'It is an actual-virtual circuit on the spot, and not an actualisation of the virtual in accordance with a shifting actual' (77).

In *Play* and *Not I*, Beckett encloses his audience within a *crystal-theatre*. As no virtual image is equal to the situation, recognition fails. Yet we remain trapped within Beckett's drama. As we fail to actualise any virtual image in relation to Beckett's world, we enter onto Deleuze's actual-virtual circuit. Deleuze claims that, in the course of this thought that thinks through its failure, the process of attentive recognition may achieve a kind of hyperactivity. Virtual memory, in its entirety and

in an indefinitely prolonged process, is called upon to make sense of the encounter. 'Crystalline description stands for its object, ... both creates and erases it ... It is now the description itself which constitutes the sole decomposed and multiplied object' (Deleuze 2010: 122). The immanence of Beckett's crystal-theatre is founded upon the prolongation of this process. Trapped within the actual-virtual circuit, any opposition between spectator and spectacle, real and imaginary, subject and object that description establishes is erased as soon as it is posed.

What is *Play*'s spotlight? It is a spotlight, a common enough theatrical device. Once we affirm that *Play* is merely a theatrical construction, however, we discover that this light has drawn us into a role within Beckett's fiction and that this role does not belong to the imagination alone. Once we say that the spotlight represents an imaginary inquisition, we find ourselves to be the reality behind the inquisitor and that our pursuit for answers is very real. In *Not I* we have a mouth speaking, a figure listening and the audience observing. We are invited to understand the piece as an explicitly theatrical construct, simply set in whatever theatre it is performed. However, throughout *Not I*, the relationship between spectator and spectacle is continually undermined. Auditor is not alone in appearing to be both a spectator and a part of the performance. While the audience find themselves cast into their inquisitorial role, MOUTH is presented as a spectator to her own speech; unsure, as we are, precisely what is being said of whom or why. All three – audience, Auditor and MOUTH – are continually passing through the roles of spectator and spectacle, forcing the circuit of our description to begin again and fail again. In Beckett's crystal-theatre, we are at once 'I' and 'not I'; both audience and actor, torturer and victim, the automaton and the visionary.

In an essay that deals with the ethical experience of Deleuze's philosophy, Aislinn O'Donnell describes the cinematic hero in precisely Beckettian terms. 'The figure of resistance is not the hero. It is the one who fails. Fails again. Fails better. Wandering takes the place of action' (O'Donnell 2011: 229). If Beckett's crystal-theatre is a theatre of resistance then this is because it disrupts the given structures of consciousness. For Deleuze, the perpetual failure of crystalline description transfigures the power of memory. Memory ceases to fix the world and our place within it in accordance to our habitual patterns of thought. Instead, our encounter with the unthinkable prolongs the interval between perception and understanding, action and reaction. By means of this gap, memory is deployed as a creative becoming; what Bergson would call *creative emotion*.[14] As our description is

multiplied, displaced and modified, the various clichés that have automated our thinking lose their sensory-motor coordinates. Taken up by this process of creation and erasure, their interconnections enter a potentially limitless series of metamorphoses. Immersed in Beckett's world, our consciousness takes on Beckett's fragmentation and disorder; a constellation of singularities as we grasp *Not I*'s autonomous intensive flashes, a schizophrenic split as we are caught astride *Play*'s heautonomous worlds of sound and vision. In Beckett's crystal-theatre, we find ourselves living and breathing a logic that is not our own; our failure to think becoming the power of thought to breach its own boundaries and wander, briefly, beyond its walls.

Notes

1. Due to the brevity of this essay, it has not been possible to offer a full account of Deleuze's complex notions of the 'outside' and the 'unthought in thought' as they are developed within his cinema books and throughout his wider philosophical project.
2. Discussing Deleuze's antipathy towards the theatre, Cull writes: 'For instance, we cannot ignore Deleuze's occasional denigration of theatre in relation to his apparently favoured art of the cinema. In *L'Abécédaire*, for instance, as Charles Stivale has reported, Deleuze remarks that theatre tends not to provide opportunities for 'encounters', though with certain exceptions (like Bob Wilson, Carmelo Bene).' (Cull 2009: 1–2).
3. Ronald Bogue, in his commentary on Deleuze's cinema studies, situates Deleuze's conception of the inferiority of the theatre entirely within his discussions of the relationship between audio and visual elements of film (Bogue 2003: 194) Theatre cannot, for Deleuze, create the cinematic 'single sound continuum' where the speech-act becomes inseparable from the out-of-field, non-verbal eruptions and the film's soundtrack or incidental music. Deleuze, however, identifies automation and its relationship to the unthinkable in thought as a more fundamental difference between the cinematic and theatrical experience. 'It is cinema's automatic character which gives it this capacity – in contrast to the theatre' (Deleuze 2010: 172).
4. One senses that Deleuze is compelled to write *One Less Manifesto* partly in order to critique the theatre's representational and molar functions and clear the way for a genuine encounter with Bene's world of 'universal becoming' (Deleuze 2000a: 256). Throughout, Deleuze argues against molar structures of thought that identify only a representational function of the theatre; particularly those that would glorify and limit the theatre to its capacity to represent 'conflicts, contradictions and oppositions' (Deleuze 2000a: 252). Deleuze's somewhat offhand dismissal of so-called 'angry women' who accuse Bene of sexism and phallocentrism in his representation of the female body can be explained (if not entirely excused) by Deleuze's determination to present Bene's drama as a theatre of minority becoming that would be, for Deleuze, impervious to such critique.
5. For a discussion of the crisis of cliché, habitual modes of thought and the corresponding development of time- and crystal-images, see the last chapter of *Cinema 1: The Movement-Image* (Deleuze 2009: 201–19) and the first chapter of *Cinema 2: The Time-Image* (Deleuze 2010: 1–23).

6. See the third chapter of *Cinema 2: The Time-Image* (Deleuze 2010: 42–52).
7. 'A purely optical and sound situation does not extend into action, any more than it is induced by an action. It makes us grasp, it is supposed to make us grasp, something intolerable and unbearable' (Deleuze 2010: 17).
8. Here, Deleuze is discussing the relationship between cinema and Bergson's philosophy in reference to their shared concerns with movement and time.
9. '… this man Shower – or Cooker – no matter – and the woman … standing there gaping at me … What's she doing? he says – stuck up to her diddies in the bleeding ground – coarse fellow – What does it mean? he says – What's it meant to mean? – and so on – lot more stuff like that – usual drivel …' (Beckett 2006: 156).
10. '… what? . . the buzzing? . . yes … all the time the buzzing … so-called … in the ears … though of course actually … not in the ears at all … in the skull …' (Beckett 2006: 378). MOUTH refers to this buzzing throughout and in such a way as to imply that it is a voice in her skull, transmitted by her mouth.
11. MOUTH is clearly not in control of the 'buzzing' voice which she is transmitting. Further, she insists on the absence of any physical or emotional feeling. During the first minutes of the play, she asks whether she is being punished and must suffer for her sins before asserting that she is not suffering after all (Beckett 2006: 377). Though she screams, she does so only in order to see whether such a thing is possible and what might come of it (Beckett 2006: 378). She does not know whether she is standing, sitting or lying down and merely presumes that her eyelids have continued to blink (Beckett 2006: 377, 378).
12. This element of *Not I*'s construction should put one in mind of *The Unnamable* and Beckett's question: 'What am I to do, what shall I do, what should I do, in my situation, how proceed? By aporia pure and simple? Or by affirmations and negations invalidated as soon as uttered, or sooner or later … Otherwise it would be quite hopeless. But it is quite hopeless' (Beckett 2009: 285). Indeed, Knowlson reports: 'Asked further about the sources of *Not I*, Beckett referred questioners back to his own novel *The Unnamable*' (Knowlson 1997: 590).
13. This is an experience recounted in Ruby Cohn's description of *Not I*. 'As our concentration flags in the theatre, MOUTH and her words become for us an actual buzz and a ray' (Cohn 1980: 20).
14. In his study of Bergson, for example, Deleuze notes: 'By means of this interval, something extraordinary is produced or embodied: creative emotion … a cosmic Memory, that actualises all the levels at the same time, that liberates man from the plane or the level that is proper to him' (Deleuze 2006: 111). The importance of this interval or gap for Deleuze's conception of art encounters that force thought beyond its habitual bonds has been recently emphasised by both O'Sullivan (O'Sullivan 2006: 45–6) and O'Donnell (O'Donnell 2011: 223) to name only two writers who have influenced this study.

Potentiality as a Life: Deleuze, Agamben, Beckett

Audronė Žukauskaitė Lithuanian Culture Research Institute

Abstract

In *Essays Critical and Clinical*, Deleuze argues that Beckettian characters usually strive towards becoming imperceptible. This statement immediately poses another question: what is becoming imperceptible and where does it lead? How can we rid ourselves of ourselves? Paradoxically enough, Deleuze states that becoming imperceptible is life. The literal and self-evident meaning of life seems somehow incompatible with the image of dissolving and decaying characters in Beckett's works. Contrary to this self-evidence, the notion of life in Deleuze and Beckett should be interpreted as pure potentiality which opens both the potential to be (or do) and the potential not to be (or do). Beckettian characters together with other figures, such as Bartleby, let us think of a life in its potential not to be. The life of the individual gives way to impersonal and singular life: a life of pure immanence. Such a life can be immanent to a man who no longer has a name, though he can be mistaken for no other: the Beckettian Unnamable.

Keywords: becoming imperceptible, a life, potentiality, virtuality

In *Essays Critical and Clinical*, Deleuze discusses Beckett's *Film* as an attempt to escape both perception and self-perception: 'How does one become imperceptible?' (Deleuze 1997: 23). He invites us to imagine Bishop Berkeley who had enough of being perceived and of perceiving. There is something unbearable in being perceived. Referring to Beckett's *Film*, Deleuze asks: 'How can we rid ourselves of ourselves, and

www.eupjournals.com/dls

demolish ourselves?' (Deleuze 2008: 69). This is, as Deleuze has put it, 'the problem', which is followed by 'the general solution': we can get rid of ourselves by becoming imperceptible. 'Becoming imperceptible is Life, "without cessation or condition" ... attaining to a cosmic and spiritual lapping' (Deleuze 1997: 26). This 'general solution' poses many theoretical problems: what does becoming imperceptible mean in Deleuze and Beckett's universe and where does it lead? If becoming imperceptible leads to molecular dissolution, what does a life signify in this specific context? And, finally, what are the conditions of possibility for becoming imperceptible? Can we examine this possibility in terms of pure potentiality?

I. Deleuze: A Life

In his last text, *Pure Immanence: Essays on A Life*, Deleuze introduces the notion of a life which is quite different from any understanding of life as the self or personal identity. Contrary to these expectations, a life refers to 'impersonal individuation rather than personal individualization', to 'singularities rather than particularities' (Rajchman 2005: 8). A life is an indefinite quality, a 'virtuality', which may appear in the actual life of the individual. Deleuze refers to Charles Dickens's novel *Our Mutual Friend*, and especially to an episode describing a dying man:

> Between his life and his death, there is a moment that is only that of *a* life playing with death. The life of the individual gives way to an impersonal and yet singular life that releases a pure event freed from the accidents of internal and external life, that is, from the subjectivity and objectivity of what happens [...] The life of such individuality fades away in favor of the singular life immanent to a man who no longer has a name, though he can be mistaken for no other. A singular essence, a life ... (Deleuze 2005: 28–9)

Deleuze speaks about singularities without individualities: for example, very small children do not have individuality but they have singularities: a smile, a gesture ... These singularities can also be reached by becoming imperceptible, which ends by becoming like everybody else. This is the experience of F. Scott Fitzgerald: 'after a real rupture, one succeeds ... in being just like everybody else' (Deleuze and Guattari 2004: 308). Becoming everybody/everything (*devenir tout le monde*) means many things: it is becoming imperceptible, becoming indiscernible, becoming impersonal. As far as all these features relate to the Body without Organs,[1] we can presume that becoming imperceptible

leads not to nothingness or the total dissolution of the subject but to the virtual state of the Body without Organs. This virtual state of the Body without Organs comes into play by haecceity, in the production of intensities, in the medium of becoming and transformation (558–9). Becoming imperceptible is a passage from one state to another, an increase or decrease in power (a virtual quality).

> Such is the link between imperceptibility, indiscernibility, and impersonality – the three virtues. To reduce oneself to an abstract line, a trait, in order to find one's zone of indiscernibility with other traits, and in this way enter the haecceity and impersonality of the creator. One is then like grass: one has made the world, everybody/everything, into a becoming . . . (Deleuze and Guattari 2004: 309)

The haecceity and impersonality of the creator is what Deleuze calls a life. In this sense, 'A life contains only virtuals. It is made up of virtualities, events, singularities' (Deleuze 2005: 31). By virtuality, Deleuze means that it is not something that lacks reality but something that can be actualised in any event or a state of things, in any object or subject. Regardless of these actualisations, the plane of immanence, which is also the plane of the Body without Organs, is purely virtual and contains only virtualities. 'Events or singularities give to the plane all their virtuality, just as the plane of immanence gives virtual events their full reality' (31). Being a virtual quality, a life may or may not connect with the life of the individual: it appears in the writings of Dickens or Fitzgerald and especially in Beckett, because 'nothing is ever finished in Beckett, nothing ever dies' (Deleuze 1997: 26). Immobilised, paralysed and submerged in a state of becoming imperceptible, Beckett's characters still reconnect to this virtual quality of a life which keeps them going. As Deleuze points out, 'When the character dies, as Murphy said, it is because he has already begun to move in spirit. He is like a cork floating on a tempestuous ocean: he no longer moves, but is in an element that moves' (26). This is what becoming imperceptible strives for: to get rid of perception and self-perception, to empty space both from objects and the subject, to rid ourselves of ourselves. At the end of Beckett's *Film*, after all possible amputations,

> The room has lost its partitions, and releases an atom into the luminous void, an impersonal yet singular atom that no longer has a Self by which it might distinguish itself from or merge with others. Becoming imperceptible is Life, 'without cessation or condition' . . . attaining to a cosmic and spiritual lapping. (Deleuze 1997: 26)

II. Agamben: Pure Potentiality

Giorgio Agamben in his essay 'Absolute Immanence' reads Deleuze's last text[2] with wonder and great admiration. What is a life? What does it mean that a life is virtual and consists only of virtualities? Agamben, referring to specific punctuation in Deleuze's text (a colon, ellipsis dots), points out the indeterminate character of this term: contrary to the life of the individual, a life refers to impersonal and non-organic power. 'The technical term *a life*... expresses this transcendental determinability of immanence as singular life, its absolutely virtual nature and its definition through this virtuality alone' (Agamben 1999: 224). The most important thing here is that life for Deleuze might do without any individuality: in other words, it is detached from individual or subjective consciousness; but a life always has a singularity, a haecceity. In this sense, a life eludes all transcendence of the subject and of the object: a life is a pure immanence because it is immanent only to itself. Quite paradoxically, Agamben equates the Deleuzian notion of life with his own notion of bare life: for example, referring to Dickens's text, he points out that 'The fact is that the *bare life* that it presents seems to come to light only in the moment of its struggle with death' (230; my emphasis). Agamben is right to state that the notion of life appears simultaneously in the works of Michel Foucault and Deleuze; but if for Foucault life explicitly relates to the question of the body and of population, what it means for Deleuze remains quite mysterious. Nevertheless, Agamben interprets the term saying that

> the difficult attempt to clarify the vertigo of immanence by means of 'a life' leads us instead into an area that is even more uncertain, in which the child and the dying man present us with the enigmatic cipher of *bare biological life* as such. (Agamben 1999: 230; my emphasis)

Bare biological life is one of the key concepts in Agamben: bare life is the 'invention' of power, it is the object of power and at the same time the resistance to power. Thus, for Agamben bare biological life necessarily is a political category, engendering both the annihilation and the extension (procreation) of life.

Another interesting thing in Agamben's reading of the Deleuzian text is related to the notion of potentiality. First, Agamben's reading of the Deleuzian text on a life appears in the chapter on potentiality. Second, Agamben several times interprets 'a life' in terms of pure potentiality, although this term is missing in the English translation of the book. For example, Agamben translates the Deleuzian example of a child's smile as

an instance of pure potentiality: 'The smallest infants are traversed by an immanent life that is pure potentiality [*pure puissance*], even beatitude through suffering and weaknesses' (Agamben 1999: 230).[3] Trying to find the meaning of the 'vertigo' of immanence, Agamben discusses two possible modes of understanding vitalism in Deleuze: the first as act without essence, the second as potentiality without action. Agamben points out that

> As absolute immanence, *a life*... is pure contemplation beyond every subject and object of knowledge; it is pure potentiality that preserves without acting. Brought to the limit of this new concept of contemplative life – or, rather, living contemplation – we cannot then fail to examine the other characteristic that, in Deleuze's last text, defines life. In what sense can Deleuze state that *a life*... is 'potentiality, complete beatitude?' (Agamben 1999: 234)[4]

Agamben explains that in the field of immanence desire is immanent to itself and in this sense it lacks nothing. Potentiality is a life that preserves itself, desires itself and is complete in its immanence. 'It is, then, possible to comprehend why Deleuze writes that a life is "potentiality, complete beatitude" ', he continues. 'Life is "composed of virtuality"; it is pure potentiality that coincides with Being, as in Spinoza, and potentiality, insofar as it "lacks nothing" [...]' (Agamben 1999: 237).

In the last citation, Agamben equates his own notion of potentiality with the Deleuzian notion of virtuality. The notion of potentiality or the potential should be differentiated from the notion of possibility because Deleuze makes a clear distinction between 'the possible' and 'the virtual'.[5] For Deleuze, the possible doubles reality and simply waits to be realised; by contrast, virtuality or potentiality does not have to be realised because it is already real; virtuality or potentiality can be actualised following the lines of differentiation and divergence. Similarly, for Agamben, a potentiality, in distinction from mere possibility, means the potential for something to be and not to be at the same time. In other words, it introduces the occurrence of contingency. As Agamben points out, 'It is a potentiality that is not simply the potential to do this or that thing but potential to not-do, potential not to pass into actuality' (Agamben 1999: 179–80). Following Aristotle, this means that all potentiality is also an impotentiality of the same and in respect to the same. 'Beings that exist in the mode of potentiality *are capable of their own impotentiality*; and only in this way do they become potential' (182). Agamben explains this potentiality of not being as a fundamental passivity which is at the heart of every potentiality: 'Every human power is *adynamia*, impotentiality' (182). Without this potential

of not to be, potentiality would have passed into actuality and would be indistinguishable from it. But this is the biggest challenge for philosophy: how to think of the potentiality of not being?

The example of such a potentiality of not being Agamben finds in Melville's Bartleby – a character that is also very important for Deleuze. Deleuze interprets Bartleby's formula 'I would prefer not to' as an exhaustion of language and of all action possibilities. Bartleby counts what he prefers not to do and at the same time renders what he was doing impossible.

> The formula is devastating because it eliminates the preferable just as mercilessly as any nonpreferred. It not only abolishes the term it refers to, and that it rejects, but also abolishes the other term it seemed to preserve, and that becomes impossible. In fact, it renders them indistinct: it hollows out an ever expanding zone of indiscernibility or indetermination between some nonpreferred activities and a preferable activity. [...] I would prefer nothing rather than something: not a will to nothingness, but the growth of a nothingness of the will. (Deleuze 1997: 71)

Here we see that the great metaphysical question 'Why there is something rather than nothing?' is interpreted by Bartleby in the opposite way: 'I prefer nothing instead of something.' Deleuze interprets this non-preference not as a will to nothingness (a formula for nihilism) but as nothingness catching the will itself, as a pure patient passivity. Deleuze points out that many other of Melville's characters prefer 'no will at all, a nothingness of the will rather than a will to nothingness [...] They can only survive by becoming stone, by denying the will and sanctifying themselves in this suspension' (Deleuze 1997: 80). This nothingness of will is also the main feature of Beckett's characters: here we can think about Molloy, Malone and the character of *The Unnamable* who prefer to become imperceptible or indiscernible on the surface of the earth.

It is precisely this nothingness of the will that makes Bartleby an extreme figure of potentiality: 'As a scribe who has stopped writing, Bartleby is the extreme figure of the Nothing from which all creation derives; and at the same time, he constitutes the most implacable vindication of this Nothing as pure, absolute potentiality' (Agamben 1999: 253–4). Thus, Bartleby's formula 'I would prefer not to' equally opens the potential to be (or do) and the potential not to be (or do). Agamben carefully reads Aristotle's doctrine of potentiality: 'For Aristotle, all potential to be or to do something is always also potential not to be or not to do (*dynamis mē einai, mē energein*), without which

potentiality would always already have passed into actuality and would be indistinguishable from it [. . .]' (245). The potential not to be is crucial here and it transforms every potentiality into an impotentiality. The architect has the potential to build even if he does nothing; Bartleby has the potential to work even if he prefers not to. While Aristotle defines the possible-potential (*dynaton*) as something which in the process of realisation eliminates its potential not to be (or impotentiality),[6] Agamben points out that it is precisely the potential not to be (or contingency) that is at the core of the notion of potentiality. Agamben recalls *Theodicy* by Leibniz, which describes the Palace of Destinies, composed of infinite chambers with different possible destinies. This 'Baroque inferno of potentiality' shows everything that could have been, but was not and 'in which nothing is compossible with anything else and nothing can take place' (266). Contrary to this mausoleum of possibilities, Bartleby keeps open the potential not to be and in this sense redefines a life as contingency.

III. Deleuze and Beckett: Potentiality as Exhaustion

The question of potentiality reappears in Deleuze's text on Beckett – 'The Exhausted'. Here, Deleuze describes Beckett's character as someone who is exhausted in relation to potentiality. This is explained through the distinction between someone who is tired and someone who is exhausted: 'The tired person has merely exhausted the realization, whereas the exhausted person exhausts the whole of the possible. The tired person can no longer realize, but the exhausted person can no longer possibilize' (Deleuze 1997: 152). The tired person is someone who cannot do something, but the exhausted exhausts the potential to be (or do) and not to be (or do) and drowns into impotentiality. Deleuze points out that tiredness and exhaustion presuppose a different combinatorial logic: in tiredness the possible is realised according to a certain plan or goal; one possibility is preferred and realised and another is excluded (you can choose shoes to go out or slippers to stay in). By contrast, in exhaustion one possibility is not excluded for another but all possibilities coexist with one another and become interchangeable (for example: shoes to stay in; slippers to go out). 'The disjunctions subsist, [. . .] but the disjointed terms are affirmed in their nondecomposable distance [. . .] The disjunction has become *inclusive*: everything divides, but into itself [. . .]' (153). This means that in exhaustion all possibilities coexist in potentiality without any structure or plan. They are not only possible or impossible but compossible, coexisting in their potentiality.

As such, potentiality is not something to be realised (only possibility can be realised) but a contingency that can or cannot occur: 'One no longer realizes, even though one accomplishes something. [...] one remains active, but for nothing. One was tired of something, but one is exhausted by nothing' (153). Exhaustion as potentiality is non-preference: 'I would prefer not to', Bartleby's Beckettian formula. 'Beckett's characters play with the possible without realizing it; they are too involved in a possibility that is ever more restricted in its kind to care about what is still happening' (153).

Deleuze calls this 'play with the possible without realizing it' the combinatorial and establishes a connection between the combinatorial and exhaustion: 'Must one be exhausted to give oneself over to the combinatorial, or is it the combinatorial that exhausts us, that leads us to exhaustion [...]?' (Deleuze 1997: 154). Deleuze refers to different combinatorial practices in Beckett: this is the combination of 'sucking stones' in *Molloy*, or the combination of five small biscuits in *Murphy*. The combinatorial relates to specific practices of exhaustion of language, words and things, and also the exhaustion of potentialities of space in *Quad*. These potentialities are counted without any interest or preference, because they are revealed not to be realised (to be or do) but to open their potential not to be or not to do. In Beckett's universe, there are no necessities (cannot not be) or possibilities (can be); there are only contingencies, which equally open the potentiality and impotentiality.

Sarah Gendron points out that the potentiality not to be is one of the main features of Beckettian characters:

> This is the status of the majority of Beckett's characters: if they *are*, what they *are* is 'not quite there'. [...] Some of his characters are literally absent in one way or another. 'Auditor' in *Not I* can, for example, be seen but not heard. Others, like 'V', the offstage voice in *Footfalls*, can be heard but not seen. (Gendron 2004: 49–50)

Beckett's characters are always on the edge of nothingness, about to vanish or expire, like Malone in *Malone Dies*, or the character of *The Unnamable*. Some of these characters, like ghosts or the chorus of urns (*Play*), never promised to be present. Some of them are only body parts, or the Organs without Bodies, like MOUTH in *Not I*. As Gendron points out,

> Beckett's subjects [...] greatly resemble what Deleuze calls the 'virtual object', an entity that escapes determination, and in particular humanization. [...] They are, like Ada, May, V, and Willy never *quite there*. Never fully present,

> they are also never entirely absent. They have the property of 'being *and* not being where they are, wherever they go'. (Gendron 2004: 51)

Regardless of their vague existence, Beckettian characters still have this quality of life, of immanent substance, which keeps them going. For example, in *Malone Dies* the character states:

> But what matter whether I was born or not, have lived or not, am dead or merely dying, I shall go on doing as I have always done, not knowing what it is I do, nor who I am, nor where I am, nor if I am. (Beckett 2010a: 53)

The character is always in the process of becoming imperceptible, becoming the virtual Body without Organs, which can take different shapes and consistencies: sometimes 'I go liquid and become like mud', sometimes 'I am so hard and contracted' (Beckett 2010a: 51); sometimes the character can hardly resist the sensation of dilation, so that his body covers the surface of the world, sometimes he shrivels and shrivels (61–2). He would gladly give himself the shape and consistency of an egg, 'with two holes no matter where to prevent it from bursting, for the consistency is more like that of mucilage' (Beckett 2010b: 15). But the most important thing is that by becoming imperceptible he brings his molecular components into play with the world – he makes a world:

> perhaps that's what I feel, an outside and an inside and me in the middle, perhaps that's what I am, the thing that divides the world in two, on the one side the outside, on the other the inside, that can be as thin as foil, I'm neither one side nor the other, I'm in the middle, I'm the partition, I've two surfaces and no thickness, perhaps that's what I feel, myself vibrating, I'm the tympanum, on the one hand the mind, on the other the world, I don't belong to either [. . .] (Beckett 2010b: 100)

Although the Beckettian subject always already appears in the mode of impotentiality, it is precisely this impotentiality that carries a life in its pure potentiality.

Notes

1. The three characteristics defining the becoming imperceptible (the (anorganic) imperceptible, the (asignifying) indiscernible, and the (asubjective) impersonal) relate with the three characteristics defining the Body without Organs: the disarticulation of the body, the deconstruction of signification, and desubjectification (Deleuze and Guattari 2004: 177, 308). From this we can conclude that becoming imperceptible leads toward becoming the Body without Organs.

2. Deleuze's *Pure Immanence: Essays on A Life* originally was published under the title *L'Immanence: Une Vie* (Editions de Minuit, 1995), which is translated by Agamben as *Immanence: A Life* (Agamben 1999: 221).
3. In English translation: 'Small children, through all their suffering and weaknesses, are infused with an immanent life that is pure power and even bliss' (Deleuze 2005: 30).
4. In English translation: 'complete power, complete bliss' (Deleuze 2005: 27).
5. In *Difference and Repetition* Deleuze makes a distinction between 'the potential or virtual object', which can be actualised through differentiation and divergence, and the logical possibility, or the possible, which resembles the real (Deleuze 2004: 263–4). On the difference between the virtual and the possible, also see *Bergsonism* (Deleuze 1991: 96–7).
6. 'A thing is said to be potential if, when the act of which it is said to be potenial is realized, there will be nothing impotential' (Aristotle *Metaphysics*, 1047 a 24–6, cited in Agamben 1999: 264).

