Hughes draws from this literary reference, however, an approach not only to style but also to content. He claims this narratological logic of plot and story can be discerned across the work of this period and beyond, with examples reaching from *Empiricism and Subjectivity* to the final texts. In making this well-argued claim, Hughes offers revealing insights into the repetition of key themes under the sign (although not the style) of the novel. And if, following his lead, Hughes' own text were to conceal a story beneath its plot, what would it be? The *plot* is quite clearly an investigation of the importance of experience and representation, and of how, from a phenomenological standpoint, they are constituted. But the *story* uncovers Deleuze's monistic return to this theme just as a *Série noire* detective novel might consider the mechanics of serial criminality of a mind perhaps unaware of its own *idée fixe*. If the 'French school' of such fiction draws its conclusions from basic intuition and gut feelings, while the 'English' school works by deduction and evidence (Deleuze 2003: 115), one would have to say that here Hughes displays the second method while perhaps taking inspiration and drive from the first. Many readers of Deleuze are in equal measure intrigued and perplexed by the apparent proliferation of ideas which nevertheless seem, perhaps paradoxically at first, to cohere into a project. This project, partly masked by constant shifts in terminology, focus, sources and collaborators, is the concern of *Deleuze and the Genesis of Representation*. But Hughes' detective story is less a 'whodunit' than a 'howdunit', because he has clearly also seen that an important underlying thread does indeed link the range, however volcanic, of Deleuze's work. The aim therefore is to elucidate how this cohesion comes about, and the hunch is followed up in a style which might be described as Holmesian: deductive, incisive and self-assured, but not without a certain dry wit and even, at times, theatricality, in its claims.

Hughes' argument similarly has the advantage of a formal simplicity in so far as the book is divided into three parts, each dealing with one of the texts in question. Part one explores and justifies the focus on Husserl, considering the way his ideas are reflected in *The Logic of Sense*. Part two turns to *Anti-Oedipus* and the genesis of the ego

in desiring and social production; while part three draws together the static and dynamic geneses as described in *Difference and Repetition*. Each section lays out its points and draws partial conclusions which both reinforce the central thesis and open out to related issues. One example among many is the way part three considers, on top of the general theme of genesis, *Difference and Repetition*'s postulation of the non-transcendental constitution of time. Hughes is able not only to unravel Deleuze's description of these processes, but also to round up this complex problem succinctly:

> [I]n other words, just as the other two passive syntheses produced not representations in specific temporal modalities, but the transcendental possibility of those modalities themselves, this third synthesis does not produce a determinate future, but the transcendental element of the future in general. (149)

This tracking of the ways in which the syntheses of the sub-representational domain are inseparable from the constitution of modalities of time themselves allows Hughes to return to this relationship in his conclusion. Here, he clearly identifies the important threshold between the sub-representational domain and the emergence of consciousness of phenomena as representations: 'In the third synthesis, however, time ceases to be transcendental. By means of the progressive determination and actualization of Ideas, time becomes a representation which passes in the present of an empirical consciousness' (154).

This succinctness is used to good effect throughout the book and plays a part in conferring an impressive degree of coherence to the text as a whole. This is clearly intended, of course, and is all the more evident on closer reading of the three sections.

In the first part, Hughes begins by outlining those areas of Husserlian phenomenology which form the basis of *The Logic of Sense*. Among these, he highlights two phenomenological moves, namely those of *reduction*, or the putting out of play of those phenomena which are not part of the objectively given world, and of *constitution*, or the genetic production of objects in consciousness. The latter is especially important in that thought as representation, the building of the transcendental from the empirical, can only be meaningful if we have a theory of how objects and sense are constituted in the first place. Accordingly, the theory of perception developed in Merleau-Ponty's *Phenomenology of Perception* is also stressed in its postulation of immanent relations between objects. Keen to counter prevailing views of Deleuze as anti-phenomenological,

Hughes argues that, although Deleuze 'never makes a big deal of the reduction' (6), critics (such as Lawlor and Brassier) are right to contend that, despite appearances, he ends up in a basically phenomenological position: consciousness of individuated objects in a field of perception where relations always already exist. In support of this, examples of 'significant use' of the reduction are drawn from *Proust and Signs* and from Deleuze's criticisms of the image of thought, particularly in *Difference and Repetition*, where 'Deleuze's critique of the image of thought can thus be read as a reaffirmation of the necessity for reduction even if he does not use that particular word' (8).

Two important and related issues are linked to this, as the text makes clear. The first is that, whatever other forms of phenomenology or their interpreters may claim, this stance is by no means some idealistic or relativistic denial of objective reality. The approach adopted by Husserl/Deleuze does not deny the existence of external reality: the table as phenomenon does not replace or cancel out the table as object. The action of putting assumptions out of play does not leave us confronting nothing, but rather instantiates the existence of the world of phenomena *in addition to* that of objective reality. The second point, again stressed throughout by Hughes, concerns the role of meaning. Despite being central in Deleuze, Hughes picks it up as a key source of misunderstandings. As he reminds us at several points in the text, the world of the real as sense (hyletic) data is meaningless by itself until sense is bestowed onto it by the passive syntheses. The commonplace view that Deleuze argues that we should ask 'what does it do?' rather than 'what does it mean?' is only valid up to this threshold of the emergence of meaning, as we will see below. It follows that Deleuzian questioning of the validity of interpretation or the consideration of meaning in communication needs to be understood in the light of their constitution.

Accordingly, Deleuze's critique of given forms of transcendence therefore relies on an ability not just to postulate the constitution of objects in experience, but also to describe the processes in question. For Hughes, much of Deleuze's work centres on this very task. Like Husserl, Deleuze is concerned not just with describing phenomena, but also with explaining them and their processes. Unlike the early Husserl however, Deleuze is only interested in genetic phenomenology, or the immediate production of sense rather than its sedimentation. It is not hard at this point to agree that this relationship exists in a Deleuzian consideration of meaning as event, and Hughes' focus on this point takes its justification precisely from this link. The clarity and confidence with which these arguments are made is something of a hallmark and deserves, I think,

wide recognition. Just as this claim is made, Hughes makes a point of making clear not only what has been said, but also what is going to be covered and how. He carefully lays out Husserl's stance and situates it exactly in his argument, showing how far Deleuze follows Husserl and at which points they diverge, for instance in the former's critique of a Husserlian lack of phenomenological rigor or its intentionality, as we will see.

However, the fact that the text appears to be arguing that the whole of Deleuze's work can in effect be rooted in one concept of Husserl's phenomenology may well strike some readers as problematic. Hughes himself accepts that this does not necessarily justify our use of the phenomenology label – admittedly a question 'of little importance' (19). What it does do, however, is to situate the movement of Deleuze's thought between two well-defined poles: the *genesis* of thought is to be scrutinised, and the method of *reduction* is to be used as a basic observational technique. It is in this light that we should read *The Logic of Sense*, and, according to Hughes, *Anti-Oedipus*.

Part two's focus on *Anti-Oedipus* as description of genesis is particularly interesting in so far as it brings a certain coherence to the proliferation of ideas for which the book is notorious. The treatment of the text and its complexities is both systematic and enlightening and as such complements existing studies by Goodchild (1996), Holland (1999) and, more recently, Buchanan (2008), with which readers are doubtless familiar. A crucial argument, however, is made regarding the claim to identify cross-textual themes. Not only does reading *Anti-Oedipus* from the point of view of production make the text easier to understand, but, in fact, 'if the book is read as a collection of separate concepts with only ambiguous relations to one another, it becomes impossible to understand' (66). Whether Hughes is right naturally depends on whether we accept his central claim. But his analysis does at the very least also raise some interesting questions. The first of these is whether Deleuze's work is one which should be 'understood' on these terms. Speaking personally, I feel that Hughes' argument is convincing, but some readers will doubtless point to the many ways in which a work such as *Anti-Oedipus* seems to escape categorisation in any way, least of all, perhaps, in terms of meaning. As Foucault once suggested (mischievously perhaps?), meaning itself might be displaced by the *effectiveness* of this 'thing', which he 'dare not even call a book', and which refers to nothing other than its 'own prodigious theoretical inventiveness' (Foucault 1997: 7). This issue of the displacement of meaning by effect – *what does it mean?* by *what does it do?* – is one which Hughes

takes up, arguing that we are wrong to assume that meaning is never relevant, as we have seen. For Deleuze, a focus on the meaning-less depths does not mean that meaning itself is excised from thought, merely that it must be understood as produced on top of the genetic syntheses of experience. In this light, the demystification of the text as *object* is welcome, especially to newer readers of Deleuze who often turn, rightly or wrongly, to *Anti-Oedipus* before some of the less well-known books.

The second question raised by Hughes' argument introduces its own double movement. Because it is necessary for Hughes to demonstrate his thesis across a range of texts, there is the implicit need to reassess the role of Guattari in the collaborations. The aim here, it would seem, is not to expunge Guattari's contributions – which Deleuze of course stresses as being of fundamental importance, for instance in well-known passages of *Dialogues* (Deleuze and Parnet 1996: 23–4). However, to argue that Deleuze's concern with genesis is a *continuous* theme requires that it be shown to lie at the heart of the collaborative work, which, by that token, must be revealed to be essentially 'Deleuzian'. Guattari, I will suggest later, comes out of this argument as a peripheral figure, almost as collateral damage.

Part three tackles *Difference and Repetition* with much the same gusto as parts one and two. Hughes is keen to point out that his view goes 'against the grain' of current readings which emphasise the text as 'more or less a theory only of the static genesis' (103). On the contrary, we are exhorted to see *Difference and Repetition* alongside the other texts studied and to realise that for Deleuze, *the* question of the world of phenomena and its genesis is the same throughout. Deleuze goes well beyond the constitution of experience itself, however. He theorises not just the actualisation of phenomena in individual, differenciated subjects, but also describes how this is necessarily implicated in the production of temporality itself: not only does the virtual engender unindividuated actuality, but the process is reciprocal, and founded on the production of time as actualisation takes place. In typical style, Hughes outlines in a brief table just how schematic this process is, at least in its correspondence between texts. Clear parallels are drawn between dynamic genesis, desiring production and the production of time, on one hand, and static genesis, social production and differenciation-individuation on the other.

Interestingly, Hughes begins his explanation by problematising critical readings (e.g. those of Badiou or Hallward) of Deleuze as 'otherworldly', particularly in his emphasis on the virtual. The point missed by such critics is that Deleuze does indeed theorise the constitution of the virtual

as *a time* in which Ideas are structured: by proving the concreteness of Ideas and the determination of the virtual, we can show how the virtual–actual dyad escapes this critique of Deleuze as being a merely contemplative thinker. The central argument is that for Deleuze creative actualisation is the 'true meaning of time' (110): it is the very process of progressive determination which determines where Ideas come from and go to. It is the process by which the future itself becomes present and is thus an indispensable movement of realisation.

Here Hughes is typically concise in his definitions and argument:

> I want to suggest here that the Deleuzian Idea is the form that any concrete object takes before we fully recognise or know what that object is. In the Idea, the object itself becomes a problem for thought. Progressive determination would then be nothing more than the progressive determination of a concrete object of perception. (115)

What's more, this welcome concision is not infrequently accompanied by a certain dry humour: 'Despite the fact that Deleuze used the vocabulary of biology and the example of differenciation in the egg almost exclusively to describe the process of actualization, we have to notice that the outcome of this process is not a chicken' (116).

Despite (or perhaps because of) its focus, Hughes' study is able to lend some clarity to key elements of the Deleuzian panoply, almost as an aside. One example is the development of an argument which clearly presents the role of representation as the end point of quality and extensity which can only refer to represented objects as such. If actualisation produces psychological consciousness, then it does so via the forms of representation as 'the element of knowledge' (118) which has its own legitimate and non-legitimate uses.

This section of Hughes' book (119–26) is one of the richest and best argued, presenting a whole series of points which tie into the main theme. We return to the 'dead representations' of *The Logic of Sense*, and the *legitimate* use of representation which recognises its necessarily mobile nature, being 'legitimate insofar as it is tied to its process of production' (120). The point is important enough to attract the claim that it 'seems to be the ultimate aim of *Difference and Repetition*, and perhaps of Deleuze's philosophy in this middle period as a whole' (119). The role of representation is especially important if we take Hughes' point that it must be understood as a result of static genesis: rather than being *dynamic* in movement and material dispersion it begins in a form of time and culminates in representation as, ultimately, a *static* form of things available to human consciousness.

This of course leads to a final description of dynamic genesis equated to the production of time (127). After covering the familiar ground of Bergsonian analysis of (dis)continuity in time/movement, Hughes argues that the necessary syntheses of movement cannot be produced without a form of originary subjectivity which carries out the synthesis. Hughes' reading of *Difference and Repetition* makes crucial links here between the role of habit and contraction and synthesis itself in the formation of subjectivity, but he also stresses the latter's limited field of operation. It is the limited ability of the subject to 'grasp' the fullness of its experiences that leads to its exhaustion. It seems worth noting that Hughes' point about the translatability of these ideas across the whole of Deleuze is quite borne out by reflections of just this point in later work, notably in *The Time Image*, where Deleuze draws explicitly on Blanchot (Deleuze 1985: 221–2). The 'contemplative soul', or synthetic ego seen in the work of Europe's great film directors, is not one of Husserlian intentionality, but rather of the individual gifted only with the 'empty power to exchange itself for something'. This power, being empty only in so far as it exchanges itself for everything, is exactly the same as that of the 'seers' whose 'impower of thought' Deleuze situates in cinema's special ability to create such images through characters such as Johannes in Dreyer's *Ordet*.

In the psychic situation of films such as *Ordet*, it is the character as seer who, apparently a marionette incapable of thought or action, relies instead on belief, thus reminding us of the need to affirm both the irrationality of the real and our relationship with this world rather than attempting to transcend it with 'reason'. As Ambrose (2007) stresses, what is striking is the way in which the automatic can force thought, how the very lack of rational awareness of characters can inspire movement in our own reflective processes. Hughes, by demonstrating the (progressively) determined nature of subjectivity, draws a line of connection from the earliest work on Hume directly into the cinema books and the consideration of subjectivity that closes his third chapter, stressing the role of constitution and the implications this has for alterity.

This closing section is one where one fully appreciates that, across the three chapters of *Deleuze and the Genesis of Representation*, a key strength of the study is its own coherence, down in part to the extreme care taken to make points clearly. We are left in no doubt as to the goal of the text in showing that 'there is a very general yet consistent conceptual structure behind Deleuze's three central texts, and that this structure traced out a consistent theory of the genesis of representation'

(158). This clarity ranges from statements of the intent of the study, to the cross-reference of points throughout its three main chapters. Each part builds on the others and frequent links forward and back are of great help as complex arguments are followed across texts. Hughes, as we have seen, has a talent for pithy summaries which many readers will appreciate. This is perhaps especially the case when they develop a real sense of dialogue with the reader by basing deductions on questions which, Hughes rightly assumes, the reader is likely to ask at a given stage. Consequently – and somewhat in tune with the detective novel theme – rather than present his arguments as *faits accomplis*, Hughes is not afraid to ask questions as if thinking through the points himself, which makes one feel at home within the argument and often slightly less uncomfortable about having failed to grasp a particular point. This, alongside the combination of detailed argument and concise roundups, succeeds in making the text open to a wide readership, indeed clarifying some points as well as, if not better than, some introductory guides. A good example of this is the way in which Hughes tackles 'side' themes, such as of 'fatigue' (137–8) which, as he points out, may be assumed to result from the passage of time. Since Hughes shows that time cannot depend for its constitution on syntheses which in turn depend on other syntheses, it makes no sense to see exhaustion as being a result of the passage of time in infinite regress. The genetic ego therefore suffers fatigue, on the contrary, because of its limited ability to contract relations and exhausts itself because it contemplates too much, 'trying to possess too many instants in one grasp' (138). Despite appearances and quasi-causes, then, the cause of fatigue – and hence of stability and escape from raw being – occurs within and because of a limited, immanent contractual range.

The reader is also struck by Hughes' refusal to be put off by Deleuze's terminological variety, concluding on the contrary that this is no obstacle once one has perceived the basic unity of the work and that despite manifest differences of style and language, essential themes recur in the three texts in question. All that really changes is the terms used to describe the movement of thought through the stages of perception, a point to which the text often returns: 'Despite the complete disparity in technical vocabulary between books, there is a very strong correspondence in their separate descriptions of these early stages of the genesis' (140). The attention paid by Hughes to this issue is extremely helpful. For instance, while it is true, he argues, that the word 'genesis' appears only four times in *Empiricism and Subjectivity*, and even then only to be criticised, we need to understand that the reference in this

context is precisely to the Husserlian 'sedimentation' theory of sense which Deleuze rejects elsewhere in favour of a more immediate and dynamic interpretation. We are able therefore to see that the question of *Empiricism and Subjectivity* is exactly that of the phenomenological question of genesis: how does the subject arise from the given? (16).

These correspondences are supported by diagrams along the way which show clearly how evolving sequences of syntheses relate to each other. These culminate in a table (156) which shows how they relate across the three texts studied. Given the sometimes oblique ways in which Deleuze returns to topics from different angles, such schematisations will be welcome to many in providing a 'key' of sorts to the proliferating language which, if we are honest, can at times both delight and frustrate us as readers.

Adding to this Hughes' careful and sustained policy of recapping and pre-capping, it becomes obvious from the way the text summarises key points and presents others upstream that the whole project has been worked out with the explicit goal of carrying the reader through complex terrain. This is particularly obvious in part two, where Hughes deals deftly with *Anti-Oedipus*, shedding a good deal of light on this demanding text. Given the obviously daunting range of Deleuze and Guattari's first collaboration, there is much to be said for an approach which selects one theme and follows it through the different permutations to which it is subjected throughout the book, thus cracking open some of its complexities. Moreover, comparing the same themes across texts, rather than complicating things, actually makes them more accessible, and once basic ideas have been established, the reader can with more confidence use knowledge from one text to make sense of another.

This confidence rubs off partly from Hughes' own, which is clear in instances where he takes critical aim at a number of commonplaces. Included on the list of misreaders is Foucault, for instance, guilty of taking 'phantasm' to mean the same in *The Logic of Sense* as it does in *Difference and Repetition* (165 n. 34). Deleuze's purported anti-Hegelianism may also be entirely unfounded (134), with the former offering instead a 'flashy Hegel' and a contingent view of history whose non-teleology 'still progresses according to a dialectical logic of sublimation or double causality' (170 n. 18). A further example is Hughes' convincing argument that a clarification of detours in the treatment of the syntheses in *Difference and Repetition* justifies their being understood as operating in linear fashion. Despite Deleuze's roundabout way of presenting the concepts, we need, for Hughes, to

understand them as following a progression: each one relates to the previous in a series of transcendental exercises (129) of each faculty.

Beyond the confident style, Hughes also has a series of genuine points about Deleuze that seem well worth making and has produced a text which, oddly perhaps, seems to fulfil two very different purposes. In the first instance, it is a scholarly study of some of the most complex ideas in the work of notoriously problematic thinkers. Hughes' weaving of a web of relations between Kant, Husserl, Merleau-Ponty and Deleuze is something of a feat, but it might be more appropriate to call it an 'instruction'. Secondly, therefore, in situating Deleuze's thought, concepts such as static and dynamic genesis are explained with both an eye to detail and an impressive command of the big picture and the lines of argument being followed. The point here is that the text appears to be achieving that rare goal of speaking to a remarkably wide audience of both specialists and neophytes. A lack of familiarity with the intricacies of Husserl's late work is not a problem since the concepts are so clearly laid out. What is more, the way these concepts are treated is extremely helpful for anyone 'perplexed' by the difficulties of Deleuze and the context of his ideas.

At the end of the book, Hughes seems to suggest that we may want to question this apparently monotonous focus on the same theme, and he is surely right to maintain a critical line. Craven homages to Deleuze (and Guattari) which do little other than repeat their *mots d'ordre* do nothing at all either for neophytes or those already familiar with the work. Hughes' criticality is refreshing then, and succeeds in operating in the space between either glorifying or sacrificing Deleuze. Hughes, thankfully, does neither, choosing instead a much finer path of balanced and detailed critique whose aim is to clarify, explicate and situate his subject.

Deleuze and the Genesis of Representation, then, ultimately impresses by the strength and clarity of its arguments. Are there nevertheless details which some readers may find problematic?

For Hughes, few have actually considered the debt owed by Deleuze to phenomenology, and fewer still have been able to link his ideas clearly to those of, for instance, Husserl and Merleau-Ponty on this score. To support these claims, repeated references are made to the essentially phenomenological nature of Deleuze's work. For some, this will come as no surprise: Francois Dosse's recent biography, despite describing Deleuze's attitude to phenomenology as 'ambivalent' and the link to Husserl as largely superficial, reveals that Merleau-Ponty's *The Visible and the Invisible* was a favourite text (Dosse 2007: 189). Toscano describes Deleuze as developing from Husserl 'an-other phenomenology'

(Toscano 2005: 204) . The extent to which Hughes' reading goes 'against the grain' then, might be open to question. Similarly, there are times when the welcome degree of incisiveness and confidence risks tipping over into a boldness which some might find excessive. One example is when Hughes claims early on that 'the only way to understand Deleuze's texts is to understand them as a theorization of genesis, and the only way to understand a Deleuzian concept . . . is to determine its place and function within the genesis in which it participates' (16).

Not all will agree that 'the only way' to understand these texts is indeed the one offered here. But the excessiveness or otherwise of these claims can be judged only on the evidence made available, and Hughes certainly provides plenty. Moreover, if the thesis of unity in the work unsettles some readers, it will be welcomed by those disquieted by readings which appear to see Deleuze as a sort of concept factory whose productive machinery required no fuel, pulling rabbits out of hats. I made the point earlier on that Hughes' demystification is no bad thing in attacking views of Deleuze which may appear both sanctifying and actually unhelpful. While failing to explain anything much at all about the work, they also provide ammunition to those who, rather than welcome inventiveness, reproach what they see as obfuscation, barbarism, irresponsibility and so on. Perhaps someday Deleuzians with time on their hands will quantify just how much effort has been spent rectifying the mis- (or non-) readings which proliferate, especially across the social sciences, of Deleuze (and Guattari). A far better idea though would be to consider Hughes' text as an example of how elucidating the genealogy through an *explication* of Deleuze's work can provide a genuine *explanation* of some of its most difficult ideas. Placing the fabric of relations under the magnifying glass lifts them off the plane and gives them a shape which allows us to see the texture of the individual pieces and their warp and weft. The genuinely critical spirit behind this raises questions about simplistic notions of creativity while providing extremely useful contextual information about which other fingerprints can be found on Deleuze's work. Some may disagree with Hughes that this demonstrates a profound, almost monotonous, unity in Deleuze's work at the level of its basic concerns. But I feel it must be accepted that whereas he generates both light and heat, Hughes should be congratulated for shedding much more of the former than the latter.

That said, and on a different and perhaps rather ungenerous note, there are times when Hughes' impressive clarity seems to slip a little. Deleuze, as we know, claimed to 'believe in philosophy as a system' (Deleuze 2003: 338), but there are times when Hughes' phraseology seems to imply chinks of doubt that the systemic and systematic nature

of the work is indeed clearly demonstrable. If Deleuze's concepts initially 'all come together to form a consistent, if not systematic, theory of genetic constitution' (20), they later become 'systematic but incoherent' (155), and then 'systematic and totalizing' further on (157). The extent to which these phrases actually cloud Hughes' point, however, is minimal, and examples of this sort of hesitation are rare in the overall tone of extreme clarity and incision.

A further reaction to *Deleuze and the Genesis of Representation* may occur to readers who conclude that Hughes, contrary to Deleuze's advice (Deleuze 2003: 339–40), fails to remain concrete by giving one concept primacy over another and focusing so closely on the essential nature of genesis. This would be unfair, however, in that the text is at pains to stress the ways in which Deleuzian syntheses are explications of one another – albeit in a particular order – in contradistinction to their Kantian counterparts whose a priori nature fails to explain their constitution. A desire to engage with concrete questions beyond those of 'simple' perception also guides Hughes' insistence on the complex role of alterity in the system: it is the world without others, in its schizophrenic depths, which makes genesis *necessary* as an escape from the chaos of raw being (150–3). It is once more significant that on this point, as on many others, Hughes sees a direct lineage between Husserl and Deleuze.

A final potential concern returns to the issue, raised by Hughes himself, of the implications of recent biographical information for our understanding of the Deleuze–Guattari writing relationship. One may on one level recognise reflections of the not uncommon desire to 'de-Guattarise' Deleuze, which takes effect, intentionally or not, in three ways. On the one hand, works are grouped together that some may consider disparate, seeing no reason to assume that a co-authored text should be considered any differently to individual work on this account. Hughes moreover clearly considers *What is Philosophy?* to be 'Deleuze's last major work' (157), as indeed Deleuze himself seems to imply when stating his desire to write 'a short text' offering a clarification of the notion of concepts (Deleuze 2003: 339). On the other hand, Hughes insists that the themes which underpin apparently diverse works are the same: it is, by implication, Deleuze's underlying obsession with representation that is the real 'story' across the whole corpus. A third example of the erasure of Guattari from the scene is provided by Guattari himself, who claimed, in the *Anti-Oedipus Papers*, that he did not 'recognise' himself in *Anti-Oedipus* (Guattari 2006). Beyond details in support of the hypothesis downgrading Guattari's role, whether or not Hughes is correct to follow this thread depends of course largely on the evidence he brings to the investigation, and the latter

is substantial. Husserl, Merleau-Ponty and Kant's particular forms of phenomenology are brought to bear in ways which make a convincing case for identifying the hand of Deleuze at the centre even of the joint work. Coupled with Dosse's (2007) description of the decline in the Deleuze–Guattari relationship, and his claim that *What is Philosophy?* was indeed essentially written by the former, one might be tempted to agree with Genosko (2001) that there is indeed a concerted and slightly skewed attempt to de-Guattarise the 'Deleuziana'. And yet while there is certainly something to be said for demystifying the idea of a four-handed concept factory, it would clearly be unfair to include Hughes among those who maintain the 'bad Guattari' thesis. On the one hand, there is no obvious reason why one should not focus on the key concerns of one part of the authorial assemblage if one chooses, and indeed the complexities of some of the arguments here certainly justify it. *Deleuze and the Genesis of Representation* is no biography, and as a piece of detection is not a 'whodunit' but a 'howdunit'. Were it the former, and spoke of 'de-Guattarising' Deleuze, why not also 'de-Deleuze' the advocate of 'becoming-imperceptible' himself?

Editor's Acknowledgments

I would like to express my profound gratitude to Ian Buchanan, first for encouraging and helping me to organise the international conference 'Deleuze and Activism', held at Cardiff University in November 2009, and for suggesting that I edit this Special Issue of *Deleuze Studies*, but also, and mainly, for always giving me reasons to believe in my work.

My appreciation also goes to all the anonymous reviewers of the articles published here – they definitely helped to improve each one of them. Finally I would like to thank the contributors themselves, for their patience and collaboration.

Introduction: Beyond the Royal Science of Politics

Marcelo Svirsky Cardiff University

Anxieties over democracy in the post-war era, reinvigorated by philosophical nostalgia for the modern icons of civic engagement – including Jean-Jacques Rousseau, John Stuart Mill and James Madison – resulted in a flourishing industry of academic writing on political participation, especially in the English-speaking world and particularly in the field of political science. Almond and Verba's legendary *The Civic Culture* (1963) and Carole Pateman's *Participation and Democratic Theory* (1970), together with Robert Dahl's and Seymor Martin Lipset's works on democratic theory, are just a few of the most prominent names and different works that have become the pillars of a very influential clergy, which has helped circumscribe contemporary understandings of politics. The paradigm introduced by such thinkers (and supported more effervescently by republicans than by liberals) did not seek to replace or challenge the privileged political form that is 'representative democracy'; rather, it assumed that 'mass participation is the lifeblood of representative democracy' (Norris 2002: 5), and identified elitism as that which impedes the reinvigoration of democratic regimes (see Schumpeter 1950).

As a sequel to this colossal effort, researchers on political activism have anchored the concept firmly within official politics through the invention of a statistical science of voting fluctuations, participation in party politics and other formal indicators; only lately has this school of thought devoted any critical attention to the evident limits and barriers of formal political participation (see Norris 2002). Other trends in political theory have derided the efficacy of activism by forcing the concept into a reductive alignment with merely habitual social habits, thereby making the future of political life dependent on banalities such

as 'bowling together' (cf. Putnam 2000). By default, such developments in political theory tend to categorise the informal protests of the citizenry as the most radical of activist practices. Ultimately, the tides and modes of civic engagement (or disengagement) are seen as symptomatic of either the flourishing or the declining state of an existent 'democratic spirit', which is invariably celebrated *per se*, leaving no room for significant criticism of the nature of the 'democracy' supposedly animating that 'spirit'.

As Deleuze and Guattari have explained, this characteristic 'royal' science of politics 'continually appropriates the contents of vague or nomad science' – those forms of political investigation looking 'to understand both the repression it encounters and the interaction ' "containing" it' (Deleuze and Guattari 1987: 367–8). One major task of new activist war machines is, then, to escape entrapment within the black hole of the majoritarian discourse on civil society, captured and defined by pervasive notions of 'representative participation'. Although the 'NGOisation' of the public sphere since the 1980s (see Yacobi 2007), together with other forms of political proliferation, have broadened the visible political field, the potential of non-institutional forms of action has been weakened ideologically by a whole state apparatus comprised of research centres and budgets, instrumental teaching, and a parliamentary politics that has incorporated the discourse of civil society – all of which have effected a *sectorisation* of society and political life. The epistemological aspirations of the three 'ideal circles' (Deleuze and Guattari 1987: 367) of the state, economy and civil society are commonly used to categorise political eruptions as forms of participation in the official, representative state politics. It is in this light that we must interpret the failure of academia to come to terms with the division of labour lately being imposed by the transversal relations between intellectual investigation and political situatedness embodied in *militant research*. As Deleuze and Guattari suggest, 'we know of the problems States have always had with journey-men's associations or *compagnonnages*, the nomadic or itinerant bodies . . . ' (368).

It is clear that a Jamesonian 'strategy of containment' is at work in the narrative tradition of royal political science. It is in the notion of 'representative participation' that a function of formal unity or a strategy of containment has been founded, which, as Jameson puts it, 'allows what can be thought to seem internally coherent in its own terms, while repressing the unthinkable . . . which lies beyond its boundaries' (Jameson 1981: 38). By tying official politics together with every form of political participation it can ensnare, what royal political science does

is 'radically impoverish . . . the data of one narrative line' – namely, that of the new activisms – 'by their rewriting according to the paradigm of another narrative . . . ' – namely, that of representative participatory politics (Jameson 1981: 22). The subversive power of political *potentia* is thus contained by this reductive strategy; civil society becomes the main territory of this imprisonment, assisted by a false equation of official participation with challenging politics.

Rather than problematising the political, this royal understanding of activism uses its 'metric power' to axiomatise politics, while simultaneously repressing activist experiences that refuse simply to align with 'the given' of formal politics. An example of this can be seen in the hostility of western states towards organisations such as 'Wikileaks' or the 'Animal rights movement', each of which are immersed in creative acts of citizenship that actualise *ruptures*. Such new scenes and acts are constantly at risk of being appropriated by this royal science of politics, which imposes upon them a model that channels civic participation according to established rules and concepts. Activisms that seek *only* to guarantee the workings of representative democracy are essentially *slave activisms*; they dwell in safety and their impact and potential is expected to be absorbed without drawing the system into new structures of resonance.

The assumption that 'mass participation is the lifeblood of representative democracy' not only imposes a particular model of the political, it also reinforces a pejorative way to conceive activism. By positing representative democracy (or any other regime) as the reified model of political process, theory necessarily idealises certain forms of involvement over others. For example, classical participatory theory is often blind to the creative significance of the activist energies being unfolded in such events as critical teaching in schools, revolutionary philosophical writing, the deconstructive effect of a critical assemblage that confronts patriarchal power, or of civic homosexuality which disrupts heterosexism. In fact, the assumptions underlying 'representative' participation are troublesome for at least two reasons. Firstly, participation in the formal political process of 'representative democracy' does not in itself necessarily implicate a critical attitude or action, seeking a less repressive and more creative life. To evidence this, it is enough to keep in mind some fearful recent examples of mass political support for 'representative' state violence, as occurred last May when thousands of Israelis marched in Tel Aviv and the streets of Jerusalem to back the killing by the Israeli Defence Forces of nine activists from the Turkish Foundation for Human Rights and

Freedoms and Humanitarian Relief, as they boarded the *Mavi Marmara* ship sailing to Gaza as part of a humanitarian flotilla. Similarly, we might remain mindful of other, no less electrifying, cases of popular support for wars and genocides in South America, Asia, Eastern Europe and Africa, or of events such as the Holocaust. In these instances, mass participation more accurately falls within the Reichian analysis of a popular 'desire for fascism' – which lies worlds away from a participatory liberalism that idealises the commitment of the public to activist citizenship (see Isin 2009) and to the tolerant 'good life' that western democracy claims to represent. Secondly, passivity is not necessarily a sign of political anaemia, but may be a cultural expression that requires local explanation. Here, research at times confuses the visible with the political: absence of visible mass participation might be a sign of unconscious and pre-conscious compliance with ongoing forms of oppression, and can impact more energetically on the perpetuation of a regime than can tangible acts of the body – these modes of active abandonment produce the reign of daily microfascisms.

After Deleuze and Guattari, political activism may be approached in a fundamentally different way: without an image, without a form. As Deleuze and Guattari make clear, the interaction between royal and nomad science produces a 'constantly shifting borderline', meaning that there is always some element that escapes containment by the 'iron collars' of representation (Deleuze and Guattari 1987: 367; see also Deleuze 1994). This occurs when the plane of consistency is passionately thrown against the plane of organisation, when a nomad element inserts itself in political struggles in which, for instance, the boundaries of citizenship are challenged and reopened (as occurred in the struggle associated with the *sans-papiers* movement, see Isin 2009), or barriers of ethnic segregation are challenged by new forms of interculturalism (as occurs with bilingual forms of education). It is through these 'smallest deviations' that smooth types of political activity dwell within the striated forms of state politics (Deleuze and Guattari 1987: 371). Deleuze's and Deleuze and Guattari's political philosophies have created some of the conceptual tools which may be put to innovative use in activism that seeks to break with repressive traditions. Their alien relation to the standards set by the royal science of politics (see Patton 2000) – an alienation laid out in the philosophical resources they draw on, in the issues and concepts that characterise their work and, principally, in the incessant movement of their thought – points towards a richer philosophical weaponry with which to confront and possibly overcome political inhibitions, in both knowledge and practice.

In truth, Deleuze and Guattari do not provide ready-made blueprints for revolution – neither recipes nor rules – but they do certainly describe a minor art of thinking/doing, one which allows activists to target stable forms of life wherever they impede creation, wherever they are mystified by representation. Activists couldn't hope for more powerful tools to assist their diverse struggles to overcome oppression, where this is a phenomenon understood comprehensively as a reactive style of power manifested in techniques of conceptual and material capture. Indeed, the two volumes of *Capitalism and Schizophrenia* are slowly but surely beginning to share some of the glory that volume one of Karl Marx's *Capital* occupied for more than a century; henceforth, we are faced with the urgency of thinking anew the nature of social struggles, and how to engage them successfully.

Exchanging conservative for 'radical' ideologies, proving the guilt of the majoritarian group, celebrating recognition of identity, seeking political representation, instigating litigation and arousing strikes, marches and protests – all these conventionally privileged resources for transformative action are now seen as conforming to a certain model of activism. As Buchanan warns, 'from conformity it is but a short step to complicity' (Buchanan 2000: 75), because activism that treads established paths of dissent is always in danger of being besieged and contained by the organism of the State. A new horizon stretches out: by engaging more forcefully with the celerity of the 'itinerant' activist, a coextensive plane between the conceptual apparatus of politics and the more radical activist practices of rupture and creation may be constructed beyond the royal science of politics, while remaining prudent with respect to the 'gravitational field' of representative participation (Deleuze and Guattari 1987: 372). This is where a new science of activism is to be found:

> Whenever ambulant procedure and process are returned to their own model, the points regain their position as singularities that exclude all biunivocal relations, the flow regains its curvilinear and vertical motion that excludes any parallelism between vectors, and smooth space reconquers the properties of contact that prevent it from remaining homogeneous and striated. (Deleuze and Guattari 1987: 373)

The task undertaken by the contributors to this special issue is to launch a preliminary experimentation with the conceptual tools appropriate for a new science of activism, each exploring different dimensions of the 'Deleuzian horizon' outlined here. The issue is the result of a conference held at the Centre for Critical and Cultural Theory, Cardiff University,

in November 2009. Here the participants gathered to discuss the idea that Deleuze offers activism a new kind of freedom from capture by the state-forms of representative politics; indeed, the speakers described how Deleuzian frameworks often engage with the smooth spaces that radical activism simultaneously practice and seek to create.

Desire, Apathy and Activism

Simone Bignall University of New South Wales

Abstract

This paper explores the themes of apathy and activism by contrasting the conventionally negative concept of motivational desire-lack with Deleuze and Guattari's positive concept of 'desiring-production'. I suggest that apathy and activism are both problematically tied to the same motivational force: the conventional negativity of desire, which results in a 'split subject' always already 'undone' by difference. The philosophy of positive desiring-production provides alternative concepts of motivation and selfhood, not characterised by generative lack or alienation. On the contrary, this alternative ontology describes an identity that is not primarily 'undone' by difference, but 'done' or 'made' through the complex and piecemeal relations it forges with various aspects of the bodies it encounters. Understood as a complex multiplicity, the self or community accordingly has a primary, immediate and active interest in the quality of its multifaceted relations with others. Finally, I argue that some contemporary forms of activism can be read as practices aimed at creating and safeguarding the social conditions that foster the complex relational composition of selves and communities.

Keywords: activism, apathy, identity, Deleuze, desire, ontology, negativity, politics

While global society flounders in economic crisis and political violence, middle-class white westerners comprise a political strata apparently characterised by 'motivational deficit' (Critchley 2007; Bernstein 2001). The rituals of liberal democracy produce a politics that palls with the immensity and complexity of global injustices and the tasks of redress

that are called for. In modern thought, apathy is often associated with negativity – it signifies incapacity, immobility, absence of direction, or existential emptiness. In fact, the prevalence and constancy of apathy as an indicator of dissatisfaction in everyday life may correlate, at least in part, to the emphasis modern western philosophy places upon critical negativity and negation. I begin by arguing that this persistent emphasis on negativity is a residual effect of the negativity of desire which is conventionally understood to be the grounding condition of action. However, while this generative negativity is celebrated within modernism and many strains of 'postmodernism', neither style of thinking is capable of conceptualising a mode of transformative action that is not problematically fettered to the negativity that such action paradoxically aims to oppose. I then suggest that Deleuze and Guattari's absolutely positive concept of desire – and their corresponding ontology of the complex relational self – offers an alternative way of understanding political motivation, potentially enabling a path of flight from the pervasive problem of political disengagement.

I. Apathy

The amorphous phenomena of 'boredom' and 'apathy' define a characteristic modern negativity (Spacks 1995; Svendsen 2005). Modernism 'posits an isolated subject existing in a secularised, fragmented world marked by lost or precarious traditions: a paradigmatic situation for boredom' (Spacks 1995: 219). While alienation is associated with a sense of subjective disconnection and paralysis, modern apathy extends across the entire social field as an effect of 'profound' boredom that has no focus and no relief (Heidegger 1993: 99). Profound apathy is then socially indicated by a systemic loss of interest and attachment, a turning away and closing off from others, and an associated failure of responsibility and care in comportment towards others (Hammer 2004; Emad 1985). One ceases to be attentive to others when afflicted by apathy: 'boredom, unlike engagement, implies no respect for the identity of the other' (Spacks 1995: 231). The typically modern (and western) stance of foppish or cultivated disinterest in others may also serve a related socio-cultural function; in *contriving* to be bored, the subject rejects the possibility of intimacy and so 'repudiates attempts to establish a mode of equality' (199).

One's relation to oneself is also called into question by the experience of boredom. Conceptualised as a project of development, the modern self is constituted through reflexive acts of desire and by the recognition

these acts solicit. The process of self-determination is effectively halted by boredom, since 'almost always it suggests disruptions of desire: the inability to desire or to have desire fulfilled' (Spacks 1995: x). For the self defined by desire, such disruption corresponds with a loss of motivation, direction and satisfaction. The negativity of profound boredom collapses the self into an existential crisis: one suffers a hiatus in one's project of self-directed desire and the material transformations associated with one's project.

However, negativity paradoxically plays a privileged role in modern critical philosophy and underlies modern conceptions of agency (see Coole 2000). Boredom is not simply disabling and disruptive, but is also understood as the putative ground for the emergence of reflexive selfhood: 'boredom reveals beings as a whole' (Heidegger 1993: 99). Boredom reveals an ontological void, an open emptiness which is a primary and defining negativity, but which is also constitutive and transformative because it defines one's fundamental attitude of being-in-the-world as unfinished and striving. In turn, this striving plays a causal role in projects of self-directed becoming. In this capacity, 'boredom aids the fulfilment of desire' (Spacks 1995: 242). On the one hand, then, boredom is an existential negativity that indicates an absence of desire or interest, a state of alienation and loss of affective capacity, and a moment of existential crisis experienced as a painful suspension of the passage of developmental time. In this sense, the primary cultural function of boredom is to serve as a critical indicator of subjective or social dissatisfaction. On the other hand, boredom is a generative negativity: a causal absence felt as alienation and emptiness, which prompts an active desire for alleviation of the uncomfortable experience of negativity. Such negativity constitutes a subject-in-process and causes the production and transformation of being. In this sense, a second overarching cultural function of boredom is the provocative role it plays as a causal or motivating force of constructive processes.

This ambivalence, I suggest, sits at the heart of the problem of apathy. While action seeks to 'negate the negative', negativity is always necessarily preserved because it is not only critical but also constitutive. This is often celebrated in terms of the resilience of 'difference' as the power of critical opposition or destabilisation within dialectical and deconstructive politics, but it also means that the causal or constitutive force of negativity has no final relief (see Coole 2000). Consequently, subjectivity is condemned to oscillate anxiously between tenuous existence and the void of subjective emptiness: 'every human life is thrown back and forth between pain and boredom' (Schopenhauer,

cited in Svendsen 2005: 131). Apathy takes hold because negativity is always preserved as a necessary, constitutive force of subjective life. Critical theory thus often adopts an attitude of resignation towards the phenomenon of negativity. It seems 'there is no solution to the problem of boredom' (Svendsen 2005: 133), and with this resignation comes apathy. Alternatively, critical thought seizes upon the generative aspects of ontological negativity in order to reinvigorate a sense of democratic purpose and commitment to activity. Indeed, in grappling with the material reality of global conflict, post-imperialism, strife, terror, poverty, ecological devastation and global displacement, a significant strain of contemporary political philosophy takes ontological negativity as a given point of departure. Often drawing on Lacan's concept of the divided and self-alienated subject, this kind of project is exemplified by the post-Marxist political thought of Ernesto Laclau and Chantal Mouffe, or of Slavoj Žižek.

Another recent response, also starting from a Lacanian-influenced theory of split subjectivity (the 'dividual'), is given in Simon Critchley's work on ethics and commitment. Critchley begins with the idea that philosophy responds to the generative negativity that is the failure and disappointment thrown up by the 'present time defined by the state of war' in which global humanity finds itself (Critchley 2007: 8). In this morass of contemporary conflict, we suffer a 'motivational deficit' and a 'moral deficit', each connected to the 'felt inadequacy' that evidences 'the lack at the heart of democratic life'. Existing structures of liberal democracy have apparently failed to provide an alternative to the passive nihilism of apathy and the active nihilism of terrorism; they seem unable to stop us from plunging into 'violent injustice', and cannot alleviate the threatening suspicion that social participation is meaningless (6, 8). Critchley seeks a solution to this situation by reinvigorating the possibility of subjective conscience and commitment to ethical action. To this end, he connects Badiou's notion of 'fidelity' to Levinas' notion of the subjective 'trauma' prompted by the experience of the 'unfulfillable demand' of the alienated other in relation to the self. The unfulfillable demand is the source of splitting and felt inadequacy within the subject. Critchley argues that this experience of subjective trauma in the face of the other's demand – the experience of internal splitting and division – is itself the experience of 'conscience'. The affect of internalised trauma accordingly becomes the ground for ethical and political action. On Critchley's view, accepting the ontological negativity of the divided self as a ground for political action logically tends towards a deepening of democratic engagement.

Politics cannot be confined to order and consensus when the ethical subject is 'defined by commitment or fidelity to an unfulfillable demand'. Rather, politics involves the 'manifestation of dissensus, the cultivation of an anarchic multiplicity' that involves a 'continual questioning from below of any attempt to impose order from above' (13). While I am sympathetic to the 'responsible anarchism' and to the political outcome of reinvigorated democracy that Critchley arrives at, I worry that taking a starting point of given negativity – disappointment, strife, conflict, lack, inadequacy – maintains a problematic connection of negativity with motivation and action.

The key problem for activism is that both desire/action and apathy/inaction are prompted by constitutive negativity. Generative negativity has the potential to motivate action and transformation, but worldly evidence suggests that the response mostly tends towards apathy and inaction. In my view, this problem arises because apathy and activism are both tied to the same motivational force: the ambivalent negativity of desire. Desire/lack produces the model of the split self as the seat of motivation; the split subject is motivated to negate the negativity that divides it, but must paradoxically preserve this negativity that not only divides, but also constitutes its being. One way out of this difficulty is suggested by the alternative process of transformation or becoming described by Deleuze. This unconventional ontological process is not driven by lack or absence felt as emptiness, dissatisfaction or loss accompanied by a consequent longing for fulfilment. Nor does it rest upon an acknowledgement that the self is always already 'undone' by alterity and is moved to conscionable action for the other as a result. On the contrary, Deleuze's alternative theory of ontology describes an *unambiguously generative* process of association caused by a purely positive and productive force of desire. Desiring-production results in a process in which the self is not 'undone', but 'done' or 'made' through difference. The following section considers this alternative understanding of ontology, in order to re-assess the critical privilege currently attracted by the modern concept of negativity.

II. Desiring-Production and the Complex Self

The conceptualisation of desire as associational or 'machinic' appears as a persistent theme throughout Deleuze's work (Deleuze 1990, 1991, 1997; Deleuze and Guattari 1983, 1987). Unlike the conventionally negative concept of desire/lack, which undermines the unified self and results in the 'split' subject, desiring-production is a positive causal force

that generates a 'complex' individual. Like the 'dividual', a 'complex' self is also decentred and uncertain, but not in the same way as the Lacanian subject is. Deleuze's alternative theory of ontology emerges from his quite particular and innovative reading of Spinoza (Deleuze 1990). As part of an assemblage also combining (and at times creatively transforming) aspects of Bergsonian, Humean and Nietzschean thought, Deleuze's Spinozism enables a model of selfhood that constantly flees or escapes its own limits by forging increasingly complex and active relations with other bodies.

According to Deleuze and Guattari, individuals are complex forms of order that develop consistency over time. Bodies are 'assemblages' that arise via the causal force of desire, which brings about the process of association and connection joining constituting elements (Deleuze and Guattari 1983: 1–9, 283–96). Desire results in emergent complex bodies when the elemental relations that compose the body take on enduring habits of association. The individual is thus a complex and shifting unity of 'movement and rest, speed and slowness grouping together an infinity of parts' into a set of resonating relations (Deleuze and Guattari 1987: 256). On this view, any consistent form of complex organisation constitutes an individual body, which therefore might not be material in a physical sense. Selves, communities, languages, philosophies: all are 'bodies' existing as relatively consistent forms of actual or ordered being, rather than formless virtual states of quickly morphing force relations that combine in transient unities and then fragment and dissolve.

Furthermore, as forms of enduring order comprised of semi-stable relationships between parts, bodies exist across varying levels of complexity. I am a body composed of elemental relations. Some of these are internal relations, for example between my biological cells or between the thoughts that lend order to my comprehension of things. Others are external relations I have forged with other bodies in my world, for example with colleagues, with locations, or with Deleuzian philosophy (Deleuze and Guattari 1987: 260, 254). These internal and external relations that engage me with varying kinds of consistency on various levels of order and in various circumstances of engagement collectively constitute and define me. Thus, bodies are complex forms of individuation defined by the stability or consistency of their internal and external relationships and the complex and multi-leveled affective capacities these produce.

However, while individuals are here constituted by their relations with others, these are not simply one-on-one encounters between entire entities. Revising Kleinian object-relations theory, Deleuze and

Guattari insist that an individual emerges with the forging of *part relations*, for example by incorporating 'a breast into his mouth, the sun into his asshole' (Deleuze and Guattari 1983: 4). Accordingly, individuation involves the establishment and perpetuation of the complex *part relationships* that collectively define a particular bodily entity. Our interrelationships, our desires, describe the complex 'piecemeal insertions' we make into each other's lives (Deleuze and Guattari 1987: 504). Complex bodies are thus affected *not wholly or in entirety*, but by a vast number of internal and external relations at any one time, which impact upon and transform them in partial and selective ways according to the nature of the elemental connections and disjunctions (261ff). Some of these partial affections are fairly constant forces in a life, giving individuals a certain consistency across time and environments; others are transient relations that affect bodies momentarily, though sometimes significantly enough to introduce a radical and lasting alteration to their character. Shifts in connective relations at the elemental level cause the kinds of continuity and change that simultaneously define the consistency of a character *and* evidence its transformation over time.

The rest of this paper will be devoted to expanding some rationale for argument about the superior affinity for activism of the complex relational subject. Deleuze's concept of causal desire as a generative positivity that produces and transforms complex bodies points to a way out of the difficulty described in the first half of this paper. Unlike 'split' subjectivity, the 'complex' subject is constructed through the creative force of desiring-production, which is unconnected with ontological lack, and thus neither depends upon nor multiplies negativity when it diversifies the desiring self. But it is not yet apparent how Deleuze's affirmative and relational bodily ontology and the causal positivity of desiring-production relates to the *activism* of the subject. It seems that bodies are complexly *constituted* by difference and desire – a body is a form that emerges or emanates via the force of desire, but apparently as a *passive* effect of the encounters and affective relations that define its character. In fact, for the Spinozist (and Nietzschean) Deleuze, there are active and passive forms of bodily constitution. The normative aim of a body is to increase its affective capacities by increasing its active powers of engagement and sociability (Deleuze 1988: 97–104). This idea, taken from Spinoza, is expressed in various places throughout Deleuze's own *oeuvre*. In the second chapter of *Difference and Repetition*, for example, he describes the becoming of being as a process involving an increasing activity of constitution, in terms of a kind of non-linear 'progression'

through the moments described as the 'three syntheses of time' (Deleuze 1994: 70–91). This process is not so much a temporal progression of successive stages of bodily development occurring through time, as it is a description of the qualitative shifting of the nature of a body's constitution throughout its existence. A body takes shape with the initially passive or chance combination of simple elements into a complex order; but it may gradually develop a more active and directed process of self-formation, if it exercises a capacity to selectively choose the part-relations that will come to comprise the character of the emergent body.

The 'first synthesis' describes how the time of the present is constituted through the repetition of 'cases' across successive instants (Deleuze 1994: 70–2). For example, I am a materiality or a 'case' that 'repeats' from instant to instant in a form that is perceived to be consistent. In fact, with respect to my presence, the thing that is repeating from moment to moment is the perceived consistency of the internal and external relationships that define me. Of course, I am really undergoing constant transformation – as I write, millions of my cells are dying and being replaced; my brain waves are shifting in intricate patterns of excitation, and so forth – but I *imagine* myself to persist as a formal consistency in time, just as others similarly imagine me. Deleuze explains that this 'contractile power' of the imagination produces the lived experience of the actual present because the imagination fuses successive instances of actuality and the reality of bodily modifications into a continuity and consistency of perception (Deleuze 1994: 70; Deleuze and Guattari 1987: 281); but with this power of the imagination and the 'fusion of repetition' it produces comes a propensity for the contemplating mind to slip into habit (Deleuze 1994: 73–5). We habitually perceive the actual world of the present time consistently, as a repetition of the same from moment to moment.

The first synthesis of time is then a 'passive synthesis' in two respects: the actual present we inhabit from moment to moment takes form through a passive process of emergence, as chance relations between elements cohere into consistent relations to form actual bodies and worldly structures; furthermore, when imagination renders this actual present consistent we can slip into the passive acceptance of the 'givenness' of the actual world. Accordingly, Deleuze insists that the proper 'role of the imagination, or the mind which contemplates, is *to draw something new from repetition*, to draw difference from it' (Deleuze 1994: 76). With this 'drawing of difference' from the apparently repetitive relations that constitute the time of the present,

the mind becomes capable of acting on and reconstituting the relations that comprise the present: 'underneath the self which acts are little selves which contemplate and which render possible both the action and the active subject' (75). The first synthesis of time is associated with the passive emergence of the actual present through the consolidation of constitutive relations; it accordingly tends towards the problem of habit. The second and third syntheses then describe the steps involved as the mind engages in 'becoming-active' and breaks with habit. With the passage from the first to the third syntheses of time, the contemplating mind develops active ways to modify the actual present. It does this by seeking virtual differences within and between actual repetitions in the present (76).

If the passive synthesis of habit constitutes the living present, the passive synthesis of memory involves the 'pure past' and this constitutes the second synthesis of time (81). The first synthesis comes 'first' since it provides the *foundation* of time; this is because we can only think of the process of time and of transformation on the basis of that which we have already become; we can only think at all in terms of the consistency the actual present allows us to experience. But the second synthesis that involves 'memory' *then* gives us awareness of the ground beneath or *prior to* this foundation. From the position of coherency described by our actual embodiment in a given circumstance, we can 'remember' the idea of this ground: we can become mindful of the virtual chaos that becomes actual order, 'the moving soil occupied by the passing present' (79). By 'memory', Deleuze does not mean simply the reminiscence of the former presents that we have previously lived, but rather the more profound memory of the virtual past which never was actually present. This is the 'unrepresentable' past in its pure form, which is the 'synthesis of all time in which the present and the future are only dimensions' (82). The memory of this 'pure past' involves the awareness that the relations comprising bodies – relations that repeat in the present to constitute actual lived experience – could always have been differently produced in different circumstances of emergence. It also reminds us that the 'cases' that repeat are comprised of differential relations between elements, and that these relations in fact constantly shift and recombine in complex associations. While the first synthesis concerns the habitual repetition of the same and the similar, the second synthesis concerns the retrospective repetition that is memory. With the second synthesis of time, the contemplating mind 'remembers' difference is the ground for the emergence of that actual consistency which repeats as the present. With this awareness of grounding difference comes the

unsettling of the givenness of the actual, and the possibility of a 'third', active synthesis of time.

The third synthesis of time involves an *active* force of desire. The third, active synthesis is a rare event, which does not inevitably follow from the first two in a logical linear progression; it is the 'final' synthesis in the progression because it requires the groundwork of the first two to have already taken place. The third synthesis of time involves the thought of time as 'untimely'; it institutes a 'caesura' in the time of the present (Deleuze 1994: 88–9), with respect to the pure past that grounds it, in order to imagine a future which has not yet come to pass, and which imaginatively 'draws a difference' from the present. The mind engaged in contemplating the future-oriented third synthesis of time thinks the totality of all the actual presents (meaning not only 'the now', but also the history of the former presents that have been) – together with the virtuality of the 'pure past' which has never been (89). The third synthesis of time thereby involves thinking the actual lived present in terms of its repetitions and its habitual consistencies through time, and asking whether, if the part-relations that comprise actual complex bodies (the 'little selves' that exist 'underneath' the 'self that acts') were returned back to the virtual chaos from whence they came, they would be worthy of returning in the same form, reconstituting the same complex body (89). For example, I could ask of myself: is my habitual form partly comprised of some associations that I would be better off without (a draining colleague, an odious relative)? Are there certain elements within me (say, an interest in Deleuze scholarship) that could be differently combined with compatible others with the effect of producing a new and more complex body (say, a reading group) that joins all the participating bodies at their sites of affective involvement? Can this involvement add to my own existing level of complexity to produce a 'better' or more adequate self, one more complexly compatible or receptive to engagement with others? I might also ask which of the existing part associations I enjoy with others bring me particular satisfaction, and so might benefit from some reinforcement or development? For Deleuze, these decisions constitute the operations of the 'little selves' that comprise the complex and shifting subject:

> There is a self wherever a furtive contemplation has been established, whenever a contracting machine capable of drawing a difference from repetition functions somewhere. The self does not undergo modifications, it is itself a modification, the term designating precisely the difference drawn. (Deleuze 1994: 79)

While some bodies will only ever be the passive result of their formation through external forces, certain other bodies – those invested with the powers of imagination and reason – are capable of increasing their active powers of engagement, sociability and self-constitution. The three syntheses of time trace a 'progression' through passivity to activity: from habitual constitutions formed through passive associations, which can be transformed through the resource of 'pure memory', to result in active forces of desire. For Deleuze this active quality of desire is, properly speaking, the active force of material composition and transformation. The 'progression' is, however, non-linear because desiring-production is involved from 'the start' as the causal force that assembles complex bodies. But desire is initially passive and non-directed, and the passage towards active desire and the active synthesis of worldly being begins with the memory of virtual difference in the second synthesis of time, and emerges properly in the third (Deleuze 1994: 85, 90). Accordingly, it is possible to think that emergent complex bodies are not only produced through desire, but are also sometimes involved in *acts* of desire and directed assemblage.

But here arises a second problem: how is desiring-production invested with direction? With ontological negativity – the view that reality is produced and transformed by the compulsion to plug an original lack – the negative is the focus of desire's direction. Even while it seeks to preserve the negative (which is the condition of its existence as such), transformative desire actively opposes the negative. Desire transforms dissatisfaction into action, imperfection into ideal form, inequality into equity, alienation into unity. But what guides desire in the *absence* of negativity? *Why* might a body seek to desire in an active and self-transformative way, rather than a passive and habitual, safe and self-secure way?

A Deleuzian answer to this question is likely to be found in the Spinozist concepts of 'joy' and 'conatus', which together describe a normative principle of ethical association. Joy expresses the sensation a body experiences with the enhancement of its powers of affectivity and complexity. This is achieved when aspects of its own body are combined with those of another, to form a more complex emergent unity that is more affectively potential and expresses each individual in terms of those aspects they share in common (Deleuze 1988: 49–51). Properly conceived, joy is the basis for an ethical attitude of desire because it is *necessarily mutual* (Deleuze 1990: 281–2). Bodies sometimes experience a fortuitous, unplanned joy, but joy can be actively forged between bodies that understand they have something in common. This shared

common element can form the basis of a more complex combination that can enhance them both. Joy is mutual because *both* bodies are enhanced by the emergent complexity that results from a compatible encounter. If bodies meet and only one body benefits or is enhanced, the resulting affect won't be joyful, it will be something else – pleasure or power – but not joy, which is strictly mutual.

'Conatus' refers to the desire of a body to persevere in its being, where being is defined in terms of affective capacity. Conatus entails that bodies will strive in 'an effort to augment the power of acting or to experience joyful passions' by actively organising their encounters. This allows them to form agreeable associations that enable them to mutually maximise their affective potentialities (Deleuze 1988: 101). However, bodily encounters do not involve the meeting of whole entities, but rather take place 'bit by bit' at the multifarious sites of elemental combination that bring individuals into part-relations (Deleuze 1990: 237). My striving for joy involves me in an effort to foster an adequate understanding of myself and others with respect to the ways in which we share *some* common constituting elements. This understanding provides me with the basis of an appropriate comportment towards another, assisting the better 'organising' of our encounter. Developing a *mutual* understanding of the elements we share helps us to actively and selectively build joyful combinations at suitable sites of affective compatibility and also to avoid disagreeable combinations that force incompatible associations between conflicting aspects of our personalities. Joy results from the active desire and the active forms of understanding that are necessarily involved when complex bodies engage in contrived acts of partial and selective relationship that produce preferred emergent forms (261). There will always be some elements of passive constitution involved in processes of individuation, since a body always partly results from passive encounters with other bodies it does not know and does not adequately understand. Indeed because of the complexity of material reality, one's knowledge of oneself, others and the world is never complete and transparent. However, equipped with a developing personal history of joyful encounters, an individual invested with the powers of imagination and understanding can strive to develop a more acute awareness of its constitution through multifaceted relations with others, informed by the experience of these part-connections as sympathetic or antipathetic. Such self–other awareness potentially enables a discerning and active desire to operate in the deliberate creation of new compatible associations: joining with another in ways that celebrate those aspects in which we agree while acknowledging that there are various ways in which

aspects of our characters disagree and cannot happily combine. So, it is possible to think that emergent complex bodies are produced through desire, but that they are also involved in the laborious process of deliberately contriving some part-relations with other bodies. The 'bit by bit' partiality of bodily encounters transforms relational bodies in piecemeal and selective ways: some aspects of bodily constitution will always remain untouched by the engagement with the other. The promise of mutual joy potentially guides bodies in actively directing their affective relations. Active desire can discerningly develop certain elemental associations while avoiding others, thus providing scope for personal adaptation, mutual accommodation and complex relational development while simultaneously preserving the consistency or relative identity of the multiple subject.