Book Reviews

Scott Wilson (2008) *The Order of Joy: Beyond the Cultural Politics of Enjoyment*, New York: SUNY Press
and
Gregg Lambert (2006) *Who's Afraid of Deleuze and Guattari?*, London and New York: Continuum.

Where does the theoretical battle between Lacan and Deleuze stand today? Has a battle that, begun amidst the fallout from Deleuze and Guattari's *Anti-Oedipus* and pitched polemically as the final tussle between ontological negativity and positivity, finally ceased, or have the very terms of battle themselves been irrevocably questioned? With the recent English publication of François Dosse's joint biography *Deleuze-Guattari* (2010), Anglophone academia has an opportunity to assess more closely the multifaceted and frequently obstreperous relation between Deleuze, his former Lacanian co-author Guattari, and Lacan himself, to say nothing of Freudian psychoanalysis more generally. Dosse's commentary renders Lacan as little more than a hazy, mythical outline, a shadow to be escaped by Guattari through his pioneering work in group analysis at the La Borde clinic and to be endlessly resented and shadow-boxed by Deleuze, who nevertheless seems to borrow much from Lacan in his single-authored books of the late 1960s.

In this essay, I will try to fill in something of that mythical outline, and in so doing try to indicate the irretrievable convergences and divergences that make the Lacan/Deleuze disjunction an especially fruitful one for contemporary theory. In the interstice between Lacan and Deleuze lie pressing questions around the interface between theory and politics, around the relative importance of metaphysics for contemporary thought, and around the question of language and the symbolic in their relation, positive or negative, to philosophical and artistic creation. My guide in broaching these questions will be two books, very different

Deleuze Studies 6.4 (2012): 638–649

in style and approach but both implicated in the debate in useful ways: Gregg Lambert's *Who's Afraid of Deleuze and Guattari?* and Scott Wilson's *The Order of Joy: Beyond the Cultural Politics of Enjoyment*. I hope to sketch a divergent portrait of Deleuze and Lacan that inserts both within a wider context of understanding, one defined by the schism between two particular approaches to modernity, and to modernism: maximalism and minimalism. One approach, maximalism, would respond to the discrepancy between history and any attempted theoretical or artistic representation of its movements through an affirmational insistence on life, or time, or desire as vital forces that cut across temporal distinctions; the other, minimalism, would subtract all but the most formal elements necessary to invoke the disjunction between history and its theorisation, or between modernity and modernism.

There has been comparatively little work done on the relation between Lacan, Deleuze and the intersection of modernity and modernism, both concepts bound up with a particular reading of the relation between history and the persistence of a philosophical and artistic avant-garde pitched against its tide. The cultural and literary references that pepper the work of both thinkers are canonically modernist: in Lacan, the persistent references to Joyce and, to a lesser extent, Beckett, are intimately related to his subtractive and formalist vision of psychoanalysis. Just as Beckett's late plays and novels assumed a more and more minimalist form, so would the form of Lacan's work – principally his famous seminar – and the conceptual framework that unfolded within it take on the spare, ascetic character redolent of the high modernism of the second half of the twentieth century. Deleuze, too, would devote much attention to Beckett and to the modernist vortexes of Francis Bacon, but despite the plethora of references to avant-garde culture from his early work up to his extraordinary books on cinema, the conceptual framework that animated his thought would resist the subtractive current of modernist experimentation, instead adopting something of a maximalist insistence on the primacy of positivity and life as the condition of any truly creative philosophical avant-garde. Underpinning this metaphysics of creation lies a conception of desire stripped of any determinant negativity, arguably more Freudian than Lacanian in its insistence on an originary positivity prior to the territorialisation of desiring flows in temporary sediments or 'machines'[1]

This is only a rough typology, to be sure, and one should not make the mistake of buying wholesale Deleuze and Guattari's own occasional mischaracterisation of Lacan in the two volumes of *Capitalism and*

Schizophrenia as a thinker dedicated to constitutive negativity and the shackling of desire to Oedipal law. Lacan's later seminars, in particular, emphasise consistently a concept, *jouissance*, entirely removed from the constrictive domain of a positive/negative opposition. As the internal excess that attends the operation of symbolic castration, *jouissance* can be said to transcend the dialectic of negativity that characterises desire in its usual, tragic form. To this extent, *jouissance* is something of a conceptual cousin to Lacan's famous *objet petit a*, the object that 'falls out' of the Symbolic as an avatar of the division of the subject and as an embodiment of desire's tragic movements.

The psychoanalytic object, for Lacan, and somewhat paradoxically, is to be found outside the bounds of the standard subject/object opposition, and as such outside the bounds of any distinction between positivity and negativity, affirmation or negation, although its relation to desire implicates it nonetheless in the terrain of subjective division and failure that discords with Deleuze's emphasis on vital creation. *Jouissance*, in particular, is central to Scott Wilson's *The Order of Joy*, a book that admirably attempts to put Lacanian concepts to work rather than continue their seemingly endless exegesis, and that uses aspects of Deleuze's thought to incite Lacanian ideas to take on new forms outside their clinical application. Indeed, *jouissance* might be useful as a bridging concept between Lacan and Deleuze; while Deleuze makes much of *objet petit a* in his *Difference and Repetition* and *Logic of Sense*, it is *jouissance* as the excessive substance of the human drive that most closely cleaves to the prevailing vitalism of Deleuze's metaphysics. There are as many differences as similarities, of course, and these will become apparent in my reading of Wilson's book.

The Order of Joy is situated between philosophy, psychoanalysis and cultural studies. Much of its argumentative structure is derived from a similar merging of conceptual coordinates, with Deleuze's insistence on vital immanence intermixed with a Lacanian concern for the articulation of subjective and social forms of signification and affect. The principle virtue of Wilson's book, despite its occasional forays into overstatement and undertheorisation, is its willingness to find common cause in Lacan and Deleuze, not merely as an academic exercise but as a means to throw light on prevailing political and cultural concerns. The 'order of joy' is the name Wilson gives to the contemporary conjuncture of war, commerce and the state, a conjuncture widely defined as characteristic of a 'supercapitalism' that has all but destroyed the meaningful distinctions between law, transgression, citizen and commodity, distinctions that sustained the normative governmental discourses of the twentieth

century. As Wilson writes, 'the empire thrives on the disorder in which various multitudes assemble and disassemble in different divisions of joy' (25). The book is ordered as an investigation in turn of each of these poles of contemporary life, with a sustained emphasis on the ways in which each element of contemporary capitalism – war, commerce, the state – organises the forms of joy that both sustain and threaten them.

Given its centrality to the architecture of Wilson's argument, 'joy' itself remains relatively underspecified conceptually. Indeed, it seems to act mainly as a placeholder or avatar for the various kinds of pleasure that, for Wilson, are the main aim and the main result of contemporary cultural and political practices in the 'West'. As he writes, in typically unequivocal fashion, 'A general economy of pleasure, enjoyment, and joy shapes particular orders of subjective experience. Pleasure and pain constitute a continuous, fluctuating surface that provides the interior and exterior boundary of the subject in its sensitive broaching of the real' (xv). Thus, the task of the contemporary theorist is to unlock the various manifestations of pleasure and displeasure as they fuel the growth of supercapitalism and its various pathologies. Lacanian *jouissance*, as a kind of affect that transcends the old and, for Wilson at least, superseded dialectic between law and transgression, is the principle inspiration underlying Wilson's invocation of 'joy', but it is through the articulation of the an-economism of *jouissance* with the immanence of Deleuze's metaphysics that Wilson's theoretical wager lies.[2] The conceptual function of 'joy', as well as providing an umbrella for the various kinds of affect that Wilson reads off the intersecting surfaces of war, economy and governance, is also designed to provide a buffer against what Wilson describes as the 'hyperrationalism' of Lacanian theory as it has been formalised by Jacques-Alain Miller, the general editor of Lacan's seminars.

The question of formalisation captures an interesting tension between the differing heritages of Lacan and Deleuze, and one intimately connected to the minimalism/maximalism typology I identify above. Wilson broadly follows Elizabeth Roudinesco's characterisation of Jacques-Alain Miller's editorial project, arguing that 'Miller's growing influence was itself one of the reasons why Deleuze and Guattari wanted to give Lacan "some help" in the liberation of some of his concepts from the dogmatism that was surrounding them' (4). The easy equation of formalisation, something that Lacan held as being essential for the growth of psychoanalysis as a theoretical science, with dogmatism here underlines Wilson's essentially Deleuzo-Guattarian commitment to an ontological fluidity, a fluidity that repeatedly bleeds into the conceptual

structure of his argument. The implication of Wilson's aversion to Miller's formalism is that psychoanalytic categories must mirror the flux and contingency of the contemporary order if they are to have any purchase on it. Indeed, much of the polemical focus of Wilson's analysis of 'supercapitalism' comes from his repeated insistence that previously discrete categories are now so thoroughly in flux as to be formally indistinguishable, a process of merging, of a kind of forced and absolute becoming, that typifies the violent impact of excessive control and the 'imperial power of capital'. Wilson's insistence on the violent interpenetration and growing indistinctness of aspects of contemporary life reaches its apogee in the following:

> The following questions, therefore, need to be posed to the concept of jouissance in an era when the concepts of work, leisure, knowledge, production, truth, meaning, the good, utility, sex, the body have become problematized to such a degree that they barely seem operative. (11)

But we might ask whether, far from hobbling our analyses of contemporary politics and culture, the development of a formal language serves to cut us off, however temporarily, from the immanent flux and disorder that is itself now an ideological and structural prerequisite for the sustenance and expansive power of capital, and in so doing gives us temporary access to the interstitial space of critique. As many have already cautioned, is there not a danger that, by closely cleaving to the presumed fluidity of forms of social life, a Deleuzian analytical language risks reproducing what it purports to critique? Or instead, one might argue that there is, in fact, nothing inherent to the construction of a relatively stable conceptual language that *precludes* its adaptation to the exigencies of history and political change; indeed, a fair amount of Wilson's diagnostic of contemporary capitalism is striking, despite its vaunted lack of 'dogmatism', for its rigid ahistoricism, in the sense that its conceptual architecture, whilst built up with a rhetoric of intensity and difference, is rather too firmly fixed in place (exclusively, the 'West' of advanced capitalism and consumption) and time. One gets little sense from Wilson's analysis of how the particular types of joy that he identifies emerge, and how they might be replaced.

To return to the categories of minimalism and maximalism I introduced earlier, we can characterise aspects of Wilson's *The Order of Joy* as embodying the point at which a commitment to a non-hierarchical theoretical language of immanence, one underpinned by the privileging of a non-representational substance or affect ('joy' in this instance), tips over into an uncomfortably rigid *minimalism*, one that precludes

the distance and critical flexibility that the best analytical languages afford us. The subtractive conceptual minimalism that I associate with Lacan, by contrast, is one that permits a sense of the interdependence of our categories of analysis while permitting an estranging distance between the language and object of analysis, an estrangement itself conceptualised as the very condition for the disjunction and articulation of the signifier and the Real. A good comparative example, and one that Wilson himself puts to interesting effect, is Lacan's use of knots. Frequently and incorrectly dated to the 1970s, Lacan had in fact held a fascination throughout his career with the non-representational power of knots, and in particular with the ways in which they might be used to bypass the semantic structures of language to directly instantiate the interpenetration of psychoanalytic concepts and phenomena. Wilson uses the figure of the Borromean knot, well known as Lacan's favoured figure to instantiate the interpenetration of the orders of the Imaginary, Symbolic and the Real, to figure the overlapping of commerce, war and the state, and to highlight the commingling of his own categories of 'joyful immanence', 'anorganic joy' and the 'event'.

Briefly put, Wilson envisions 'joyful immanence' as placed at the intersection of war and commerce, and as designating the point at which 'an extreme activity meets and becomes indistinguishable from an extreme passivity, in a passionate hatred indistinguishable from love' (27). (Notice again Wilson's compulsive elision and conflation of concepts.) Broadly identifiable as the subjective condition of supercapitalism, joyful immanence signifies the point at which consumption and the production of death in war become articulated. Anorganic joy, by contrast, signifies for Wilson the intersection of war and governance, 'where modes of control overcode the real on a plane of intensity', and where 'governance itself becomes militarized, totalitarian, and control takes a combative and lethal form, particularly with regard to its own population' (26). Joy is here conceptually severed from any particular organism, becoming instead the rootless affect traded between differing forms of the military-governmental nexus. Finally, 'event' designates the relative eclipse of meaning, and in particular the severing of a lack of meaning from its (supposed) conditioning in Lacan by the logic of the signifier. Wilson writes, 'The event that must be affirmed is the death of meaning (or God or judgement), the event that irrupts precisely in the default of function' (31). Thus, supercapitalism is defined by Wilson by its mode of appearing, in the form of irruptions that preclude any resort to the representational and differential logic of the signifier.

For all that one might celebrate the tenacity and originality of Wilson's refiguring of the concept of affect in a sweeping and ambitious diagnosis of contemporary capitalism, and for all that one might lament the lack of context and periodisation with which Wilson imposes his analysis, my focus will remain on the *form* that Wilson's analysis takes, against his own misgivings about the prioritisation of form over content. To do so means to leave aside the multiple cultural analyses that pepper the text, from disquisitions on *Trainspotting* to a perceptive reading of *The Bonfire of the Vanities*. It is not always clear how these cultural interludes elucidate or contribute to the wider stakes of Wilson's argument, but they provide some welcome colour.

What are the stakes, then, of Wilson's appropriation of the Borromean knot, and how might the alternative conceptual minimalism of Lacan's use of the knot highlight some of the limits of Wilson's, and by extension Deleuze and Guattari's, insistence on the plane of immanence? Principally, Wilson extracts from the three interlaced rings of the knot an emphasis on intersection, on the constitutivity of the borderzone, most obviously within the context of the articulation of the aforementioned three variants of joy, but by implication also in the almost apocalyptic vision of contemporary politics that frames the theoretical argument. As Wilson puts it, 'It is where they intersect [...] that the new divisions of joy can be discerned, divisions that disclose the characteristic symptomatology or structure of feeling that characterises supercapitalism' (11). Leaving aside the problematic conflation here of 'affect' and 'feeling', surely concepts that any sustained reflection on the heritage of psychoanalysis in contemporary cultural theory must take pains to differentiate, what is most striking in Wilson's appropriation of the Borromean knot is how *static* his three concepts of joy remain, even upon and through their points of intersection. Thus, despite their proclaimed interpenetration, the 'joyful' vicissitudes of war, commerce and governance are largely considered apart from one another. More seriously from a Lacanian perspective, Wilson seems to rely on the three registers of the Imaginary, Symbolic and Real as conceptual incentives to his own theorising, only to ultimately hold the three apart even as their apparent intersection helps produce the variants on affect that make up the 'order of joy', a holding apart that Lacan's very use of the Borromean knot was explicitly designed to foreclose. In only one of a number of examples, Wilson holds that 'It is in the imaginary domain of self-love rather than in a purely economic or symbolic domain of self-interest that commerce takes place, in contradistinction to humanity' (18). Such a claim leaves little room for a theoretical understanding of narcissism

(or 'self-love') as it joins with the calculability of individual and collective forms of symbolic and monetary exchange; to make a polemical point in separating the field of commerce from economic or symbolic self-interest, Wilson risks the very unsubtlety and rigidity that his move was presumably intended to avoid.

Over and above such specific examples, this holding apart of the rings of the knot testifies to the paradoxical rigidity that Wilson's metaphysics, for all its emphasis on fluidity, evinces. We might ask whether it is in the ultimate fidelity to a kind of Deleuzo-Guattarian anti-formalism, what I have christened a modernist maximalism, that threatens to deflate Wilson's analysis into the rigidity of a theoretical minimalism, without the subtractive mutability that characterises Lacan's properly minimal appropriations of knot theory. One final example of this will suffice: in his preoccupation with the event as an eclipse of meaning, Wilson neglects, again we might suspect through his too-quick holding apart of the Symbolic and the Real, the very Real core of the Symbolic, as the material and repetitively meaningless substance of the logic of the signifier as it detaches from relations of signification, in so doing supporting the non-sense of the drives. It is death, specifically, that Wilson holds as having lost all meaning within the evental movements of supercapitalism, but a recognition of the utter penetration of the Symbolic by the Real might have led Wilson to that quintessential drive, the death drive, as the truth of the precariousness of meaning, and to a subsequent realisation that meaning is *always* suspended between sense and non-sense, between death and life, and forever in refusal of the choice of one or the other.[3]

Further, in holding, as Wilson does, that 'The absence of meaning, of even a relation to meaning, is compensated by the passion of love and narcissism' (30), the subtle intrication of – to cite only the rings of the Borromean knot relative to the quote – the Imaginary and the Symbolic is hidden from view. Lacan insisted, from his very earliest seminars to his very latest, that the lauded 'play of the signifier', the maximalist excess of meaning, was an ideological chimera unless considered as the epiphenomenon of a fundamental deadlock in meaning itself tied intimately to the radical, dualistic deadlock of narcissistic self-love, of a subtractive material substrate of signification and forms of identification that, in their non-sense, nonetheless ground the play of signification. Deleuze, as it happens, comes close to such a recognition in his *Logic of Sense* through his own discussions of 'non-sense', but there is little recognition of that in the Deleuzo-Guattarian metaphysics of *The Order of Joy*.

Gregg Lambert, in his irreverent and pithy *Who's Afraid of Deleuze and Guattari?*, largely avoids the risk of theoretical speculation and innovation that makes *The Order of Joy* such an invigorating read. It is a very different book, designed as a response to both prominent critiques of Deleuze and Guattari in contemporary Continental thought, and as a philosophical riposte to Cultural Studies and other related appropriations of the project of *Capitalism and Schizophrenia*, appropriations that 'remain at the level of interpretation' (5). Deleuze and Guattari, by contrast, tasked themselves with 'trac[ing] intensities in the process of "becoming revolutionary" ' (5), although we must register the paradox that this took place within the sphere of book authorship, and therefore to some degree within a matrix of interpretation. The implication of Lambert's comment, though, points us towards the 'prelinguistic and impersonal' (50) as the crux of Deleuze and Guattari's ontological interest, an interest that must, again, be expressed within the constrictive domain of the signifier and its vicissitudes. To some degree, Wilson reckons with the same problem, insofar as his account of war, commerce and the state must simultaneously challenge the normative governmental discourses that held these domains apart, and invent a new analytical language to account for their radical interconnection. To do so would, I think, require a move similar to that made by Lacan in identifying at the level of form the Real and the Symbolic, as co-constituting fields caught in a relationship of constitution and potential dissolution, between meaning and non-meaning.

Lambert, too, poses himself the question of the Real and the signifier, in particular in his polemical confrontation with the critique of Deleuze recently forwarded by Alain Badiou (1999) and Slavoj Žižek (2003). Intriguingly, however, Lambert resists posing Deleuze as an affirmationist foil to the Lacanian and Hegelian attachment to negativity, the reductive typology so often invoked as defining the limits of any potential rapprochement between Lacan and Deleuze, preferring instead to weave their concepts together without reducing one to the other. He makes good use, for example, of an observation by the Lacanian analyst Lucie Cantin, who argues that perversion represents 'the denial of the signifier (of castration) as having any final meaning or word in the subject's own desire: a denial that takes the form of a demonstration [. . .] concerning the nothingness upon which the Other's desire is founded' (87). The pervert, for Cantin, negates the effectivity of Symbolic castration, placing him- or herself in the position of the master of the desire of the Other, pronouncing the final word on the Other's desire while impotently attempting to deny the signifier access

to his or her own desire. Lambert cleverly links such a position to the standard Lacanian critique of Deleuze, whereby the actuality of the logic of the signifier is negated in favour of a 'perverse' desire dominated by the fantasy of flows, of potentially endless flux. Such a position, for Lambert, 'reduce[s] the virtual in Deleuzian philosophy to the position of fantasy in the psychoanalytic reading' (89), and thus occludes the complex mutual interaction of the virtual and the real, reducing the virtual to a mere projection or fantasy of a pre-linguistic energy or drive capable of avoiding definition by the signifier.

The question of the virtual and the real in Deleuze is, to some degree, also the question of the Real and the Symbolic, although no doubt Lambert would object to my substitution of 'fantasy' for 'Symbolic' in my own extrapolation of Deleuze's 'virtual'; nevertheless, the relationship between the virtual and the actual closely mirrors that of the Symbolic to the Real, if only because the virtual, far from being a unified domain separate from the temporary sedimentation of actuality, is a heterogeneous yet unified force situated in a position of what Lacan called 'ex-timacy', of a kind of intimate estrangement, with the actual. What neither Wilson nor Lambert seems able to theorise, however, is the possibility of a virtual, or 'pre-linguistic', force, one that we might associate with non-sense, *inhabiting language itself*. Here again, Lacan's emphasis on the materiality of the signifier, of the Real material substrate that simultaneously constitutes the actuality of sense while threatening it from without, performs a theoretical move beyond the dualism of the virtual and the actual, or beyond Wilson's compulsive collapsing of conceptual demarcations, and that allows a firmer understanding of the breakdown in meaning, of how unmeaning underpins meaning in a paradoxical relation of antagonistic constitution.[4] While the Deleuzian response would be to insist on the wider, metaphysical consequence of the virtual/actual distinction, of its transcendence of the mere logic of signification, this leaves open the question of precisely how the 'pre-linguistic' is inevitably articulated by the signifier; Lacan's account of extimacy at least provides an advance upon any ultimately dogmatic or vitalist separation of the signifier from the virtual, an arbitrary separation that simultaneously reproduces the regressive, pre-theoretical association of the signifier with the function of representation.

Intriguingly, Lambert addresses himself to the same question of the relation of Deleuze to modernity, and to modernism, that I address at the beginning of this essay. Lambert writes:

> in Deleuze's championing of the impersonal and the prelinguistic, one can easily detect the visceral signs of a vital need to escape this particular

> situation, signs which perhaps bear the resonance with so-called modernist aspirations. [. . .] I would suggest there's something else at work which could easily be missed by such too simplistic and reductive a dismissal of Deleuze's poetics. (50)

It is unclear to me why posing the question of Deleuze's relation to modernism would amount to a dismissal of Deleuze's poetics, and one must ask again how a 'poetics', or a particular manipulation of the signifier, can be simultaneously 'prelinguistic' without insisting on the absolute intimacy of the prelinguistic to the Symbolic itself. By the end of Lacan's storied career, it was this insistence that came to define his minimal modernism, one that both interfaces with and contradicts the vital maximalism upon which Deleuze and Guattari's thought is built. Wilson and Lambert, in their very different ways, pose the question well, without quite grasping the analytical language necessary to render this most important of theoretical paradoxes in all its intriguing, and frustrating, complexity.

Notes

1. Freud had insisted on such an originary positivity or 'affirmation' in his essay on Negation (1925). See Freud (2001).
2. There are those for whom such a theoretical synthesis can only result in philosophical confusion and contradiction. My own position on this will become clear as this essay progresses, but for an excellent summation of the argument against such syntheses, see Hallward (2010).
3. Wilson recognises that, for Lacan, 'the life of speaking beings is afflicted with a lack of meaning' (29), but a fuller sense of the interpenetration of the Symbolic by the Real would have underscored how such an affliction is, paradoxically, as much in the service of meaning as it is in its negation. Wilson goes on to cite Deleuze and Guattari's contention that 'What we're interested in is how something works, functions – finding the machine. But the signifier's still stuck in the question "What does it mean?" ' (quoted in Wilson 2008: 29), which seems to me to be another way of avoiding the fundamental collusion of sense and non-sense – indeed, the machinic function cited by Deleuze and Guattari here is an analogue of the material substrate of signification that Lacan so assiduously mapped.
4. Perhaps the finest expression of this argument of Lacan's comes in his 23rd Seminar, where the symptom is radically reconfigured as a senseless but constitutive point of *jouissance* essential to the economy of the subject. See Lacan (2005).

Call for Papers

The First International *Deleuze Studies* in Asia Conference, Taipei, Taiwan

The English Department at Tamkang University, the publisher of the internationally renowned *Tamkang Review*, is pleased to announce that it will be hosting The First International *Deleuze Studies* in Asia Conference on the theme 'Creative Assemblages', 31 May–2 June 2013, and, prior to the conference, the Deleuze Camp, 25–29 May, 2013.

Creative Assemblages

As one of the most important terms in Gilles Deleuze's oeuvre, 'assemblage' refers to the territory of an object along with its own regime of signs and pragmatic system. Yet assemblage also refers to the force of deterritorialisation underlying the structure which is pending to be effectuated so that new connections can be established. In other words, the Deleuzian assemblage is not only a territorial gesture, framing its own territory but also a performative practice of carving out new routes of thinking. Most important of all, Deleuze and Guattari emphasise the epistemological sparks emanating from launching creatively the continual process of territorialisation, deterritorialisation and reterritorialisation of assemblages.

Yet, where can we perceive assemblages? They are everywhere: human beings, as centers of indetermination, are assemblages of images, with which Deleuze 'assembles' the brain with the screen, the world with the film to expound his philosophy of time. Even virtual assemblages on digital networks (email, Facebook, Twitter) in our quotidian life can be regarded as assemblages. Assemblages can be practical and political instead of just theoretical. In this light, to what extent can Deleuze's philosophical thinking assist us to canvass various assemblages in prospect, and what is the assemblage between us and Deleuze in retrospect? Is it possible for us to theorise the new informatics sensibilia by formulating the *dispositif* of the horizontal/rhizomatic assemblages? And apart from the superficial/superfluous assemblages, is it possible to build any vertical but not arborescent assemblage?

Situating this notion in the contemporary world, we are seeking to form transdisciplinary assemblages in order to respond to and have dialogues with the present predicaments. Possible topics for papers may include but are not limited to:

1) Connections between Deleuze and Guattari's work;
2) Connections among all the different arts, including literature, film, music, architecture, etc.
3) Deleuzian Asian Assemblages;
4) Affect and Asian Aesthetics;

5) Image and Thought;
6) Deleuze and Gender;
7) Psychoanalysis and Schizoanalysis;
8) Creative betrayal of Deleuze;
9) Pros and Cons of Deleuze;
10) Ecology with/without Guattari;
11) Digital Folds;
12) Translation as Expression.

Although we wait to hear from several invited speakers, currently confirmed speakers include:

Jeffrey A. Bell (Southeastern Louisiana University, USA)
Ian Buchanan (University of Wollongong, Australia)
Hsiao-hung Chang (Taiwan University, Taiwan)
Claire Colebrook (Pennsylvania State University, USA)
Jiang Yuhui (East China Normal University, China)
Kokubun Koichiro (Takasaki City University of Economics, Japan)
Patricia Pisters (University of Amsterdam, Holland)
John Protevi (Louisiana State University, USA)
Anne Sauvagnargues (École Normale Supérieure de Lyon, France)
Kailin Yang (Taipei National University of the Arts, Taiwan)

If you are interested in presenting at this **conference**, submit panel proposals and/or individual abstracts (maximum 250 words) with your institutional affiliation and a short bio. The deadline for submission of abstracts for the conference is 31 January 2013. However, for early notification, you are encouraged to apply by **1 September 2012**. The conference registration fee is US$180 for regular attendees, US$150 for early birds, and US$110 for students (the subscription fee of *Deleuze Studies is in-built*), including refreshments and lunch each day.

Prior to the conference, there will be a five-day **Deleuze Camp**. As spaces are limited, registrations will be accepted on a first-come first-serve basis. Applications should include a short bio and a brief statement of one's research interests in Deleuze. The camp registration fee is US$220.

The working language of the conference and the camp is English. The webpage of the academic event. http://www2.tku.edu.tw/~tflxcfp/ will be available after 25 March 2012. For further inquiry, please contact Professor Hanping Chiu, the organiser, at hp.chiu@gmail.com

NOTE: Those who pay the registration fee of this conference can be exempted from the subscription fee of *Deleuze Studies* if they register for the **2013** Lisbon Deleuze Studies International Conference.

Deleuze's Rethinking of the Notion of Sense

Daniela Voss

Abstract

Drawing on Deleuze's early works of the 1960s, this article investigates the ways in which Deleuze challenges our traditional linguistic notion of sense and notion of truth. Using Frege's account of sense and truth, this article presents our common understanding of sense and truth as two separate dimensions of the proposition where sense subsists only in a formal relation to the other. It then goes on to examine the Kantian account, which makes sense the superior transcendental condition of possibility of truth. Although both accounts define sense as merely the *form of possibility* of truth, a huge divide cuts across a simple formal logic of sense and a transcendental logic: transcendental logic discovered a certain genetic productivity of sense, such that a proposition always has the kind of truth that it merits according to its sense. In pursuit of this genetic productivity of sense, Deleuze applies different models of explanation: a Nietzschean genealogical model of the genetic power of sense, and in *The Logic of Sense* a structural model combined with elements of Stoic philosophy. This article follows Deleuze in setting up a new and very complex notion of sense, which he radically distinguishes from what he terms 'signification', that is, an extrinsic, linguistic or logical, condition of possibility. Rather, sense has to be conceived as both the *effect* and the intrinsic *genetic element* of an extra-propositional sense-producing machine.

I. The Fregean Account of Sense and Truth

In his famous essay 'On Sense and Reference' (1892), Gottlob Frege introduces the following phraseology: 'A proper name (word, sign, sign combination, expression) *expresses* its sense, *stands for* or *designates* its reference' (Frege 1993: 27). He goes on to examine what the sense of a sign and what its reference is. According to him, the reference of a sign is the definite object that the sign designates, while the sense of a sign contains the 'mode of presentation' of the object. There can be different modes of presentation for the same object. As such there are also different signs for the same object, that is, signs with different senses but with the same reference. Frege's most famous example is that of the 'morning star' and the 'evening star', which are two signs with different senses yet referring to the same planet Venus. Now Frege treats propositions in a similar way (28). Propositions have two dimensions, the dimension of sense and the dimension of reference.[1] The sense that a proposition expresses is the *thought* contained in the proposition. 'Thought' is understood as the 'objective content, which is capable of being the common property of several thinkers' (28), no matter what language they speak and regardless of the desires and beliefs they individually connect with this thought. The reference of a proposition is generally sought by inquiring after the reference of its components. Considering cases in which components of the proposition have no reference, Frege discovers that the lack of reference of a part of the proposition has no bearing upon the sense of the whole proposition but it leaves the question of its reference in abeyance. He cites the example: 'Odysseus was set ashore at Ithaca while sound asleep' (28). Poetry or fiction provides plenty of these examples, that is, propositions that contain proper names without a reference. However, as Frege states, it is only in works of art that we are satisfied with the dimension of sense and do not seek to advance to the question of reference, but in other cases we press on: 'It is the striving for truth that drives us always to advance from the sense to the reference' (29). The dimension of reference is the locus where the question of the truth and falsity of a proposition, that is, its truth-value, is decided. This is why Frege says that the reference of a proposition, if it has one, 'is either the True or the False' (29). By making the truth-value constitutive for the reference of a proposition, Frege stipulates a strangely detached relation between sense and the question of truth and falsity. As Frege concludes: the truth-value of a sentence 'must remain unchanged when a part of the sentence is replaced

by an expression having the same reference' (30). That is to say, although the sense of a proposition might be altered by the substitution of one expression by another, the truth-value of the whole proposition remains the same, provided that the substituted expression has the same reference as the one it replaces. In other words, truth and falsity remain to some extent unaffected by sense. On the other hand, a proposition with no sense cannot be true, and in this respect the requirement of sense is a necessary condition for a proposition to be true. Sense is a 'condition of truth' insofar as it contains a number of logical conditions, which define a grammatically well-formed expression. But sense is by no means a sufficient ground for truth: there are propositions that make perfect sense from the point of view of their form of expression, but that are nonetheless false. An example would be the proposition 'A decahedron is a regular geometrical figure.' It is impossible to find a referent for the whole proposition (decahedrons are nonregular), but still the proposition contains a thought that makes sense and could mistakenly be regarded as true. Thus, in grasping the sense of a proposition, one cannot be assured of its truth-value. The question of truth and falsity is decided only with regard to the dimension of reference, independent from the dimension of sense.

Deleuze's objection to these conceptions of sense and truth and their relation with one another is twofold: having discovered sense as the condition of truth, the relation of the condition to the conditioned is on the one hand too loose and on the other hand too intimate. Let us unfold Deleuze's position step by step.

The relation between the condition and the conditioned is too loose because both terms of the relation remain more or less independent from one another. While sense is indifferent to what it conditions, the conditioned itself, that is, truth, remains unaffected by the condition, which is supposed to render it possible. Sense is only the *formal condition of possibility* of truth (Deleuze 1990: 18/29).[2] That is to say, it can only determine the logical conditions under which a proposition would be true. It cannot exclude the case of false propositions that make sense. As Deleuze says: sense retains 'an extension larger than that which is conditioned, sense does not ground truth without also allowing the possibility of error' (Deleuze 1994: 153/199). Thus Frege's conception of sense cannot materially account for the truth-value of a proposition. In order to determine the truth-value of a proposition, we have to turn to the dimension of reference. There is in fact no way to pass from sense to reference, that is, the truth-value. One can certainly deduce

from one proposition further propositions by means of grammatical transformation rules or semantic implications of concepts, distributed within the original proposition. For instance, given the proposition that a person *x* is a widower, we can conclude from this that *x* is a man, that *x* was married, and that the wife of *x* has died. However, in inferring these further propositions we remain on the same level, the level of signification, and never cross over to the level of denotation or truth. In effect, 'signification can never exercise its role of last foundation, since it presupposes an irreducible denotation' (Deleuze 1990: 18/29). Hence, although sense is discovered as a condition of truth, it amounts only to a formal condition of possibility for a proposition to be true.

The second part of Deleuze's objection actually follows from the first. In making sense the condition of truth, an essential step was made to establish a ground for a 'critique' of truth. However, the critical project is doomed to fail not only because the ground remains larger than the grounded (first objection), but also because the ground is thought *in the image* of the grounded (see Deleuze 1990: 105/128, 123/149). The condition *resembles* the conditioned from the point of view of its logical form. That is to say, within the conditioned or those propositions that we hold to be true (for example, scientific propositions describing objective states of affairs) we already find inscribed the logical form of identity of the concept as well as logical forms of the relations of concepts with one another. We then extract the logical forms of the propositional facts and stipulate them as the formal conditions of possibility for a proposition being true in relation to an objective state of affairs.

According to Deleuze, we are trapped in a circle: 'One is perpetually referred from the conditioned to the condition, and also from the condition to the conditioned' (Deleuze 1990: 19/30). This is to say that the condition is nothing but the *form of possibility* of the conditioned, and the form of possibility is fabricated retroactively in the image of the conditioned. Deleuze states that

> by whatever manner one defines form, it is an odd procedure since it involves rising from the conditioned to the condition, in order to think of the condition as the simple possibility of the conditioned. Here one rises to a foundation, but that which is founded remains what it was, independently of the operation which founded it and unaffected by it. (Deleuze 1990: 18–19/30)

It should be noted, however, that Deleuze is not rejecting a whole tradition of linguistic analysis and philosophy of language. He is rather trying to complement it by adding a new dimension to the proposition,

and calling this new dimension 'sense', whilst referring to Frege's dimension of sense as the dimension of signification. Deleuze maintains that the dimension of signification is not sufficient to ground truth, and the dimension of denotation or reference can ground truth only in rare cases, namely when the proposition is assumed to be ready-made and isolated from the context of living thought. As Deleuze says, 'there is only a single case where the designated stands alone and remains external to sense: precisely the case of those singular propositions arbitrarily detached from their context and employed as examples' (Deleuze 1994: 154/200). However, as soon as we place a proposition in the context of living thought, that is, in relation to a problem, we will see how sense is engendered in the particular determination of the problem and its conditions and how this sense already implicates a truth, which cannot be detached from the genesis of sense.

Before we turn to Deleuze's account of sense and truth, we will first look at the Kantian definition of sense and Deleuze's rejoinder that the Kantian critique merely replaces the formal possibility with transcendental possibility. According to Deleuze, 'Kant invented two new forms of possibility, the transcendental and the moral' (Deleuze 1990: 18/30). In the following section, we will thus present the Kantian account of sense and truth and then apply Deleuze's criticism to the case of Kant.

II. Kant's Transcendental Logic of Sense

As it is well known, Kant draws the 'clue to the discovery of all pure concepts of the understanding' (Kant 1998: A76/B102) from the Aristotelian table of logical forms of judgement.[3] He recognises the importance of the logical forms of judgement as the formal condition of possibility for a proposition to be true. Thus Kant claims that 'the formal aspect of all truth consists in agreement with the laws of the understanding' (A294/B350). This is to say that certain laws of the understanding, for example the principle of non-contradiction, must hold for all cognitions posed in propositional form. In this way, general logic provides a necessary formal criterion of truth.[4] However, Kant goes much further than general logic can ever go. He explains that *general logic* only considers the logical form of our cognitions and their relation with one another, hence it abstracts from all content, that is, from any relation of our cognitions to the object (A55/B79). *Transcendental logic*, by contrast, has to do with pure concepts of the understanding insofar as they are related a priori to objects. Therefore transcendental logic

provides a further criterion of truth: namely the requirement that pure concepts can be constructed in the formal intuition of space and time and thus be related to an object; for without the relation to a possible object of experience, a cognition will completely lose its content and hence all truth.[5]

Kant's invention of the transcendental has a revolutionary effect: truth is no longer simply a matter of adequation with an external state of affairs, as it is suggested from the point of view of an empirical consciousness. To put it differently, the Kantian invention of the transcendental contradicts the simple assumption that the locus of truth for a proposition is the dimension of denotation or reference. The idea that (1) a proposition is true, if and only if what is said or expressed applies to the designated object or state of affairs it refers to, and that (2) a successful reference makes a proposition true, while an unsuccessful reference makes a proposition false, grounds a conception of truth which presupposes the existence of a reality exterior to sense. Kant's revolutionary move is to make truth dependent on sense, which is to say that a true cognition necessarily points beyond itself to an object or state of affairs that can no longer be posited in reality exterior to sense. In fact, Kant renders sense a superior condition of truth, but he does so only at a high cost: namely that of *interiorising* the relation between cognitions and the manner in which they relate to objects or states of affairs. This means that for Kant the outside world is not truly exterior: it remains relative to the a priori conditions of the transcendental subject. In other words, for something to have a sense, that is, to be an object for us, it has to be related to the transcendental conditions that constitute sense. There is nothing beyond this world constituted by the conditions of transcendental consciousness, that is, nothing that we can understand or make sense of. Anything that falls outside the transcendental scheme or structure, that is, that which cannot be constructed in space and time, and ordered according to a priori conceptual rules, is not a possible object for us. One could say that Kant's transcendental philosophy is a *logic of sense*: he stipulates the transcendental conditions for something to have a sense, that is, to be an object for us.

Therefore, it follows that from the point of view of transcendental logic the proposition 'A decahedron is a regular geometrical figure' is nonsensical, that is, without any sense. Since it is impossible to construct a regular decahedron in space, the proposition cannot be related to a possible object of experience, hence it has no content, that is, no sense. It is important to note that while the proposition can be said to have a sense from the point of view of general logic, transcendental logic

dispels this proposition altogether. The same happens with a proposition like the following: 'The width of Navidson's house inside exceeds the width of the house as measured from the outside by a quarter of an inch.'[6] From the point of view of formal logic, there is nothing wrong with this proposition. However, we are dealing with a transcendental impossibility: a house the interior of which is greater than its exterior is an impossible object. Not only can it not be constructed in space, it also contradicts the a priori condition of community. The category of community provides that the coordinated parts in an aggregate determine each other reciprocally. In the case of the house, in which the inside exceeds the outside, there is no reciprocal determination of parts. Thus the proposition cannot be related to a possible object of experience and therefore has no content, no sense. The same kind of transcendental impossibility applies in cases when something appears without any preceding cause, for instance, the sudden apparition of an angel. Such a thing would also be no possible object of experience. We could easily extend the list of examples; what is important to note, however, is that in the Kantian transcendental logic nothing escapes the transcendental conditions of sense. We cannot talk reasonably about an object that contradicts the a priori conditions of experience. To put it positively: whatever proposition we hold to be true, the referent of this proposition has to satisfy the transcendental conditions of sense. In this way, sense is made a superior condition of truth.

To sum up, Kant raises himself above the ordinary dimension of the proposition, the dimension of reference as the locus of truth, and introduces the dimension of sense as a superior condition. In *The Logic of Sense*, Deleuze praises transcendental philosophy for discovering sense as the form of a genetic productivity (Deleuze 1990: 105/128): according to the transcendental principle, 'a proposition always has the truth, the part and the kind of truth which it merits, and which belongs to it according to its sense' (96/117). However, Deleuze shows by the example of Husserl how the transcendental account of a genetic power of sense fails: although transcendental philosophy considers a genesis of sense, the notion of sense remains muddied because it is confused with the dimensions of the proposition, from which it has to be distinguished (98/120).

> It is not only the dimension of signification that is given ready-made, whenever sense is conceived as a general predicate; and it is not only the dimension of denotation that is given in the alleged relation between sense and any determinable or individualizable object whatsoever. It is the entire

> dimension of manifestation, in the position of the transcendental subject, which retains the form of the person, of personal consciousness, and of subjective identity, and which is satisfied with creating the transcendental out of the characteristics of the empirical. (Deleuze 1990: 98/119)

Thus, Deleuze's criticism that we have already encountered still obtains and can be applied to Kant: Kant seeks to provide a transcendental foundation for a proposition to be true, but the transcendental conditions that he stipulates are fabricated *in the image of* the conditioned. In other words, the Kantian approach imports the characteristics of the conditioned into the account of the condition, that is, the transcendental is modelled upon subjective and psychological facts, or how things seem to our empirical consciousness. As Deleuze says at various places, Kant simply traces the transcendental from the empirical (Deleuze 1994: 135/176–7, 144/187). Consequently, the Kantian transcendental conditions produce exactly the propositions of knowledge that they are supposed to ground, because they have been abstracted from the form of the propositions of our empirical consciousness in the first place. According to Deleuze, there is a fatal *circularity* involved to the extent that experience is both presupposed as a fact and legitimised retroactively as the only possible form of experience.

Deleuze further argues that the Kantian transcendental conditions of possibility are 'too large' in relation to what they condition; they represent 'too broad a mesh in relation to what they claim to capture or regulate' (Deleuze 1983: 50/56).[7] They are only conditions of *possible* experience, not of *real* experience (Deleuze 1994: 154/200). The crucial point here is that Kant only provides an account of extrinsic conditioning. This is to say that the Kantian transcendental account depends upon the conformity of the manifold of sense data with the transcendental conditions. The diversity of the world is thus pre-judged and reduced to the objects conditioned by a given field of representation. Deleuze objects that the Kantian attempt to foundation only secures our traditional ways of thinking in accordance with the logic of representation.

By contrast, Deleuze demands that the relation between the condition and the conditioned be one of *intrinsic genesis*, and not of extrinsic conditioning (Deleuze 1994: 154/200). Furthermore, he demands that we must not think of the condition in the image of the conditioned (Deleuze 1990: 105/128, 123/149). It must be rather *something heterogeneous and unconditioned* that is capable of providing a *real*

foundation, that is, not as a transcendental form of possibility but as an *internal principle of genesis*.

In the following section we will discuss Deleuze's own notion of sense, which he sharply distinguishes from the Kantian conception of sense as the necessary relation to a possible object of experience. For Deleuze, sense is produced in a sub-representative domain, instead of being imposed by a superior, linguistic or logical, order of representation. In order to keep these two senses apart, Deleuze introduces a distinction between sense and signification: 'signification refers only to concepts and the manner in which they relate to the objects conditioned by a given field of representation; whereas sense is like the Idea which is developed in the sub-representative determinations' (Deleuze 1994: 155/201). Following Deleuze, this sub-representative domain can be understood as both being (the 'being of the sensible', 140/182) and thought ('the unconscious of pure thought', 155/202). In *Difference and Repetition*, Deleuze will explain the way in which terrible movements, that is, psychic or spatio-temporal dynamisms working within the sub-representative field, give rise to a double genesis: the genesis of the act of thinking within thought and the ontological genesis of species, individuated things and their relations.

III. Deleuze's Use of a Nietzschean Model of the Genetic Power of Sense

Drawing on structuralism and also on Nietzsche's idea of sense production, Deleuze develops his own conception of an intrinsic genesis of sense by making sense the *effect* of the determination of problems. As a starting point we will take up some of Deleuze's thoughts on Nietzsche.

Deleuze summarises Nietzsche's account of sense in his paper 'Conclusions on the Will to Power and the Eternal Return', which he gave at a conference on Nietzsche at the Abbey of Royaumont in 1964:

> A thing never has only one sense. Each thing has several senses that express the forces and the becoming of forces at work in it. Still more to the point, there is no 'thing', but only interpretations hidden in one another, like masks layered on the other … Nietzsche invents a new conception and new methods of interpretation: … by replacing the simple relation between sign and sense with a complex of senses, such that every interpretation is already the interpretation of an interpretation *ad infinitum*. (Deleuze 2004a: 118/164)

For Nietzsche, things are *signs* or *symptoms* of a state of forces or 'will to power'. On Deleuze's reading, it is important not to understand the

will to power as a will that wants power and struggles for recognition. Rather, the will to power designates the differential relationship of forces, which differ not only with regard to their quantity but also with regard to their quality. The quality of a force, that is, its being either an active or reactive type of force, is determined through the difference in quantity with related forces. Following Deleuze's analysis, reactive forces are forces of adaptation, of conservation and obedience, while active forces are those that go to the limit of what they can do and are willing to undergo transformations. Active forces are spontaneous, expansive and creative inasmuch as they give new interpretations and directions. In sum, the will to power expresses the dynamic and differential relations of active and reactive forces that are in a state of combat. Whenever some forces take hold of a thing, they bestow a fresh interpretation to it, that is, determine a new meaning or purpose 'through which any previous "meaning" or "purpose" are necessarily obscured or even obliterated' (Nietzsche 1968a: 513). According to Nietzsche, the entire history of a thing can be read as a 'continuous sign-chain of ever new interpretations and adaptations' (513) whereby each interpretation is the result of a combat of forces. What is important for Deleuze here is that these combats never result in a neutralisation or equalisation of the differences of forces and their internal heterogeneity. On the contrary, what returns is only a *disequilibrium* of forces. There is no final end, no ultimate goal to such processes of differentiation and combat: it is an infinite becoming. Therefore, the sense of a thing is always a *plurality* of senses that expresses the various processes of transformation, resistance or appropriation inflicted on the thing. As Nietzsche says: 'The form is fluid, but the "meaning" [*Sinn*] is even more so' (514).

Thus the meaning or sense of a thing varies as a function of the forces, or the will to power that appropriate it. Moreover, truth for Nietzsche is not an invariant or perspective-independent value: it has to be related to the forces that lurk beneath the surface and determine the sense of a thing or a concept. In his notes from 1887, which are contained in the posthumously published collection of notes entitled *The Will to Power*, Nietzsche says: ' "Truth" is therefore not something there, that might be found or discovered – but something that must be created and that gives a name to a process, or rather to a will to overcome that has in itself no end' (Nietzsche 1968b: 298).

Deleuze praises Nietzsche for bringing the conceptions of sense and truth in relation to forces. He agrees that sense is the product of a complex process and not something already given, inherent in a thing

or concept. In his essay 'On Nietzsche and the Image of Thought' from 1968 Deleuze characterises sense as

> an 'effect', an effect produced, whose laws of production must be uncovered. ... This is one of structuralism's essential ideas, unifying authors as different as Lévi-Strauss, Lacan, Foucault, and Althusser: the idea of sense as an effect produced by a specific machinery, a physical, optic, sonorous effect, etc. (Deleuze 2004b: 137)

Deleuze concedes that his conception of sense has affinities with that of the structuralist tradition, but nevertheless it is not the same. For Deleuze, the machinery that produces sense is not a given static structure but rather a dynamic differentiation of forces such as Nietzsche's will to power. However, Deleuze finally goes beyond Nietzsche, because Nietzsche's genealogical method is still too much lodged within history, that is, the effectuation of historical, socio-political forces. He will add the dimension of virtuality and determine processes of a static genesis or pure becoming that arise in the virtual. A detailed elaboration of the virtual can be found in *The Logic of Sense*, but already in *Difference and Repetition*, Deleuze defines sense as the product of virtual Ideas or problems. As he explains there, the Idea or problem is constituted of sub-representational differential elements which have no sense themselves but which produce sense through their reciprocal relations. Thus sense is constituted in the problem or the Idea, and truth is engendered as the limit object of the production of sense. 'Limit' must be understood in the mathematical sense of the early geometrical phase of differential calculus: the limit as something that is continuously approached but never reached. In this way truth is a limit concept, or a limit object of an infinite genetic series of interpretations (see Deleuze 1994: 154/200). In summary, Deleuze says in *Difference and Repetition*:

> What is essential is that there occurs at the heart of problems a genesis of truth, a production of the true in thought. Problems are the differential elements in thought, the genetic element in the true. We can therefore substitute for the simple point of view of conditioning a point of view of effective genesis. (Deleuze 1994: 162/210)

For Deleuze, the 'problem' is thus a differential structure endowed with an intrinsic genetic power to generate sense. Although the problem can be incarnated in propositional form and in the empirical world, it belongs to an extra-propositional and sub-representative realm. This means that the problem and its conditions remain often unconscious and

have to be made explicit. For it is only in relation to a certain problem that a question becomes possible and a proposition acquires sense.

In order to better understand the way in which sense is produced through the determination of a problem and its conditions and how truth is engendered as the limit of the process of sense production, let us consider an example, the example of Kant. The underlying problem in Kant's *Critique of Pure Reason* can be specified and rendered explicit in propositional form as the question 'What can I know?'. Kant examines our faculties of cognition, defines for each faculty a proper domain for its exercise, and determines the rules of their collaboration in a united common sense. Limits are drawn and illegitimate uses are denounced. However, in his book on Nietzsche, Deleuze challenges the Kantian critique, claiming that 'there has never been a more conciliatory or respectful total critique' (Deleuze 1983: 89/102). Kant merely called the claims to knowledge and to morality into question, but he never questioned the values of true knowledge and true morality themselves. In other words, the higher interests of reason (true knowledge, true morality, true religion) remain sacred. However, following Deleuze (and Nietzsche), the ideals of truth and reason to which Kant devoted himself only conceal the work of established forces, in particular, the State with its territorial claims and imposition of law and order, the Church with its moral authority, and all the prevalent interests and values. 'Kant claims to be beholden to the requirements of truth and reason; but beneath these requirements of reason are forces that aren't so reasonable at all: the state, religion, all the current values' (Deleuze 2001: 69).

Thus Kant's immanent critique of reason by reason itself does not satisfy the demands of a radical immanent critique that abandons transcendent and extrinsic ends of reason. Instead of liberating us from metaphysical convictions, the belief in a transcendent realm of truth, essences or Ideas, Kant simply replaces the fetters by subjugating us to reason and its interests. We are told that we are free when we obey the demands of reason, since it is we who are giving the orders. In this way, reason persuades us to continue being docile (see Deleuze 1983: 92/106). Following Deleuze's and Nietzsche's analysis, Kant successfully installed the priest and legislator within us (93/106) and thus the power of the State and the Church remain unchallenged.

As we can see, Deleuze considers the Kantian question 'What can I know?' in relation to its implicit conditions that betray a conservative and moral motivation of the Kantian project. In Nietzschean terms, these implicit conditions are forces, such as the State and the Church, which are at work in an unimpeded manner and constitute the underlying

extra-propositional and sub-representative problem, determining its sense and pointing the way to its solution. Deleuze, however, coins the term of the *dogmatic image of thought*, which replaces the terminology of forces and their effects with that of conditions and postulates producing illusions. It is important to note that the term 'image of thought' does not merely designate a deceptive image or illusion, that is, an ideology that covers up true thought. Rather, thought itself is produced by the image of thought, which acts like a specific machinery *coding* thoughts in accordance with some normative form. As Claire Parnet explains in *Dialogues*, co-authored with Deleuze:

> 'Images' here doesn't refer to ideology but to a whole organisation which effectively trains thought to operate according to the norms of an established order or power, and moreover, installs in it an apparatus of power, sets it up as an apparatus of power itself. The Ratio as tribunal, as universal state, as republic of spirits (the more you are subjected the more you are legislators, for you are only subject . . . to pure reason). (Deleuze and Parnet 1987: 23/31)

Thus for Deleuze, the image of thought has to be considered as a productive machine or apparatus of power that is installed by established forces. It is true that in his early work of the 1960s Deleuze has not yet found the concepts of 'machine', 'coding' and 'apparatus of power' – these concepts will be developed later during the collaboration with Félix Guattari – but he does speak of the image of thought as an established order (that is, the order of representation) and analyses it in terms of a series of postulates that determine what it means to think and what the ultimate goals of thought are. These postulates need not operate visibly; more often they remain unconscious forming implicit subjective presuppositions, which are essentially prephilosophical or non-philosophical in nature. This means that they are already at work when we start to think, although we may not always be aware of it.

In *Difference and Repetition* in particular, Deleuze analyses how the dogmatic image of thought has influenced philosophers in the way they determine their problems and anticipate their solutions. Kant as well fell prey to the dogmatic image of thought, which postulates an affinity between thought and truth and also presupposes the logic of representation which entails the identity of concepts and their logical relations in judgements. In short, when Kant laid out his problem concerning the possibility of knowledge and its limits, he did so under the presupposition of the dogmatic image of thought. The postulates of the dogmatic image of thought were already implicitly at work as the underlying extra-propositional and sub-representative problematic

structure, generating the sense of the Kantian question 'What can I know?'. Hence the general solution that Kant developed, that is, his account of objective knowledge, necessarily satisfies this conditional problematic structure. As Deleuze says at several places: '*We always have as much truth as we deserve in accordance with the sense of what we say*' (Deleuze 1994: 154/200).

The example of Kant illustrates how the truth that he seeks (such as true knowledge) is dependent on the manner in which the problem and its conditions are laid out. It is important to note that the conditions are part and parcel of the problem, that is, they belong to it intrinsically. Whenever we ignore the conditions, under which a question, such as the Kantian question 'What can I know?', is raised, we 'forget' the underlying extra-propositional and sub-representative problem that generates sense, and we are left with an abstract general solution.

> Once we 'forget' the problem, we have before us no more than an abstract general solution, and since there is no longer anything to support that generality, there is nothing to prevent the solution from fragmenting into the particular propositions which constitute its cases. (Deleuze 1994: 162/211)[8]

For Deleuze, the art of posing problems requires bringing to light the conditions that work implicitly at a subconscious level, generate the sense of what we think or say and determine the ultimate goal of thought. In the case of Kant we can see how the conditions and postulates of the dogmatic image of thought produce a transcendental logic of representation, that is, a logic that relates the dimension of sense to the a priori mental structure of the transcendental subject.