I have argued that a complex subject is a 'producing/product identity' (Deleuze and Guattari 1983: 7), which may be simultaneously constituted by desire and actively involved in the constitution of relations through desire. The active desire of a complex subject will be guided by experience and the promise of joy. Complex bodies benefit from being actively involved in the constitutive process, even when this process transforms the self, because such activity leads to an increased affective potentiality and to finding joy with others. However, a third problem persists in Deleuze's positive ontology of desiring-production: how does a purely positive causal desire account for the existence of negativity? When desire is purely affirmative, how can one desire the refusal of the negativities that predominantly characterise the contemporary world?

One possible answer lies in Deleuze and Guattari's distinction between the different orders or qualities of desire that come to define the kinds of interactions a body is disposed to forming (Deleuze and Guattari 1983: 277–96). While everything emanates from the force of association that is desiring-production, the relations between elements comprising bodies may not develop into active organisations of desire, but alternatively may take form as reactive organisations. In *Anti-Oedipus*, this is discussed in terms of the difference between the 'subjected-group' and the 'group subject' – a distinction which recalls Sartre's critical comparison of the different styles of political organisation embodied by the 'serialised group' and the 'group-in-fusion' (Deleuze and Guattari 1983: 64, 256, 277ff; see also Sartre 1976; Guattari 1995; Genosko 2000: 123–33). The way desire is organised in a material form influences the subsequent openness of that body to forming new associations and increased levels of complexity. Bodies that welcome new part-associations with neighbouring bodies (because these are the key to

self-transformation and increased joyful complexity) are defined by an active organisation of desire; such bodies enjoy a shifting consistency organised around a core set of characteristics, but are generally open to modification and brave the risks of instability. These bodies determine their constitution through immediate and open practices of relation (rather than by establishing rules concerning membership that limit and protect self consistency). They remain open to the primary creative force of desiring-production.

By contrast, a body that seeks to preserve its established identity will prevent its own transformation by resisting the formation of new associations with other bodies. This kind of body is a reactive body, which is restricted by the rules it enforces to protect its given identity. It 'wards off' the transformative force of desiring-production (Deleuze and Guattari 1983: 120). Reactive bodies are characterised by fixed constitutive relations and institutionalised habits of association. Reactive bodies resist the free flow of the primary force of desiring-production; this blockage can result in serial or systemic relations of inequality, when the associations comprising the body take on regular hierarchical forms. That is, a relation becomes unjust when it is cemented into a regular pattern of dominance and subordination; this fixture of relations introduces negativity into the positive flow of desiring-production. For Deleuze and Guattari, problems of injustice, alienation and other kinds of negativity are not already given. They are produced through concrete forms of reactive desire, for example an 'Oedipal' or 'imperial' coding which defines desire in relation to lack, longing and appropriative satisfaction (28; see also Bignall 2010). Constructed social negativities must accordingly be addressed and transformed at the level of desire. The distinction Deleuze and Guattari make between open/active and blocked/reactive organisations of desire suggest a basis for critique. Hierarchical and fixed relations that have become blocked and resistant to transformation, resulting in closed bodies that seek to preserve the givenness of their identities and their political relationships, can be criticised on the basis of the primary force of free-flowing desiring-production. The apparent givenness of entrenched orders is an illusion that is maintained by techniques of political coercion used by bodies with an interest in preserving such existing orders. Despotic bodies and the constructed negativity of economic scarcity or social alienation can each be criticised on this basis.

I have been arguing that desiring-production results in complex subjects formed through multifaceted relations with others; such subjects have an immediate interest in the quality of their social milieu and in

making their relations ever more joyfully complex and actively directed. Accordingly, Deleuze's positive conceptualisation of desire offers a more appropriate ground for active subjectivity and political engagement than the conventional negativity that problematically grounds the 'split' subject. I have sketched three responses to the main criticisms of (Deleuze's) ontological positivism: that desiring-production produces subjects as passive effects of a constitutive process (the problem of agency); that desiring-production is not normatively directed towards the generation of preferred complex forms (the problem of intention or direction); and that desiring-production cannot account for the existence of negativity and does not allow for critical negation (the problem of critique). While more can be said about these problems, I hope to have gestured towards some possible bases for reply. The following section considers some of the political implications flowing from the idea that complex bodies emerge from an associative force of desiring-production.

III. Positive Politics and Activism

Deleuze's Spinozist ontology provides a conceptualisation of subjectivity entirely constituted by relations with others. This kind of reliance upon alterity is quite different from the sort of subject-constitution endured by the 'split' subject that is '*undone*' by alterity. Because they meet in *partial and selective* ways, complex individuals are not always already reduced or compromised by their one-on-one encounters with others and potentially moved to action on the basis of the conscionable trauma this provokes. Rather, complex individuals are intricate, shifting unities of the multipartite relations that immediately and qualitatively compose them. This means that the complex self has an *immediate* interest in activating and cultivating its relational being. More significantly, complex selves have a positive interest in forming increasingly complex interactions with the other – in fostering and not repudiating, managing or simply enduring their engagements with others. By developing multipart relations with multiple others, the individual develops an increasingly complex constitution that is more affectively potential and so is more joyful. This in turn implies that the 'complex' self has a direct interest in fostering a diverse and rich social milieu that ensures exposure to a wide variety of 'piecemeal encounters' with others, such that they may maximally find areas of mutual sympathy and enhanced affective capacity in their multifarious social relations.

While the activism of the 'split subject' is *mediated* by the experience of negativity which propels actions of redress, the rewarding experience

of joyful mutuality means that the 'complex subject' has an *immediate* interest in the quality of associations and in making desire active. Such activism is not mediated by a negativity such as a 'disadvantage' that the activist community must simultaneously embody and struggle against; rather, it is motivated by the possibility of finding mutually beneficial relations with others, since these lead to the joy of increased complexity through community (see Bignall 2010). An important difference between the 'split' subject and the 'complex' subject thus concerns the different motivational starting points they figure. The split subject is motivated by the ontological negativity that it simultaneously embodies and struggles against, yet never finally overcomes; the complex relational subject is motivated by the principle of joyful mutuality, which corresponds with increased affective potentiality. The rewarding experience of joy means that the complex subject has an *immediate* and natural interest in desire and in making desire active. It is in the active selection of chosen affections that one forges compatible forms of relationship, increasing one's own powers of affectivity and capacity for affection and in turn finding increased possibilities for experiencing joy.

Deleuzian ontology encourages one to think of oneself as a 'complex' self, with a direct interest in activism that aims to create enabling social conditions of diversity, equity, liberty and radical democracy since these are the conditions that permit open exchange and interaction in communities of practice. As a 'complex' self, one also has an unmediated interest in activism that seeks to safeguard the wider ecological conditions that protect other forms of (non-human) diversity as part of a broad existential milieu. Part-connections with non-human others permit the privileged kinds of becoming (-animal, -molecular, and so forth) that Deleuze and Guattari associate with the radical diversification and enhanced complexity of established forms (Deleuze and Guattari 1987: 232–309). Arguably, a directed and constructive Deleuzian politics develops from a cultivated understanding that the complex social benefits of diversity and equality of opportunity act as the material scaffolding for the constitution of the complex self. A Deleuzian ethics develops from the notion that a conscientious effort must be made towards fostering the adequate understandings of self and other that could enable happy part-combinations, together with the practised commitment to refrain from imposing upon others in ways that diminish them. Both of these principles of ethical relationship are normatively guided by the promise of joy that flows from mutuality, where mutual compatibility leads bodies to join in more complex levels of community. The politically important thing about joy is therefore its

function as a principle of *mutuality*. Active bodies will seek to maximise the mutual sympathy of their combinations; but this does not entail that they should strive to meet bodies they perceive as wholly similar, resulting in a politics of community based on identity and sameness. Rather, *conceptualised as complex*, bodies will strive to meet in active and joyful ways with sympathetic *elements or parts* of various other bodies they encounter. This means that quite radically different communities can combine successfully, when they seek to interact in ways in which they are compatible and do not force an unhappy combination at those sites of character where they conflict.

The activist tactics of some contemporary anarchist groups may be read as a subversive politics of joyful practice. Pink Bloc, Ya Basta!, Billionaires for Bush, and the Rebel Clown Army employ comic performance art, absurd costumes and high camp glamour in acts of non-violent disturbance against the world's macropolitical governing elite. In Simon Critchley's words, such activism works to

> exemplify the effective forging of horizontal chains of equivalence or collective will formation across diverse and otherwise conflicting protest groups… Deploying a politics of subversion, contemporary anarchist practice exercises a satirical pressure on the state in order to show that other forms of life are possible. (Critchley 2007: 124)

Like Critchley, I find this 'new language of civil disobedience' utterly compelling and often hilarious. However, 'it is the exposed, self-ridiculing and self-undermining character of these forms of protest' that Critchley 'finds most compelling', since he sees them as an exercise in political humour or 'tactical frivolity' expressing a 'powerless power that uses its position of weakness to expose those in power through forms of self-aware ridicule' (Critchley 2007: 124). By contrast, I think it is more useful to believe that something much more positive and constructive might be going on here than the critical deconstruction of the state through a conscientious political practice of ridiculous self-effacement.

In my view, the protesters *add* an extra dimension of complexity and potentiality, a virtual difference, into the mix of the protest situation. They perform difference by embodying it, clad in imaginative fancy-dress costume more 'appropriately' worn in festive situations or in fantastical other-worlds; they inject virtual difference into the actual-world space of civil and political engagement. Their bizarre presence compels the state forces to attend to the diversity they make manifestly visible, or else renders the guard ridiculous when it returns a blank stare of non-acknowledgement, and thereby implicitly critiques and destabilises

the reactive body of the state that tries to ward off transformation as it denies and repels difference. This critique is, however, positive in conduct, designed not simply to destroy the self-composure of the state but also to evidence that 'other forms of life are possible' and, if possible, to seduce the state forces into a becoming-otherwise. Although their actions are underwritten by a serious political intent, the protesters engage playfully with the state forces, tickling them, affecting them with a sense of fun and hilarity, inventing new forms of 'combat' and 'weaponry': water balloons, feather dusters and wadding armour. They aim to combine opposing bodies in new assemblages of relation, not through violence and the polar separation of conflicting opposites, but more positively through the shared experience of fun, humour and festivity that potentially draws even the most disparate bodies together, allowing them to combine – not entirely, but at particular sites of affectivity – in micropolitical instances of joyful community. Beyond wry self-effacement and critical deconstruction, such acts might therefore best be thought of as positive and productive, aiming to create novel forms of engagement tactically invented through the manifestation of virtual differences in actual social relations. These potentially indicate ways of being-otherwise that broaden the habitual horizons of existing social and political conventions and encourage the becoming-minor of majoritarian forms. This positive ambition and achievement appears to me as the most significant aspect of these new forms of anarchist protest.

The principle of joyful interaction is clearly not an essentialist, stand-alone or cover-all principle for political society. *Starting* with the positive and abstract principle of mutuality does not mean that concrete institutions of common practice (such as those fostering democracy) and emergent principles of political protection (such as rights) are not needed to safeguard bodies from destruction by bodies who care less about cultivating mutual joy than they do about maximising their own pleasure or power. But *starting* with the notion of affirmative mutuality as a basis for thinking about active processes of self and social formation does avoid the problem that constitutive negativity leads to political inactivity as much as it does to activism. It also places a different *primary* emphasis on political society – away from a politics of restraint stemming from a subterranean ontological conflict, and towards a politics of complex recognition and sympathy. Here, mutuality is presented as a preferred (but not 'given') norm of political conduct and critical conflict becomes necessary when efforts to find mutual consensus fail, or when joyful practice is routinely crushed by forms of political domination. Similarly, the negativities of hostility, shame and boredom are not ontologically

given, but more like errors of practice to be avoided and guarded against.

The notion that complex bodies can agree to meet 'bit by bit' in sympathetic ways and to avoid meeting in ways that diminish them suggests that Deleuzian philosophy offers some scope for a politics of consensus, supplementing the anarchic dissensus that Critchley privileges. However, consensus will never be final and complete, but is emergent, contextual and temporary, institutionally limited to recognised sites of part-commonality that enable complex bodies to form the sympathetic engagements leading to increased complexity and joy (cf. Tully 1995; Connolly 2008). Here, acknowledgement of dissent is intrinsic to the development of consensual group activity. Sympathetic disagreement involves understanding those aspects of complex bodily interaction that cannot currently combine well, and resisting the attempt to impose upon and homogenise disparate bodies under a coercive unity that betrays the differences between them. Formally identifying and recognising standard areas of disagreement is therefore also an important task of political society. Indeed, we might fruitfully rethink negative 'rights' in this way: not as eternal and inalienable principles of sovereign integrity flowing from fixed human characteristics, but as a meta-stable discourse about principles of political restraint that regulate human interaction. Such discourse would be constructed with respect to current understandings about the difference and dissensus that evidences the limits of consensual engagement. Even so, although limited and partial, finding productive consensus should be the *primary* aim of interacting orders, because (genuine) consensus is joyful and so is normatively preferred. Although this is an undeveloped aspect of his own work, Deleuze's philosophy arguably provides us with an attractive basis for rethinking rights and democratic engagement in a milieu of multicultural difference (see Patton 2010; Lefebvre 2008).

A starting point of given negativity – strife, conflict, lack – prompts the model of the divided self that has held such persuasive sway in modern critical thought and persists in many strains of postmodern thought, but which to me seems likely to compromise the quality of the social engagement that is possible. I have argued against the negative as a motivational force. A more effective starting point for activism is found by looking for examples of positive mutuality in encounters. This approach does not deny that most societies are predominantly characterised by conflict, inequality, war, trauma, alienation and exploitation. However, within this majoritarian state of violence and hostility, there also exist minor modes of positive social engagement,

acts of respectful recognition, and exemplary practices of genuine care that join participating orders in the experience of mutual understanding and appreciation at particular sites of their relationship. *Starting* with these moments of 'felt adequacy' assists political communities in understanding how they can combine well in partial and selective ways; from the positive experience of mutual accord, they can start to identify new sites of combination that work well as the location of new forms of complex political union. This developing understanding is rewarded by the gradual emergence of an active understanding about 'good' forms of engagement, which may then guide the institutionalisation of preferred forms of complex national and international community. Starting with the experience of shared joy, rather than lack and division, provides selves with an unmediated interest in the quality of their relations with others, and, by extension, an interest in fostering the kinds of political community that are able to support diverse encounters, leading to forms of increased commonality and complexity. When desire is not mediated by negativity, we might even speculate that, severed from the conditions of its generation, profound apathy could cease to emerge and take hold as a systemic problem of political disenchantment.

Note

I am grateful to Marcelo Svirsky, Ian Buchanan and the participants in the 'Deleuze and Activism' conference held in Cardiff, November 2009. Paul Patton and others at UNSW also offered useful comments on an earlier version of this paper. I appreciate the thoughtful reading and criticism offered by reviewers. Thanks also to Tony Fletcher, Ben Sellar and Sam Sellar for helpful discussion of the 'three syntheses'.

'To Believe In This World, As It Is': Immanence and the Quest for Political Activism

Kathrin Thiele Utrecht University

Abstract

In *What is Philosophy?*, Deleuze and Guattari make the claim that '[i]t may be that believing in this world, in this life, becomes our most difficult task, or the task of a mode of existence still to be discovered on our plane of immanence today. This is the empiricist conversion.' What are we to make of such a calling? The paper explicates why and in what sense this statement is of exemplary significance both for an appropriate understanding of Deleuze's political thought and for a most timely conceptualisation of politics in a world so clearly defined by immanence, and nothing but immanence. I argue that Deleuze's rigorously constructive approach to the world is not beyond politics, as some recent readings have declared (e.g. those of Badiou and Hallward). Rather, we have to appreciate that in Deleuze and Guattari's demand for a 'belief in this world' the political intersects with the dimension of the ethical in such a way that our understanding of both is transformed. Only after this 'empiricist conversion' can we truly think of a Deleuzian politics that does justice to a plane of immanence 'immanent only to itself'.

Keywords: immanence, ethics, politics, transcendental empiricism, Badiou, Foucault, Spinoza

I. Deleuze and the Political

Writing on Deleuze and the question of politics does not really entail venturing into *terra incognita*. Given that so many founding thinkers

Deleuze Studies Volume 4: 2010 supplement: 28–45

www.eupjournals.com/dls

in the Deleuzian legacy have already engaged with this theme, the indebtedness of one's argument and thought to others is inevitably unending.[1] However, looking at the many recent publications in what is called 'theory' in general, and in the vicinity of a Deleuzian philosophical horizon in particular, the question of politics stands out again and calls for renewed attention. Regarding Deleuzian scholarship in particular, the question is how things stand with Deleuze and politics now – after a first global round of philosophical reception of his philosophy. Can we really envision and concretise a Deleuzian political activism, a becoming-active so badly needed in relation to today's political state of affairs? Is there really a 'Deleuzian Politics', and if so, what does it look like?

When so many are calling for new political solutions, the question concerning the becoming-active of philosophical thought is not just one question amongst others. Rather, in times like these it becomes a question touching on the very legitimacy of a philosophical thought as such, that is, it becomes *the* criterion for measuring how and in what ways it relates to the world we are currently living in, and – most of all – to the world 'we are about to change'. So when, in 2006, Peter Hallward concluded his book on Deleuze, *Out of This World: Deleuze and the Philosophy of Creation*, with the statement that '[f]ew philosophers have been as inspiring as Deleuze. But those of us who still seek to change our world and to empower its inhabitants will need to look for our inspirations elsewhere' (Hallward 2006: 164), he was expressing only what our current situation seems so utterly determined by: change – at whatever cost.

This slightly ironical remark – which, I hope, will serve its purpose in this article – should, however, not give the impression that I disagree with Hallward's urge to relate thought and life. The times really are what they are, and Deleuzian trajectories are both needed and asked for.[2] In considering how to respond to the question as to what kind of politics the Deleuzian universe suggests, there is at least one answer that can be ruled out immediately: if what is meant by politics involves an axiomatic of categorical prescriptions, then no, there is no 'Deleuzian Politics'; there is in Deleuze's thought neither a set programme nor recourse to prescription. While this may not seem to be such big news given the well-known turn towards micropolitics in Deleuze and Guattari, one has to put emphasis on this moment of saying 'no'. Right at the beginning of the argument to be presented here it is important to stress that what is truly political in Deleuze and Guattari has less to do with what they stood up for than with how they managed to turn away from, and thus radically expose, the ways in which the question of politics itself

is usually phrased.[3] In Deleuze and Guattari, politics is not discussed according to the kind of frameworks we are normally used to: neither normative or moral principles, nor a concern for justice, equality and freedom, nor any attempt to choose between or attempt to harmonise these conflicting categories, represents the frame in which they conceive of politics. Instead, in accordance with a very Spinozan *realism*,[4] the function of the term 'politics' in Deleuze and Guattari is, first of all, to stand in for the 'all there is' as such: politics – first of all – is nothing but the name of the force-relations, the milieu, and strata of everything that exists, the *always already yet never once and for all* territorialised regime,[5] the actualised plane of immanence which, however manifold in the virtual, only ever comes politically distributed. This is why Deleuze and Guattari, in *A Thousand Plateaus*, declare that 'politics precedes being', but also that, '[i]n short, everything is political, but every politics is simultaneously a *macropolitics* and a *micropolitics*' (Deleuze and Guattari 1987: 203, 213). From the affective structure of individual bodies to the structure of state-formations and beyond, everything is political in the sense that what 'there is' is a result of struggles between divergent forces, a result that shows greater or lesser stability and that can never definitively be fixed once and for all.[6]

This attitude towards politics comes very close to that of Michel Foucault, whose portrait as a political thinker likewise remains a contested one, and who also exemplifies this different approach, in particular in his lecture on 'Security, Territory, Population' at the *Collège de France* in 1978 (the famous course on biopolitics). There, Foucault explicitly presents his investigation as a philosophical inquiry, but that is an inquiry into 'the politics of truth', for, as he says, ' I do not see many other definitions of the word "philosophy" apart from this'. Since this is how he wants his undertaking to be understood, he rejects every sort of imperative discourse 'that consists in saying "love this, hate that, this is good, that is bad, be for this, beware for that"', and he most poignantly ends his enumeration with the following statement: 'So in all of this I will therefore propose only one imperative, but it will be categorical and unconditional: Never [do politics]' (Foucault 2009: 3–4).[7]

In framing my argument, however, with reference to this statement of Foucault's, am I not merely confirming Hallward's criticism of Deleuze, a criticism shared also by Alain Badiou who in his second opus magnum, *Logics of Worlds: Being and Event II*, states that 'Deleuze . . . came to tolerate the fact that most of his concepts were sucked up . . . by the *doxa* of the body, desire, affect, networks, the multitude, nomadism and enjoyment into which a whole contemporary "politics" sinks, as

if into a poor man's Spinozism' (Badiou 2009: 35)? Is it not true then that Deleuze's *philosophical* gesture, rather than helping 'to change our world', simply leads 'out of this world'? Of course, this is not the conclusion to be drawn here, and what I hope to achieve in what follows will involve elaborating and unfolding the above mentioned alternative approach to political thinking in Deleuze: a becoming-active of philosophy which, in its concern for practice, requires a becoming-active in this world.

II. 'To Believe In This World, As It Is': Deleuze's Practical Philosophy of Immanence

In the face of heightened political expectations in many of today's philosophical discourses, it is important to take a step back and investigate the concepts themselves, to identify where they are located in the thought at stake, and how they function within this thought. In making use of one of Deleuze and Guattari's most central statements – the ethico-political demand for 'a belief in this world' – I would like to explicate how their thought intervenes into this world *beyond* any oppositional staging of the political concern that, as it seems right now, too many theoretical debates believe to be the only truthful one.[8] In developing such a reading of politics, it is important to operate on different levels: First, we have to adequately understand the rigorous philosophical demand for an immanence immanent only to itself that is so fundamental to Deleuze's thought. His strong commitment to immanence and nothing but immanence already turns every ontological endeavour into a practical one, and that is into an endeavour driven by an *ethico-political* impetus. It is only when we have reached this Spinozan cross-over of ontology and ethics that we can move further and inquire into more concrete *political* directions.

First Formula of Immanence: Ontology = Ethics

In *What is Philosophy?*, Deleuze and Guattari give us a first version of the statement of 'belief in this world': 'It may be that believing in this world, in this life, becomes our most difficult task, or the task of a mode of existence still to be discovered on our plane of immanence today. This is the empiricist conversion' (Deleuze and Guattari 1994: 75). If we take the demand for a 'belief in this world' as Deleuze's formula for addressing the question of immanence in its full ethico-political potential, then we have to understand that this thought is

first of all announced as a 'task', even a 'most difficult task'. It is phrased as a radical shift, a turn away from what we are used to think, and think thought to be, and it is this that they call the 'empiricist conversion' – *conversio*, a turning, with a long philosophical heritage from St Augustine to the American philosopher Ralph Waldo Emerson.[9]

Earlier in *What is Philosophy?*, Deleuze and Guattari also say that 'the entire history of philosophy [can] be presented from the viewpoint of the instituting of a plane of immanence' (Deleuze and Guattari 1994: 44). Yet, they continue, even today '[i]mmanence can be said to be the burning issue of all philosophy' (45). And this is so because immanence 'takes on all the dangers that philosophy must confront, all the condemnations, persecutions, and repudiations that it undergoes' (45). This *difficult* heritage – we have to remember that Spinoza, their 'prince of philosophy' when it comes to immanence, was accused of the severest heresy – produces confusions, and instead of being thought in itself, i.e. as an immanence immanent only to itself, immanence in most of philosophy's history is related to something else that contains it: '[R]ather than this substance of Being or this image of thought being constituted by the plane of immanence itself, immanence will be related to something like a "dative," Matter or Mind' (44). Immanence is handed over to a *transcendent* frame, and the movement, the infinite movement that only a thought of pure immanence ('the empiricist conversion') enables the world to become, is stopped again. Movement and tendencies (to use a Bergsonian concept), or longitudes and latitudes (the Spinozan equivalent), in short 'the world' conceptualised immanently, is again brought to a halt and the dynamic plane of immanence is referred back to static verticality. Hence the claim: 'Whenever there is transcendence, vertical Being, imperial State in the sky or on earth, there is religion; and there is Philosophy whenever there is immanence' (43).

If immanence is the true business of philosophy – of a philosophy worthy of its name, finally 'mature enough' (Deleuze and Guattari 1994: 48) – and as such entails a truly *difficult* task, it would be wrong to assume that thinking immanence merely means substituting new terms, while the image of thought – that which thinking is believed to be – remains untouched. Most of the time, the transcendent – from its most commonsensical version as 'what everybody knows' to its most abstract a priori structure as universal law – is re-introduced into our ways of thinking. It is re-introduced both on the level of what is thought and on the level of what thought itself 'is'. What is not taken into account is that thinking immanence as immanent only to itself not only changes the linguistic registers of thought, but does something to the act

of thinking such thought itself. This is the essential 'active' dimension of Deleuze's and Guattari's claim 'to create' and 'to invent' concepts. Everything is affected in this turn, because '[i]mmanence is immanent only to itself and consequently captures everything, absorbs All-One, and leaves nothing remaining to which it could be immanent' (45).

It is necessary to dwell a little further on this. In order to grasp this change of register for thought itself – a change in both its terminological and its practical dimensions – the notion of empiricism as linked to the Deleuzian concept of 'belief' needs further explication. Here it is fruitful to come back to the specific 'American' atmosphere of Deleuze's thinking and in particular to William James' early description of pragmatism as a radical empiricism in which, as Deleuze writes in his essay on 'Bartleby, or the Formula', it 'was also necessary for the knowing subject, the sole proprietor, to give way to a community of explorers, the brothers of the archipelago, who replace knowledge with belief' (Deleuze 1997: 87). It is via such superior empiricism – to read James alongside Bergson – that the demand for a 'belief in this world', as a 'most difficult task' that also implies a different *practice* of thinking itself, is best captured.[10] Thinking the world differently, when 'belief in' replaces 'knowledge of' the world, *turns* the world from something given into something to be explored, always to be constructed and created, and this again not according to the measure of 'what is' but according to the measure of 'what this world is capable of'.[11] What such a thought implies – at the very heart of it – is an *ethos*, an active and affirmative attitude towards the world (how to construct otherwise?); and Deleuze, in the context of discussing American pragmatism, also names its ingredients: truth *and* trust, hope *and* confidence – 'not belief in another world, but confidence in this one, in man as much as in God' (Deleuze 1997: 87). Relating the ethico-political dimension thus to the ontological undertaking is what a rigorous thought of immanence generates and where – one could say in a most Emersonian way – it truly turns away and averts itself from the conventions of thought, so that not only what is thought (the world) becomes something else, but thought itself becomes . . . *a* world.

Second Formula of Immanence: 'A Belief In This World, As It Is'

Let us turn to a second version of Deleuze's demand for a belief in this world. This time the expression is taken from Deleuze's *Cinema 2: The Time-Image*, and it is brought forth in the following way:

> The link between man and the world is broken. Henceforth, this link must become an object of belief . . . Whether we are Christians or atheists, in our

> universal schizophrenia, *we need reasons to believe in this world*. It is a whole transformation of belief . . . to replace the model of knowledge with belief. But belief replaces knowledge only when it becomes belief in this world, as it is. (Deleuze 2000: 172)

In following my argument so far, a misunderstanding could sneak in that is important to avoid, and that – reading this version of the 'belief' statement closely – is addressed explicitly by Deleuze. While his notion of 'belief' can only ever be understood appropriately by linking it to a 'pragmatics'[12] such as I have shown above, Deleuze of course also sees the orienting framework of divine providence within this otherwise so *worldly* American tradition: a latent religiosity which, in the face of writers like Melville, Emerson and Thoreau, surely deserves an appropriate investigation in itself,[13] but which does not sufficiently transform the concept of belief in order to express what Deleuze is looking for, and thus cannot be taken as the endpoint of the discussion of belief.

Turning to the context of the discussion of 'belief in this world' in *Cinema 2*, we notice that Deleuze – although in a totally different thematic context – treats the problem of re-inscription of the transcendent into worldliness more thoroughly. The cited passage is taken from a discussion of the cinematographic significance of Roberto Rossellini and Jean-Luc Godard. Addressing again the turn from knowledge to belief, and in precisely the same manner as we saw in the first statement, Deleuze claims that Rossellini 'undoubtedly still retains the ideal of knowledge, he will never abandon this Socratic ideal'. For, '[w]hat made *Joan of Arc at the Stake* a misunderstood work? The fact that Joan of Arc needs to be in the sky to believe in the tatters of this world. It is from the height of eternity that she can believe in this world' (Deleuze 2000: 172). In contrast to any such transcendent height that safeguards the belief in this world, Godard's work stands alone in enduring an immanence immanent only to itself:

> In Godard the ideal of knowledge, the Socratic ideal which is still present in Rossellini, collapses: the 'good' discourse, of the militant, the revolutionary, the feminist, the philosopher, the film-maker, etc., gets no better treatment than the bad. Because the point is to discover and restore belief in the world, before or beyond words. (Deleuze 2000: 172)

The question of belief – of faith, hope and confidence – is, therefore, not as straightforward as it seems at first. We have already established that a rigorous thought of immanence captures everything and *leaves nothing* to which it could be immanent. Any undemanding belief in this world as harbinger of a better one – at which Deleuze hints with

his reference to 'the "good" discourse, of the militant, revolutionary, feminist, philosopher', in which the divisions between good and evil, right or wrong, have already been decided on – is not at all what is required. His claim of restoring 'belief in the world, before and beyond words' indicates that this notion of belief precisely does not mean an already established 'belief in'. Belief in the Deleuzian sense must be understood as a continuing motor, an activity for keeping the movement which creates . . . a world . . . becoming-other: no freezing and blocking but endless transformation. Only in this way is the doubling of belief in this second version, according to which 'belief replaces knowledge only when it becomes belief in this world, as it is', fully understandable. The addition to the formula of belief in this version – the 'as it is' – thus makes all the difference. It is not an expression of resignation or an ultimate acceptance of the most visible limits that determine this world, but the paradoxical formulation of the only movement that might lead to real transformation: Active affirmation of 'what is' in order to become inscribed in a dynamic process and thus re-acquire the potential to create something new!

As if the demand for a belief in *this* world is not already a difficult and ambivalent enough task, Deleuze asks for more. What is needed is a practice that in a most Nietzschean sense 'wills everything all over again' – a belief in this world, *as it is*. There is to be no other sphere, no better world, providing this one with a saving horizon – such would only set limits to this world (in regard to what it is capable of) and allow for an escape from the bloody here and now. But also no conceptual movement that misunderstands the 'all over again' as 'every time a new beginning'.[14] Rather, in this kind of belief, what is fundamental is the endless task of repeating and thereby deepening the condition of immanence: We cannot turn back the wheel and will always have to carry on and work from what has already happened.

The task thus always gets more difficult, and Deleuze shows his heritage as a Spinozan *realist* nowhere better than here: 'To believe in this world, as it is', as a thought of pure immanence, does not mean producing an affirmation of the world according to the ideality of 'what should be' – measuring the possible via the criterion of 'what is', and thus *limiting* this world from the very start. No, what is truly required is to produce an active affirmation in the face of every single result the world ever takes. Only this way is the becoming-active in and for this world truly never ending; only this way is it an infinite task,[15] in which mere affirmation of chance becomes *active affirmation*, and belief in this world – still harbouring the comfort of the transcendent (divine

providence, revolutionary axiomatic or a saving messianism) – becomes a 'belief in this world, as it is'. It is this most demanding *realist* undertaking that alone leaves open 'what the world is capable of'.[16]

However, given that this is such a difficult thought, and one so easily misread in political terms, it may be helpful to consider yet another context in which Deleuze emphasises the very same *realist* point. This is Foucault's *thought of the outside*, as it is treated in Deleuze's study *Foucault*, where, in reading the latter as a thinker of force-relations, not purely of the rigours of discourse analysis but most significantly of resistances too, Deleuze addresses the specific demand of immanence that concerns us here. When he discusses Foucault's early encounter with the Blanchotian 'thought from outside',[17] the seemingly all too *promising* notion of the outside is not to be understood as an outside beyond this world, a realm above or below which grounds it, thereby re-introducing transcendence. On the contrary, the outside is nothing but the other side, the literal outside of the formed strata: '[T]here is nothing lying beneath, above, or even outside the strata. The relations between forces, which are mobile, faint and diffuse, do not lie outside the strata but *form the outside of strata*' (Deleuze 1988: 84, my emphasis). Counter-intuitive at first but nonetheless most central, Deleuze and Foucault turn the thought of the outside from harbouring a promise of the *advent* of a better world – separated from the here and now – into the very *advent*urous process of the here and now itself, utterly *immanent* and *this-worldly*. No ticket to another world then, but only *negotiations* within this world, in the very middle of it, enable openings and niches which – at their best – escape and resist control.

Third Formula of Immanence: Negotiations

'The belief in this world, as it is' encapsulates the entirety of the complex thought of immanence which Deleuze pursues in all of his philosophical endeavours. His thought-universe is permeated structurally by this ethico-political dimension engaging with this world, and understanding itself as intervening therein. To demonstrate conceptually how the thought of an immanence immanent only to itself, rather than merely contemplating the world, *constructs* it in every move and gesture it makes, is to refute the argument according to which Deleuze's philosophy only leads us out of this world, with which it ultimately cannot be bothered. However, it would be a mistake to believe that this constitutes an effective response to those voices doubting the legitimacy of Deleuzian (and Foucauldian) thought for our world today. For much

more is at stake – and here we have to return to our initial starting point and discuss the 'critical arrow' Alain Badiou has fired at Deleuze.

It could be argued that Badiou and Deleuze share extraordinary similarities in terms of their urge to practise philosophy as a form of intervention into this world. In what follows, however, a third version of the Deleuzian belief in this world will be introduced and juxtaposed to a statement by Badiou, in a way that reveals just how far such similarities ultimately turn out to mark deep differences. What will be argued here is that rather than there being a myriad of similarities between Badiou and 'Badiouians' on the one hand and Deleuze and 'Deleuzians' on the other, there is in fact – certain parallels notwithstanding – a major rift between the two thought-universes, a rift that concerns precisely the claim of immanence, which as a starting point for philosophy proper seems to be shared by both thinkers. Likewise, contrary to what is normally claimed on the Badiouian side – that it is Deleuze's thought of immanence which harbours a 'latent religiosity' (Badiou 2008: 387) because of its supposed misconception of the 'event' as 'the fate of the One' (385) – in my view precisely the opposite must be argued. It is Badiou's misconceiving of the thought of multiplicity as a thought of the One, and thus his reification of the virtual into a One, that leads to his opting for the supposedly pure immanence of the multiples, which in turn, however, instead of allowing for a thinking of immanence immanent only to itself, hands it over to a second order, to something that only ever contains immanence.[18]

But we have to move slowly and explain in detail what is at stake here. For the purposes of the present comparison with Badiou, it is best to consider at first only the beginning of Deleuze's third version of the demand for a 'belief in this world'. This is found at the end of a conversation with Antonio Negri in 1990, where Deleuze repeats again what he believes the modern relation to the world to be: 'What we most lack is a belief in the world, we've quite lost the world, it's been taken from us' (Deleuze 1995: 176). If we now turn to look at the epigraph to Badiou's *Logics of Worlds*, we encounter the exact same diagnosis in regard to the worldly state of affairs. The epigraph – taken from André Malraux's *Antimémoires* – reads as follows: 'France's agony was not born of the flagging reasons to believe in her – defeat, demography, industry, etc. – but of the incapacity to believe in anything at all.' (Badiou 2008: 1).

The same beginning, then – but what follows? Let us turn to Deleuze and see how he proceeds. After having stated that '[w]hat we most lack is a belief in the world, we've quite lost the world, it's been taken from us', he continues: 'If you believe in the world you precipitate events,

however inconspicuous, that elude control, you engender new space-times, however small their surface or volume . . . Our ability to resist control, or our submission to it, has to be assessed at the level of our every move' (Deleuze 1995: 176). As we can see, in Deleuze's 'belief' there is no new collective imaginary (a One) from where and towards which our becoming-active is and ever will be legitimised; rather, the political impetus expressed here is no more, but also no less, than a most singular movement 'assessed at the level of our every move'. Only in this way is immanence not impeded, the world not blocked, such that everything becomes-transformed. Such active belief is apparently also nothing particularly grand. Most of the time – as the explications in this passage show – it is a very 'inconspicuous' and 'small' undertaking. It is thus to affirm and to become-active, but in a most moderate and indeed *negotiable* way. It is, as Gregg Lambert once described it:

> the affirmative principle . . . [that] can be understood as the most sobering response to this predicament: to believe in this world, as it is, neither in a transformed world, nor in another world, and to provide an image of thought that thoroughly belongs to this world which is ruled by the powers of the false; moreover to raise falsehood to a positive principle in the service of those who choose to live in this world and not in another. . . Restoring our connection to the world, but also assuming a constant vigilance over clichés and ready-made linkages. (Lambert 2002: 131)

A political horizon based on falsehood, negotiations and singular movements cannot but stand in opposition to Alain Badiou's rigid and truthful political vision. In Badiou's eyes it is precisely such 'contemporary *doxa*' (Badiou 2008: 2) that reduces the world to the political fallacies and lethargies of the majoritarian 'democratic materialism' in which 'the logic of the One' and, following from there, 'this sovereignty of the Two (bodies and languages)', rules, and to which he so strongly opposes a 'materialist dialectic' in whose formula the category of truth – although pluralised – reappears: '*There are only bodies and languages, except that there are truths*' (4).[19]

While it cannot but remain a matter of ongoing debate just how a Deleuzian point of view in regard to political action differs in kind from a Badiouian one,[20] one fact seems unambiguous: Badiou's claim to a renewed 'Politics of Truths', but also his harsh critique of all non-universal political formations from which he delimits a 'new universalism', underline the categorical differences at stake here.[21] While at first it seems to be a merely political dispute over the best or most appropriate strategy to adopt, what we are facing here is in fact more

fundamental, revealing a *principal* difference in regard to the question of how thought and practice are interrelated. To unfold this categorical difference will form the last step of the present argument.

III. Spinoza's Heritage

What has been shown so far is that according to Deleuze's philosophy thought is always already thought as practice. It is a *practice of actual construction*, whose significance shows itself in every instance. The 'ability to resist control' (inasmuch as the 'submission to it') is to be 'assessed at the level of our every move'. The construction and practice of this world is everything, for the world 'is' nothing but politics. In staging the political problem thus, giving *practice* preference over *truths*, Deleuze, rather than weakening his thought into 'a poor man's Spinozism', rigorously continues what a thought of immanence immanent only to itself ever demands.

To envision politics again as 'knowing', as a *prescriptive* 'Politics of Truths' striving for axiomatic principles (and thereby clearly opposing what Foucault meant when he defined philosophy as a 'politics of truth'), is both *conceptually* undermining of the thought of immanence and *practically* counter-productive. What cannot be avoided in this rectification of politics is the re-introduction of transcendent principles (universals, truths) that pre-determine the political terrain and thus stop movement, freeze the world, and become yet another variation of the kind of politics of which Foucault was so weary, that (political) business as usual which he rejects by postulating: 'Never do Politics!'

Instead, in a truly immanent thought, one that pursues this demand also into practice, the political question itself must change. Rather than a *credo* that is to be 'followed' it must become first a *question* of analysis (of that which 'is' the world – in *A Thousand Plateaus* Deleuze and Guattari call this an a-signifying semiotics) and second, on a more affective level, a *carrying forward of the movement of immanence*, that is 'a belief in this world, as it is' as the only condition for a different future. A becoming-active as political activism cannot be based on the – however rigorous – renewal and restoration of categories such as universalism and truth, which are to be followed with the same categorical fidelity that any knowing 'believing in' has always prescribed. To the contrary, 'belief in the world, as it is', according to Deleuze, must remain a fully immanent process of experimentation – an open-ended process that only ever constitutes itself parallel to what it experiences; an experimentation, however, that is to be understood in a most sober sense, a *negotiating*

from within. His epigraph to *Pourparlers* clarifies this:

> Philosophy isn't a Power. Religions, states, capitalism, science, the law, public opinion, and television are powers, but not philosophy. Philosophy may have its great internal battles (between idealism and realism, and so on), but they're mock battles. Not being a power, philosophy can't battle with the powers that be, but it fights a war without battles, a guerrilla campaign against them. And it can't converse with them, it's got nothing to tell them, nothing to communicate, and can only negotiate. Since the powers aren't just external things, but permeate each of us, philosophy throws us all into constant negotiations with, and a guerrilla campaign against, ourselves. (Deleuze 1995: epigraph)

If we let immanence capture everything, then every philosophical endeavour will be just as much entangled with politics in so far as the ethico-political is always already present in even the purest ontological undertaking. Rather than presupposing a descriptive ontological axiomatic from which a prescriptive politics follows, Deleuze claims that we have to *endure entanglements* if we are to claim to follow through a thought of immanence immanent only to itself. The political question today will not find an effective response without changing what it is that is being questioned. Foucault saw this in one of his interviews from 1984, when asked by Paul Rabinow what his own stand towards politics was:

> I have never tried to analyze anything whatsoever from the point of view of politics, but always to ask politics what it had to say about the problems with which it was confronted. I question it about the positions it takes and the reasons it gives for this; I don't ask it to determine the theory of what I do. I am neither an adversary nor a partisan of Marxism; I question it about what it has to say about experiences that ask questions of it. (Foucault 1997a: 115)

While Deleuze's thought puts more emphasis on potential resistances, the openings of lines of flight and of *escapes*,[22] he nonetheless follows this cautious Foucauldian line whenever he speaks of politics in the concrete, that is, in its *actuality*. The non-unifiable concept of the 'body without organs' illustrates this just as much as the deterritorialising series of 'becomings' developed in *A Thousand Plateaus*. Rather than judging such caution as revealing a weak approach to political actuality, it is up to us finally to learn that this indirect approach is precisely not an escape from the world but a rigorous transformation of the question of politics according to the practice of a thought that affirms its absolute immanence. Whoever we are, we need reasons to believe in this world. It is, however, important to realise fully the inexistence of any dative whatsoever that could contain this immanence. Instead of again referring to nameable truths, we have to learn to *turn* the question, and with it the

apparent political vacuum, into a practice that – at its best – confirms a belief in this world, as it is, wherein our ability to resist will be assessed on the level of our every move.

It is here that one last time we come up against the significant heritage of Spinoza. The Spinoza who not only is the prince of philosophy when it comes to the question of immanence but who is also the principal point of reference when it comes to both entangling and disentangling the questions of ontology, ethics and politics. And while both Badiou and Deleuze share this heritage, Spinoza at the same time represents the line of delimitation that must be drawn between them. For, whereas Deleuze values Spinoza's *affective realism* as fundamental to an understanding of the latter's metaphysical and political system, it is Spinoza's rigour in the *mathematisation of the world* that Badiou clearly favours (and where he ultimately also sees his limits). While it is much too early to jump to the conclusion that it is precisely because of these two different Spinozas that we find such different political agendas in the two philosophers – one prescriptive and the other, as I have called it, realistic – what can definitely be concluded at this moment is that it is because of Badiou's negligence of Spinoza's theory of affects that he must ultimately criticise and reject Spinoza as a metaphysical thinker who forecloses 'the void' – which, according to Badiou, alone represents the possibility 'of thinking multiplicity, on the one hand, and novelty, on the other' (Gillespie 2001: 63). The debate over the relation between the philosophical claim of immanence and the quest for political activism here reaches another level of sophistication that will require further analysis. My aim in this article was to reach this point. Right now, the quest to link immanence and politics unfolds in two diverging directions: either formalisation (Badiou) or actualisation (Deleuze); that is, radical fidelity to the axioms of truths and universality on the one hand and active experimentation with resistances and negotiations on the other.

Notes

1. I am especially indebted to Deleuzian scholars such as Braidotti, Grosz, Marrati and Patton who in regard to the question of politics not only illuminate Deleuze's thought but also push his thinking in fruitful new directions.
2. I have also developed this demand of philosophical thought as 'active thought' in my book *The Thought of Becoming: Gilles Deleuze's Poetics of Life* (Thiele 2008).
3. Interview with Catherine Clément, 'Entretien 1980', *L'Arc*, 49, cited in Patton 1984.
4. The reference to a 'Spinozan realism' will recur in this article. It is most clearly articulated in the famous beginning of Spinoza's *Tractatus Politicus*

(1677) in which the philosophical temptation to approach the subject matter in question (in Spinoza's case 'men') 'not as they are, but as they [the philosophers] themselves would like them to be' is rejected and a realist approach to 'what is' – 'not what is new and unheard of, but only such things as agree best with practice' – is taken as the only valid method for an effective conceptual investigation (Spinoza 1956: Introduction).

5. While the formula 'always already yet never once and for all' cannot rid itself completely from the Heideggerian 'always already' as it determines Heidegger's definition of *Dasein* as 'always already ahead of itself', here it rather stands for the attempt to bring to language the logic of repetition in difference that is the beginning (without beginning) of Deleuze's thought-practice as such: 'the repetition of an internal difference which it incorporates in each of its moments, and carries from one distinctive point to another' (Deleuze 1994: 20).
6. Cf. also Paul Patton: 'Nomadology certainly does not offer any political program, any more than did schizoanalysis. Nor does it offer any straightforward political morality, in the sense of imperatives addressed to subjects . . . the question is never simply one of good or bad, but of the specificity of each case . . . It is a matter of assessing the qualities present in a given situation or the true nature of a given process: is it a creative or a destructive line?' (Patton 1984: 79–80).
7. The French version says: 'Je ne proposerai donc en tout ceci qu'un seul impératif, mais celui-là sera catégorique et inconditionnel: ne faire jamais de politique' (Foucault 2004: 6). In the English edition of the lectures, the expression 'ne faire jamais de politique' is, however, translated as 'never engage in polemics' (cf. Foucault 2009: 4). While, considering the actual context, the translation seems possible, Foucault's having meant 'politics' is, of course, much more provocative than if he had merely stated – in a real philosophical manner – that one should not engage in polemics. Since for my purposes it is important to push Deleuze and Foucault as far as possible on this, I take the French 'politique' to translate as 'politics', no matter that, for example, in the interview 'Polemics, Politics, and Problematization' from 1984, the first question Paul Rabinow asks is the following: 'Why is it that you don't engage in polemics?' – an apparent repetition of Foucault's 1978 'categorical imperative'. See Foucault 1997a.
8. This 'beyond' must of course not be read in a Levinasian sense, in which it signifies a gesture towards (necessary) transcendence – absolute Otherness.
9. 'The virtue in most request is conformity. Self-reliance is its aversion', says Emerson in one of his most important essays (Emerson 1983: 261). Given Deleuze's many references to the Anglo-American tradition, its 'superiority' in what concerns literature (cf. Deleuze and Parnet 2002: 36–76), and the pervasive re-turn to an empiricist line of thought originating in William James' radical empiricism (cf. e.g. Deleuze 1997: 68–90, esp. pp. 88ff), reading the 'empiricist conversion' in such an 'American way' is not too far fetched.
10. For both the central notion of belief in James and his radical empiricism, cf. his famous essay 'The Will to Believe' (James 1956: 1–31), and his *Essays in Radical Empiricism* (James 2003).
11. 'What the world is capable of' is not merely another phrasing of the usual moral of 'what should be', as it can be found in most (post-Kantian) practical philosophy. The latter refers the 'what is' to something else – 'a dative' as Deleuze and Guattari say – and thus reintroduces the transcendent, while 'what the world is capable of' enacts the Spinozan credo of a logic of pure force-relations.
12. Deleuze and Guattari use this term to name their politico-philosophical undertaking in *A Thousand Plateaus*.

13. Cf. Branka Arsić's work on the American literary and philosophical tradition (Arsić 2007, 2010).
14. Such as, for example, Hannah Arendt would have it in a Augustinian heritage. Cf. her dissertation on St Augustine from 1929 (Arendt 1998).
15. For the characterisation of philosophical thought as an 'infinite task', cf. Gasché 2007, in which he also discusses Deleuze as 'Thinking Within Thought'. Cf. also his most recent study on *Europe, or The Infinite Task* (Gasché 2009).
16. Again, it is important to refer here directly to Spinoza's *Tractatus Politicus* which, read in conjunction with his *Ethics*, effectuates precisely such a construction: a most rigorous affirmation of 'what is', based on the premise that 'what is' is a measure of power and not essence, for 'no one has so far determined what the body can do'. For Spinoza's discussion of natural right in the *Political Treatise* cf. Spinoza 1956: ch. II; and with regard to his central statement from *The Ethics* see Spinoza 2000: EIIIP2 S.
17. On the thought of the outside, cf. Foucault 1997b.
18. For a more detailed discussion of the diverging lines of thought of Badiou and Deleuze in regard to 'immanence' and 'ontology', leading into a discussion of how to understand the different/ciation of virtual/actual in Deleuze, cf. Thiele 2008: especially part V, 164ff.
19. While in the argument developed here the categorical concept of 'truths' – reintroduced into the domain of both philosophy and politics by Badiou – is contested because of its conceptual shortcomings in the face of a political thought based on immanence, Badiou's extrapolation of the problem alongside Descartes' early 'intuition of the same order regarding the ontological status of truths' (Badiou 2008: 5) is a most fruitful discussion of how the concept of truth/s could be torn away from a far too reductive positivist category, to be thought as 'generic multiplicities' (6).
20. One of the clearest discussions of the differences between Badiou and Deleuze can be found in Sam Gillespie's *Mathematics of Novelty: Badiou's Minimalist Metaphysics* (Gillespie 2008). For the same cluster of questions, this time also in respect to their readings of Spinoza, cf. Gillespie 2001.
21. For Badiou's well-elaborated political thought in which the categories of truth(s) and universality play a most significant role, see especially Badiou 2003 and 2005.
22. This is what especially the feminist legacy in Deleuzian scholarship (Braidotti, David-Ménard, Grosz, Marrati, to name just a few) has most poignantly shown by engaging with the Deleuzian concepts of difference, immanence, nomadology and bodies. Instead of painting yet another grand picture of thought *beyond* different/ciation, theirs is the task of furthering and carrying forward this condition for a different future. To give just one example (from Elizabeth Grosz): '[F]eminist politics should, I believe, now consider the affirmation of a politics of *imperceptibility*, leaving its traces and effects everywhere but never being able to be identified with a person, group, or organization. It is not a politics of visibility, or recognition and of self-validation, but a process of self-marking that constitutes oneself in the very model of that which oppresses and opposes the subject' (Grosz 2005: 194).

The Common as Body Without Organs

Vidar Thorsteinsson Ohio State University

Abstract

The paper explores the relation of Michael Hardt and Antonio Negri's work to that of Deleuze and Guattari. The main focus is on Hardt and Negri's concept of 'the common' as developed in their most recent book *Commonwealth*. It is argued that the common can complement what Nicholas Thoburn terms the 'minor' characteristics of Deleuze's political thinking while also surpassing certain limitations posed by Hardt and Negri's own previous emphasis on 'autonomy-in-production'. With reference to Marx's notion of real subsumption and early workerism's social-factory thesis, the discussion circles around showing how a distinction between capital and the common can provide a basis for what Alberto Toscano calls 'antagonistic separation' from capital in a more effective way than can the classical capital–labour distinction. To this end, it is demonstrated how the common might benefit from being understood in light of Deleuze and Guattari's conceptual apparatus, with reference primarily to the 'body without organs' of *Anti-Oedipus*. It is argued that the common as body without organs, now understood as constituting its own 'social production' separate from the BwO of capital, can provide a new basis for antagonistic separation from capital. Of fundamental importance is how the common potentially invents a novel regime of qualitative valorisation, distinct from capital's limitation to quantity and scarcity.

Keywords: the common, body without organs, biopolitical production, Marxism, communism, value theory

It is well known that Michael Hardt and Antonio Negri's work owes much to the thought of Gilles Deleuze. Negri co-operated with Deleuze and Guattari during his exile in Paris; he wrote texts with Guattari and

Deleuze Studies Volume 4: 2010 supplement: 46–63

he shares with Deleuze a passion for Spinoza. Furthermore, Michael Hardt is the author of an introductory book on Deleuze's philosophical writings from the 1960s (Hardt 1993), and Hardt and Negri mention *A Thousand Plateaus* as one of the two 'models' for their book *Empire* (the other being Marx's *Capital*) (Hardt and Negri 2000: 415). While it is necessary to understand the relationship between these authors through their shared appreciation of philosophies of materialism and immanence, for example those of Marx and Spinoza, they also share to a large degree an understanding of certain developments in contemporary capitalism. Interesting comparisons can be made between Deleuze and Guattari's later, more explicitly social theory, as put forth in the *Capitalism and Schizophrenia* volumes, and Hardt and Negri's trilogy *Empire*, *Multitude* and *Commonwealth*. Here we will explore how Hardt and Negri's relatively newly developed concept of *the common* complements Deleuze and Guattari's political thought, while also demonstrating how it might benefit from being understood in light of Deleuze and Guattari's terminology, and in particular their concept of the 'body without organs' (BwO), as it appears in *Anti-Oedipus*.[1]

Hardt and Negri claim to rely heavily on 'the excellent commentaries of Gilles Deleuze' on the passage from disciplinary society to the society of control in Foucault's work (cf. Hardt and Negri 2000: 22–3, 419). Deleuze interpreted Foucault as having implicitly analysed the arrival of post-industrial *societies of control*, where the disciplinary capitalism of the factory is replaced by more fluid forms of control characterised by a regulation of space that is open, and dependent on internally motivated cooperation of its subjects (Deleuze 1992). This corresponds in many ways to Hardt and Negri's description of advanced capitalistic societies where older, Fordist modes of production have been replaced by more flexible, immaterial and 'feminised' ones (Hardt and Negri 2009: 131–5). Hardt and Negri maintain that since the 1970s a new technical composition of labour has begun to dominate in what they term 'biopolitical production'. Simultaneously, Foucauldian biopower completes a process in which the inner, subjective life of the worker has been fully subsumed under capital, turning the worker into both the subject and object of work.

Michael Hardt, however, 'both adopts and inverts Michel Foucault's usage' of the term biopower, in a manner that emphasises not only its oppressive aspect but also its liberating potentials (see Hardt 1999: 90, 98–9). In this, Hardt and Negri build upon similar approaches already developed to some extent by the Italian workerists' thesis of the 'social factory'. This thesis is based on passages in Marx's *Grundrisse*

and *Capital* relating to 'real subsumption' and the 'general intellect'.[2] Marx's notion of the general intellect indicates 'to what degree general social knowledge has become a direct force of production' (Marx 1973: 706), general social knowledge here referring to, for example, the level of education, technical skills and other immaterial assets that are required for workers and machines to fulfil their function. Real subsumption refers to the stage in capitalist development when capital has increased 'the value of its operations to the point where it assumes social dimensions', in which 'the immediate purpose of production is to produce *as much surplus value as possible*' (Marx 1976: 1035, 1037). That is, all of society's productive powers have in actuality been directed towards maximisation of surplus value and capitalist social relations entirely subsume and transform the labour process.

The social-factory thesis, of which Negri was one of the main proponents in 1970s Italy, consequently argues that class composition has to be understood not solely in terms of factory-workers versus capital owners, but as a more extensive system containing also unwaged labour, women's work inside the household, students, the unemployed, etc. Surplus-producing labour, then, comes to be seen as not confined to the interior of the factory, but as dispersed throughout society as a whole.[3]

I. Dilemmas of Autonomy

What these descriptions of the developments of contemporary capitalism have in common – regardless of whether we call them societies of control, the social factory, biopolitical production, or the capitalism of real subsumption – is a notion of the *immanence* of capitalist productive relations to all of social life. Capitalism is no longer an objective structure to which subjects can oppose themselves, because even subjectivity is already moulded and produced by capital: labour and capital – defined by Marx as 'variable' and 'fixed' capital (Marx 1976: 317) – tend to become one. The emphasis on this aspect of Marxism in workerist thought is well explained by Nicholas Thoburn in his discussion of Raniero Panzieri. Panzieri argued that capitalistic productive *relations* (that is, the social structure of capitalism) could not be distinguished from capitalistic productive *forces* (that is, labour and its subjective and social composition): 'The *forces* of production thus had capitalist *relations* immanent to them in a "unity of 'technical' and 'despotic' moments" ' (Thoburn 2003: 77, quoting Panzieri). This resonates perfectly with Foucault and Deleuze's poststructuralist

account of power as immanently constitutive of social structures rather than as neutral to them, and even more so with Deleuze and Guattari's schizoanalysis where there is no distinction in nature between desiring-production and social-production but only in regime (Deleuze and Guattari 1983: 31). Hence, it is difficult to imagine an 'outside' to productive relations, and it becomes hard to see what physical or mental activity is not already social or immaterial labour. Hardt and Negri phrase it thus:

> the capitalist market is one machine that has always run counter to any division between inside and outside. It is thwarted by barriers and exclusions; it thrives instead by including always more within its sphere. ... In its ideal form there is no outside to the world market: the entire globe is its domain. (Hardt and Negri 2000: 190, see also 413)

In real subsumption, there is no outside to neither capital nor market; 'work is always already capital' (Thoburn 2003: 109), and labour loses its autonomy as it emerges structured by capital. Despite the problematic created by labour and capital becoming increasingly indistinguishable, Hardt and Negri have remained remarkably faithful to Italian workerism's 'reversal of perspective'. Mindful of how the *operaismo* and *autonomia* movements of the Italian 1960s and '70s were able to reverse the dominant perspective on labour towards viewing it as the site of political energy and resistance, Hardt and Negri see biopolitical production as not only exploitative and oppressive. In work, there remains the potential for autonomous productive organisation that could serve the needs of workers in a supposedly communist manner – even if work has undergone significant transformations with the decline of Fordism. Simultaneously, they have continued to emphasise resistance as ontologically prior to the powers of state and capital (Hardt and Negri 2005: 64). In fact, they maintain that the global emergence of Empire is not only the result of capital's own dynamics of expansion but a reaction to working-class struggles in the occident, national liberation struggles in the global south, and state socialism (Negri and Dufourmantelle 2004: 60). Hardt and Negri emphasise that any separation from or refusal of capital must – paradoxically, as it were – be socially and economically grounded in capitalistic productive relations and in fact they state that *any* 'theoretical effort in this context to pose the autonomy of the political, separate from the social and the economic, no longer makes any sense' (Hardt and Negri 2005: 78).

The major theme of Hardt and Negri's research, at least since the publication of *Empire*, has been to grapple with the challenge of how

it would be possible to radically oppose capital while not introducing any ideological separation from it that would entail betraying the tenets of a materialist philosophy of immanence; an opposition that would make sense despite the pervasiveness of social and biopolitical production. This attempt can be traced further back to the workerist notion of the *operaio sociale* or 'socialised worker', originally developed by Negri (Wright 2002: 171–5). An attempt to formulate the socialised worker's opposition to capital is contained in the notion of 'autonomy-in-production', which tries to formulate an antagonistic autonomy from capital.[4] This autonomy is not gained by negating an increasingly cognitive and subjectively internalised labour-process, but by affirmation of workers' power and productivity along the militant lines of a workerist reversal of perspective.