IV. Deleuze's Structural Model of a Genesis of Sense

It might have been noticed that throughout this article we have not yet discussed the Deleuzian concept of the event.[9] This is so because it plays a minor role in *Difference and Repetition* and is fully developed only in *The Logic of Sense*. Nevertheless already in *Difference and Repetition* the concept of event is mentioned and it appears that we have to understand Deleuzian Ideas-problems in terms of events.[10] Following Deleuze's analysis, 'problems are of the order of events' (Deleuze 1994: 188/244) and he distinguishes 'real events on the level of the engendered solutions, and ideal events embedded in the conditions of the problem' (189/244). Parallel to this distinction between real (or actual) and ideal (or virtual) events, Deleuze introduces in *The Logic of Sense* two

different readings of time: Chronos and Aion. Chronos is defined as the time of the present which encompasses past and future as horizons relative to the present. According to Deleuze, Chronos designates the empirical or physical aspect of time, insofar as Chronos captures the physical changes in things, their interactions and mixtures. Aion, on the contrary, is defined as a 'virtual time' that slips away from the present by extending indefinitely into the past and the future. Aion is the time of pure events. This distinction between Chronos and Aion is crucial because it allows Deleuze to assign the phenomenon of sense an autonomous status, that is, a kind of independence from the combat of historical and empirical forces. It allows Deleuze to surpass Nietzsche's genealogical method, which is still a form of historical explanation, and to assess sense from a new perspective that regards sense as a surface-effect. In *The Logic of Sense* Deleuze advocates a 'geographical method' for looking at things and he distinguishes three dimensions: the depths of states of life or bodily states of affairs, the heights of 'lofty' Ideas (Platonic or Kantian), and the surface of sense or incorporeal events (see Deleuze 1990: 132/157–8). It is under the impact of Stoic philosophy that Deleuze ties together the logical or linguistic notion of sense and the metaphysical notion of incorporeal events. He will thus define sense as an event. Events are never fully exhausted in any actual space and time (Chronos); instead, they extend indefinitely into the past and the future and therefore belong to Aion or virtual time. To unpack this further let us briefly look at the Stoic physics and the central role it plays for their logic of sense.

Unlike Plato, Aristotle and their schools, the Stoics believed that bodies are the only things that exist and are capable of acting and of being acted upon. However, it is important to note that the Stoics held a very broad notion of 'body': for instance, they argued that bodies also comprise souls on the grounds that causal interaction is possible only between bodies, and since there is causal interaction between soul and body, the soul must be a body.[11] On the same grounds the Stoics also took knowledge, thoughts or virtues (such as wisdom or justice) as bodies.

Apart from this bodily realm of existents, the Stoics distinguished a second realm of non-existent somethings, or incorporeals, which, although they cannot be said to be or exist (infinitive *einai*), nevertheless subsist (infinitive *hyphistasthai*). In other words, incorporeals are not beings but rather a way of being, an *effect* resulting from the interaction of bodies. According to Stoic physics, bodies act as causes to one another, thereby giving rise, not to a new property as we might assume,

but to an incorporeal effect. As the sceptic Sextus Empiricus explains in his work *Against the Professors*:

> The Stoics say that every cause is a body which becomes the cause to a body of something incorporeal. For instance the scalpel, a body, becomes the cause to the flesh, a body, of the incorporeal predicate 'being cut'. And again, the fire, a body, becomes the cause to the wood, a body, of the incorporeal predicate 'being burnt'. (Long and Sedley 1987: 333)

In this quotation we can already see how Stoic physics lays the ground for a new logic that has to deal with incorporeals or incorporeal predicates. In our days we would probably call it a logic of facts or events. However, as the French scholar Émile Bréhier notes in his 1928 book *La Théorie des incorporels dans l'ancien Stoïcisme*:

> In one sense, they [the Stoics] are as far as possible from a conception such as that of Hume or Stuart Mill who reduce the universe to facts or events. In another sense, however, they make possible such a conception by radically separating that which no one before them had – two planes of being: on the one hand, profound and real being, force; on the other hand, the plane of facts which play themselves out at the surface of being, and which constitute a multiplicity of incorporeal beings, without bounds and without end. (Bréhier 1962: 13; my translation)[12]

That which distinguishes the Stoic logic of facts or events from modern and contemporary ideas that conceive objective reality, that is, the universe and every single object as a synthesis of facts, is the Stoic insistence on the relation of attribution or predication of facts to real, corporeal bodies. Reality, or to put it more precisely, existence is corporeal: it comprises the realm of bodies that act and are acted upon. Only the effect that one body brings about in another is incorporeal. For this reason, the Stoics invented the realm of incorporeal predicates or attributes to bodies. As Bréhier argues, the incorporeal attribute that arises as an effect of the causal interaction between bodies coincides with the logical predicate of the proposition: the Stoics used the same word κατηγόρημα (*kategorema*) for both and regarded the verb as its proper expression (Bréhier 1962: 21, 19). Like certain Megarian philosophers, the Stoics interpreted propositions containing the copula *is* and a predicate adjective not as a relation between classes of objects (an object and its property) but as an act constituted by the penetration of bodies (20).[13] For instance, the proposition 'the iron is hot' finds its proper expression in the proposition 'the iron heats'. The red-hot iron is the incorporeal effect of the mixture of two bodies, the fire and the iron.

Thus Stoic logic is concerned with incorporeal predicates or attributes, that which is expressed in a proposition or said by a word. As Sextus Empiricus reports, the Stoics held the opinion

> that three things are linked together, 'the signified' [*semainomenon*], 'the signifier', and 'the name-bearer'. The signifier is an utterance, for instance 'Dion'; the signified is the actual state of affairs [*pragma*] revealed by an utterance, and which we apprehend as it subsists in accordance with our thought, whereas it is not understood by those whose language is different although they hear the utterance; the name-bearer is the external object, for instance, Dion himself. Of these, two are bodies – the utterance and the name-bearer; but one is incorporeal [*asomaton*] – the state of affairs signified [*semainomenon pragma*] and sayable [*lekton*], which is true or false. (Long and Sedley 1987: 195–6)

At first sight, the Stoic distinction between 'the signified', 'the signifier' and 'the name-bearer' seems to parallel the modern Fregean distinction between 'sense', 'sign' or 'proposition', and 'reference'. However, following Frege, the 'sense' of a proposition is an objective *thought* which is understood and shared by a community of speakers, no matter what beliefs and desires they connect with it and what language they speak. Clearly, Frege presupposes that a thought can be translated into different languages, thereby keeping the same objective content. The crucial point, following Frege, is that sense is completely mind-dependent. On the contrary, the Stoics believe that as an incorporeal attribute expressed by a word or proposition, sense is something added to the object or state of affairs that makes it appear differently, that is, in another aspect or mode. In other words, there is an irreducible distinction between an object or state of affairs (*pragma*) and a state of affairs *signified* (*semainonmenon pragma*), which lies precisely in the fact of being signified by a word or proposition added to the object as an incorporeal attribute. This incorporeal attribute they also call sayable (*lekton*). Sayables are neither physical bodies nor properties of bodies, neither are they thoughts, since for the Stoics thoughts are also corporeal bodies. Sayables are inexistent, yet they subsist in between bodies and language as incorporeal attributes. In Bréhier's reading, Stoic logic has to be considered as deeply non-Fregean. Dealing with incorporeal attributes, Stoic logic refers to a new ontological plane, which is the realm of sense or events.

Bréhier's monograph on Stoicism is of great importance for our purposes here, since Deleuze's conception of sense discussed in *The Logic of Sense* evolves out of the encounter with Stoic philosophy not

least through that monograph (Butler 2005: 129). Sense, for Deleuze, has to be conceived as sense-effects or sense-events that subsist as real, virtual phenomena. They are outside being, or in Deleuze's words, they are an 'impassive extra-Being which is sterile, inefficacious, and on the surface of things: *the ideational or the incorporeal can no longer be anything other than an "effect"*' (Deleuze 1990: 7/16–17). Sense-events or sense-effects are sterile and inefficacious, because as inexistent incorporeals they cannot act or be acted upon. Hence, Deleuze, like the Stoics, draws a qualitative distinction between the realm of causal interaction between bodies or forces, and the realm of impassive incorporeal events or sense. He also distinguishes sense from the realm of language. Being an incorporeal double of the proposition, sense is independent of both affirmation and negation and is also unaffected by the modes of the proposition. This means that sense is entirely neutral.[14] However, to say that sense is an incorporeal or neutral 'double' of the proposition should not be misunderstood: for Deleuze, the process of doubling up the proposition which express it does not imply 'an evanescent and disembodied resemblance' (125/151) to the state of affairs which are denoted by the proposition. Instead, Deleuze insists both that sense is inseparable from its status of a neutral double and that it is 'something unconditioned' (123–4/149), capable of giving rise to an unconditioned and heterogeneous synthesis. The problem, which Deleuze tries to solve here, is to reconcile the sterility and neutrality of sense with the power of genesis (see Deleuze 1990: 32/45, 95–6/116–17). On the one hand, he wants to maintain the *impassibility* of sense-events which allows him to dissociate the sense-event from its temporal actualisations (100/122). This is to say that sense-events essentially belong to Aion, a virtual time, which is distinct from Chronos, the time of physical changes, interactions and mixtures between bodies, whence it follows that sense-events are characterised by a certain autonomy or independence from historical, political forces or bodily states of affairs. On the other hand, Deleuze does not want to abandon the idea of a *genetic power* of sense, both 'in relation to the proposition itself, insofar as the expressed sense must engender the other dimensions of the proposition (signification, manifestation, and denotation)' (95–6/116) and also in relation to the process of determination of bodies and their mixtures.

How can Deleuze combine the impassibility of sense with the power of genesis? In trying to respond to this problem Deleuze introduces as a first step 'a double causality: that of bodies, states of affairs, and mixtures, but also that of the quasi-cause which represents the state

of organization or disorganization of the incorporeal surface' (Deleuze 1990: 108/131). The relation of quasi-causation, which is supposed to hold only between incorporeal sense-events on the surface of things, gives rise to a so-called 'static genesis'. Deleuze distinguishes a logical static genesis and an ontological static genesis.[15] In the logical static genesis, he aims to show that sense generates the proposition and its three dimensions: *reference* to or *denotation* of individuals or states of affairs; *manifestation* of the person and the person's beliefs, feelings, opinions; and finally *signification* as the form of possibility of true propositions. For this reason, he ties sense together with the 'problem', defined as 'an ideational objectivity or ... a structure constitutive of sense' (120/145), as he has previously done in *Difference and Repetition*. However, he now confers all the characteristics of sense that we have encountered as elements of Stoic incorporeals upon the 'problem'. The problem '*is not* propositional' (122/147); it 'is neutral with respect to every mode of the proposition' (123/148), it is 'independent of both the negative and the affirmative' (123/148), 'it inheres, subsists, or persists in propositions and blends with extra-being' (123/148). Above all, 'the synthesis of the problem with *its* own conditions constitutes something ideational and unconditioned' (122/147). Following Deleuze, 'sense is thus expressed as the problem to which propositions correspond insofar as they indicate particular responses, signify instances of a general solution, and manifest subjective acts of resolution' (121/146). The problem is thus defined as 'expressed sense' (122/148) and as a genetic element that generates the logical proposition and its dimensions.

The ontological static genesis is much more complicated, because Deleuze has to deal with a seemingly outright contradiction: 'How can we maintain both that sense produces even the states of affairs in which it is embodied, and that it is itself produced by these states of affairs or the actions and passions of bodies (an immaculate conception)?' (Deleuze 1990: 124/149). Deleuze suggests that it is 'in a different way that sense is produced by bodies' (124/149). Sense is no longer a surface effect of the interaction of *individuated* bodies (such as a knife and the flesh of a body, or a piece of iron and fire, and so on). Instead bodies are taken now 'in their undifferentiated depth and in their measureless pulsation' (124/149–50). We are dealing now with an impersonal and pre-individual 'transcendental field' to use Sartre's term, but this field is not to be determined as that of a consciousness.[16] Rather, it is an intensive milieu or potential prior to the determination of bodies, persons or consciousness. This original intensive depth or transcendental field organises surfaces and produces sense, and sense in its turn 'brings

about individuation and all that ensues in a process of determination of bodies and their mixtures' (126/151) by means of its relation to the quasi-cause. It seems that the quasi-cause is the crucial element by means of which sense inherits its genetic power. We therefore have to examine in greater detail what the relation of quasi-causality between incorporeal sense-events or sense-effects means.

In fact, already the Stoics considered a kind of relation between incorporeal event-effects in their doctrine of destiny. For the Stoics, all things happen by destiny, and they describe destiny as an inescapable ordering and sequence of causes.[17] This sequence of causes is not to be understood as a series in which each term is the effect of the previous term and the cause of the following, but as a connection of cause to cause. Destiny is thus the plurality of causes and their rational ordering in the world. It is now compelling to think of the plurality of event-effects also as related to one another: although the Stoics have split the chain of cause and effect by qualitatively distinguishing corporeal causes and impassive incorporeal effects, there certainly is a causal chain A–B–C, in the sense that the body A is a cause *to* the body C of which the effect B has come to be predicable as an incorporeal attribute. Given these two premises, the ordered series of corporeal causes on the one hand and the peculiar causal nexus between causes and effects on the other hand, there seems to follow a certain relation of event-effects as well. This is precisely how Bréhier argues: the Stoic concept of destiny concerns a relation between corporeal beings and not between events. However, 'because the events are the effects of these causes, it is certain that they are therefore related to one another. No matter how heterogeneous they are, they all depend on destiny which is unique' (Bréhier 1962: 35; my translation). Deleuze picks up on this, declaring that there is 'a bond of effects' (Deleuze 1990: 6/15), the laws of which 'perhaps express in each case the relative unity or mixture of bodies on which they depend for their real causes' (6/15).[18] Deleuze further interprets this relation between event-effects by means of the modern concept of structure and comes to speak of it as a surface organisation of at least two heterogeneous series that resonate with one another in their distance. The resonance of series is effectuated by a paradoxical element, intervening as nonsense or as an aleatory point, and which Deleuze also calls the 'quasi-cause' (95/116). Without indulging too much in details, we can already see that Deleuze envisages here a new type of causation, that is, a structural causation among sense-events or sense-effects, which are made to resonate by a paradoxical element (nonsense), which traverses the series.[19] The paradoxical element is something that

evades precise determination, but it is not nothing since it functions by bringing together the series or elements of a structure and making them resonate through their distance. It can even be an empty space, as for instance the vacuity in a flower arrangement according to the Japanese art of *ikebana*, which miraculously constitutes the whole structure and bestows it with a living breath. As Deleuze says, 'the void is itself the paradoxical element, the surface nonsense, or the always displaced aleatory point whence the event bursts forth as sense' (137/162). Deleuze conceives of sense and nonsense no longer simply as opposites, but as complementary elements, which are related to one another in the structural organisation of an incorporeal surface, endowed with the genetic power to produce spatio-temporal actualisations of sense-events. 'Nonsense and sense have done away with their relation of dynamic opposition in order to enter into the co-presence of a static genesis' (141/166).

In summary, Deleuze envisages in *The Logic of Sense* a structural quasi-causality that obtains only among sense-events and makes them communicate with one another: 'each one communicates with the other through the positive characters of its distance and by the affirmative character of the disjunction [the disjunction of divergent series]' (Deleuze 1990: 175/205). He thus looks at the genetic productivity of sense in a new way: sense is not only the effect of the interaction of corporeal, historical or political forces or states of affairs. It also partakes in the structural organisation of an incorporeal surface and is attached to a quasi-causality that is independent of the causal interaction between bodies (see Deleuze 1990: 169/198). As a consequence, Deleuze's reading of Nietzsche's will to power undergoes a fundamental change: while he had previously described the will to power as a relation of (historical or political) forces, he now interprets it as an 'affirmative synthetic disjunction' (174/204) of incorporeal sense-events or sense-effects following very special laws of structure. Nietzsche's inner world of the will to power thus becomes 'a Dionysian sense-producing machine, in which nonsense and sense are no longer found in simple opposition, but are rather co-present to one another within a new discourse' (107/130).

V. Conclusion

In following the general lines of Deleuze's work of the 1960s, we have seen how in various stages a new Deleuzian concept of sense takes shape. Deleuze insists that sense is a fourth dimension of the

proposition that shall not be confused with signification, denotation or manifestation (Deleuze 1990: 19/30). Traditionally, sense has been conceived as signification, that is, as a condition of the possibility of truth. Thus formal logic regards sense as a necessary formal condition for a proposition to be true. But sense and truth remain in a strangely detached manner, insofar as the sense of a proposition tells us nothing about its truth-value. Transcendental logic, on the other hand, defines sense as a superior condition of possibility of truth. This means that a proposition always has the truth that it merits in accordance with the condition of sense, that is, its possibility of being constructed in space and time and related to an object of experience. However, Deleuze objects that transcendental philosophy is not capable of assuring a real genesis, since the condition of sense is firstly fabricated in the image of the conditioned, and secondly gives rise only to a genesis of possible experience, which is not a true genesis but rather a purely extrinsic, conceptual conditioning. In a first approach to this problem of genesis, Deleuze aligns with Nietzsche in thinking sense as a plurality of senses that vary in accordance with the forces, or the will to power, that take hold of a thing. Sense is thus the effect of a differential relation of historical, social or political forces. In *The Logic of Sense*, however, Deleuze goes beyond Nietzsche in defining sense as a surface effect that obeys laws of structure that are no longer bound to the depths of existent forces. As we have seen, Deleuze discovers a 'double causality' which not only comprises the causality of bodies and forces, but also a 'quasi-causation' between incorporeal sense-events. The Stoic notion of incorporeal sense-events combines a physical notion of sense with a linguistic notion. It is here where Deleuze finally finds something heterogeneous and unconditioned that merges neither with the state of affairs that a proposition denotes, neither with the desires or beliefs of the person who manifests him- or herself in the proposition, nor with the concepts and the logical and semantic relations that compose the dimension of signification of a proposition. Incorporeal sense-events are this heterogeneous and unconditioned extra-being that subsists outside bodily states of affairs and language, and that gives rise to an internal 'static genesis', which not only produces the proposition and its dimensions (signification, denotation and manifestation), but also the individuation of bodies and consciousness. In sum, Deleuze's own logic of sense implies a notion of sense which is irreducible to a logico-linguistic phenomenon or condition of possibility. Following Deleuze, sense has to be understood as a real and incorporeal something that partakes in a surface organisation or machine fuelled by a disjunctive

synthesis, or in other words, 'a system of echoes, of resumptions and resonances' (170/199) between series of sense-events.

Notes

1. In the third series of *The Logic of Sense*, Deleuze presents a more detailed account, according to which a proposition has three dimensions: denotation (or reference), manifestation and signification. However, for the point we want to make here, Frege's distinction between sense and reference suffices.
2. Note on references to books by Deleuze: in the body of the text the reference to the page number is given as follows: the first page number refers to the English translation, the second number to the original French edition.
3. Note on references to Kant's *Critique of Pure Reason*: the first page number refers to edition A, that is, the first German edition from 1781, the second number to edition B, that is, the second revised German edition from 1787.
4. See Kant 1998: A 59–60/B 84: 'these criteria [of truth] concern only the form of truth, i.e., of thinking in general, and are to that extent entirely correct but not sufficient. For although a cognition may be in complete accord with logical form, i.e., not contradict itself, yet it can still always contradict the object. The merely logical criterion of truth, namely the agreement of a cognition with the general and formal laws of understanding and reason, is therefore certainly the *conditio sine qua non* and thus the negative condition of all truth; further, however, logic cannot go, and the error that concerns not form but content cannot be discovered by any touchstone of logic.'
5. See Kant 1998: A62/B87; see also A277/B333, B149.
6. The example is taken from the novel *House of Leaves*, written by Mark Z. Danielewski (2000).
7. See also Deleuze 1994: 68/94.
8. In his early book *Empiricism and Subjectivity*, using the example of Hume, Deleuze demonstrates the way in which we miss Hume's problem when we simply consider and criticise his so-called theory of atomism and theory of associationism. We then have turned Hume's philosophical theory into an abstract general solution and fragmented it into particular theories that are disqualified from the beginning as 'shifty projects'. Deleuze counters that a philosophical theory is 'an elaborately developed question' and 'to criticize the question means showing under what conditions the question is possible and correctly raised … the question is always about the necessary development of the implications of a problem and about giving sense to philosophy as a theory. In philosophy, the question and the critique of the question are one; or, if you wish, there is no critique of solutions, there are only critiques of problems' (Deleuze 1991: 105–6/118–19).
9. The concept of the event is truly one of Deleuze's most important concepts. In his 1988 interview with Raymond Bellour and François Ewald, 'On Philosophy', Deleuze says: 'I've tried in all my books to discover the nature of events; it's a philosophical concept, the only one capable of ousting the verb "to be" and attributes' (Deleuze 1995: 141/194).
10. See Deleuze 1994: 187/242–3: 'Ideas are by no means essences. In so far as they are the objects of Ideas, problems belong on the side of events, affections, or accidents rather than on that of theorematic essences.'
11. Thus Nemesius, a Platonist, reports on Cleanthes, head of the Stoic school in Athens: '(1) He [Cleanthes] also says: no incorporeal interacts with a body, and

no body with an incorporeal, but one body interacts with another body. (2) Now the soul interacts with the body when it is sick and being cut, and the body with the soul; thus when the soul feels shame and fear the body turns red and pale respectively. (3) Therefore the soul is a body' (Long and Sedley 1987: 272).

12. Part of this citation is quoted by Deleuze in *The Logic of Sense* (1990: 5/14).
13. The Megarian school of philosophy, founded by Euclid of Megara (c. 450–380 BC), had a great influence on Zeno, the founder of the Stoic school, who was said to have studied under Euclid's pupils and successors. In particular, Megarian logic, developed by the Megarian philosophers (or 'Dialecticians' as they were also called) Diodorus and Philo, can be seen as a precursor to Stoic logic.
14. Deleuze discusses the paradox of the neutrality of sense in *The Logic of Sense* (1990: 32–5/46–9). It should be noted that Deleuze, although he refers to the notion of sense (that is, sense as an ineffectual, neutral double of the proposition) as a *paradox*, it does not follow that he strictly denies this definition of sense. He rather modifies and enhances the definition of a neutralised double by insisting that sense is not to be conceived as 'an evanescent and disembodied resemblance, an image without flesh' (125/151) and that sense should not be 'deprived of its generative power' (Deleuze 1994: 156/203). He obviously wants to distance himself from Husserl's notion of sense, sense as *noema* (see Deleuze 1990: 122/147).
15. We cannot follow here Deleuze's account of the static genesis with its two different stages in all the details (see, for example, Deleuze 1990: 115–16/140–1). A detailed explanation would require the introduction of further Deleuzian concepts, such as 'differentials' and 'singularities', as well as a discussion of his reading of Leibniz. Instead, we will have to content ourselves with giving the idea of Deleuze's static genesis and examine its novelty in comparison to the concept of genesis that we have previously encountered in relation to Nietzsche.
16. Deleuze is referring to Sartre's 1937 essay 'The Transcendence of the Ego'; see Deleuze 1990: 98–9/120, 102/124.
17. See Long and Sedley 1987: 336–7 and their translations of citations by Aetius, Gellius and Cicero.
18. See also Deleuze 1990: 169/198: 'Destiny is primarily the unity and the link of physical causes among themselves. Incorporeal effects are obviously subject to destiny, to the extent that they are the effect of these causes.'
19. See also Deleuze 1990: 174/204: the communication of events 'consists of the erection of a paradoxical instance, an aleatory point with two uneven faces, which traverses the divergent series as divergent and causes them to resonate through their distance and in their distance'.

The Creation of the Concept through the Interaction of Philosophy with Science and Art

Mathias Schönher University of Vienna

Abstract

In *What Is Philosophy?* we find philosophy devised as that power of thinking and creating which, in a division of labour with science and art, creates the concept. This division of labour points to the free interplay of Reason, Understanding and Imagination in Kant's *Critique of Judgement* and enables us to affirm, without obliterating the differences in kind, the non-hierarchical relationship between the three forms of thought that is asserted by Deleuze and Guattari. However, as powers of thinking and creating, philosophy, science and art do not inscribe themselves in a transcendental subject. Rather, Deleuze and Guattari conceive of them, following Spinoza's 'creating nature', as powers that express themselves in an attribute in which every thinking subject participates.

Keywords: Deleuze and Guattari, Kant, Spinoza, *What Is Philosophy?*, concept, creation, interaction, power

I. The Creative Powers of Thinking

Although Gilles Deleuze is one of the most influential philosophers of the second half of the twentieth century, his last book, *What Is Philosophy?*, written in collaboration with Félix Guattari, has received relatively little attention. For many readers, this book 'came as a surprise, even as something of a disappointment', recalls Isabelle Stengers, noting that it faced readers with 'a strong differentiation between the creations which

are proper to philosophy, to science, and to art' (Stengers 2005: 151). The creative ideas pertaining to philosophy, through which philosophy performs its thought, are the concepts it creates by means of conceptual personae on the plane of immanence; those pertaining to science are the functions created by means of partial observers on the plane of reference; those pertaining to art are the compounds of sensations consisting of percepts and affects created by means of aesthetic figures on the plane of composition. 'Thinking is thought through concepts, or functions, or sensations', state Deleuze and Guattari, 'and no one of these thoughts is better than another, or more fully, completely, or synthetically "thought"' (Deleuze and Guattari 1994: 198). In all three cases, the modes of thinking 'are specific, each as direct as the others, and they are distinguished by the nature of the plane and by what occupies it' (198).

Regardless of this explicit dismissal of any hierarchy of the three forms of thought, Peter Hallward, for instance, argues for the precedence of philosophy. He underlines the clear distinction between the forms by examining them independently of each other, then ranking them. The fact that he gives philosophy precedence is surprising, however, since he criticises the conception of philosophy proposed by Deleuze and Guattari, which, he writes, 'leads forever out of our actual world' (Hallward 2006: 164). It would therefore seem to make sense for Hallward to argue for the precedence of science, which deals with the actual world. But in his assessment, Hallward turns his attention to the three forms of thought in terms of the product of their creation, and defines philosophy as 'the most immediate discipline of thought', which 'unlike science or art, ... can claim to think at the highest degree of proximity to absolute chaos' because it has the privilege of going furthest 'in the spiritualisation of its medium', in which it brings forth creation (129, 132).

In a paper based mainly on Deleuze's essay on Melville's *Bartleby the Scrivener*, Joost de Bloois makes an exemplary attempt to counter arguments in favour of a hierarchy of the three forms of thought, looking at the relationship between conceptual persona and aesthetic figure. He argues that 'the very classical distinction between "philosophy *as such*" and "art *as such*"' that prevails in *What Is Philosophy?* leads to an 'artificial' distinction between conceptual persona and aesthetic figure, whose fundamental 'shared image of philosophy and literature' reveals its common 'indetermination' in the figure of Bartleby (de Bloois 2004: 124, 126; my translation). According to de Bloois, Deleuze and Guattari's 'stroke of genius' consists in 'having realised

that philosophers, too, *write* fables' (118; my translation). Bartleby thus points to writing as the common characteristic of philosophy and literature: 'he is at once a *figure* and a *persona*' and, as the mask of any writer, presents nothing less than 'the precondition of all possible writers' (115; my translation). Since, by analogy with the dichotomy of concept and affect, the conceptual persona presupposes the aesthetic figure, philosophy appears as merely a derivative of literature: 'The conceptual persona . . . transforms the philosopher into a *writer*', and an aesthetic paradigm becomes the pivot of philosophical activity (120; my translation). Thus, whereas Hallward establishes a hierarchy by evaluating the product of creative activity with regard to its contiguity to chaos, what de Bloois attempts is to undermine hierarchy by reducing the clearly distinct forms of thought through a sufficiently neutralised figure on a common plane. Having deprived philosophy of its clearly distinguished realm, de Bloois then criticises Deleuze and Guattari for subordinating their 'philosophical project' to 'aesthetic modernity' and 'curtailing the critical potential' of philosophy by denying it autonomy (128; my translation).