Some critics, however, have argued that Hardt and Negri's notion of autonomy-in-production is untenable. Thoburn is one such critic, agreeing in his book *Deleuze, Marx and Politics* that certain '[n]ew aspects of social productivity might escape for a little while' (Thoburn 2003: 98) and could indeed become the 'driving force of production', but nevertheless insisting that such a situation could really only develop in 'disciplinary space', not in contemporary spaces of biopolitical control. Thoburn phrases his argument thus:

> Indeed the capitalist socius has many little lines of flight, even autonomous zones where creation is allowed to operate outside of capitalist relations of productivity . . . before they are generalized as a new productive activity; but such spaces (or lines of flight) enrich rather than contradict capital. (Thoburn 2003: 98)

Thoburn goes on to point out that Negri's image of the autonomous, socialised worker of the Italian 1970s – which later mutates into the *multitude* of Hardt and Negri's eponymous book – has a tendency to exceed Deleuze and Guattari's political horizon, especially in terms of what Thoburn calls the latter's 'minor' characteristics. Thoburn quotes Guattari as claiming that even though there are interesting ways in which new productive forces contain liberating potentials, 'capital still operates as the universal plane' of these forces (Thoburn 2003: 98). And Deleuze, we should recall, gives a similar kind of warning in his 'Postscript on the Societies of Control', speaking of how the new and seemingly more flexible spaces of late capitalism 'could at first express new freedom, but . . . could participate as well in mechanisms of control that are equal to the harshest of confinements' (Deleuze 1992: 4). For Deleuze and Guattari, this position will only offer modest opportunities

for resistance, which Thoburn designates with the terms 'cramped' and 'minor', implying that radical politics must be 'premised on cramped, impossible, minority positions where social forces constrain movements' (Thoburn 2003: 90). If this is the case, then it seems indeed like Hardt and Negri's notion of autonomy-in-production as an effective strategy against and beyond capital is mistaken, or worse, a self-delusion. This dilemma is well put by Alberto Toscano in a recent essay:

> The challenge today is to think an antagonism that would not be entirely detached from the conditions of production and reproduction of contemporary capitalism. The mere positing of duality, say between Empire and multitude, without the conflictual *composition* that can provide this duality with a certain degree of determinateness, can arguably be seen to generate a seemingly heroic, but ultimately ineffectual horizon for theoretical analysis and political militancy. (Toscano 2009: 127)

What a truly radical autonomy from capital requires, again in Toscano's words, is the 'twin affirmation of an integral *immanence* of capitalist relations to the social (of a thoroughgoing *socialisation* of production) and of the radicalisation of the antagonism between capital and labour' (Toscano 2009: 111). Such an antagonism would amount to perceiving 'communism as separation' (110) from the social fabric that simultaneously sustains its immanent foundation.

II. Bodies of Disjunction

Taking the cue from Toscano's twofold challenge, I think it may be convincingly argued that Hardt and Negri's notion of autonomy-in-production already fulfils the demand of being sufficiently rooted in the production and reproduction of capital – in fact, most of Hardt and Negri's critics maintain that their theory is *too* immersed in these; too immanent, as it were.[5] Therefore, it seems like the question of whether 'autonomy-in-production' entails sufficient antagonism between capital and labour is the more pertinent one.

Hardt and Negri's latest work, *Commonwealth*, is perhaps their most innovative attempt at the formulation of just such an immanent antagonism. However, it does not consist of an antagonism between *capital and labour* in the classical sense. What Hardt and Negri are proposing is an antagonism of a new kind: the antagonism between *capital and the common*. This juxtaposition, I argue, is Hardt and Negri's attempt at giving autonomy-in-production the necessary foundations to overcome a 'seemingly heroic' posture eventually

generalised by the plane of capital, but also at resolving the dilemmas that the social-factory thesis inevitably creates by its fusing of labour and capital. This could, then, also allow Hardt and Negri to exceed the cramped and impossible space of Deleuze and Guattari's minor politics in a more successful way than before, when simple autonomy-in-production was lacking the notion of the common. In fact, Negri has stated that the common is his main point of divergence from Deleuze and Guattari. In a recent volume, Negri puts it clearly: '*the common* constitutes indeed the crucial element differentiating my theorization . . . from Deleuze and Guattari's theorization' (Negri and Casarino 2008: 118).

What is the common then, and how does it attain antagonistic autonomy while being at the same time grounded in the productive relations of actually existing capitalism? How does it remain faithful to Deleuze and Guattari's philosophy of immanence while also subverting capital in an antagonistic manner? What kind of phenomenon is it? In answering these questions I take advantage of the fact that the exact ontological status of the common still remains fairly fluid and open in Hardt and Negri's writings. Even though Negri grants that 'the common in the end is that which differentiates most [his] thought from Deleuze and Guattari's thought' (Negri and Casarino 2008: 120), I would like to suggest an interpretation of the common which relies heavily on a key concept from Deleuze and Guattari's work. I will try to demonstrate that the common is in fact a 'body without organs', albeit of a kind that is not anticipated in concrete terms in the two volumes of *Capitalism and Schizophrenia* where the concept is developed. This will demonstrate that while Hardt and Negri develop a 'major' politics as opposed to Deleuze and Guattari's minor politics, their thinking continues to be lucidly interpretable in light of a Deleuzo-Guattarian conceptual apparatus.

In Deleuze and Guattari's presentation, different bodies without organs (BwOs) pertain to different regimes or relations of production, different 'abstract machines' corresponding to the productive machinery and organisation characterising a particular mode of production. This applies to production in the universal sense developed in *Anti-Oedipus*, regardless of the split between desiring-production and social-production characteristic of capitalism. In *Anti-Oedipus*, the BwO is most prominent in Deleuze and Guattari's discussion of psychoanalysis and desiring-production, and less so in their treatment of capitalism and social-production, where the 'full body' of the socius comes to the fore. Hence it might seem more appropriate to discuss a given social

regime – despotism, capitalism or, as I will attempt, the common – as a socius or full body. The benefit of sticking with the conceptual tool of the BwO, however, is that it provides us with a level of abstraction that is suitable for the discussion of an as-yet unrealised social formation. This is in no way an illegitimate use of the concept, for the difference between social-production and desiring-production is not a difference in nature but only in regime, as already noted (Deleuze and Guattari 1983: 31).

According to the description in *Anti-Oedipus*, the BwO is linked to 'a full body that functions as a socius' but is distinct from the historically separate social formations designated by different sociuses as its more general, universal condition. This socius may be the 'body of the earth' (savagery), the body of the tyrant (despotism), or the body of capital (Deleuze and Guattari 1983: 10). Deleuze and Guattari claim that the 'body without organs belongs to the realm of antiproduction' and that it 'couples production with ... an element of antiproduction' (8). This antiproductive element of organisation and selection is required for a specific desiring-machine to sustain its production; this is its BwO. Its function is, specifically, to add the *disjunctive synthesis* of recording, selection and differentiation to what would otherwise remain a directionless and accumulative desiring-production invested through the *connective synthesis*.[6] With some degree of simplification, we can say that the disjunctive synthesis of selection and recording performed by the BwO corresponds to Marx's *relations of production*, while the more primal connective synthesis of undifferentiated accumulation is characteristic of the *forces of production*.

Despite the abstractness of the concept of the BwO, we can now see how it underlies the relations that define actual social regimes. The BwO of capital has certain characteristics that serve to distinguish the socius of capital from the other social bodies. Speaking of older social forms, Deleuze and Guattari write that '[t]he prime function incumbent upon the socius has always been to codify the flows of desire, to inscribe them, to record them, to see to it that no flow exists that is not properly dammed up, channelled, regulated' (Deleuze and Guattari 1983: 33). This description would, presumably, apply to rigid social structures such as despotism. But 'the *capitalist machine* ... finds itself in a totally new situation: it is faced with the task of decoding and deterritorializing the flows' (33). Capitalist relations of production, then, rely on a particular kind of BwO that manages or subsumes desiring-production without directly controlling it, that is, it functions by decoding and releasing flows on its surface rather than restraining them. The encounter of decoded flows of money-capital and the decoded

flows of labour, according to Deleuze and Guattari, is essentially what gives rise to capitalism, meaning that the task of the capitalist BwO is not to code or recode but to decode: 'Capitalism is in fact born of the encounter of two sorts of flows: the decoded flows of production in the form of money-capital, and the decoded flows of labor in the form of the "free worker" ' (33). This decoding is the essential, defining feature of capital – its 'very fabric of existence'– and the role of the surface of its BwO is primarily to 'register' these flows by the means of axiomatisation. And in the case of capital, this axiomatisation takes the simple form of money rather than the semiotic code characteristic of savagery and despotism: 'unlike previous social machines, the capitalist machine is incapable of providing a code that will apply to the whole of the social field. By substituting money for the very notion of a code, it has created an axiomatic of abstract quantities' (33). Money, according to Marx, is the 'universal or social equivalent' forming an 'independent presence of exchange value' (Marx 1976: 183, 235) which under real subsumption is capable of investing the whole social field.

This axiomatic, of course, is Marx's general formula for capital of M-C-M′ (Marx 1976: 247–57). One important consequence of this axiomatic of the capitalist BwO is that it moves 'further and further in the direction of the deterritorialization of the socius' (Deleuze and Guattari 1983: 33) – that is, to be able to create surplus value (the difference between M and M′), the axiomatic demands a constant cycle of investment and reinvestment which knows no limits and will for that reason ultimately pose problems for capital. 'Value therefore now becomes value in process, money in process, and, as such, capital' (Marx 1976: 256), capital which is bound to an everlasting search for surplus value and will stop at nothing. Deleuze and Guattari phrase it thus: 'Capitalism tends toward a threshold of decoding that will destroy the socius in order to make it a body without organs and unleash the flows of desire on this body as a deterritorialized field' (Deleuze and Guattari 1983: 33).

Deleuze and Guattari go on to describe how the BwO of capital serves to continuously repress and destroy the socius, while simultaneously injecting it with its vast productive energies. In this manner, capitalism is always acting against limits that are its own creation: 'capitalism constantly counteracts, constantly inhibits this inherent tendency while at the same time allowing it free rein; it continually seeks to avoid reaching its limit while simultaneously tending toward that limit' (Deleuze and Guattari 1983: 34, see also 303, 320). So, on the one hand, there is an abstract socius which serves as capital's 'fundamental

raw material' which capital 'does not confront . . . from the outside' (33) but immanently, and on the other hand, the BwO of capital which is in charge of registering the flows on its surface, that is, the exchange of commodities and labour – thereby forming the basis of the quantitative axiomatic of value that expresses the ultimate productive relation of capital, Marx's M-C-M′. Hence the BwO of capital expresses the characteristics of capital in a twofold way as a *relation of production* and also as a corresponding *mode of valorisation*, requiring a special kind of value-theory as will be discussed in more detail below.

III. Social-production of the Common

Let us briefly observe how Hardt and Negri define the common in *Commonwealth*:

> By 'the common' we mean, first of all, the common wealth of the material world – the air, the water, the fruits of the soil, and all nature's bounty . . . *We consider the common also and more significantly those results of social production that are necessary for social interaction and further production, such as knowledges, languages, codes, information, affects, and so forth.* (Hardt and Negri 2009: viii; emphasis added)

This emphasis on the common as social production and reproduction suggests that for Hardt and Negri the common indeed designates a social relation, a relation of production. Hardt and Negri – even before *Commonwealth* – have repeatedly emphasised the *social* nature of what is produced in biopolitical production, making frequent use of the term *social production*. In *Commonwealth*, Hardt and Negri claim that the arrival of biopolitical production poses 'significant challenges to traditional concepts and methods of political economy in large part because biopolitical production shifts the economic center of gravity from the production of material commodities to that of social relations, confusing, as we said, the division between production and reproduction' (Hardt and Negri 2009: 135). They thus echo Deleuze and Guattari's use of the term 'social production', which is a major constitutive element in how Deleuze and Guattari see productive and social relations as being immanently 'produced' themselves, that is, the BwO of a certain socius is a *product* of a particular kind. The BwO, in other words, is the product of social production whereas the flows it registers are the products of desiring-production. Hardt and Negri speak of the 'biopolitical economic growth' of the common as 'a process of social composition' (284), that is, as a production of the socius.

The fundamental difference between Hardt and Negri's social production in relation to the BwO of capital, and Deleuze and Guattari's, is that for the latter this social production is not pictured otherwise than as the social production of that same body of capital. Desiring-production on the BwO of capital may seek and create lines of flights, but social production is always exclusively an extension of capital's BwO.[7] Hence, even though Deleuze and Guattari picture BwOs as corresponding to modes of production (savagery, despotism and capitalism, respectively), they articulate neither how one such BwO comes to succeed another nor how the BwO of capital could be transformed.

For Hardt and Negri, conversely, the social production taking place in capitalism does not exclusively contribute to the perpetuation of capital's own BwO: it is producing a new social body, the body of the common. The common, as Hardt and Negri state clearly, is a new mode of production, socially produced by the existing body of capital: 'Every mode of production, capital included, at first powerfully expands productive forces but eventually holds them back, thereby generating the foundations of the next mode of production' (Hardt and Negri 2009: 298), that 'next mode' clearly involving the common. Hence, the 'counteracted tendencies' of contemporary biopolitical capital are not merely internal to it, but are constituted by the presence of two heterogeneous and conflicting social elements: capital and the common.

A useful way of distinguishing between the biopolitical production of capital and the biopolitical production of the common, then, is to view capital and the common as separate bodies, even though the latter emerges from the former by means of immanent social production. '[T]he biopolitical process', Hardt and Negri write, 'is not limited to the reproduction of capital as a social relation' – that is, it is not entirely limited to the social production or reproduction of the BwO of capital as it seems to be on Deleuze and Guattari's account – 'but also presents the potential for an autonomous process that could destroy capital and create something entirely new' (Hardt and Negri 2009: 136). Biopolitical, social (re)production begins to introduce its own, separate, BwO, the BwO of the common.

The common thus attempts to give new foundations to 'autonomy' under real subsumption: it is an economic regime that radically subverts and distinguishes itself from capital's BwO while simultaneously remaining 'immanent' to it. Capital is increasingly dependent on the common as its source of wealth, and hence the common is 'immanent' to biopolitical production in capital even as these are two distinct bodies.

IV. Opposed Regimes of Value

There are many ways to picture the juxtaposition of the common with capital and how it might successfully replace the conceptually and practically untenable distinction between capital and labour. I argue that its most explosive aspect, however, is contained in the incompatible modes of valorisation intrinsic to the respective bodies of the common and capital. The *actual relationship* between the two bodies as they currently exist, in Hardt and Negri's description, is such that while the common forms the body of autonomously organised biopolitical production, capital forms the exploitative body which hovers over it – having to invent novel ways of extracting surplus value from it. These ways of exploitation are part new and part old. They are old in the sense that they involve a recourse to what Marx termed 'primitive accumulation': 'And insofar as today's neoliberal economy increasingly favors accumulation through expropriation of the common, the concept of primitive accumulation becomes an even more central analytical tool' (Hardt and Negri 2000: 138). But they are new in the sense that they account for the growing hegemony of the most advanced form of capital, finance capital: 'The key for finance is that it remains external to the production process. It does not attempt to organize social labor-power or dictate how it is to cooperate. It grants biopolitical production its autonomy and manages nonetheless to extract wealth from it at a distance' (289). Postmodern, financialised capital, then, depends on and exploits the common in a way that is different from Fordist capitalist management. We have already seen how the exploiter (capital) and the exploited (the common) have acquired two distinct BwOs, which form essentially different productive regimes. This means that exploitation – the extraction of surplus value – has to adapt itself to this reality with a fitting mode of valorisation. The BwO of capital that Deleuze and Guattari describe in *Anti-Oedipus* involves some characteristics that can be directly related to the new mode of valorisation that is a fundamental and novel part of Hardt and Negri's theory of the common. Deleuze and Guattari write that the BwO of capital

> will give to the sterility of money the form whereby money produces money. It produces surplus value… It makes the machine responsible for producing a relative surplus value, while embodying itself in the machine as fixed capital [i.e. machinery]. Machines and agents cling so closely to capital that their very functioning appears to be miraculated by it. (Deleuze and Guattari 1983: 10–11)

Here, Deleuze and Guattari are of course dealing with the riddle of how money seems able to generate more money – a capacity for limitless multiplication that the common and finance capital actually seem to share. Interestingly, Deleuze and Guattari seem inclined to solve this riddle by referring to the classical Marxist distinction between labour and capital, quoting Marx's discussion in the third volume of *Capital* of how the 'productive powers and the social interrelations of labour time… seem transferred from labour to capital' (Deleuze and Guattari 1983: 11). Deleuze and Guattari seem content to describe capitalist valorisation as completely explainable by the labour–capital distinction, speaking of the 'apparent objective moment' (11) of money begetting more money as 'fetishistic' and 'miraculated' – always requiring the input of abstract labour, the cornerstone of Marx's theory of value.

At other points, however – and much more in line with the real subsumption thesis, whereby labour becomes increasingly indistinguishable from capital and hence unable to account on its own for the creation of value – Deleuze and Guattari seem to be advancing a more complex theory of how surplus value would actually be created on the BwO of capital. Indeed, as Thoburn points out, Deleuze and Guattari maintain that capitalism depends less on the quantitative extraction of surplus value via exploitation of labour and more on a 'complex *qualitative* process' (Deleuze and Guattari 2004: 543), although this process remains largely unexplained. This kind of surplus value cannot be accounted for by hypothetical allocation of socially necessary labour time and would require a whole new theory of value. Such a theory, Thoburn argues with reference to Guattari's work, would have to conceptualise what Guattari calls *machinic surplus value* as 'based on qualitative intensity and variation of work' (Thoburn 2003: 97). However, Deleuze and Guattari's emergent value-theory of qualities remains ambiguous as to how machinic surplus value is really created, and does not detach itself fully from the classical Marxist notion that such an 'abstract-machinic' or 'social' surplus value would have to be understood as somehow untenable, fetishistic or miraculated.

A theory of qualitative value, however, is unequivocally demanded by Hardt and Negri in *Commonwealth*. They seem to argue that such a new theory of value could not truthfully apply to capital, which on their thesis is always and inevitably 'constrained by the logic of scarcity' (Hardt and Negri 2009: 283). The biopolitical cycle, on the other hand, has 'to be understood now in relation to the *qualities* of the common' (284). These qualities are not translatable onto the surface of the BwO of capital and this incommensurability is demonstrated by the

fact that 'when capital accumulates the common and makes it private, its productivity is blocked or lessened' (288). Here we see an emerging juxtaposition of two modes of valorisation, corresponding to the two different modes of production: the quantitative logic of scarcity that is a by-product of capital, and the qualitative logic of excess and growth that belongs to the common.

On the body without organs of the common, the apparatuses of capture of the capitalist BwO appear as fetters and limitations to productivity, perhaps akin to the elements that 'botch' the BwO as described in *A Thousand Plateaus* (Deleuze and Guattari 2004: 166). Hardt and Negri give an outline of a new theory of value that could account for these problems:

> The critique of political economy, too, including the Marxist tradition, has generally focused on measurement and quantitative methods to understand surplus value and exploitation. Biopolitical products, however, tend to *exceed* all quantitative measurement and take *common form*, which are easily shared and difficult to corral as private property. (Hardt and Negri 2009: 135–6)

Subsequently, Hardt and Negri draw a comparison with the standard numerical columns of debit and credit in conventional quantitative economy, and move on to pose the question thus: 'How can one create an economic table filled with qualities?' (Hardt and Negri 2009: 287). Although this question remains an open one in *Commonwealth*, I suggest that we interpret it as opening towards a solution of Deleuze and Guattari's problematic notion of machinic surplus value. It seems that the BwO of capital is actually not capable of any valorisation other than of the quantitative kind. This, then, would be a description commensurable with both Marx's *and* Deleuze and Guattari's analysis of capital as a quantitative axiomatic in which exchange value (quantitative by nature) fully dominates. The features that seem to contradict this – that is, abstract-machinic surplus value, qualitative social production, the production of subjectivities and so forth – can now be understood as part of biopolitical production, not properly belonging to the BwO of capital, but to the BwO of the common. This machinic surplus value might of course still *appear* as 'miraculated' on the BwO of capital, but only if we fail to perceive that it is in fact created (*not* miraculated) on another BwO: the BwO of the common.

V. A Common Program

Let us now readdress Toscano's challenge: to 'think an antagonism' closely related to 'the conditions of production and reproduction of

contemporary capitalism' while holding 'a certain degree of determinateness' (Toscano 2009: 127). What the common brings together and clarifies are two aspects of biopolitical production: First, social production, which is now understood as the social production of the common as a new relation of production, or a new BwO. Thus, social forces do not necessarily constrain the movements of the multitude, as Thoburn argues with reference to Deleuze and Guattari (Thoburn 2003: 90); rather, the multitude produces its own socius because the 'surplus' of social production under biopolitical capitalism is, of course, also social in nature: it is the common. Second, the common seems to provide us with a new kind of BwO on which it would be possible to theoretically account for the creation of qualitative machinic surplus value – social in nature, which could be called 'abstract-machinic surplus value'. On the BwO of the common, such a social surplus value would neither have to be seen as 'miraculated' or fetishised as Deleuze and Guattari would have it, nor as requiring a recourse to a pre-biopolitical labour-theory of value which makes an untenable distinction between labour and capital.[8]

Eugene W. Holland writes that considerations of the 'different relations of production' that could potentially free difference (meaning surplus value) from capitalist axiomatisation – such as the productive relations here ascribed to the common – 'already point well beyond any capitalist horizons, about which Deleuze and Guattari are not inclined to say very much at all' (Holland 1997: 531). The common certainly points beyond these horizons, and, primarily because of the novel ways in which value can be created by and within the common, arguably does so better than Hardt and Negri's previous concept of autonomy-in-production. The merit, hence, of introducing what I am here calling *the BwO of the common* is that it links the notion of the common to Deleuze and Guattari's insightful analysis of capitalist valorisation and social production, while also transcending their silent or 'minor' horizon. It articulates a dimension of conflict with capital that reaches a truly 'social' level; immanent to the social field, yet extending beyond the cramped and minor position Deleuze and Guattari limit themselves to.

It falls outside the scope of this essay to describe what concrete forms the antagonism between capital and the common might take in future social struggles. Let it suffice to mention two practical advantages offered by insisting on the capital–common distinction: First, the common is a very apt tool for analysis of the evolving and complex dynamics of post-Fordist capitalism, especially as they relate to immaterial labour and production, direct exploitation, financialisation, and debates over intellectual property. Thus, the common contributes

significantly to a Jamesonian 'cognitive mapping' of the apparent mysteries of postmodern capitalism. Second, the common offers a framework for political activism that is grounded in the economic contradictions of the current social order. Such a framework does not limit itself to, say, minor lines of flight, voluntarism, racial and gender identity politics, communicative action or antagonism within social discourse, to name only a few examples of the modest terrains marked out by leftist theory over the last decades. The common offers an opportunity to revisit the old Marxist insistence on the social embeddedness of any radical ideology; communism not only as an idea but also as a movement springing from within the social body.

Perhaps unexpectedly for a consistent critic of Hardt, Negri and poststructuralist tendencies within Marxism in general, Slavoj Žižek has in fact emphasised the importance of Hardt and Negri's concept of the common for the first three of what he calls the four 'possible antagonisms' contained in contemporary capitalism: ecological catastrophe, intellectual property, biogenetics and social exclusion (Žižek 2009: 53). Even though Žižek implies mistakenly that the fourth antagonism does not fall within the domain of the common, his acceptance of the common as a designator for the revolutionary challenges of the near future indicates that the common–capital distinction could become the basis of a communist programme extending well beyond the scope of Hardt and Negri's current readership.[9]

Notes

1. It falls outside the scope of this paper to fully examine the variations of the concept of the BwO through Deleuze's *The Logic of Sense* and his and Guattari's *A Thousand Plateaus*. See, however, note 7.
2. Marx discusses real subsumption (as opposed to formal subsumption) in his appendix to *Capital Volume I* (Marx 1976: 1034–38). A helpful analysis of the social-factory thesis and its relation to readings of Marx can be found in Thoburn 2003, especially Chapters 4 and 5, 'The Social Factory' and 'The Refusal of Work', as well as in Chapter 6 of Wright 2002. See also Read 2004, Chapter 3, for a thorough discussion of formal and real subsumption.
3. Mariarosa Dalla Costa was 'the first of the workerists to advance a coherent case for the claim that the extraction of surplus value could occur outside the sphere Marx had designated as the direct process of production' (Wright 2002: 134–5).
4. I imitate Thoburn's use of the phrase 'autonomy-in-production'. Negri and Hardt more often use the phrase 'autonomous production' (see e.g. Hardt and Negri 2000: 276; 2009: 334, 364).
5. To name one example of such a critique, Slavoj Žižek equates Hardt and Negri's socio-political analysis with a 'fascination' for contemporary capitalism (Žižek 2007: 47). This is paralleled in Žižek's critique of Deleuze, whom he views as

'the ideologist of late capitalism' given the aptness of his and Guattari's analysis in the *Capitalism and Schizophrenia* volumes (Žižek 2004: 293).

6. For a concise analysis of the three syntheses (connective, disjunctive and conjunctive) developed in *Anti-Oedipus* see Holland 1999: 26–35.
7. It should be noted, importantly, that in *A Thousand Plateaus*, Deleuze and Guattari begin to develop their understanding of the body without organs in a direction that is somewhat more inimical to capitalist social production than in *Anti-Oedipus*. However, it can be concluded that the productive capacities of the BwO of *A Thousand Plateaus* are either directed solely towards desiring-production (i.e. not social production), or towards extremely 'cautious' modes of social assemblage that would certainly conform to Thoburn's 'minor' interpretation of Deleuzian politics. The BwO of *A Thousand Plateaus* is described in terms of 'disarticulation', 'experimentation' and 'nomadism' and stands opposed to 'organisms' of any kind. However, its separation from existing structures – the organism, the sign and the subject – demands '[c]aution' and skilful negotiations with 'the dominant reality' so as not to bring it 'back down on us heavier than ever' (Deleuze and Guattari 2004: 176–8).
8. It is important to keep in mind that Hardt and Negri are not offering a full-fledged value-theory of common qualities and their surplus. Cesare Casarino indicates the extent of ontological research required for such a theory, which would account for the 'two radically different modalities of surplus' constituted by capital and by the common (Negri and Casarino 2008: 30). Perhaps the most exciting challenge for a new theory of value would be to address the question of money, thus posed by Hardt and Negri: 'Might the power of money (and the finance world in general) to represent the social field of production be, in the hands of the multitude, an instrument of freedom, with the capacity to overthrow misery and poverty? … We cannot answer these questions satisfactorily yet, but it seems to us that efforts to reappropriate money in this way point in the direction of revolutionary activity today' (Hardt and Negri 2009: 295).
9. This essay is based on a paper of the same name delivered at the conference 'Deleuze and Activism' at the University of Cardiff on 13 November 2009.

Activist Materialism

Dimitris Papadopoulos University of Leicester

Abstract

This paper explores a form of activism that operates with and within matter. For more than 150 years materialism has informed activist practice through materialist conceptions of history and modes of production. The paper discusses the ambivalences of these previous configurations of activism and materialism and explores possibilities for enacting activist interventions in conditions where politics is not only performed as a politics of history but as the fundamental capacity to remake and transform processes of matter and life. What is activism when politics is increasingly performed as a politics of matter? What is activism when it comes to a materialist understanding of matter itself?

Keywords: activism, materialism, matter, Marx, minor science, technoscience

I. 1844

> The real unity of the world consists in its materiality... (Engels 1987 [1878])

The recent resurgence of materialism poses questions about its implications and relevance for politics. Rather than addressing institutional or representational politics I am interested here in tracing the connections of materialism to the transformative politics of social movements: collective direct activism on the immediate level of social and material life. In each particular historical chronotope there is a distinctive set of social movements which become capable of initiating social change. How is materialism related to these transformative

forces? And what kind of political activism do today's novel forms of materialism promote?

The articulation between materialism and activism is unstable, full of discontinuities and breaks. It is in Marx and the early rebellions that took place in the 'New World', and in the Communes and uprisings across Europe, that materialism first becomes directly linked to political activism: activist materialism. Since then materialism has been the target of interrogation not only from idealist positions and various dualist ontologies but also more recently from within the very political forces of the western post-1960s Left which were embracing materialism in one form or another. Critiques from the Left did not position themselves outside the materialist movement, they were not first and foremost an opposition; rather, it was an immanent movement enunciated from the very core of materialism itself that lasted up until the 1980s and 1990s and finally ushered a new version of materialism to the fore. Deleuze and Guattari's work exercised an important influence on the movements that attempted to rework materialism. During the long history of the encounter between materialism and activism both of them changed meanings, and each new formation of the one influenced the meaning of the other, producing new configurations of social practice.

Marx's work is probably the first attempt to connect activism and materialism on the level of everyday political practice. The *Theses on Feuerbach* exemplifies the articulation between materialism and activism in a remarkable and equally unexpected way. Thought objects and abstract contemplation are what Marx tries to defy, that is, idealism. The movement which changes society is the movement which opposes idealism. It is real, objective, that is, material, says Marx. Marx's materialism is conceived as sensuous everyday practical activity which has the capacity to change the material conditions of existence. The moment of transformation is the moment when, to use Marx's term, civil society collapses and a new social material order emerges. This very modern understanding of materialism was epitomised in *The German Ideology*: here communism is not 'an ideal to which reality have to adjust itself'; it is 'the real movement which abolishes the present state of things' (Marx and Engels 1846: 48).

It is in the *Economic and Philosophical Manuscripts* (1844) that Marx introduces a new definition of materialism grounded on inserting political activism into the understanding of materiality. Here he uses the concept of 'species-being' to describe human activity as the process of the self-making of the human species in a direct practical and organic relation to other species and the whole of the natural world. Despite

its essentialist connotations, 'species-being' is as close as one can get to a radical understanding of a form of self-instituted collective emancipation in which cooperation and interaction among humans as well as between humans and the material world is crucial (Dyer-Witheford 2006). For Marx the question is to uncover both what impedes this process, i.e. how capitalist labour alienates 'species-being', and how collective material self-transformation is possible. Who controls the process of material transformation, who participates and in which position, are questions which drive Marx's activist reading of materialism. This materialism is activist because it is a 'life activity', in the literal sense: 'life engendering life'. There is no social transformation outside of the material realm.

Marx's early materialism avoids the pitfall of epistemology: the attempt to distinguish between a strong materialist perspective which gives absolute primacy to matter (all that exists is matter) and a weak materialist perspective that puts the emphasis on how we conceive matter (all that exists is dependent on matter). Such an epistemological definition of materialism wouldn't be sufficient to distinguish it from idealism because at the end what we define as matter would involve an idealist move. From an epistemological viewpoint both positions, the materialist as well as the idealist one, are in principle tenable. But Marx's early materialism is ontological through and through: there is no transformative activity which is non-material. Since activity is inherently material, matter itself cannot be conceived as an outside or as an object of human practice: matter is humanity's body. 'Species-being' is the collective metabolic transformation of matter: activist materialism. There is a monist understanding of matter here that resonates with today's neo-materialism (for a superb example of the new materialism see Bennett 2010), so much influenced by Deleuze and Guattari's work which will be discussed extensively later in the paper. For now we can say that both Marx's early materialism and today's neo-materialism share a strong emphasis on matter as a vital force: inorganic matter as well as biological and social life are movements of matter itself. Nevertheless, in terms of Marx's early definition of materialism, merely highlighting the importance of materiality as an assemblage of heterogeneous forces is not enough to account for the kind of transformative political engagement that was his main concern. Marx's monist ontological materialism is infused with an activist dimension which takes place on the actual everyday life of 'species-being': the collective capacity to affect material change. Marx's ontological reading of materialism is one that focuses on practice, but a form of practice which is not solely in the hands of people but also

depends on non-human forces ('nature'). Practice and matter cannot be thought independently. And the reason for this is not epistemological but political: activist materialism is a response to capital's breaking up of the 'species-being' into classes and races. Materialism without activism is not transformative, in fact it is impossible. This is the quintessence of Marx's early account of a practical ontology and an activist materialism. What happens to this configuration of materialism 34 years before the bicentenary anniversary of the *Economic and Philosophical Manuscripts*?

Marx's and in particular Engels' late work contains a second reading of the activist materialism developed in their early writings: dialectical materialism. 'Diamat' consolidated the absolute emphasis on matter but introduced a different conception of its role which had tremendous impact on theorists of the Second International and the emerging Marxist social movements. 'Diamat' foregrounded activist materialism as a rather dogmatic epistemological doctrine that gradually removed the practical ontological concern with matter and subsequently transformed the meaning of activism. Already in the early writings there are numerous instances where, instead of the practical ontology described in the previous paragraphs, we find a relation to nature dominated by the ideal of progressivism and the total human mastery of nature's laws. This understanding also changed the meaning of activism. In *Anti-Dühring* (1878) and *Ludwig Feuerbach* (1886) Engels set out a materialist cosmology that served to define activism as a political practice which is mono-causally determined by a set of laws extracted from nature: historical materialism. This is characterised by both a bifurcated dualist ontology – with objective material reality and its inherent laws on the one hand and social practice on the other – and also by a reduction of materiality to human social institutions and structures. Activism was reduced to the efficacy of changing social structures. Historical materialism announces the erasure of the activist materialism to be found in the early works of Marx and Engels.

II. 1908

Moscow! Moscow! Moscow! (Irina in Chekhov 1900)

In *Materialism and Empirio-Criticism* Lenin follows this line and conceives materialism exclusively as a theory of knowledge. He writes: 'For the sole "property" of matter with whose recognition philosophical materialism is bound up is the property of being an objective reality, of existing outside our mind' (Lenin 1908: 260). Materialism here starts

from the assumption of an ontological duality, two separate entities: matter on the one hand, mind on the other. Lenin reduces materialism to gnosiological realism, while the activist materialism of the early Marx was one which asserted a monist ontology: mind is matter, the unity of the world is sustained by its materiality and the immanent action of matter and mind alike. Lenin's approach is a radical departure from a position which is concerned with bringing together practice and matter. Rather, his concern was to develop a conceptual instrument which splits ideas in two opposite camps. While Marx and Engels' early activist materialism was concerned with how matter is changing and can be changed, Lenin's materialism was developed as a strategic tool for the selection of the social and political forces of his time which might potentially transform into a revolutionary historical subject.

Lenin was building a war machine. He was trying to develop a philosophical conception of materialism which had no other target than to reveal the functioning of a deep social dichotomy between the working class and capital (for an extended analysis of these issues see Jordan 1967). His only goal was to submit theory to the everyday requirements of his revolutionary practice. This was truly phenomenal and unparalleled (albeit fatal). With his philosophical work Lenin developed a tool to extend the social division as far it could go, to the far end of mind and the history of ideas. In the unsurpassable *What Is To Be Done?* (1902) Lenin claims that social conflict penetrates every corner of society, every social relation, every idea. Nothing is untouchable by class antagonism, it takes a partisan organisation and a revolution to change it. This is partisan philosophy and partisan practice. And it is a truly activist move; however this particular move enacts a different materialism. It is carried out in the name of materialism but it is not an activist monist materialism. It is one which subsumes matter and dominates nature in the name of historical progress. If Marx's early materialism was of a kind which proclaimed the irresistibility of revolution on the grounds of a unified monist movement of matter and activism, Lenin's materialism is dualist, elevating irresistibility to something completely different: the will for action.

'Materialism must be a form of idealism, since it's wrong – too' (Sahlins 2002: 6). Marshall Sahlins' aphorism concentrates the post-Second World War predicament with the configuration of an activist materialism à la Lenin. Lenin's reduction of monist materialism to gnosiological realism had far-reaching consequences for the philosophical scaffolding of the social forces which found themselves entangled in the Marxist enterprise and in the emerging working-class

movements from the beginning of the twentieth century up to the 1970s and 1980s. The most important consequence was that gradually materialism failed to contribute to an ethical and political programme for the everyday enactment of activist practice. Activist materialism became everything but activist, quickly turning into an ideology of state socialism and an abstract philosophical system. In the post-Second World War period, materialism gradually lost its strength as an ethical project for revolutionising everyday practice.

III. 1977

Always historicize! (Jameson 1981)

The end of the 1970s probably saw a peak in the process of an immanent critique of materialism which rendered visible its contradictions as inherited from the Leninist period. The following quote from Raymond Williams displays the state of thought and mood among politically committed left intellectuals at the time:

> It took me thirty years, in a very complex process, to move from that received Marxist theory (which in its most general form I began by accepting) through various transitional forms of theory and inquiry, to the position I now hold, which I define as 'cultural materialism'. The emphases of the transition – on the production (rather than only the reproduction) of meanings and values by specific social formations, on the centrality of language and communication as formative social forces, and on the complex interaction both of institutions and forms and of social relationships and formal conventions – may be defined, if any one wishes, as 'culturalism', and even the crude old (positivist) idealism/materialism dichotomy may be applied if it helps anyone. What I would now claim to have reached, but necessarily by this route, is a theory of culture as a (social and material) productive process and of specific practices, of 'arts', as social uses of material means of production. (Williams 1980: 243)

During the period of the crisis of materialism which unfolded in the decades between 1950 and 1990 the notion of culture reordered the existing meanings of materialism and fuelled the development of a new constellation of concepts and activities into the heart of the social conflict of the post-war period. Of course, not all of the various movements and critiques of materialism embraced the notion of culture. The point here is not to unify these extremely diverse movements and traditions under one overarching rubric. Rather, what is of importance is that the insurgency against the previous materialism evolved in proximity to new everyday activities whose many faces and actions pertain to changing cultural power (see Gilbert 2008; Papadopoulos, Stephenson and Tsianos 2008).

This turn to culture thoroughly changed the way political activism is performed, moving the target away from the state itself towards power's pervasive materialisation in the whole societal nexus: in terms of gender relations, racialisation processes, social institutions, social and civil rights, the political representation of excluded groups, and so on. Many societies, many cultures, many socialisms, Raymond Williams would have said. This remaking of materialism corresponds with the practices of new social forces that found themselves outside the traditional organisational forms of the working-class movement which appeared as the inheritor of the materialist politics of the previous periods. The new politics of cultural counterinsurgency, not least as exemplified in the new youth cultures of the 1960s and the variously globalised events of 1968, spread across the globe with a velocity far beyond the wildest utopian dreams that Soviet propaganda bureaucrats and western communist parties ever imagined for their own materialist politics (see Connery 2005).

But where exactly was the materialism in this activism which propelled itself through cultural politics? The most likely answer is that there was very little materialism in this 'cultural materialist' politics, at least not in the sense of an activist and practical ontology concerned with a monist understanding of matter (as in Marx's early version). Nor was there much of the materialism of the late Marx/Lenin period with its strong focus on gnosiological dualism and the efficacy of social structures. Cultural politics questioned both versions of materialism and developed along many disparate and diverse paths: all of which were, however, occupied with the centrality of representation and its critiques. 'Discourse' seems to have been one of the paths that helped this move. Ironically, the discursive turn and the turn to language set in motion an activist politics which followed the activist materialism of the previous decades. Umberto Eco's *The Open Work* (Eco 1989) and James Clifford's collection *Writing Culture* (Clifford and Marcus 1986), as well as the broader linguistic turn (Rorty 1967) and the interest in hermeneutics (Gadamer 1989), are just some examples of intellectual engagements that marked the path to the undiscovered continent of representation. It was through the changing of meanings and the challenging of representations that the very process of social activism was now being performed.

Another important path for the revision of materialism that developed during this period came from an interest in social space as a key battlefield for social antagonisms. How is space regulated, appropriated and re-appropriated by marginalised social groups? Marxist inspired

readings of everyday space (Lefebvre 1991), the situationist movement (Debord 1981), and cultural geographers (Harvey 1990) all turned to kaleidoscopic remakings of space in order to articulate an everyday, mainly urban, activism that made radical interventions in the politics of post-war Europe and North America possible. The attention to space as lived experience is closely related to body politics. The body becomes an open substratum for the inscription and re-inscription of social signification. In this sense signification moves from the mind itself to the body and emerges in a process of subjective embodiment through a social context (cf. Csordas 1994; Harré 1996; Overton 1998) or through cultural-political constellations (cf. Bourdieu 1987; Braidotti 2002; Fausto-Sterling 2000).

But actually what the activism of the post-war period was mainly preoccupied with was subjectivity and difference (Blackman et al. 2008). As cultural studies has so vividly shown, subjectivity is always in the making because it entails a non-expressed otherness, a non-discursified and imagined possibility of social relations (Hall 1990; Papadopoulos 2006). Such a theoretical move was particularly important in a period where identity politics occupied a central place in the political life of the societies of the Global North (Clifford 2000). Already in the 1970s and 1980s, cultural studies, feminist politics, anti-racism and gender studies identified the limitations of an activist materialism qua Lenin which saw social consciousness either as committed to working-class change or as wrong and ideological. In resonance with Althusser's take on ideology (Althusser 2001), new social movements focused on the emergence of multiple political subjectivities that defy straightforward classification as wrong (false consciousness) or right (revolutionary) according to previous conceptions of activist materialism. Crucial for this attempt was the process of articulation (Clifford 2001; Hall 1986a; Slack 1996). Activism here is conceived as a movement of articulation which by rethinking Gramscian hegemony attempts to contest domination through 'rendering the symbolic increasingly dynamic, that is, by considering the conditions and limits of representation and representability as open to significant rearticulations and transformations under the pressure of social practices of various kinds' (Butler 1997: 23; see also: Hall 1986b; Laclau and Mouffe 1985). This understanding of political subjectivity as subjectification and the result of articulation is what essentially captured activist practices in this period, positioning subjectivity in the tension between coercion by institutional mechanisms and articulation through them.

Cultural politics challenged previous versions of materialism on the grounds of an increasing diversification of social strata and classes. It is this diversification that brought a new form of activism which, rather than focusing on materialism was concerned with the fight for representation. In this struggle, discourse, space, body and subjectivity are approached as constitutive of an oppositional politics of difference. Cultural studies, women's studies, postcolonial studies and queer politics have all participated in and critiqued this fight for representation (see Hall and Jefferson 1976; Clifford 1986; Sedgwick 1990; Spivak 1999; Warner 1999; Butler, Laclau and Žižek 2000; Mouffe 2000). The importance of representation comes from the dissolution of social class as the central actor and political force in society. The political order of transnational neoliberal societies is an order which is supposed to be occupied by multiple players working to foster alliances between themselves and to establish new relations of power. And it is precisely this form of relationality which triggers the imperative for representation (Stephenson and Papadopoulos 2006). Representation enters the realm of politics as the attempt to give voice and operative agency to social groups who have been excluded by the politics of the traditional versions of activist materialism. We can trace the singular trajectories of these emergent oppositional subjectivities of new diverse social groups in civil rights movements, in the events of 1968, in feminist movements, anti-work movements and new forms of social cooperation, in the 1960s cultural rebellions and in the fight against colonialism and racism.

IV. 1987

The only enemy is two. (Deleuze 2001)

However deep the break between Leninist activist materialism and the cultural materialism of the post-war period might be, there remains nevertheless a peculiar form of continuity. Lenin's materialism reduced activism to the radical intentionality of a subject determined to reflect the antagonistic conditions of existence. Cultural materialism retained this reduction but introduced a differentiation with respect to the subject itself. Instead of a unified self-identical subject we now have a plethora of subjectivities and of possible contexts in which they are constituted. This break implied a deep change in the way political activism was conceived: Leninist activism subsumed every activity under a single social conflict between labour and capital, while the activism of cultural politics multiplies the fronts on which social antagonisms are encountered and

fought. Nevertheless, despite this radical break, both positions retain a strange commitment to epistemological dualism. Representation and ideas are the battleground on which the conceptualisation of activism thrives. It is about negotiating and transforming the conditions of thinking and feeling that make activism possible. In a peculiar way cultural materialism followed Lenin's path in focusing on how we represent reality. What cultural materialism introduced was a new conceptualisation of the main determinants of representation. It is no longer the class structure of society but rather the endless variability of social contexts that allows different configurations of representation. In this sense the question for cultural activism becomes one of how reality is constructed in the subject itself, or 'social constructionism'. In both positions, however, practice and matter are subsequent to ideas; and despite their pervasive critiques of dualism, both retained a dualist ontology. Here is Deleuze and Guattari's well-known diagnosis of this situation:

> We invoke one dualism only in order to challenge another. We employ a dualism of models only in order to arrive at a process that challenges all models. Each time, mental correctives are necessary to undo the dualisms we had no wish to construct but through which we pass. Arrive at the magic formula we all seek – PLURALISM = MONISM – via all the dualisms that are the enemy, an entirely necessary enemy, the furniture we are forever rearranging. (Deleuze and Guattari 1987: 20)

In much of their work, and most centrally in *A Thousand Plateaus*, Deleuze and Guattari introduce a monist materialism which attempts to rehabilitate matter from its enslavement in representation. Their move is co-extensive with the (re-)appearance of a form of materialism that puts the primacy of matter on the agenda of political practice and theory after the 1990s and creates the possibility for the emergence of a novel configuration of activist materialism. Strangely enough it was the poststructuralist faction of the cultural activism of the previous decades that prepared the way for this move – in particular feminist materialism, the attention to the body, as described earlier, and the persistent but evasive attempts to put materialism back on the agenda (one need only recall Althusser's (2006) subterranean movements). But even more crucial to the reinvigoration of activist materialism is the increasing impact of scientific knowledge on everyday life and on the structures of production in the Global North that posit matter as an active, self-ordering, emergent player in a radically post-human world (see Papadopoulos 2010). Matter is before thinking, matter is in

thinking, matter is everywhere. For Deleuze and Guattari there is no empty space, there is always matter and matter is always differentiated. Representations are a particular form of differentiation in their own right, they do not exist prior to or *vis-à-vis* matter. Representations are movements of matter as much as genetic mutations or geological movements are. Deleuze and Guattari's point is not to eliminate the distinctive importance of representations and ideas, rather, their claim is that when representations are considered as separated from matter they become strategic tools for ordering material reality. Representations are closures and reterritorialisations that are used as powers to organise matter in a particular way.

The materialism emerging gradually after the 1990s focuses on the question of monism instead of concentrating on the binary opposition between materialism and idealism. It is this very dichotomy that undermines monist materialism. It is not about which position you take in this thinking, it is about the very act of taking a position. For Deleuze and Guattari the real enemy of materialist thinking is not idealism, it is dualism. 'The only enemy is two' (Deleuze 2001: 95). Materialism after the 1990s is an anti-dualism that gradually transforms the relation between activism and materialism that informed most of social movements during the Leninist period and after: matter and mind, activism and materialism start to fuse again into one process. The practice itself, the site of action and its thinking, gradually became equally important for the activism of the 1990s. It is not a coincidence that many of the social movements of this period and since focus on the question of reclaiming. The activism of reclaiming attempts to re-appropriate the immediate spaces of existence by simultaneously transforming them through everyday actions: reclaim the streets, reclaim the city, earth activism and the permaculture movement, the remaking of transnational spaces through migration movements, radical queer activism and the building of new social relationalities and communities, cyberactivism, the alter-globalisation movement, the production of the commons. In all of them we encounter an emphasis on reclaiming material spaces and relations vital for developing new alternative social and material projects (for an extended discussion see Papadopoulos et al. 2008; Chesters and Welsh 2006). This was, of course, also a central characteristic of previous forms of political activism, in particular of feminism. But the primary difference here is that either the question of reclaiming social and material spaces was not conceptualised as such or else was considered secondary with regards to the 'real' and 'primary' struggle, which was supposed to focus on radical demands addressed to

the state and its institutions in respect of recognition and representation. In contrast, the activism emerging after the 1990s, and in particular since the Zapatista movement, is less concerned with the state's mediation; instead it *consciously* attempts to force existing institutions to change by creating alternative materialities and forms of life.

Deleuze and Guattari's monist materialism captures a key moment of this form of activism that reconnects us with the activist materialism of the early Marx described at the beginning of this paper. It is the question of how to change matter and create new forms through collective practices. Deleuze and Guattari's materialism questions how the very moment of morphing matter comes into being. The emergence of form is neither the transcendent imposition of a preconceived plan on matter – forget the architect and the bee – nor is it simply a movement of self-organised matter that becomes represented in the mind of the subject – forget autopoietic systems. Neither external plan, nor internal self-organisation. In this sense, it is neither idealism nor materialism (as conceived until now). The position Deleuze and Guattari try to develop is that it is the movement of matter itself that makes both a materialist as well as an idealist stance possible. Both the capacity to create form and the capacity to understand the emergence of form are immanent to existence. There is no monism if there *is* a dualist option; 'there is nothing that is one, there is nothing that is multiple' (Deleuze 2001: 99). Deleuze and Guattari tried to avoid thinking along the either-or of materialism and idealism/dualism. The very possibility of thought is immanent to matter's movements.

Morphogenesis in Deleuze and Guattari is neither a property of self-ordering material systems nor the result of a vitalist force that initiates material change; nor of course is it the ability of the subject's mind to form matter according to a preconceived plan. There is something not immediately present in the actuality of material flows – something virtual – that makes matter congeal into stratified stable forms. In each particular setting there is a virtual ordering principle (an abstract machine in Deleuze and Guattari's words) that links and connects flows and properties of matter. An often utilised example in *A Thousand Plateaus* is the organism. When does an aggregate of various bodily processes and functions become a thing which can be called an organism? An organism is ordered matter – the moment when matter in flux, in movement, in variation becomes a discernible thing amenable to intervention, management, manipulation (through medical practice for example, or in the course of ontogenetic development). Embryology and biology, medicine and psychology, play an equal role with ontogenetic

change, gene activity, epigenetic interactions and the environment to produce a coherent story of what an organism is in a particular historical chronotope. Out of the movement of unformed matter and non-formalised processes of the body without organs (BwO), as Deleuze and Guattari call the non-organismic body, we encounter the formed and stratified form of the organism:

> The organism is not at all the body, the BwO; rather, it is a stratum on the BwO, in other words, a phenomenon of accumulation, coagulation, and sedimentation that, in order to extract useful labor from the BwO, imposes upon it forms, functions, bonds, dominant and hierarchized organizations, organized transcendences. The strata are bonds, pincers. 'Tie me up if you wish.' We are continually stratified. But who is this we that is not me, for the subject no less than the organism belongs to and depends on a stratum? (Deleuze and Guattari 1987: 159)

In this understanding of monist materialism, matter becomes the horizon and the substratum on which an alternative to the previous versions of materialism can emerge. Matter becomes (once more) the way to reconnect activism and materialism. The crucial move for materialism since the 1990s is to seek in matter an escape from a situation where the demise of the everyday transformative activist aspect of materialism became so pervasive. Deleuze and Guattari's move to a monist materialism is not a theoretical choice; it is the result of a political diagnosis according to which any desire for change has been vampirised by the institutions of the state. Even more than that, in the previous decades desire itself has been transformed into a capitalist institution (cf. Holland 2005). Every social struggle is reinserted as a rejuvenating feature of capitalist production, every social innovation is made productive. The story of the twentieth century is not a history of revolutions; it is rather a history of counter-revolutions (Müller 2000) where every desire has been appropriated, regurgitated and effaced by capitalism. The bottom line for Deleuze and Guattari's take on materialism, as a monist materialism based on a renewed attention to matter, is the attempt to reactivate the transformative force of desire. Deleuze and Guattari try to do this by breaking the link between 'desire' and 'desire for'. Every 'desire for' is a closure: desire for revolution, desire for mastering nature, desire for recognition, desire for an identity, desire for not having an identity, desire for desire. This is the political move Deleuze and Guattari reinsert into the new materialism: to disrupt the view that the creativity of people, animals and matter can be viewed as a desire which can always be folded back into capitalist domination

and valorisation. Every 'desire for' is already captured and appropriated. This is the spell capitalism casts upon life.

The key political ingredient of monist materialism is that desire needs to be disarticulated from its essential function as something which has a target and object. The diagnosis: 'desire for' is the way capitalism revolutionises itself. The radical political key to monist materialism is that it allows desire to be engendered in a way that can move beyond its recoding into the political closures of the counter-revolutions of the twentieth century. The prominent role of matter in Deleuze and Guattari is a small gesture of rebellion against the capture of earlier materialisms within a docile machine for constantly revolutionising capitalism. Deleuze and Guattari perform this small gesture of freedom by inserting indeterminacy into the way desire operates; and they do so by turning to the underlying indeterminacy of matter: matter is primarily unformed and in continuous variation, an oscillation between various intensities, closures and openings. Matter is a political exit. Matter is escape. The making of a life. Matter can break the capitalist spell.

The turn to matter becomes political when it is articulated in relation to this understanding of desire. That is why, despite the various attempts to read Deleuze and Guattari's materialism in a scientistic way – that is, as a cosmology attentive to science (see for example De Landa 1997) – what Deleuze and Guattari propose is a rather minor move, one which attempts to interrupt the appropriation of desire by grounding it in the indeterminate movements of matter. Deleuze and Guattari refer to this move also as a science but crucially a minor science (or a nomad, ambulant, itinerant science). In Proposition III of the War Machine chapter in *A Thousand Plateaus* they describe this as a practice which follows matter's immanent traits, confronts problems instead of applying theorems, pushes matter to the next threshold, connects practical effects and affects of practice. Against a science of matter or a technology to control it, Deleuze and Guattari emphasise practice as the key dimension of a minor science that knows how to surrender to matter. Minor science is a practice which is essentially experimental; rigorous but not systematic, it directly links activity with matter. It is here that the neo-materialism of the 1990s and after can once again become activist, with minor, nomad science on the one hand and the big, royal, imperial science of the state on the other: 'What we have . . . are two formally different conceptions of science, and, ontologically, a single field of interaction in which royal science continually appropriates the contents of vague or nomad science while nomad science continually cuts the contents of royal science loose' (Deleuze and Guattari 1987: 367). If

there is to be an activism of neo-materialism it will be developed in the decades to come from the practices of the nomad scientist, the artisan who operates within the constraints of matter, who follows singular material possibilities, and who thereby escapes state striation.

V. 2027

> Among the tortures and devastations of life is this then – our friends are not able to finish their stories. (Woolf 1992)

Minor science is embedded in a reality primarily defined by the centrality of scientific knowledge for the making of a polity in the societies of the Global North. Politics are increasingly performed through science itself (cf. Papadopoulos, forthcoming 2011). Physical, biological, chemical bodies can be thought as political in their own right (Protevi 2001). Minor science can respond to this tight articulation of politics and scientific knowledge. Simultaneously scientific knowledge is a constitutive element of a transformation traversing the societies of the Global North by becoming increasingly distributed in society (the so-called 'knowledge society'). The figure of the 'socialised worker' (Negri 2005) captures this move to a mode of production and circulation based on the valorisation of the totality of life and the intellectual creativity of the individual worker. In this context, scientific knowledge on the one hand becomes explicitly political and, on the other, permeates a wider range of social strata than ever before in the Global North.

Minor science is part of the social material conditions prevailing today; it operates below and outside state science and yet, as discussed in the previous section, it is continuously under pressure to be absorbed into the big science of the state.

> The fact is that the two kinds of science have different modes of formalization, and State science continually imposes its form of sovereignty on the inventions of nomad science. State science retains of nomad science only what it can appropriate; it turns the rest into a set of strictly limited formulas without any real scientific status, or else simply represses and bans it. (Deleuze and Guattari 1987: 362)

Even the very idea of minor science itself can be buried under the desire for the new grand theory which can be assimilated into state science. The minor science of matter can be deployed to support a new grand system of thought; a grand theory that uses all the fashionable and marketable concepts and ideas circulating today – complexity, event, affect, multiplicity, networks, assemblages, etc. – to create a new

meta-framework with which to approach the world. Cosmopolitical assembling as a new cosmology. A new abstract theory. Producing a new grand theory is one possible trap for today's minor science. A Deleuzian century? This would be the end of every inspiring and transformative potential of today's neo-materialism. The unfinished story of contemporary minor science is that it can so easily become absorbed into the workings of state science, that is, become a 'desire for' a grand system, a philosophical materialism devoid of its activist element. This kind of philosophical materialism will then become nothing but a form of governance of things and events. Latour the governor, Badiou the priest, Žižek the buffoon: actors in the imperial court in which state science feeds on the practices of minor science to produce a new cosmology that shapes technoreality.

Minor science and state science are inextricably bound together. In fact, minor science exists in the very core of state science. Pamela Smith has shown how artisan production – probably the most vital aspect of minor science – was crucial for the emergence of the rationalist objectivist scientific world-view which came to dominate the western world increasingly after the sixteenth century. It was the artisans' work, an intellectual revolution from bottom up, that 'transformed the contemplative discipline of natural philosophy into an active one' (Smith 2006: 239). Artisan science was later codified and appropriated into a new disembodied epistemology of experimental science. But experimental science never abandoned artisanal production. In fact experimental science and imperial science always rely on artisanal production and the minor science of matter. It was thanks to the purported modesty of meticulous artisanal efforts that Boyle's bottom-up experimental laboratory science won out over Hobbes' top-down geometric science (Shapin and Schaffer 1985; Haraway 1997).

This is even more the case today. In experimental science, the 'discovery' of 'natural facts' and 'realities of matter' was a distinct procedure that preceded possible technological applications. With the rise of technoscience, such applications become the very drive behind basic research. Discovery *is* fabrication. Science is not about observation but about modification. This situation creates an even more intense pressure for maintaining minor science, making it part of the fast-moving world of technoscientific research. In other words, one of the main characteristics of minor science – its interventionist, direct, ambulant quality – is now a dominant feature of technoscience itself. Propelled by the post-Second World War rise of big science, the later proliferation of the assembly-line industrial scientist (see Shapin 2008), the spread

of an entrepreneurial scientific culture, the neoliberalisation of research culture and the precarisation of intellectual and affective labour, science and its applications increasingly fold into each other. Minor science fuels the everyday workings of contemporary technoscience.

Scientific practices and objects are as much the result of artisanal work as they are of the precarised labour of industrial scientists and of the entrepreneurial investments of corporate and state science. The problem is not so much that minor science and state science meet and collide – an image which Deleuze and Guattari have pictured in their all too typical masculinist reading of science as an agonistic field in *A Thousand Plateaus*. Rather, minor science and state science co-constitute what Donna Haraway calls zones of implosion where the boundaries between human and non-human, nature and artificiality, are meaningless: 'the chip, gene, bomb, fetus, seed, brain, ecosystem, database'. Such imploded technoscientific objects make up the conditions of our actual material presence in the world, they are 'wormholes that dump contemporary travelers out into contemporary worlds' (Haraway 1997: 43).

The entanglement of minor and state science is the very reality in which our material existence unfolds. In these conditions the crucial challenge for minor science is to engage with radical activism again. Among the questions this activism is facing today are the following: How can minor science contribute to the immediate making of liveable words (Haraway 2007; Puig de la Bellacasa 2010; in press)? How can justice be inscribed in relation to our technological objects, our cells and organs, the water, the air, the soil? And how can material justice be instigated in a non-dualistic manner?

As minor science implodes into big state science and itself tends towards a grand system of thought, rather than theorise this implosion, it may be we need to fabulate. Thriving in communities which will only selectively make use of big state science the new activisms that will emerge in the decades to come will be truly operating on the level of matter. They will mobilise radical political interventions through intra-acting with and within matter. The remaking of matter engenders radical liberation projects. And thus perhaps our almost 200-year-old tale of emancipation will happily become a reality.

Note

I am grateful to Marcelo Svirsky for his insightful suggestions and encouragement. Special thanks go to Maria Puig de la Bellacasa, Hywel Bishop and Jan L. Harris for their critical engagement with the text.

Activism, Philosophy and Actuality in Deleuze and Foucault

Paul Patton University of New South Wales

Abstract

Deleuze and Foucault shared a period of political activism and both drew connections between their activism and their respective approaches to philosophy. However, despite their shared political commitments and praise of each other's work, there remained important philosophical differences between them which became more and more apparent over time. This article identifies some of the political issues over which they disagreed and shows how they relate to some of their underlying philosophical differences. It focuses on their respective approaches to the state, to 'actuality' and to the analysis of the present.

Keywords: Deleuze, Foucault, activism, state, actuality, history

> But the thought is one thing, the deed is another, and another yet is the image of the deed. The wheel of grounds does not roll between them.
>
> (Nietzsche 2005: First Part: 'The Pale Criminal')

Much of Deleuze's career as a political activist involved common causes with Foucault during the early to mid 1970s. These included his participation in the *Prisoner's Information Group* established by Foucault, Daniel Defert and others at the beginning of 1971, along with his role in the campaign later that year in support of immigrant workers and against racism that was sparked by the shooting of a young Algerian in the Paris neighbourhood known as the *Goutte d'Or* (Dosse 2010: 309–13).[1] Defert and Donzelot describe the interaction with the prison environment in and around the experience of the *Prisoner's Information Group* as a pivotal moment in the history of the forms of political

activism that emerged in the aftermath of May '68, suggesting that it represented 'a transformation of political intelligence' (Defert and Donzelot 1976: 33). Elements of this transformation found expression in the efforts by Deleuze and Parnet to characterise a new politics and a new relationship between political and intellectual activism. The final chapter of *Dialogues*, published in 1977, develops the idea of radical politics as experimentation defined in terms of Deleuze and Guattari's theory of the different kinds of line or segments that make up a social field, but also in terms of the state as agent of realisation of the 'abstract machines' that overcode a given society. They invoke a 'becoming-revolutionary of people, at every level, in every place, instead of the Marxian concept of a revolution that changes everything by the capture of state power and the establishment of new social relations of production' (Deleuze and Parnet 2002: 147).

Foucault's work followed a different political trajectory. His 1975–6 lectures at the Collège de France, under the title 'Society Must Be Defended' (Foucault 2003), undertook a critical genealogy of the discourse of war and domination that had provided the language of much of his thinking about power. After a sabbatical in the United States in 1976–7, he embarked on a genealogy of the forms of exercise of sovereign power that led him to explore elements of liberal and neoliberal governmentality (Foucault 2007, 2008). From 1980, his focus shifted away from the exercise of power over others and towards forms of self-government as theorised by the ancient Greeks.