My interpretation of *What Is Philosophy?*, in contrast, grants neither science nor art nor philosophy priority as a more perfect or more direct form of thought, while refusing to obliterate the difference in kind between them. On the contrary, each of these forms is assigned a specific activity, which finds expression in the creative ideas that can only be produced on its own plane; and each form secures its own realm precisely by positing its own objects through these creative ideas. 'With its concepts, philosophy brings forth events. Art erects monuments with its sensations. Science constructs matters of fact with its functions' (Deleuze and Guattari 1994: 199).[1] Philosophy, science and art must not be identified from the outset as three disciplines that consist in the collection of the products of their creation – as universalities formed by an abstraction of the products, abandoning the singularity of each creation. Instead, we must define them as those 'ways of thinking and creating', those 'modes of ideation', that express themselves in the act of creating the concept, the function or the compound of sensations through the conceptual persona, the partial observer or the aesthetic figure; or, to put it another way, which unfold as the power of thinking and creating in 'always singular moments' in which thought is raised time and again anew to a specific creative faculty or power, precisely through creative ideas (8, 12). However, in *What Is Philosophy?* Deleuze and Guattari say that philosophy creates concepts in interaction with science and art. 'Philosophy, science, and art', they write, 'are

immediately posited or reconstituted in a respective independence, in a division of labor that gives rise to relationships of connection between them' (91). This division of labour does not limit their independence, because each form, in its own realm, remains independent of the other two. Nor does it contradict the autonomy of each form, an autonomy lent by its own creation; rather, this interaction serves precisely to enable philosophy, science and art to stimulate each other strongly enough to become capable of bringing forth a creation and expressing themselves as autonomous faculties or powers of thinking and creating. That they are dependent on one another, yet do not restrict each other's independence, confounds the dispute over the precedence of one or other of these forms of thought. Philosophy arrives at the concept with the help of science and art, in that these latter intervene freely in the creative process and support philosophy in creating its specific ideas and, in turn, in positing its objects in a realm where science and art themselves are quite unable to do so. Philosophy's concepts thus acquire their determinations through allusions to the actual with the help of science, which, for its part, finds expression through the partial observer as 'scientific faculty of knowledge' (215). And philosophy arrives at the sensations of the concepts with the help of art, which, for its part, finds expression through the aesthetic figure as 'faculty of feeling' (212).

My interpretation considers Deleuze and Guattari's last joint work in the lineage of Kant's *Critique of Judgement*, lauded by the authors as 'an unrestrained work of old age, which his successors have still not caught up with', where 'all the mind's faculties overcome their limits, the very limits that Kant had so carefully laid down in the works of his prime' (Deleuze and Guattari 1994: 2). Seven years before the publication of *What Is Philosophy?*, Deleuze declared in his preface to *Kant's Critical Philosophy* that 'an unregulated exercise of all the faculties' would 'define future philosophy' (Deleuze 1984: xiii). Whereas in his first two *Critiques*, Kant assumes an interrelationship which is dominated by one of the faculties and rigorously regulated by its laws, in the *Critique of Judgement* he finds, beneath this hierarchy of faculties, unregulated use and with it the basis of all harmonious interaction. In the aesthetic of the beautiful and the sublime, 'the various faculties enter into an accord which is no longer determined by any one of them, and which is all the deeper because it no longer has any rule'; they correspondingly 'find their accord in a fundamental discord' (Deleuze 1984: xii). In *What Is Philosophy?*, philosophy is finally devised in its relation to science and art as one of these three faculties or powers of thinking and creating which, in free interplay, create the philosophical

concept. And we can say of this work what Deleuze wrote in 1963 of Kant's third *Critique*: that it goes beyond presenting the exercise of ready-made faculties under particular conditions to offer insight into the genesis of those faculties, which 'are engendered in their original free state and in reciprocal agreement' (Deleuze 2004: 68). However, the three faculties do not inscribe themselves in a transcendental subject, as with Kant, or depend on a predefined subject, but posit and reconstitute themselves at the same time as the subject, which only distinguishes itself from thought by carrying out the movements of that plane on which it is creative. The possibility of a subject that does not precede its own creative activity – or, conversely, the becoming-subject that necessarily occurs when carrying out these movements by means of the conceptual persona, the partial observer or the aesthetic figure – is based on 'every creation' being 'a construction on a plane that gives it an autonomous existence' (Deleuze and Guattari 1994: 7). The plane gives autonomy to the creation, because it is the plane itself which, in performing its movements, becomes the 'brain layer' of a singular subject. That subject unfolds out of thinking only when it creates, so that a creation never remains dependent on an already given subject of lived experience.

Deleuze and Guattari's reference to a 'brain layer' becomes clear through the example of Raymond Ruyer and the illustrations he provides. Ruyer presents a man on a chair; he is wearing glasses, looking at his writing hand and the sheet or 'layer' of paper on the table before him. Ruyer then puts us in the man's position, showing us his visual field (now framed by the glasses on our nose), which moves out from our body along the writing hand to the sheet of paper and the table. Our visual field is thus composed, like a collage, of the parts of our body and the various objects. During the absolute survey of my visual field, writes Ruyer, I am everywhere at once: 'The multiple details of sensation are distinct one from another, but nevertheless the ones are not really *other* for the others, because together they make up my sensation, which is only one' (Ruyer 1952: 99; my translation). With respect to Leibniz's monad, Deleuze refers to Robert Rauschenberg, whose collages weave their components into surfaces so dense that they become 'opaque' and lose all referential function (Deleuze 2006: 30). They form smooth spaces with close vision – visual fields that, without a prevailing perspective or rigid spatial dimensions, do not allow any strictly definable exterior point of view. While the writing man's habitual gaze at the objects in front of him already marks one exterior point of view, and our observation of the man at work adds another, the absolute survey cannot attain its unity by referring to a subject of lived experience,

because that would lead to an infinite regress of echelons of viewers. 'Between the "I-unity" and the visual field there is only a purely symbolic "distance" ... My visual field itself necessarily sees itself through an "absolute survey"' (Ruyer 1952: 101–2; my translation). The primary plane of sensation has to perceive itself; the viewer is thus completely embedded in the plane, just as Rauschenberg's 1963 collage *Estate*, as a visual field, immerses the viewer in the sensation of early 1960s New York with its survey. The collage releases the viewer from any kind of experience that might be felt by a city tourist, who can confirm his expectations using prepared routes to continue his accustomed routine with the happy feeling of having seen what there is to be seen. Finally, a further illustration presents the previously observed visual field as a layer or sheet of paper that from a distance looks like a picture postcard. Ruyer shows that this distance of the 'I-unity' in the absolute survey does not exist: he labels the illustration 'false representation of the visual field' (Ruyer 1952: 103; my translation). The self-surveying field of consciousness cannot be represented, just as the plane as the brain layer in *What Is Philosophy?* is only given in the survey on that plane by the I of thinking, in which the plane raises itself to a singular power.

II. The Distinction of Planes as Aspects and as Layers of the Brain-Subject

Philosophy, science and art transect chaos in order to produce their creative ideas on a specific plane of creation – 'always confronting chaos, laying out a plane, throwing a plane over chaos' (Deleuze and Guattari 1994: 197). The plane of transection's particular relation with chaos defines which type of movement of thought is carried out, and determines the power of thinking; the plane itself defines the elements that are created on it and warrants for their cohesion. Hence, only on the plane of immanence, with its infinite movements, is it possible to create the concept which brings forth the event and does thinking accede 'to the infinite movement ... and reconquers an immanent power of creation' (140). Only on the plane of reference, with its finite movements, are those referential relations possible 'by which science constitutes or modifies matters of fact and bodies' and science gains its power: 'Functions derive all their power from reference' (138). And finally, only on the plane of composition is it possible to create compounds of sensations, which in the finite restore the infinite and are forces in themselves. Philosophy's plane of immanence, with concept and conceptual persona, science's plane of reference, with

function and partial observer, and art's plane of composition, with compound of sensations and aesthetic figure, cannot be reduced to one another through their specific relation to chaos – nor can they join up to form a neutral plane: 'The three planes, along with their elements, are irreducible' (216).

Laying out a plane is the condition for that plane to rise to the power of thinking and creating by virtue of the creation it bears. As a power, the plane is a 'layer of a brain-subject', and is what unfolds the subject out of the thinking whose movements that very subject carries out (Deleuze and Guattari 1994: 214). Carrying out these movements is only possible by means of the conceptual persona, the partial observer or the aesthetic figure, which expose us to chaos and draw us into a becoming-subject in line with the aspect of the respective plane. The three great forms of thought constitute 'the three aspects under which the brain becomes subject, Thought-brain. They are the three planes, the rafts on which the brain plunges into and confronts the chaos' (210). The raft image is apt in that, similar to the notion of point of view that Deleuze develops in his study on Leibniz with recourse to Whitehead's superject, the aspect is not so much a point as 'a place, a position, a site' (Deleuze 2006: 20). It 'does not mean a dependence in respect to a pregiven or defined subject; to the contrary, a subject will be what comes to the point of view, or rather what remains in the point of view' (21). This differentiation between the aspect and the layer of a brain-subject with regard to the planes recalls Spinoza's distinction of attribute and power, which Deleuze and Guattari condense into their conception of planes. When they write that 'immanence does not refer back to the Spinozist substance and modes but, on the contrary, the Spinozist concepts of substance and modes refer back to the plane of immanence as their presupposition', they are linking the creative divine substance, and the created modes, to the plane of immanence as the precondition of creation, which determines the relation between substance and modes (Deleuze and Guattari 1994: 48). When they then add that this 'plane presents two sides to us, Extension and Thought, or more accurately, its two powers, power of being and power of thinking', they are referring to the distinction between the attributes of Extension and Thought on the one hand, and the powers of being and thinking on the other (48/50; translation modified). Because Deleuze and Guattari apply this dual distinction to the plane of immanence itself, the plane with these two attributes as its two sides represents the condition for it to unfold as the power of thinking and creating by virtue of the creation it carries, and thus also to unfold as the two powers.

For Spinoza,[2] God's absolute essence is formally the power of being, and objectively the power of thinking. It is expressed by God's formally producing in the attributes and at the same time objectively understanding how he produces. The power of being finds its expression in the modes of the attributes, which also include God's infinite intellect as a mode of the attribute of Thought. With respect to the power of being, this attribute is not distinct from the attribute of Extension, so that in their formal being, ideas also take on a form of existence. The power of being is established according to its possibility and according to its necessity by the formally distinct attributes, for these are the condition of its being active, and taken together are the formal essence of God, which makes them necessary. The power of thinking finds its expression in the objective being of the ideas, in other words the ideas insofar as they represent something. Deleuze stresses that the objective being, even the idea of God as the objective being of infinite intellect, would be nothing 'without this formal being through which it is a mode of the attribute of Thought. Or, if you like, it would be only potential, without this potentiality ever being actualized' (Deleuze 1990: 122). Accordingly, the power of thinking – which, as a divine power, is always an actualised, active power – points to the attribute of Thought not only as its sole objective condition, but at the same time as its formal condition. Thus the formal possibility of the idea of God is established in the attribute of Thought, while its objective necessity is established in God's absolute essence.

In any case, to return now to *What Is Philosophy?*, the attributes are always the condition of the powers. It is for this reason that Deleuze and Guattari find it more accurate to say that the plane of immanence presents its two powers to us than to say that the plane of immanence presents its two sides, Extension and Thought, to us – because strictly speaking it is only the plane of immanence when it becomes a power of thinking and creating, or, to put it another way, because it is only through the creation of concepts that philosophy itself rises to become a power, to become the plane of immanence as the layer of a brain-subject:

> At the same time that the brain becomes subject – or rather 'superject', as Whitehead puts it – the concept becomes object as created, as event or creation itself; and philosophy becomes the plane of immanence that supports the concepts and that the brain lays out. Cerebral movements also give rise to conceptual personae. (Deleuze and Guattari 1994: 211)

The moment of creation corresponds in Spinoza to the transition from created nature to creating nature, from infinity to the absolute, from

the infinite movements to the power of thinking and creating. Laid out as a presupposition, the plane remains prephilosophical for as long as the concept has not been posited as creation. 'Prephilosophical does not mean something preexistent but rather something *that does not exist outside philosophy*, although philosophy presupposes it. These are its internal conditions' (Deleuze and Guattari 1994: 41). It is only with the creation of concepts according to the specified aspect that the plane becomes the plane of immanence, becomes a power, becomes philosophy. The always singular moment of creation is the moment when, as Éric Alliez emphasises, 'philosophy as the expression of a constructivism' unfolds its power (Alliez 2004: 15). Philosophy does not remain dependent on a pregiven subject of lived experience – that subject is located in a historically determined mental landscape, as is everything that, in Ruyer's example, is on the table or the sheet of paper and is identified by the subject present, thus being defined as a historical state of affairs in agreement with the collective milieu. Even when the philosopher constructs concepts, he uses components taken from this mental landscape, breaks them out of it and reassembles them like a collage, forming Riemannian spaces in which the connection between one term and the next is not defined and can be effected in an infinite number of ways. This construction makes it possible, in the survey of the plane, to be immediately co-present to all its components and, in the 'condensation' effected by the survey, to create those opaque surfaces which are absolute and stand for themselves. The intentionally opened rift, the hiatus, as Deleuze writes with reference to Book V of Spinoza's *Ethics*, functions 'to bring together to the maximum degree terms that are distant as such, and thereby to assure a speed of absolute survey' (Deleuze 1998: 150). These hiatuses require one to reconstitute a missing chain, but in return allow one to jump 'from a relative speed (the greatest) to an absolute speed', which Deleuze calls the 'speed of power' (149–51).

To explain how it is possible for thought to gain access to the infinite movement and to reconquer an immanent power of creation, it is necessary to follow a strong hint by Deleuze and Guattari and probe more deeply into Spinoza's work. We must go beyond the ordinary ideas of opinion 'and arrive *as quickly as possible* at mental objects determinable as real beings' (Deleuze and Guattari 1994: 207). To this end, however – in order to reach concepts, in other words those ideas 'that must be created' – we must also make use of opinion, 'but only so far as is necessary to get to a plane where we go from real being to real being and advance through the construction of concepts', through

reconnecting the components taken from chaos into a concept and sequencing the concepts among themselves, until they are created in their full maturity (207). We must connect the ideas to their causes, even if we draw on opinion to do so, writes Deleuze of Spinoza, in order to 'reach the idea of God as quickly as possible' and to proceed in a manner excluding all opinion, in a way that moves 'from one real being to another, deducing ideas one from another, starting from the idea of God' (Deleuze 1990: 137–8). In this way, we will arrive at the adequate ideas, which are distinguished by the fact that they express their own cause. The cause of ideas in their objective being is the idea of God, so that the adequate ideas give expression to the absolute power of thinking, or the objective essence of God, which corresponds to the idea of God. As God formally produces in the attributes the way he objectively understands himself, the ideas connect in the attribute of Thought in accordance with their own content: the content of an idea (in other words, what the idea objectively is) is identical with the formal existence of the idea in the attribute. Starting from the idea of God, 'ideas are then linked according to their own content; but their content is also determined by this sequence' – that is to say, it is in the content or objective being of the idea that the power of thinking finds its expression, as the power of being finds expression in the form of that idea (138). The form of the idea is automatically united with the content through its autonomous sequencing with the other ideas following the order of infinite intellect. Ideas are mental objects, determinable as real beings, if they express the power of thinking in which they participate, the objective essence of divine nature. In the same way, for Deleuze and Guattari, the plane of immanence as an immanent power of creation finds its expression in the concepts, through their sequencing in accordance with the infinite movements of the plane, which gives creation an autonomous existence.

In the creation of the concepts the plane of immanence becomes the power of thinking and creating, which unfolds as a layer of a brain-subject:

> [The brain, under the] aspect of absolute form, appears as the faculty of concepts, that is to say, as the faculty of their creation, at the same time that it sets up the plane of immanence on which concepts are placed, move, change order and relations, are renewed, and never cease being created. (Deleuze and Guattari 1994: 211)

The infinite movements of the plane of immanence can only be performed as a subject which itself only arises in that process, in line with the aspect of the plane. The cerebral movements give rise to

conceptual personae, for maintaining oneself on the plane of immanence, remaining in thinking, is possible only through a continuous sequencing of concepts. The conceptual personae proceed by linking concepts, they designate '*insistence*' in philosophical thinking, they draw us into a becoming-subject (Deleuze and Guattari 1994: 76), and we could say, with Spinoza, that they set a 'spiritual automaton' in motion. They are the only compass for carrying out the movements, and in this sense correspond to the idea of God, which guides us in the linking of adequate ideas. When the brain becomes subject, Thought-brain, it is as a line of becoming on the plane, as a hyphen between thought and brain. 'The plane of immanence has two facets as Thought and as Nature', write Deleuze and Guattari, and it is unceasingly permeated by 'unlimited movements . . . on two sides' (38, 44). As a fold between Thought and Nature, which arises with the movements on both sides of the folded plane at once, the brain-subject expresses the actual mental objects, which have become nature, as real beings, with their power to posit themselves as creative ideas. 'Infinite movement is double, and there is only a fold from one to the other. It is in this sense that thinking and being are said to be one and the same' (38). Philosophy, as this Thought-Being, creates the concept – that is, a chaos that has 'become Thought, mental chaosmos' (208).

In *What Is Philosophy?*, Spinoza is hailed as 'the only philosopher never to have compromised with transcendence', as having postulated immanence as 'only immanent to itself' and hence as a plane which, even as a power of thinking, does not inscribe itself in the subject of thinking (Deleuze and Guattari 1994: 48). By doing so, 'he fulfilled philosophy because he satisfied its prephilosophical presupposition', since in carrying out the movements, as a fold running through the whole plane, the I of thinking does not set itself apart as an overriding I (48). Philosophy as a plane of immanence thus does not add itself to the prephilosophical plane through the creation of concepts. This is 'the vertigo of immanence' to which the I succumbs – a spiritual automaton or 'a sort of child-player against whom we can no longer do anything, a Spinoza who leaves no illusion of transcendence remaining' (48, 72).

But despite the high status of Spinoza in *What Is Philosophy?*, it is Jean Hyppolite's characterisation of Kant's *Critique of Judgement* – as a 'Leibnizianism of immanence' – that seems best to fit the philosophy of Deleuze and Guattari (qtd in Kerslake 2009: 105). For if they tie the creative divine substance and the created modes to the plane of immanence as the presupposition of creation, then substance exists only in the moment of creation as an expression in the modes; it

exists only in the transition in which the modes themselves become substantial. A becoming-substantial of the modes is, so to speak, a becoming-monad in the vertigo of immanence, a becoming-subject in the crossing of the entire plane, in the survey: 'I am no longer myself but thought's aptitude for finding itself and spreading across a plane that passes through me at several places' (Deleuze and Guattari 1994: 64). And this I is constantly torn apart by the divergent planes, by philosophy, science and art, or, as Deleuze writes about Whitehead in his Leibniz study, 'pushed apart, kept open through divergent series and incompossible totalities' – for Whitehead, the 'bifurcations, divergences, incompossibilities, and discord belong to the same motley world *that can no longer be included in expressive units*, but only made or undone' (Deleuze 2006: 92). In *What Is Philosophy?*, Deleuze and Guattari counter this unfurling of divergent series, this emancipation of dissonance or of unresolved accords, with their conception of thinking, in which the motley world no longer posits itself as immanent to a subjective unit, but in the junction of the three possibly incompossible planes. 'It could be said that the monad, astraddle over several worlds, is kept half open as if by a pair of pliers'; it could also be said that the I torn apart in a perpetual show of strength, the acrobat, constantly ties itself up again into a brain-subject and makes and undoes the world (Deleuze 2006: 157).

III. The Extrinsic Interferences of Philosophy with Science

Philosophy modulates the concept with inseparable components, positing it as object or event. The concept 'posits itself and its object at the same time as it is created' (Deleuze and Guattari 1994: 22). The 'positional enunciation is strictly immanent to the concept because the latter's sole object is the inseparability of the components' of which it, and hence the event as concept, is composed (23). For its part, science posits the actual matter of fact with the function: 'an object is scientifically constructed by functions' (117). The function posits the matter of fact as external, though not as independent but in reference to the scientific plane, which also defines the conditions of reference. The functions 'are defined by their reference, which concerns not the Event but rather a relationship with a matter of fact or body and with the conditions of this relationship' (22). The scientific act of positional enunciation thus 'remains external to the proposition [or function] because the latter's object is a matter of fact as referent' (23). Science constitutes or modifies the actual matter of fact, constructing

this, its object, with distinct determinations: 'Acts of reference are finite movements of thought by which science constitutes or modifies matters of fact and bodies' (138). These acts of reference of the function are, as Deleuze and Guattari point out, very different from the philosophical concept, involving no longer inseparable components but rather distinct determinations. The realm of function does not, however, just extend to that of the scientific function, but also to that of the logical function and that of opinion. 'Through functions, science continually actualizes the event in a matter of fact, thing, or body that can be referred to', whereby these relationships are made with the plane of reference and not with a pregiven subject – whereas opinion, with its 'function of the lived', refers to already constituted objects, which it relates to a subject of lived experience (126, 144). Opinion founds its reference on pure qualities, such as can be abstracted from a universal subject in the perception of an object, in order to form the arguments of the functions of opinion as '*lived states*' (151).

Art thinks through affects and percepts; it uses sensations to create the compounds of sensations themselves: 'We paint, sculpt, compose, and write with sensations. We paint, sculpt, compose, and write sensations' (Deleuze and Guattari 1994: 166). Art does not actualise the virtual event but expresses the event without actualising it, by giving it a universe which sets the compounds of sensations in motion; art erects monuments with its sensations and posits its object in this way. In contrast to opinion, art does not abstract any pure quality; as 'percepts, sensations are not perceptions referring to an object (reference)' (166). Art 'goes beyond the perceptual states and affective transitions of the lived', for we 'attain to the percept and the affect only as to autonomous and sufficient beings that no longer owe anything to those who experience or have experienced them' (171, 168). The pure quality of opinion, which serves for reference, remains isolated from the universe in which it unfolds, whereas art precisely considers 'the quality . . . from the standpoint of the becoming that grasps it' (Deleuze and Guattari 2005b: 306). Art 'implies the emergence of pure sensory qualities, of sensibilia that cease to be merely functional and become expressive features, making possible a transformation of functions' (Deleuze and Guattari 1994: 183). The qualities of art, the qualities in becoming, cannot be apprehended by functions; they remain 'what the Middle Ages called the "signifiable complex" of a proposition, distinct from the matter of fact' (Deleuze 1997: 105; translation modified).

Concept, scientific function and compound of sensations must each be created separately, even though philosophy, science and art each need

the assistance of the others to do so. When 'an object – a geometrical space, for example – is scientifically constructed by functions, its philosophical concept, which is by no means given in the function, must still be discovered' (Deleuze and Guattari 1994: 117). If this geometrical space is determined by a function as a scientific matter of fact, the concept of this space is not therefore given, but must first be created on the plane of immanence: 'A function of space can be given without the concept of this space yet being given' (133). Likewise, a compound of sensations may be given without the correlate concept having been created – or, as Deleuze and Guattari put it, 'a sensation exists in its possible universe without the concept necessarily existing in its absolute form' (178). Like the function, the compound of sensations can thus be created before the concept, and conversely the concept before either, for it is said of each of these three elements that 'none of these elements can appear without the other being still to come, still indeterminate or unknown', and each 'created element on a plane calls on other heterogeneous elements, which are still to be created on other planes' (199). Just as, for example, a new space function calls for the creation of a correlating concept, and on that basis philosophy spins forth thought in a 'heterogenesis' (199), so art occasionally – to return to Deleuze's examination of the play of faculties in Kant – pushes philosophy 'towards an inspiration which it would not have had alone' (Deleuze 1984: xii). But more than that, the creation of a concept will entail the creation of further concepts on the same plane as well (see Deleuze and Guattari 1994: 19). In other words, a concept itself will also call for the creation of new concepts with which it can link up. The degree of attention that Deleuze pays to this heterogenesis of thought is evidenced in particular by his cinema books and his study on Leibniz. But even if he notes the simultaneous appearance of the film and Bergson's thinking, or explains how the fold as the characteristic of the Baroque finds expression through the different forms of thought at the same time, Deleuze still emphasises in both cases that philosophy, science and art must be creative on their own account without direct transposition, although he goes so far as to say that the 'monad and its system . . . cannot be understood if they are not compared to Baroque architecture' (Deleuze 2006: 31).

With their creative ideas, philosophy, science and art each posit their own object, or more precisely the event, the actual matter of fact or the monument. Even when science, for example, 'is concerned with the same "objects" it is not from the viewpoint of the concept; it is not by creating concepts' (Deleuze and Guattari 1994: 33). Indeed, it is only the same

object inasmuch as it is identified as such by recognition, in *What Is Philosophy?* the finite movement of thought that gathers together the whole of the negative. Joining together in the brain and continually knotting up the brain-subject, the planes of philosophy, science and art do not address the same object with concept, function and compound of sensations. 'The three thoughts intersect and intertwine but without synthesis or identification' (198–9). Each posits its own object, but they must intertwine in order to allow the free interplay from which creation emerges. To this end, though, they must first of all free themselves from the well-coordinated interaction to which opinion subjects them. Lacking creative force, opinion cannot avoid designating solely an already constituted object, starting from a pregiven subject of lived experience. Conceptual art, while directly raising the question of its own relationship to the concept and to the function, is a prime example of how opinion crosses the boundaries of philosophy and art to support itself, and for this reason can go no further than, as Deleuze and Guattari put it, 'to find ordinary perceptions and affections in the infinite and to reduce the concept to a *doxa* of the social body or great American metropolis' (198). So when Joseph Kosuth in his 1965 artwork *One and Three Chairs*, to which *What Is Philosophy?* unmistakably alludes, installs 'a sufficiently neutralized plane of composition', on which the supposed artwork hierarchically arranges 'a thing, its photograph on the same scale and in the same place, its dictionary definition', he is referring to the recognition of the viewer, the subject of reflection who brings forth the intended artwork by identifying an object in this hierarchical arrangement with the help of the prevailing opinion (198). A chair, a photograph thereof and the definition of a chair provides us with everything we need to form the cliché of a chair, supplying the referents for what we mean when we say: 'This is a chair.' And as Kosuth leaves the selection of the chair and the photography to an arbitrary agent, the object is hardly likely to escape from the sphere of functions whose arguments are consensual perceptions and affections. The agent must subject himself to the disciplinary power of the system of opinion implemented in the social body in order to make the right choice, namely 'a seat with a back, and often arms, usually for one person'. This is how the functions of the lived calibrate themselves against the given state of affairs and set up linguistically and culturally separate social milieus into which philosophers, like anyone else, are bound, right down to their mental movements.

Now, of the different types of 'interference between the planes that join up in the brain', the 'extrinsic interferences' are those in which

each of the three forms of thought 'remains on its own plane and utilizes its own elements' (Deleuze and Guattari 1994: 216–17). In the division of labour involved in the creation of the concept, the extrinsic interferences establish those relationships of interconnection on which the interaction of philosophy and science rests. 'Philosophy has a fundamental need for . . . science', say Deleuze and Guattari in summary, 'because science constantly intersects with the possibility of concepts and because concepts necessarily involve allusions to science that are neither examples nor applications, nor even reflections' (162). Science cannot provide a basis for the possibility of concepts – that can only be done by the plane of immanence laid out by the philosopher – but science does intersect this possibility with actual matters of fact and bodies, which it constitutes or modifies with its functions, and thus calls for the creation of correlate concepts. Concepts necessarily involve allusions to science because 'philosophy will be able to draw out concepts from these matters of fact inasmuch as it extracts the event from them', and this extraction of the event implies that we find 'allusions to them on the plane of immanence and in the event' (52, 161). In order to create the concept as event, 'it would be necessary to return to the interior of scientific matters of fact or bodies in the process of being constituted' (140). To be precise, the philosopher extracts the event 'from everything that a subject may live, from its own body, from other bodies and objects distinct from it, and from the matter of fact' (159). As is made clear at several points in *What Is Philosophy?*, if not only the realm of scientific function, but the realm of function as a whole – including the mental landscape and the historical milieu formed by opinion – forms the actual factors on whose basis philosophy determines concepts, then the philosopher in any case 'neither reproduces the matter of fact nor imitates the lived' (160). He or she 'does not look for the function of what happens but extracts the event from it', so that the concept itself abandons all reference and instead contains allusions to the actual (160). In respect of the creation of the concept, therefore, we must not separate what the scientific faculty of knowledge determines as matter of fact from what this faculty or power, in its degenerate form, accommodates through the application of recognition in the function of the lived – even if great importance is attached to that separation in answering the question of science's creative activity. In the process of the concept's constitution, a distinction in the realm of function cannot be upheld at all, because in that process wresting the determinations away from the matter of fact, the body, the lived, means nothing other than removing them from

chaos, for they appear first of all as chaotic. Creation requires that we plunge into chaos and free ourselves from all the historical ballast that is still preventing us from becoming philosophers anew. The difference between science and philosophy in their respective attitudes towards chaos establishes a difference in kind between concept and function, and assigns them to their belonging on their own plane (see Deleuze and Guattari 1994: 117–18). Since concept and function order chaos in different ways within a chaosmos, philosophy cannot adopt the order of science and simply transpose the elements of science directly onto its plane. For this reason it is the extrinsic interferences with science that are necessary for the creation of the concept, because philosophy 'remains on its own plane and utilizes its own elements', so that it always creates with its 'specific means' (217, 161). And these interferences are necessary not only when a correlating concept is created for an already given function of science, because every kind of determination has recourse to science's and opinion's acts of reference. Concept and function are not creations *ex nihilo*, since chaos is not a nothingness. Chaos first and foremost contains that which we expose to chaos when we plunge into it in order to produce something new. 'Chaos is characterized less by the absence of determinations' than by 'the impossibility of a connection between them', by the fact that there is 'not a movement from one determination to the other' (42). Only through determinations taken from chaos being reconnected within a concept in accordance with the order of philosophy, and through the sequencing of the concepts among themselves, does thought accede to the infinite movement of the plane of immanence and reconquer an immanent power of creation. Thus, if science supports philosophy in the creation of the concept, it does so precisely not by assuring a reference of the concept.

The extrinsic interferences that occur between all forms of thought when 'the interfering discipline' proceeds 'with its own methods' or means therefore appear 'when a philosopher attempts to create the concept of . . . a function (for example, a concept peculiar to Riemannian space)' (Deleuze and Guattari 1994: 217). The concept of a function strictly speaking means creating the concept which is peculiar to a function, or as Deleuze and Guattari put it, the concept for Riemannian space. The extrinsic interferences with science and the allusions in the completely created concept both relate to the object that science constitutes or modifies with the functions and that it thereby posits as extrinsic. 'The concept does not reflect on the function any more than the function is applied to the concept. Concept and function must intersect,

each according to its line' (161). In the case of philosophy, this line leads from the matters of fact that science actualises to the events; in the case of science, it leads from the events to the matters of fact:

> If the two lines are inseparable it is in their respective sufficiency, and philosophical concepts act no more in the constitution of scientific functions than do functions in the constitution of concepts. It is in their full maturity, and not in the process of their constitution, that concepts and functions necessarily intersect, each being created only by their specific means. (Deleuze and Guattari 1994: 161)

In their full maturity, the two heterogeneous elements – concept and function – outline an object as though they tied together the event and the object posited as matter of fact, as though enveloping them with the two lines of philosophy and science. 'The two lines are therefore inseparable but independent, each complete in itself: it is like the envelopes of the two very different planes' (Deleuze and Guattari 1994: 161). We find allusions to the matters of fact, to the object of science, 'we find only allusions to them on the plane of immanence and in the event' (161). The event, on the other hand, wrests itself from the function and cannot be grasped as a matter of fact. Deleuze and Guattari liken the event from the viewpoint of science to a cloud: 'Philosophy can speak of science only by allusion, and science can speak of philosophy only as of a cloud' (161). Philosophy has a fundamental need for science, although the two lines of philosophy and science are independent and each is complete in itself – and 'science is . . . equally and intensely in need of philosophy' (162). But philosophy does not reflect on the function, and provides science with no sort of criterion for a distinction in the realm of function.

IV. The Intrinsic Interferences of Philosophy with Art

In Kant's aesthetic of the beautiful and the sublime, the various faculties of thought enter into a discordant accord which is not dominated by any one of these faculties and not regulated by any predefined law. And it is precisely beauty – which, in *What Is Philosophy?*, reveals the division of labour of philosophy with art – that leads us to a free interaction, guided by taste, of all three forms of thought. The starting point for characterising the intrinsic interferences by which philosophy arrives at the sensation of the concept is the following passage:

> The fact that there are specifically philosophical perceptions and affections and specifically scientific ones – in short, sensibilia of the concept and sensibilia of the function – already indicates the basis of a relationship

> between science and philosophy on the one hand, and art on the other, such that we can say that a function is beautiful and a concept is beautiful. The special perceptions and affections of science or philosophy necessarily adhere to the percepts and affects of art, those of science just as much as those of philosophy. (Deleuze and Guattari 1994: 132/126; translation modified)

This relationship, which enables us to say that a concept or a function is beautiful, thus consists in the perceptions and affections of science or philosophy adhering to the sensations of art. The interference in question is 'intrinsic', and must not be confused with an extrinsic interference, which appears even when, for instance, 'a philosopher attempts to create the concept of a sensation' or 'when a scientist tries to create functions of sensations' as long as they use their 'own methods' or means (Deleuze and Guattari 1994: 217).

> [Sometimes] we speak of the intrinsic beauty of a geometrical figure, . . . but so long as this beauty is defined by criteria taken from science, like proportion, symmetry, dissymmetry, projection, or transformation, then there is nothing aesthetic about it: this is what Kant demonstrated with such force. (Deleuze and Guattari 1994: 217)

Because science 'remains on its own plane and utilizes its own elements', this beauty, even if it is described as intrinsic beauty, is completely different from the beauty that points to intrinsic interferences (Deleuze and Guattari 1994: 217). Only these intrinsic interferences with art can be the reason why there are sensibilia of the concept and sensibilia of the function and thus the conceptual persona, which can raise the concept to creation, or the partial observer, who can raise the function to creation. 'Partial observers are *sensibilia*', write Deleuze and Guattari, '*the perceptions or sensory affections of functives themselves* . . . For their part, conceptual personae are philosophical sensibilia, the perceptions and affections of fragmentary concepts themselves' (131).

In order to create the function, explain Deleuze and Guattari immediately after discussing the intrinsic beauty of a geometrical figure, 'the function must be grasped within a sensation that gives it percepts and affects composed exclusively by art, on a specific plane of creation that wrests it from any reference' (Deleuze and Guattari 1994: 217). In the same way, philosophy is dependent on art because its special perceptions and affections also necessarily adhere to the percepts and affects of art. As the perceptions and affections of philosophy are neither percepts and affects themselves nor derive from habitual experience, they must go back to art, or to be more precise, to the conceptual persona, which philosophy can only awaken to life with the help of

art. The division of labour between these two forms of thought does not, however, imply that with the completely given concept, art has already posited a correlating artwork: the artwork must likewise be created for itself. In addition, philosophy – or science – does not call for a single and precisely defined artwork that art still has to create. Thus, the Rauschenberg collage is an artwork 'for' the Riemannian space of mathematics, but so are the smooth spaces with close vision in Bresson's films.

At the same time as the concepts are attaching themselves to the corresponding sensations, the conceptual personae slip in among the aesthetic figures. There is an 'intrinsic type of interference when concepts and conceptual personae seem to leave a plane of immanence . . . so as to slip in . . . among the sensations and aesthetic figures'; and these 'slidings are so subtle, like those of Zarathustra in Nietzsche's philosophy or of Igitur in Mallarmé's poetry, that we find ourselves on complex planes that are difficult to qualify' (Deleuze and Guattari 1994: 217). In turn, 'partial observers', continue Deleuze and Guattari now returning to science, 'introduce into science sensibilia that are sometimes close to aesthetic figures on a mixed plane', whose subtle slippings advance so far onto art's plane of composition that the partial observers mix with the aesthetic figures (217). It is difficult to separate the aesthetic figures from the compounds of sensations on the plane of composition. 'Aesthetic figures . . . are sensations: percepts and affects, landscapes and faces, visions and becomings' (177). Their seeing is only perceiving inasmuch as they 'have passed into the landscape and are themselves part of the compound of sensations': not perception but percept (169). That the aesthetic figures are sensations by no means excludes art's being dependent on an interaction with philosophy and science to create the compounds of sensations in its possible universe – a universe that sets these compounds of sensations in motion. In this interaction, art creates the compounds of sensations by rising, through the performance of the movements by means of the aesthetic figure, to the power of thinking and creating, to be a layer of the brain-subject. 'Art . . . lays out a plane of composition that, in turn, through the action of aesthetic figures, bears monuments or composite sensations' (197).

For concepts and conceptual personae to be able to mix with the sensations and aesthetic figures at all, the intrinsic interferences of philosophy with art must imply that art, in order to support philosophy in a division of labour for the creation of the concept, composes the percepts and affects to which the concepts adhere – that art, in an interaction with philosophy, awakens to life the conceptual persona that

raises the concept to creation. Everything points to the conclusion that the subtle slippings of philosophy open up concepts to the plane of composition to such an extent that the concepts form a universe for art, setting in motion the corresponding percepts and affects that art has composed. And indeed, Deleuze and Guattari say that 'concepts are centers of vibrations, each in itself and every one in relation to all the others', counting the vibration (because it is already durable or compound) as one of the different 'monumental types, or "varieties", of compounds of sensations' of art (Deleuze and Guattari 1994: 23, 168). They also describe concepts given in their full maturity as 'conceptual blocs', and by comparison, the work of art as a '*bloc of sensation*' (208, 164). In any case, there must be a real interplay between the planes in order to arrive at the concepts as conceptual blocs. To this end, philosophy must connect up the concepts to the percepts and affects of art, so that these percepts and affects are set in motion; this motion, in turn, induces an aesthetic figure on the plane of composition, and with this aesthetic figure, the conceptual persona arises on the plane of immanence through the connecting up of the concepts to the percepts and affects. This interplay even leads to the conceptual personae seeming to leave a plane of immanence and mixing with the aesthetic figures, so that 'between them, not only alliances but also branchings and substitutions take place' (66). And all this is possible because the 'plane of composition of art and the plane of immanence of philosophy can slip into each other to the degree that parts of one may be occupied by entities of the other', without fusing (66). In fact, 'in each case the plane and that which occupies it are like two relatively distinct and heterogeneous parts' (66). The reason why the planes slip into each other, according to Deleuze and Guattari, is that 'the concept as such can be concept of the affect, just as the affect can be affect of the concept' (66). And together with concept and sensation, conceptual persona and aesthetic figure also pass into one another, but again they do not fuse: even if 'aesthetic figures are not the same as conceptual personae they pass into one another, in either direction, like Igitur or Zarathustra, but this is insofar as there are sensations of concepts and concepts of sensations' (177). This mixing of concept and conceptual persona with sensation and aesthetic figure, as the plane of immanence and the plane of composition slip into each other, derives from a becoming that is produced through the affect, when philosophy connects up concepts with the percepts and affects composed by art. The affect thus causes the concepts to vibrate, and these vibrations are transferred to the extent that 'branchings and substitutions', interlinking

the planes, arise between conceptual persona and aesthetic figure. The conceptual persona and the aesthetic figure, asserts *What Is Philosophy?*, can 'pass into each other in a becoming that sweeps them both up in an intensity which co-determines them' (66). Despite their shared intensity, it is still possible to distinguish a sensory becoming from a conceptual becoming – even in the affect of the concept, the affect being on the plane of composition and the concept on the plane of immanence. Accordingly, the aesthetic figures never fuse in the conceptual personae, whose sensation is only a perception inasmuch as, having totally passed into the concept, for them the concepts themselves are the percepts:

> Sensory becoming is the action by which something or someone is ceaselessly becoming-other (while continuing to be what they are), ... whereas conceptual becoming is the action by which the common event itself eludes what is. Conceptual becoming is heterogeneity grasped in an absolute form; sensory becoming is otherness caught in a matter of expression. (Deleuze and Guattari 1994: 177)

The intrinsic interferences of philosophy with art draw the thinker into a form of athleticism, for he or she is on two planes at the same time and does not produce a synthesis but ties the planes together without referring them back to a unity, in a constant battle, since – Kant again – 'they struggle against one another' in him or her (Deleuze 1984: xii). This struggle is a condition of creation itself, to the extent that it tears the planes from their tacit connection by opinion; they shake off the stabilised I of opinion to knot themselves always anew in singular moments of creation. According to Deleuze and Guattari, '*Igitur* is just such a case of a conceptual persona transported onto a plane of composition, an aesthetic figure carried onto a plane of immanence: his proper name is a conjunction' (Deleuze and Guattari 1994: 67). As conjunctions, these thinkers 'do not produce a synthesis of art and philosophy' but branch out and do not stop branching out (67):

> They are hybrid geniuses who neither erase nor cover over differences in kind but, on the contrary, use all the resources of their 'athleticism' to install themselves within this very difference, like acrobats torn apart in a perpetual show of strength. (Deleuze and Guattari 1994: 67)

In this perpetual show of strength, the hybrid genius establishes the correspondence between the planes, bridging the I of thinking, which is constantly split anew like 'a tightrope walker', like Zarathustra

(Nietzsche 1976: 124). 'The brain, under its first aspect of absolute form, appears as the faculty of concepts', as the power of the concept to become a subject through the conceptual persona, by creating the concept itself as event, a conceptual becoming as heterogeneity grasped in an absolute form (Deleuze and Guattari 1994: 211). 'And this *I* is not only the "I conceive" of the brain as philosophy, it is also the "I feel" of the brain as art' (211).

When the concept itself, as conceptual persona, becomes subject, it determines, as intensity, our becoming – or to be more precise, the conceptual persona is nothing but this becoming, the thinking, perceiving and feeling of the concept. This is the moment in which philosophy finds its expression through the concept, as that power of thinking and creating which is the power of the concept itself. 'What depends on a free creative activity is also that which, independently and necessarily, posits itself in itself' (Deleuze and Guattari 1994: 11). The concept, created 'relative to its own components, to other concepts, to the plane', posits itself as 'absolute through the condensation it carries out' (21). The moment of creation is the transition from the infinite movements to the concept as intensity, and corresponds to the transition in Spinoza from created nature to creating nature, from the infinite to the absolute: the concept unfolds its power, it 'posits itself and its object at the same time as it is created' in carrying out the infinite movements of the plane of immanence, in the thinking, perceiving and feeling of the concept (22). The concept itself is what makes us think through the conceptual persona, makes us see and become. 'It is no objection to say that creation is the prerogative of the sensory and the arts, since . . . philosophical concepts are also "sensibilia"' (5). Concepts are of a creating nature, in the same sense as Deleuze and Guattari say with reference to art that 'the sensation is not colored but, as Cézanne said, coloring' (167). Through the intrinsic interferences with art with which philosophy awakens to life its conceptual persona – which, as 'a living category', applies the movements of the plane to the concepts – the concept is created as a vital idea, becomes an intensity, and posits itself as absolute (3). The conceptual persona performs the infinite movements of thought on the plane of immanence and erects interferences, intervening 'between the plane and the intensive features of the concepts that happen to populate it. *Igitur*' (75). Or, to make it explicit: 'This was to take place in the combinations of the Infinite face to face with the Absolute. Necessary – the extracted Idea. Profitable madness. There one of the acts of the universe was just committed . . . Proof' (Mallarmé 1982: 92).

V. The Interaction Led by Taste

At the beginning of *What Is Philosophy?*, Deleuze and Guattari assert that 'the time has come for us to ask what philosophy is', noting that they have often raised this question and always provided the same answer: 'Philosophy is the art of forming, inventing, and fabricating concepts' (Deleuze and Guattari 1994: 2). However, they continue, 'the answer not only had to take note of the question, it had to determine its moment, its occasion and circumstances, its landscapes and personae, its conditions and unknowns' (2). As long as the concept has not yet received these determinations, as long as it is formed but not yet created, linked to other concepts, given in its full maturity, the plane remains still-transparent, in other words prephilosophical, and the conceptual persona still in limbo. All three elements must be constructed as such; and as none of them is 'deduced from the others, there must be coadaptation of the three' (77). Because, on this basis, 'the concept must be created, it refers back to the philosopher as the one who has it potentially, or who has its power and competence', who awakens the conceptual persona to life precisely by surrendering to the power of the concept (5):

> The philosopher is the concept's friend; he is potentiality of the concept. That is, philosophy is not a simple art of forming, inventing, or fabricating concepts, because concepts are not necessarily forms, discoveries, or products. More rigorously, philosophy is the discipline that consists in *creating* concepts... Because the concept must be created, it refers back to the philosopher as the one who has it potentially, or who has its power and competence. (Deleuze and Guattari 1994: 5/10; translation modified)

Philosophy is the 'activity of creating concepts' to the same extent that science and art consist in 'scientific or artistic activity'; it consists as philosophy only in the creative implementation of the movements of thought on the plane of immanence, which entails the now of our becoming (Deleuze and Guattari 1994: 8).

'The philosophical faculty of coadaptation, which also regulates the creation of concepts, is called *taste*' (Deleuze and Guattari 1994: 77). Thus taste guides not only the construction of the elements and their mutual coadaptation but also, starting from this basis, the positing of the concept as event in each singular moment of creation. Taste first appears as the triple faculty which imposes on itself the rule for the coadaptation of the three elements of philosophy: 'No rule... will say in advance whether this is the good plane, the good persona, or the good concept; for each of them determines if the other two have succeeded or not, but each must be constructed on its own account', and we construct 'only

as we go along and on the basis of their coadaptations' (82). In respect of taste, 'as the triple faculty of the still-undetermined concept, of the persona still in limbo, and of the still-transparent plane', write Deleuze and Guattari, 'the laying-out of the plane is called Reason, the invention of personae Imagination, and the creation of concepts Understanding' (77). Art serves as Imagination, with whose help philosophy invents the conceptual personae and brings them to life; science serves as Understanding, with whose help philosophy constructs and determines concepts; philosophy is in this case Reason, which is stimulated in this free yet also necessary interaction until, in the moment of creation, it finds its expression as the power or faculty of thinking and creating, in the creation of concepts. Alongside coadaptation, 'the free creation . . . of concepts calls for a taste' that guides it and at the same time 'appears as philosophical taste', as 'love of the well-made concept, "well-made" meaning not a moderation of the concept but a sort of stimulation' – a stimulation through interference with science and slippings into the sensations and aesthetic figures of art (77–8).

While opinion proceeds by applying recognition and mediates between a subject of lived experience and its object, the philosophical concept needs taste in order to become the object of creation, just as the brain becomes subject through the conceptual persona. Apart from a rule that the philosopher imposes on himself, no rule is valid for the free interplay. 'The philosopher . . . can determine a concept only through a measureless creation whose only rule is a plane of immanence that he lays out and whose only compass are the strange personae to which it gives life' (Deleuze and Guattari 1994: 78). The conceptual persona, which advances through reconnections of the components taken from chaos in a concept and in the sequencing of the concepts among themselves, is not prescribed any rigid categories by the plane: the plane 'implies a sort of groping experimentation' and points to an 'instinctive, almost animal *sapere*' (41, 79). Nietzsche, suggest Deleuze and Guattari, 'sensed this relationship of the creation of concepts with a specifically philosophical taste' and was aware that 'it is certainly not for "rational or reasonable" reasons that a particular concept is created or a particular component chosen' (78). A groping experimentation, a taste, remains the only possibility of orienting oneself in the smooth spaces, given in close vision, of sequencing the concepts beyond the intentionally opened rift, the hiatus, when the linkage between one of them and the next is not defined in advance.

Because the concept is given its determination by allusions to the actual, we need have no sympathy for Hallward's characterisation, in

a detailed discussion of *What Is Philosophy?*, of Deleuze's thought as 'post-mystical philosophy' with no relation to the actual (Hallward 2006: 133). Due to the interaction of philosophy with science and art for the creation of concepts, it makes no sense to allow philosophy the exclusive privilege of being capable, with concepts, of creation in its purest form. Yet this does not mean obliterating the differences in kind between these three forms of thought and denying philosophy the potential for its very own and specific creation, as de Bloois does. It is not in spite of, but precisely because of the intrinsic interferences that philosophy posits the concept as a singular creation and expresses itself as an autonomous power of thinking and creating. The hybrid genius of Deleuze and Guattari therefore reveals itself in the stimulation of taste for a free interplay of thought in its three great forms, an interplay that resists the degeneration of thought into opinion.[3]

Notes

1. I am following Stengers's use of 'matter of fact' instead of 'state of affairs' for the translation of *état des choses* (Stengers 2005: 153). For all quotations from *What Is Philosophy?* (Deleuze and Guattari 1994) that include other modifications to the English translation, the second page number refers to the French edition (Deleuze and Guattari 2005a).
2. I base my considerations of Spinoza entirely on Deleuze (Deleuze 1990: ch. 7).
3. This article was translated from the German with the help of Michael Scuffil and Kate Sturge. It outlines the framework of my forthcoming book on *What Is Philosophy?* I would like to thank Professor Richard Heinrich (University of Vienna) for his continuous support.

The Strangest Cult: Material Forms of the Political Book through Deleuze and Guattari

Nicholas Thoburn University of Manchester

Abstract

This article investigates the complex object of the political book. Mobilising Deleuze and Guattari's typology of the book, the article assesses the material properties of four specific books (or sets of books): Mao Zedong's 'Little Red Book', Russian Futurist books, Antonin Artaud's paper 'spells', and Guy Debord and Asger Jorn's 'anti-book' *Mémoires*. Highly critical of the dominant mode of the political book, what they call the 'root-book', Deleuze and Guattari draw attention to the troubling religious structures and passions that order its field. Here the book internalises the world as the origin and source of truth and authority – a mode of existence as dear to the avant-garde as it is to religious formations: 'Wagner, Mallarmé, and Joyce, Marx and Freud: still Bibles.' But the book also features in Deleuze and Guattari's counter-figure of the 'rhizome-book', where they foreground the dynamic materiality of this medium: 'A book has neither object nor subject; it is made of variously formed matters, and very different dates and speeds.' The rhizome-book is an enticing concept for assessing the political book, yet Deleuze and Guattari pay little attention to the specific, concrete attributes of this medium. In focusing on the properties of particular books this article seeks to address that absence, and so contribute to an understanding of the political book that is fully engaged with its material forms.

Keywords: the book, rhizome-book, Deleuze and Guattari, Mao Zedong, Russian Futurism, Antonin Artaud, Situationist International

> One can speak out only through the mouth, but the book's facilities for expression take many more forms. (Lissitzky 2000: 135–6)

The place of the media form of 'the book' in the emergence of the political cultures and structures of the modern nation state has been the subject of an important body of research (Eisenstein 1980; Darnton 1996; Febvre and Martin 1997). Considerably less attention has been paid to the place of the book in extra-parliamentary political cultures, or – and this is where my primary interest lies – to political critique of the book's form and function. A rare exception can be found in Deleuze and Guattari's *A Thousand Plateaus*. In a surprising and singular assessment, here the common understanding of the book as a generic instrument of secular enlightenment is supplanted with an image of the book as a fraught and ambivalent material entity, one entwined with a rather troubling political passion. Highly critical of the dominant mode of the political book and its associated semiotic and subjective patterns, what they call the 'root-book', Deleuze and Guattari develop a set of concepts for a fully materialist understanding of this medium, and point to the possibilities of a counter-figure, the 'rhizome-book'.

As N. Katherine Hayles (2002: 32–3) insists in *Writing Machines*, the materiality in question is complex and emergent. Materiality is not a fixed property of the book, but a mutable product of its physical, sensory, textual, conceptual, temporal and affective materials and relations. It is well known that a concern with the full complexity of material relations is paramount in Deleuze and Guattari's work. Yet despite their materialist framing of the book – and, with *A Thousand Plateaus*, their own experiment in the rhizome-book[1] – they pay little attention to the book's concrete forms and materials. Against that tendency to abstraction, this article seeks to keep the book's rich materiality at the centre of discussion, so contributing – in the spirit of contemporary studies in textual materialism and the practitioner field of the artists' book (Hayles 2002; Drucker 2004; Selcer 2010) – to an understanding of the political book that is fully engaged with its material forms. As such, the article at once sets out the contours of Deleuze and Guattari's typology of the book and mobilises it to assesses the material properties of four specific books (or sets of books): Mao Zedong's 'Little Red Book', Russian Futurist books, Antonin Artaud's paper 'spells', and Guy Debord and Asger Jorn's 'anti-book' *Mémoires*.

Allow me to make a few methodological points before beginning the discussion proper. A reader familiar with the above group of books may already be questioning the wisdom of analysing together such disparate

works, of which only Mao's book fulfils the conventional criteria of a 'political' book (the others sit more comfortably in the analytic framework of the cultural avant-garde). And one of these sets of books, Artaud's spells, would not under any normal rules of classification even be designated as 'books' at all, for these single-sheet artefacts are closer to letters or artworks on paper. Why, then, have I brought this heterogeneous group together? Well, Mao's book is included principally because it is a paradigmatic case of the political root-book, and a book about which very little has been written, remarkably so given its global impact. The other books analysed here are all selected because they are at once singular experiments in textual inscription and the form of the book, and particularly enticing examples for thinking with the concept of the rhizome-book. The very heterogeneity of the set is of course part of the appeal, for I in no way wish to compose a unified group of rhizome-books – this set is fundamentally open. Neither do I seek to establish a hard formal boundary between the book and its associated mediums of inscription, not least of which is the letter – hence my inclusion of Artaud's spells. After all, Deleuze and Guattari, as I show, have no objection to breaching the boundaries of the book, or, as is well known, to finding value in the open-ended arrangement of disparate elements.[2] As for the 'politics' of these works, the point is not whether they are self-identified as 'political books', but how they trouble and overcome the form of the root-book, itself a most political entity.

I. The Delusional Passion of the Book

From the first pages of *A Thousand Plateaus* one encounters a rather unusual typology of three kinds of book: the 'root-book', the 'fascicular root-book' and the 'rhizome-book'. These are tendencies or organising patterns in the field of the book, not mutually exclusive categories; in any particular book one would expect their co-presence and interaction, albeit with varying degrees of prominence. But for Deleuze and Guattari, the dominant tendency, such that it is the 'classical' figure of this medium, is the root-book.

The root-book is a signifying totality, an enclosed and sufficient entity constituted as an image of the world. It is a formation immanent to the sacred texts of Judaism, Christianity and Islam. To limit my discussion to Christian expressions, for Francis Bacon in his 1605 *Advancement of Learning*, God provided two books: the volume of the Scriptures, which reveals God's will, and the volume of the creatures – the book of nature – which reveals his power (Borges 2000). These books exist in an

imitative relation of complementarity, where the essential forms found in nature are mirrored in the universal book of Scriptures. Earlier, in his 1550 *Primera parte de las diferencias de libros que hay en el universo*, Alejo Venegas conceived of the book as an 'ark' and 'depository' of divine knowledge. As Walter Mignolo (2000: 351) explains, for Venegas, 'The human book has two functions: to know the creator of the Universe by reading His Book and, at the same time, to censure every human expression in which the Devil manifests itself by dictating false books.'

The essential structure of the root-book is clearly evident in these foundational expositions of the book. As it creates an *imitative* image of nature, the book presides, through the law of reflection, over the *split* between book and world. Severed from the world and, as such, pristine in its spiritual autonomy, the book is also a vector of *authority*, as is clear in Venegas: the 'ark' of the book both enjoins subjection to God's word and ensures against 'false books'. There is, then, a mundane *subject* constituted in the book's truth and authority, but it can also develop a peculiar *passion*, a 'monomania' of 'the book as origin and finality of the world' (Deleuze and Guattari 1988: 127). Deleuze and Guattari (111–48) make this point about the book's passional subjectivity through an assessment of the book's place in the semiotic system they call the 'postsignifying regime of signs'.