Both Deleuze and Foucault repeatedly drew connections between their own social and political activism and their respective approaches to philosophy. However, despite their shared political commitments and praise of each other's work, there remained important philosophical differences between them which became more and more apparent over time. Their political collaboration came to an end around the time of the campaign against the extradition of the Baader-Meinhof lawyer Klaus Croissant in 1977. In Foucault's case, as I will show, the political differences that emerged in 1977 carried over into his 1978 lectures on neoliberal governmentality. In Deleuze's case, the precise nature of their philosophical and political differences is partly obscured by the highly idiosyncratic account he gives of Foucault's approach to philosophy in interviews and in his *Foucault*, published in 1986 two years after Foucault's death.[2] The lesson to be drawn is that we should be wary of taking their views of the relationship between their respective approaches to philosophy and politics at face value. As Nietzsche's Zarathustra reminds us in the passage quoted above, the thinking that

motivates human actions is one thing, the actions another, and neither of these are identical with the rationalisations or retrospective accounts given by the actors themselves.

The high point of their common political and theoretical engagement was undoubtedly the 'Intellectuals and Power' interview, conducted in March 1972 and published in the issue of *L'Arc* devoted to Deleuze later that year.[3] Together they outline a new conception of the relationship between 'theory' and 'practice' according to which practice is not the application of theory, any more than it is the source or inspiration of theory to come. They reject the idea that there is a single 'totalising' relation between theory and practice in favour of a more local and fragmentary conception. Theory is neither the expression nor the translation of a practice, but is itself a local and regional practice that operates as a series of relays from one practice to another, while practices are relays from one theoretical point to the next. It is in the course of this discussion that Deleuze advances the much quoted formula that epitomises the pragmatism of their approach: theory should be considered a tool-box, or a pair of spectacles that may or may not provide a useful view of the world. If a theory does not help in a given situation, the theorist-practitioner should make another (Deleuze 2004: 208).

This conception of the theory-practice relation as a series of relays within a multiplicity of elements at once theoretical and practical implies a novel conception of the nature and political task of the intellectual as a multiplicity that connects with other social forces rather than a subject who represents a class or a group. He or she is, to use Guattari's term, a 'groupuscule'. Deleuze attributes to Foucault the important lesson of the 'indignity' of speaking for others, as exemplified in the practice of the *Prisoner's Information Group* which sought to bring to the public at large the voice of those imprisoned. In turn, Foucault suggests that it was one of the lessons of the upsurge of direct political action at the end of the 1960s in France that the masses have no need of enlightened consciousnesses in order to have knowledge of their situation. The problem is rather that their own forms of knowledge are blocked or invalidated. The role of the intellectual therefore does not consist of bringing knowledge to or from the people but of working within and against the order of discourse within which the forms of knowledge appear or fail to appear. More generally, it consists of struggling against the forms of power of which he or she is both the object and the instrument.

Deleuze endorses the rejection of the distinction between reform and revolution that we find elsewhere in Foucault,[4] along with the idea that power itself forms a system that is inherently fragile and liable to

unravel at any point. The continuity in the forms of exercise of power, its cynicism as well as its puerility, is manifest in the similarities between the treatment of prisoners, schoolchildren and factory workers that Foucault has demonstrated through his historical account of disciplinary power. Moreover, the then present (1972) political situation shows how the different kinds of repression directed at immigrants, workers, students and young people generally are readily totalised from the point of view of power. The political conclusion he draws is that it is not for those struggling against this process and this future to totalise or to work through existing representative institutions such as unions or political parties: the task is rather to establish 'lateral connections, a system of networks and popular bases' as well as different mechanisms for the circulation of information (Deleuze 2004: 210).

Foucault makes the connection between the problem of finding adequate forms of struggle and the present ignorance of the nature of power. It took until the nineteenth century to arrive at knowledge of exploitation, but we remain largely ignorant of the nature of power: certainly the existing theories of the state and state apparatuses are inadequate to understand the nature of power and the forms of its exercise, as is the theory of class power associated with Marxism. Foucault credits Deleuze's *Nietzsche and Philosophy*, as well as his work with Guattari, for advancing the manner in which this problem is posed (*Anti-Oedipus* was published in March 1972). He implicitly refers to his earlier comments about working within the order of discourse and knowledge in suggesting that identifying and speaking publicly about the centres of power within society is already a first step in turning power back on itself: 'If discourses such as those of prisoners or prison doctors are struggles it is because they confiscate at least for a moment the power to speak of the prison that is currently held by prison administrators and reformers alone' (Deleuze 2004: 211). Perhaps alluding to a lesson learned from their experience with prisons, he adds that it is not the unconscious that is challenged by such discourses of struggle but the secrecy that is all too often the condition of the exercise of power: 'The discourse of struggle is not opposed to the unconscious but to the secret… The secret is perhaps more difficult to bring to light than the unconscious' (211–12).

Deleuze's response obliquely illustrates their differing attitudes towards psychoanalysis. He takes up Foucault's point about relative ignorance of the workings of power by outlining a summary version of the thesis developed in *Anti-Oedipus* concerning the difference between individual or group interests and desiring-investments: it is the nature

of the desiring-investments in a social body that explains why people can act against their interests. Foucault agrees that there is a complex interplay between relations of power, desire and interest and that people can desire the exercise of power by those who act against their interests and even their lives, as occurred in the case of fascism (Deleuze 2004: 212).

Finally, Deleuze returns to the question: how to conceive of the necessary networks and transversal connections between the different sites of struggle against power, whether from one country to another (Vietnam-France) or within a given country? Foucault responds by describing the current revolutionary struggle as one against power rather than against exploitation and, as such, one in which the proletariat may be involved but not necessarily in a leading or pre-eminent role: the struggles of women, prisoners, conscripts, homosexuals and others also form part of the revolutionary movement. Their commonality derives not from a theoretical totalisation but from the system of power itself, which in countries like France is exercised in a way that maintains capitalist relations of exploitation. For this reason, Deleuze comments, 'Every partial revolutionary attack or defense in this way connects up with the struggle of the working class' (Deleuze 2004: 213).

Many of the points made in this landmark interview continued to reverberate through the work of Deleuze and Foucault in the years that followed, albeit in different guises. Much of Foucault's work during the latter part of the 1970s sought to develop new conceptual tools for understanding power and its relation to knowledge or theory. His 1982 text 'The Subject and Power' offers much the same analysis of the totalisation of micro-powers by a dominant or ruling power that he gave a decade earlier (Foucault 2000: 326–48). The first lecture of his 1976 course at the Collège de France takes up the question implicitly posed by his 1972 remarks about the relative lack of understanding of the nature of power and sets out a series of heuristic principles designed to reorient the study of power away from the juridical, political and ideological apparatuses of the state and towards the material operations of domination and subjectification throughout society, along with the formations of knowledge that accompany them. At the outset of this lecture, he returns to the inhibiting effects of global theories in relation to 'subjugated knowledges', defining his genealogical approach as one that targets 'a combination of erudite knowledge and what people know' – the technical knowledge of the practitioners of particular forms of power and the disqualified knowledge of those subject to them – and suggesting that this would not have been possible were it not for 'the

removal of the tyranny of overall discourses, with their hierarchies and all the privileges enjoyed by theoretical vanguards' (Foucault 2003: 8).

The ideas canvassed in the 1972 discussion between Deleuze and Foucault continue to influence many of those concerned to develop mutually productive relations between political activism and academic theorising.[5] But this text also shows points of mutual incomprehension between them. At one point, for example, Deleuze endorses and attributes to Foucault the idea that theory is 'by nature opposed to power', even though Foucault has just suggested that theory always takes place within an order of discourse and knowledge that is governed by forms of power (Deleuze 2004: 208). Deleuze appears to understand 'theory' to mean something like the conception of philosophy as the creation of concepts that he later described as 'in itself' calling for 'a new earth and a people that do not yet exist' (Deleuze and Guattari 1994: 108). However, this conception of theory continues to rely on the repressive conception of power that Foucault soon came to challenge. Deleuze refers here to the radical fragility of the system of power and its 'global force of repression' (Deleuze 2002: 291; 2004: 208; translation modified).

Philosophically, there were always differences between them. Some of these differences become apparent after the publication of Foucault's *History of Sexuality Volume 1* in 1976. A letter that Deleuze wrote to him in 1977, subsequently published as 'Desire and Pleasure', sets out a number of disagreements over the nature of power and its relation to desire, the relative primacy of desire in relation to power, along with Deleuze's reservations about Foucault's attachment to concepts of truth and pleasure (Deleuze 2007: 122–34). Some of these differences were restated several years later in a footnote in *A Thousand Plateaus* that reaffirmed the priority of desire over power and the primacy of lines of flight or deterritorialisation in any given assemblage (Deleuze and Guattari 1987: 530–1).

In retrospect, it is not surprising that these differences should have emerged around 1977. That year was a turning point in the history of the French left, when the adherence to Marxism on the part of many who had participated in the forms of activism that flourished after 1968 began to crumble. The reasons for this were complex, but they coalesced around the issue of Soviet dissidence and the Gulag, along with the contemporaneous and brief popularity of the so-called 'New Philosophers'. For the most part, these were former students of the *École Normale Supérieur* who had been taught by Althusser and who had been engaged in the post-'68 Maoist left: Bernard-Henri Lévy, Jean-Marie Benoist, Michel Géurin, Christian Jambert and Guy Lardreau. Others

such as André Glucksmann were also associated with this movement. His book *La Cuisinière et le mangeur d'hommes* (Glucksmann 1975) was one of the first to combine Foucauldian theses about the 'Great confinement' with evidence derived from Solzhenitsyn and others about the Soviet camps. Levy's *La Barbarie à visage humaine* (Levy 1977) also drew parallels between Foucault's account of confinement in *Histoire de la folie* and what happened in the USSR. He invoked Foucault by describing his own book as 'an archaeology of the present' and by drawing on the theory of disciplinary power outlined in *Surveiller et punir* to frame his account of modern totalitarianism. In this manner, David Macey comments, Foucault became 'part of the new philosophy's vulgate' (Macey 1994: 386).

Foucault's own engagement with the New Philosophers was more circumspect. Macey describes a three-page review of Glucksmann's *Les Maîtres penseurs*, published in *Le Nouvel Observateur* in May 1977, as his 'most significant gesture of support for the new philosophers' (Macey 1994: 387).[6] Foucault praised the book for tracing the horrors of the Soviet Gulag to the manner in which nineteenth-century German philosophy – Hegel in particular – linked the state and the revolution such that revolution promised a true and benign state while the state in turn promised the serene accomplishment of revolution. By contrast, one month later, Deleuze published a denunciation of the New Philosophers in which he expressed his disgust at their martyrology of the victims of the Gulag and of history more generally. He also accused them of trafficking in big empty concepts such as The Law, The Power, The Master and so on.[7] Macey suggests that the reference to power contained an implicit rebuke of Foucault and that their differing attitudes towards the New Philosophers contributed to their 'increasing estrangement' (388). Whether or not this was intended, it is true that Foucault and Deleuze tended to drift apart from the mid '70s, sometimes taking different positions on issues of the day. In what follows I focus on two moments at which important conceptual and political differences emerged between them. The first turns around the Klaus Croissant affair at the end of 1977 and their respective conceptions of the state. The second relates to the respective conceptions held by Deleuze and Foucault of 'the present' (*actualité*).

I. Genealogy and the State

The extradition of Klaus Croissant in November 1977 was a key episode that is often cited as a turning point in their relationship, especially by

some of Foucault's biographers. François Dosse – following a written response by Deleuze to James Miller some years later, in which he insists that there was no single cause of their estrangement but a number of contributing factors – lists the Croissant affair as one among a series of political disagreements, alongside their different attitudes towards the New Philosophers and their deep divergence over Israel-Palestine (Dosse 2010: 314). Croissant had been one of the defence lawyers in the trial of members of the Red Army Faction (RAF) in 1975. After having been charged with supporting a criminal organisation and jailed on more than one occasion, he fled to France in the summer of 1977 and applied for political asylum. In response to his arrest by French authorities in September 1977, Foucault, Deleuze and Guattari were among those who joined a Committee established to oppose his extradition and agitate for his release from prison. Their activities were to no avail as Croissant was finally extradited on 16 November, shortly after the suicide of three leading members of the RAF, Andreas Baader, Gudrun Ensslin and Jan-Carl Raspe, in Stannheim and then the killing of abducted businessman Hanns-Martin Schleyer on 19 October. Foucault and Deleuze were among the small crowd of protesters outside *La Santé* prison when Croissant was removed. However, they took different positions in the public campaign in his favour. Foucault published several pieces against the extradition of Croissant, but he refused to sign a petition circulated by Guattari and signed by Deleuze among others. He considered it too lenient towards the RAF and preferred to restrict his support to the lawyer and to the right of accused parties to legal representation.[8] Macey claims that what Foucault found unacceptable in the petition was a characterisation of the West German state as 'fascist': 'In other words, Foucault was prepared to fight for Croissant's right to asylum, but he would not lend his name to any statement which lent support to a thesis associated with the Red Army Faction itself' (Macey 1994: 394). Eribon offers a slightly milder version of the unacceptable petition, describing it as presenting West Germany as drifting towards 'police dictatorship' (Eribon 1991: 260).

Foucault's reticence towards any support for the opinions much less the actions of the RAF has since been taken to imply that Deleuze and Guattari themselves supported terrorism. The editor of Foucault's lectures, Michel Senellart, describes Deleuze and Guattari's opinion piece in *Le Monde* on 2 November 1977 ('*Le pire moyen de faire l'Europe*'[9]) as one that 'gave backing to terrorist action' (Foucault 2007: 393 n. 26). It is difficult to reconcile this claim with the text of the article. The passage cited by Senellart follows comments on the

characterisation of Baader and other members of the RAF by the press in Germany and France that sought to portray them as Nazis or the children of Nazis. Deleuze and Guattari write: 'Leaving aside the search for filiations, it is simpler to recall that the question of violence, and even of terrorism, as a response to imperialist violence, has constantly troubled the revolutionary and worker's movement since the last century in very diverse forms' (Deleuze 2007: 150). There is no evidence to suggest that Deleuze or Guattari ever condoned the violent actions of the RAF. There is evidence to suggest that Guattari in particular did not.[10] Both were well aware that the temptation to resort to violence was real among members of the post-'68 left across Europe and the passage from their article cited above simply acknowledges this fact. Deleuze and Guattari's text presents the issue of Croissant's extradition as raising questions about the role of Germany in the emerging European Union. They suggest that it has acquired a position of strength in relation to other European governments such that it is able to export its judicial, police and 'informational' model and to become the central organiser of repression in other countries such as France: a decision by the French court to allow extradition would in effect favour 'the importation of the German state and judicial model' (149).

Foucault's increasing distance from the views of his former friends is apparent in his own comments on 'the German model' in lectures delivered in the first half of the following year (Foucault 2008). These lectures were the only ones that Foucault devoted to issues arising directly from contemporary politics.[11] They make it clear that the role of 'the German model' in the immediate political context is part of the reason for undertaking these historical analyses of neoliberal governmentality, even as they develop an account of this model very different from that put forward by Deleuze and Guattari: 'The German model which is being diffused, debated and forms part of our actuality, structuring it and carving out its real shape, is the model of a possible neo-liberal governmentality' (Foucault 2008: 192). An immediate concern in these lectures is to show that policy shifts underway in France during this period, such as the abandonment of a social security system based on the wartime principle of national solidarity in favour of a system that would provide assistance to those unable to participate in the economic game without imposing additional constraints on the market, represent the radicalisation of themes found in German neoliberal social policy elaborated from the 1930s and adopted after 1945. Foucault's broader aim is to show that 'political actuality' is more complex than is recognised by many of the

proponents of state theory. He points out that the work presented in these lectures was undertaken partly for what he calls 'a reason of critical morality' that amounts to a direct challenge to the 'state phobia' that was widespread in twentieth-century political thought and particularly amongst the French extra-parliamentary left during the 1970s. By 'state phobia' he means, firstly, the idea that the state possesses its own intrinsic tendency to expand, 'an endogenous imperialism constantly pushing it to spread its surface and increase in extent, depth and subtlety to the point that it will come to take over entirely that which is at the same time its other, its outside, its target and its object, namely: civil society' (187). Secondly, state phobia involves the idea that sovereign power is a phenomenon with its own essential characteristics. At the heart of this attitude is an essentialist conception of the state such that administrative, welfare, bureaucratic, fascist and totalitarian forms of state may all be regarded as expressions of the same underlying form: 'there is a kinship, a sort of genetic continuity or evolutionary implication between different forms of state' (187).

Elements of this approach can be found among a variety of Marxist theories of the state as instrument of class domination, or among anarcho-Nietzschean theories of the state as 'the coldest of all cold monsters' (Nietzsche 2005: 43).[12] The concept of the state outlined in Deleuze and Guattari's *A Thousand Plateaus* (1980) also retains elements of state phobia. They propose an abstract definition of the state-form as an apparatus of capture that exists whenever two fundamental conditions are met: the constitution of a milieu of interiority and the establishment of a standard or centre of comparison on the basis of which a surplus can be extracted (Deleuze and Guattari 1987: 444). As such, they suggest, there is a 'unity of composition' among different kinds of state that is not found in the diverse forms of nomadic war machine (Deleuze and Guattari 1980: 427). Deleuze and Guattari's conception of the state is by no means ahistorical: there is an evolution of forms of state and, even in the present, there are significant differences between totalitarian, fascist, social democratic and neoliberal states. Yet these different 'axiomatisations' also involve an isomorphism to the extent that all nation states are particular 'domains of realisation' of the underlying capitalist axiomatic (464).

Foucault objects to the essentialism of the state phobic conception that it licenses the 'interchangeability of analyses and a loss of specificity' (Foucault 2008: 188). His aim, by contrast, it to maximise specificity, for example by showing that the welfare state has neither the same form nor the same origin as 'the Nazi, fascist or Stalinist state' (190).[13] Second,

the inbuilt dynamism of the state ensures that, whatever the context and whatever political process is under discussion, it can always be criticised by reference to the worse that will inevitably follow: 'something like a kinship or danger, something like the great fantasy of the paranoiac and devouring state can always be found' (188). As such, the state phobic conception allows its protagonists to deduce political analyses from first principles and avoid altogether the need for empirical and historical knowledge of contemporary reality. In this sense, Foucault argues that it sustains a critical discourse the value of which is artificially inflated since it enables its supporters to 'avoid paying the price of reality and *actuality*' (188; emphasis added). Foucault's analysis of governmentality seeks to disqualify this essentialist conception of the state from the outset. His approach does not seek to extract the essential nature of the modern state but to question it from the outside by 'undertaking an investigation of the problem of the state on the basis of practices of governmentality' (78). From this perspective, the institutions and policies of the state are nothing more than the residue or the effects of the ways in which more or less centralised power has sought to govern territories, populations, economic and social life: they are 'the mobile effect of a regime of multiple governmentalities' (77).

Foucault's final objection to state phobia points to its ignorance of the widespread suspicion of the state from within twentieth-century liberalism. His analysis of the origins and emergence of German neoliberalism shows how this kind of critique of the state and its 'intrinsic and irrepressible dynamism' was already formulated during the period from 1930 to 1945 in the context of efforts to criticise the whole range of interventionist policies from Keynesianism to National Socialism and Soviet state planning (Foucault 2008: 189). The influence of anti-state liberalism in the post-war period meant that all those on the left who participate in this state phobia are 'following the direction of the wind and that in fact, for years and years, an effective reduction of the state has been on the way' (191). A constant refrain of Foucault's criticism of state phobia is a plea for realism about the state and its origins. By implication, it is the lack of realism on the part of his former political companions that contributes to the emerging gulf between them. His genealogical sketch of neoliberal governmentality is one element of a broader methodological argument in these lectures against the kind of political criticism that interprets the present by reference to already given concepts of state and society. His aim is quite different: to investigate the particular ways in which sovereign power was conceived and exercised, in order to show the historical

specificity of government. In this manner, he proposes 'to let knowledge of the past work on the experience of the present' (130). Deleuze and Guattari's treatment of the different forms of state past and present shows that the issue is not simply whether or not the political theorist takes history into account, but the precise means by which this is to be achieved.

II. Philosophy, Politics and 'Actuality'

The distance that separates the conceptions of 'theory' held by Foucault and Deleuze becomes apparent when we compare the latter's characterisation of the former and his attempt to pursue what he presents as a Foucauldian form of criticism of the present. For the most part, Deleuze does not undertake the same kind of genealogical interpretation of the present that we find in Foucault, even though he regularly compares Nietzsche's untimely and Foucault's *actuel* with the realm of becoming and pure eventness that is the object of his own philosophy. One exception to this is the diagnosis outlined in his 'Postscript on Control Societies', and in his 'Control and Becoming' interview with Negri, where he describes the present as the initial stages of a newly emerging 'control society'.[14] This diagnosis stands in stark contrast to the account of the present given in his 1972 discussion with Foucault, where Deleuze saw the political present as a period of repression after the social upheavals of '68 and its immediate aftermath: not only as a response to what occurred in '68 but as the concerted preparation and organisation of the immediate future by reinforcing the social structures of confinement. His diagnosis at this point effectively anticipated the New Philosophers in describing the present period by reference to Foucault's discussion of 'confinement'. In 1990, he offers a diagnosis that draws upon Foucault's discussion of political technology in *Discipline and Punish*, suggesting that this moment is witness to the birth of a society characterised by the predominance of a new type of political technology.

Just as the modern society described by Foucault in *Discipline and Punish* is characterised by a diagram of disciplinary power, so Deleuze describes the new society emerging at the end of the twentieth century as one characterised by a diagram of control. Control society comes next in the series identified by Foucault, in which each kind of society is defined by a particular diagram of power. Thus, sovereign societies were succeeded by disciplinary societies and now 'Control societies are taking over from disciplinary societies' (Deleuze 1995: 178). This raises

the question: what is meant by 'control' in the context of this specific diagram of power? How does it differ from disciplinary power? In the first place, in so far as it is the name of a particular technique for the exercise of political power, we can say in the light of Foucault's later clarification of his concept of power that it involves a certain kind of action upon the action, or the field of possible actions, of others (Foucault 2000: 326–48). Control power is different from disciplinary power at the level of its primary material, its means, modalities and ends. At the level of primary materials, control does not operate on the individual but on 'dividuals', not on the mass of people but on samples or data-banks. Unlike disciplinary societies, control societies do not form individuals to fit certain moulds in order to produce docile bodies, obedient subjects and so on. Rather, they extract dividuals where these are not whole persons but a certain number of functional aspects, each one defined in relation to particular ends. The dividual is a bundle of aptitudes or capacities such as the financial means that ensure a capacity to repay a bank loan or the scholarly aptitudes that guarantee entry onto a given program of study. A multiplicity of dividuals do not constitute a mass of people but rather a sample or a data-bank that can be analysed and exploited for commercial, governmental or other ends.

At the level of the means of its exercise, control makes use of pass-words rather than order-words. Individuals are associated with an increasingly long and potentially endless chain of pass-words, including passwords for their computers, email servers, assorted bank and credit card logins, online shopping, travel agencies, journal subscriptions, professional associations and so on. In contrast to disciplinary societies, control societies do not establish institutional spaces of confinement but series of thresholds through which one can only pass with the right password. They establish different kinds of penalties as alternatives to imprisonment, such as fines, community service, compulsory rehabilitation and so on. They establish home medical care instead of hospitalisation, lifelong education and training instead of schools and colleges, and enterprises of various kinds instead of factories. Control operates in the open air rather than in confined spaces, by means of various digital and electronic technologies. To take an example that has emerged since Deleuze wrote his 'Postscript', consider the manner in which GPS location has become utilised in a whole series of devices, from personal direction-finders to electronic bracelets and other tracking devices. In the words of one commentator:

> GPS represents the final stage of this evolution. Even the electronic bracelet remains essentially disciplinary, transforming the home into a prison and trapping the condemned as though in his apartment burrow. By contrast, mobile technologies of surveillance in real time liberate the individual. They liberate his energy and his desire so that he can work at his own always ephemeral and perfectible integration. (Razac 2008: 61)

At the level of the modality of action, control mechanisms do not impose particular moulds according to the nature of the institution in which they are employed, producing a certain kind of subject, body or relationships. Rather, they involve the continuous modulation of behaviours or performances in and by means of their relations to one another. In turn, this implies a series of replacements in different domains of social life. For example, the replacement of apparent acquittal by unlimited deferral of judgement in the judicial sphere; the replacement of manufacture by the sale of services or immaterial products in the economic sphere; the replacement of examinations by continuous assessment in the educational sphere. In each case, it is a question of abandoning disciplinary modalities in favour of other means of acting upon the action of people. Razac is not the only one to suggest that Foucault's analyses of 'security apparatuses' in the course of his 1977–8 lectures, 'Security, Territory, Population', played a more or less implicit role in Deleuze's characterisation of control society. The basis for this suggestion lies above all in the mode of regulation of a given material that is common to Foucault's security apparatuses and Deleuze's control societies: 'continuous modulation and the treatment of the object of power adapt in real time to what actually occurs' (Razac 2008: 40). At the same time, however, Razac points to the historical difficulty raised by this suggestion: Foucault situates the emergence of techniques of security at the end of the eighteenth century, whereas Deleuze situates the transition to control societies in the latter half of the twentieth century after the Second World War.

In other respects, too, the reference to Foucault, which is fundamental for Deleuze's definition of control society, is more troublesome than it first appears. Deleuze presents his diagnosis as though it corresponded fully with Foucault's method of undertaking an analysis or an archaeology of the present. In fact, it corresponds more with the manner in which Deleuze presents Foucault's method than it does with Foucault's own work. Following Nietzsche's way of writing a genealogy of the present, Foucault reinterprets past practices, institutions and forms of knowledge from the perspective of a hitherto unnoticed distance. His genealogies describe the discursive and non-discursive

formations (*dispositifs*) from which we are separated by hitherto imperceptible fractures in the hermeneutical frameworks within which we live and experience the historical present. In this manner, he shows up the madness of incarcerating the insane, the arbitrariness and injustice of imprisoning convicts, the irrationality of making our identity as subjects depend upon our sexual behaviour. In the terms of his own retrospective account of his genealogical method in 'What is Enlightenment?' these are all examples of practices that were previously considered unproblematic or unavoidable but that we can now perceive as contingent and open to change (Foucault 1997: 315). Foucault describes the aim of his genealogies as pursuing this break with the past in a manner that might serve as a condition for further change.

Deleuze offers a different account in *What is Philosophy?* when he explains how Foucault's analysis of the present does not aim to capture the form of society in which we live at any given moment but rather the form of society that is emerging. He argues that, whereas he and Guattari identify becoming as the source of change, Foucault writes from the perspective of the actual (*actuel*). He does not mean *actuel* in the ordinary French sense of this word, which refers to that which is current or present, but rather something much closer to Nietzsche's 'untimely'. It is in this sense, according to Deleuze, that we must understand Foucault's use of the term 'actuality'. It is not a question of what already exists or is present in a given historical moment, but of what is coming about, of what is in the process of becoming.

Deleuze defends this reading of Foucault's use of *actuel* with reference to a passage in *The Archaeology of Knowledge* in which Foucault draws a distinction between the present (*notre actualité*) and 'the border of time that surrounds our present, overhangs it and indicates it in its otherness' in order to suggest that Foucault writes from this border between present and future (Foucault 1969: 172; 1972: 130). Even though Foucault's text does not describe it in this way, Deleuze suggests that this border between the present and the future is what he means by the actual. He offers a more extended commentary on this passage from *The Archaeology of Knowledge* in 'What is a Dispositif?':

> The novelty of a *dispositif* in relation to those that precede it is what we call its actuality, our actuality. The new is the *actuel*. The *actuel* is not what we are but rather what we are becoming, what we are in the process of becoming, that is to say the Other, our becoming-other. In every *dispositif* we must distinguish what we are (what we are already no longer) and what we are becoming: the part of history and the part of the actual. (Deleuze 2007: 350)[15]

Deleuze employs the same form of words in *What is Philosophy?* in spelling out the proximity of his own 'becoming', Nietzsche's untimely (*l'inactuel* or *l'intempestif*), and Foucault's supposed *actuel* in suggesting that all three terms refer to 'that which is in the process of coming about': not what we presently are or recently were, but rather 'what we are in the process of becoming – that is to say, the Other, our becoming-other' (Deleuze and Guattari 1994: 112). The problem is that Foucault does not use the term in the manner that Deleuze suggests. His text actually contrasts this border region with 'our actuality' (Foucault 1969: 172; 1972: 130).

A second difficulty raised by Deleuze's reference to Foucault in elaborating his concept of control society emerges when, in his 'Postscript', he reminds us that Foucault himself was one of the first to point out that we no longer live in an age of discipline: 'we were no longer in disciplinary societies, we were leaving them behind' (Deleuze 1995: 178). According to this diagnosis of the present, disciplinary society is already disappearing. The techniques of disciplinary power are in crisis, and institutions such as the school, factory, hospital, army and prison have more or less reached their use-by date: 'It is simply a matter of nursing them through their death throes and keeping people busy until the new forces knocking at the door take over. Control societies are taking over from disciplinary societies' (Deleuze 1995: 178).

In other words, Foucault recognised the end of the relatively brief historical reign of the disciplinary model of power that followed the sovereign model and that had been progressively replaced by the control model since the end of the Second World War. In the course of a 1977 interview, 'The Eye of Power', he noted that 'disciplinary power was in fact already in Bentham's day being transcended by other and much more subtle mechanisms for the regulation of phenomena of population, controlling their fluctuations and compensating their irregularities' (Foucault 1980: 160).[16] Moreover, the fact that he had devoted *Discipline and Punish* to the detailed analysis of the disciplinary model is difficult to reconcile with Deleuze's thesis regarding the meaning of 'actuality' for Foucault. In the terms of Deleuze's hypothesis, *Discipline and Punish* should have analysed what we are in the process of becoming rather than confining itself to the disciplinary society that we were. It is true that in his lectures in the years that followed the publication of this book Foucault did focus on technologies of power that succeeded the disciplinary model, such as mechanisms of security. But this led him in an altogether different direction to that suggested by Deleuze's account of control society, namely towards the analysis

of different forms of governmentality and a genealogy of liberal and neoliberal government. This project led him in the direction of a more and more refined study of the different means by which states sought to act on the actions of people. In the terms of Foucault's study of different forms of governmentality, the idea that a society might be defined by a single diagram of power in the manner that he had suggested in *Discipline and Punish* no longer played a role. Deleuze's Foucault is based upon an earlier moment of Foucault's thought but also upon a philosophical conception of history that does not have the same commitment to realism, or rather the same means of expressing historical reality. For Deleuze, it is the philosophical concept rather than historical knowledge of the past that is supposed to act upon our experience of the present.[17] In the end, they held very different views of the relation between activism and philosophy.[18]

Notes

1. The *Groupe d'information sur les prisons* (GIP) grew out of efforts to support Maoist militants imprisoned during the repression of leftist activity in 1970. Its aim was to gather and publish information about conditions in French prisons and it was organised as a decentralised series of groups around particular prisons. For further information see Deleuze's 'Foucault and Prison' (Deleuze 2007: 277–86) and Defert and Donzelot 1976.
2. As well as this book, a thorough treatment of their relationship would need to take into account the interviews in Deleuze 1995 as well as the interviews and other texts about Foucault in Deleuze 2007. The present article is well short of a comprehensive discussion of the topic but one that I hope will stimulate further investigation.
3. See Deleuze and Foucault 1972. This interview is reprinted in Foucault's *Dits et écrits*, tome III (Foucault 1994: 306–15). English translations appear in Foucault 1997: 205–17 and Deleuze 2004: 206–13. Page references are to the latter version, although the translations are modified.
4. See 'Powers and Strategies', a 1977 interview with the editorial collective of *Les révoltes logiques*, in Foucault 1980: 134–45.
5. See for example Chaloupka 2003 and Rowe and Dempsey 2004.
6. Foucault's review '*La grande colère des faits*' appeared in *Le Nouvel Observateur*, 625, 9–15 May 1977, pp. 84–6. It is reprinted in Foucault 1994: 277–81.
7. Deleuze's text, '*A propos les nouveaux philosophes et d'un problème plus général*', dated 5 June 1977, was first published as an interview in *Le Monde*, 19–20 June 1977. It was also printed as a supplement to the journal *Minuit* (no. 24, May 1977), and distributed free of charge in bookshops. It is included in *Two Regimes of Madness* as 'On the New Philosophers (Plus a More General Problem)' (Deleuze 2007: 139–47).
8. Eleanor Kaufman writes a propos their different attitudes towards the Croissant issue: 'Foucault's support was on legal grounds, and he did not sign the petition that expressed a more vehement condemnation of West Germany's totalitarianising tendencies. The clash between Foucault's position and Deleuze's

more extreme one seems to have been the principal ground for their falling-out' (Kaufmann 1998: 248). She cites Eribon 1991: 258–62, and Macey 1994: 392–7. See also Dosse 2010: 314.

9. Translated in *Two Regimes of Madness* as 'Europe the Wrong Way' (Deleuze 2007: 148–50). I have been unable to determine whether this article is identical to the text of the petition circulated by Guattari. It contains no characterisation of the West German State as fascist nor any suggestion that it was becoming a police dictatorship. However, since Senellart refers explicitly to this text it is appropriate to ask whether it might be read as implying support for terrorist action.
10. Dosse comments that Guattari's refusal to publicly condemn the actions of the RAF or the Italian Red Brigades in 1977–8 may perhaps be explained by his own underground efforts to dissuade many of those tempted by terrorism (Dosse 2010: 295). See also Guattari's review of the film *Germany in Autumn*, in which he comments that the only result of the RAF's actions 'will have been to echo the collective melancholia that has present-day Germany in its grip' (Guattari 1982: 108).
11. Michel Senellart comments in his essay contextualising the 1977–8 and 1978–9 lectures that the study of German neoliberalism and American anarcho-liberalism 'is Foucault's sole incursion into the field of contemporary history throughout his teaching at the Collège de France' (Foucault 2007: 385). Francesco Guala describes the lectures in 1979 as his one and only 'diversion into contemporary political philosophy' (Guala 2006: 429).
12. In the section of Part One of *Thus Spoke Zarathustra* entitled 'On the New Idol', Nietzsche writes: 'State is the name for the coldest of all cold monsters. Coldly it tells lies; and this lie crawls out of its mouth: "I, the state, am the people"' (Nietzsche 2005: 43).
13. Deleuze and Guattari develop their own detailed and complex analyses of fascism. A thorough comparison of their approach with Foucault's governmentality analysis would need to take this into account. See, for example, Holland 2008 and Protevi 2000.
14. The interview with Negri first appeared in *Futur antérieur*, no. 1, Spring 1990. The 'Postscript' first appeared in *L'autre journal*, May 1990. Both are reprinted in *Negotiations* (Deleuze 1995: 169–76; 177–82). See also the comments in 'What is an Act of Creation?' (Deleuze 2008: 317–29).
15. The original text reads: 'La nouveauté d'un dispositif par rapport aux précédents, nous l'appelons son actualité, notre actualité. Le nouveau, c'est l'actuel. L'actuel n'est pas ce que nous sommes, mais plutôt ce que nous devenons, ce que nous sommes en train de devenir, c'est-à-dire l'Autre, notre devenir-autre. Dans tout dispositif, il faut distinguer ce que nous sommes (ce que nous ne sommes déjà plus), et ce que nous sommes en train de devenir: la part de l'histoire, et la part de l'actuel' (Deleuze 2003: 322).
16. Earlier in the same interview, he commented that 'the procedures of power that are at work in modern societies are much more numerous, diverse and rich' (Foucault 1980: 148). See also *Dits et écrits*, tome III, 'La société disciplinaire en crise' (Foucault 1994: 532).
17. Deleuze acknowledges the difference between his own and Foucault's commitment to history in commenting in an interview that he did not approach things 'through structure, or linguistics or psychoanalysis, through science or even through history, because I think philosophy has its own raw material that allows it to enter into more fundamental external relations with these other disciplines' (Deleuze 1995: 89).
18. I am grateful to Marcelo Svirsky and an anonymous reader for helpful comments on an earlier draft of this paper.

Politics in the Middle: For a Political Interpretation of the Dualisms in Deleuze and Guattari

Rodrigo Nunes Pontificia Universidade Católica do Rio Grande do Sul

Abstract

The paper identifies three recent lines of interpretation of the politics that can be derived from Deleuze and Guattari, all of which share a way of reading the dualisms in their work that can be traced back to how they understand the actual/virtual partition, and to an alleged pre-eminence of the virtual over the actual. It is argued that this reading is not only inaccurate, but obscures the political dimension of Deleuze and Guattari's work. Clarifying the latter requires a reinterpretation of the dualisms involved (as dyads rather than binaries), of the relation between virtual and actual (as a formal distinction where one acts back upon the other), and the drawing of a clear distinction between what Deleuze calls a 'transcendent exercise' of thought and sensibility and the properly metaphysical exercise that sets up the distinction between virtual and actual. What then appears is an image of Deleuze's and Guattari's thought that is far more concerned with practical questions and with a situated political practice of intervention.

Keywords: dyad, immanence, univocity, virtual, actual, intervention

That dualisms play a major structural role in Deleuze's and Guattari's work, both solo and collaborative, is a fact that will have escaped no reader. One could, in effect, speak of three ways in which dualism appears in it as a problem. At first, dualism itself is identified as the problem, a target and mark of what to avoid in philosophy: 'the only

Deleuze Studies Volume 4: 2010 supplement: 104–126

enemy is two' (Deleuze 1973), ultimately the One/Multiple opposition behind both monism and dualism. It is exactly the false choice between these two pairs that the concept of 'multiplicities' is supposed to disarm. But the alternative that follows is set up as an irreconcilable opposition – in the end, 'one can only think in either monist or pluralist terms' (Deleuze 1973). Inevitably, this will raise the recursive suspicion that such a dichotomy is itself still mired in dualistic thinking. Finally, this will in turn cast suspicions over all the other dualisms that run through Deleuze and Guattari's work. They acknowledge as much in the introduction to a book whose dualistic nature is most obvious:

> We make use of a dualism of models only so as to arrive at a process that would refuse every model. . . . To arrive at the magical formula that we all search for: PLURALISM = MONISM, going through all the dualisms that are the enemy, but the absolutely necessary enemy, the furniture we are constantly moving around. (Deleuze and Guattari 2004a: 31)

It is obvious why they would find it necessary to exorcise such suspicions: the threat they represent is nothing less than the ultimate failure of some of the highest avowed goals of their philosophy. If the point is to affirm the univocity of Being, then allowing any form of dualism to creep in risks reintroducing a categorial distinction within Being that returns it to its Aristotelian equivocity. If the point is to affirm an absolute immanence 'immanent to nothing but itself' (Deleuze and Guattari 2003: 49), then the danger is the re-institution of a metaphysical supplement outside the plane of immanence, thereby reintroducing the dative relation that is the sign of transcendence.

Alain Badiou is the most prominent commentator to have stressed how these dualisms can be traced back to the crucial distinction between actual and virtual: according to him, 'the nominal pair virtual/actual exhausts the deployment of univocal Being' (Badiou 1997: 65). While it is not, as I hope to show, a matter of simply reducing all other oppositions to this one, or even of mapping them onto either side of the line, Deleuze's own final statement on his philosophical project would seem to warrant such a conclusion. In his last published essay, the flag of his early 'transcendental empiricism' is unfurled into the presentation of a pure plane of immanence or transcendental field by which the given is given to empirical representation, a field containing nothing but 'virtuals [which] become actualised in a state of affairs and a lived state' (Deleuze 2003c: 363). If it plays such a central part in Deleuze and Guattari's thought, it is inevitable that the virtual/actual distinction should also have a determinant role in interpretations of their work – and thus also

in the assessments that have been made of its political consequences, which is our specific concern here. Looking at recent examples of the latter, I suggest there are three general lines along which they appear, all of which can be traced back to a shared manner of reading the virtual/actual dualism – which, in turn, affects their approach to other dualisms more generally, and to politics specifically. My contention is that the errors common to all three approaches obscure the ways in which Deleuze and Guattari can be useful for thinking political practice. Proposing an alternative reading – in which their dualisms appear as *dyads* instead of *binaries* – coupled with an analysis of these errors, may thus shed some new light on what an activist practice inspired by Deleuze and Guattari *can be*, as well as aiding the negative task of pointing out what (*contra* these three lines of interpretation) it *is not*.

I. Three Times Two Equals One

Let us start by identifying these three different ways of thinking the relationship between Deleuze and Guattari's thought and politics, the first of which expresses a positive evaluation, the other two a negative one. The first approach generally corresponds to a dominant strain in the 'revival' enjoyed by the two thinkers since the 1990s (itself largely due to their English-language reception), in various academic disciplines as well as in some political and artistic circles. Here, Deleuze and Guattari appear as proponents of a politics of 'movement'. Not only a politics of flux over stasis, but also one that pitches social movements (in the broad sense) against institutions (state, parties, unions, etc.), and values openness over identity, nomadic displacement over attachment, the temporary, the mobile, the small-scale and the micropolitical over larger, more permanent and cohesive forms whose horizon would be macropolitical.

It is obvious that this approach finds much support not only in explicit statements made by Deleuze and Guattari themselves, but in many of their overt political commitments and practices.[1] While this interpretation runs diffusely through several texts and political or aesthetic practices, it was arguably the publication of Hardt and Negri's *Empire* (2000) that provided it with a focal point, and the reasons for its prevalence are to some extent tied in not only with that book's success, but with the conditions that enabled it: a worldwide tide of political mobilisation, the protagonists of which by and large fell outside more traditional organisational forms, and which, having first tasted the subversive potential of new communication technologies, articulated a

politics that pointed beyond the limits of the nation state towards a transnational space created by the consolidation of the global capitalist market. It seemed natural that some of those taking part in this moment would find resonances in Deleuze and Guattari's politics. For its positive take on their work, and for the importance this acquired in certain political milieus, one could call this the *activist* line of interpretation.

The centrality suddenly achieved by two such eccentric (in every sense of the word) thinkers has elicited a critical reaction in which we can identify the two other main lines of interpretation. Here, Deleuze and Guattari appear as either *anti-political/depoliticising* or else as *political despite themselves*. In the first case, they are charged with retreating from the site of politics itself into either a quasi-mystical contemplation of the boundless power of creation, of which actuality is only a limitation, or into the purity of a utopianism lacking any footing in the concrete constraints of practice. From this perspective, Deleuze and Guattari are ultimately indifferent 'to any notion of change, time or history that is mediated by actuality' and to the relations and 'politics of this world' (Hallward 2006: 162), caught up in the aristocratic *askesis* of a thought that reaches beyond the actual towards a reunification with an all-productive One-All (Badiou 1997: 22–3); or else are incapable of understanding the most fundamental insight of Marxism-Leninism, for which the question of strategy lies precisely at the point where necessity and liberty cease to be opposed in absolute terms and become related in the situatedness of political action (Badiou 1977: 37–8). In the second case, the equation of resistance with an affirmative desire as power to differ turns Deleuze and Guattari into the unwitting apologists of a capitalism that works precisely through the modulation of desire and the production of difference: here, in short, they become the 'ideologist[s] of late capitalism' (Žižek 2004: 184). If "'enjoy in your little corner"' is 'the maxim of rhizomatic multiplicities' (Peyrol[2] 1977: 50), this can either be read as a call away from political work proper into self-indulgent, inconsequential distraction, or, worse, as the promise of an unfettered expression of desire that may have appeared radical in the 1970s, but which has since then been recuperated into the mechanisms of capitalist accumulation and political legitimation. When resistance has become effectively indistinguishable from capitalism, it can offer no answer to the question: 'how, then, to revolutionise an order whose very principle is constant revolutionising?' (Žižek 2004: 213).

From the point of view of the virtual/actual partition and the other dualisms, it is immediately striking that the image of Deleuze and Guattari's thought that can be extracted from each alternative is

ultimately quite similar. In fact, the first stands in an inverted relation to the other two, so that what appears as positive on one side is negative on the other, and vice versa. This inversion overdetermines the evaluation of all the dualisms whose political sense is more immediately obvious: major/minor, molar/molecular, *dispositif*/line of flight, state/nomad, macro/micropolitics, re/deterritorialisation… In all three versions, the series of first terms is placed on the side of the actual, while the series of second terms falls on the side of the virtual. Not only do they take the distinction as a starting point, they are also clearly premised on a prevalence of the virtual side over the other: 'we need two names for the One *in order to experience that it is from only one of them that springs the ontological univocity designated by the nominal pair*' (Badiou 1997: 65; original emphasis). As a consequence, the image of Deleuze and Guattari's thought that emerges is one that ascribes philosophical and political eminence to the second series to the detriment of the first: a philosophy and a politics of the virtual, the minor, the molecular, the micropolitical, nomadism, lines of flight, and (absolute) deterritorialisation.

It is important to notice that, although both critics and advocates share this *doxa*, each arrives at it in a different way. While the two tomes of *Capitalisme et schizophrénie* tend to be enthusiasts' main point of reference, Badiou's critique is mostly predicated on Deleuze's solo work, where political concerns are much less explicit, and gives little attention to Guattari. Žižek, on the other hand, insists on a sharp break and change of direction taken by the 'original', 'good' Deleuze – from the sterile Sense-Event as the effect of bodily causes towards a notion of becoming as the virtual production of the actual – under the "'bad" influence' (Žižek 2004: 20) of the activist Guattari. Hallward is the only one to grant the same weight to the collaborative works, which would stand in continuity to the others in so far as they also subscribe to a logic where the stress placed on the virtual empties the relations among actual elements/bodies in favour of the direct relation of each actual thing to its virtual 'ground'.

This inverted relation explains the tone common to the three critiques of Badiou, Žižek and Hallward: that of 'revealing' the true face of a thought misread by its 'disciples'. 'Which Deleuze?', Badiou starts by asking; and the answer is quickly forthcoming: we must uncover, behind the usual image of the affirmation of difference and multiplicitous heterogeneity, a 'metaphysics of the One' (Badiou 1997: 20) in which the impulse of thought, though singular each time, is always reconnected to its source in the One-All. Against the same misconception, Hallward

offers a portrait of a philosophy in which what matters is 'the redemptive re-orientation of any particular creature towards its own dissolution', a 'spiritual, redemptive' Deleuze who is unconcerned with matter, nature or the world, an '*extra*-worldly' thinker of '*dis*-embodiment and *de*-materialisation' (Hallward 2006: 3; original emphasis). Žižek's position is slightly different, as for him one must rescue the true Deleuze and his politics from 'the deadlock and impotence of the "popular" Deleuzian politics' and 'the popular image . . . based on the reading of the books he co-authored with Félix Guattari' (Žižek 2004: xi–xii). While not spelled out in Badiou, this political dimension also figures in Hallward, who closes his book with the suggestion that 'those of us who still seek to change the world and to empower its inhabitants will need to look for our inspiration elsewhere' (Hallward 2006: 164).

At any rate, and whatever one makes of these critiques, it is clear how they aim at the heart of Deleuze's project, solo or with Guattari. In Badiou's and Hallward's *anti-political* account, the weightiest charges are at least three. First, that the professed immanentism is in fact a philosophy of emanation; as such, Deleuze and Guattari fail to make the 'conversion' by which 'univocal Being is said of difference and, as such, revolves around beings' (Deleuze 2003a: 91) and instead make the actual/creatural entirely dependent on the creative, self-differentiating power of an extra-worldly One. Second, and consequently, that a categorial distinction ultimately subsists between virtual and actual, entailing a failure to sustain the univocity of Being and a slippage between immanent and eminent or emanating cause.[3] Third, that the resulting thought of individuation is ultimately grounded in what Deleuze calls the pre-critical 'negative of limitation' – and one should recall here Deleuze's entreaty that 'every reduction of individuation to a limit [i.e., as the finite that is said by limitation of the infinite] or complication of differenciation compromises the whole of the philosophy of difference' (Deleuze 2003a: 318). The *political despite themselves* version of the critique, on the other hand, returns to Hegel's critique of the tautology of Spinoza's Substance and gives it a Marxian twist: anything that affirms the world is inevitably too compromised by it; genuine critique can only come from negating it; and so Deleuze and Guattari can only capture their time in a mystified form, by (re)producing its ideology.

Now, if all three interpretative lines – one positive, two negative – only invert the values of a common basic understanding, a defence of the political significance of Deleuze and Guattari's thought will have to share with the critiques a certain task of 'demystification'. In other words, we

may have to rescue Deleuze and Guattari from (some) friends as much as from their foes. If that is the case, the best way to proceed is by working back towards what the three alternatives share – an emphasis on the virtual/actual distinction, and on the pre-eminence of the former over the latter.

II. The Flux *and* the Party?

We could, in fact, start precisely with a situation in which Guattari publicly disagrees with someone attempting to reclaim his thought. In the early 1980s, Guattari travelled to Brazil on the invitation of fellow psychoanalyst and cultural critic Suely Rolnik, where he took part in various encounters and more or less formal debates with several groups from the political milieu that, at that time, was consolidating itself into the Workers' Party (PT). Alongside other texts – including a dialogue between Guattari and a then thirty-something Lula, fresh out of leading the metalworkers' strikes of the late 1970s and running for office for the first time – these debates were collected by Rolnik in *Molecular Revolution in Brazil*, a quietly influential book in Brazil that has only recently appeared in English.

As we have seen with Žižek, Guattari can sometimes be presented – especially by philosophers – as the 'activist' who drew Deleuze away from his rigorous philosophical path. For pretty much the same reason, he finds a warmer reception in the *activist* line of interpretation. This makes it all the more remarkable to discover him involved in the following exchange, in which his interlocutor begins by praising 'what I understand of what Guattari thinks' – that there is a need for 'various molecular revolutions … a multiplicity of feminist, lesbian-feminist, black, and other groups, questioning patriarchal or phallic structures' that should invest in constructing 'new forms of performance, assemblages that seek to question those power structures' that, like the party, reproduce 'the patriarchal structure' (Guattari and Rolnik 2008: 123–4). Guattari replies:

> If the movement works like that, OK. But there might also be situations in which it falls apart. I'll give a historical example: all the different components of the *Autonomia* movement in Italy broke down, and often because of this kind of discourse.… They organized themselves in structures – very interesting ones, actually, such as publishing houses and cooperatives – which within a few months became completely depoliticized.… No doubt this process would have appeared at some point in history, one way or another. Nevertheless, a different script could have been written: the autonomization

> of the feminist members operating as a factor to reinforce the effectiveness of movements [instead of their] collapse into a black hole. Just imagine if all the women in the PT . . . suddenly decided to say: 'That's it, we've had enough of Lula and all that, we're off.'
>
> Comment: And then they'd organize themselves into women's groups. I think that would be great!
>
> Guattari: Maybe. But to think it great that a movement like the PT should disappear is debatable, to say the least. (Guattari and Rolnik 2008: 124–5)

This exchange is located at the intersection of two series: that of a country (Brazil) reaching the end of a military dictatorship that had prevented various micropolitical transformations brewing throughout the 1970s, and whose main point of convergence in the 1980s would become the PT, from entering into compositions that lent them consistency and urgency; and that of a European (Guattari) processing the sometimes tragic defeats of the previous decades, the double edge of Mitterrand's electoral victory, and the onset of the *années d'hiver* of Integrated World Capitalism. The caution and nuance shown in Brazil perhaps have something to do with this descendent curve. It is certainly easy to follow a difference in tone in his collaborations with Deleuze, from the post-1968 heat of *L'Anti-Oedipe* to the exhortations to restore our faith in this world in *Qu'est-ce que la philosophie?* Had they lost faith in movement, in micropolitics, in the molecular – in all those things we recognise the *activist* Deleuze and Guattari for – and settled instead for the reform that you could get, the *change you could believe in*? Or was there never an a priori choice between micro- and macropolitics, molecular and molar, minor and major in the first place?

We must take note that even *L'Anti-Oedipe*, an exalted book if there ever was one, does not speak of a *choice* as such. In fact, the opposition between molecular and molar is presented as a 'theory of the two *poles*' (cf. Deleuze and Guattari 2008: 406ff.). This is because

> there is molar *and* molecular everywhere: their disjunction is a relation of inclusive disjunction, which varies only according to the two senses of subordination, depending on whether the molecular phenomena are subordinated to the large ensembles, or subordinate them instead. (Deleuze and Guattari 2008: 407; original emphasis)

How are we to conceive of a dualism that is not a choice? In speaking of two 'poles', what may well have been in Deleuze's and Guattari's minds is the Simondonian *dyad*. This Platonic notion, which interestingly does not figure in Deleuze's review of Simondon's *L'Individu et sa genèse physico-biologique* (Deleuze 2004b: 120–4), plays arguably as structural

a role in Simondon's thought of individuation as does the virtual/actual pair for Deleuze; it is certainly through it that, 'in Simondon's dialectics, the problematic replaces the negative' (122). For a dyad is a relation of inclusive disjunction between two indefinite terms in a dynamic relation of tension that constitutes a field in which the terms themselves become singularised. It is the mistake of the hylemorphic schema to assume the extremes as already individuated givens; the primacy of the pre-individual entails that there is only a polarised directionality between two indefinite extremes, so that 'every realised quality appears as a measure in an indefinite dyad of absolute and opposed qualities' (Simondon 2005: 163).

It seems perfectly clear that the overarching opposition of *L'Anti-Oedipe* and *Mille plateaux* – capitalism and schizophrenia – is meant not as a binary, but as a dyad. Between the two, neither is desirable: 'we have only spoken of a schizoid pole in the libidinal investment of the social field, to avoid as much as possible the confusion of a schizophrenic process with the production of a schizophrenic' (Deleuze and Guattari 2008: 455). 'One does not attain the BwO, or its plane of consistency, by de-stratifying wildly' (Deleuze and Guattari 2004a: 199). But this logic should be extended to the other dualisms: if we understand the opposition between molar and molecular (major and minor, macro and micropolitical etc.) as dyadic, there is no contradiction between Guattari's apparent support of the (seemingly) macro against micropolitical forms in the quotation above. What he saw in that moment of Brazilian history was the PT as the focus for a process of convergence that intensified the heterogeneous desires and groups that went into its constitution, while managing to stop their differences from just being annulled; and Lula, the charismatic figure relayed by the mass media, not as ' "the Father of Oppressed" or "the Father of the Poor"', but 'the vehicle of an extremely important vector of dynamics in the current situation', for 'nowadays one can't consider the struggles at all the levels without considering this factor of the production of subjectivity by the media' (Guattari and Rolnik 2008: 240). This is Lula not (or hopefully not) as the mirror that would become the fixed other of transference, but as a 'transitional object' that could be reappropriated by those projecting themselves onto him.

We must indeed conclude that Deleuze and Guattari establish *no* absolute opposition between, to borrow the title of Badiou's (1977) polemic, 'the flux' and 'the party'. There is no *a priori* choice concerning the forms in which the virtual may become actualised, since that would be to assume these forms as self-identical givens, rather than to think

them as singular solutions within a problematic field defined by two extremes. What matters is that 'there be' virtuality, deterritorialisation, or potential each time – and that it be, as it were, 'cultivated'. To be sure, one can point out the greater arborescent tendency inherent in the party-form, or the risks inherent in the growing identification of a movement with a charismatic, mediatic leader (who then ceases to be a transitional object and becomes the mirror of transference). But to dismiss either outright on the grounds that they possess a 'transcendent' form is precisely to think in a transcendent way: separating the actual from its virtual conditions, reducing it to an a priori form 'filled' each time with content, rather than a singular being each time.

III. To Have Done With Dualisms

Yet does this not take us back to that point common to all three approaches to Deleuze and Guattari's politics: the preponderance of the virtual over the actual? If the 'real' movement, even in the political sense, is that of the virtual, does one not end up with precisely what a philosophy of immanence was supposed to counter: a negation of this world, its vicissitudes and the challenges it imposes on us, and a search for comfort beyond it? Are the critics not correct in pointing out a tendency towards pointless idealism, or the risk of celebrating all one opposes by always discounting actual processes and effects in favour of their potentials? Given practical application, does all this not effectively tend towards an exclusive emphasis on the 'small' or the 'local', and ultimately a refusal of any form of concerted action, scalability, negotiation, institutionalisation, mediation...? A stubborn refusal to see the larger picture in which one may, after all, be complicit – or a condemnation to self-satisfied subcultural irrelevance?

The crucial element here is the verb *to tend*. It is undeniable that the various critiques play on tendencies found in Deleuze and Guattari; the question is what we can gain from resisting their downplaying of other tendencies, and what image of their thought emerges when it is taken as a whole, rather than in half. To that end, we must return to the philosophical questions concerning the virtual/actual distinction. 'In order to suppress the opposition between the One and the Multiple' – precisely the one in which Deleuze and Guattari would be entangled – one must make 'one and multiple cease to function as adjectives in order to give place to a noun: there are only multiplicities' (Deleuze 1973). The point is, precisely, that 'there are two kinds of multiplicities' (Deleuze 2004a: 33), as per Bergson's modification

of Riemann. The one is characterised by 'exteriority, simultaneity, juxtaposition, order, quantitative differenciation, *difference in degree*, a numerical multiplicity, discontinuous and actual'; the other is 'internal, of succession, fusion, organisation, heterogeneity, qualitative discrimination or *difference in nature*, a *virtual and continuous* multiplicity that is irreducible to number' (Deleuze 2004a: 30–1; original emphasis). In the first case, there is only actuality, actual relations. In the other, a 'line that goes from the virtual to its actualisation', an indivisible line whose each division amounts to a change in nature, that is, to an actualisation that happens 'through differenciation, along divergent lines'; the virtual 'to the extent that it becomes actualised [*en tant qu'il s'actualise*], in the process of becoming actualised [*en train de s'actualiser*], inseparable from the movement of its actualisation' (Deleuze 2004a: 36).

In this one finds the elements with which to dispel once and for all the myth of a political 'cult of the small' in Deleuze and Guattari: if the virtual is continuous, and thus foreign to number – if the operation of counting belongs to the actual, and is therefore a way of bringing the virtual into actualisation – then micro or molecular politics is not defined by its opposition to large numbers or scalability. Through its focus on the virtual, it is in fact entirely indifferent to scale, size, or measurement itself, in the same way that the opposition between singularity and totality (the latter being the category that would define dialectical, and as such Marxist, thinking) does not entail the automatic conclusion that 'small is beautiful'. If 'small' can only be said of discontinuous, actual multiplicities, 'micro' and 'molecular' refer to the virtual, continuous multiplicities that are implicated in *any* discrete multiplicity, *big or small*. This is why there is no a priori choice that excludes any actual existing party or leader, or the party-form and the leader-form as such. It is clear, then, that the 'cult of the small', whether celebrated by 'activists' or countered by critics, is premised on a very elementary confusion between the two kinds of multiplicity, when the whole point is exactly not to oppose the Multiple to the One, '*but on the contrary to distinguish two kinds of multiplicity*' (Deleuze 2004a: 31; original emphasis). The extensively 'small' is only 'beautiful' to the extent that it envelops more intensive potential; it can otherwise be quite ugly, turning in upon itself in a passive flight, a suicidal 'black hole', or a reactionary reterritorialisation. It is, in fact, the same distinction at work in the opposition between majoritarian ('not a relatively greater quantity, but the determination of a state or standard according to which greater as well as smaller quantities will be said to be minoritarian') and

minoritarian ('one must not confuse "minoritarian" as a becoming or process and "minority" as an ensemble or state') (Deleuze and Guattari 2004a: 356).

It is important to notice that, unlike all the oppositions it founds, the one between actual and virtual multiplicities is in itself not dyadic. The crucial thing, however, is that the difference between them *not* be taken as categorial, as that would mean that Being itself is irremediably split, and is thus not said in *one*, but *two* senses. It is clear that, for Deleuze, they are to be understood in the same way as he interprets the attributes of extension and thought in Spinoza: as two *formally* (qualitatively, quidditatively), not *ontologically*, distinct sides of the real (cf. Deleuze 2002a: 30–1). Ontologically the same, they can be distinguished in *thought*. This is why the heart of *Différence et répétition* is a chapter on the 'image of thought', which almost 20 years later Deleuze will describe as 'the most concrete and necessary, and leading onto the following books, up until the researches with Guattari, when we invoke . . . a rhizomatic instead of an arborescent thought' (Deleuze 2003b: 283): for the task of 'transcendental empiricism' is none other than to institute a new image of thought.

Throughout Deleuze's oeuvre, including the books with Guattari, it is possible to discern two meanings of 'thought'; two different levels that one could roughly map onto Spinoza's first two modes of knowledge. First, there is thought as representation, which can be understood, with Kant, as the subsumption of a (differential) manifold under conceptual identity. It is never a case of ascribing a secondary reality to the actual, disputing the rights of representation, or arguing that it does not give us something true about the world – that it is a simulacrum or illusion that hides from us the true, virtual realm of Being. On the contrary, Deleuze (and Guattari) are, like Bergson, perfectly happy to acknowledge its practical utility, or that of science: being able to recognise identities is an evolutionary advantage to the extent that it imposes some degree of predictability on the world. The illusion lies not in representation itself, but in the hypostasis of the empirical/actual as the totality of Being. This is why we need a second level of thought that allows us to see the actual as the singular expression of virtual conditions. Given the same phenomenon, this second level allows us to perceive what appears as an identity for the first as being itself constituted by differences *that differ in time*; the empirical is cracked open by what undermines its self-identity and delivers it to new becomings. We can thus say at once that what appears to us is always new, and that it is only from the perspective of a higher, 'transcendent exercise' (Deleuze

2003a: 258) that it can appear as new. Every thought in the first sense appears as new, every repetition as productive of difference – every arborescence traversed by the rhizomatic, every assemblage by lines of flight, every majority by minoritarian becomings, every molarity by the molecular, etc. – when the actual is conceived in relation to its virtual potentials. The evolutionary advantage brought by representation must thus be qualified: the transcendent exercise that uncovers the differential conditions of existence of the empirical is above all a *practical* matter of liberating the potentials given in the present, of seeing the given actual as not necessary, but as open to transformation.

Clearly, however, if the transcendent exercise of thought *relies* on an actual/virtual partition, it cannot *found* it in itself. It requires a 'third mode' of knowledge, a properly *metaphysical* exercise of thought, to provide it. This is why Deleuze – celebrated by Badiou in this regard – remained entirely indifferent to the theme of the 'end of metaphysics' (cf. Badiou 1997: 69). If the point is to advance a new image of thought capable of connecting to what falls *outside* the reduction of the real to *the empirical*, only a *meta*-physics will do. Yet this metaphysics cannot be founded on the immanent movement of history, nor in any apodictic way – since the new image defines thought precisely as the *problematic* expression of virtual ideas. The key here is the Kantian distinction between knowledge and thought. While we need a metaphysics to *think* what this realm of virtuality may be, it is itself premised on the possibility of a transcendent exercise: it is *because* there is a transcendent exercise of sensibility that *senses* (but does not *perceive*) virtual intensities, and a transcendent exercise of thought that *expresses* (but does not *experience*) virtual ideas, that a metaphysical *thought* (and not *knowledge*) is possible.

Once the possibility of a new image of thought has been established – once the 'transcendental' moment has been dealt with – it is no longer a matter of providing a philosophical account of how problems are determined, but of determining them: of experimenting (with) immanence, with what it means to live 'in' (or maybe 'live out') immanence. 'In my earlier books, I tried to describe a certain exercise of thought; but describing it is not yet exercising thought in that way', says Deleuze; 'proclaiming "Long live the multiple" is not yet doing it, one must do the multiple' (Deleuze 2006: 13).

This allows us to understand the importance acquired by concrete ethico-political questions, in particular the dialogue with Marx and the confrontation with the capitalistic plane of immanence, in the two volumes of *Capitalisme et shchizophrénie*. But the goal of instituting

a new practical reason had been clear from the start: 'none of this would matter if it were not for the practical implications and the moral presuppositions of [the representative] distortion' – the 'conservatism' that turns us away 'from the highest task – that of determining problems, of applying to them our decisive and creative power' (Deleuze 2003a: 344). That metaphysics is necessary for an ethics, but must be measured by the latter's effects: this, and not a direct rational (or mystical) intuition of the One-All, is Deleuze at his most Spinozist.[4]

IV. 'Do the Multiple'...

Once the partition of virtual and actual has been attained, it can be applied to the practical task of orienting oneself in the world. We have seen that, for Simondon, orientation always presupposes a position along an indefinite dyad (indefinitely cold/hot, high/low, etc.). A dyad, in fact, is nothing other than a continuous multiplicity that changes in nature (that is, differenciates into a discontinuous multiplicity) when divided; thus, for example, it is along a continuum of indefinitely more painful/pleasurable that sensations can be individualised into perceptions of 'pain' or 'pleasure'. Now, if what we could call Deleuze's and Guattari's *dualisms of orientation* are such continua, it is necessary to conclude that the oppositions they establish define two indefinite *virtual* directions along which actualisations take place. This implies, firstly, a relation of 'more or less' in any actualisation: an actuality can be(come) *more or less* rhizomatic, molecular, minoritarian, smooth, *more or less* arborescent, molar, majoritarian, striated... Secondly, it affords two different registers by which to analyse one and the same assemblage: according to the (virtual) 'lines of segmentarity that stratify, territorialise, organise, signify, attribute it', or the (virtual) 'lines of deterritorialisation through which it flees incessantly' (Deleuze and Guattari 2004a: 16). Evidently, (re)territorialising potential will tend to the stabilisation of some actual forms, which in turn act back upon the virtual conditions of the assemblage as whole. This means that the first register of analysis always necessarily includes actual forms (state apparatus, institutions, binary molarities), though not simply as opposed to and cut off from virtuality; thus, for instance, the concept of totalitarian state 'is only valid on a macropolitical scale', but 'fascism is inseparable from molecular foyers that pullulate and go from one point to another *before* they resonate all together in the national-socialist state' (Deleuze and Guattari 2004a: 261).[5]

In all such dualisms there is, strictly speaking, *only* the middle: if they constitute virtual continua, it would be absurd to ascribe an actual existence to either pole. Moreover, the formal distinction of actual and virtual effectively forbids anything being actualised as, say, 'purely' molar or 'purely' molecular: a purely molar assemblage would be one without any virtual potential (which, as we have seen, is only the way in which actualities *appear* in representation), while pure virtual potential is by definition not actual. To put it schematically, one could say that the 'less virtual' pole has as its limit an actuality with a minimal degree of virtuality *above zero*; while the limit for the 'less actual' pole is the knowable and livable: the point beyond which there is only a chaos where no actuality takes hold.

This designation of 'less virtual' and 'less actual' is evidently inappropriate, since we are talking about two *virtual* directions along which elements are *actualised* as more or less open to variation, as possessing more or less virtual potential. But putting it in such terms can help us understand why it cannot be a matter of *choosing* one extreme over the other: the choice is simply impossible, as beyond each limit there is only impossibility – an actuality without virtuality or chaos.

But what does it mean to speak of 'limit' here? There is a common thread to the *apolitical* and other-worldly Deleuze and Guattari, the *political despite themselves* apologists of a boundless power of deterritorialisation that is ultimately capital's own, but also to a certain aestheticised *activist* celebration of tiny exceptions and infinitesimal local subversions, and to Hardt and Negri's substantialisation/anthropomorphisation of absolute deterritorialising power in the form of the multitude: all of them collapse *metaphysical* and *transcendent* exercises of thought into one another, and thus erase the crucial distinction between *knowledge* and *thought*. For if metaphysics can pose a plane of immanence as absolute deterritorialisation in *thought*, it does not deliver any *empirical knowledge* of the plane *as such*. 'Empirical knowledge of absolute deterritorialisation' is by definition a nonsensical formulation, since absolute deterritorialisation, as pure chaotic virtuality, entails the inexistence of any (actual) subject for whom it could appear as an (actual) empirical object.

The 'transcendent [exercise of a faculty] does *not at all* mean that it addresses itself to objects *outside of the world*, but, on the contrary, that it grasps *in the world* that which concerns it exclusively, and which gives birth to it in the world' (Deleuze 2003a: 186, emphasis added). This is why the 'highest task' of 'determining problems, of applying to them

our decisive and creative power' is a concrete, *practical* question through and through: the transcendent exercise that Deleuze invites us to engage in consists in thinking the actual in relation to its virtual conditions so as to liberate the potential for the new in the present – but precisely *not* as a leap into unbounded potentiality. It is a matter of activating the virtual of *this* actual, '*to the extent* that it becomes actualised [*en tant qu'il s'actualise*], *in the process of* becoming actualised [*en train de s'actualiser*], *inseparable from the movement* of its actualisation' (Deleuze 2004: 36; emphasis added). We never experience virtual totality *in itself*, but only virtuality *in so far as it is mediated by an actual encounter*. If truth is 'in every respect a matter of production, not adequation' (Deleuze 2003a: 200) – problematic and not apodictic – it is because the transcendent exercise does not *know* the virtual, but *expresses* it each time in a new, singular way.

Evidently, the idea of an actual 'mediation' must be said not only of the actualisation of thought, but of actualisation in general. In fact, it is *only* if we conceive of the actual as acting upon the virtual as much as the other way round that the partition of the two can be shown to be formal, not categorial or hierarchical (where one would be the other's ground, in a unidirectional relation).[6] If Deleuze speaks of a 'static genesis' that goes from virtual to actual, it is in order to provide an account of the asymmetrical, novelty-producing character that necessarily falls away if one remains at the mechanistic level of dynamic, actual causes – not to eliminate them. 'The event is of a different nature from the actions and passions of the body. But it *results* from them: [it] is the effect of corporal causes and their mixtures' (Deleuze 2002b: 115; original emphasis). But if there is a difference in nature between the two serial causes, the relation between them cannot itself be causal. The event of an actual encounter between two bodies, being determined by mechanical causality, cannot create the new itself; but it determines new relations among virtual conditions, effecting a virtual Event that produces a new actualisation. A *metaphysical* exercise can think the virtual as a continuous Whole of relations; but the intersection between the two series that effects the Event (the object of a *transcendent* exercise) is necessarily mediated by an actual event.

It is no surprise that all interpretations that posit a pre-eminence of the virtual over the actual will tend to miss the proper place of event, individuation and agency in Deleuze's (and Guattari's) thought: the intersection (and also re-commenced scission) between actual and virtual series. This is evident in Hallward (2006), who faults Deleuze for eliminating individuation and individuality in favour of a boundless

creating power. But also in Badiou (1997), whose exposition of the virtual as ground is by and large premised on the second synthesis of time, thus erasing the 'ungrounding' that supervenes on it with the third synthesis/Event. Žižek, on the other hand, does at one point consider the possibility that the two different ontologies he identifies – virtual as sterile event-effect of actual causes; virtual as productive of the actual – could be the two sides of the same one; but then, not uncharacteristically, decides that the model for such a two-sided ontology can only be symbolic castration (Žižek 2004: 84–5).

V. . . . Then Do It Again

If Deleuze speaks of a '*decisive* and *creative* power', it is because to view the present as contingent and to liberate its potentials for becoming-other necessarily involves an element of decision. Not the autonomous act of an unfettered subjectivity or noumenal agent, since we are dealing with conditions that we neither control nor can make exhaustively clear; but a wager that extracts a new dice-throw not guaranteed by any knowledge. Such is the case with politics, 'not an apodictic science. It proceeds by experimentation' (Deleuze and Guattari 2004a: 575).

What the dualisms of orientation offer us is a series of bipolar axes and double registers with which to consider the potentials of the actual: both to view it as a singular, contingent solution of different problematics, and to guide our choices when acting on it. These choices concern identifying the givens of present problems and producing new solutions to them – *not* choosing one pole over the other, as if they could be treated as actualities. To put it in a formula: no choice between the *two poles*, because one can only ever choose *in between* them. Politics is where life is, and '[t]hings do not begin to live except in the middle' (Deleuze 2006: 41).

In his virtuosic treatment of *Capitalisme et schizophrénie*'s dualisms, Jameson refers to them as a key part of the 'fictive mapping' that organises its materials 'into force fields', but does not linger on the implications of the metaphor: a force field is a dyad, an intensive continuum defined by two or more attractors. He is absolutely right in pointing out that the insistence of dualisms in those two books 'always tempts us to reinsert the good/evil axis . . . and to call for judgment where none is appropriate', so that 'the reader feels perpetually solicited to take sides with the Schizo against the Paranoid . . . and with the Nomads against the State' (Jameson 1997: 412) – but this is exactly what is prevented if we read them dyadically. Famously, it was as an

ethics that Foucault suggested *L'Anti-Oedipe* should be read, listing some 'essential principles' of its 'art of living contrary to all forms of fascism': a series of general guidelines rather than a system of moral judgements attributing good and evil (Foucault 2001: 134–5). The first of these – liberating action from 'every unitary and totalising paranoia' – should then be understood as having the same relation to the others as the self-referential item ('included in this classification') in Borges' Chinese encyclopaedia cited at the start of *Les mots and les choses*. It is the in-built unsettling of the ensemble that pre-emptively exposes as paranoid in itself any attempt to transform those ethical principles into a morality.

If it is true that Deleuze and Guattari place a higher value on deterritorialisation, this value is subordinated to the practical problem of resisting the conservatism that reduces the real to the given and turns the latter into necessity. That this error should be opposed *in act* entails that it is never a matter of saying that *everything is possible*, which is practically vacuous, but of saying that, in every *here* and *now*, there are *potentials* that can be *acted upon*. If the political practice to be derived from this attitude can be given a name, it is *intervention*.

> For an authentic analysis (a schizoanalysis, a molecular analysis, what we call it isn't important) the first concern won't be interpretation, but *intervention*. What can we do to clear up a situation? ... What's the point of trying to determine the role of the father, the mother, the national education system, Knowledge, Power, the Economy, if we don't offer to intervene in any way and to work through these different components? (Guattari 2009: 52; original emphasis)

An intervention singularises a situation as the contingent production of certain conditions, decomposes it into different levels and registers (macro- and micropolitical, molar and molecular, etc.), identifies the potentials and the points that one can get a grip on, and tests its present limits by liberating what may be latent in it. It is premised on *experimenting* with the virtualities 'of this actual', and never (*pace* Hallward) on an *experience* of the virtual Whole as such, in dissolution of every actual tie. While the plane of immanence as absolute deterritorialisation *sub specie aeternitatis* can be the object of a metaphysical *thought*, a direct, unmediated experience of immanence is tantamount to death, or psychosis. A philosophy of intervention is not at all a 'philosophy of death' (Badiou 1997: 24), but a practical work of removing the blockages that stop life.

> To unmake the organism was never to kill oneself, but to… install oneself on a stratum, to experiment with the chances it offers us, to search for a favourable place in it, eventual movements of deterritorialisation, possible lines of flight, to experiment with them [*les éprouver*], to ensure conjunctions of flows here and there… (Deleuze and Guattari 2004a: 198–9)

That death is one of the poles of the 'master' dualism, deterritorialisation–reterritorialisation, shows us that in our *experience* there are only ever relative deterritorialisations – and that this applies even to the most molar, majoritarian, arborescent formations. To deny that would amount to falling prey to representative thought. Here Deleuze and Guattari's methods must be applied back to them in order to show that the sustained critique of revolutionary groups in a book like *L'Anti-Oedipe* was a singular and local response to a certain *style* of militancy that they saw around them at the time; it is neither a critique of any form of organisation whatsoever, nor a principled hostility to militancy as such. We can call the political practice they propose an 'involuntarism' (cf. Zourabichvili 1998; Thoburn 2010: 136), provided we take every care to distinguish this from 'inaction', and see it as strictly opposed to 'voluntarism'. That is, while every action involves a wager that can only be verified in practice, it will be more or less capable of adequately expressing the problematic coordinates of the situation (and thus of successfully intervening therein) to the extent that it is more or less immanent to it, more or less connected to these coordinates. The egoic investment of a group that isolates itself as the subject that acts (the 'activist') is an obstacle to this 'dissolution' into the situation, in so far as it locks the intervention into a duality that detaches an 'active force' from a 'passive matter' by obscuring the several levels in which the two communicate. Deleuze and Guattari's Blanchotian paradox consists in saying: the more passivity is contracted, the more powerful the action; the more one opens up to exteriority, the more one can fold into an intimacy (Deleuze and Guattari 2003: 59); the more one affirms powerlessness, the greater the power that can be extracted from it (Deleuze 2003a: 257–8).

This 'dissolution', however, does not in itself imply a *negation* of organisation. On the contrary: in a situation such as community organising, one can perfectly well imagine that it would take a good degree of internal consistency for a group to be able to sustain an intervention that 'dissolves' itself in the life of its constituency so as to connect to all the flows that traverse it on various levels (the constitution of space, memory, economic or interpersonal relations, etc.).

But how far do these dyads take us from a trivial aestheticisation of infinitesimal change? If we are willing to go as far as accepting that in every nomad there is a state and in every state there hides a nomad (however little), what effect can this really have against an order that survives by 'revolutionising itself'? Deleuze and Guattari will be the first to admit that there is no guarantee: 'smooth spaces are not in and of themselves liberating', but only the place where 'the struggle changes, becomes displaced': 'Never believe that a smooth space will suffice to save us' (Deleuze and Guattari 2004a: 625). No guarantee; only intervention. Lines of flight can turn out bad, either because they find paranoid reterritorialisations, or because they become isolated and turn in upon themselves, or because we are never far from finding out that what we struggled for objectively led to the opposite of what it was we desired. (The French free radio movement, in which Guattari was very active, managed to open the airwaves to non-state actors, only to see them colonised by commercial ones.)

Yet we have already seen how there is nothing in Deleuze and Guattari that is *contrary* as such to the scalability, mass mobilisations or forms of organisation that more radical transformations may demand; the front is always both micro- and macropolitical. And if there is some fairness in identifying in *L'Anti-Oedipe* an 'apocalyptic accelerationism' (Noys 2010), this was never simply premised on the idea that deterritorialisation in and of itself would suffice to save us.[7] To affirm deterritorialising power does not mean saying yes to all deterritorialisations, but knowing how to *select*[8]: hence relative deterritorialisations are never separated from the problem of constructing a *plane of consistency* that allows for mutually reinforcing transversal connections – to the point, at times, of open antagonism. '[W]e cannot allow ourselves a dualism or dichotomy, even under the rudimentary form of the good and the evil.... Good and evil can only be the product of an *active* and *temporary* selection to be recommenced' (Deleuze and Guattari 2004a: 16; emphasis added). It is never just a matter of fleeing, but of constructing an *active* flight:

> Flights are everywhere, they are born again each time from the displaced limits of capitalism. And undoubtedly revolutionary flight (the *active* flight...) is not the same thing as other kinds of flight, the schizo flight, or the druggie [*toxico*] flight. But this is precisely the problem of marginalities: to make all lines of flight connect on a revolutionary plane. (Deleuze and Guattari 2004b: 376; emphasis added)

To faithfully repeat Deleuze and Guattari today consists not in the dogmatic assertion of an *ortho-doxa*, but in a renewed attempt to identify the problems that determined their solutions so as to ascertain to what extent they may still be our own, and in the permanently recommenced search for ways of determining our problems by individualising new solutions in the present. Solutions which, once determined, cannot bypass the problem of producing consistency, nor be satisfied with a vacuous celebration of the virtual, but must negotiate paths between molecular and molar, micro- and macropolitics, de- and reterritorialisation, the clinical and the critical. 'Practice does not come after terms and their relations have been established, but actively participates in the tracing of lines, confronts the same dangers and variations as them'; for 'before Being, there is politics' (Deleuze and Guattari 2004a: 249).

Notes

1. It also downplays others: the non-ideological flexibility in dealing with parties and governments (which characterised Guattari's work at La Borde, with the *Centre d'études, des recherches et des formations institutionelles*, in the free radio movement, and his approximation to Communist, Socialist and Green parties at different points); but also their stances, neither condemning nor condoning, towards armed struggle in Europe and the Palestine Liberation Organisation.
2. Pseudonym of Alain Badiou.
3. For Badiou, it is either this, or the two collapse into each other, in which case the virtual is no more than '*ignorantie asylum*' (Badiou 1997: 81).
4. 'Spinoza does not call his book an Ontology . . . he calls it *Ethics*. Which is a way of saying that, whatever the importance of my speculative propositions, you can only judge them at the level of the ethics that they envelop or implicate' (Deleuze 1981).
5. It must be noted that, despite the recurrent provisos that they are not opposed by 'size, scale or dimension, but by the nature of the system of reference' (Deleuze and Guattari 2004a: 264), the sometimes equivocal use of those pairs that suggest dimensions (molar/molecular, macro/micropolitics) can be a source of confusion. Furthermore, there is one case where the poles are not virtual: in 'double articulation', molar and molecular are both actual and opposed in scale, even if only relatively (the cell is molecular in relation to the organism, the individual in relation to the species, etc.). In this case, the virtual 'matter' is identified with 'unstable flow-particles' (cf. 55).
6. Among commentators, John Mullarkey (2006) has gone the farthest in contesting the primacy of the virtual in Bergson/Deleuze, finding support in a reading of the former to counteract the latter's tendency of overstressing the virtual to the point of placing the processual character of his metaphysics at risk. To do so, Mullarkey argues that the virtual should be understood as the infinite series of successive, actual *Chronos* indefinitely embedded in each other, eliminating the need for an eternal *Aion* of pure, virtual events. He concurs, nevertheless, that it is a matter of playing some tendencies in Deleuze's thought

off against others – and provides an excellent discussion of why and how Deleuze requires all of them, and their tension, to be simultaneously maintained.

7. I believe Noys' coinage does capture a real tendency in Deleuze's and Guattari's work, as well as in other strains of twentieth century and contemporary thought, and that it raises important questions as to how we might strategically conceptualise the relation between capitalism and resistance, especially in the present conjuncture. It is certainly a relatively accurate description of some authors who have appropriated Deleuze and Guattari's thought, such as Hardt and Negri, and (particularly) Nick Land. Where I would depart from Noys' analysis is in what seems to be the almost 'programmatic' status that he attributes to 'accelerationism' *in Deleuze and Guattari*, seemingly implying that they espouse a linear teleology in which an intensification of deterritorialising 'production' (in the very broad, ontological sense) would, necessarily and in and of itself, beat a path out of capitalism through its very acceleration. There certainly are passages, in *L'Anti-Oedipe* above all, that could suggest this reading. I would, however, argue that not only is it countered by many other statements that can be found throughout their work, not least their stringent remarks on neoliberalism from the 1980s on, but also by some fundamental traits of their philosophy. An accelerationist 'programme' sits uncomfortably with a radical ontological commitment to contingency and an opposition to any teleologism. Furthermore, (absolute) deterritorialisation, as a veritable ontological principle, is independent from and irreducible to its historical embodiment in capitalism; it neither relies on the latter exclusively in order to take place, nor would it fail to apply even in a putative 'post-capitalist' world. Rather than a generalised goal or an invariable strategic bet, the stress on deterritorialisation points to situated, tactical engagements against structures and blockages that are given. In other words, to *relative* deterritorialisations that are never entirely separated from the formation of new assemblages: 'the collective recapturing of those dynamics that can destratify the moribund structures and reorganize life and society in accordance with other forms of equilibrium, other worlds' (Guattari 2002: 260).
8. As far back as *Nietzsche et la philosophie*, Deleuze already made it clear: 'The real as such is an ass' idea.... Affirmation understood as... affirmation of what is, as truthfulness of the true or positivity of the real, is a false affirmation. It is the ass' "yes".... The Dyonisiac "yes", on the other hand, is that which knows how to say "no".... To affirm is to create, not to carry, to bear, to take on' (Deleuze 2001: 208–13).

The Greek Gloom and the December 2008 Uprising

Ioulia Mermigka National and Kapodistrian University of Athens

Abstract

This paper employs the notion of apparatus of capture in the context of the historical formation and transformations of the Greek nation state. The aim is to demystify the overcoding poles of political sovereignty as they are expressed in different chronological periods and to sketch an analysis of the appropriations of social living forms, social movements and war machines into regimes of signs. The term war machine is deployed as a key term for grasping the variables of content and the variables of expression that are encountered in the different historical circumstances. The order word modernisation illustrates not only the machinic enslavement but also new social subjections within a society of the spectacle and global capital. The account given here of the December 2008 uprising in Greece offers an insight into the political event and attempts a pragmatic analysis of the December war machine.

Keywords: apparatus of capture, war machine, history, modernisation, uprising, Greece

The following essay offers a student perspective on activism that attempts to make sense of the chapter '7000 B.C.: Apparatus of Capture' from Deleuze and Guattari's *A Thousand Plateaus* and records a fragmented trajectory of modern Greek history. The record outlined here is chronological, moving from the early stages of the formation of the Greek nation state to the series of modernisations that took place in the closing decades of the twentieth century. The final section provides an account of the December 2008 uprising and describes the political activism that accompanied the events. The term war machine is used

Deleuze Studies Volume 4: 2010 supplement: 127–141

abstractly throughout for different expressions of war, violence and resistance. The aim is to synchronise an outline of major Greek history with Deleuze and Guattari's theories of the state and minor politics.

The Greek historical climate is analysed in terms of vertical and horizontal political significations, national suppressions and regimes of resistance. Analysis of the Greek economy and the state is combined with an account of semiotic transformations arising within the society of the spectacle. The spectre of anarchy is tracked through the symbolic and political transitions of recent decades and an account given of the social violence erupting on the street and in the university.

Finally, I attempt to touch upon aspects of modernisation in terms of Greekness, the proletariat, the middle class, the Left, the so-called anarchist 'space', and resistance against authority and police repression. Here the account is mainly concerned with outbreaks of street violence and the principles of autonomous resistance.

I. 1821–96: The Double-Headed Eagle

The year 1821 marks the beginning of the Greek war of independence against the Ottoman Empire. The struggle of the bandits becomes an armed mobilisation essentially directed against the Ottoman state (Vournas 1974: 31–4). The war machine is soon captured. A double-headed eagle, a symbol of the revolution, looks in opposite directions, one head to the east, the other to the west. In one of its variations the eagle is crowned and holds a globe with a cross in its left foot, and a lance in its right (Herzfeld 1989). The double-headed eagle suggests a double articulation of political sovereignty.

The east-facing head implies both an overcoding pole, encapsulating the Christian-orthodox and despotic signifiers, and a pole signifying the supersession of those signifiers in the parliamentary function and the processes of national subjection. Conspiracies are hatched and town revolts erupt when the state's overcoding itself provokes decoded flows: whether the economic and social privileges of chieftains of the revolution in regional towns or the constitutional or cultural demands of the centralised political forces. The first governor of Greece, Kapodistrias, is assassinated in 1831 and the Bavarian king Otto has to deal with regional revolts during his reign until 1862 (Omada Enantia stin Lithi 1996: 359–400; Deleuze and Guattari 2004: 477–80). Moreover, despite the church's alignment with the state, the crown and the sultan, there are flows of Christian irredentism that bring about crises over the Eastern Question (Skopetea 1988: 251–71; Stathopoulou 1991: 166–204).

The west-facing head resonates with the glorifications of classicism and rationalism in western thought. Archaeology has discovered among the ancient Aegean civilisations highly evolved empires that had solved the western problem of how to 'take advantage of the oriental agricultural stock without having to constitute one for themselves' (Deleuze and Guattari 2004: 497). Classicism and the Enlightenment entail not just philosophy or aesthetics but an art of war, based on flows rather than codes.

The Greek state born out of the revolutionary machine enters into a series of financial pacts and military alliances with the quasi-imperialistic European states. This western alignment effectuates the public parliamentary function (with pro-French, pro-British and pro-Russian parties) and determines the financial and diplomatic arrangements of the Greek state while overcoding it with notions of Hellenistic and ancient Aegean glory. In the vacillating poles of political sovereignty the capitalist axiomatic of flows is introduced into a glorified archaeological democracy. In 1896 Athens mounts the revived Olympic Games.

The disjunction between the nationalists and the modernists after 1875 illustrates the knots at the western pole (Vournas 1974: 498–535): The oriental solution of the nationalists and the resonances of Hellenist-Christian irredentism on the one hand; the western solution of the modernists aligned with the capitalist axiomatic for the territories that would be annexed on the other. 'It is as if two solutions were found for the same problem, the oriental solution and then the western one, which grafts itself upon the first, and brings it out of the impasse while continuing to presuppose it' (Deleuze and Guattari 2004: 498).

II. 1914–22: The National Schism

In 1912, in the first Balkan War, the newly formed Christian states of Greece, Bulgaria, Serbia and Montenegro go to war against the Ottomans. The Balkans claim autonomy for the Christian populations in the Ottoman territories but the Ottomans ignore their ultimatum. The outcome of the war falls in favour of the Balkan League. The Great Powers consent to the annexation of some territories but raise objections with regard to others, leading in 1913 to the second Balkan War. The outbreak of the First World War the following year places the Greeks in an ambivalent position. The liberal Prime Minister Venizelos joins forces with the Allies, while the German-friendly king Constantinos holds to a supposedly neutral position. In 1916 the Greek state is split between two capitals: the pro-Venizelists in Thessaloniki and the royalists in

Athens. When the French occupy Athens, battling with the royalists and blocking all commercial flows, angry royalist supporters blame the liberals as traitors. Venizelos is excommunicated by the Orthodox Church, and in December 1916 thousands of people gather in Athens to throw signed stones of anathema in protest at the 'Satan-traitor' (Delta 1988: 277–80).

In 1917, with support from the British and the French, Venizelos returns to Athens and Greece enters the Great War. The outcomes are positive for Greece and in 1919 Greek troops land in Asia Minor to protect the Christian population. Venizelos wages a war of diplomacy, and of gradual territorial annexation, so as to pursue the 'Great Idea' of a 'Greece of five seas and two continents'. The romantic-nationalist pole, however, wins the elections of 1920 and the Greek army marches deeper into Turkey. The result is the 'Asia Minor Catastrophe' of 1922 and the first compulsory population exchange, involving approximately 2 million refugees.

The formation of the new Turkish state under Kemal Atatürk coincides with the waning of the 'Great Idea', along with the definitive collapse of the Ottoman Empire. Kemal's war machine against the sultan and the Greeks, and his pacts with the Allies, seeds the birth of the Turkish state in the pattern of the *Zeitgeist*. The Great Powers have to negotiate with another isomorphic albeit heterogeneous player. The Greek–Turkish friendship from then on becomes a recurrent issue.

III. The Greek Language Question and the People's Refrain

The Greek language question reveals not only the suppressive mechanisms involved in the birth and coming of age of the nation state but also how it was transformed by 'nationalitarian' phenomena (see Deleuze and Guattari 2004: 504). From 1830 to 1890 the major language of bureaucracy and the political elites is a purifying version that settles the tension between archaic and modernist-colloquial varieties in favour of archaic constants (especially ancient Athenian Greek). However, the demotic or vernacular language gradually comes to affect the major language. From 1888 a linguistic radicalism in favour of the demotic language begins to tip the balance towards modernist constants with socialist, romantic, nationalistic, or even racist variations (see Fragkoudaki 2001).

Over the following years more literature is written in the demotic language, but despite attempts at educational reforms the archaic varieties continue to dominate. The indirect discourse they are based upon entails a diachrony with ancient Greek and a synchrony with the

archaic religious language of Orthodoxy, and in general with the dogmas of Hellenist-Christianity. After the collapse of the 'Great Idea' and the relocating of the enemy from the external (the Turks) to the internal (the communists), the demotic language also comes to be linked more closely with the workers' movement and the Left.

In an implementation of realpolitik, the liberal Venizelos passes a series of educational reforms in favour of the demotic language, but also in 1929 issues a legal order word, the *idionymon*, that penalises insurrectional ideas and aims in particular to prosecute communists and anarchists and to enforce repression against unionist mobilisations. With the coming of the Great Depression, Venizelos is forced to default on Greece's national debt, built up from loans for industrial modernisation and the housing of refugees from Asia Minor.

The refugees bring with them a sound of the east, a people's refrain. The *bouzouki* and other oriental instruments become orchestrated with the Greek voice. The refugee songs, known as 'Rebetika', relate tales of love couplings, dominations and subjections, either to authority or to addictions. The Rebetika are censored by government, while the Left passes moral judgement on their delinquent content. Nevertheless, they are the seed that would transform a recurring Greek sound. Musical matters of expression and the Greek voice merge at this particular period into a Greek chromatic sound that will become popular from the 1950s onwards.

IV. 1950–74: The Repressive Modernisation

During and after the Second World War the Greek milieu becomes polarised between the eastern Soviet pole and the western Anglo-American pole, both with their limits and thresholds. The Greek civil war lasts from 1944 to 1949. The communist resistance attempts to prevent a capitalistic state but it also anticipates it: radical socialist elements of people's power and gender equality coexist alongside property rights and the operation of the state as coordinator of private relations (Hart 1996: 273). By the 1950s the Greek milieu will definitely belong to the western neighbourhood of the capitalist megamachine (Deleuze and Guattari 2004: 480).

The right-wing Greek state overcodes its national sovereignty by means of a structural violence. The Communist Party is declared illegal and the military and police issue an order word obliging citizens to sign a certificate of national (anti-communist) beliefs. Many Leftists are imprisoned or sent into exile on rocky islets. As Athens becomes

rapidly populated by new proletarian flows from the countryside, urban planning by army technocrats striate the city, ensuring that highway constructions and administrative centres provide easy military access and facilitate police control. This is a new technical machine. On the basis of this urban rationale military groups seize Athens and usurp power in 1967 (Anonymous 2002: 55–80).

The modern social subjection also derives from the organisation of housing policies, which aim at promoting private property in newly built blocks of flats. In this way, people living in refugee slums and working-class neighbourhoods lose their social networks and tend to be assimilated into a new urbanised middle class. The state's recognition 'that workers work better when they have a decent house' resonates with the greed of the new class of building contractors (Anonymous 2002: 80–72; Deleuze and Guattari 2004: 1989: 499–505); the resulting urbanisation of the period is described in Greek as a 'construction orgasm'.

The repressive modernisation of the period is also related to the rise of a public sphere with a mixed semiotics. In 1952, women gain the right to vote and be elected, but they still represent servants for the reproduction of the nation and guardians of the family (Komninou 2003: 69). Through the spectacle and the culture industry, capitalism advances its own limits of a libidinal economy. In the commercial Greek cinema of the period there is an overloaded investment in a modern version of a deviant femininity that decodes traditional gender relations, but the recurrent narrative ending is either a happy orthodox marriage or a life condemned in sin and shame (Athanasatou 2001: 342–6). The new task of the state apparatus consists in 'organizing conjunctions of decoded flows as such' (Deleuze and Guattari 2004: 498); in the Greek case this entails not only the participation of women in the labour market, in the public sphere and in the spectacle, but also their social subjection to a folded patriarchy. A modern house, a modern family and a night out at the *bouzoukia* clubs smashing plates: these are some of the prerequisites for the new social subjection.

There is also an international aspect to the national subjection. The dominant patriotic regime resonates with the desire for the union of mother Greece with Cyprus, but negotiates this revived irredentism with NATO and the USA. On the other hand, there is also a patriotic counter-signifying regime which turns away from the West to enunciate a polemical anti-Americanism (Stefanidis 2008: 285–306). The escalating left-wing mobilisations of the early 1960s share this patriotic passion, but direct it towards the East and the Third World struggles of the times.

The strategy of the repressed Left is to wear the face of Greekness, but provide another post-traumatic consciousness for it. In poetry and music this is expressed in the glorification or relative deterritorialisation of both the Greek *topos* and the victimised heroism of the people (Gavriilidis 2007). This radical patriotism integrates the war machine of the 1960s into a mixed semiotic (Deleuze and Guattari 2004: 131). In December 1960 it is the construction builders who first clash with the police and initiate a cycle of violent protest. Unionist mobilisation then escalates, making specific professional demands on the state, but also fighting against the structural violence of the police (Lampropoulou 2008: 220–41). Over the next years, the workers' and students' demand for democratisation of the state crystallises around the Left. From 1963 the Left aspires to gain power and gradually bring about a socialist transformation. Until 1963 it encouraged the counter-violence of the movements but from then on strives to pursue the struggle at the level of axioms. The situation comes to a head with the political assassination of the pacifist MP G. Lamprakis in 1963 and the killing of a student by police in the summer of 1965, when for over 40 days thousands of people take collective action on the street and clash with police (Katsaros 1999: 49–70).

This war machine should not be identified with the Left. It is rather what escapes from both the conjugation of capitalist flows of the repressive state and from the hierarchical organisations of the Left. If it is identified with the Left, it must be considered to have been defeated, since in 1967 the colonels' tanks march into the same streets and take over the power. From 1974, after the fall of the junta, the Left becomes assimilated into political games within social democracy. The war machine is rather the unnameable revolutionised mass of the period. It creates sheets of past that relate to the coexistence of a proletarian consciousness and a flight from the plane of capital (Deleuze and Guattari 2004: 521), and its peaks of present always involve its zone of indiscernibility between the poles of political sovereignty.

Such a high point of the war machine is the Polytechneio uprising in 1973. It begins as a students' revolt against the junta liberal reforms. The revolutionised youth creates a snowball effect and thousands take on to the streets. The spontaneity of the uprising and the heterogeneity of the crowds inhibits any organisation from the Left in terms either of armed revolt or public negotiations. The reformists accuse the revolutionary Left of being inciting agents. Everybody anticipates the intervention of the army that eventually suppresses the uprising. The consequences are another coup in Greece and in Cyprus, which results in the Turkish invasion and the division of the island.

In 1974, Karamanlis, the engineer of the repressive state of the 1950s, returns to secure national unity and consolidate democracy. He makes the date of the Polytechneio uprising a national anniversary, legalises the Communist Party and resolves the language question by establishing the demotic as the official language. Moreover, the monarchy is abolished by plebiscite. The right-wing government, despite the lure of neoliberalism, added social welfare axioms in order to meet the requirements of the European Community.

V. 1981–2004: The Populist Modernisation and the Spectre of Anarchy

In 1979–80, without the consent of the organisations of the Left, students occupy some of the universities and demonstrate against the educational reforms planned by the right-wing government. The students are labelled as anarchists. On the anniversary of the Polytechneio Uprising in 1980 a 21-year-old worker and 26-year-old student are killed by the police. Riots break out, because the government bans the rally from accessing the American embassy.

The ultra-populist Papandreou, leader of the Panhellenic Socialist Movement (PASOK), wins the election of 1981 under the slogan 'change'. He had promised withdrawal from NATO and the then EC and the closing down of the US military bases, but none of these are actualised. In 1981 Greece is officially a member of the EC. Papandreou adds more axioms signalling a shift in the style of government, but not in substance. His reforms bring Greece out of the national closet: civil marriage is introduced against stiff opposition from the church, adultery is removed from the catalogue of criminal offences and the dowry system is, legally at least, abolished. Papandreou also amends the family law and adds axioms at practically all levels of social policy (Clogg 1994: 183–4). He becomes so popular that Greeks refer to him by his first name, Andreas.

PASOK's decentralised socialism involves the nationalisation of problematic companies already indebted to the largely state-controlled banks. This, far from bringing with it any noticeable improvement in productivity, merely provides an opportunity to continue the former right-wing patronage by way of expanding the pay-roll. Via the leader's populism, the new policies regulate anti-production with social welfare policies and bounteous financial opportunism (Clogg 1994: 188). The slogan 'change' orders that capital will continue to produce surplus value thanks to the government's rescue of capitalists, and on the

other hand that the state will regulate public debt. The public sector and bureaucracy grows gigantic; consent is secured by appointments in the public sector based on clientist relations; alliance with the party and favouritism for its members serves the interests of individuals and families and masquerades as realising the socialist liberal desire for the promised civil society. Andreas, despite his socialist polemic, ensures social subjection within the wider capitalist axiomatic.

Andreas functions as a libidinal image that symbolically occupies a limit but at the same time signals the displacement of capitalist desire. It is striking how he obscurely fascinates the crowds when, in an outspoken way, he dumps his feminist wife, a figure of some political standing, for a much younger air hostess, and even more striking how, when he is accused of being bribed by a capitalist, he still remains adored as a political icon. An oedipal detail of the 'dirty 89', the year a series of scandals breaks, is that the money is hidden in nappy boxes. The same year, radio and TV broadcasting are deregulated and the Adam Smith complex replaces the Oedipus complex. The resulting so-called deregulation is related to the wider re-structuring of communication systems and the new forms of machinic enslavement and media ecology.

In between, anarchists and autonomists with no clear outlines along with intellectuals and artists and other members of what is generally referred to as the underdog political culture, begin to settle in Exarchia, a neighbourhood close to the Polytechneio. In 1984 the police pursue a gentrification policy in the area, since the youth's abstract politicisation and radical culture can not be easily assimilated by the state apparatus. On the anniversary of the Polytechneio uprising in 1985 a 15-year-old student is shot by the police. The Polytechneio and the Chemistry department nearby are occupied and violent protests take place. The police invade the buildings, despite the university asylum which forbids the police and the army from entering university premises. The state demonstrates its capacity for 'socialist' structural violence. At the same time a war machine against the monopoly of state violence forms. It is rooted in an anarchist polemic which endangers it but also effectuates a space of unlimited and vital political expression.

In 1990–1 there is a high-school student mobilisation and another cycle of contention. The educational reforms introduced by the right-wing government include anachronistic measures like compulsory school uniforms, prayer and hoisting of the flag, and generally a tendency to limit student rights in favour of an arbitrary school. Moreover they increase competition for university entry and do not by any means

resolve the issue of fee-paying crammer schools. Overall, education is to be based more on memorisation than critical thinking.

The wave of high-school occupations sweeps the country. In Athens the demonstrations are violently repressed by the police. It is during this time that I first encounter political theories and become involved in political activism. The period remains significant not so much for our eventual victory in resisting the government's measures but for the fact that the seeds of a proletarian consciousness were sown, at a critical distance from party and other groupuscules, in spite of the desire for belonging.

The situation culminates in the events of 1991 when a left-wing teacher is killed by far-right thugs and four civilians die when a building is set alight during a demonstration the next day. The blame is placed on the anarchists for their agitation against the social order, despite the fact that the fire most probably resulted from the extensive use of tear gas by the police. It is at the beginning of the '90s that an anarchist 'space' becomes more articulated, in contrast with the vertical organisations of the Left. From then on, arson becomes a virtuality haunting this 'space'.

Not long after, in 1993, the government pursues the privatisation of public transport and other conservative reforms. The bus drivers are polarised and strikers clash with the police. However, a shift is marked during this time, as the flow of Albanians and other immigrants from around the globe become the new constant capital. Greek capitalists exploit this development, while the state does little to secure the immigrants' civil integration and public-opinion gate-keepers cultivate a climate of xenophobia. This racial class rupture will mark the atrophy of the proletarian consciousness over the next few years.

The anarchist movement that gains momentum mainly among the youth detaches itself from struggles at the level of axioms, since its relation to labour is one of precariousness, of a proclaimed negation of wage labour and of inertia in regard to capitalist relations. The figure of the proletarian will be replaced in some anarchist factions with the figure of the revolutionary, the scarlet slogan 'revolt' taken to justify its avant-garde position. In 1995 at the anniversary of the Polytechneio uprising, anarchists occupy the university. University asylum is again violated when the building is burned and more than 500 are arrested and filed as extremists. Some anarchists from then on tend to appropriate the Polytechneio as their symbol of revolt. It is in this way that the 'space' is striated in police files and in the area around Exarchia.

The rupture in proletarian consciousness will be even more obvious in the next few years as the order word 'modernisation' takes on new

forms of circulation. The stock-market crash of 1999 involves lower- and middle-class civilians, even in remote regions of Greece, who invest their microcapital in so-called bubble stocks and lose their savings as a result. Elsewhere, the events in Seattle and Genoa inspire a mobilisation in Greece during the EU–Western Balkan Summit in Thessaloniki in 2003, where the Black Bloc attempt a more organised presence in terms of social counter-violence within the anti-globalisation movement.

In 2004 Athens hosts the Olympic Games and national pride in the cradle of democracy is revived. However, with foreign and public debt escalating, the right-wing government proves to be iniquitous. A series of public scandals break out, involving almost all levels of social authority: judges, priests, bankers, MPs and ministers, civil servants, journalists... The slogan now becomes 'shed light', but the gloom is thick. On the one hand, the processes of subjectification have managed to cultivate indifference, cynicism and atavistic consumerism; on the other hand, the counter-signifying regime is either appropriated by the mainstream Left or endangered by the sublimation of social war by the anarchists.

VI. The December 2008 Uprising

One further precursor of the December 2008 uprising is the student movement of 2006–7. The state's programmes for education reform generally try to link the public university with the axioms of private education. In response, student organisations on the Left, following a logic of hegemony, try to dominate the students' assemblies and impose a parochial politics. In June 2006 and March 2007 proletariat youth fight against police repression and the mobilisation turns into an uprising. The situation is already complicated as the students – the so-called 'generation of 700 euro' (the minimum wage), who somehow have to invent a life within the new capitalist relations – merge on the street with the anarchists and the lumpenproletariat.

This unnameable student proletariat affiliates more closely with the conscientious labour objectors than it does with the myopic Left (cf. Thoburn 2003). There is, however, a tendency to relate the student mobilisations with labour issues and with new forms of activism, like the blocking of public transport, occupations of radio stations, protests in workers' neighbourhoods and reclaim-the-streets parties. What has remained from these mobilisations are the networks of social relations that ensued from the occupations, a spirit of solidarity that grows out of autonomous forms of organisation, and a student community

that, even if it didn't manage to intensify qualitatively the mobilisation, nevertheless discovered new lines of flight.

In the summer of 2007, a series of forest fires break out across Greece leaving the land scorched. Many mourn and others covet the ready-to-be-built-upon land. The echoes of the financial crisis reach Greece. In December 2008 in the area of Exarchia – a sanctuary for political underdogs – a 15-year-old student is cold-bloodedly shot dead by the police. The murder releases a flow of resistance and affect. A war machine forms against state repression and the capitalist colonisation of everyday life. The line of flight it traces is a line of fire, and one that is not easily put out. Police repression meanwhile escalates; the city chokes with tear gas and the mainstream media churn out legalistic nonsense, promoting bad conscience and binary divisions between good and bad demonstrators.

Even though it is the anarchists who trigger the line of fire, in the demonstrations, behind the barricades, and in the assemblies the war machine is formed by a multiplicity of crowds. Anarchist politics germinates the seeds of the politics of the act, but the war machine exceeds their political signals (see Day 2008). The social composition of the uprising is not polarised between political or ideological milieus but involves bevies of high school and university students, unnameable proletarians, lumpenproletarians, refugees, immigrants and civilians who have no prior fixed political allegiance but choose to participate in the violent expression against the police, against chain stores as symbols of the society of the spectacle, against the banks as symbols of financial capital, and against public buildings as symbols of the state (Kalamaras 2009: 21).

Following the early days of 'burning and looting' a smoother urban space is created: Universities in Athens and Thessaloniki are occupied by political activists; high-schools and university departments by students; the HQ of the Workers Confederation by insurgent workers; the HQ of the News Editors Union by media activists, the National Opera House by artists. From occupied municipal buildings and other public spaces in many Greek cities there are calls for people's assemblies; public TV and radio stations are interrupted briefly by activists. The December uprising is a feast of activism, a feast in the most original sense. This is because the series of events are organised by the revolutionary assemblages themselves and the duration of the uprising depends on their political will and creativity and ability to overcome fatigue.

A pragmatics of the war machine deals with how it is appropriated. The dominant raison d'être of the two major political parties wants

the Left to be undermining democracy by inciting social violence. The Greek-style culture of violence, according to this regime of signs, is a return of the repressed of the Left: the Left must suppress all revolutionary ideas and practices in order to aspire to parliamentary power. Left intellectuals in response implement a minimum abstraction in relation to the uprising's materialism, seeing it as a cultural event or an expression of apolitical rage on the part of the youth. They proclaim that the uprising lacked political articulation and that violence must be condemned wherever it comes from. In this way the Left exorcises its defeat in the civil war and the ghost of a Stalinist revolutionary totalitarianism. It interprets its revolutionary peaks like the Polytechneio uprising of 1973 as a legitimate resistance in a state of exception. Its bad conscience and its subjection to the apparatus enforces the state of exception of the legitimate state in violently repressing the uprising and the rhizomes that spread in its aftermath. In general it confirms its vertical hegemony in relation to social struggles by projecting its integration within democratic institutions (see Flesh Machine 2010: 69–97).

The anarchist 'space' is outlined by its resistance against the monopoly of state violence. From the 1990s on that principle of resistance has transformed the 'space' into a counter-signifying regime that makes critical statements on the functions of democracy and capitalism and has been attracting a growing number of people. In the December event, the right to social counter-violence as a matter of expression brings to the foreground the potentiality of a war against the *logos* and the law of the democratic state, and of a grounding of a people's *nomos*. Other features of the anarchist 'space' include an emphasis on the political values of autonomy in the post-Fordist era, self-organisation amongst craft unions, direct democracy in decision making, and horizontal networks of free-spirited relations outside consumerist frameworks. Some anarchist fractions, however, take war against the state as their sole mission.

These fractions are composed by the lumpenproletariat (see Thoburn 2003). The affiliation of the anarchist 'space' with the lumpenproletariat and with political activists outside or on the margins of the law is one of the revolutionary connections that transform this 'space' into a counter-signifying regime. Especially after December there is an urgent need to conjugate the variables of content and the variables of expression of the uprising so as to open up its assemblages to a patient and sober, but revolutionary, line of flight (Deleuze and Guattari 2004: 97). This line of flight will have to entail the involution of the genealogy of social violence in regard not only to the national context but also to

the trans-national militarisation of the policing of protests. Through the spectacle of violence and police repression the new conception of security reconstitutes the war machine in conformity with the requirements of the capitalist axiomatic, which promotes a special kind of secured peace (Deleuze and Guattari 2004: 516).

As far as the circumstances of the current crisis in Greece are concerned, the transformational work being done in relation to autonomous craft-unionism, the unnameable proletariat and minorities, refugees, immigrants, social centres and queer politics within the anarchist 'space', is endangered by the post-subjectification of some anarchists as the revolutionary avant-garde of the movement. On 5 May 2010, during a massive demonstration against austerity measures imposed by the government, the IMF and the EU, three bank employees and a foetus are killed during an arson attack on a bank. While this event does not represent the anarchist 'space', it is a virtuality that haunts that 'space' and becomes actual when the line of fire turns into a line of abolition. More than ever there is a need for sober collective analysis of the anarchist subjectifications and for new revolutionary connections with the lumpenproletariat and with minorities.

The situation looks as though it has reached an impasse in regard to the conjunctions of the capitalist axiomatic within the current crisis. The gloom grows thicker. The hegemonic Left deepens the inertia of the proletariat by proclaiming occasional strikes; some anarchist fractions hold to their tight solidarity with anarchist prisoners, political criminals and armed struggle terrorists; the decentred anarchist 'space' rallies and tries to effectuate anew its abstract machine outside the strata, on the strata and between the strata. It is from within the unnameable proletariat, the unemployed and the minorities that new lines of flight will be drawn and vital connections made against the automation of the capitalist axiomatic and its bureaucratic programming (Deleuze and Guattari 2004: 522).

Allow me to conclude with a slogan from the December uprising: 'Freedom does not exist, all we have is choice.'

Life Resistance: Towards a Different Concept of the Political

Brad Evans University of Leeds

Abstract

In an attempt to reaffirm Deleuze's Nietzschean affinities, this article argues that it is possible to detect in his thought an alternative concept of the political which gives ontological priority to difference. In order to map this out, a Deleuzian reading of the Zapatista experience will be provided, with particular attention given to the manner in which power is re-conceptualised, resistance strategised, subjectivities recast, and political solidarities formed anew. Once this has been established, the paper will argue that not only does Deleuze provide us with a meaningful basis for political action, he offers us possibilities for creating new forms of political solidarity that no longer take Hegelian inspired dialectical enmity or dangerous Kantian unfulfilment as their point of theoretical departure.

Keywords: total war, resistance, concept of the political, difference, the Other, politics of friendship

I. Deleuze's Resistance

Michael Hardt and Antonio Negri's trilogy remains the most ambitious attempt at making Deleuze relevant to today's political climate (see Hardt and Negri 2000, 2004, 2010). Foregrounding Deleuze as the affirmative theorist of micropolitical nomadism, Hardt and Negri's project places him in direct confrontation with the two great modernist thinkers who dominate contemporary political thought: Immanuel Kant and George Wilhelm Hegel. 'The leitmotif of Kantian philosophy',

Deleuze Studies Volume 4: 2010 supplement: 142–162

they suggest, is the 'necessity of the transcendental, the impossibility of every form of immediacy, the exorcism of every vital figure in the apprehension and action of being' (Hardt and Negri 2000: 81). While their anti-Hegelianism, contra Fanon, results in a scathing critique of the dialectical method for the manner in which it re-produces the colonial mind: 'Colonialism constructs figures of alterity and manages their flows in what unfolds as a complex dialectical structure... *Reality is not dialectical, colonialism is*' (124, 129). One could argue that these battles are altogether Deleuzian. Deleuze did not hesitate to call Kant 'the enemy' (Deleuze 1990: 6). Neither did he refrain from accusing Hegel of 'inspiring every language of betrayal' (Deleuze 2004: 144). While Kant was singled out for his deceitful 'politics of compromise', which allows us to question certain parameters of knowledge, truth and morality while refusing to bring thought to bear on these terms in themselves (Deleuze 2006: 83, 84), Hegel, caught in a double Kantian bind, stands accused of infecting all political struggle with a 'spirit of revenge' so that political triumphs always define the 'weak *as* weak', with the victory of the slaves written into the world as their 'victory *as* slaves' (109). What is being uncovered here is the process wherein a state of mind becomes a 'mind of state': where Kant's *Cogitatio Universalis* demands a higher unity in order to tame the multiplicity of forces which potentially troubles the unification of the faculties of reason (Deleuze and Guattari 2002: 367), Hegelian dialectics perpetuate this drama with greater inner purpose by conceiving '*power as the object of a recognition, the content of a representation, the stake in a competition, and therefore mak*[*ing*] *it depend, at the end of a fight, on a simple attribution of established values*' (Deleuze 2006: 9–10). Either way, the political as a function of difference is the problem to be solved.

Whatever problems one may have with Hardt and Negri's wider project they nevertheless pose a critical question about the relationship between imperial 'war machines' and canonical 'images of thought'. Kant is a somewhat easy target. His universal disposition directly relates the singular predilection for difference to the problem of war. This is no small matter. Whereas Hobbes taught us that there can be no politics without security, and no security without the State, Kant encourages us to believe that there can be no security without universality, and no universality without moral progress towards the unification of the species. Hegel's legacy is more complicated. If Kant inaugurated the modern age, it was with Hegel that modernity became problematic in so far as its inner workings became visible and self-consciously theorised (see Habermas 1987). Hegel is therefore for many the founder of the

modern theory of *resistance*. While Hardt and Negri recognise this, they find this approach problematic on two distinct counts. Historically speaking, since the dialectical method has been implicit in recreating the master/slave dichotomy out of the ashes of liberation, inscribed into the fabric of its counter-hegemonic discourse has been a profound distaste for anything which differs from the orthodox Eurocentric schema. Now that all social relations are underwritten by networked thinking, ideas concerning linearity, teleology and limit conditions have been firmly displaced by notions of complexity, contingency and emergence. As a consequence, even if dialectics did once harbour the potential for political transformation, it now has little or no relevance to the operation of contemporary power which works at the level of pure strategy. From this perspective then, while the Kantian attempt to realise the unification of the species for the sake of its own protection arguably makes him the imperial philosopher whose time has come, Hegel and his descendents have no political relevance in the post-dialectical field of play.

Dialecticians have invariably fought back. John Holloway was among the first to take critical aim at Hardt and Negri's project. 'Politically', he explains, while 'the emphasis on the power of the working class has an obvious appeal... the understanding of labour and capital in terms of an external relationship leads to a... failure to explore the internal nature of the relation between labour and capital leading the autonomist analysts to underestimate the degree to which labour exists *within* capitalist forms' (Holloway 2002: 174). Dialectics then becomes the only method capable of providing 'the escape plan, the thinking-against-the-prison, thinking-against-the-wrong-world, a thinking that would no longer make sense if we were outside of the prison of the wrong world'. Holloway thus calls upon us to 'strengthen negativity', 'make the scream more strident' and in the process negate in whatever way we can the negativeness of our existence – the negation of the 'untruth of the world' (8). To his credit, Holloway is not blind to the failures of the past, but he believes that since it is possible to move away from the 'logic of synthesis' (which he takes to be the focus of concern for Hardt and Negri) and on to the 'movement of negation', it is possible to negate the present without colonising the future. Slavoj Žižek has been less forgiving. Lamenting that 'Deleuze more and more serves as the theoretical foundation of today's anti-global Left' (Žižek 2004: xi), Žižek insists that in-vogue tendencies to invoke Deleuzian notions such as becoming, multiplicity, nomadism, micropolitics, and the power of the affirmative, make him at best a compliant apologist: 'There are, effectively, features that justify calling Deleuze the ideologist

of late capitalism' (185). Since Deleuze lacks the negative power of truth, Žižek effectively ascribes to him a truly nihilistic agenda which claims the resistance of everything and yet, being ill-equipped to pose the right questions, actually ends up creating nothing, offering only a life of endless becoming which in the end shows an allegiance to 'the infinitely divisible, substanceless, void within a void' (24).

Deleuzian scholars have responded to these critiques by suggesting that Deleuze's relationship with Kant and Hegel was actually more complex than the literal Nietzschean reading ordinarily suggests. Paul Patton's response, for instance, has no problem reconciling Deleuze with the constitutional tradition of political liberalism (see Patton 2008). While Ian Buchanan and Adrian Parr strike a now familiar note by explaining that

> Too many people are content to say Deleuze, like Nietzsche, was against Hegel without ever asking why . . . But this critique is only meaningful to the extent that it is read in terms of Deleuze's conception of philosophy's purpose, which is precisely Marxian to the extent that, like Marx, they hold that the point of philosophy is not to understand society, but to change it. (Buchanan and Parr 2006: 1)

While these efforts to nuance Deleuze's thought have their benefits, there is a danger here that in *re*-acting to such criticisms Deleuzian Studies either becomes the victim of a dialectical entrapment or attempts to become all things to all people in a frantic search for acceptance. The suggestion is not, of course, that Deleuze needs to be authenticated, still less that we should refrain from using his concepts wherever appropriate. But having said this, to argue in favour of a Deleuze who is open to all forms of interpretation (affirmative/negative, creative/compromised, micro/macro, singular/universal, nomadic/sedentary, non-Statist/Statist) not only risks confirming what Žižek contends – that Deleuze is an ultimately substanceless political philosopher whose arbitrary positioning at best inspires an allegiance to the purely contingent – it also invites those 'bad readings or displacements' derived from 'arbitrary selections' of his works (not least the well-documented appropriation of Deleuze's ideas by various advocates within military academies) that he was so keen to warn us against in the particular context of Nietzsche's fate (Deleuze 2004: 17).

For Deleuzian scholarship what is at stake here centres on his relationship with Nietzsche. Should this be read in purely philosophical terms? Or might it offer to us something more *politically* than do those attempts to reconcile Deleuze with the best of the Enlightenment tradition? While

the style of Deleuze's *Nietzsche and Philosophy* does allow for some distancing in the sense that it is written from the perspective of the commentator exploring his target's thought processes, it is undoubtedly clear that this is done out of admiration rather than denunciation (unlike in the study of Kant). Keith Ansell-Pearson (2004) is therefore correct to insist that Deleuze's political 'battle cry' should not be divorced from its Nietzschean affinity. Such a severance would only undermine Deleuze's ontological commitment to the affirmation of difference, his belief in the creative dimension to resistance, his distaste for dialectics, his preference for the genealogical method, and his allegiance to Dionysian forces (nomadic, singular, micro and multiple) over Apollonian forces (sedentary, total, macro and universal). Moving away from the proposition that resistance is a creative process there is also a danger that Deleuze's contribution to our understanding of the political will simply be made to reaffirm well-established antagonistic terms of engagement.

Moving beyond this impasse, this paper will argue that it is possible to detect in Deleuze's thought an alternative concept of the political which gives ontological priority to difference. In order to gain a tangible purchase on this, a Deleuzian reading of the Zapatista experience will be presented, thereby countering the ludicrous assertion that Deleuze is merely some 'other-worldly' philosopher who provides us with no meaningful basis for normative political action.

II. Total War

When power takes life to be its object, resistance to power already puts itself on the side of life and turns life against power: 'life as a political object was in a sense taken at face value and turned back against the system bent on controlling it' (Deleuze 1999: 76). Life in other words not only 'becomes resistance to power when power takes life as its object, but invoking a special and particular "right to life", when power becomes bio-power, resistance becomes the power of life, a vital power that cannot be confined within species, environment or the paths of a particular diagram' (77). With life therefore said to be already richer in possibilities, the life which exceeds expectations *becomes a life of resistance*. Inevitably, since life resistance combats the forms of confinement (capture) and technical strategies (overcoding) so essential to forms of species manipulation, it equally refuses to accept the dangerously unfulfilled categorisation which power necessarily imposes in order to control and transform existence. This is crucial to our understanding of contemporary political struggles. Contemporary warfare is not simply

about containing the problem. By-passing the classical concern with sovereign integrities, it is fought over the modalities of life itself (see Smith 2006). As Tony Blair reiterated on numerous occasions (e.g. Blair 2007), Westphalia aside, the battle today is for the global value space. It is about bodies that matter. Somewhat ironically then, sanctioned in the name of lasting human peace, this global will to war is also triumphed to be an advance in Liberal reason (see Ignatieff 2003). It is the surest of indicators that humanity can be brought together through the necessary battles which are waged against unnecessary species endangerment. War is no longer therefore simply fought in order to destroy those terroristic elements which occupy an epistemic place of exteriority to the normal order of things; rather, for the most part, it is now waged by 'other means' upon maladjusted insurgent populations which, although dangerous, are open to remedy and demand lasting engagement (see Bell and Evans 2010).