I present Chinese Maoism as an example of this postsignifying regime below, but it is useful first to set out its principal characteristics. As analytically (if rarely empirically) distinct from the 'signifying' regime, the postsignifying regime of signs is an 'active' rather than 'ideational' semiotic system. It is characterised less by the endless cycle of interpretation of signs, than by 'concise formulas' conducive to passional, subjective action. The radiating network of signification anchored in centres of interpretive authority (priest, political leader, despot) here breaks down. Instead, local 'points of subjectification' emerge that are constituted through the betrayal of dominant social relations and semiotic codes (Deleuze and Guattari give the example here of the betrayal of food by the anorexic) and a certain monomania that leads the subject on a passional vector through a series of finite linear proceedings, each drawn, as if to a 'black-hole', by the pursuit of its end. The particular semiotic expressions of the passional regime are composed of a 'subject of enunciation' and a 'subject of the statement', where the latter is bound to the utterances of the former and acts in a 'reductive echolalia' as its respondent or guarantor.[3]

It is in the action-oriented formulas of this regime that the book proper emerges, as it moves away from an essentially oral, 'nonbook' character

with external referent in God or despot, and instead – like a 'portable packet of signs' (Deleuze and Guattari 1988: 122) – comes to internalise the world as the origin and source of truth and authority:

> in the passional regime the book seems to be internalized, and to internalize everything: it becomes the sacred written Book. It takes the place of the face and God, who hides his face and gives Moses the inscribed stone tablets. ... *The book has become the body of passion* ... It is now the book, the most deterritorialized of things, that fixes territories and genealogies. (Deleuze and Guattari 1988: 127)

As is clear from the Old Testament references, the root-book and its 'delusional passion' is religious in origin, but it is not limited to such formations (Deleuze and Guattari 1988: 127).[4] Indeed, this 'strangest cult' has been a key feature of avant-garde culture and politics: 'Wagner, Mallarmé, and Joyce, Marx and Freud: still Bibles' (127). Mallarmé's (1971: 690) formulation of the book as 'spiritual instrument' – 'all earthly existence must ultimately be contained in a book' – is perhaps the clearest expression of this tendency. But the degree to which Marx is subject to the passional form of the book is questionable; indeed, in *The German Ideology* Marx himself makes a direct critique of the religious mode of the book that is remarkably resonant with that of Deleuze and Guattari.[5] Nonetheless, this defence of Marx cannot always be made of Marxism, at least not as expressed in regimes where Marxism became state doctrine. And it is from this milieu that I want to take a specific case of a political root-book.

II. Mao Zedong's Little Red Book

It would be difficult to find a book more enmeshed in its immediate environment than *Quotations from Chairman Mao Tse-Tung* (henceforth, *Quotations*), otherwise known as the Little Red Book. If it trails considerably behind the Bible in estimated sales figures, the majority of the 900 million copies of the second-best-selling book in world history[6] were published in a period of under four years, between 1964 and 1967, with the second year of the Cultural Revolution, 1967, accounting for 350 million (Lei Han 2004: 1; MacFarquhar and Schoenhals 2006: 240; Wilkinson 2008: 29). Of course, the Little Red Book was not a cause of the Cultural Revolution, yet – as is indicated by its frequent and central presence in the iconic posters and photographic images of the period – it was an object with a considerable agential role in inspiring, distributing and consolidating the collective passions of that

upheaval.[7] These posters and images also speak to the importance of the book as a rich material entity – as does its popular name, which foregrounds less the content or 'quotations' than the physical dimensions of the book, and its colour.

Quotations is principally a means for the transmission of the politico-philosophical system officially known as 'Mao Zedong Thought'.[8] While Mao's China was comprised of different semiotic regimes (with more than a little despotic signification), Mao Zedong Thought is a clear exemplar of the dynamics of the word and the book in the postsignifying regime of signs. Žižek is not alone in observing a wholly 'cosmic' orientation in Maoism, one that bound the Chinese people and Party to a transcendent trajectory of liberation that Mao's Thought discerned in human and natural history (in Mao Zedong 2007: 10).[9] This prophetic *reflection* of the world in Mao's Thought is simultaneously a *separation* from it, one that protects the 'purity' of the word against the 'ubiquitous contamination' of the everyday world (Lifton 1970: 49).[10] But, in accord with the passional structure of the root-book, it is a pristine truth that is subsequently returned to the world as authority and action. As such, Mao Zedong Thought constituted the Maoist 'point of subjectification', spiritualising the word as substance, nourishment and energiser of an immortal revolutionary cause. In the language of a 1966 People's Liberation Army newspaper:

> The thought of Mao Tse-tung is the sun in our heart, is the root of our life, is the source of all our strength. Through this, man becomes unselfish, daring, intelligent, able to do everything; he is not conquered by any difficulty and can conquer every enemy. (qtd in Lifton 1970: 72)

So configured, this passional subjectivity was to transcend mere individual mortality, as the catastrophe of Mao's Great Leap Forward (1958–62) rather confirms: between 15 and 40 million people died of starvation, over-work and summary killing as Mao sought an ultra-voluntarist route to industrialisation via the super-exploitation of labour, exporting grain during the famine to fund the import of military and industrial technology (Dikötter 2011). This subjective principle is also evident in Mao's words – in this framing of nuclear war, for instance, from a letter to Khrushchev: 'For our ultimate victory, … for the total eradication of the imperialists, we … are willing to endure the first [US nuclear] strike. All it is is a big pile of people dying' (Mao, qtd in Chang and Halliday 2007: 505). Such immortal political subjectivity was operational through individual identification with the macro, cosmic orientations of Mao's Thought, but its power was manifest also in its

ability to function at a micro-level, drawing as Maoism did a set of ethical criteria and associated practices to assess and modulate everyday behaviour.

With these characteristics, it is no surprise that while an early essay by Mao (2007: 44) called to 'oppose book worship', by the time of the Cultural Revolution Mao's books had become elevated to a fount of singular knowledge: 'the best books in the world, the most scientific books, the most revolutionary books' (qtd in Lifton 1970: 72).[11] Thus sanctified, Mao's texts took on the authoritarian function of the root-book that we saw above in Venegas, as is apparent in the call of the Communist Party daily, the *Red Flag*, to 'establish with utmost effort the absolute authority of the great Mao Zedong's Thought', 'Let Mao Zedong's Thought control everything' (qtd in Lu 2004: 65).

If this is the passional subjectivity of Mao's Thought, an important means of its social articulation was the particular structure of *Quotations*, to which I now turn. *Quotations* was initially published on a restricted basis in May 1964 under Lin Biao's direction as a vehicle for the education of the People's Liberation Army, which he headed. The book comprised selections of Mao's works under thirty thematic chapters, extending to thirty-three in 1965. This enabled a pedagogical practice characterised by group learning and recitation of passages and slogans, an approach that became central to the book's use following mass publication in 1966. Lin Biao described the benefits of such pedagogy in 1959: 'Learning the writings of Comrade Mao Zedong is the shortcut to learning Marxism-Leninism. Chairman Mao's writings are easy to learn, and once learned can be put to use immediately' (qtd in Yan and Gao 1996: 179–80). With a largely illiterate population such an approach to the 'shortcut' of learning has progressive features, but it is closely associated with authoritarian signifying patterns. As an 'active' rather than 'ideational' semiotic structure, the concise formula of the root-book requires only identification, as interpretation 'gives way to pure and literal recitation forbidding the slightest change, addition, or commentary' (Deleuze and Guattari 1988: 127). So much is clear in the words of one Shanghai newspaper in 1967: 'We must carry out Chairman Mao's instructions whether we understand them or not' (qtd in Robinson 1971: 509).

The passional activation of *Quotations* was constituted not only in the structure of its content and pedagogical mode, but also in its wider material properties. It is the *redness* of *Quotations* that is its most striking and alluring feature. Its red vinyl covers unify the book globally across its translations, perhaps with something of a universal appeal, but

in China they carried particular semiotic resonance. Already a prominent signifier of prosperity in Chinese culture, red connoted a commitment to Chinese communism, and was elevated into a foundational sign of struggle during the Cultural Revolution. One former Red Guard remembers:

> At the time China was engulfed in a permanent red storm. . . . Chairman Mao was our red Commander-in-Chief. We called ourselves 'his little red devils'. We read and quoted his little red book. Wore his red buttons on our chests. Red Flags. Red armbands. Red blood. Red hearts. . . . We could not tolerate anyone who was of a different color. (Rae Yang, qtd in Schrift 2001: 79–80)

In this fashion the redness of *Quotations* could be experienced as a collective flood of colour. Describing Mao's 1966 sunrise audiences with the Red Guards in Tiananmen Square, one biographer writes: 'Waved in the air, the red covers [of *Quotations*] made the square resemble a field ablaze with butterflies' (Terrill 1999: 318). But the mass distribution of the compact object of the book – with the rich sensory qualities that are germane to this tactile, portable medium – was such that its compound of redness, struggle and Mao Zedong Thought could also be experienced at an intimate, personal level. The endorsement leaf in Lin Biao's calligraphy contributed to a feeling of intimacy with the book, a feeling no doubt entrenched by the emotional disjunction associated with the subsequent defacement or removal of this page by each owner, following Lin Biao's death and denunciation.[12] The book could also take part in everyday ritual. At the start of the work and school day, groups would line up in front of Mao's portrait and wave *Quotations* while giving the 'three respects and three wishes'; the same practices might also take place immediately on waking or before a meal (Lu 2004: 132–3). Rhythmic waving of the book had a place in Maoist dance routines known as 'loyalty dances', and according to Xing Lu (2004: 133–4) there was even a correct manner of holding *Quotations* at such ceremonies: with the thumb placed in front and fingers behind, the book would be held over the heart to indicate loyalty and boundless love.

I will close discussion of Mao's *Quotations* by turning to the postsignifying theme of monomania as manifest among the Red Guards, the passional agents of the Cultural Revolution. The properties of the root-book had a specific articulation with the Red Guards' mode of autonomy, an autonomy that was central to the unleashed brutality of the Cultural Revolution, following Mao's call to 'boldly arouse the masses' against the established authorities (CCCCP 1966).[13] This is the somewhat paradoxical autonomy of the postsignifying mode of

subjectivity, with its monomania and reductive echolalia. As Lifton (1970: 60–2) argues, the autonomy of the Red Guards was characterised by a rare sense of 'participating in a great moral crusade' and 'of taking matters *into their own hands*', but in a fashion constituted through a 'totalistic attack upon any signs of the independent (non-Maoist) self'.[14] Here, not only did the mass-distributed *Quotations* open a direct line of affective integration between Mao and the population that was unmediated by Party structure, but its 'reject[ion]' of 'intermediaries or specialists' allowed a recoiling of Mao into the masses, the subject of enunciation into the subject of the statement (Deleuze and Guattari 1988: 127). Like a portable packet of signs, *Quotations* thus provided the Red Guards with a distributed and mobile set of points of passional subjectification and enunciation unmoored from – and in betrayal of – established sources of institutional authority. Mao did not 'hide his face' in the direct sense that Deleuze and Guattari mark as constitutive of the passional regime – 11 or 12 million Red Guards came to Beijing for the 1966 rallies with Mao, and his image, as part of the official cult of personality, was famously ubiquitous. Nevertheless, at these occasions Mao rarely spoke beyond a few words – to do otherwise would have been to risk the distributed authority of the passional forces set loose: 'The leader who used to lecture for hours to persuade his followers of the merits of a new policy now merely appeared before them with an upraised hand and a glassy smile' (Terrill 1999: 318).

III. The Rhizome-Book

Deleuze and Guattari set out their counter figure of the 'rhizome-book' by returning to the relation between the book and the world. If, as we have seen, the root-book is in a relation of separation and imitation with the world – 'The law of the book is the law of reflection' – it is based on a misapprehension of nature: 'How could the law of the book reside in nature, when it is what presides over the very division between world and book, nature and art?' (Deleuze and Guattari 1988: 5). It is a quite different understanding of nature that informs the rhizome-book, a book no longer characterised by a pristine truth in imitative separation from the world, but by an immersive transformation, an 'aparallel evolution of the book and the world' (11). In this sense, the 'book exists only through the outside and on the outside' (4). The root-book does of course also exist through relations with its outside (as we saw in the Cultural Revolution), but in the rhizome-book the outside is

no longer structured by the book's spiritual autonomy and truth. Rather, here the outside floods into the book. The book loses its root or unity and becomes a 'rhizome' of prodigious connection, a 'little machine' that plugs into its outside not to reproduce the world in the book's image, but to construct a discontinuous series of intensive states or plateaus (4).

The rhizome-book is, as such, a complex and variable arrangement of heterogeneous materials: 'A book has neither object nor subject; it is made of variously formed matters, and very different dates and speeds' (Deleuze and Guattari 1988: 3). Yet despite these materialist conceptual framings, Deleuze and Guattari offer little significant insight on how the specific material and formal properties of the book might be expressed in the mode of the rhizome-book. This is understandable, given the radically open process that the concept seeks to name. But it has the unfortunate effect of allowing the rhizome-book to feature by default as a rather abstract entity, and not itself something with concrete and various material manifestation. This description of the rhizome-book is indicative: 'The ideal for a book would be to lay everything out on a plane of exteriority . . . , on a single page, the same sheet: lived events, historical determinations, concepts, individuals, groups, social formations' (9). For all the powerful evocation here of the immanence of the book to its outside, as material form it features only as a metaphorical 'single page'.

Sceptical readers might at this point respond that the rhizome-book is fundamentally a figure of *conceptual* production, that this is where its materiality lies, not in any serious or sustained relation to the book's concrete forms. Indeed, this assertion can find some support in Deleuze and Guattari's argument itself, in their concept of the 'fascicular root-book'. Essentially the botched escape from the root-book, the fascicular root-book has severed its principal root or unity such that it opens out to the world – a world now fragmented and chaotic – but the book persists as an image of that world, compensating for chaos with a supplementary unity in the work, a unity that is perhaps even more powerful for its apparent absence: 'The world has become chaos, but the book remains the image of the world. . . . A strange mystification: a book all the more total for being fragmented' (Deleuze and Guattari 1988: 6). The concept seems designed precisely to scupper modernist experiments in the form of writing. Joyce is the main example, but William Burroughs's 'cut-up' method also illustrates this figure of the book, as does Nietzsche (astonishingly so, given his importance to Deleuze), whose 'aphorisms shatter the linear unity of knowledge, only to invoke the cyclic unity of

the eternal return' (6). Here the critique of formal experimentation is made in no uncertain terms:

> To attain the multiple, one must have a method that effectively constructs it; no typographical cleverness, no lexical agility, no blending or creation of words, no syntactical boldness, can substitute for it. In fact, these are more often than not merely mimetic procedures used to disseminate or disperse a unity that is retained in a different dimension for an image-book. Technonarcissism. (Deleuze and Guattari 1988: 22)

And yet Deleuze and Guattari are not wholly hostile to experimentation with the book's form, for the passage continues:

> Typographical, lexical, or syntactic creations are necessary only when they no longer belong to the form of expression of a hidden unity, becoming themselves dimensions of the multiplicity under consideration; we only know of rare successes in this. We ourselves were unable to do it. We just used words that in turn function for us as plateaus. (Deleuze and Guattari 1988: 22)

These quotations make Deleuze and Guattari's own tastes in method amply clear – 'We just used words'[15] – but there is no a priori rejection here of intervention in the book's material form. Neither should we expect there to be; if an 'assemblage, in its multiplicity, necessarily acts on semiotic flows, material flows, and social flows simultaneously' (Deleuze and Guattari 1988: 22–3) then it would make no sense to deprive the assemblage of the book the possibility of acting on its material forms. And so, succumbing to their own argument, Deleuze and Guattari do in fact make some brief positive comment on concrete experiments in book form. In developing the concept of the rhizome-book they give some prominence to three modern works on the early thirteenth century Children's Crusades, works that generate a nomadic expression in the flow of narratives, movements and peoples. Here there is definite appreciation of formal innovation. In Armand Farrachi's *La Dislocation*, for instance, they note that the 'sentences space themselves out and disperse, or else jostle together and coexist, and ... the letters, the typography begin to dance as the crusade grows more delirious' (23–4).[16]

The task, then, is to consider the dynamics of the rhizome-book in a way that is attentive not only to the book's conceptual and textual features, but to its full materiality, its heterogeneous 'working of matters' (Deleuze and Guattari 1988: 4). I attempt this below through concrete cases, for it would run counter to the spirit of this most immanent of concepts to either set out universal criteria for the rhizome-book,

or consider it outside of its empirical expressions. In what follows, each set of books is initially approached, as was Mao's *Quotations*, through their linguistic structure and/or conceptual content. But against the spiritual autonomy of the word in the root-book, here the word is shown to be enmeshed with diverse materials and oriented toward expression that is not constrained by the semiotics of authority. I place attention on the singular ways the particular books break with the root-book mode – break, that is, with the division between world and book, the book's unity and teleology, and its integrated subjectivities. In the course of discussion I touch on some features of the root-book that I have not thus far considered: its relation to the sensory patterns of the State-form and to the structures of the capitalist commodity. The focus throughout is on how the qualities of the rhizome-book are manifest in the artefact of the book itself, in the context of the aesthetic and political concerns of each book's immediate environment.[17] Since Deleuze and Guattari provide only minimal tools for the analysis of the book's concrete materiality, I at points draw on concepts that they use to explore material culture in other fields. I would underscore that the books are presented here not as a cumulative account of the emergence of the rhizome-book, but as a variable field of its expression, each book foregrounding one or more aspects of the rhizomatic tendency in the material forms of the book.

IV. Polysensuality and the Russian Futurist Book

Given the cleavage the root-book enacts with the external world, it is appropriate to start with a set of books within which the physical and sensory properties of matter take centre stage: the Russian Futurist books of the 1910s. In their foundational concepts of 'the self-sufficient word' and 'transreason' ('*zaum*'), the Russian Futurists (or Cubo-Futurists, as they are sometimes known) took the word not as a transparent vehicle of truth and communication, but as a polymorphous *object*, placing emphasis on the phonic, graphic, hieroglyphic qualities of writing.[18] Here the word as object is unmoored from chains of signification. Instead, phonetic analogy, rhythm, raw verbal material, obscure idioms become the substance and organising principles of expression (Lawton 1988: 13). The transrational word is not without its own kind of passion; in the words of Aleksei Kruchenykh, one of the principal exponents of *zaum*, this 'not yet frozen' or 'melted language' is fundamentally 'emotional' in tenor, associated with intensive states: 'when the artist wants to convey images not fully defined', 'When

one loses one's reason (hate, jealousy, rage …)', 'When one does not need it – religious ecstasy, love' (Kruchenykh, qtd in Markov 1969: 347; Kruchenykh 1988a: 182–3).

So, while in Mao's *Quotations* the word was abstracted from the world in the purity of Mao Zedong Thought, in Futurist transreason the word is drawn back into its variable material fields. In this one can discern elements of Deleuze and Guattari's (1988: 117) 'presignifying' regime of signs, a regime that 'fosters a pluralism or polyvocality of forms of expression that prevents takeover by the signifier and preserves expressive forms particular to content'. But the important point for my purposes is that this Futurist approach to language is integrated with the form and physicality of the books themselves.

Russian Futurist books were conceived of as active, polysensual objects in a fashion that undoes the root-book cleavage between world and book, as the book itself becomes a vital entity adequate to the rhizomatic movements of the transrational word. This manifests in a number of ways. It is most immediately apparent in the exuberance of materials deployed in these books. Developing from an interest in folk culture, ritual-related art, ideographic text, illuminated manuscripts and the ornate objects of nomadic peoples, Futurist books have a wild tactility about them. In deliberate contravention of the fine-printing tradition of the *livre d'artiste*, they are often roughly hewn works assembled of cheap, disposable materials – an early example, *A Slap in the Face of Public Taste*, was famously bound in burlap – and diverse print technologies, including lithographed manuscript, handwriting, linocuts, hectography and rubber stamps. They were not to be read as such, but in all their variability were to 'see, listen to, and feel' (Aleksei Remizov, qtd in Gurianova 2002: 26).

To this polymorphous array of materials there corresponds a specific aesthetic form, one that is manifest against the principal sensory structures of the root-book. The modern book, as it has developed through Gutenberg print culture, intensifies the abstracted optical function at the expense of sensuous complexity. The rigid linear text, uniformity of letterforms, and identical copies produce, in Marshall McLuhan's words, a 'visual technology of uniform time and uniform continuous space in which "cause" is efficient and sequential, and things move and happen on single planes' (qtd in Janecek 2002: 41). This indicates why Deleuze and Guattari also name the root-book the 'State apparatus-book': it not only produces patterns of dogma and authority, as we have seen in *Quotations*, but it also imparts the striating temporal and territorial sensory patterns of the State-form.

In contrast to this optical aesthetic, Futurist books have a strong relation to the 'haptic' aesthetic Deleuze and Guattari associate with nomadic art (it is not incidental that a number of the Russian Futurists were heavily influenced by the art forms of the Scythian nomads; Ash 2002). I have noted that these books are most tactile, sensual entities, but the haptic is a mode of *vision*, an immersive 'close vision' that invests the eye with the property of touch, drawing it into a field that dissolves perspective and is grasped only through a local and variable integration of parts, where 'orientations, landmarks, and linkages are in continuous variation' (Deleuze and Guattari 1988: 493). In Futurist books, the interweaving and merging of image and text, the use of handwriting, transrational flight of sense, graphic wandering of words, unbounded colour, variability of printed materials and fluctuation in rhythm all pull the book away from its striated, optical mode and attract an immersive manner of perception, one that allows for an experience of sensory simultaneity (Gurianova 2002). Gerald Janecek (1984: 117) thus writes of Kruchenykh's work: 'a page of "text" need not be read sequentially in linear time, but can be taken at a glance and absorbed by the same process of free visual exploration used in studying a painting'. It is a disorienting sensory experience of which Kruchenykh (1988b: 76) was well aware: 'We can change objects' weight (the eternal *force of gravity*), we see buildings hanging in the air and the weight of sounds.'

As can be discerned in Kruchenykh's comment here, the haptic aesthetic combines with a quality of *movement*. For Deleuze and Guattari, the haptic aesthetic is comprised of a particular kind of 'line', an 'inorganic line' that breaks with the 'organic' mode of representation. Whereas organic representation, through the principle of symmetry, limits variability in repetition by maintaining the domination of a central point with radiating lines (as in star-shaped figures), haptic aesthetic forms express a power of variation, with a 'streaming, spiralling, zigzagging, snaking, feverish line' (Deleuze and Guattari 1988: 499). Art here no longer constructs an organic empathy between representation and human subject, but articulates a different mode of life – the traits, flows, impulses of an elementary *life of matter*, an 'inorganic life' (498). Now, for Deleuze and Guattari (398, 386) this nomadic, inorganic line is associated with certain kinds of mobile objects – jewellery and weaponry; objects that do not 'work' in and for striated space, as do tools, but express variable movement undetermined by the 'gravity' of the State-form. If Futurist books express a haptic aesthetic, as objects they share also the nomadic quality of movement. For now the itinerant property

of the medium of the book – this 'most deterritorialized of things' – is no longer articulated with distributed authority (as it was in Mao's *Quotations*) or with the striated perceptual patterns of the State-form (as is imparted by the Gutenberg book). Rather, like *paper jewellery*, these 'living entit[ies]' that defy gravity and 'fly out' on publication serve to distribute a feverish, inorganic life of matter.[19]

The Futurist book also raises a challenge to the root-book's linear or teleological relation to the world. As Nina Gurianova (2002) argues, the temporal, spatial and rhythmic dislocations of these books are such that, to employ the name of one of the most accomplished Futurist works, this is a world *backwards*. But there is still perhaps a danger of the book operating here (in the mode of the fascicular root-book) as an archetype, of 'typographical cleverness' propagating a supplementary unity in the fragmented work. It is important, then, that the undoing of the book's teleological relationship to the world is compounded by another aspect of the Russian Futurist book, the persistent troubling of its own unity, as is especially evident in Kruchenykh's work.

Kruchenykh had something of compulsive passion for publishing and was chiefly responsible for perhaps upwards of 200 publications (Janecek 1984: 112). But it is a passion operative against any principle that would orchestrate a unity or model in the work; true poets, he proclaimed, 'should write on their books: after reading, tear it up' (Kruchenykh, qtd in Markov 1969: 130). This destructive tendency took the somewhat inorganic form of an insistence on 'the necessity and the importance of irregularity in art' (Kruchenykh 1988b: 75). For instance, *Worldbackwards* – a book of poetry by Kruchenykh and Velimir Khlebnikov, and images by Mikhail Larionov, Natalia Goncharova, Nikolai Rogovin and Vladimir Tatlin – is a highly heterogeneous collection of materials and rhythms. But it is also internally irregular: the order of pages differs between copies; individual lithographed pages vary in the colour and weight of paper; rubber-stamped sheets have inconsistent use of letters and decorative symbols; even the covers of the book – in what is the first example of collage in book design – are inconsistent (Janecek 2002). Kruchenykh was also in the habit of assembling materials across different books – reproducing manifestos and texts in different works, using pages from one book in another, even in one case of publishing a new book, *Zaumnik*, from an older work, *From All Books*, simply by adding a newly designed cover (albeit one by Aleksandr Rodchenko) (Janecek 1984: 109). In these peculiar practices the book becomes an interminable arrangement of fragments, a looping movement as pages are assembled and reassembled like the

discontinuous folds of the most rhizomatic of organs: 'These books … smell of phosphorous, like fresh brain curls' (Terentyev 1988: 179).[20]

V. Antonin Artaud's Paper Spells

In formulating the figure of the rhizome-book, Deleuze and Guattari make use of a concept they famously draw from Antonin Artaud, the 'body without organs'. If the root-book is one tendency in the field of the book, the book 'also has a side facing the *body without organs*, which is constantly dismantling the organism, causing asignifying particles or pure intensities to pass or circulate' (Deleuze and Guattari 1988: 4). As a body without organs, the rhizome-book undoes the sensory organisation of its subject. The haptic materialism of the Futurist book moved in this direction – breaking as it did with the sensory patterns of the striated optical function – but it is in Artaud's paper 'spells' or 'gris-gris'[21] that one finds the most singular concrete experiment in textual matter as body without organs. Artaud sent these epistolary objects from Ireland and the Sainte-Anne Hospital and Ville-Évrard asylum in France in 1937 and 1939 as protective or imprecatory devices to friends, doctors and public figures – seven are known to exist, including one that remained unsent to Hitler.[22] Composed of writing, pictograms and obscure symbols in ink and coloured crayon, included with letters or sent alone, these spells are scraped, scored, hacked things about which no separation can be made between artefact and text, form and content.

As with Futurist books, these spells are entwined with a particular mode or experience of language, one that Deleuze elucidates in his assessment of surface and depth in the linguistic operations of Lewis Carroll and Artaud. Against the incorporeal linguistic surfaces of Carroll, language for Artaud is carved into the depths of the body. In an experience symptomatic of schizophrenia, the body is an 'involution' of the world around – a 'body-sieve' (Deleuze 1990: 87), a 'membrane of infinite crevices' (Artaud 1988: 87): 'Things and propositions have no longer any frontier between them, precisely because bodies have no surface … Every word is physical and immediately affects the body' (Deleuze 1990: 86–7). Deleuze elucidates the specific procedures by which Artaud transforms the pain of this corporeal semiotic – for the body/word conjunction is experienced as a wounding assault – into an active relation. In brief, Artaud breaks down language into phonetic elements, converted into 'breath-words' and 'howl-words'. In these, 'all literal, syllabic, and phonetic values have been replaced by *values which are exclusively tonic*', values which correspond to a disaggregated body,

a body without organs: 'an organism without parts which operates entirely by insufflation, respiration, evaporation, and fluid transmission' (88).

Now, the important point for my purposes is that Artaud's spells can be understood as artefactual manifestations of this relation between language and body. To borrow from Stephen Barber's (2008: 49) assessment of Artaud's notebooks, the spells are a 'prototype', a 'testing-ground' for the transformational process of the body without organs. Artaud writes: 'I have the idea to put into operation a new re-assembling of the activity of the human world, idea of a new *anatomy*. / My drawings are *anatomies* in action' (qtd in Barber 2008: 67). This operation is at once destructive of the existent body, and a generative practice – a procedure both 'terminal' and 'insurgent' (54). And it takes the paper not as a mediating vehicle, but a material immanent to its procedures; in these spells Artaud constructs a paper body without organs. Let us see how.