While counter-insurgency literatures present this as the latest strategic thinking (see Kilcullen 2009), indigenous populations have been mapping these biopolitical contours for some considerable time. Writing some four years after the first uprising against the 'New World Order', Subcomandante Marcos, a spokesperson for the indigenous Zapatistas of Mexico, published a highly original article in *Le Monde diplomatique* (Marcos 2002). Entitled 'The Fourth World War', this article offered a remarkably concise genealogy of modern warfare which begins by navigating through the three major wars which shaped the twentieth century: the First and Second being the familiar Great Wars, the Third synonymous with the Cold War. Marking a new departure, the Fourth War thus refers to a post-Cold War condition which, although revealing many commonalities, presents some distinct strategic turns:

> Afterwards came the Fourth World War, which destroyed everything from before, because the world is no longer the same, and the same strategy cannot be applied. The concept of 'Total war' was developed further: it is not only a war on all fronts; it is a war which can be anywhere, a total war in which the entire world is at stake. 'Total war' means: at any moment, in any place, under any circumstances. The idea of fighting for one place in particular no longer exists. Now the fight can take place at any moment.

As Marcos sees it, 'the problem' begins to appear when one poses the question 'Who is the Enemy?':

> We are saying that humanity is now the enemy. The Fourth World War is destroying humanity as globalization is universalizing the market, and

> everything human which opposes the logic of the market is an enemy and must be destroyed. In this sense, we are all the enemy to be vanquished: indigenous, non-indigenous, human rights observers, teachers, intellectuals, artists. Anyone who believes themselves to be free and is not.

Hence, for Marcos, since 'Total War' implies that the entire planetary biosphere is at stake: 'There are no longer civilians and neutrals. The entire world is part of the conflict… Everyone is a part, there are no neutrals, you are either an ally or you are an enemy.'

This abandonment of political neutrality is not incidental. It is fully indicative of the contemporary strategic landscape which has witnessed the blurring of all conventional demarcations (see Dillon 2007; Dillon and Reid 2009). One only has the think for instance of the notion of Humanitarian War to give credence to this fact. This undoubtedly raises some challenging political questions. Not least, what does it mean to be politically active when activism itself is openly recruited into a veritable state of war? The Zapatistas have undoubtedly been at the forefront of these recombinant dynamics. Their insurgency has been unique for a number of reasons: 1) The first movement to ever declare outright war on an internationally recognised agreement [NAFTA], they forced strategic analysts to begin conceptualising warfare beyond the confines of the State (see Arquilla and Ronfeldt 1997). 2) Moving beyond reified sovereign conceptions of power, i.e. US hegemony, what the Zapatistas emphasised was the need to reconcile political power with a more general economy of biopolitical production. 3) Since their resistance reveals how life consciously struggles against all aspects of biopolitical control, especially imposed forms of 'good governance', they have become testament to the fact that the life which resists finds its most potent (hence more problematic) expression through the political affirmation of *life's differences*. As Marcos writes: 'when confronted with the search for hegemony, "the first task" is to recognise that there are "differences between us all" and that in light of this we aspire to a politics of tolerance and inclusion. You cannot aspire to eliminate the other, that which is different, and neither can you ignore it' (cited in Duran and Higgins 1999: 270).

Difference is not explained here dialectically. Difference already registers in the affirmative:

> We are 'other' and different… we are fighting in order to continue being 'other' and different… And what we are – far from wanting to impose its being on the 'other' or different – seeks its own space, and, at the same time, a space of meeting… that is why Power has its armies and police, to force

> those who are 'other' and different to be the same and identical. But the 'other' and different are not looking for everyone to be like they are . . . The 'everyone doing his own thing' is both an *affirmation of difference*, and it is a respect for other difference. (Marcos 1999c)

While this commitment to 'the Other' has prevented the Zapatistas from oedipalising their cause, hence remarkably making non-violence a strategic option (see Evans 2009), there is a perhaps more important point to be made here: When life becomes the principle object for political struggles, one no longer ties political strategies or analysis to conventional limit conditions. Conditioning the possible, modes of active production instead define the biopolitical field of operations. This is not of course to suggest that wretched conditions cannot be defined as unjust or intolerable, but neither is it to play by the pre-set rules of political engagement. This exposes the fundamental difference between biopolitics and dialectics. Where a dialectical logic presupposes contradictory elements within a realm that it ultimately unifies, biopolitical logics presuppose connectable elements within a field in which everything is recombinant. With complex forms of self-organisation therefore replacing linearity, limit conditions are efficiently seconded by a general economy of political production. That is to say, once the strategic assumption that the universe is heterogeneous firmly displaces the dialectical assumption that the universe is homogenised, power struggles become a matter of pure strategy.

III. Fugitive Subjects

Compound life has become the 'permanently temporary' habitual reality for many of the worlds *sans-papiers* (see Bauman 2002). Even sovereignty itself, as Green Zones testify, has become nodal. Nevertheless, while encamped life is undoubtedly wretched and de-politicising, foregrounding the spatial figuration of the camp may lead us to underestimate how contemporary wars have become wars of movement (Virilio 2003). While Giorgio Agamben (1995, 2005) has provided us with some insightful commentary on the de-politicising nature of encamped life, his *Camp as Nomos* hypothesis remains tied to the static sovereign view of the world. If however we accept that biopolitical rule is in the ascendancy then the general ordering of the earth becomes a *Nomos of Circulation* (Evans and Hardt 2010). It is no coincidence then that some strategic analysts have been arguing that success in contemporary theatres of war is dependent upon mastering

the network form (see Arquilla and Ronfeldt 2001). Not only do they allow one to operate more effectively in today's dynamic and radically interconnected world, network forms also benefit those who are *pro-active* in their strategic pursuits. It has thus all become a planetary game of 'GO'. Invariably, since the principal message here is that nothing is strategically marginal – that is to say, emergency is written into the fabric of all emergence – what potential there is for terror is placed into the heart of all possible *event*ualities (see Evans 2010). Knowing that we don't know thus registers at one and the same time as a wonderful condition of possibility and as the source of all our anxieties. With this in mind, given that the principal task for security practitioners is to pre-empt radical emergence, any ontological form of nomadism (animate/inanimate, actual/virtual) become *ipso facto* potentially dangerous (think illegal migration, shadow economies, unknown viruses, so forth). To put it another way, since the autonomous/emergent political subject cannot be left to chance, there is a simple choice to be made: either conform to the liberal attempts at making life live compliantly or become *politically fugitive*.

Here the Zapatistas are particularly instructive. While their *de facto* autonomous process has rightly received considerable attention (see in particular Burguete Cal y Mayor 2003; Mattiace 2003; Ross 2005, 2006; Sierra-Sierra 1995); the role *movement* plays in their struggle is often overlooked. Indeed, not only are they forcing us to re-conceptualise physical space, but, more profoundly, it is evident that their revolution offers a distinct nomadic disposition which has radicalised the intellectual political terrain. Since their uprising on New Year's Day 1994, the Zapatistas' ability to traverse space has been politically significant. This event in particular epitomised what Nietzsche termed the 'untimely'. A momentary appearance which truly unsettled the natural political order of things, its success was testament to the power of a revolutionary-becoming which, at the point of its emergence, proves to be completely imperceptible within conventional political registers. This tendency to move collectively en masse, while subsequently evacuating those off-limit territories without a trace, has repeatedly enabled the Zapatistas to display their autonomous power by entering politically sensitive areas to which they would not *Other*-wise belong. Such excursions have in numerous instances been political dynamite. On 12 September 1997, for instance, the Zapatistas kept their promise as a delegation of 1111 unarmed members travelled from Chiapas to the Federal District of Mexico City. In 1999, 5000 Zapatistas descended upon the republic for a referendum on the indigenous people's

right to define their own meaning of rights. In the spring of 2001 they would join forces with the National Indigenous Congress (Congreso Nacional Indigena) to march through 17 Mexican cities as the Zapatista motorcade embarked on a two-week journey that would end with some 200,000 sympathisers filling the *Zocalo* in Mexico City infamously chanting 'Todos Somos Marcos' (We are All Marcos).

Marcos has more recently toured the entire nation as part of the 'Otra Campana' (Other Campaign). While this tour witnessed some remarkable acts of political theatre – e.g. Marcos actually gaining entry into a maximum security prison – la Otra perhaps best illustrates how movement has been placed at the heart of revolutionary thought and practice. La Otra was first announced by the Zapatistas in their *Sixth Declaration from the Lacandon Selva* on 6 June 2005. This declaration was for many a significant moment, not least because many political commentators had felt that the Zapatistas' time had passed.[1] Facing such suggestions John Ross has noted that 'La Sexta [the Sixth Declaration] shows once again the Zapatistas at their most politically savvy, whenever you expect them to be outspoken they respond with a barrage of silence, and when they are assumed to be a thing of the past they show, with a barrage of communiqués – they keep compounding us by being one step ahead'.[2] In a remarkable moment of self-criticism, the Zapatistas felt that there was something missing from their project: namely, oppressed constituencies which were not necessarily indigenous:

> The first thing we saw was that our heart was not the same as before, when we began our struggle. It was larger, because now we had touched the hearts of many more good people. And we also saw that our heart was more hurt; it was more wounded. It was not wounded by the deceit of the bad governments, but because, when we touched the hearts of others, we also touched their sorrows. It was as if we were seeing ourselves in a mirror.[3]

The Zapatistas therefore recognised that they had reached a new moment in their revolutionary process – 'a point in which we could possibly lose everything we have if we do not move forward'. This called for a 'new step forward in the indigenous struggle' to 'unite with other social sectors that suffer'.

The Other Campaign sought to instigate another type of politics, 'a different way of doing politics' which fully recognises that genuine autonomy cannot simply be achieved by remaining static. Reflecting the dynamism of the world around, the Other Campaign therefore sought to reconcile autonomy with a willingness to continuously create reciprocal

adaptive networks, so that differences can be made to work together to produce new and alternative spaces. Hernandez Navarro believes this enables the Sixth Declaration to go well beyond the 'indigenous question' and 'announce a more far-reaching political initiative' which not only 'predicts the collapse of the political class' but seeks to depart from the rigidness of the 'traditional Left' (cited in Marcos 2006a: 15). The real strength of this new initiative is 'born of social energy generated in the heat of *mobilisation*'. This has been reflected by Marcos in what he termed *the Other Geometry* of the campaign. This calls for the creation of 'new realities which are already emerging, and which will go on appearing further ahead, need another theoretical reflection, another debate of ideas' (Marcos 2006b). Given that autonomy must therefore be receptive to political change in order for this project to work, openness must be built in to the revolutionary struggle: 'In our dreams we have seen another world... This world is not a dream from the past, it was not something that came to us from our ancestors. It came from ahead, from the next steps we are going to take' (Marcos 1994). *Nomadic tendencies* invariably come to the fore:

> In our theoretical reflection we talk about what we see as tendencies, not consummated or inevitable acts, they are theoretical reflections about the 'way we move', that is why we reject attempts at universality and eternity in what we say or do – 'what matters above all is the path, the direction, the tendency' – we are doing so not only in order to know what is happening and to understand it, but also, and above all, in order to try and transform it. (Marcos 2003b)

These tendencies provide us with a meaningful insight into what Deleuze and Guattari termed the 'Pure Idea of War': 'the distinction between absolute war as Idea and real wars seems to us to be of great importance... The pure Idea is not that of the abstract elimination of the adversary but that of a war machine *that does not have war as its object* and that only entertains a potential or supplementary synthetic relation with war' (Deleuze and Guattari 2002: 420). Not having war as its object, the war machine is a 'pure Idea' that is aphoristic and imperceptible to conventional political registers. It is not predicated on some original enmity; neither does it begin by negating the world. This pure idea of war as a nomadic becoming only therefore appears in the form of an antagonism directed against all forms of capture and overcoding once appropriation has occurred. When the imperceptible becomes perceptible! As such, what may appear to be an antagonistic refusal to follow the imperial production of peaceful subjects already

registers in the affirmative. As Deleuze writes, 'the aim of war machines isn't war at all but a very special kind of space, *smooth space*, which they establish, occupy, and extend. Nomadism is precisely this combination of war machine and smooth space... War machines tend to be much more revolutionary, or artistic, rather than military' (Deleuze 1990: 33). Revolutionary-becoming, in other words, is markedly different from violent revolution. Nietzsche thus returns here with renewed force in relation to the recasting of political solidarities:

> the nomadic adventure begins when they seek to stay in the same place by escaping the codes. As we know, the revolutionary problem today is to find some unity in our various struggles without falling back on the despotic and bureaucratic organisation of the party or State apparatus: we want a war machine that would not recreate a State apparatus, a nomadic unity in relation with the Outside, that would not recreate the despotic unity. This is perhaps Nietzsche at his most profound, a measure of his break with philosophy, as it appears in aphorism: to have made thought a war machine, to have made thought a nomadic power. And even if the journey goes nowhere, even if it takes place in the same place, imperceptible, unlooked for, underground, we must ask: who are today's nomads, who are today's Nietzscheans? (Deleuze 2004: 260)

IV. The Solidarity of Rights

Political activism cannot be divorced from the creation of solidarities with those deemed to be at the raw end of power. The activist is more often than not defined by the actions they undertake on behalf of those disenfranchised populations existing on the global periphery. From this perspective, while political realists have generally been lauded for their self-serving agendas, liberal theorists and practitioners have positioned themselves as the exemplars of political activism. Setting aside concerns for sovereign integrities, their commitment to alleviating unnecessary suffering is presented as the basis for a cosmopolitan ethic that will bring a new world community together. However, despite the self-declared *human*itarianism this account offers, one question tends to escape considered critical attention: How are political rights actually realised? If one takes the well-established juridical approach to liberal power then one locates the rightful act in the commitment to uphold legal declarations. Exalting the best of the positive law tradition, what is right then becomes synonymous with the legal protections offered to distant others. This, however, is only part of the story. Economic conditions have continually disrupted and transformed any

static semblance of legal rights. Indeed, while some liberals continue to tell an abstract juridical tale, at the level of policy it is now widely accepted that in order to achieve genuine social cohesion a commitment to political rights must be accompanied by a commitment to dealing with the problems of maladjusted economic subjects. A mere glance at the United Nations Declaration of Human Rights provides us with sufficient evidence for this fact. While it pays due attention to necessary protections from legal transgressions, it is the Declaration's Human Security guarantees (regarding access to resources essential for survival, education, healthcare, shelter, clean drinking water, and so on) which are seen as a triumph of the liberal conscience.[4] As Richard Falk suggests, thinking about security in human terms allows us to envisage a political 'community for the whole of humanity which overcomes the most problematic aspects of the present world scene . . . [and where] difference and uniformities across space and time are subsumed beneath an overall commitment to world order values in the provisional shape of peace, economic well-being, social and political justice, and environmental sustainability' (Falk 1995: 243).

While poststructuralist theorists are well aware of the limitations associated with juridical approaches to freedom, rights and justice (see Braidotti, Colebrook and Hanafin 2009), less attention is paid to the way in which a biopolitical approach might offer a critical perspective on the de-politicising nature of liberal humanitarianism in practice.[5] That is to say, while there is sufficient evidence of how the commitment to sovereign forms of right necessarily leads to the creation of abandoned lives reduced to 'bare life' through the sovereign encounter (see Agamben 1995, 2005), insufficient attention has been paid to the more positive power dynamics at play which, working in the name of human development and progress, actually serve to de-politicise alternative forms of political subjectivity *within* the remit of humanitarian discourses and practices. This offers an important corrective to Agamben. Whereas his concept of 'bare life' begins with the de-politicisation of others in order to construct political and moral registers, bare life in a biopolitical sense begins with the promotion of others in order to facilitate the elimination of that which is seen to be undesirable/regressive. Not then a form of bare life in the sense of legally suspended or abandoned; rather the 'bare activity' of a species life whose wretched conditions permit interventionist forces to act out of necessity. When life as such is reduced to the level of a victim incapable of providing even for the 'bare essentials', it is through the subsequent alleviation of suffering that all life is reduced to mere technology.

Deleuze and Guattari understood this all too well. Human rights, they argued, were merely 'axioms'. That is to say, what are presented as inviolable universal rights can quite easily 'exist on the market with many other axioms', or else can simply be suspended when the 'determinate inequalities of development dictate' (Deleuze and Guattari 1994: 106, 107). Human rights as such actually tell us 'nothing about the immanent modes of existence of people provided with rights'. The Zapatistas have learned this well. Their non-juridical approach to rights is well established (see Higgins 2004). Less attention, however, has been given to their conscious refusal of the human security prescriptions, which in the process of challenging imposed conditionality provides for critical reflection on the practice of saving strangers. Marcos understood early in the struggle that through the politicisation of aid warfare was taking place by other means (Marcos 1999a). This would have a profound impact upon the Zapatistas' entire relationship with all non-governmental organisations (see Marcos 2001, 2003a). While an inevitable side-effect of this has been self-deprivation,[6] it has nevertheless led to the creation of entirely new forms of solidarity which have redefined the benefactor/recipient relationship in a more reciprocal and locally sensitive manner (see Earle and Simonelli 2005; Olesen 2000, 2005). Development projects still happen; but not in order to meet statistical quotas set by technocrats in order to give a minimum valuation on the stock of life; rather, to enrich the indigenous communities' control over their own political affairs. Inevitably, since this conscious decision has effectively undermined the prevailing human security principle that underdevelopment is dangerous, the Zapatistas have in the process of exposing the de-politicising nature of biopolitical technologies forced the political back into conflict analysis (Evans 2008). One cannot propose scientifically deduced cause/effect remedies for a struggle which does not agree with the underlying economising logic. Neither can one deploy an army of technocratic ameliorators with a mandate for social transformation into a political crisis zone when those within the zone do not believe that they are the problem to be solved. A critical redefinition of the political itself is needed, in order to move from tolerance to genuine hospitality towards that which is different.

V. A Different Concept of the Political?

Jacques Derrida once said that the 'the rapport of self-identity is always a rapport of violence with the other; so that the notions of property, appropriation and self-presence, so central to metaphysics,

are essentially dependent on an oppositional relation with otherness' (Derrida 1984: 117). The Zapatistas have seemingly taken note of this modern truism. Centuries of indigenous persecution easily cultivates hate and resentment. Once mobilised into a political force, these historical animosities tend to re-cast old dialectical foes against one another in a perpetual struggle for mastery. Had the Zapatistas follow this trend, Marcos believes, they would have simply produced another brand of 'fundamentalism, converting the Zapatista movement into a movement *against* another race' (El Kilombo 2007: 18). Importantly then, for Marcos, since there are 'historical arguments which back up the idea that from *there* comes the pain', in order for the Zapatistas to create a 'new horizon' it is essential that from the outset one begins with a 'respect for the Other who is different'. Only then can they 'eliminate from us the possibility of fundamentalism'. In light of this attempt to proactively thwart fundamentalist tendencies, Deleuze's call in his study of Bergson to 'think differences of nature, independent of all forms of negation' (Deleuze 1988: 41) reads than more than an expression of admiration for a bygone philosopher. Intensifying the normative basis for affirmative politics, the concept of the political itself is recast to give ontological priority to difference. This represents a radical departure from conventional political referents. The orthodox approach begins with the political as a problem in the context of establishing the order and demarcations of battle, but for those advocating lasting peace, the political only gains meaningful currency when as the source of this enmity it is foregrounded as *the* problem to be solved.

The idea that the political should be conceptualised through a dialectical enmity is well established.[7] Realists deploy it in order to maintain their allegiance to epiphenomenal tensions. This enables them to present a world of neat sovereign demarcations through which it is possible to clearly identify other/self, them/us, outside/inside, enemy/friend and so on. Liberals on the other hand have openly recruited this Schmittean approach in order deploy it against itself. The politics of exceptionalism thus becomes the principal rallying cry for those who advocate a globally inclusive imaginary in order to rid the world of unnatural spatio-determined divisions. There is a tragic irony to all this. In order to save humanity from itself, liberals take the worst aspects of Schmitt's thought (i.e. ontologically prior enmity) in order to use it against its resulting tensions. Furthermore, the idea of separate sovereign orders is brought into question in order to re-establish a true planetary basis for sovereign power. Schmitt's nightmare vision of the fall of *jus publicum Europaeum* is therefore recast as the liberal condition of

possibility. Through selective appropriation of his ideas, Schmitt comes to represent the diagnostician in chief along with the chief adversary to be vanquished at all costs. If this renders Schmitt the bastard child of Hegelian disdain, no recourse to Kant will provide us with the political solution. The focus of concern here is not with the highly abstracted and reified account of sovereign power which tends to underwrite post-Kantian politics. Neither is it with the debilitating idealism of Kantian universality. What concerns us lies beneath the surface of this architecture. A shameful deceit, Kantian universality masks an altogether more sinister biopolitical imperative which, casting suspicion over all human life, means that all life is recruited into a perpetual state of internal war without distinction.

To explain this it is necessary to point out the irresolvable dilemmas upon which Kantian rule depends: Kant preaches universality but accepts that the universal is beyond the realms of lived experience. He preaches the international virtues of law but accepts that one's encounter with moral law has to be contingent. He demands that all life strive towards the unification of the species yet acknowledges that this is always going to be met with internal revolt and political strife. He insists upon autonomy even though he starts his analysis by offering an account of freedom in which man has fallen to the guilt of his own unmaking. He promotes human progress yet puts forward the thesis of infinite regress to highlight humankind's imperfections. And he claims that all life has an original predisposition to good while at the same time a natural propensity to evil. Taken together, while Kant therefore demands that life must be made to live for the sake of its own protection; he knows full well that to live in this Kantian way reveals how the capacity to be unnecessarily dangerous is inherent to all species of life. As such, not only does he condemn all life to a temporal purgatory, i.e. life is always guilty of the moral deficiencies of the past, yet incapable in its own right of exorcising them in the future. He also demands these imperfections in order for life to prove its moral and political worth. Hence, although Kantianism undeniably moves beyond the familiar geo-strategic epiphenomenal tensions (friend/enemy, outside/inside, bios/zoe), what takes their place is the biopolitical proposition that all life is always somehow dangerously unfulfilled.

Marcos cuts to the chase when he argues that 'the problem is respect towards the Other . . . Whatever political relationship that is not based in respect is manipulation. Well-intentioned or bad-intentioned, it doesn't matter, because it is manipulation . . . That's why we said, starting

there, we can construct respect or we can construct a relationship of domination' (El Kilombo 2007: 29, 30). How then does this respect for the Other who is already different manifest itself politically? Gregg Lambert (2008) and Charles Stivale (2008) have pointed us in the right direction in their attempts to explore the meaning of the Deleuzian notion of 'friendship'. Lambert, for instance, detects in Deleuze's later work a desire to place the Other at the forefront of our philosophical enquiry. This he believes forces an entire re-evaluation of the meaning of friendship as a political and philosophical concept that appears ontologically prior to the friend/enemy distinction: 'that is prior to any presupposition of a social commonality or relationship to identity, before we can even begin to think of the possibilities of friendship again' (Lambert 2008: 50). For Stivale, friendship cannot be divorced from Deleuze's political philosophy since it is intimately bound both to the creation of philosophical concepts and to active engagement:

> Deleuze's understanding of friendship is not that of a common or ideal bond and can hardly be encapsulated in a neat definition... However, Deleuze's myriad practices of friendship stand in sharp contrast to any ultimate recognition of friendship as distress, for such a defeatist view would fail to acknowledge that this distress constitutes but a complementary fold in the active engagement of friendship. (Stivale 2008: xiii)

For Stivale then, the question is not 'Who is the friend?' but more pertinently 'What can friendship do?' If we can say that that a Deleuzian notion of friendship is intimately bound up with our becoming in this world, forcing us indeed to find reasons to believe in this world, perhaps we can therefore say that friendship is precisely what he had in mind when he found in Nietzsche a philosophical ally who 'break[s] with philosophy, as it appears in the aphorism: to have made a war machine of thought, to have made thought a nomadic power' (Deleuze 2004: 260). It was Nietzsche after all who enabled Deleuze to move away from the morally reductive concern with 'how should we live?' towards considering the ethical possibilities of 'how might we live?' (May 2005: 7).

This certainly takes us into some fertile conceptual territory. While Derrida may provide us with obvious points of further connection, Agamben also appears to have something in common. As he recently stated: 'I maintain, rather, that "friend" belongs to the class of terms that linguists define as non-predicative; these are terms from which it is not possible to establish a class that includes all the things to which the predicative in question is attributed' (Agamben 2009: 29). Friendship

in other words is not a referent to be captured. It does not possess some objective denomination through which one might expose some transcendental essence. Friendship is a 'pure experience' of the world (30). Politically speaking, it is irrevocably bound to the 'pure fact of being': 'Friends do not share something (birth, law, place, taste): they are shared by the experience of friendship. Friendship is the con-division that precedes every division, since what has to be shared is the very fact of existence, life itself. And it is this sharing without an object, this original consenting, that constitutes the political' (26). Importantly, for Agamben, since the concept of friendship is equipped with an *intensity* that registers as political potential, he equally gestures towards a concept of the political which no longer needs to be based on enmity or some profound suspicion that political difference is *the* problem to be solved. Providing a more thorough and meaningful basis for this is perhaps the most difficult and yet most urgent task we face today.

Notes

1. For instance, in January 2005, Vincente Fox called the Zapatistas 'practically a thing of the past' with the 'people of Chiapas looking forward ... with a new face'. See W. Weissert, 'Mexico's Fox Calls Guerrilla Movement a Thing of the Past', Associated Press, 12 January 2005.
2. Interview conducted in Mexico City, 17 December 2005.
3. See the EZLN 'Sixth Declaration from the Lacandon Jungle'.
4. Amongst an abundance of literature dedicated to this, see in particular Booth 1991, 2005; Buzan 1991; Buzan et al. 1998; and Wyn-Jones 1999.
5. A notable exception to this is the work of Mark Duffield (see in particular Duffield 2007).
6. As June Nash observes 'The resistance of the Zapatista communities is also expressed in their rejection of government handouts in every form, be it textbooks, medical supplies and interventions, immunization programs, and other programs that might well benefit communities' (cited in Earle and Simonelli 2005: xi).
7. In his *Politische Theologie* (1922), Carl Schmitt first made his now well-established claim that sovereign power refers to 'he who decides upon the state of exception' (Schmitt 2006: 21). This would be developed more fully into a 'Concept of the Political' in the volume bearing that name (Schmitt 1996).

Defining Activism

Marcelo Svirsky Cardiff University

Abstract

Activism is defined in this paper as involving local instigations of new series of elements intersecting the actual, generating new collective enunciations, experimentations and investigations, which erode good and common sense and cause structures to swing away from their sedimented identities. By appealing to Spinozism, the paper describes the microphysics of the activist encounter with stable structures and the ways in which activism imposes new regimes of succession of ideas and affective variations in the power of action. Rather than understanding activism as supporting or leading social struggles, the definition of activism pursued here conceives it as an open-ended process and stresses the role of investigation in relation to practices within the social situations to which activism addresses itself.

Keywords: activism, revolution, intervention, encounter, ideas, affects

> O Romeo, Romeo, wherefore art thou Romeo?
> Deny thy father and refuse thy name, . . .
> 'Tis but thy name that is my enemy.
> Thou art thyself, though not a Montague.
> What's Montague? It is nor hand, nor foot,
> Nor arm, nor face, nor any other part
> Belonging to a man. O, be some other name!
> What's in a name? . . .
> So Romeo would, were he not Romeo call'd,
> Retain that dear perfection which he owes
> Without that title. Romeo, doff thy name . . .
> (*Romeo and Juliet*, 2, 2, 33–47)

The proper name, functioning as a colour-line in this dramatic work, creates a dividing gulf – an obstacle that impedes a love – which, for Juliet, can only be fulfilled in the after-life of the name, beyond the violence of the couple's actual subjectivities. Here, Juliet's plea is not a lament, nor a banal cry of grief. It is far more significant; it is a discovery, or better, a rebellion in itself. Two moments are simultaneously involved in it. First, Juliet reproaches the organising function of the name in relation to the pre-personal body – 'Tis but thy name that is my enemy: Thou art thyself, though not a Montague.' And second, in order for this reproach to become an active challenge, Juliet urges Romeo to dissent, to 'doff thy name' – to abandon it – demanding that he transcend his own organisation and alter the logic imposed by his name, for the sake of a bastard love. Her affect already recognises that the possibility of a prohibition 'would require *both persons and names*' (Deleuze and Guattari 1983: 161).

Juliet thus asks Romeo to detach his body from the subjective territory of the Montague – 'Deny thy father…' (Reynolds 2009: 50). The two moments expressed here – the discovery of an organisation taking place and the call for action – are united in a critical attitude towards that which suffocates love, which, for the twosome, is really that which suffocates life. However, we must notice that what turns this attitude into an inflective relation to life lies in the relation between these two moments. Juliet's rejection of the organising function of the name in relation to the body – 'What's Montague? It is nor hand, nor foot, nor arm, nor face, nor any other part' – is an invitation to each body part to reclaim its autonomy, and to enter into the transversality of love. Her inquiry makes clear that the opposition to, or negation of, the state of things in the actual ('Tis but thy name that is my enemy') is to be subordinated to an affirmation of life through the potentiality of new assemblages to come, assemblages that halo the actual and are associated with a particular state of things ('without that title…'). What comes first, anyway, if we may speculate, is the positivity of the love running between Juliet and Romeo throughout their encounter.

This is their first affective discovery, which draws them into a search for alternatives. The negation is secondary due to the character of the inquiry: it has the power to make the reader wonder the unthinkable for the sake of performing the impossible love: does an arm, or a face, have a name? What does it mean to change a name? Juliet's inquiry thus creates the idea of another rhythm in which the love might be consummated. In this way her intervention joyfully affects the play, shifting the reader from one degree of reality to another. Here Juliet is, in

a Deleuzian sense, fabulating, hallucinating 'a couple to come' (Deleuze 1995: 174). She incites Romeo to depart from the protective world of his own familial fabulations, this time in the Bergsonian sense (cf. Bogue 2006: 202–23).[1] Another idea of love starts to condense throughout the scene, one indicative of an alternative image of the encounter of Juliet and Romeo.

There are three interconnected practical qualities present in Juliet's radicalism:[2] a confrontation with a stratifying organisation (the name and its filiative association); a situational engagement (Juliet's demand for Romeo to engage actively and intervene in his circumstances to produce another sociability, that is, another encounter which might enable their love); and, lastly, an inquiring attitude towards the actual – a militant investigation which eludes the pincers of royal science and its representations (the place of the family in the city of Verona, the tribal prohibitions, and so on). As a necessary step in the creation of new conditions, Juliet interrogates the conditions she wishes to leave. It is from the perspective of the third quality that we should read her enigmatic call at the beginning of the scene, intended to shake Romeo from his familial knot: 'Wherefore art thou Romeo?' – a genealogical call asking for reasons, interrogating the processes by which Romeo has come to own and still retains his name. Juliet directs her question towards Romeo's positioning in the world, interrogating his commitment and obedience to the attachments and stratifications now trapping him in immobility. From this perspective, 'Wherefore art thou?' means: 'What are your reasons for clinging to, in what ways are you committed to, your particular name and your way of life?' Or, as Deleuze and Guattari might put it: 'What are your microfascisms, Romeo?' In other words, Juliet's speech suggests that we should abandon the organised and patriarchal sense of the state of things (the name) by way of problematising *our relations* with other bodies, ideas and things in their actual state, not in general, but in an encounter within the situation in which they dwell. This calls for a reconsideration of the present composition of such relations. Indeed, ultimately, it is *a call to arms*, a call for new and better encounters – an approach I shall call the activist problematic.

I. Introduction

This brief detour through Shakespeare introduces us to the main focus of this article: to try to develop a conceptualisation of activism, working towards a definition. As we shall see, this will involve a return to the

practical qualities we have just discerned in Juliet's speech. The concept of activism I envisage here is intended to open up what is analysed, making possible further connections and intersections, and bolstering activism itself. Only when we manage to create a productive relationship between the material aspect of the assemblage ('the intermingling of bodies reacting to one another' [Deleuze and Guattari 1987: 88]), on the one hand, and its discursive aspect, on the other, is representation eluded, allowing us to open the actual up to a more transparent relation with the virtual. In other words, activism has to be also present *in* the concept, stirring both thought and action. From this, we can see why there is little interest here either in the investigation of individual motives or in a normative framework. For instance, the psychological and social mechanisms used in political psychology to explain activism in terms of the structure of causality between the individual psyche and the action itself – such as parental inculcation, principled education, political morality, universal moral duty, social altruism, and so on (see, for example, Gross 1997) – in fact explain very little concerning the empirical relationships between bodies and things. Such mechanisms do not account for the body of the activist, the field of action, the assemblages involved, and the multitude affecting and being affected. The tendency of such psychology to search for the origins of political actions in terms of the theorisation of psycho-social motives appears misplaced when we think of the world in terms of fluxes of incessant creation.

Spinozism, as Deleuze contends, 'confers on finite beings a power of existence' that is never exhausted, and which 'bears with it a corresponding and inseparable capacity to be affected, [which is] *always exercised*', in an infinity of ways (Deleuze 1992: 91, 93; emphasis added). In other words, the power of acting is not something to be found in a personality of this or that type, nor necessarily in one specific environment rather than another. More simply,

> We can know by reasoning that the power of action is the sole expression of our essence, the sole affirmation of our power of being affected. But this knowledge remains abstract. We don't know what this power is, nor how we may acquire or discover it. *And we will certainly never know this, if we do not concretely try to become active*. (Deleuze 1992: 226; emphasis added)

Instead of theorising incentives, it is better to explore by experimentation that which is already actively varying. Western normative ethics have tried to impose a democratic framework that limits and contains nomadic forms of resistance (the concept and practice of civil society

bear the hallmark of all forms of that containment). But merely by creating distinctions between moral worlds, such normative ethics do nothing to further the exploration and intensification of present activist potentialities.

It is crucial for what follows that we examine the relationship between activism and the concept of revolution. Deleuze and Guattari clarify what revolution means: 'schizophrenising the existing power structure, making it vibrate to a new rhythm, making it change from within, without at the same time becoming a schizophrenic' (Buchanan 2008: 10; Deleuze and Guattari 1983). Therefore, revolution is given in the passage of a structure from rhythm A to rhythm B (the structure changing in the passage), where the structure can that of a social, political or economic system, a system of friendship, an educational system, a household, an individual person, a specific human-animal system (for example bovine slaughter regulations, or practices of species preservation), a field of art, or of any other stable natural or social environment. However, it is important to stress that we are not advocating here a sequential model of revolution, one determined by a telos adopted in advance. As revolutionaries, we always exist in many dimensions, in the midst of that from which we try to escape and struggle against, interwoven with the material we start to experiment with. It is the passage that is revolutionary, not the final arrival at a new rhythm. And yet, activism is not itself that passage of rhythms; rather, it is a temporary sub-rhythm of denunciation, wounding the first rhythm, from which it carves out a becoming into new territories. As Raunig explains, drawing on Holloway's works on the Zapatista movement: 'it is more the first steps into seemingly new terrain, posited on the old terrain, fighting against this old terrain and using it at the same time to transform it into something different' (Raunig 2007: 41–2).

Always starting as a wound of alterity within the habitual, activism refers to that fleeting fraction of encounters and connections still not engaged in the organisation of the second rhythm. If, following Guattari, we conceive the machine as being in opposition to structure (Guattari 1984: 111–20), then we may conceive activism as machinic, that is to say, plugging a movement of deterritorialisation into a territorial assemblage, and thereby activating the territory for further connections (Deleuze and Guattari 1987: 333). This causes the assemblage to swing 'between a territorial closure that tends to restratify [it] and a deterritorialising movement that, on the contrary, connects [it] with the Cosmos' (337). When activism connects itself to a system, an established relation of forces is distracted, and to some extent diverted into a

far-from-equilibrium state. In other words, we learn from Deleuze that the revolutionary passage occurs when a system is pushed beyond a critical threshold, moving from a state of equilibrium into a state far from equilibrium (see Bonta and Protevi 2004). As an assemblage of encounters pushing the system towards new states, activism is one of the causes bringing about evolution and re-creation within the system. Nothing concerning the success or betrayal of the revolutionary passage is relevant to us here; rather, the focus is on the assemblages of affects agitating stable systems in order to tip them in non-linear directions. As a sign of denunciation, activist practices trace out and map the lines of a society at specific zones – its intensities and boundaries – with a view to grafting an outside onto them. In this way, they become indicative of those zones' new potentialities. By installing themselves in official territories, activist practices thus become the harbingers of a new openness.

There is, however, no dissociative distinction between activism and revolution; rather, activism infuses the concept and practice of revolution with an incessant discomforting movement that helps to protect new revolutionary forms of organisation from the dangers of stratification and its oppressive side effects. In this perspective, activism nurtures revolution, keeping it alive. Here, Raunig's treatment of the concept of the revolutionary machine, used to explore missed concatenations between art and revolution during the nineteenth and twentieth centuries, might help clarify the relationship between the two concepts. Following Negri's works from the 1970s, and Hardt and Negri's *Empire* (2000), Raunig adopts the 'triad model of the revolutionary machine' as comprised simultaneously of insurrection, resistance and constituent power (see Raunig 2007: 25–66). For Raunig, insurrection is the mediating component that concatenates the revolutionary screams of horror – the expression of resistance, and hope – and the expression of constituent power (see 41–8). Immanently, the three components are all present in activism, but the irruptive character of insurrection – its 'temporary flare' (56), compared with the more laborious character of resistance and constituent power – make it a better basis for exploring the relationship between activism and revolution. Contra Raunig, the division he proposes between a time of duration of the permanent molecular revolution (expressed by resistance and constituent power) and a time of rupture (expressed by the event of insurrection) runs the risk of dispensing with the latter when the former is actualised through processes that deepen the fascistic tendencies in the new organisation. Incessant activist ruptures are vital to maintaining a

rhythm of infinite movement in a revolutionary machine. Activism, we might say, is revolution's *conatus*, its tendency or instinct to persevere in its revolutionary power; thus we have a series of activist ruptures within revolutionary processes – the power of creation as constituent power remains faithful to the eternal return of difference, and draws itself away from the entrapments of constituted power. Deleuze and Guattari pointed to the coupling of resistance and constituent power in their treatment of the war machine; opposition, resistance, can engage in revolutionary action '*only on the condition that they simultaneously create something else*' (Deleuze and Guattari 1987: 423).

Although Raunig, as did Hardt and Negri before him, portrays insurrection as essentially spectacular (think the Paris Commune of 1871, the Russian Kolkhozes, or the Zapatistas), it is possible to understand insurrection as a perceptible act of opposition to a ruling power or habit, without tying it to a Hollywood-style image. For instance, a Bartlebyan moment of refusal is an act of opposition which might infect a state of affairs and develop into an activism,[3] whether it occurs in a scrivener's office, in a call for a love, or at home through the forces exerted by a change in posture of a woman's body when a patriarchal tradition is challenged. It is in the insolence and intensity of the challenge posed against constituted power (whatever its form or mode), and its associated way of life, that activism is located, and not necessarily on the barricades or protest marches.

Activism's logic is thus interventionist and operationally hyper-active. First, it latches onto certain zones and injects external forces, causing a differential change in the system. Second, it involves an emphatic attention to life, similar to Bergson's attentive recognition; that is to say, it evaluates each object by causing it to pass through different planes in order to gain a critical appreciation of it; at the same time it frees itself from the distractions of habitual recognition that social systems impose upon us (cf. Deleuze 1989: 44–68).

II. A Second Distinction

For Deleuze, life has an ever-changing problematic structure. Every multiplicity changes its virtual structure by way of actualisations, that is, by passing into temporary solutions (the virtual differentiates itself and becomes different from itself in the process). This brings forth new conditions for the creation of the new in the real (see Smith 2007). Aided by various representational and mystifying machines, patterns and forms hide these processes; further, stratified patterns have the power to

create interests, which in turn force neurotic and paranoiac functions onto desire (see Deleuze and Guattari 1983). As a result, there is a backwash of narrowing our belief in the potentiality of virtual structures. With little belief in the virtuality of life, always interwoven with social obedience, a peaceful and wide zone of sedated individuals is secured. Balibar's Spinozism explains how this passivity is engendered:

> When an individual is passive, it is because his soul has been subjugated by the circulation of the affects and by the 'general ideas' that inhabit the collective imagination . . . His body too will have been simultaneously subjugated by the unrestrained influence of all the surrounding bodies. (Balibar 1998: 94–5)

From this passage it becomes clear why activist practices take it to be part of their responsibility to recirculate affects away from the 'general ideas' of a society (or of smaller multiplicities). In so far as, collectively, we vehemently stick to the dominant forms of life (practices and discourses) without any critical intake, we deepen our complicity with the burial of the virtual, as well as with the betrayal of the infinity of life. Activism finds here its most basic function: the unfolding of a Julietian critical engagement with dominant forms of life and their self-reproductive representations – the 'general ideas'. In this sense, activism is that which diverts life from its tendency to eternalise and deepen itself in its actual forms, that which pledges to 'connect the roots or trees back up with a rhizome' (Deleuze and Guattari 1987: 14).

A critical engagement can be deployed at least in two ways, following a distinction between two conceptions of how to revolutionise the world (Colectivo Situaciones 2001: 31). The first is characteristic of traditional leftist politics, which base their political struggles on a yearning to change the world. Here, activism is expressed in the encounter of forces, bodies and things which furthers direct struggles against multiplicities, and in which singularities are perceptibly isolated by agglomerations of the ordinary. In this version, strategically, activism collides with the stable structure, producing a sort of dialectical relation. Theatrically, the subject in this drama is the resulting antagonism. Operationally, it aims at a transformation of the state of things that may amount to a combinatorial view of novelty: 'only little more than the rearrangement of matter in the universe into ever new forms' (Smith 2007: 2).

In contrast, some contemporary forms of escape – those proliferating alternative life-experiences – are not concerned with changing the world, but rather would like 'to produce it anew' (Colectivo Situaciones 2001: 31). These activisms problematise the structure of the existence of the actual form by contemplating and experimenting with the

changing conditions of the new – 'testing . . . alternative forms of social organisation' (Raunig 2007: 60) – bringing about change not in a combinatorial fashion, but in the nature of particular areas of life. By embracing the whole of the real and not only the actual, new singular points are created by changing the multiplicity in question. What is most significant in these sorts of activisms is that resistance is thought and operated not in a dialectical contraposition to constituted power (*potestas*) in a reactive mode; rather, though an unavoidable relation of conflict with constituted power comes into being, resistance here unfolds as immanent difference which draws on the natural force of creation (*potentia*).[4] From this perspective, Raunig's distinction between resistance and constituent power appears redundant; the two are not just linked but mutually implicated.

This version of activism multiplies new practices, and in doing so bypasses existent stable practices and their manifestations of oppression.[5] The first mode of activism assumes that solidifications and closures can be challenged. The second mode leans on the assumption that oppression cannot take on everything; this mode always opens up a reflexive distance that is absent in the first mode. As praxis, the first mode of political activism is reactive, polemical, litigious, and engaged in incessant argumentation. As examples we can think of pressure groups for legislation change, High Court petitions, protests, persuasion campaigns, and so on. The second mode is more quiet but ontologically invasive. Examples include alternative modes of education, promoting new ways of life, rethinking narratives, investigating the conditions of oppression, and so on. Comparing the two versions, we should keep in mind that there is a 'feedback' aspect in confrontational activism: challenging a practice or an idea has a nurturing effect.

III. The Functions of Activism

Activism is not a secluded or hidden phenomenon. It is extroverted, involved in the generation of public events. Most activisms I know of take very seriously the repercussions of their actions within the broader society, both locally or/and globally. Many activists publish reports on their practices and experiences, have internet sites, or, more traditionally, distribute printed material to the general public; indeed, it is well known that they are anxious to encourage the public to participate in and attend their discursive dramas.

Ill-advisedly, some forms of activism develop into missionary activity, and sometimes wind-up as messianic. This carries the risk of destroying

the very becoming characteristic of activism. Any presumption on the part of activists to define life in moral terms – instead of understanding their activity as promoting potentialities – functions to homogenise activism and fill the plane of consistency with energy of just one type. This excess then becomes equivalent to a drastic reduction in the potential of bodies, hence the indices of heterogeneity and of transversality are reduced as well. This version of activism, which is unfortunately always present to some extent, generally takes the form of a paranoid reaction to the world on the part of well-defined and determined subjects – 'the Stalins of the little groups' (Deleuze and Parnet 2002: 139). The terror they impose, like that of the majoritarian society, is one of reterritorialisation.

What is it that activism brings about? What occurs in the encounter between activist practices (body A) and its spectators (body B)? What can be said of that encounter? We are going to need to anchor off Spinozist shores (*Ethics*, Books II and III). First we need to add to the drama a necessary third body, C, which is that body of stable relations (social, political, educational, cultural, and so on) into which activism taps. We already know that, for most of us and for most parts of our lives, a relation of commitment and obedience is what characterises our relationship to C (B–C).

What activism does, when it acts, is introduce an initial movement of deterritorialisation into the internal relations of body C, forcing a variation in the latter's relations to the spectators (body B), and in the interim creating a new relation between activism and the spectators. Let us take a simple example to see how the three main bodies may encounter one another in a concrete situation. In Israel, a segregationist educational system (body C) complements a broader structure of social segregation between Jews and Palestinians, citizens of Israel. In 1998, a group of parents (body A) set up an initiative to establish a bilingual, Arabic–Hebrew School in the northern region of the Galilee. Sufficient numbers within the local communities (body B) were enthusiastic enough to join in, and, ultimately, the school named *Galilee* was established and has operated ever since (see Svirsky et al. 2007; Svirsky 2010). In this example, reaching new operational rhythms was bound up with the repressive operations of older rhythms (mainly rooted in an obsession with collective identity).[6]

As the encounter begins to express itself, effects on the different bodies start to circulate, caused by the intermingling of affections between them (affections might include: one's route home changes because of a demonstration; police repress demonstrators; a class is cancelled by

the student union; humanitarian relief reaches a population under siege; an alternative school building is found; and so on). Following Spinoza's epistemological parallelism, we may say that to every object or thing there corresponds an idea (Deleuze 1992: 113–4). Following the activist encounter then, at least two sorts of ideas are being affirmed on the bodies: ideas that have friction, itself caused by activism as their object, and ideas that have as their objects different aspects of the system of relationships A–B–C. The affections caused by the activist encounter arouse different spiritual and bodily sympathies and antipathies, which are tantamount to the ideas of these affections (attesting to different degrees of compossibility between the bodies in the encounter and their different capacities for being affected). Correspondingly, the power of acting of the bodies involved in the encounter either increases or decreases. Whichever is the case, we are, according to the definition of Spinozist affects, in the presence of a regime of the succession of ideas, which is followed by a variation in the power of action or in the force of existing. Deleuze explains that 'this kind of melodic line of continuous variation' is defined by Spinoza as affect (Deleuze 1978: 3–4). It is not unlikely that the circulation of new passions will be one of the effects of an activist initiative. When faced with the eruption of a new activism, spectators may react with either enthusiasm or anger, or some permutation of the two. But activism makes clear that there is no linear correspondence between such passions and the variation in the power of acting (increase or decrease), since the displeasure or rage triggered by a certain activism may lead ultimately to counter-activism.

The key point here concerns the slide or passage between two different states of ideas in the bodies involved, and, especially, the attitudes of the bodies in respect of the ways they come to perceive the functioning of the stable body C under the activist attack. These perceptions will depend on the ways we understand the activist encounter in its relations both with the social stable body under attack and with us, the spectators; they depend on the kind of ideas we have of these relationships and effects. Though 'our ideas of affections do of course "involve" their own cause, that is, the objective essence of the external body', it is also true that 'as long as I remain in the perception of affection, I know nothing of the [action]'. Thus, my idea of a particular demonstration, of a new school, of a humanitarian aid project, and so on, is only partial, and of the lowest kind in Spinoza's terms, since they only '*indicate* a state of our body' (Deleuze 1992: 146–7; 1978: 6).

What this kind of knowledge creates is an image that only expresses the objects (the activist encounter and the relationships between the

bodies) by their effects on us. How bad are these inadequate ideas for our analysis of activism? Practically speaking, what would it mean for us, as spectators, to have a higher knowledge of causes – that is, to have 'notion-ideas' of the activist encounter and to become the cause of our own affects, rather than having merely 'affection-ideas' of it? And how might activism help us to move away, at least partially, from the passions that the accidental pattern of the encounter affirms in us? All these questions are important in so far as they contribute to the more general question of how activism approximates the threshold of becoming a project of alternative collective action.

A notion-idea, says Deleuze, 'no longer concerns the effect of another body on mine, it's an idea which concerns and which has for its object the agreement or disagreement of the characteristic relations between two bodies' (Deleuze 1978: 10).[7] This notion of agreement (and disagreement) between the encountering bodies needs to be seen in light of Deleuze's account of the Spinozist idea of 'what a body is capable of': its significance depends on our efforts to know which affections we and others are capable of, given our society, our culture, our specific historical life, and so on. From the point of view of the notion-idea, drawing up an ethological chart of the compositions of relations seems to be essential for activism. Put simply, this means developing a reasonable knowledge of 'what a people can bear' when they are confronted with practices such as those introduced by activism (contrary to what critics may think, this is not necessarily equivalent to developing practices which are in harmony with the actual). What we can bear politically is seen here as linked to what our bodies can do in relation to a specific political issue. Reasonable knowledge leans on the assumption that affecting others joyfully should not be considered a sin for activists. For Spinoza, reason is, after all, a problem of becoming, and self-righteous 'anti-becoming' attitudes abound among activists. This question of reasonable knowledge takes us back to Juliet's investigation of the conditions for a new, more agreeable encounter with Romeo. And the idea of investigation being part of activist practice leads us on to what has been implemented lately by activists and researchers as *militant research* (see Biddle et al. 2007; Malo de Molina 2004; Benasayag and Sztulwark 2000). As defined in 2009 by the Collective 'Precarias a la Deriva' (Madrid), militant research is a process of re-appropriating our own capacity for *world*-making, which questions, problematises and pushes the real through a series of concrete procedures. More forcefully, for the Argentinean 'Colectivo Situaciones', activism is not about leading or supporting struggles but about dwelling actively in

the situation – investigating it – with a view to the emergence of an alternative sociability (Colectivo Situaciones 2001: 37). The first premise of activist militant research is that there is no global knowledge on how things should be; rather, activism entails an engagement in the production of situational or local knowledge. This is why the activist-machine is a paradigmatic case of learning in Deleuze's sense – a constant experimentation of the discordant exercise of the faculties disconnected from every form of identity (cf. Deleuze 1994: 164–7).

In terms of how this might be done, organising protests on behalf of the rights of weakened groups, or filming their experiences to gain sympathy (or prizes), is not enough. What is needed is the combination of activist research with populations experiencing alternative sociabilities (Colectivo Situaciones 2001: 38).[8] Here resides one of the major differences between investigation-based activists and classical civil society NGOs, which tend to adopt an a priori agenda for change. It is not that regular acts of protest lack any significance; rather, the claim here is that they cannot be seen as the focus of revolutionary action. The situational production of knowledge should be seen in direct relation to the difference between changing the world and creating it anew, with revolutionary activism being committed to the latter.

It is true that the activist-machine 'kills the joy' (Ahmed 2009) of those fearing the effects of the activists' revolutionary horizon on their peaceful life and privileges. In so doing, activism necessarily undermines solidarity. But producing unhappiness cannot be activism's goal or sense. Although sadness inevitably accompanies every activism – even those supporting the action may feel 'local sadness' (Deleuze 1978: 9) – it is hard to see the point to causing sad affects in others. We already know one of the activist's bad habits: to induce in us sadness and resentment as the necessary preparation for forming a critical attitude which will make us politically active.[9] But there is no good reason to look for such bad encounters as a matter of strategy (tactical bad encounters might be considered circumstantially, assuming an awareness of their destructive effect on all bodies involved). '[N]othing in sadness . . . can induce you from within sadness to form a notion common to something which would be common to the bodies which affect you with sadness and to your own' (11). At times, as activists, we feel the urge 'to make things clear' to help people to understand a particular issue by engaging in radical action, as if they are in need of a brighter light in their life. But pure intensity does not necessarily lead to a good encounter: 'a blue that is too intense for my eyes will not make me say it's beautiful' (14).

From a Spinozist ethical perspective then, working towards a level of strategic knowledge concerning the ways bodies A, B and C can be mutually affected goes hand in hand with the need to 'organise encounters' as 'the effort to form an association of men in relations that can be combined' (Deleuze 1992: 261). The incredible amount of time activists spend on articulating ideologies will count for little if their practices are separated from a strategy that includes, at least partially, entering into joyous participation with others – meaning, pursuing compossible relations with them. Activism's role is not to secure that compossibility, but to open up and remain open to its potentiality.

Let us move on to another of activism's functions. The inadequate idea brought forth by the affections between the bodies involved in the activist encounter has two sides: 'they "involve privation" of the knowledge of their cause, but are at the same time effects that in some way "involve" that cause' (Deleuze 1992: 149). The second aspect, explains Deleuze, contains something positive, indispensable for the passage into adequate ideas, which is, in fact, the power of thinking, or what is enabled in the first instance by the faculty of imagination (149–50). This natural condition not only leads to the conceptualisation of the passage into common notions, but also means that we might have a multiplicity of several and different affection-ideas – inadequate ideas. Reacting to an activist action, we might form a specifically fearful image of a particular intervention as the result of becoming affected with anger. But, in addition, the intermingling of affections in the activist encounter also actualises the formal idea of the revolution. Whichever of the affects it arouses, the variation of affection-ideas caused by the activist encounter involve a sort of 'background noise' – a singular range of frequencies of perceptions – involving an idea (inadequate as it might be) of a 'people to come' hovering above and intersecting with activist practices. In other words, given that 'the ideas we have are signs, indicative images impressed in us' (147), we are claiming that the disrupting action of activism imprints in us a hallucinating sign which indicates the formal presence of a revolution. This is why we said before that activism is not itself the revolutionary passage of rhythms in a structure, but only announces that passage's potential existence. It is apparently to this feature of activism that Appadurai directs his words:

> The imagination has become an organised field of social practices, a form of work … and a form of negotiation between sites of agency … and globally defined fields of possibility … The imagination is now central to all forms of agency, is itself a social fact … [it] is today a staging ground for action, and not only for escape. (Appadurai 1996: 31)

This function of activism stands in relation with the other, that of striving for the formation of common notions. Though causing bad encounters for many, for the 'background noise' not to become dead noise and activism not to be washed away, activism needs to avoid creating an excess of the unhappiness it inevitably causes. For example, when activists clash with the institutional forces responsible for raising separation walls (the Berlin Wall, the West Bank wall, and so on), they still need not to overlook the idea or possibility of more agreeable encounters taking place between the segregated bodies.

IV. Method

The life of an activist is marked by a sense of urgency, anxiety and alertness to a life under attack. It involves both a type of discomfort with the world, and a life-force seeking out the new; activism is therefore in and of itself turbulent and restless. It threatens our neat and secure life. It is the pure form of terror. This is perhaps why the drama of activism can be so annoying for spectators, and so dangerous for activists.

To describe activism's machinations I turn to Deleuze's theory of the series, as formulated in *The Logic of Sense* (1990). The claim here is that every activist-machine working in a particular zone of social, cultural or political action comes into being through the creation of a new series of interconnected elements as a result of alternative connections with (a) given registers of the actualised world, and (b) new imaginations. The new series engendered by the activist-machine never isolates itself, but rather aims at producing a communication of divergence with a specific official series within a particular zone of thought and action. This is analogous to a situation in which, suddenly and without warning, we introduce a new set of actors from among the audience or the street, to become an integral part of a performance on stage – or, if you prefer, we add an entirely new deck into the middle of a card game, or bring on a third team during a football game. In all of these instances a new game is created; by dissolving the former rules we bring new connections to bear upon the large conjunctions to which subjects and objects are currently in thrall, thereby changing the structure of the game. Once such a connection between the series has been established, a disjunctive and productive movement of distancing between the old and the new series appears, certain modes of excess start to circulate, and, finally, new products and flows come into play.

For example, when the State of Israel, its governments and its Jewish majority insist upon referring to Israel as 'The Jewish State', they are appealing to a certain associated series of elements in order to affix a certain symbolic meaning to a structure that is 'haunted by a desire for eternity' (Guattari 1995: 37): Jewish-State-the-Biblical-Land, Jewish-State-Holocaust-European-debt, Jewish-State-the-few-against-the-many, Jewish-State-agricultural-revolution, Jewish-State-stretching-out-its-hand-in-peace, Jewish-State-the-only-democracy-in-the-Middle-East, and so on. Conversely, when activist groups in Israel/Palestine articulate the name of Israel with other elements that are 'shaped by a desire for abolition' (37) – such as Israel-Nakba, Israel-segregation-apartheid, Israel-Gaza-strip-blockade, Israel-the-West-Bank-the-Wall, Israel-discrimination-Arab-minority, Israel-militarism, and so forth – they are in fact appealing to an alternative series of real relations implicating the state's name. This second series attaches itself to the first series by implanting a differential correspondence between the respective elements of the series, thereby creating disequilibrium. As José Gil has pointed out, the true machine of innovation in Deleuze's thinking of the event is the disjunction as the synthetic movement of divergent terms (Gil 2008: 18). There is an excess of one series over the other through their common interface, in this case with the name of Israel functioning as the Empty Square, and enabling 'indirect interactions between elements devoid of so-called natural affinity' (Deleuze and Guattari 1987: 348).

Through the activist interlacement of a new series, a paradox is introduced: 'Paradox is initially that which destroys good sense as the only direction, but it is also that which destroys common sense as the assignation of fixed identities' (Deleuze 1990: 3). This being the case, we can understand why, today, both Zionists and their critics sense a certain discomfort when appealing to the name of the Jewish state. This forced encounter between the two series, instigated by activism, redefines the trajectory of the name of Israel – approximating this name to its problematic actualisations. From the activist-machine perspective, a straightforward proposition such as: 'It is the Jewish state that is oppressing, segregating and committing war-crimes' changes something in the way the struggle is expanded upon, since new, real connections and relations are being claimed.

The question, in the case of Israel and its name, becomes not whether Israel must be recognised as a Jewish state, but what this name expresses in terms of actual experiences and virtual potentials. In this respect, Derrida's treatment of the name of apartheid might

be worth quoting, interspersed with references to the Middle-Eastern analogy:

> Those in power in South Africa [Israel] have not managed to convince the world, and first of all because, still today, they have refused to change the real, effective, fundamental meaning of their watchword: apartheid [the Jewish state]. A watchword is not just a name... is also a concept and a reality... [They]... wanted to keep the concept and the reality, while effacing the word, an evil word, *their* word. They have managed to do so in *their* official discourse, but that's all. Everywhere else in the world... people have continued to think that the word was indissolubly – and legitimately – welded to the concept and to the reality. (Derrida 1986: 163)

In the past, Derrida urged the world to call a thing by its name with regard to South African apartheid. In contrast with Juliet's plea, calling Israel by its preferred name 'will remain the "unique appellation" of this monstrous, unique, and unambiguous thing' (Derrida 1986: 159). By calling the thing by its name, while imposing a contretemps upon it, this part of the actual loses its grip on recent identifications. This is where we face the polyphony of the naming-function. On the one hand, in *Romeo and Juliet*, 'the proper name, when assigned to people, functions to consolidate... the subjective territories of individuals within a given society, that is, within an official culture' (Reynolds 2009: 48). On the other hand – as in the case of the names of the apartheid and the Jewish state: 'the naming-function provides a counter-tactic by which to undermine societies' mechanisms of control and surveillance' (280).

The connection between the two series of elements instigated by activism forges a new space of relations and a new structure in which a problematisation of social and political issues is brought to the fore. The connection – or *ligaçao* in Gil's terms – is what creates 'a critical distance between members of the same species' by introducing variation (Deleuze and Guattari 1987: 322). We are now in a position to dare to offer an alternative reading to the famous 'Lodge yourself' passage in *A Thousand Plateaus* (161): investigate; create an alternative series of elements having new visual, audible and material elements; investigate-experiment. Then, by making connections, this series should intersect the dominant series at different points; investigate-experiment. You will be overwhelmed by the apparition of new images and affections, and, as a result, a reconsideration of life becomes inevitable.

Notes

1. As Bogue explains, for Bergson, fabulation is a protective shield (against social dissolution) which 'goes hand in hand with religion in creating the myths of forces, myths, and deities that foster social cohesion and individual contentment' (Bogue 2006: 205). In Shakespeare's play, familialism takes the place of religion.
2. I follow here the way the Argentinean Colectivo Situaciones (2001) explain their perspective on *Contrapoder* ('counter-power'). For Benasayag and Sztulwark (2000), the contemporary *Contrapoder* is expressed by creative and constructionist struggles that are not derived from sadness and do not rely on models or seek central power. Rather, they produce an anti-systemic subjectivity and are situational in their operation.
3. To appropriate Bartleby beyond this point will be futile, since Bartleby, as Deleuze explains, 'is too smooth for anyone to be able to hang any particularity on him' (Deleuze 1997: 74). As such, Žižek's (2006) Bartlebyan politics – premised upon an essential movement of subtraction from the hegemonic system which both guarantees an outside and allows one to criticise contemporary forms of what he defines as pseudo-resistance – as well as Hardt and Negri's (2000) take on Bartleby as the iconic anti-Empire work-refusnik – are both excesses of interpretation (cf. Beverungen and Dunne 2007), desperate formalisations of Bartleby.
4. As Raunig explains, in *Foucault* (2006), 'Deleuze makes the point that a social field offers resistance before it is organised according to strategies' (Raunig 2007: 53). In Hardt and Negri's register, 'resistance is prior to power'.
5. Oppression here is understood as the oppression of creative processes. Aiming at the ontological conditions of creation, oppression is infinite stratification, i.e. the accumulative spatialisation, homogenisation and quantification of duration. Oppression is a natural tendency, the twin of creative processes. In its social register, oppression mystifies stratification using the logic of representation. It occurs everywhere, including throughout activist initiatives.
6. This means that the idea that a revolutionary initiative can construct itself in isolation from the 'general society' in a separate territory is a short-term illusion. I have explained elsewhere how *Galilee*, as an intercultural assemblage, is being thrown back into the dichotomies of ethnicity just because it doesn't confront properly the fact that *potestas* can't be ignored (see Svirsky 2010).
7. To clarify: the affection-idea is associated with the effects of the mixing of bodies in the encounter, whereas the notion-idea is associated with the degree of agreement or disagreement of the characteristic relations of the bodies.
8. Since their appearance in the late 1990s, Colectivo Situaciones have made several interventions-investigations with different groups, such as with 'escraches-groups' (actions aimed at unmasking mainly individuals involved in the last Argentinean dictatorship), with Tupamaros (a revolutionary movement that emerged in Uruguay during the 1960s), and with the 'Movimiento de Trabajadores Desocuapdos de Solano' (a movement of the unemployed in the locality of Solano). For an extensive list of their activities and their published literature see: http://www.situaciones.org
9. Sometimes activists are not that different from Spinoza's priest or despot, who needs the sadness of his audience and their feelings of guilt in order to influence them. But sadness can only diminish our power of acting.

Between Realism and Anti-realism: Deleuze and the Spinozist Tradition in Philosophy

Jeffrey Bell Southeastern Louisiana University

Abstract

In 1967, after a talk Deleuze gave to the Society of French Philosophy, Ferdinand Alquié expressed concern during the question and answer session that perhaps Deleuze was relying too heavily upon science and not giving adequate attention to questions and problems that Alquié took to be distinctively philosophical. Deleuze responded by agreeing with Alquié; moreover, he argued that his primary interest was precisely in the metaphysics science needs rather than in the science philosophy needs. This metaphysics, Deleuze argues, is to be done 'in the style of Whitehead' rather than the style of Kant, and in developing this metaphysics Deleuze draws heavily on Spinoza. The present essay examines this Deleuzian-Spinozist metaphysics done in the style of Whitehead, the 'metaphysics science needs', drawing on the writings of David Hume and Bruno Latour in the process. This discussion will in turn enable us to situate Deleuze's metaphysics in relation to contemporary debates concerning speculative realism and correlationism, and especially Quentin Meillassoux's critique of the latter. Our conclusion will be that the kind of metaphysics Deleuze pursues is neither correlationist nor straightforwardly realist, but rather charts a course between realism and anti-realism.

Keywords: Ferdinand Alquié, Spinoza, David Hume, Bruno Latour, Quentin Meillassoux, correlationism, David Lewis

Deleuze's thought can be situated relative to realism and anti-realism by way of two responses he received following his talk entitled 'Method of Dramatization' given to the Société Française de Philosophie on 28 January 1967. The first is from Ferdinand Alquié, who expressed a concern about Deleuze's use of examples from science and psychology to make philosophical points:

> I understand that Mr. Deleuze criticizes philosophy for making the Idea a conception that is not adaptable, as he would like, to scientific, psychological, and historical problems. But I think that alongside these problems there remain classical philosophical problems, namely problems having to do with essence. In any event, I don't believe, as Deleuze does, that the great philosophers have never posed such questions. (Alquié cited in Deleuze 2003: 106)

Coming from the man who was overseeing his work on Spinoza at the time, this criticism got Deleuze's attention. The second question is from Alexis Philonenko, a Kant and Fichte scholar, who sought clarification of Deleuze's arguments concerning the relationship between the representational and the subrepresentational. Philonenko compared these arguments to Maïmon's, noting that the latter's differential elements compare to Deleuze's subrepresentational elements, and the integration of these differentials to the representational. For Philonenko, a consequence of this approach is scepticism, for we are left without a criterion whereby we can discern 'what we produce and what the object produces . . . [and] what is produced logically and what is not'. 'So', Philonenko concludes, 'this is what I want to know: what part does illusion (or the illusory) have in the movement of differential elements?' (Philonenko cited in Deleuze 2003: 114).

Before addressing Deleuze's response to these two questions I first want to show how they give rise to issues concerning realism. We will then be better placed to introduce Deleuze's thought into the constellation of debates that currently surround realism, anti-realism and speculative realism.

Alquié's concern with Deleuze's talk was that the distinctiveness of philosophy was being supplanted by science. Is philosophy merely a midwife to the sciences? For Deleuze the answer is clearly no. When asked, for example, whether the topological model discussed in the conclusion to *A Thousand Plateaus* is 'transposable into mathematics [and] biology', Deleuze says 'it is the other way around', and to clarify this point he adds: 'I feel that I am Bergsonian – when Bergson says that modern science has not found its metaphysics, the metaphysics it

needs. It is that metaphysics that interests me' (Deleuze 2007: 41). This metaphysics should not, Deleuze stresses, be undertaken 'in the style of Kant', but rather 'in the style of Whitehead' (Deleuze 2007: 41). What this involves will be discussed below, but it is important first to appreciate the fact that Deleuze is interested in the metaphysics modern science needs, rather than the science philosophy needs.

With this turn to metaphysics we also return to the choice that has come to characterise much of post-Kantian philosophy – one can follow Humean empiricism and its positivist and nominalist variants or one can follow Kantian critique and its idealist and rationalist variants, but, it is generally assumed, one cannot follow both simultaneously. Philonenko's question regarding illusion comes from the Kantian perspective. Kant identifies as a transcendental illusion the process whereby one extends the concepts of the pure understanding to form judgements regarding things that are beyond the limits of possible experience (e.g., the existence of God, the claim that the world must have a beginning in time, etc.). The point of Kant's critical project is to determine the limit that marks the line between legitimate and illusory claims to know what is real and what is not. But even with this project in hand, Kant admits that the transcendental illusion 'does not cease even after it has been detected and its invalidity clearly revealed by transcendental criticism' (Kant 2003: 299); the mind naturally and inevitably slips into illusion. On Philonenko's reading of Maïmon, moreover, we cannot even be certain about the line we draw between legitimate and illusory judgements, since it is uncertain whether the integration of differentials from which our judgements arise is the product of our own making or a real consequence of a real object. Similarly, from the empiricist perspective, when we are led through the association of ideas and habit to impute causality and necessity to objective relationships, or to infer a substantial self that accompanies our thoughts and perceptions, and Hume too would leave us with no way to differentiate between reality and illusion other than in terms of the strength and vivacity of our beliefs themselves, which is certainly no guarantee. As Deleuze says of Hume, 'From the point of view of philosophy, the mind is no longer anything but delirium and madness. There is no complete system, synthesis, or cosmology that is not imaginary' (Deleuze 2001: 83).[1] Deleuze's response to Philonenko's question may thus seem surprising, but it is unambiguous – for him there is no place for illusion with respect to the subrepresentational field; this field is 'perfectly determinable', as Deleuze puts it, and 'the illusion only comes afterward, from the direction of constituted extension and the qualities that fill out these extensions' (Deleuze 2003: 115). For

Deleuze, therefore, the real is to be associated with the processes that constitute the givenness of objects rather than with the constituted, identifiable objects and categories themselves. It is for this reason that Deleuze identifies the style of metaphysics he is interested in with Whitehead instead of Kant; rather than base an understanding of reality upon identifiable categories and forms of judgement, Deleuze argues that our scientific, representational understanding of reality presupposes subrepresentational processes that are not to be confused or identified with whatever is identifiable as a result of these processes.

In the choice between Kant and Hume, therefore, Deleuze's preference seems clear – Hume. But where does this leave Deleuze relative to realism, and to metaphysics in particular? At first sight it might appear that Deleuze should be placed solidly within the anti-realist camp. After all, if what can be said of reality may in the end be illusory, and if Deleuze, much like Hume, is willing to say that 'there is no complete system, synthesis, or cosmology that is not imaginary', then it would seem to be difficult to place him in the realist camp. But is he therefore an anti-realist?

To answer this question I will sketch out the difference between realism and anti-realism by way of Quentin Meillassoux's critique of correlationism, which, as Meillassoux himself puts it, is ultimately a radical critique of any 'contemporary opponent of any realism' (Meillassoux 2007: 408). Put briefly, correlationism holds that we cannot know reality as it is in-itself but only as it is for-us, as a correlate of consciousness, language, culture, conceptual scheme, etc. Meillassoux notes that Fichte's *Principles of Scientific Knowledge* is the 'chef d'oeuvre of such a correlationism' in that it shows how any attempt to posit a reality as independent of any positing is still a reality that is posited as such (Meillassoux 2007: 408). Correlationism, however, is not committed to a subject-object dualism but more importantly rejects any attempt to hypostatise a reality that would be autonomous and independent. This is why Meillassoux will understand correlationism not as 'an anti-realism but [as] an anti-absolutism', for it is invoked 'to curb every hypostatization, every substantialization of an object of knowledge which would turn the latter into a being existing in and of itself' (Meillassoux 2010: 11). Whether these autonomous beings are Ideas or objects, correlationism, for our purposes, is anti-realist in that it holds that any reality in-itself is always from the start an in-itself correlated with something else.

Let us turn now to more traditional understandings of anti-realism, deriving from the analytic tradition. The term itself was first used by

Michael Dummett to characterise those positions which argue that reality is what is necessary in order to state meaningful, true sentences.[2] Dummett will refer to this as semantic realism, and others will call it deflationary realism, but it is clear that it is a form of correlationism or anti-realism in that the real is accounted for not as it is in-itself but only in so far as it is necessary to the utterance of meaningful, true sentences. As Quine famously put it: 'To be assumed as an entity is, purely and simply, to be reckoned as the value of a variable. In terms of categories of traditional grammar, this amounts roughly to saying that to be is to be in the range of reference of a pronoun' (Quine 1980: 13). Donald Davidson, one of Quine's most prominent students, will break with what he sees as Quine's continuing adherence to what Davidson calls the third dogma of empiricism, by which he means that scheme-content dualism whereby a pure content ('sensory firings' in Quine's case) is forged and translated by a conceptual scheme into the content of our knowledge of reality.[3] In rejecting the third dogma Davidson may appear to be a realist – he does, after all, claim to uphold a form of monism which asserts that there is nothing but objects and events. And yet when he argues for the reality of these objects and events his argument in the end largely follows Quine, claiming as it does that objects and events (especially the latter) are real only because we could not utter the meaningful sentences we do without them.[4] Finally, though we could go on, in David Lewis's modal realism – a realism that goes well beyond that of common sense in accepting the reality of possible worlds – Lewis argues for the reality of possible worlds by showing that they are necessary if our everyday counterfactual claims are to be meaningful and true (see Lewis 2001). In all these cases and in others, the real is not considered as it is in-itself but only as it is necessary to some other process (namely, a linguistic and semantic process); in this sense, correlationism and anti-realism are alive and well within the analytic tradition.

In his attempt to move beyond correlationism, Meillassoux draws support from an important ontological claim that he derives from correlationism itself, even though he admits that it 'is not an ontology, strictly speaking'. He argues that, 'according to the correlationist, if I remove myself from the world, I can't know the residue. But this reasoning supposes that we have access to an absolute possibility: the possibility that the in-itself could be different from the for-us. And this absolute possibility is grounded in turn on the absolute facticity of the correlation' (Meillassoux 2007: 431). In other words, from the epistemological claim that one cannot 'know the residue' of what would *be* independent of what is for-us, Meillassoux draws the ontological

conclusion that the world could be other than it is for-us, which entails, in turn, the possibility of a world without correlation, a world without givenness. From here it is a simple step to the undermining of correlationism, since if the real, X, can be known only as a *posited* X, then it follows from the ontological conclusion concerning the facticity of the correlation itself that there is the possibility of an X that is not posited, a world without givenness for-us.

One of the challenges that attends Meillassoux's conclusion – a challenge that is central to what has been called speculative realism (and which has not been ignored within the analytic tradition either) – is to account, in a noncircular manner, for the facticity of thought itself – especially the normative patterns of thought – and hence for the relationship between thought and the structure of reality from which thought emerges. It would lead us too far astray to enter into these debates here, but it should be noted that Meillassoux's own concerns regarding realism and the facticity of thought are widely shared and are being addressed from a number of different perspectives.[5]

To return to the relationship between philosophy and science – and clearly science has a lot to say about the origins of thought – we can begin by discussing David Lewis's Humean understanding of necessity, or what he calls Humean supervenience. On Lewis's reading of Hume, any claims we make regarding the world supervene upon a given distribution of particular facts. For example, given any two worlds, if they are identical in every way and share the same laws of nature then they will remain identical at any and all later times. There cannot be a change in the distribution of particular facts, or a divergence between the two worlds, without a simultaneous change in the laws that supervene upon these worlds and facts. Given the laws of probability, the chance that a single throw of the dice will give me a six are one in six. Three or four sixes may show up in a row, but given enough throws the number of times I throw a six will approach one in six. The laws of probability thus supervene upon a given distribution of particular facts in the world (here rolls of the dice) up to and including $time_1$. If there is a non-zero chance, however, that after $time_1$ sixes come up every time then that would effect the chance distribution at W at $time_1$. It would be something higher than one in six, but this would contradict Humean supervenience, since the world at $time_1$ would both be and not be in accordance with the laws of probability up to and including $time_1$. Lewis refers to this as an undermining future.[6] Meillassoux, for his part, contends that what makes the Humean understanding of necessity possible is that there be a totality relative to which the particular facts

are compared, and hence upon which the necessary laws supervene. It is the *totality* of throws at $time_1$ combined with the throws after $time_1$ that gives rise to undermining futures. Following Badiou and Cantor, however, Meillassoux argues for the non-All that cannot be totalised and which therefore undermines the necessary laws that would supervene upon a given totality. The notion of an undermining future would not even arise on this reading. This is not to say that there are no particular facts or regularities between facts. Within a large set of observations the odds of sixes appearing may be one in six, or there may be countless other regularities, but the 'laws' that supervene upon these regularities are, Meillassoux argues, 'contingent. They are not necessary. As Hume said, we are unable to demonstrate any such necessity' (Meillassoux 2007: 441).[7]

Turning now to Deleuze, we have what might be called 'Deleuzian supervenience', whereby the axiomatic supervenes upon the problematic, but the problematic forever exceeds the axiomatic: it is the 'power of the continuum, tied to the axiomatic but exceeding it'. Axiomatics, or what Deleuze will also call major or royal science, draws from problematics the necessity of inventing and innovating; while problematics, as minor or nomad science, calls upon axiomatics to actualise solutions to the problems it lays out. Deleuze and Guattari are clear on this point: 'Major science has a perpetual need for the inspiration of the minor; but the minor would be nothing if it did not confront and conform to the highest scientific requirements' (Deleuze and Guattari 1984: 486). To clarify this point we can turn to Spinoza, and to Deleuze's review essay of Gueroult's first volume on Spinoza's *Ethics*. Here Deleuze argues that what is important about Gueroult's approach is his stress on the fact that Spinoza doesn't begin with the idea of God (God enters the scene only with the sixth definition and the ninth proposition). Does this mean that the first five definitions and eight propositions are inessential to Spinoza's project – mere preliminary work that had to be got out of the way before the real work began? For Gueroult and for Deleuze the answer is no. Otherwise, Deleuze argues, we get 'two misreadings of the attribute: 1) the Kantian illusion that makes attributes forms or concepts of the understanding, and 2) the neo-Platonic vertigo that makes attributes already degraded emanations or manifestations' (Deleuze 2003: 149).

With this claim we arrive at the central feature of Spinozism as Deleuze understands it – namely, the relentless tracking down of transcendence in all its forms. And here we find the two misreadings of Spinoza to which Deleuze refers, both of which call upon transcendence.

First, the Kantian illusion that turns attributes into concepts that transcend substance as that which is applied to substance (this is also Badiou's misreading of Spinoza[8]). Second, the neo-Platonic misreading of Spinoza that sees substance as a pure One and the attributes as degraded emanations of this One (Hegel and Bertrand Russell are guilty of this reading). Substance, however, is neither One nor multiple, but is rather a multiplicity, a substantive multiplicity. The attributes, therefore, are fully real and are *really* distinct from one another, but they are not numerically distinct and they do not transcend substance, nor are they the degraded emanations of substance. They constitute, to repeat, what Deleuze will call a substantive multiplicity:

> The logic of real distinction is a logic of purely affirmative difference and without negation. Attributes indeed constitute an irreducible multiplicity, but the whole question is what type of multiplicity. The problem is erased if the substantive 'multiplicity' is transformed into two opposed adjectives (multiple attributes and one substance). (Deleuze 2003: 150)

For Deleuze, therefore, Spinoza does not begin with God but with the problematic, with substantive multiplicity. To understand Spinoza adequately, therefore, it is essential to clarify what is meant by substance, and in what way it is not to be confused with either God or the modes and attributes. By far the most common interpretation of substance is to understand it as a being, albeit an absolute, infinite being, that is in some way parcelled by the modes and attributes. At the risk of anachronism, we could apply Heidegger's ontological difference and say that substance is typically understood onto-theo-logically as being in contrast to Being. Although I will not, as some do, assert that substance is to be understood as Being, as no-thing in Heidegger's sense of the term, I would argue that substance is not to be conceived as a being either. It is precisely this latter reading of substance that lends itself to the two misreadings of the attributes listed above. One reading of Spinoza's theory of substance that avoids interpreting substance as being can be found in H. F. Hallett's works.[9] For Hallett, substance is 'absolutely indeterminate', or in-determinate, as I have argued elsewhere.[10] Hallett's interpretation is by no means the consensus view, but it does have important textual support. For example, since God is defined in the *Ethics* as absolutely infinite (1D6), God can in no way be limited or in any way determinate, for to be determinate would entail it being related to another that it is not. As Spinoza argues in his letter to Jelles, 'all determination is negation' (Spinoza 1996: 260),[11] and hence substance cannot be determinate if is to be absolutely infinite and

affirmative, which is precisely how Spinoza understands it, as he makes clear in a letter to Lodewijk Meyer where he claims that substance is the 'infinite enjoyment of existing' (Spinoza 1996: 102). This also accounts for why God is absolutely infinite rather than infinite in its own kind, as the attributes are, since this would require being a determinate form of infinite and hence a form that *could*, when understood conceptually by way of the understanding – namely the infinite mode of understanding – be related to what it is not, to what is other than it. Yet another reason for adopting Hallett's reading follows from a related claim Spinoza makes in his letter to Jelles that anyone who 'calls God one or single has no true idea of God' because, as we have already noted, all determination is negation and God, as substance, is the 'infinite enjoyment of existing', or the 'absolutely infinite power of existing', as Spinoza will also put it in the *Ethics*.[12]

To clarify the Spinozist context within which Deleuze's thought navigates, we can turn to Deleuze and Guattari's claim in *A Thousand Plateaus* that God is a lobster, a double articulation. It is all too easy to underestimate the philosophical importance of this claim, but we can also see it at work in Deleuze's essay on Gueroult, where Spinoza's first eight propositions correspond to the first articulation, or, as Deleuze puts it, 'the first eight propositions represent a first series through which we ascend to the differential constitutive elements' – the attributes. As Deleuze had stressed earlier in the essay, there is 'no ascension from attributes to substance . . . to absolutely infinite substance'; rather, there is an ascension through a 'regressive analytic process' to the 'differential constitutive elements' themselves, to the substantive multiplicity. (Deleuze 2003: 150). Then there is the second articulation, the second series running from the ninth to the eleventh proposition, 'through which', Deleuze argues, 'the idea of God integrates these elements and makes clear it can be constituted only by all these elements together'. The attributes, as a multiplicity of incommensurable and really distinct entities, come to be integrated by the power of *causa sui* whereby 'essence is the cause of the existence of substance and the cause of the other things that derive from it' (Deleuze 2003: 153). Understood in this way, God as *causa sui* is both the condition that enables the regressive analytic process which leads to a multiplicity of really distinct attributes (first articulation) and the conditioned that is the integration of this multiplicity (second articulation). God is self-caused, or: God is a lobster, a double articulation.

We can now return to Alquié's question and Deleuze's response, and in turn situate Deleuze relative to realism and anti-realism. As

discussed earlier, Alquié was troubled by Deleuze's use of examples from science in his talk, creating the impression that philosophy was a mere expository tool in the service of science. In response to Alquié's question Deleuze stresses that he does 'believe in the specificity of philosophy, and furthermore, this belief of mine derives from you yourself' (Deleuze 2003: 106); moreover, Deleuze immediately adds, 'Even the concepts such as singular and regular, or remarkable and ordinary [i.e., philosophical concepts for Deleuze], are not exhausted by mathematics. I want to call on Lautman's theses: a theory of systems must show how the movement of scientific concepts participates in a dialectic that surpasses them' (Deleuze 2003: 107). In other words, and to state this in terms used above, royal science and axiomatics develops concepts that participate in, or supervene upon, nomadic and problematic philosophical concepts, and the latter are not exhausted by the former. Hence there is not, pace Lewis, a one-to-one structural supervenience between that which supervenes (axiomatics) and that which is supervened upon (problematics), but rather a supervenience that entails a non-causal relationship between the actualised and structured and that which exceeds these structures, such as philosophical concepts. Deleuze's seconding of Alquié's belief in the specificity of philosophy should thus not be underestimated, especially in light of recent calls among philosophers to return to realism. In response to this call, there have been roughly two distinct approaches. In the first it is argued that the way to do justice to reality in-itself is through mathematics. For Badiou 'mathematics is ontology' (Badiou 2007: 19), and Meillassoux tracks Badiou's approach quite faithfully, arguing that 'what is mathematizable cannot be reduced to a correlate of thought' (Meillassoux 2010: 117). The second approach accounts for the reality and nature of objects themselves by drawing on science, and dynamic systems theory in particular (DeLanda's and Protevi's work loom large here). There is tremendous work being done in each of these two approaches, but the concern, and it is precisely this that prompted Alquié's question, is that they may reduce philosophy to being simply an adjunct to mathematics and/or science. What is lost in these approaches is the distinctiveness of philosophy itself.

To clarify what it is that makes philosophy distinctive for Deleuze we can now turn to the question of how his understanding of the principle of sufficient reason – a good philosophical principle if ever there was one – differs from that of Lewis and Meillassoux. Since for Lewis laws supervene, in the structured manner discussed above, upon the particular facts of the world, and since worlds, both actual and possible,

constitute a totality, the claims of science can adequately represent the necessary distributions and regularities of each world. The *totality* of particular facts within each world thus provides a sufficient reason for the laws and claims that supervene upon these worlds. To clarify by way of example: if I roll a pair of dice and it comes up sixes 20 times in a row I may begin to think there must be a *reason* why this is happening – either faulty or loaded dice. Similarly, if a student happens to see their professor at the store they would likely think nothing of it (a mere chance encounter), and they may continue to think so even if they happen to run into them again later that day; but if this continues then at some point they will no doubt begin to think there is a *reason* that explains these encounters – namely, they are being stalked. For Meillassoux, however, what gives these examples their sufficient reason and explanatory power is that they are held in relationship to a set or totality of other examples. Relative to the totality of past instances, dice do not come up sixes 20 times in a row, nor does one run into one's professor more than once or twice on any given day outside the classroom. For Meillassoux, by contrast, the non-All undermines this explanatory power and with it the principle of sufficient reason. For him, consequently, there is no necessity other than the necessity of contingency. We cannot state why things are the way they are rather than another way. The arguments Meillassoux uses to justify this claim rely heavily upon the force of negation and contradiction (Hegel lurks behind the scenes here). He will thus argue, for example, 'that to be contingent you must not be contradictory, because if you are contradictory you are everything and you can't change' (Meillassoux 2007: 331). A similar claim is made in *After Finitude* where he argues that a philosophy of becoming will have to do away with contradictory entities for they cannot change and become what they are not – they already are what they are not (Meillassoux 2010: 69–71). And in his critique of correlationism itself Meillassoux calls upon Fichte's strategy, what Meillassoux calls 'pragmatico-genetic contradiction', to show that the content of a claim is contradicted by the very way in which the claim is put forward. The content of the claim 'X is not posited' is contradicted by the very fact that it is *posited* as not posited. Similarly, the content of correlationism's claim that all reality in-itself is a correlate for-us is contradicted by the absolutisation of contingency that goes along with this claim and which results in the facticity of the correlation itself. It is on the basis of these arguments, and the binary logic of contradiction they presuppose, that Meillassoux rejects the principle of sufficient reason. 'If you want to speak about what

exists,' Meillassoux argues, 'you can only *describe*, as phenomenology does' (Meillassoux 2007: 391) but the fact that it is something rather than nothing 'cannot be described' (Meillassoux 2007: 392). Despite the obvious differences between Lewis and Meillassoux – one accepts the principle of sufficient reason and accepts that worlds, both actual and possible, constitute totalities, while the other does not – they both share a commitment to a logic of representation – an 'it is or it isn't' logic – that Deleuze identifies with the actualisation of the actual world. In short, the logic of representation presupposes the bifurcations of actuality, the fact, as Deleuze argued in an early essay on Bergson, that 'virtuality exists in such a way that it actualizes itself as it dissociates itself; it must dissociate itself to actualize itself' (Deleuze 2003: 40). As dissociated and actualised, we have mutually exclusive differences, either/or contradictions, and the logic of representation presupposes these differences in order to represent that which the representation is *not*.

By contrast, and following from his Spinozism, Deleuze attempts to set forth philosophical concepts that presuppose a logic of expression and sense rather than a logic of representation. Rather than build upon mutually exclusive differences and contradictions, Deleuze tries to draw from difference-in-itself a Spinozist substantive multiplicity that presupposes 'a logic of purely affirmative difference and without negation' (Deleuze 2003: 150). It is this logic that accounts for the fact that, for Deleuze, philosophical concepts are not exhausted by scientific or mathematical concepts. Nearly 30 years after his 'Method of Dramatization' talk, Deleuze will continue to make much the same point. As Deleuze and Guattari argue in *What is Philosophy?* science sets out to map functions that represent the actualisation of the actual, or that accurately describe the regularities of the world.[13] Philosophy, by contrast, creates concepts which counter-actualise the actual and involve the problematic upon which the actual supervenes. Understood in this way, Deleuze, unlike Meillassoux, will continue to adhere to the principle of sufficient reason. As Deleuze argues in his book on Leibniz, the principle of sufficient reason does not imply that every actuality – Adam's eating of the apple for example – was determinately detailed and sketched in advance such that the actualisation itself was a foregone conclusion to anyone with complete knowledge (such as God); to the contrary, for Deleuze the principle of sufficient reason is the substantive multiplicity, in the Spinozist sense sketched above, that is the sufficient reason for the determinate (see Deleuze 1992: 41–58). As Deleuze will argue in numerous places, this substantive multiplicity

is real but not actual – it is what he will also call the virtual. Deleuze's logic of expression, however, does not entail a rejection of the actual world, an attempt to get out of this world and the logic of representation. It is, rather, an attempt to intensify the actual world, including its representations, to problematise it, and to do so while remaining fully within it. To argue otherwise would mean allowing transcendence to sneak in through the back door, and Deleuze, like Spinoza, is keen to hunt down transcendence in all its forms.

From this perspective, therefore, Deleuze is neither a correlationist anti-realist nor a straightforward realist. Deleuze is not a correlationist since he follows no binary logic of the for-us distinct from the in-itself; rather, he is a monist developing philosophical concepts that follow a logic of expression or sense rather than a binary logic of contradiction, a logic of representation. Each actual entity, or each mode in Spinoza's terms, is thus to be understood as an expression of substance, a substance that is only identifiable *as such* when expressed in a mode. Substance, therefore, does indeed turn around its modes, as Deleuze had said was how he understood Spinoza (Deleuze 2004: 306). As such, each actual entity is a real, determinate expression of substance, of substance as substantive multiplicity, or it is the expression of the nondenumerable which Deleuze and Guattari define as being 'neither the set nor its elements [the one or the multiple]; rather, it is the connection, the "and" produced between elements, between sets, and which belongs to neither, which eludes them and constitutes a line of flight' (Deleuze and Guattari 1984: 519). Between the elements of the correlation, therefore, between the for-us *and* the in-itself, there is the 'and', and it is this 'and' that 'constitutes a line of flight' that escapes and eludes every correlation, every attempt to reduce reality to a correlation. Similarly Deleuze is not an anti-realist in the analytic sense of the term for he soundly rejects the view that the real can only be accounted for in so far as it is necessary for meaningful, true sentences; rather, he asserts that the real as problematic, substantive multiplicity exceeds these representations and is irreducible to them, and thus the logic of representation presupposes the nonsense and nondenumerable upon which it supervenes. Deleuzian supervenience is thus not like Lewis's Humean supervenience, since Lewis follows the logic of representation whereby necessary laws supervene upon the particular facts of the world, and a change in the latter entails a change in the former. These laws therefore re-present the particular facts of the world. For Meillassoux there is no supervenience since there is no correlation between a totalised world and that which represents this world, even though, as we have

seen, Meillassoux continues to adhere to a logic of representation. Deleuzian supervenience, by contrast, follows a logic of sense, and thus the actual, the axiomatic, supervenes upon the problematic, which is not a correlate it represents but the expressiveness and power of the actual itself. Deleuzian supervenience, to recall our earlier comments, does not involve a structured relationship between the axiomatic and the problematic that it is *not*, but instead conveys the relationship between the actual and the in-determinate, de-structuring power that problematises the actual.

But Deleuze is not a straightforward realist either, if by realism one means the affirmation of an autonomous reality with properties and features that are independent of anyone's beliefs, linguistic practices, conceptual schemes, etc. The very idea of an autonomous reality in-itself presupposes, as Bruno Latour has argued, a stabilisation of events, events that are indeed real but are neither autonomous nor heteronomous. This has been a consistent theme for Latour, even though he has not always used the same terms to state it; put briefly, events and autonomous objects and facts are not to be confused with one another even though they are not fundamentally distinct, much less different in kind. Rather, objects and autonomous facts are stabilised events; or, adopting Latour's own metaphor, objects and autonomous facts are 'the cooled down continents of plate tectonics' (Latour 1993: 87). As Latour understands it, autonomous objects and facts 'in-themselves' are inseparable from their unstable networks; or, as he argues the point in *Laboratory Life*, what accounts for 'the solidity of [an] object' is that it is 'constituted by the steady accumulation of techniques', which is what keeps it 'from becoming subjective or artefactual' (Latour and Woolgar 1986: 127). An object may become particularly stable and even become lionised as a textbook fact, as an integral element of what Latour refers to as ready-made science, but it may lose allies to other objects and through a 'steady accumulation of techniques' and alliances give way to new textbook facts. Latour gives the example of how, prior to Watson, chemists thought, and the textbooks stated as an established fact, that the four DNA bases were in the enol form. This made it much more difficult for Watson to cast doubt upon this fact and put forth the case that the bases were actually in the keto form (Latour and Woolgar 1986: 171–2). Watson was eventually able to problematise the established textbook fact concerning the enol form, and this problematising process – what Latour calls science in the making – led in the end to the new textbook facts that now credit Watson (and Crick) with discovering the structure of

DNA. A Latourian ontology is monistic, therefore, in that it includes nothing but objects and events, or substantive multiplicities as Deleuze puts it. But this is not a stable monism of autonomous objects and lawful events; rather, it is an aberrant monism that continually moves between stable natures and unstable, problematising events. From a Latourian perspective, therefore, it is only when substantive multiplicity has become actualised and stabilised that it becomes consonant with the logic of representation, and hence only then can one say that it consists of a determinate duality between an autonomous, objective in-itself and a heteronomous, correlationist in-itself-for-us, between facts and artefacts, between realism and anti-realism. Between realism and anti-realism, then, there is the 'and', the substantive multiplicity that is tracked by the metaphysics Deleuze believes science needs. Deleuze believes this metaphysics is possible, and sees the development of it as the distinctive task of philosophy.

Notes

1. Deleuze reiterates this point in his short essay, 'Hume', where he argues again that Hume understands 'the essence of the mind as delirium or fiction' (Deleuze 2003: 166).
2. See Dummett's 1963 essay, 'Realism' (in Dummett 1978).
3. See Davidson's essay, 'On the Very Idea of a Conceptual Scheme' (in Davidson 2001a).
4. See Davidson's essays 'Mental Events' and 'Events as Particulars' (in Davidson 2001b).

'Man Is Ill Because He Is Badly Constructed': Artaud, Klossowski and Deleuze in Search for the Earth Inside

Rick Dolphijn Utrecht University

Abstract

Starting with Antonin Artaud's radio play *To Have Done With The Judgement Of God*, this article analyses the ways in which Artaud's idea of the body without organs links up with various of his writings on the body and bodily theatre and with Deleuze and Guattari's later development of his ideas. Using Klossowski (or Klossowski's Nietzsche) to explain how the dominance of dialogue equals the dominance of God, I go on to examine how the Son (the facialised body), the Father (Language) and the Holy Spirit (Subjectification), need to be warded off in order to revitalize the body, reuniting it with 'the earth' it has been separated from. Artaud's writings on Balinese dancing and the Tarahumaran people pave the way for the new body to appear. Reconstructing the body through bodily practices, through religion and above all through art, as Deleuze and Guattari suggest, we are introduced not only to new ways of thinking theatre and performance art, but to life itself.

Keywords: Artaud, Deleuze and Guattari, body without organs, theatre, God, Klossowski, language

> I should say that human affairs would be much more happily conducted if it were equally in the power of men to be silent and to speak; but experience shows that there is nothing which men have less power over than the tongue, and that there is nothing which they are less able to govern than their appetites.

I. Artaud's Body without Organs

In his 1948 radio play *To Have Done With The Judgement Of God*, Antonin Artaud coins the phrase 'the body without organs'. Although Artaud never really developed this image, it does make a nice introduction to his radically new ideas on the body, especially in its relation to God and to what he named 'the soil'. Contrary to much of his earlier work (for example, *The Theatre and Its Double*, 1938), which consisted of essays on the theatre, his radio play comments on the state of the (Western) world. Vitalising the way we live our bodies, Artaud stresses that delivering man from his 'automatic reaction' and 'restoring his freedom' are the quintessential tasks of the human being who has lost faith in God but has yet to realise the consequences for the new type of 'life' this loss of faith entails. The human being needs to 'remake his anatomy' in order to remove the sickness that has haunted him. Only then, by scraping out his body, can man experience how wrong turns into right and right into wrong – as Artaud paraphrases Nietzsche. He therefore urges us to search for our 'body without organs'.

Most famously, Artaud's two-part manifesto *The Theatre of Cruelty* (1932) tells us that the body in theatre is striated by *language*, *dialogue* and *words* that prevent dynamical and spatial expressions from happening. By stressing the way in which dialogue overcoded bodies in Elizabethan theatre, Artaud is not, however, pleading for the abolition of the spoken text in theatre. On the contrary, it is in theatre in particular that human expression can very well be a sonic stage experiment. But sound or language should never be *imposed upon* the body by the director, who would then double or 'repeat' the author (the performer), as Lehmann put it (Lehmann 2006: 32), or, worse, would suppress and paralyse the body of the actor. Expression, rather, should follow from the intermingling of performing bodies, or engage with it. The body, as our epigraph from Spinoza suggests, should not be left at the mercy of an alien voice that rules the tongue, governing and colonising the body according to language's linguistic or semiotic rules (for instance, giving the actor the ability to speak of an I and a You, and capturing/identifying the objects that surround him or her). It should not be considered as the mere instrument through which the one who speaks 'forces the event into the Word [*le verbe*] or, more precisely, into the *epos* by which she relates in the present the origins of her person' as Jacques Lacan put it (Lacan 2006: 212). The body should not be turned into a predominantly linguistic sense organ, subjected to the Signifiers it has to consume and produce – Signifiers that, as genuine power markers, pierce the body like

a sword, like a second spine dramatically limiting its ways of expression. The body should be allowed to speak *from itself*; it should be given 'another voice', the way Diderot gave the woman a second voice in his *Les Bijoux indiscrets* (1748) in which the voice of the face (as it organises the body through the ears, the eyes and the mouth) is countered by the voice of the body (in Diderot's case the pearl, or the vagina). A voice that is not semiotic, not interested in language and code.

Reading Artaud's thoughts on the state of theatre in his time, and on the state of the world itself, could we say that the illnesses of theatre as Artaud identified them are symptomatic of Western culture as a whole? Artaud certainly seemed to make this connection (see Artaud 1935). If we agree with him, it follows that the Judgement of God, as it features in the title of his play, is in fact equivalent to the overdetermination of what Brian Massumi summarised as 'code text and signification', which he claims still dominates all thought on the body, subjectivity and social change (Massumi 2002: 66). In theatre, as well as in our everyday intersubjective world, dialogues colonise the body, grabbing it by the ears, eyes and mouth, reterritorialising it through an alien use of senses muting other experiences that might befall it. Well before the 'linguistic turn' impressed upon the humanities the idea that language is the first and foremost entry point for understanding the human condition – and for the human being to come to *any* 'sense-retention and sense-prospecting', as Derrida put it in his early essay on Husserl (Derrida 1978b: 78) – Artaud had already countered the entire argument. Capable of major bodily modifications, ordering the composite body as a whole, Artaud claimed that language as it dominates performance creates a verbal straitjacket that above all *removes* us from the world and our body, obscuring and deforming sense-retention and sense-prospecting.

The link that Artaud makes between the dominance of the written dialogue and the Christian God (ergo *the Judgement of God*) can be seen as acceptable within the humanities today. Marshall McLuhan argued that the first steps from an oral culture to a literate culture were taken with Plato's dialogues (McLuhan 1962). But turning the Book into the dominant form for thinking is by no means an innocent thing: it brings with it new strategies and new forms of organisation. McLuhan himself concluded that 'writing is the spatializing and arrest of oral speech' (McLuhan 1953 :119). Alfred North Whitehead's suggestion that Western philosophy could be considered as a series of footnotes to Plato (Whitehead 1978: 39) only underscores that, in its literate, written, form, the progress of Western thought silenced and imprisoned

the body and began to take the Book, the written dialogue, as its primal means of exposure. Establishing a connection, then, between this written tradition originating with Plato and the Christian tradition increasingly focused upon the Bible as written word, is not such a big step to take (it can already be found in Wilson [1937]). Christian theology is expressed through the New Testament and not through the words of the priest, just as Plato's thinking was not expressed verbally but through his written dialogues. It is not the body but the written word which organises the world (and human bodies) in its spatial form, as McLuhan, following Wilson, insists. Christian faith, finding its essence in the Bible, the written voice of God, perpetuates Platonism in so far as its form of expression and all of the Judgements it implicitly accepts and transfers follow a similar strategy. Indeed, McLuhan concludes that Christianity is *the same* as Platonism, since it accepts the means adopted by the latter to organise the world (a strategy that required the printing press and the Reformation in order to become fully operative, as McLuhan argued in 1962).

What Artaud suggests, then, is in line with the way in which scholars like Massumi propose to take life beyond code, text and signification. Massumi sets out to 'Rethink body, subjectivity and social change in terms of movement, affect, force and violence – before code, text, and signification' (Massumi 2002: 66). Artaud pursues a similar tactic when he claims that the Christian literate God, by *starting from* Language, has robbed us of our bodies (stressing their uselessness) in order to organise them according to His Judgements, His Language, His Organs.[1] In particular, the mouth is paralysed by the demands required by articulation. For it is not by a Lacanian speaking up, by forming and spatialising and identifying ourselves verbally, that language is driven out of our bodies again. On the contrary, not only do the words that leave our mouths overcode or harness our body on its outside, they also, similarly to a disease, intrude into the entire body in a bid to reorganise it. Although Christianity, in its guise as our guide to Truth, has long since left us, or at least undergone a dramatic metamorphosis, our mouths and consequently our bodies have never ceased to be defined according to His Words. If we believe Ernest Renan, who concludes that 'Socrates and Molière merely touched the skin. He [Jesus] carried fire and rage into the very marrow' (Renan 1864: 235), there is little hope that our secular age will be able to exorcise His Presence any time soon. His Words, as we are still repeating them, inscribing them into ourselves, continue to express Christianity by performing and projecting His Linguistic Structures, organising not only themselves but also the

world according to His Premises. This is what Nietzsche meant when he stated in *Twilight of the Idols* that 'we are not getting rid of God because we still believe in grammar' (Nietzsche 1990: 48). Nietzsche *knows* that it is indeed our *humanity* which God takes away from us. That is why Artaud cannot but conclude that the Christian literate God creates man without sexual or digestive organs: *as his equal*, as the Word.

II. Artaud and Deleuze and Guattari

When Deleuze and Guattari place Artaud's 'body without organs' (or BwO) at the centre of their materialist ethics, they develop his argument in many directions. Especially in plateau six of *A Thousand Plateaus*, 'How Do You Make Yourself a Body without Organs?', Deleuze and Guattari deploy the idea in their search for a series of ways out of the forms of organisation imposed by God/Language. It no coincidence that this plateau appears in the midst of those sections of the book in which Deleuze and Guattari's set out their theory of Language (plateaus 4, 5 and 7). For it is in a bid to ward off of the forces of organisation *as a whole* that they are led to explore the ways in which the masochist, the drug user and the schizo (as three routes amongst others) attempt to undo the respective organs/organic structures that form them, or better, that obstruct them from reaching *their particular* body without organs. But the three routes mentioned should therefore not be seen as experiments in themselves; as Dale rightfully concludes: 'they are only valuable because of the effects and ideas they engender in other visions and experimentations' (Dale 2002: 96). With Deleuze and Guattari, the BwO is not a given trajectory; it is a quest, or, as they summarise it: 'Find your body without organs. Find out how to make it. It's a question of life and death, youth and old age, sadness and joy. It is where everything is played out' (Deleuze and Guattari 1987: 151).

Artaud's position is not very different from Deleuze and Guattari's. Yet he arrives at it in a very different way. For although Artaud advises us to remove the Christian organs from our bodies, he is not against the organs as such. On the contrary, he wants us to get back in touch with our own organs – with those we have forgotten, those that have never sealed off our body from the outer world, that never cared to form, identify or qualify the body as a coded inside. Deleuze and Guattari, use the image of the BwO to develop the idea that there is only an outside (that the inside is a mere incarnate, folded-in outside, an inside of the outside). Artaud agrees with this when he refuses to work with the inside-outside opposition altogether and instead focuses on the

geometric lines, as Bernard Cache calls them (Cache 1995: 70), that pass through all objects, that reject any attempt at interiority. Artaud is in search of those affective lines that string the body to the other object, refusing an opposition between inside and outside while creating inflections within spatio-temporal events. The sexual or digestive organs – denied by Christianity, as they have always opened up the body, creating an absolute outside – are of particular interest to Artaud. By embracing those organs and the 'earthly' organisations they allow, Artaud wants to restore the body's necessary link to the soil (*terroir* or *Boden*), according to which the body lives its life in the first place.

Just as Deleuze and Guattari ask us to find our own BwO, Artaud asks us to find our organic culture which he considers 'une culture basée sur l'esprit en relation avec les organes, et l'esprit baignant dans tous les organes, et se répondant en même temps' (Artaud 1971a: 228). This 'wakefulness', as Nietzsche would call it, is achieved by exploring 'the barbaric and primitive means of totemism, whose savage vitality I would worship' (Artaud 2000: 12). Contrary to Freud's idea of the totem – and Freud would definitely critique the naive stance Artaud seems to propose here – Artaud sets himself the task of rediscovering the body not yet cultivated, not yet cut off from nature.

Certainly, when compared to Freud, Artaud's organic culture refers to a different kind of structure. In Deleuze and Guattari's terms, we can call it rhizomatic. A rhizome can very well be considered a structure, but one that, rather than being imposed upon us through God/Language, follows from the way in which our bodies(/minds) are lived as an open interval on the surface of the earth, which nurtures them and encloses them like a womb. Artaud knows very well that a body is all about discovering life, and that the alimentary and sexual regimes that Christianity (and Freud!) subject to language (to the Word) need to be radically rediscovered. Indeed, it is these two regimes that should be considered the *essence* of life: *they* define its eternal and necessary lacks, as Whitehead taught us (Whitehead 1978: 105–6), they keep on reinventing the series of structures through which the morphogenesis of the body takes place. Finding out how to come to oneself in terms of space (the alimentary regime) and time (the sexual regime) in no way allows life to 'solve' these lacks (which would take us back to Freud). Life is necessarily about the continuous disturbance and opening up of individual cells, and it is only in this 'robbery' as Whitehead called it (Whitehead 1978: 105) that life *needs* to merge in the alimentary and sexual events that *necessarily* extend way beyond the human body. Life needs to rob; it is its moral imperative to assimilate with the soil, to assemble itself with and

according to other (organic and inorganic) bodies (to come), through social and cultural vibrations. It needs to merge with what it defines as the edible just as much as it needs to get away from the poisonous; it needs to affect and be affected by what it loves. Life knows no inside or outside; it *has* to experiment with processes of inclusion and exclusion.

In other words, these continuous processes of inclusion and exclusion, of pure desire, without reducing human life to a biological essentialism, can very well be considered the organising forces that keep on creating the body. They are not fixed and do not go back to particular Laws that impose themselves upon life, the stable stigmatising structures through which God/Language demands that we express ourselves. On the contrary, the forces Artaud is searching for are those organisations responsible for the creation of life itself as they fall back upon the material and immaterial forces through which the human being came into being. These forces have increasingly gone unnoticed by us because of the domination of God/Language. When Artaud, in his radio play, states 'L'homme est malade parce qu'il est mal construit' (man is ill because he is badly constructed) he is referring to how the power (*potestas*) of God and of Language has, over time, deformed man, has isolated man by removing him from the organisations in which his powers function best. Artaud is thus not asking us to ward off all the organisations that striate the body. He wants us to get back in touch with those *naive* organisations that are about life, that are necessarily and essentially creative of life. He wants us to understand, as Peter Hallward puts it, that 'Vital or creative difference itself is primary' (Hallward 2006: 13).

Next to the idea that we need to redo organisation, Artaud also asks us to vitalize spirituality, the second of his precepts. For the 'God' in his *To Have Done With the Judgement of God*, we must understand, by no means refers to spirituality in general. The God here is the Western Literate God, or, better, Christ. That is why Artaud continuously affirms: 'Christ has always been what I most abhor' (quoted in Schumacher 1989: 176). It is the spirituality of the human, all too human, Jesus that in the end is radically different from the spiritualities Artaud searches for. Artaud is actually very keen on what are essentially *animist* spiritualities, as they express the soil similarly to the way our minds express our bodies. Indeed, he argues that spirits are the *ideas* of the soil, whereas the soil is the *object* of these expressions in a similar way to how the mind is an idea of the body and the body the object of the mind (see Spinoza 2001: 2P13). Spirit(uality) and soil are actually *the same thing*.

In both *The Baphomet* (1965) and *Nietzsche and the Vicious Circle* (1969), Pierre Klossowski claims that God gave form to the identity of the self: 'The "death of God" (the God who guarantees the identity of the responsible self) opens up the soul to all its possible identities . . .' (Klossowski 2005: 45). The One God, the Christian God, the Father, organises the processes of subjectification. His death thus meant the loss of personal identity. In *The Logic of Sense* Deleuze continues Klossowski's argument not only by connecting the Father to processes of subjectification, but also by connecting the Son to the facialised Body and the Holy Spirit to Language (Deleuze 1990: 280–301). Or, at least, the occidental Divine Order doubles its Trinity (Holy Spirit, Son and Father) by authorising the analogous identities of language, facialised Body and subjectification. That is why, when Deleuze and Guattari later return to the body without organs, they do so while mapping theories of language, faciality and processes of subjectification (plateaus 4, 5 and 7 of *A Thousand Plateaus* deal with language, 6 with the BwO, and 5 and 7 with the Face). In short, Deleuze (and Guattari) show us that the One God that is at the same time Three is the foundation of the facialised body, the repetitive construction of processes of subjectification and the denotator of all of this into language (the Word) as a totality (Deleuze 1990: 292). The fulcrum of Christianity is then the Face of Christ (as they claim in plateau 7): the semiotics expressed through the double system of semiotics (with an axis of significance and one of subjectification) unfolds itself from the bony face of Christ.

III. Find Your Organic Culture!

In order to move away from Christianised culture, and, more practically, to get theatre out of the grip of language, Artaud seemingly turns himself into an ethnographer, setting before us two cases in which he hopes a true organic culture can be found. He was in search of a positive take on the organs, for a spirituality and even a language that was unaffected by the external Judgement of God. In his essay on Balinese theatre (written after visiting a performance in Marseille) he is most explicit about how *art* allows us to vitalize the body in many ways. Discussing the art of movement in Balinese theatre, he says:

> What is in fact curious about all these gestures, these angular and abruptly abandoned attitudes, these syncopated modulations formed at the back of the throat, these musical phrases that break off short, these flights of elytra, these rustlings of branches, these sounds of hollow drums, these robot squeakings,

> these dances of animated manikins, is this: that through the labyrinth of their gestures, attitudes, and sudden cries, through the gyrations and turns which leave no portion of the stage space unutilized, the sense of a new physical language, based upon signs and no longer upon words, is liberated. (Artaud 2000: 54)

If we keep in mind that Artaud's definition of the sign has nothing to do with a Saussurean/Lacanian Signifier (as it refuses the Real, does not know of a referent), but much more with those expressions that Language or Language-based semiotic systems fail to capture, this fragment tells us a lot about how Artaud wants to liberate theatre *and us* from the Judgement of God. Linking the form of expression to the form of content, when concluding that the flows of the Balinese dancers answer to a spiritual architecture of movement, gesture and sound, Artaud seems to be well aware of how the dancers, from the moment they step into the performance area (*kalangan*), open themselves up to appeasing the Lower Spirits (the *Butha*) they desire to engage with. This spiritual architecture of (seemingly) curious movements thus offers intensive zones in which soil and spirit are enfolded *themselves*, expressing the body of the earth *as* the body of the earth, and not by means of an artificial Language or system of Judgement. Balinese dance, Artaud claims, has nothing artificial about it, is not subjected to the Sacred in any way, as the sounds and gestures he experiences are *instinctive*. Of course, the dances and sounds are in the end highly stylised: the movements of the hands, the rolling of the eyes, the various inflections performed, are all part of a highly considered mathematics. But it is a stylised mathematics that is not imposed upon the body, not written into it, but rather *follows from* the body and the roots that take it deep into the soil. Even the improvisation (some forms of Balinese dance allow for quite a bit of this) is not based upon the possibilities offered by the music or by the human body but rather attempts to feel the virtual presence of the earth and its spirits. Its spirituality thus does not come from above, but rather pops up from matter in the immanent forming of bodies, or in how the meat follows from the soil.

The second case in which Artaud experienced a positive take on organisation and spirituality, and even language/expression, comes from a journey he undertook in the mid-1930s to Mexico. There, Artaud visited the transhumance Tarahumaran people, to whom he gave some talks on the decadence of Western culture. Hoping to discover the magic reality of the Tarahumaran culture, which should have been more 'true' than the polluted West, he was ultimately quite disappointed to find that

colonialism had managed to conceal the Mexican body so dramatically. This did not stop him, however, from writing lyrically about the people he was introduced to:

> Il y a au Mexique, lice au sol, perdue dans les coulées de lave volcanique, vibrante dans le sang indien, la réalité magique d'une culture, dont il faudrait peu de chose sans doute pour rallumer matériellement les feux. (Artaud 1971b: 224)

Again, Artaud's notion of the material body, of meat(blood), comes with a spirituality. But this time it is a spirit that is no longer expressed through the bodies of a people. It is covered in the soil, buried by sedentary colonialist powers, and, most of all, under the spell of the occidental God. With the introduction of guitars and violins (through the Jesuits) and occidental dance patterns (called *Matachines*), completely foreign to the Tarahumaran native dance patterns (see Fontana 1979), the magical reality Artaud was looking for indeed seemed to be overcoded by alien powers.

IV. The Omnipresence of God

Unfortunately things did not get better for the Tarahumaran people. The Christian codes and strategies only grew thicker and more thorough over the ensuing decades, overcoding the spirits and the soil even more than in Artaud's day. Balinese culture, though in many ways capable of excluding (which means not relating to) other ideas and people (as Clifford Geertz [1993] noted), has also been more and more dominated by Western ideas. Balinese theatre has thus turned into 'Traditional Balinese Theatre' adapted to the demands of tourism (only rarely is the epic *Ramayana* not staged as a 'best of'). This once again shows that colonialism was essentially a mild precursor of postcolonialism. Though Bali was only (actively) colonised for about 50 years, and better examples could be given in this respect, postcolonialist strategies have proven to be much more powerful than the earlier colonial ones, and not least in terms of their potential to Christianize. Postcolonialism is not a form of control that introduces only a new economic and aesthetic code (when it comes to theatre or to life). It always introduces God, that is, the Holy Trinity of Language/facialised Body/Subjectification. Following Artaud we cannot but conclude that the dominance of Western culture brought with it a Christian Spirit that feeds and breathes and defines the Mexican, the Balinese, and actually pretty much *all* bodies in the world. The omnipresence of the Christian God is, then, not a given, as

the Roman Catholic Church has always insisted, but a very successful political project.

The ways in which Christianity exercises its power are endless. For when we agree that it comes with a great emphasis on written language, with a reterritorialisation of the body into an identity/onto the face, and with processes of subjectification, these series of strictly related strategies project the face of Christ in every possible direction.[2] This is why Artaud's critique of the Judgement of God, of the dialogue, does not just question the way in which the body of the performer has been dominated by the dialogue, but critiques *all* bodies active within theatre. Artaud's revolutionary ideas are directed towards *all* 'things' that appear on stage, including the body which we refer to as the storyline or the body of the *mise-en-scène*. Its fury addresses the body of theatre as a whole.

Michel Foucault has even argued that it was the power particular to Christianity, which he calls 'pastoral power', that invented modern bureaucracy and the nation state. He emphasises that: 'Christianity brought into being a code of ethics fundamentally different from that of the ancient world' (Foucault 2000: 333). This new ethical code can be captured in terms of a doubled (anti-hierarchical) movement. It indeed introduces a *modern* form of power, fundamentally different from royal power, in so far as its leaders are asked to sacrifice themselves for the sake of their flock instead of commanding the commoners to save the throne. At the same time, it organises the social by introducing a particular type of written language (bureaucracy), which reterritorialises the bodies of the subjects into and onto well-defined and identifiable faces, organising the flow of (human) life into citizens, as formal archived unities living their lives in distant relation to the 'soil', as Artaud imagines it.

David Sorkin, indirectly commenting on the success of scholars like Jonathan I. Israel, offers a nice addition to Foucault's ideas on Christianity when he claims that the idea of the Enlightenment as a quintessential secular phenomenon is a false master narrative that has remained surprisingly strong over the past decades (see Sorkin 2008). His genealogy – which, for instance, includes theologians who were very influential during this time yet were left out by those faithful to the master narrative – tells us that the whole process was actually deeply religious in nature, and led not so much to a Death of God as to a *renewing* of faith and piety – a reading of history much more in line with how not only Foucault[3] but also Artaud and Klossowki (and actually also Nietzsche) conceptualise God in postcolonial times.[4]

Nietzsche's travels to 'the obverse side of the *death of God*: namely, the Kingdom of Heaven, out of which emanates *creation of the world*' (Klossowski 2005: 187) do not just account for the personal history of this particular philosopher but are a miniature of the trajectory of Christianity in the postcolonial era. Even more so after His death, the Christian God occupies Himself with the facialised or identified bodies that give form to the intersubjective world in which we find ourselves on a daily basis, and also with the facialised, aesthetic, religious and political institutions already mentioned, such as theatre (and its more contemporary remediations). Indeed, we cannot but agree with Deleuze and Guattari when they conclude: 'Jesus Christ superstar: he invented the facialization of the entire body and spread it everywhere' (Deleuze and Guattari 1987: 176).

Let us take a little more time to think through the idea that the Face of Christ overcodes the entire body. The difference between the bony appearance of Christ that incarnates not only as the Son (the facialised body) but at the same time also as the Father (Language) and the Holy Spirit (Subjectification) – which is of course the essence of a Trinity – and that of more worldly (State) powers, lies precisely in their bodily appearance. It is for good reason that the Body of God is different to that of the statesman, in so far as the latter is strong, muscular and built to impress. The body of the statesman is exchangeable and can easily be reduced to a pair of shoulders (as in a bust). Its face is also of a very different kind, as it does not project itself onto the body. The face of the statesman has hardly any facial traits; it is endowed only with a very primitive character, namely that of the archetypical classical ruler which expresses pure abstract dominance. Indeed, the universal body topped with a head having minimal facial traits has been the universal expression of power from Qin Shi Huang, China's legendary first Emperor, to Saddam Hussein. The archetype of the classical ruler is the type of a territorial power characteristic of all spaces and times, supplying the minimal definition of the imagery of all dictators, but also of the institutions that facilitate dictatorial regimes. The archetype has no identity/God (as Klossowski couples them), and has not been transformed from the multiple into the One. It expresses no sadness or sorrow, no last supper, no crucifixion, no *pietà*, no *noli me tangere*.

Indeed, how different is Christ, whose appearance is by no means exchangeable. His Face, the fulcrum of signification, is in need of its body the way the façade of His Church needs a square. Christ cannot be reduced to a bust or a portrait even. Christ needs to be shown in full. Deprived of its sexual and digestive organs, as Artaud indicated,

the body of Christ invents a series of signs that give vast structure to its divine, un-earthly nature. And it does so with great enthusiasm. Indeed, the body of Christ suffers, is exhausted even, but it is by no means weak. For if there is one thing that characterises Christian or pastoral power, it is that, in contrast to Plato's statesman and the powers he embodies, it manages to conquer death, territoriality and every other limit of extension as it is essential to earthly life. Foucault was right to acknowledge that modern bureaucracies, which came into being in the West but have spread all over the (postcolonial) world today, are very much in line with the passion of Christ. In both Christianity and bureaucracy we recognise a very carefully established absence (which Franz Kafka of course beautifully described for modern bureaucracies). Neither power is socialising but rather individualising (self-cultivating) in its strategies. Neither power places itself above the crowd, but acts between its members (which it identifies) and is prepared to give its life for each and every member. Both powers, however, are creative practices of an unearthly kind.

As modern bureaucracies and the many other apparatuses of pastoral power were released from their last ideological and ethical opponents in 1989 (with the fall of Communism), the era in which we find ourselves today thus concerns a *totalised Christianity*, a fractal-like Christianity that always emerges from the infinity between two points in order to define them. It is an abstract Christianity, which seems not in need of Christ any longer, but is nowadays capable of travelling any distance by means of three axes; bureaucracy (its Apostles), capitalism (its Morality) and mass media (its Epiphany), as they continuously give birth to one another.