Writing in 1947, Artaud conceived of his spells as exorcisms performed on the 'objective inertia' of the page (Artaud, qtd in Ho 1997: 19), on its striating, organising gradients: 'The goal of all these drawn and coloured figures was to exorcise the curse, to vituperate bodily against the exigencies of spatial form, of perspective, of measure, of equilibrium, of dimension' (Artaud 1996: 42). No inert support for the written word, then, the sheet of paper is fully a part of the procedure. Like a 'body-sieve', the spell emerges as a dynamic membrane, a field of forces: sign, colour, word, lettering, combine with the material of the paper, perforated and frayed with burns, to produce 'a surface that is as much active as acted upon' (Beaumelle 1996: 40). And it is, too, a corporeal surface. Artaud performs incantation in the spells' construction, as he incises, perforates and burns the page. In this way, signs are captured and held with the force of bodily gesture, so preventing signifying circulation, depriving the word of 'its power to draw together or to express an … ideational event distinct from its present realization' (Deleuze 1990: 87).

The subject undone on the body-sieve of the paper is not only its author, but its audience too. Agnès de la Beaumelle (1996: 39) describes the spells as 'graphic expulsions', artefacts intended to act physically upon their interlocutors, to have an immediate and disaggregating sensory effect. In Paule Thévenin's words:

> Writing no longer has as its sole function that of transmitting a message or a thought; rather, it must act by itself and physically. Everything is studied,

> calculated so as to strike the eye, and through it the sensitivity, of the person for whom the spell is destined … We can scarcely look at these objects without being contaminated by their vehemence … (Thévenin, in Derrida and Thévenin 1998: 15, 17)

A trace of this vehement contamination can perhaps be gained from Beaumelle's evocative presentation of the 1939 spells from the Ville-Évrard asylum:

> their imprecatory violence now resides more in the physical state of the missive than in the words. Inscribed with a thick ink crayon in purple, the different signs (crosses, stars, triangles, spirals in the shape of serpents, the cabalistic significance of which Artaud knew well) proliferate in all directions, invade the center of the paper itself, break the continuous thread of writing drawn with the same ink crayon: fragments of writing and drawn pictograms henceforth form one body. Not only that: knots, amorphous clusters of crayon, seem to respond in counterpoint, proceeding from the same charge of aggression, to the holes produced by burning the paper (the edges of which are also ravaged); and traces of violent shades of yellow, blue, and red (Artaud also knew the symbolism of colors: these are the colors of death) intensify by their physical presence the imprecatory force of the words. These are no longer simple votive letters but true magical objects, to be handled while making ritualistic gestures …, which can 'illuminate themselves', like 'gris-gris'. (Beaumelle 1996: 40)

The medium of the letter served Artaud's spells well, for the intimate affect germane to this mode of textual communication is compounded by the letter's fragmentary and impermanent form. If the Futurist book introduced the 'worldbackwards' into the teleological field of the book's political unity and authority, Artaud's (1996: 33) spells also refuse existence as a coherent and enduring work: 'These are not drawings / they figure nothing, / disfigure nothing, / are not there to / construct / edify / establish / a world.' The spells are fragments, their audience – the addressees of these artefacts delivered by post – was limited and temporary, and they exist, in their asubjective affects, only at the edge of destruction: 'And the figures that I thereby made were spells – which, after so meticulously having drawn them, I put a match to' (Artaud 1996: 42).

VI. The Anti-Book of *Mémoires*

The last case I will consider emerges from an expressly communist environment; as such it allows me to consider the material properties of the rhizome-book through a more overtly political lens. There is

considerable justification for Guy Debord's (1993) claim that his and Asger Jorn's 1959 work, *Mémoires*, was an 'anti-book'. Comprised of text and image fragments assembled by Debord from disparate media and sources, and Jorn's structural lines, splashes and planes of colour, it is at once a memoir of Debord's pre-Situationist milieu around the Lettrist International, an exercise in the techniques of *détournement* and *dérive*, and an unworking of its own points of identification, meaning and narrative coherence. The book famously embodies its destructive valence in its binding of heavy sandpaper. But more than the violent impact on the books against which it is placed, the striking effect of the sandpaper covers is the way that when handled they foreground in a heightened sensory fashion the book's physical form and external relations, an enforced appreciation of the book's outside that is complemented by the almost translucent, rather fragile pages encountered within.[23]

The critical impact of *Mémoires* on the material field of the book includes two aspects that I have not directly considered in the rhizome-books discussed so far: a critique of capital and the commodity, and a challenge to the specifically *activist* mode of the root-book's subject. As with Artaud's spells and the Russian Futurist books, *Mémoires* breaks with the prevailing mode of communication, but it does this from a position specifically attentive to the function of language in capitalist social relations. As Frances Stracey (2003) highlights, language for the Situationist International (SI) was bound up with an emergent cybernetic mode of production, one that integrated signification with command in an 'informationist' paradigm that sought to eradicate all linguistic redundancies and ambiguous signals: a 'universal language' of which, '[s]ince its advent, the triumphant bourgeoisie has dreamed' (Khayati, in Knabb 1981: 171).[24] More succinctly: 'Words *work*' (SI, in Knabb 1981: 114). There is a striking relation here with Deleuze's (1995: 175) critique of the place of 'universals of communication' in contemporary 'societies of control', with their distributed and continuous systems of regulation: 'speech and communication have been corrupted. They're thoroughly permeated by money – and not by accident but by their very nature'.

For Deleuze, politics cannot resist this situation with an *alternative* communication – a 'counter-information' (Deleuze 2006: 322) or a 'democratic conversation' (Deleuze and Guattari 1994: 99) – since what is required is a breach in the very modes of subjectivity and exchange constituted in communicational systems. As for the Situationists, they found a breach in the informationist paradigm through the method of *détournement*. This reuse of existing semiotic and aesthetic materials

in new ensembles seeks, in Jorn's words, a 'devaluation' of received patterns of meaning (Jorn, in Knabb 1981: 55). The association with the category of political economy, 'value', is not accidental, for this was a devaluation of language to match that of social production more widely: 'Words will not cease to *work* until people do' (Khayati, in Knabb 1981: 175). In a *détournement*, the new ensemble derives its 'peculiar power' from holding together trace associations of the devalued elements with the new senses created (SI, in Knabb 1981: 55). But it is in the essential and persistent wrenching of language from the paradigm of information that the force of this first step toward a 'literary communism' resides: 'It is not "the nadir of writing" but its inversion. . . . [W]hen it uses existing concrete concepts it is simultaneously aware of their rediscovered *fluidity*, their necessary destruction' (Debord and Wolman, in Knabb 1981: 11; Debord 1983: §204, §205).

Tom McDonough (2007: 8) makes an astute observation that the destructive orientation to language in *détournement* necessarily troubles the favoured textual medium of the avant-garde – it can establish no unique and unified work in the manner of the 'Mallarméan Book'. The works of *détournement* are of a different order, and *Mémoires* is one of these, comprised as the title page notes 'entirely of prefabricated elements'.[25] Constituted of usurped and devalued words, Debord and Jorn's book removes the possibility of a distinct and self-expressive authorial subject, a move all the more powerful for its apparent location in the genre of autobiography. The referential object of the book, Debord's milieu of the early 1950s, is similarly undone as a coherent world or political subject, something itemised and foreclosed in linear historical memory. Structured around three dated chapters, moments of the history of the Lettrist International come into focus at points, but it is an unstable and virtual historical field, a field charged with potential, comprised, as the first page warns, 'of lights, of shadows, of figures', 'full of discord and dread'.[26]

The technique of devaluation does not only operate here in the redeployment of existing semiotic materials, but also in their singular instantiation on the pages of the book. As the SI journal later noted of *Mémoires*, 'the writing on each page runs in all directions and the reciprocal relations of the phrases are invariably uncompleted' (SI, in Knabb 1981: 56). Such indeterminacy is compounded by the cumulative effect of the book, with concepts and meanings coming in and out of focus as they resonate, accumulate and dissipate across its pages. This is not only an effect of language, but is accentuated by the dramatic pattern and spatialisation of the work, structured by Jorn's variously

lulling, violent and vertiginous sheets of vibrant colour (Stracey 2003). It should be underscored – and it is an astonishing achievement – that in the midst of these intensive, disorienting characteristics, *Mémoires* maintains a conceptual rigour and force, one that is found not in the conventional form of philosophical demonstration but in a kind of conceptual *performance* (Banash 2002). The book is not only an exercise in *détournement*, it invites the reader to engage with it in the manner of a *dérive*, a surrender of subjective will-to-meaning in the temporal flow and layered, non-linear spatial structure of its pages.

The anomalous character of *Mémoires* is furthered by the nature of its relation to the structure of the commodity. The commodity form of the book is a feature strangely absent from Deleuze and Guattari's assessment, as if on this matter they succumbed to the obfuscating power of the root-book. The book is a commodity that is especially effective at hiding its commercial nature, its capitalist form obscured by its apparently universal value as a transcendent intellectual, moral and aesthetic good (Striphas 2009). It is as if the generic capitalist power of commodity fetishism – to produce an autonomous artefact severed in people's minds from its socio-material relations – is given a boost by the spiritual power of the root-book, the two conjoining in something of a perfect commodity. For despite appearances, these industrial 'goods which pretend not to be goods at all' (Travis 1999) have been entwined with the emergence and development of the commodity form. The book was not only instrumental in the division of intellectual and manual labour that lies at the heart of capitalist abstract labour, but was itself the first standardised and iterable mass-produced commodity, the book industry being a prime mover in the division of labour, the hourly wage, new technologies, consumer credit and privatisation of language through copyright – and it remains today fully enmeshed in the latest industrial and technological developments (Anderson 1983; Febvre and Martin 1997; Striphas 2009).[27]

In this realm of the commodity, *Mémoires* has unsurprisingly become something of a rare item, changing hands today for upwards of US$4,000. But in its time, this anti-book had an intrinsic anti-commodity orientation. The abrasive material of the sandpaper covers seems to defy the commodity values of smooth industrial production and circulation.[28] Of course, this quality could indicate a different circuit of commercial value, that of the *livre d'artiste* or artwork proper. It is significant, then, that *Mémoires* was not created to be sold, but to be a splendid or excessive gift, a 'potlatch' – an anti-productive expenditure based not on scarcity but abundance, and one that intensifies (rather

than obfuscates) social relations.[29] In his preface to the 1993 re-edition,[30] Debord explains:

> Thus for thirty-five years my *Mémoires* were never put on sale. Their celebrity comes from only having been given out in the form of the *potlatch*: that is to say of the sumptuous gift, challenging the other party to give something more extreme in return. (Debord 1993)

If gift economies break with commodity circulation, they can introduce social relations that are themselves constraining, as the gift serves to bind and consolidate relations of obligation (Mauss 1990). And it is clear that the circulation of printed matter had an important role in maintaining the interpersonal and organisational relations of the SI (Wark 2009). But this is only part of the story, for the excess affect or intensity associated with the gift-circulation of *Mémoires* was not primarily directed toward securing a political community, public or subject. The patterns of association of the root-book – with its orientation toward establishing integrated subjectivity within its regimes of truth and authority – find no presence in *Mémoires*, which in this sense we might characterise as something of an anti-manifesto:

> This anti-book was only offered to my friends, and no-one else was informed of its existence. 'I wanted to speak the beautiful language of my century.' I wasn't too worried about being heard. … I proved my sober indifference to public opinion straight away, because the public were not even allowed to see this work. (Debord 1993)

Debord's wilful disregard here of a fundamental feature of the political book has a somewhat aristocratic air to it, but it is by no means an apolitical move. Indeed, one can interpret this statement as an aspect of what Banash (2002) considers to be the *most* radical feature of *Mémoires*, the breach it enacts in the easy transformation of conceptual and aesthetic production into instrumental 'activist' practice. For here the disaggregating property of the rhizome-book – approached thus far in the form of the Futurist 'worldbackwards' and Artaud's unproductive body without organs – has a direct impact upon the communist thematic of organisational subjectivity. Interpreted in relation to this thematic, Debord's refusal to sanction the book's existence and circulation on the activation of a public establishes *Mémoires* as an aesthetic expression of the SI's anti-vanguardism. *Mémoires* aborts its unity as a concentrated bloc of semiotic and organisational authority, all the better to affirm distributed, emergent and self-critical composition as the proper object of communist politics.[31]

VII. Conclusion

What does Deleuze and Guattari's typology of the book enable us to say about the political book? It requires that people of the political book recognise, and extract themselves from, the essentially religious structures and passions that regulate the book's field. Each time the book declares its unique truth and total access to the world, the concept of the root-book invites us to consider how this truth is created from a *cleavage* with the world, one that constitutes a spiritual dogma that is returned to the world as authoritarian passion. This approach suggests that we explore such formations with attention to the full materiality of the book, even if Deleuze and Guattari do not do so themselves. I have done this here with Mao's *Quotations*. Mao's book is a wholly material entity, but its material qualities – colour, portability, textual structure – feed into, and are governed by, the book's spiritual autonomy and authoritarian regimes of truth.

If the political book is to break with this root-book structure, it needs a different relation to matter, a relation Deleuze and Guattari approach through the concept of the rhizome-book. This concept is useful not so much as a mechanism of classification, but for what it encourages us to see in the experimental field of the political book. As such, it is best approached through the properties of specific books, in their rich 'working of matters'.

It is possible to set out some shared characteristics of the rhizome-books considered here. In these works, language is unmoored from signifying chains and dogmatic compulsions, be that in the mode of Futurist transrational sensory blocs, Artaud's howl-words, or Debord and Jorn's devalued informational patterns. And this language is enmeshed with variable material fields in a remodelling of the object of the book: as a haptic sensory arrangement of eclectic printed materials, as a dynamic membrane of body-sieve paper, as an anti-book of appropriated materials, non-linear structures and virtual images. Just as the material world floods into these books, breaching their split with nature, so also is the book's subject undone, most radically in Artaud's paper spells, which operate as involutions of body and word in sheets of sensory intensity. Each set of books, too, undoes the book's teleological authority and coherence: a 'worldbackwards' of irregular and refolded materials, a fragment put to fire, an anti-manifesto with inoperative public.

Yet it is also clear that these books emerged from singular political and aesthetic contexts and problematics. In *Mémoires*, for instance, the conjunction of communication and authority is approached explicitly as

a dimension of capital, unlike in the other works considered here, and this book's disruptive properties are a unique aesthetic expression of the communist critique of the vanguard party. These situated variations are such that the concept of the rhizome-book cannot describe a cumulative set or itemised aggregate of appropriate techniques. To take seriously Deleuze and Guattari's (1988: 4) peculiar 'taste for matter' requires that the concept operate immanently to the concrete field it surveys. In any concrete field of the book one would expect the interaction of both root and rhizome tendencies. The books considered in this article push either tendency to extremes, so indicating the singular possibilities and variations of the political book, but even here one could no doubt also find aspects of the opposing tendency, especially if they were considered in relation to their wider communities of consumption – there is nothing exhaustive about my treatment.

To conclude, the political book emerges from the works considered in this article as a highly complex entity, where politics is operative in the book's concepts and textual content, as one expects, but also in its passions and authority, and its physical, sensory, temporal and spatial properties. If radical politics concerns transformation of the very conditions of being – not the 'mere political' change against which Engels posits communism proper – then evaluation of these latter properties is as important as attending to the book's more overt political expressions (Marx and Engels 1973: 12). Indeed, it is attention to the breadth of the book's materiality that has enabled me to argue that some of the most apparently political aspects of the book can often be its most troubling.

Notes

1. 'We are writing this book as a rhizome. It is composed of plateaus. . . . To attain the multiple, one must have a method that effectively constructs it' (Deleuze and Guattari 1988: 22).
2. It appears that Deleuze's philosophical irreverence toward the book also had a practical dimension: his advice for an 'intensive' way of reading includes 'tearing the book into pieces' (1995: 8–9) and Dosse (2010: 357) reports that in order to avoid carrying an unwieldy stack of books to Vincennes, 'Deleuze would rip out the pages he needed for his class'.
3. For further discussion of the semio-politics of monomania, see Thoburn 2008.
4. In his critique of Eurocentric formulations of 'the book' as a universal standard entwined with the history of colonial subjugation, Mignolo (2000) similarly argues that the integration of religious authority with the book is less a particular manifestation of this medium than its historical condition of emergence.
5. For Marx and Engels, Max Stirner's *The Ego and its Own* functions as 'the perfect book, the Holy Book'. It posits 'the history of the kingdom of the unique [that] follows a wise plan fixed from eternity', a plan based on the egoist's

'delirious fantasy', in Stirner's words, of 'the world as it is for me' (Marx and Engels 1976: 117, 126).

6. The Bible is estimated at 5–6 billion copies and the Quran at 800 million (Wilkinson 2008: 29).
7. Mao himself commented on the power of *Quotations* in a 1966 letter to his wife, Jiang Qing, albeit while expressing an irritation with Lin Biao's role: 'I have never believed … that those little books of mine could have such fantastic magic, yet he blew them up, and the whole country followed' (Mao, qtd in Terrill 1999: 370). A large collection of Chinese posters of this period, many featuring *Quotations*, can be viewed at < http://chineseposters.net/ > (last accessed 17 January 2011).
8. Mao Zedong Thought is at once constituted in the detail of Mao's philosophy and is its unifying, passional dimension. I have taken the latter, the signifying structure of Mao Zedong Thought, to be the principal 'content' of *Quotations*. Save for one or two comments, I do not have space here to analyse the book's particular textual content.
9. The cosmic vector of Mao's world-view is amply evident in two of the most popular texts of the Cultural Revolution period, 'Serving the People' (included in *Quotations*) and 'The Foolish Old Man who Removed the Mountains'.
10. *Quotations* is liberally peppered with the trope of purity and corruption. For instance, of the practice of 'criticism and self-criticism' Mao writes that it 'prevents all kinds of political dust and germs from contaminating the minds of our comrades and the body of our Party' (Mao Tse-Tung 1966: 260). The relation between the purity of Mao Zedong Thought and its worldly field of manifestation is clear also in Mao's 1958 assessment of the apparent advantages of the 'poor and blank' condition of the peasantry: 'A clean sheet of paper has no blotches, and so the newest and most beautiful words can be written on it' (Mao, qtd in Schram 1989: 128).
11. The source of Lifton's quotation is not given.
12. The power of the word is accentuated in Chinese culture by the ideographic form of Chinese characters and the expressive art of calligraphy. The text itself reads: 'Study Chairman Mao's writings, follow his teachings and act according to his instructions.'
13. Contrary to some trends in current philosophy after Alain Badiou, I take it as read that the Cultural Revolution was the result of a split in the governing class of a demagogic state capitalist regime, as Mao sought to reassert his authority (and, ultimately, his labour-intensive route to industrialisation) following the disaster of the Great Leap Forward. For a remarkably astute communist analysis in this vein, published a year or so after the upheaval began, see Knabb 1981: 185–94.
14. The autonomy of these young Maoists was expressed more widely in their nomadic movement across the country in the 'exchange of revolutionary experience', and in the popular violence that was endemic to the Cultural Revolution, following such injunctions as 'Beat to a pulp any and all persons who go against Mao Zedong Thought', and 'Long live the red terror' (to quote Red Guard wall posters from two elite middle schools in Beijing; qtd in MacFarquhar and Schoenhals 2006: 104, 126).
15. It is because *A Thousand Plateaus* constructs its rhizome qualities in this way primarily through words and concepts alone that I do not consider it as an object of study in this article, where my interest lies in books that explicitly and extensively engage with the formal and physical properties of the medium. In any case, much has been written already about the 'plateau' and rhizome structure of *A Thousand Plateaus*, and while I in no way wish to deny its astonishing

rhizomatic dimensions, it would be a mistake in this book's own terms to elevate it to a unique model around which a class of rhizome-books should ever be arrayed.

16. Another work, *Absolument nécessaire. The Emergency Book* by Joëlle de La Casinière (1973), is credited in a footnote as 'a truly nomadic book' (Deleuze and Guattari 1988: 520). They make no further comment, but it is a work of graphic poetry and montage, expressive of the itinerant lifestyle and art-practice of its author. As Casinière (2011: 3) reports, Deleuze arranged for the publication of the work after she sent him a photocopy of the manuscript, though once it was published he remarked that he preferred the 'pale and poorly made photocopy' to the finished book. See < http://www.montfaucon.eu > for images of a complete edition (last accessed 17 January 2011). I am grateful to Joëlle de La Casinière for sharing information about this book with me.
17. A complementary approach would be to pursue the set of mutable relations that any one book forms with its social milieu, since the social effects and situated appropriations of books are of course central to their materiality. But I reject the notion that this basic position of Deleuze-inspired research bars one from using Deleuze to discuss the form of particular entities in a degree of isolation; certainly, Deleuze himself was happy to partake of the latter approach, as is evident from his close analysis of specific paintings or cinematic works. The complementarity of these approaches is clear in Daniel Selcer's (2010) excellent text, *Philosophy and the Book*.
18. The most comprehensive account of the movement, one that should not be confused with Italian Futurism, is Markov 1969. Images of complete editions of a number of Russian Futurist books can be viewed at < http://www.getty.edu/research/conducting_research/digitized_collections/russian_avant-garde/pdfs.html > (last accessed 17 January 2011).
19. The first quotation here is Gurianova's (2002: 25, 27) characterisation of the Futurist understanding of the book; the second she takes from advertisements for Futurist editions.
20. Gurianova (1999: 110) argues in related terms that 'these republications confirmed … the right to "incompleteness", and presumed ever new readings, continuous renewal, and the metamorphic nature of creation'.
21. 'Gris-gris', the noun Artaud uses for these works, signifies charm, fetish or amulet.
22. Six of Artaud's spells are reproduced in Rowell 1996. Deleuze and Guattari (1988: 164) assess the spell for Hitler as a 'BwO intensity map' of thresholds and waves, but they limit comment to its textual content and make no reference elsewhere to Artaud's spells.
23. This binding was proposed by the Danish printer Verner Permild, of the firm Permild and Rosengreen who also printed Jorn and Debord's earlier book-work, *Fin de Copenhague*. Permild was responding to Jorn's request for a binding of unconventional material – perhaps sticky asphalt or glass wool – that would leave some residue or otherwise affect the reader's hands (Nolle 2002).
24. It is worth noting that the SI also level the critique of the 'informationist' mode of language at the orthodox Left. Khayati (in Knabb 1981: 173) discusses the 'Bolshevik order' of the 'more or less magical, impersonal expressions', 'inflexible' and 'ritual formulas' that work in the image of the State to preserve its 'purity' and 'substance' in the face of obviously contradictory facts.
25. Even the degraded photographs of Debord's comrades and drinking companions are purloined from a photo-romance book on the Left Bank scene. Debord later noted that one brief phrase was his own.
26. For an enticing interpretation of the first page of *Mémoires*, see Banash 2002.

27. The reader will have noticed that the books explored here are all from pre-digital times. I discuss the material forms and politics of digital publishing in Thoburn 2012.
28. This commodity-defiance is also intrinsic to the irregular form of the Russian Futurist book, where it has an additional valence as part of the Russians' more or less direct challenge to the commodity aesthetics of speed and industry in Italian Futurism.
29. It seems that the book was not entirely abstracted from commercial economies, for it had a place in financing the SI's activities. In a letter to the German Situationist Uwe Lausen, Debord (1962) proposes that Lausen sell copies of *Mémoires* to fund the publication of *Der Deutsche Gedanke*, noting that its 'full price . . . is very high'. On the contradictions involved in financing the group, see Knabb 1981: 142. I explore the anti-commodity capacities of printed matter further in Thoburn 2010. For discussion of the affective politics of the gift, see McDonough 2007: 148–54.
30. The commercial republication of *Mémoires* raises questions I am unable to address here, but I take it as given that the reprint is a very different entity to the 1959 work discussed in this article.
31. If the SI's anti-vanguardism is articulated in *Mémoires*, this tendency was always in tension with Debord's more autocratic inclinations. For a nuanced discussion of these tendencies in the SI and the Scandinavian Situationist groups, see Slater 2001.

Beyond Bartleby and Bad Faith: Thinking Critically with Sartre and Deleuze

Dominic Smith University of Dundee

Abstract

This essay argues that important critical and political perspective can be gained on Deleuze's famous essay, 'Bartleby; or, The Formula' by viewing it as an attempt to move beyond the Sartrean framework of 'bad faith'. The argument comprises four sections. In section one, I contextualise Deleuze's essay in terms of contrasting readings of Bartleby, from a prior account by Georges Perec, to contemporary accounts indebted to Deleuze, from Hardt and Negri's *Empire* to Gisèle Berkman's recent *L'Effet Bartleby*. The argument of this section is that a problematically reductive image of Bartleby has emerged in the wake of Deleuze's essay, but that this can be challenged in favour of a more nuanced and politically significant reading by contextualising the essay as an attempt to overcome bad faith. In section two, I develop this by drawing out the nature and relevance of the threat posed by bad faith through a focus on Sartrean, Deleuzian and Badioucan critiques of Bartleby, before arguing, in section three, that attention to the concept of a 'logic of presuppositions' developed in Deleuze's essay shows how bad faith can be overcome. These sections all build towards the fourth and longest section, which draws out the wider political significance of what it means to overcome bad faith. To do so, I pay attention to how logics of presupposition function in Bartleby's story, and consider Deleuze's essay in relation to his work on 'control societies' and 'collective assemblages of enunciation'.

Keywords: Deleuze, Badiou, Hardt and Negri, Sartre, Agamben, Rancière, Žižek, Bartleby, Perec, Melville, Berkman, the formula, bad

faith, logic of presuppositions, image of thought, control societies, collective assemblages of enunciation

I. Contextualising Bartleby

In his 1967 novel, *Un Homme qui dort*, Georges Perec gives the following summary of Herman Melville's 1853 short story, *Bartleby the Scrivener*:

> Some time ago, in New York, several hundred metres from the barriers where the last waves of the Atlantic come to break, a man let himself die. He was a scribe in a law firm. Hidden behind a dividing screen, he remained seated at his desk and never moved from it. He fed on gingerbread biscuits. From the window, he looked upon a wall of blackened bricks that he could almost have touched with his hand. It was useless to ask anything of him whatsoever – to re-read a drafted document or to go for the mail. Neither threats nor pleas had a hold on him. In the end … [t]hey had to chase him from the office. He installed himself in the stairway of the building. They locked him up, but he sat down in the prison yard and refused to eat. (Perec 2004: 132; translation modified)

This description contrasts strikingly with Deleuze's essay on Bartleby, and with literature to have emerged in its wake.

Written in the third person, Perec's description outlines a story with a clear beginning, middle and end: a man (Bartleby) was employed as a scribe, he sat, he ate, he looked, he refused and, eventually, he 'let himself die'. There are forms of passivity and finality at work here that contrast greatly with Deleuze's reading. For Deleuze, Bartleby is a 'violently comical text', marked by the disruptive activity of a central statement: 'I would prefer not to' (Deleuze 1998: 68). This statement, repeated by Bartleby throughout the text, is what Deleuze famously calls 'the formula', and it is the link bringing together the story's successive events: leading Bartleby from the position of worker, through repeated 'preferences not to', to vagrancy and death in prison.

In Deleuze's treatment, everything is geared toward allowing the formula to break out of Melville's text and have effects beyond it. The formula, we are told, is devastating to any comfortable presuppositions on what shapes identity, action and choice, because, 'neither an affirmation nor a negation', it 'eliminates the preferable just as mercilessly as any nonpreferred' (Deleuze 1998: 70–1). Thereby, Deleuze takes the formula to send presuppositions on how language functions 'into flight' and to make of Bartleby a 'man without references,

without possessions, without properties, without qualities, without particularities' (74). Instead of narrowing Bartleby's significance, however, it is precisely these effects of the formula that Deleuze takes to comprise it. If, through a speech act, Bartleby is progressively stripped of what particularises him (as, for example, 'worker' or 'vagrant'), then, Deleuze holds, his actions become the more universally significant for it. As Deleuze influentially puts it, Bartleby emerges with 'no other determination than that of being man, *Homo tantum*' (86), and it is precisely this that he takes to comprise the wider significance of the formula: as a political act that frustrates and undoes the limits of identity.