V. Escape Through Art

Artaud states that cleaning the body of its incorporated Christianity requires that we break through the Christian Trinity in search of the unknown of the body/the unconscious of thought. The BwO. Only in this way can we find our organic culture. Only in this way can our blood vessels feed themselves from the soil again, opening our bodies up to the spiritual powers that have been silenced both within the body and within the earth, thereby preventing us from living for such a long time. Indeed, Artaud asks us to start searching for a pure creation of life, as Derrida calls it (Derrida 1978a: 175), a life that does not start by searching for the Other, as Derrida later seemed to suggest, but that finds itself centred in the body, that is in its material essence. A life that is by no means

separated from the body, not ruled by *any* of the Divine powers from above that (ab)use the eyes, the ears but especially the mouth (or, even better, the doubled jaws) to cut the body from the soul.

As a solution then, Derrida proposes a life innate and not born (Derrida 1978a: 293), which of course does not mean a life that takes place within the protected environment of a womb. Derrida, like Artaud, is in search of a life which breaks through the Christian Trinity, reaching out for a type of intensity that restores the unity of 'soilbody'. Life, as Derrida and Artaud propose, is by no means limited to any kind of identity at all. Life is the Everyman (*Elckerlyc*), the impersonal, freed from the masks, the *fersu* (the white screen and the two black holes) that facialise it. Indeed they opt for life from which the face is cut off, in order to allow the head to grow back from the soil, and from the body that it forms.

So how do we come to this life innate and not born? How can we conceive and incorporate new life in *any* event? Through art. Art is to Christianity what the 'war machine' is to the State (see Deleuze and Guattari 1987: plateau 12). Art is of another species, another origin. It resides permanently at the margins of Christianity and always already sets out to prevent Christianity from happening. The Christian passions can be questioned *only* through art, through the way in which art gives us the feeling of an 'unknown Nature' (Deleuze and Guattari 1987: 240), or indeed an organic culture, for which Artaud is searching. Deleuze and Guattari explain how art operates:

> But art is never an end in itself; it is only a tool for blazing life lines, in other words, all of those real becomings that are not produced only *in* art, and all of those active escapes that do not consist in fleeing *into* art, take refuge in art, and all of those positive deterritorializations that never reterritorialize on art, but instead sweep it away with them toward the realms of the asignifying, asubjective and faceless. (Deleuze and Guattari 1987: 187)

The search for the asignifying, asubjective and faceless indeed equates to warding off language, Subjectification and the facialised body, in other words, the Holy Spirit, the Father and the Son.[5] In other words, to be done with the Judgement of God equals *modern* art as it is rooted in European (clerical) culture. It equals the ways in which art allows us to revolt not only against organised religion, but against every force which Christianity has enveloped (such as bureaucracy, capitalism and mass media). This is also why modern art (as it surfaced with mannerism, yet grows from stems that developed much earlier in European history) is an occidental phenomenon which has become global only in postcolonial

times (together with Christianity). Artaud's search for organic culture (in Mexico, in Indonesia) is then in the end not so much a search for a different or unknown form of art (of theatre performance). On the contrary, his interest in aesthetic regimes that have no roots in Christianity comes from the fact that he *knows* they give him access to life, a life not formalised by the Judgement of Christ.

Artaud convinces us that it is only through the affects of art that life can be found. Art releases us from the Christian spells that separate us from the soil, the body, and the spirituality that comes with it. 'Through art, uniquely through art' (Deleuze and Guattari 1987: 186), we can radically increase our bodily sensitivity, this wakefulness that is singular and open. Through art we can overcome our human-all-too-human humanity which *is* the original sin preventing the body without organs from taking place. Deleuze and Guattari referred to this final merging with the egg, the earth, as a becoming-imperceptible. Surely Artaud suggests we do the same when he asks us to become snakes:

> If music affects snakes, it is . . . because snakes are long and coil their length upon the earth, because their bodies touch the earth at almost every point; and because the musical vibrations which are communicated to the earth affect them like a very subtle, very long massage; and I propose to treat the spectators like the snakecharmer's subjects and conduct them by means of their organisms to an apprehension of the subtlest notion. (Artaud 2000: 81)

The snake (and its coils) imperceptibly weave into the tree. Its movements challenge His superior hierarchy by smoothening, eating the tree. Thus, intricately, the tree turns into the earth. The snake is pure affect. Feeling the earth it absorbs us in it. It is the snake that reconstructs man. The snake is an aesthetics towards the imperceptible.

Notes

1. Marshall McLuhan seems to support Artaud when he accuses Plato of having established a literacy (a visual mimesis) that comes with a reduction of ontological awareness, which then could result in an impoverishment of being and a loss of richness in experience (McLuhan 1962: 52).
2. Likewise, Christianity has reterritorialised the fragmented bodies of all sorts of 'spiritualities' into a unified (identified) body of religion, which is what quite a number of non-Western theologians (like Balu) rightfully observe (emphasising language, giving it a face, turning those fascinated by it into its believers, followers even).
3. Foucault argued that 'the Church . . . serves as the historical "background" to the governmentality of the early modern period' (Golder 2007: 166).

4. An argument that has recurred in academia with the introduction of the term 'the post-secular' that has been around since the 1980s but has been the subject of a major academic spin-off only recently (see Braidotti 2008).
5. In a small symposium I organised (Rotterdam, 28 May 2004), Paul Patton noted that in his *Abécédaire* Deleuze, though not a *bon vivant*, even not too fond of eating, claims that what he likes to eat most of all is tongue, brain and bone marrow, in other words, the Holy Spirit (tongue), the Father (the brain) and the Son (bone marrow). To silence the tongue, as Spinoza puts it in our epigraph, is then perhaps best done by eating or devouring it.

Autism: Schizo of Postmodern Capital

Hans A. Skott-Myhre and Christina Taylor Brock University

Abstract

This article follows Deleuze in investigating the ways in which the symptom as a form of representation can be collapsed into immanence. Exploring the symptoms of schizophrenia and autism, it examines what implications such a collapse may have for the production of the symptom in its double articulation as representation and immanent production. The argument follows Deleuze and Guattari in asserting that symptoms hold an implicit limit for the social forms that deploy them. Arguing that schizophrenia, as one such limit, has been successfully appropriated and deferred by postmodern capitalism, it is proposed that the proliferating symptom cluster of autism may indicate a new form of limit and that 'becoming autistic' thus may have potential as revolutionary practice.

Keywords: symptom, schizophrenia, autism, becoming, limit, immanence, Mary Baggs

> *The previous part of this video was in my native language. Many people have assumed that when I talked about this being my language that means that each part of the video must have a particular symbolic message within it designed for the human mind to interpret. But my language is not about designing words or even visual symbols for people to interpret. It's about being in constant conversation with every aspect of my environment.* (Amanda Baggs, diagnosed autistic).

> *The 'Good' or healthy life… is an overflowing and ascending form of existence, a mode of life that is able to transform itself depending on the forces it encounters, always increasing the power to live, always opening up to the new possibilities of life.* (Smith 1997: xv)

If you want to look at the moon don't look to the finger that is pointing at it. (Zen proverb)

To express the world as metaphor or simile is to produce the world as separated from itself. That is, to produce the act of expression as separate from the thing expressed. While this is certainly one function that expression can perform, we are interested in another kind of expression here: the act of expression as immanent production. What is the act of immanence expressing itself? It is the communal production of the world as a mutually constitutive act founded in the relation of the material and the virtual. Immanent expression blurs the boundary between experience and articulation opening them both to an infinite field of extensive connectivity. In other words, what is at stake in rejecting metaphor and simile is the founding of an investigation into the ways in which representation can be collapsed into immanence. In this, the exploration of what implications such a collapse may have for the production of the symptom in its double articulation as representation and immanent production becomes of interest.

Deleuze describes the symptom's double articulation as both 'the states into which we fall when the process [of life] is interrupted, blocked or plugged up. Illness is not a process but a stopping of the process' (Deleuze 1997: 3) and as an articulation of a certain kind of domination. However, this articulation of domination is simultaneously a blockage and an indicator of an 'oppressed bastard race that ceaselessly stirs beneath dominations, resisting everything that crushes and imprisons' (Deleuze 1997: 4). It is this relation of the symptom as both the order word and the password beneath the order word that is of interest here.[1]

In this sense, the symptom holds no binary relation to an outside. As Spinoza would have it, there are differences but no oppositions (Spinoza 2001: IIP11C). There are transcendent and transcendental forms of the symptom, but not as binary formations of opposites. Rather, the symptom functions in terms of difference, logic, function and effect. In this formulation, the logic of the symptom holds the possibility of being incomplete or, in Spinozist terminology, inadequate (Spinoza 2001: IIP11C). Such inadequacy does not constitute an outside world of fantasy or illusion. Nor does the inadequacy of any given symptom mitigate its capacity to have profound material effect both functionally and constitutively. Any symptom's inadequacy lies in its inability to become more than an effect, a function, representation, repetition or conclusion. That is to say, the symptom is a thoroughly abstract form distinct from the life upon which it is inscribed.

With this ontological distinction between the symptom and life itself we enter into the central thesis of our exploration of the role of the symptom within the realm of postmodern capital: life itself as the revolutionary force expressed through subjectivity as consciousness. This consciousness, however, is not the consciousness of the modern individual with its repressions, dreams and agonies. It is, rather, the full field of immanent expression – expression as unmediated bios, the realm of the modes of life. This is the terrain of the Lacanian Real, the Reichian unconscious, Spinoza's conatus, Foucault's power, Deleuze and Guattari's desire, Whitman's grass and Baudelaire's flowers, as well as the force which 'ceaselessly stirs' below, through and in the clusters of symptoms delineated as schizophrenia and autism spectrum disorder.

In Marx's *Grundrisse*, this life is the ghost in the machine that may be glimpsed in fragments between the lines and moments of unspoken terror, and sensed only partially formed at the edge of awareness. The expressions of immanence in this sense hold the possibility that the absolute force, which is life itself, will not respond to the reasoned entreaties of the dialectic. It is the moment of unpredictable creation in which 'life is liberated in humanity' (Negri 1999: 103) and simultaneously the moment of the savage violence of the mob, the horde, the mass, the crowd. It is that which destroys what has been, without any certainty of what will come.

If one is to argue from the inside that current subjectivity at its limits contains modes already fully engaged in the transition to a post-capitalist lived community, then it becomes critical to examine the question of virtual tendency. Given that the current mode of sovereignty promotes and sustains an experience of the world that denies any form of subjectivity outside the sophisticated apparatuses of capture deployed by late-stage capital, it is critical to be able to go beyond such experience.[2] This is not to say, however, that one can escape to an outside. Indeed, one must, quite specifically, turn towards the inside and the very conditions that 'account for things, states of things and their mixture' (Boundas 1996: 87). These conditions hold a parallel form of actuality that contains simultaneously, within each moment, the thoroughly material instantiated form of being and the infinite virtual production of all its attributes and alternative forms. This is not the world of ideal possibility. Rather, it is the actual simultaneous production of multiple material worlds, in each moment, perceived selectively through the contingent conditions of any given event. In other words, each perception of materiality is incomplete and contingent upon the capacity of temporal extensity or diachronic time to include such

perception. When we move towards the inside, we enter the realm of intensive temporality or the time of the virtual in which all events exist within the same time or, put another way, in which all that has been produced exists but has not yet fully extended itself in time. Temporal extensity is built upon the capacity of experience to be continuous. Ruptures in that continuity produce fractures and schisms of intensive temporality within which the full force of virtual production of that which has not yet been fully expressed exists. As Negri points out:

> It is obvious that scientific attention will have to be focused more on the discontinuities (be they ruptures or innovations) than on the continuities: in effect, the continuities are nothing other than discontinuities or ruptures which have been dominated . . . every innovation is a revolution which failed – but also one which was attempted. (Negri 1999: 158)

This then is the tension of the symptom in its function as a moment of a particular capacity of perception contingent upon the ruptures and fractures in extensive time; a placeholder that marks a disruption in the deceptively smooth fabric of dominated life. Symptoms are always innovations that mark a limit and an attempt at containing the virtuality of a failed revolution.

Deleuze and Guattari outline a clear connection between socio-economic systems and socially constructed definitions of pathology in *Anti-Oedipus* and *A Thousand Plateaus*. They assert that the social category of schizophrenia marks a limit condition for the socio-economic system of capitalism, and that the primary mode of schizophrenic thought is that of decoding dominant language systems rendering them problematic as systems of control. Capitalism shares this trait in the ways that it decodes social and cultural systems and recodes them into monetary terms. However, Deleuze and Guattari argue that capitalism cannot afford to thoroughly decode the social without losing its capacity as a system of social control.

In this respect, schizophrenia as a social mode of absolute decoding serves as the limit condition for capitalism, that is, as the line it cannot cross without risking its own integrity as a system. As an assemblage of possibility for capital, schizophrenic thought functions as a model of immanent production that exceeds the limits of industrial capital and offers the possibility of opening all elements of the social to infections and parasitic engagement. In this sense, it serves as a symptom simultaneously in both registers of the symptom as we have defined it above. That is, it serves as a blockage to *élan vital* that hopes to control and maintain the force of life turned to the ends of the parasitic form. At the

same time, it functions as an inimitable force of resistance that stands to dissemble the force of the parasite itself by provoking a mutation in the social body that will produce that body as toxic to the parasite.

However, Negri (1996) has suggested that, in fact, capital has already crossed the line into a completely decoded system of absolute appropriation in which there is no real capacity to effectively recode. Baudrillard (1995) makes a similar argument in his theory of contemporary society as a simulacrum or a copy of a copy. Michael Hardt (1995) also traces this in his work on 'The Withering of Civil Society' in which he says that capitalism has decoded our social forms such as the family, the church and government into empty copies of themselves. These are social forms that look like the originals, but have ceased to function except as extensions of capital. In this sense, the symptom of schizophrenic thought, which might signal an auto-poetic immunity on the part of the social body, has entered into a co-evolutionary process in which the parasite has taken on the characteristics of the host immunology and produced itself along similar registers of becoming.

If this is correct, and capitalism has indeed exceeded the limit capacity of schizophrenic thought proposed by Deleuze and Guattari, then the question remains: is there a limit capacity for capitalism and what are its symptoms? One possibility is autism. Autism is here proposed as a limit on three grounds: 1) it was initially thought to be a form of schizophrenia and so has both an affinity with and a difference from schizophrenia; 2) it became a central focus of psychiatric control and concern under the previous regime of industrial capitalism and is now the focus of behavioural and psychiatric attention under the new regime of global capitalism; and 3) the escalating prevalence rate of autism indicates an emerging and compelling social coding that calls for deconstruction.

Leo Kanner first identified autism as a psychological disorder a little over 50 years ago (see Kanner 1943). Kanner focused on the case histories of 11 children aged between two and eight. Initially, it was thought that perhaps these children, who exhibited behaviours such as obsessiveness, stereotypy, echolalia and social remoteness, had some form of childhood schizophrenia. However, Kanner argued that they had a unique cluster of symptoms that warranted a unique diagnosis that he called autism.

In terms of our interest in the function and deployment of the symptom, autism constitutes a very interesting case. First, let's note that it is premised within the symptomatological taxonomy of schizophrenia. That is to say, it was initially perceived as a subset made up of symptoms

that fall within the diagnostic criteria for schizophrenia. However, schizophrenia itself has a rather uncertain relation to its symptoms:

> The problem with both psychiatry and psychoanalysis is that these negative symptoms [of schizophrenia] are dispersed and scattered, and are difficult to totalize or unify in a coherent clinical entity, or even localizable 'mode of existence': 'schizophrenia is a discordant syndrome, always in flight from itself'. (Smith 1997: xx)

This diagnostic imprecision and lack of an agreed-upon aetiology continues to mark schizophrenia to this day, although it is frantically covered over by pharmaceutical and psychiatric discourses. What is of interest for us, in relation to the development of autism as a symptom, is determining what set of social and historical conditions called for a new constellation that separated itself from schizophrenia. In terms of our description thus far, we might wonder in what way autism is necessary as a new kind of blockage. Is it needed in order to support emerging forms of dominance in response to new deployments of the blockages of schizophrenic process, or is it needed to promulgate the failure of these forms as a blockage? The concomitant reading is that autism emerges in dominant discourse as a placeholder for a subject to come – for an emerging form of subjectivity on the horizon of the social as virtual event. In either case, the emergence of autism out of schizophrenia is anything but an objective act of scientific taxonomic clarification. It is important to note, in this regard, our earlier assertion that the symptom is to be read in terms of difference, and in terms of logic, function and effect. Clearly, autism signals a difference in the symbolic register of the social significance of schizophrenia. What then is its logic, function and effect?

To approach this question, we can turn to Luhmann's explication of the relation between logics of communication and their effects on social systems. Luhmann suggests that the current social formation consists of communications between functionally differentiated systems (see Luhmann 1995). He argues that these communication systems are separate from life and operate purely according to the logic of their differentiation from other systems. Put another way, they are purely transcendent linguistic codes that function according to their own logic. Living forms and other function systems can perturb them, but they are closed off from anything but their own function logic. Anything that does not fall within the linguistic code of the function set constitutes the environment for that set, which, of course, is not the set itself. Luhmann posits that once these function systems are initiated, they auto-poetically

proliferate. One such system is the psychiatric function system, and symptoms such as autism and schizophrenia are modalities by which it auto-poetically proliferates. It is important to note that these systems are not hierarchical, but flat systems differentiated by function. This is, of course, a particular form of immanence as a self-producing system whose conatus is the persistence of its becoming.

In this regard, the diagnostic codes associated with psychiatry and its relation to symptoms form a uniquely compelling case. This is in part because the linguistic codes of diagnosis are thoroughly dependent on the perturbations of living bodies. As a system whose coding is premised on the binary medical code of 'this is illness and this is health' psychiatric diagnosis must premise its symptoms on the observable acts of the body. That is, its premise of difference is dependent on the functional distinction between disordered and ordered behaviour. The proliferation of this distinction is the basis of its continuation as a function system. Indeed, the function of psychiatry in this respect has nothing to do with healing mental disorders. Instead, its function is to proliferate through distinguishing a panoply of symptom clusters and diagnoses that produce research, treatments and interventions that produce more symptom clusters, etc.

Because such a functionally differentiated system is closed off from its environment, and because the environment upon which it is dependent for its perturbations and extensions is life, it by definition constitutes a representational blockage to expressions of life that would exceed its functional capacity. It is for this reason that Deleuze and Guattari state that 'the problem of schizophrenization as a cure consists in this: how can schizophrenia be disengaged as *a power of humanity and of Nature* without a schizophrenic being produced?' (cited in Smith 2007: xxi). In this sense, we should note that it is imperative to the function system of psychiatry that a schizophrenic is produced in such a manner as to block the force of the alternative immanent system of life itself.

Clearly, the emergence of any new symptom cluster signals a shift in the environment that is constituted by life itself. Autism, in this sense, holds the dual function of the symptom we have delineated thus far. Indeed, since Kanner developed his diagnosis in the early 1940s, autism has proliferated both demographically and descriptively. While the definition of infant autism has remained fairly stable, as found in the current DSM-IV-TR, the disorder itself has become increasingly complex and includes a spectrum of behaviours and ages ranging from infant to adult (see American Psychiatric Association 2000). In fact, the DSM IV has now expanded to include five disorders clustered under the term

Pervasive Developmental Disorder; namely, Autistic Disorder, Rett's Disorder, Childhood Disintegrative Disorder, Asperger's Disorder, and Pervasive Developmental Disorder Not Otherwise Specified. These diagnostic categories have both similarities and differences across subjects. In terms of differences they include variations in age of onset, aetiology, associated conditions, and epidemiology. As to similarities, there are significant variations from developmental norms including impairments in three key areas: reciprocal social interaction, communication skills and behavioural variability.[3]

We might note the ways that the symptom cluster identified as schizophrenia has morphed within the proliferating discourse that comprises the symptom cluster of autism. According to current diagnostic practices, schizophrenia comprises at least two of the following: delusions, hallucinations, disorganised speech, grossly disorganised behaviour, and absence of affect or initiative. In this regard, it is specifically the way that schizophrenic thought produces a fluid recoding of the dominant cultural structures that marks the possibility of a limit for Deleuze and Guattari. Indeed, in some respects, it is within the realm of expression in literature and philosophy that the schizophrenic can be delineated from schizophrenia as process of life – that is, the moment at which the fluid recoding of experience enters the flow of infinite process.

By contrast, the autism spectrum is not premised on the disruption of thought or speech, nor are its behavioural variations responsive to internal systems of belief on the part of the autistic subject. Instead of the active expressions of schizophrenia in delusions, paranoia, hallucinations and disorganised speech, in autism we have a turning away from the entire field of representation. The symptom constellation of autism is founded on a perceived and socially ascribed inability to engage with others, an inability to communicate, a reduced capacity for empathy and affect, and repetitive and compulsive behaviours. Where schizophrenia in some ways engages the unconscious as a rupture of the conscious social self, autism refuses the conscious self and turns inward.

In *Anti-Oedipus* Deleuze and Guattari address autism peripherally in their discussion of schizophrenia, since at the time of their writing the relevant symptom cluster was still considered within the domain of schizophrenia and they simply read it as an extreme blockage akin to catatonia. We would suggest that now autism might be read in a more significant register as the current schizo of postmodern capital. That is to say, as the new limit condition for capitalism. Our argument proceeds along two main lines: 1) postmodern capitalism

has appropriated psychosis and produced its own transcendent schizo social system complete with all the symptoms of schizophrenia: delusion, paranoia, hallucinations, disrupted and disturbed speech. It is important to note, however, that this schizo does not originate in a body, but through the perturbation of bodies on a series of abstract function systems. As a result of its production as a copy of the representation of the acts of bodies defined as schizophrenic, the schizo of capital is a simulacrum of schizophrenia. This new schizo simulacrum is distributed on a daily basis as reality through the mass media in its representation of global events and in particular in the media's 'analysis' of the economy. 2) Autism represents, as did schizophrenia, the possibilities inherent in the current production of the social subject within the regimes of capital. We would argue that the current social production of the subject cannot help but be responsive to the schizo simulacrum and its thoroughly delusional representations of itself. If, as Laing argued, the schizo is simply a more obvious manifestation of a thoroughly mad society, then autism is indeed the premier example of the radically alienated subject whose very life has become a copy of a copy (see Laing 1983).

To develop this more fully, however, we need to take a closer look at the notion of the subject. For this purpose we will define subjectivity not simply as a philosophical concept or affect, but also as a certain kind of consciousness. Because we are interested in the modes of consciousness involved in autism and schizophrenia we will leave the dominant form of consciousness, the conscious rational self, behind and turn to the form of thought delineated as the unconscious, and in particular to the concept of the unconscious found in Deleuze and Guattari. We describe this form of the unconscious as the constitutive property of the opportune moment. That is to say, the unconscious in this formulation is contingently constituted in each moment out of all the experiences of the body and the thoughts produced by those experiences. This means that the unconscious is produced simultaneously in extensive and intensive time as pure virtuality. And this formulation, of course, takes us into the field of immanence.

As Deleuze and Guattari point out in *Anti-Oedipus*: 'The unconscious poses no problem of meaning, solely problems of use. The question posed by desire is not "What does it mean?" but rather "how does it work?" ... [The unconscious] represents nothing but it produces. It means nothing but it works' (Deleuze and Guattari 2003: 119). The unconscious, as an immanent function, simply produces. We might ask, however, what are the conditions of its production as immanent function?

In Freud's *General Psychological Theory*, the chapters on repression and the unconscious suggest one possible beginning for a description of the unconscious within the logic of immanence (Freud 1963). Freud lays out the three psychic forms he is investigating – conscious, unconscious and preconscious – as though on a plane. In his account, there is no space comprised by their construction and no interiority. They are rather dynamic forces that can be mapped onto psychic planes. The unconscious is portrayed as a psychic apparatus through which sensation initially passes. Freud describes it as a field of latent conceptions. In our terms, a consonant description would be as a field of infinite potentials.

Subjectivity, in this sense of the immanent unconscious, is central to our understanding of autism as the new limit condition for capital. If schizophrenia functioned as a limit condition for capital in its production of the unconscious as a proliferation of expression, then autism produces a limit condition in its limitations to expression. A limit condition that operates both as a disregard for the regimes of the symbolic and meaning that are deployed by capital in its schizo simulacra and through an immersion into the flow of time and event. The subjectivity of autism is specifically non-linguistic, although it sustains a form of thought. This is the placeholder for a people to come out of the catastrophe of the current historical moment. However, autism, as a symptom constellation, is both a production of a limit within the current system of domination as well as a mark of its pathology.

In this regard, the symptom is produced by what Deleuze and Guattari in *A Thousand Plateaus* delineate as the molar line. This is the rigid line that territorialises, regulates, orders and segments space, bodies and social relations through the either/or logic of binary oppositions. The binary logic of molar segmentation is foundational for identitarian practices: a body becomes identifiable in rigidly molar structures – in one's identity as 'mad' or 'sane', as 'psychiatrist' or 'patient'. It is, ultimately a logic of containment and capture. The production of the autistic is a product of this line. It is the either/or logic of the functionally differentiated system of psychiatry that produces the blockage of the immanent unconscious as the autistic that must be behaviourally induced into participating as an integrated member of the existing social order. Indeed, applied behavioural analysis is the preferred and often mandated method of treatment that relentlessly seeks to reconnect the immanent unconscious subjectivity of autism to the schizo simulacra. Interestingly, one of the common tasks taught to autistic individuals in these types of 'treatment' is the ability to recognise and deploy the value system of money.

Deleuze and Guattari, however, offer us another way to understand the production and function of the autism symptom through their description of the molecular line. This is a more fluid and flexible line that forms relations and establishes connections beyond the rigid segmentation of molar structures. In contrast to molar lines, which form and stabilise identities, molecular lines operate by introducing instabilities or openings into the fabric of molar unities and as such map the potential for movement, destabilisation, and transformation.

It is a peculiar and serendipitous aspect of the systems of domination and limit that each apparatus of capture inadvertently sets up the conditions for resistance and flight. Autism is no exception. The psychiatric function system has as its primary impetus the proliferation of its function. In order to expand, it must apply its binary logic to an ever-widening field of subjects. In terms of autism, this has meant the production of an ever-expanding range of bodies identified as having specific sets of symptoms associated with autism. This is commonly referred to as the autism spectrum. As the range of bodies has proliferated, there has been a concomitant extension of capacities for self-advocacy as some bodies on the highly functional edge sustain a form of subjectivity that allows for a certain kind of border dwelling between modes of consciousness and affect. Similarly, with the development of tools that allow for translation between previously non-verbal subjects and the dominant normative population, such as computer-mediated speech systems, there has been the developing ability of subjects to advocate what they have termed neuro-diversity. In short, the molecular line of disturbance has produced the unintentional development of a minoritarian voice for autism that has begun to call for its self-valorisation as a viable alternative form of consciousness and subjectivity.

Whereas the molecular line simply establishes a clearing for a potential move beyond rigid segmentations, the third line proposed by Deleuze and Guattari, the nomadic line (the line of flight) takes us to places beyond the territorialising reach of molar unities. Lines of flight are, by definition, forces of deterritorialisation, mutation and release. Where molarity presupposes 'the submission of the line to the point' (Deleuze and Guattari 1987: 293) – the destination to the path – lines of flight constitute passages away from, or even the breaking of, points.

Here we return to the voice of Mary Baggs from our opening epigraph. Mary speaks to us in translation in a video she produced on YouTube entitled *In My Language*. The first part of the video records Mary singing somewhat tonelessly (but reminiscent of Tibetan Buddhist chanting) and interacting with various objects in her environment. Her interactions

are unconventional. For example, she rubs her face into a book rather than reading it. Following this, there is a note on the screen that reads 'Translation'. Mary begins, in a computer-mediated voice, by informing us that her definition of language is going to be radically different from what we are accustomed to. She states: 'My language is not about designing words or even visual symbols for people to interpret. It's about being in constant conversation with every aspect of my environment. Reacting physically to all parts of my surroundings.' This is a very peculiar definition of language. To say that her language is not symbolic or available for interpretation is clearly a line of flight along the same line as Deleuze's call for the creation of 'vacuoles of non-communication' (Deleuze 1995: 175) as a response to the predatory nature of capital in the realm of the symbolic.

Her language is that of the act rooted in what Spinoza would term the collision between bodies. It is a direct challenge to the realm of functional differentiation in drawing its constituent force directly through an encounter with the environment. As she moves her finger back and forth through a stream of water, Mary says: 'In this part of the video the water doesn't symbolize anything, I am just interacting with the water as the water interacts with me.' There is a flow between Mary and the environment that is mutually constitutive and contingent. There is no meaning to the act; there is simply the act as interaction between bodies. This, she says, is a native language. Such action and interaction with things and experimenting with unique body movements are common within autism, and although we seek to apply meaning to and give a reason for them, they often do not, and are not intended to, translate into the dominant vernacular.

In a profound moment, Mary reflects on the fact that her ongoing response to everything she encounters in her environment is often interpreted by the dominant culture as 'being in a world of her own'. Here she challenges one of the central assumptions of the symptom constellation of autism – that non-response to dominant codes of interaction constitutes a withdrawal from social reality. What Mary seems to be proposing is that, far from being a withdrawal from society, her language is an expression of profound engagement with and production of a non-anthropocentric social reality.

She goes on to further challenge the terms on which her 'existence, awareness and personhood' are judged. She repudiates this judgement as being falsely premised on valorising what she terms 'a tiny and limited part of the world'. Her thought, in its expansive responsiveness to everything, is so radically different that 'some people do not consider

it thought at all'. But, she goes on to assert, 'it is a way of thinking in its own right'.

However, she says she can only be taken seriously if she learns the dominant vernacular. She says it is only when she types something in our language that 'you refer to me as having communication'. She calls for a mutuality in which those of us in the dominant social reality learn her language and take it seriously. The connection between thought and personhood is so firmly bounded in that dominant reality that, she says, her personhood is invalidated unless she thinks within the frameworks prescribed by it.

Quite clearly this discourse qualifies as a profoundly minoritarian mode of thought and action. We might ask, however, in what ways does it serve as a possible limit condition for capital? In partial response, we would argue that it extends the lines of flight of the schizo into the terrain of 'The process of Life as a non-organic and impersonal power' (Smith 2007: xxi). The terrain of postmodern capital as an array of functionally differentiated communication systems is premised on the obverse form of the process of non-life as a non-organic and impersonal power. Both life and capital operate as immanent systems that creatively produce themselves. However, only the immanent field of life as force can produce itself without reliance on anything outside itself. The line of flight in autism, as explicated by Mary Baggs, lies in her definition of language as an impersonal expression of collision with all bodies. It is a refusal of the mediation of the symbolic not through an act of will but through the biological capacities of a specific array of bodies to directly engage the world in a communication composed of acts. The schizo simulacra is irrelevant to such a subjectivity because its currency is the symbol and that currency holds little value in the world of autism. In this way, the symptom implodes into itself as act rather than meaning. It is no longer to be read but to be lived.

We argue that this form of living constitutes a direct challenge to the codes and functional differentiations of postmodern capital. It marks a subject to come, not in the form of the autistic subject per se, but in the becoming autistic of all of us. This becoming autistic can be found historically in the disciplines of Taoist, Buddhist and Hindu practice and thought. In the Western tradition, it is to be found in the lineage of Spinoza. However, until now, this becoming autistic was a flow on the margins of the dominant social reality, disturbing it at the edges. That it is now ever more prevalent signals the immanent possibility of an impersonal subject extending finally beyond the bounded shell of humanity into an encounter with life itself.

Notes

1. We are referring to Deleuze and Guattari's assertion in *A Thousand Plateaus* that there are always lines of flight within the ordering structure of language.
2. For a description of the apparatuses of capture see Luhmann 1995, Hardt and Negri 2000, and Deleuze and Guattari 1987.
3. Asperger's and PDD-NOS do not necessarily have issues in the latter two areas and Retts and CDD have slightly more specific features within these areas than autistic disorder.

Forum

Introduction

Sjoerd van Tuinen Erasmus University, Rotterdam

The papers included in this forum reflect the discussions that took place during a symposium on Deleuze and Visual Art hosted by the Erasmus University Rotterdam on 14 October 2010.[1] The aim of this event was to confront the increasing scepticism provoked by the enthusiastic uptake of Deleuzian theory in contemporary art and interdisciplinary practices. Does this popularity not merely confirm and legitimate the cliché of 'the new' in the cultural production of late capitalism? Is it not typically a case of too much 'good will' and too little 'thinking' and 'creativity'? Does it not lack a 'resistance to the present'?

In contrast to their earlier *Anti-Oedipus* and *A Thousand Plateaus*, which have often been read as manuals for undoing boundaries and subverting identities, Deleuze and Guattari's *What is Philosophy?* is much more cautious about today's continual disciplinary crossovers and intermedial hybrids, especially those of conceptual art (see Zepke 2006; Alliez 2010). For whilst contemporary art is increasingly organised around some theoretical or scientific content, Deleuze and Guattari insist on the 'respective sufficiency' of these disciplines, each having its own vital ideas and inexhaustible resources. Just as 'it is in their full maturity, and not in the process of their constitution, that concepts and functions necessarily intersect, each being created by their specific means' (Deleuze and Guattari 1994: 161), art's specific medium is sensation and hence 'art should not be thought to be like a synthesis of science and philosophy' (Deleuze and Guattari 1994: 198). This means that the artistic material should be rendered expressive by itself, rather than merely reproducing concepts or functions, for what counts is 'the smile of oil, the gesture of fired clay, the thrust of metal, the crouch

Deleuze Studies 5.1 (2011): 49–51

www.eupjournals.com/dls

of Romanesque stone, and the ascent of Gothic stone' (Deleuze and Guattari 1994: 166). As soon as art neglects sensation, Deleuze and Guattari argue, it risks its own dissolution. Worse still, it risks turning its own lack of imagination into a threat for other creative practices, for example when it reduces 'the concept to a *doxa* of the social body or great American metropolis' (Deleuze and Guattari 1994: 198). For even if philosophy and art each have their own medium, they also share a common enemy: the consensual stupidity that leads to the marketing of the concept and turns sensation into a readymade whilst preventing us from beginning to create a concept or compose a work of art (Stengers 2005).

It is this relentless struggle against cliché that has made Deleuze an important inspiration for contemporary art. But the ontological basis of this struggle is much less self-evident (see Zepke 2009). This paradoxical situation offers an excellent opportunity for a return to the classical visual arts and their media. In his contribution here, Vlad Ionescu reconsiders Deleuze's conception of the image by returning to his reading of Aloïs Riegl, Heinrich Wölfflin and Wilhelm Worringer. Ionescu demonstrates how the manipulation of sensation through the sense of touch deconstructs the image as a pure optical event. An image neither transmits an iconological content nor mimes an exterior correlate, but rather mediates thymic qualities (referring to both Riegl's *Empfindung* and Deleuze's affect).

The category of the thymic also enables both Riegl and Deleuze to interpret styles from art history such as the Baroque not only as art historical epochs but also as constitutive strategies or aesthetic diagrams. For unlike what a superficial reading of Deleuze's remarks on history might suggest, Deleuze insists that the 'disassociation between an art and its history is always ruinous' (Deleuze 2006: 212), since 'every painter recapitulates the history of painting in his own way' (Deleuze 2004: 122–34). Deleuze's *Francis Bacon: The Logic of Sensation* can therefore be read as a book on art history no less than as a book on Bacon. My own article contributes to such a reading by further exploring Deleuze's passing reference to the Mannerist ideal of the serpentine figure, which I argue is paradigmatic both for Deleuze's understanding of the Baconian 'Figure' and for his definition of the artwork as a monument for the possible in *What is Philosophy?*

A further question related to Deleuze's emphasis on medium specificity is that of his relation to modernism in art. As Stephen Zepke argues in his contribution, Deleuze's modernism has a rather traditional foundation in Kant's theory of the sublime that is quite unusual in

a contemporary art context. The sublime offers an argument for 're-radicalizing' Deleuzian aesthetics with a properly Nietzschean (and perhaps 1960s) ferocity as an attack on the all too human, which today includes the diffused and networked subjectivity of the rhizome that, whilst ensuring a contemporary feel, runs the risk of reducing everything to a banal equality. By insisting in a Kantian manner that aesthetics is entirely to do with sensation, Zepke argues, Deleuze sides with Modernism against conceptual art and its inheritors in 'contemporary practice'.

Bram Ieven, too, addresses the question of whether Deleuze's work on Bacon identifies him as a modernist. By tracing the articulation of form and sensation in the *Logic of Sensation*, Ieven argues that Deleuze's theory of art grapples with, and remains encapsulated in, the modernist tradition of art and art theory; not necessarily because Deleuze emphasises medium specificity, but because of the entanglement of sensation with form and because of his distinction between formal methods of abstraction in modernist art.

Deleuze's Tensive Notion of Painting in the Light of Riegl, Wölfflin and Worringer

Vlad Ionescu Catholic University of Leuven

Abstract

Deleuze's *Logique de la sensation* is not a canonical art historical interpretation of Francis Bacon's painting and even less an illustration of Deleuze's philosophy. It is better read as a prolegomena to a semiotics of plastic art in which the visual image is related to the dialectics of touch and vision. These issues feature strongly in the art theories of Aloïs Riegl, Wilhelm Worringer and Heinrich Wölfflin. This article presents a comparative approach to the relation between Deleuze's and these writers' conception of the image and attempts to answer the following questions: does a painting appeal strictly to the sense of vision? Does its structure point to a virtual haptic function of vision and if so, does painting overturn the stable hierarchy of senses with vision at the top? Is there a gradual relation between touch and vision? Reading Deleuze reading Riegl, Worringer and Wölfflin offers an occasion to reconsider the image as a tensive surface grasped with a touching eye and seeing hand.

Keywords: haptic, optic, visuality, visual semiotics, art history, aesthetics

Reading *The Logic of Sensation* (1981) in the light of the art historians that influenced Deleuze's analysis of the painterly set up is a fruitful task, both as a way of introducing Aloïs Riegl's, Heinrich Wölfflin's and Wilhelm Worringer's art theory to Deleuzians and for determining a common plane in their conception of the painterly image. In what follows, I outline a few convergences between these authors in formulating an answer to the question: what is a painterly image? All these authors answer this question by means of a polarity: on the one

side, they resist the figurative understanding of the image in terms of a resemblance approximating a real or imagined correlate, thus equating the image to an iconic device with a deictic function. On the other side, they affirm the image as a surface of forces pointing back to the sensitive structure of the human body and particularly to two senses involved in capturing and transferring these forces, namely, the haptic (the sense of touch) and the optic (the sense of vision). Thus, my argument is that the significance of Riegl, Wölfflin and Worringer for Deleuze lies in distinguishing the image not as a stable surface on which an object is coded with consideration for its recognition, but as a surface coagulating a field of forces, on which an exterior correlate, instead of being copied, is transformed according to the tensive means proper to painting. If everything perceived is an image, the question of visual art is not how to transfer perceived images onto canvases, marble or film, but what happens to images when they encounter pictorial, sculptural or cinematic structures. Most models of image analysis correlate the plastic signifiers or sensuous data (lines, planes, colours) to something exterior to themselves, for instance to an iconological dimension. This presupposes that the constitutive plastic signifiers are convertible in different terms. In the model Deleuze-Riegl-Worringer, the sensuous data are convertible into forces, tensions and affects.

My introduction to these art historians is rather biased, since I intend to show that what unites them, and provokes Deleuze's interest in them, is a specific conception of the image. This conception consists in envisaging the image as a figural structure where plastic signifiers mediate a thymic structure, that is, a dimension appertaining to the circulation of intensities, affects, percepts and sensations. This circulation takes place through a configuration of the senses of touch and vision, the haptic and the optic. The first section to follow offers a short introduction to the ideas common to Riegl, Wölfflin and Worringer, while the second pinpoints their contiguity with ideas and concepts drawn from Deleuze's *The Logic of Sensation*.

I. Transfer of Forces via the Senses: The Haptic and the Optic

Riegl, Wölfflin and Worringer are revolutionary figures in art history. They introduced a model of art history no longer based on a taxonomy of artworks but as a study of the plastic virtuality characterising a group of images. The question they raise is: what are the plastic possibilities of representation and what type of space do they create? Riegl's *Historical Grammar of Visual Arts* (1897–1899, first published

in 1966) and Wölfflin's *Renaissance and Baroque* (1888), but also his famous *Fundamental Principles of Art History* (1914), constitute the epitome of such a model: the Baroque is not just an historical paradigm but a 'feeling of form' (*Formgefühl*), a mode of seeing in terms of masses and perpetual movement, while the Renaissance mode of seeing is in terms of lines and distinguished parts. Riegl accounts for the outline and space of the painterly image in terms of haptic and optic and a correspondence to three modes of seeing: 'close vision' (*Nahsehen*), 'normal vision' (*Normalsehen*) and 'distant vision' (*Fernsehen*). Thus whereas the Egyptian relief demands a proximate reading of its planimetrically arranged forms, the Baroque visual model requires distance in order to grasp the colossal sizes and movements in which forms are caught. Worringer traces the production of images back to two psychological preconditions – empathy and abstraction – that he homologates to two types of images. He conceives of images as the passage from virtual plastic structures to their actual realisation in concrete artworks.

These constitutive works of modern art history have to be read as pseudo-structuralist attempts to account for the artistic image as a configuration of plastic signifiers, whose mode of signification is accountable irrespective of their mimetic function and strictly through the type of relations which are brought in. Take the first of Wölfflin's polarities, 'the linear' (*das lineare*) and 'the painterly' (*das Malerische*): they stand for a twofold modalisation of the outline as a plastic signifier, tending either towards delineating the solid material outline of an object or towards its painterly dissolution. Wölfflin calls them 'fundamental', by which he understands 'virtual': they are two constitutive possibilities of the outline which may trace either the haptic solidity and distinctiveness of objects or their optic overlapping and dissolution in space. Worringer's notions of abstraction versus empathy also consist in two modalities of representation corresponding to two tendencies of relating to the exterior. One can either euphorically fuse with it (since the exterior world is felt as unthreatening and peaceful) or, due to a felt dysphoric disposition, one can reduce the exterior to its abstract, geometrical forms, implementing points of rest in what is felt as a threatening nature. Important to Worringer is the relation he introduces between two thymic values: 'tension' (abstraction as related to anxiety and the reduction of the density of space to its surface and to a strictly geometric relation) and 'relaxation' (empathy as related to a harmonious and inoffensive exterior with which one can fuse). The subtitle of this book reads 'A Contribution to the Psychology of

Style'. The thymic dimension of image analysis plays a central role in Worringer's model, where the plastic structure is the result of an affect consisting of either a euphoric and life-affirming relation to space (empathy) or an anxiety-driven and life-denying instinctual response to space reducing all relations of depth to surface relations (abstraction). In empathy, the line is an extension or an attunement to nature and follows the movement of the organic. In abstraction, the line receives a life of its own, independent of nature, significant for its velocity and force. Empathic forms are those that correspond to the human vital feeling (*Lebensgefühl*), that is, to the intrinsic affirmative vitalistic constitution of our own bodies. The opposite category, abstraction, corresponds to forms – geometric, crystalline, lines of force – that are life-denying and felt as disruptive, since they oppose the human life-affirming drives which find satisfaction in curvilinear, naturalistic representations. Antique naturalism is opposed to Gothic abstraction, the classic to primitive man, reason to instinct and so on. The broader intellectual context of this polarity can clearly be traced back to Nietzsche's polarity of the Apollonian and the Dionysian, in so far as for both Worringer and Nietzsche the plastic configuration is intrinsically linked to a specific thymic configuration or an image-affect, in which the image is the plastic analogon of the euphoric (Empathy, organic, naturalistic) or the dysphoric (Abstraction, inorganic, geometric, anxiety-driven).

We interpret these systems of polarities, firstly, as a model of image analysis based on the relation between fundamental virtual possibilities of the plastic constituents of an image (independent of their mimetic function) and their actual implementation in artworks, and, secondly, as the correlation of these plastic constituents to feeling and thus to a thymic dimension. An image for Riegl, Wölfflin and Worringer is an entity on its own, not a copy of the world but constitutive of the perception of the world. It is a plastic extension of the way the world is felt at a given moment. The mode of seeing and feeling, the type of sense and the type of space and line, subordinate the taxonomy of the actual artworks.

These virtual structures are intimately related to the aesthetic constitution of the subject ('aesthetic' in the sense of concerning the specific senses the image appeals to) where the senses of touch, the haptic, and sight, the optic, constitute the main polarity. The haptic refers to a type of line and corresponding pictorial space that clearly distinguishes represented objects by maintaining their self-enclosed materiality and that avoids any sense of depth. The Egyptian relief illustrates this haptic paradigm, based on a type of planar construction

that encloses all figures, and thus on a type of line that appeals to the sense of touch more than vision, as if the lines are associated to the fingertips that provide a direct contact with the perceived object. The optic, to the contrary, accentuates depth and illusion, arranging objects in a closed or infinite space. The art theory of Riegl and Wölfflin appeals to an aesthetics of the specific senses involved and the type of space they presuppose: from the repression of space in the haptic Egyptian art to its controlled sense in Renaissance art and the purely optic infinite space of the Baroque.

Art theory meets aesthetics here in the tradition of J. G. Herder, who arranged the arts according to the distribution of the senses and, in *Sculpture* and the fourth *Critical Grove*, attributed a central role to the sense of touch as opposed to seeing. For Riegl, Wölfflin and Worringer, the reference to the sense of touch that Herder designated as central to the appreciation of sculpture is a priori involved in the analysis of an image's visuality. The image has a synaesthetic constitution relating to the viewer not just through the sense of sight but also appealing to the sense of touch. The linear (Wölfflin), the abstract (Worringer) and the haptic (Riegl) – present not only in primitive or Egyptian art but also in the type of line used in the Renaissance mode of representation – designate a contour that the viewer is invited to associate to the sense of touch. It is this point – the image as a synaesthetic, haptic-optic construct – that Deleuze develops further in his analysis of painting.

II. Painting as the Manipulation of Senses: Deleuze

Yet where do the approaches of all these authors converge? One commonality lies in the role that sensation plays in both Deleuze's analysis of Francis Bacon's painting and in Riegl's analysis of the Baroque as the condensation of an affect (Riegl 1923). While for Deleuze the diagram mediates the sensation, implementing accidental and indeterminate visual effects on the canvas, Riegl argues that the symptom of the Baroque image lies in the conflict between two affects: 'will' (*Wille*) and 'interior sensation' (*Empfindung*). Riegl conceived of the Baroque image as the impact of an interior sensation, an inner conflict that dilutes the stability of plastic signifiers and implements a tension or an illusion of perpetual becoming, accidental movement and unbalanced composition. Wölfflin's logic of the linear and the painterly also finds its correlate in the dichotomy will–sensation. Riegl writes: 'Will is an isolating, tactile (self-limiting) element; sensation

is a connective, optical (self-dissolving) element' (Riegl 1923: 34). Accordingly, *Empfindung* is the Baroque affect per se, since an interior conflict misbalances all its plastic elements. Take Giuliano's statue from Michelangelo's de Medici tombs in Florence, where limbs and head follow different trajectories. For Riegl, the principle of the image consists of a tension due to an 'escalated sensation' (*gesteigerte Empfindung*), just like the figures of the Night and Day are 'quivered by unrest' (*durch eine Unruhe durchzittert*) (Riegl 1923: 33). Whereas 'will' maintains the unity of bodies and distinguishes and balances their parts, 'sensation' exposes form to an inner conflict. The accidental and sensation-driven quivers of Bacon's figures echo what Riegl considers the coordinating thymic principle of the Baroque: an inner tension.

Deleuze's description of El Greco's *Burial of the Count of Orgaz* (1586–88), which emphasises the top section with its erratic display of celestial sensations, finds its correlate in Riegl's account of Rubens' *Last Judgment* (1617). Riegl argues that the painting was outrageous not because, originally, only Mary was dressed, but rather because Christ is stirred by human affects, with a body animated by sensations and depicted less as a divine figure than as an angry judge. Thus, for both Riegl and Deleuze, the painterly image is a set up that extracts and crystallises a commotion of forces affecting the canvas as sensation. In both cases, the question is not how to paint an image (religious, profane) but rather how painting itself, as a circuit of forces, affects the image as such.

Painting mediates the quality and intensity of an affect (and not an iconological content), that inner tension for which – in the case of the Baroque – both Deleuze and Riegl account with the thymic category of distress and unrest. With their analysis of the Baroque as the working of sensation they meet in the centrality of the relation between sensation and affect, both considering the image as the sensible presence of 'insensible forces' independent of figurative motivation. Riegl's interior sensation plays an analogous role to the way Deleuze conceives the contact between a force and the body it traverses and acts upon.

Yet the strongest relation between Deleuze and Riegl consists in the mediation of the painterly image by a reconfiguration of the haptic and the optic. In Deleuze's analysis of painting, the notions of contour and figure are extensions of Riegl's concepts of the haptic and the optic. However, he makes an original use of this dichotomy by introducing a function of the haptic that cannot be found in Riegl. For the latter, touch is the sense corresponding to the impenetrability of objects, it is the type of visual signifier that appeals to the fingertips impinging

upon the basic material structure of an object grasped in its self-enclosed unity. The haptic does not mean literally grasping, it rather functions synaesthetically, the optical pathway (seeing) being stimulated by a reference to the haptic pathway (touching). By contrast, vision, the optical, determines the object's extension into deep space, introducing juxtapositions of planes, three dimensionality, the optical illusion of depth. Egyptian relief illustrates the haptic because a) it employs a line that appeals more to the touching hand than to the gazing eye and b) it represses space relations, the contour and the background being adjoined on the same plane, again like the touching hand, that perceives in terms of adjacent flat surfaces. Moreover, the haptic in Riegl requires a close vision due to the intimacy between the sense of touch and the correlate, whilst the optic requires a distant vision due to the distance needed to perceive space relations as a whole.

The contour for Deleuze is bimodal: it delineates the outline of the object, concentrating energy, and thus acting as a centripetal force. But it is also the deviating painterly margin that opens up the object's limits, dissipates energy, and thus acts as a centrifugal force. The contour therefore has a double function: on the one hand, it is haptic in Riegl's sense, that is, it marks the material individuality of an object perceived as a constant and solid silhouette. In this sense, it is isomorphic, meaning that it maintains a similarity of structure with the represented object. On the other hand, in its painterly function, it is heteromorphic since it dilutes the density of an object, mediates between the Figure and the Ground, and suggests a differentiation and metamorphosis of forms.

The originality of Deleuze's intervention lies in turning the haptic into a function of the optical, that is, into a quality of the eye referring to 'the juxtaposition of tones arranged gradually on the flat surface [that] forms a progression and a regression that culminates in a close vision' (Deleuze 2005: 92). Unlike in Riegl, the haptic is no longer a distinguishing but a diffusive force, related to the hand's velocity. The haptic value is perceived 'when sight discovers in itself a specific function of touch that is uniquely its own, distinct from its optical function' (Deleuze 2005: 109). The Figure's outline is therefore not haptic in the sense of Riegl, who would see it as optical, since it is based on a modulation of chromatic qualities (warm and cold) that pertain to the sense of sight. This outline no longer recalls the tangible material limits of the object. It is rather the outcome of broken lines, belonging to an optic space and displaying zones of indiscernibility. 'Haptic' in this context means a release of tensions. It refers to the intensity and velocity of a hand no

longer subordinated to the eye, a situation that excludes all consideration for the resulting resemblance and that is purely energetic instead. It is indexical in Peirce's sense, meaning that it preserves a physical relation to the designated object unmediated by the eye's formative grid. 'Haptic' in Deleuze is what Wölfflin calls the painterly quality of the Baroque, in which colour no longer aims at 'chromatic harmony' (in which each colour emphasises the purity and the local quality of the neighbouring colours) but is rather a perpetual modulation or local transition from one state to the other.

More than Riegl, Deleuze emphasises the power relation between these two senses, since the haptic is accounted for in terms of the subordination of the eye by the hand. Whereas for Riegl the haptic space is closed, regulated, balanced, geometrically proportionate and tectonically stable (think of the pyramids or modernist architecture), for Deleuze the intrusion of the haptic into vision is equivalent to the velocity and instability of the hand. It refers to an analogue modulation of colour, based on a qualitative tonal range between cold and warm, corresponding to Riegl's purely optical 'mere subjective colour sensations' (*blosse subjektive Farbenempfindungen*). This is the antipode of what Deleuze describes as haptic modulation, in which the viewer fuses with the sensation in the indiscernible layer where the eye itself is sensation. It is this synaesthetic approach to the senses that defines Deleuze's own reading of Riegl.

Another convergence between Deleuze's conception of the image and Worringer's consists in the intensity of the line. It is in the context of an intensive aesthetics that Deleuze evokes Worringer's expressionistic aesthetics and his notion of the Gothic line, which is abstract and infinite, filled with animal and vegetal motives whose function however is not representational. Deleuze's appeal to forces as motivating painting echoes Worringer's apology of the opposition of the spirit of expressionism to naturalism and the organic law of nature. The individual I, writes Worringer, is lost in an 'act of force', a *Kraftleistung*, whilst the Gothic line, as inorganic and infinite 'psychical-spiritual activity of will' (*psychische-geistige Willenstätigkeit*) or mechanical repetition multiplying itself with no pauses and accents (*eine körperlose unendliche Bewegtheit*), is independent of the subject. 'Abstraction' is the plastic regime of the Gothic line, opposed to the naturalistic, emphatic image.

As with Riegl's notions of *Wille* and *Empfindung*, 'abstraction' and 'empathy' refer both to a subject-related emotional state (a thymic dimension) and to object-related visual characteristics (a plastic

dimension). As in Deleuze, for Worringer the image is intrinsically correlated to a phoric state. It is a structure of form and affect, or as semioticians say, an exterior correlate for a thymic state. After all, the central goal of *Abstraktion und Einfühlung* is to determine the psychological preconditions on which the formation of images depends. In other words, abstraction and empathy are affects bound to formal structures, exo-egophoric structures. Empathic forms are attuned to a feeling of life that we freely empathise into them, to an unconstrained activity of the will, to an 'expenditure of energy' (*Kraftaufwand*). They are forms evaluated as beautiful because – in our apperception of them – they harmonise with our natural tendency of self-activation, they are 'in tune' (*Einklang*) with our own will and activate an 'affirmation of the general will to action' (*eine Bejahung des allgemeinen Tätigkeitswillen*). Determined by a feeling of unrest, the drive to abstraction opposes the free organic beauty, that is, its unconstrained movement, and implements an inorganic, crystalline, abstract regularity. The abstract line is the expenditure of a force, a vitalism and a velocity that reduces depth to surface geometric relations.

III. Conclusions: The Haptic as Deconstruction of the Visual Regime

In this model of image analysis, the image is a circulation of affects immanently correlated to the coordination of the senses of touch and sight. Yet, if the hand is constitutive of the image, even analogically in terms of either intensity (Worringer, Deleuze) or as bordering outline (Riegl), then the question can be raised as to whether the pictorial image is a purely visual construction or is intrinsically synaesthetic. Are 'visual' arts merely visual? An analogy of the senses implies a revaluation of the feeling of space in terms of an 'optohaptics', an image's significance consisting not in its mimetic ability but in being a specific space-time configuration of the senses. In his courses on art, Deleuze proposes a double definition of painting, a visual one in which painting is a mode of lines and colours, and a manual one respecting the German etymology of *Malerei* as deriving from *Macula*, haptic trait or spot. It is this manual definition that deconstructs the image as purely visual and detects in it the index of a hand freed from the eye, a 'blind hand' (*une main aveugle*) that produces a line with no constant direction and changing at every point, and that constitutes a third eye. The haptic intrusion as Deleuze understands it deconstructs the optical regime of classical representation, in which the image is a window onto well-defined shapes that are

organised according to linear perspective in order to be primarily seen and read as carriers of symbols. In art history, Michelangelo materialised this intervention of the hand as the constitutive plastic element that is no longer subordinated to the eye but initiates a 'mannerism' that literally gives the upper hand to the haptic.[1] In the haptic regime, the image is an entity with two dimensions: on one side, it relates to an escalation of interior sensation, on the other side, it offers a haptic treatment of an extension of matter that refers the outline to the sensation of touch and the hand's velocity. The greater the intensity of the interior sensation, the greater is its extension as mass – this is the logic of the Mannerist and Baroque image. Riegl writes that, in Michelangelo, the *terrible* corresponds to the increase of the *magnificent* (Riegl 1923: 34). This means that the increase in psychical tension corresponds to the extension of muscles, limbs, movement and space.

As a model of image analysis, in all these authors the image correlates sensation with a series of affects (will and sensation, empathy and abstraction, quiet rest and disruption). Their thymic register is related to specific spatial-temporal constructions that crystallize the quality of time and space. 'Time' does not stand here for the dialectics of retention and protention but for a felt quality, as a concentration of the extension of duration. There is, for instance, the compact, frozen time-space construction of Egyptian and Renaissance art as distinguished from the extended, unfolding time-space construction of the Baroque. Long before Deleuze, Riegl in his book on the Baroque in Rome had already argued that the Day and Night in Giuliano's Tomb must be interpreted not as symbols but as expenditures of forces. The book itself offers a 'logic of sensation', since for Riegl the image constitutes a function where lines and colours mediate intensities with the scope of creating an autonomous entity. This model of the image is an issue that requires further development in rewriting what Riegl's editors called a 'grammar of visual arts'.

Note

1. In Riegl's *Die Entstehung der Barockkunst in Rom* Michelangelo is the key representative of the radical subordination of the image to sensation. Deleuze's courses on aesthetics also emphasise the subordination of the eye to the hand in the understanding of Mannerism. See also Van Tuinen 2009.

Michelangelo, Leibniz and the Serpentine Figure

Sjoerd van Tuinen Erasmus University, Rotterdam

Abstract

In his lectures from 1987, Deleuze draws an analogy between Michelangelo's figures and Leibnizian substances by claiming that neither are essences but rather sources of modifications or manners of being. The best way to explore this analogy, I argue, is by focusing on Michelangelo's preference for serpentine shapes. By putting key passages from *The Logic of Sensation*, *The Fold: Leibniz and the Baroque* and *What is Philosophy?* in resonance with the Leibnizian accounts of corporeal aggregates and possible worlds on the one hand and art history on the other, I will try to develop a Deleuzian concept for the typically Mannerist ideal of the serpentine figure. Although Deleuze usually prefers to speak in musical terms of refrains and counterpoints by which various blocs of sensation resonate with each other, in the visual arts it is the serpentine figure that renders visible sensory becoming as a rhythmic counter-positioning of possible worlds within a single body without organs.

Keywords: Michelangelo, serpentine figure, possible worlds, composition, sensation, Mannerism

I. Michelangelo and Leibniz

Leibnizian philosophy, Deleuze argues in his lectures from 1987, gives us the key to a problem in painting, under the form: what is Mannerism? He draws an analogy between the figures of Michelangelo and Leibniz's

Deleuze Studies 5.1 (2011): 63–72

doctrine of substances by claiming that neither are essences but rather sources of modifications or manners of being:

> In some way, when one thinks of painting that is called mannerist, Leibniz's entire philosophy is without doubt mannerist par excellence. Already with Michelangelo one finds traces of a first and profound mannerism. A mannered posture of Michelangelo is not an essence. It is rather the source of a modification, the source of a manner of being. (Deleuze 1987)

Similarly, in *The Fold: Leibniz and the Baroque*, Deleuze argues that monads are not Aristotelian or Cartesian essences but individuations of an inessential and ante-predicative world. Since each monad envelops this infinite world according to its unique manner, Leibniz can be said to have introduced Mannerism in philosophy: 'Essentialism makes a classic of Descartes, while Leibniz's thought appears to be a profound mannerism. Classicism needs a solid and constant attribute for substance, but mannerism is fluid, and the spontaneity of manners replaces the essentiality of the attribute' (Deleuze 1993: 56).

Surprisingly, however, Michelangelo does not feature in *The Fold*. The only book in which Deleuze refers to Michelangelo is *Francis Bacon: The Logic of Sensation*. There he argues that 'it was with Michelangelo, with mannerism, that the Figure or the pictorial fact was born in its pure state' (Deleuze 2004: 161; cf. Deleuze 2006: 182). Both Michelangelo and Bacon can be qualified as Mannerist in so far as they escape from classical figuration through the 'extraction or isolation' of the 'figural'. Just as a modern painter must liberate himself from the clichés imposed on the image by visual culture (i.e. photography), Mannerism strives to relieve the figure of its representative role and places it in an entirely different, spiritual register of sensation, which Deleuze describes as 'a properly pictorial atheism' (Deleuze 2004: 9; Deleuze and Guattari 1994: 194; cf. Ambrose 2009). Moreover, this anti-classical liberation of spirituality implies a typically modernist tendency towards deformation and abstraction and a heavy emphasis on medium specificity or material facticity.[1] As Deleuze writes of the jarring juxtapositions of bodies in Michelangelo's *Doni Tondo* (also known as *The Holy Family*, 1503):

> The forms may be figurative, and there may still be narrative relations between the characters – but all these connections disappear in favour of a 'matter of fact' or a properly pictorial (or sculptural) ligature, which no longer tells a story and no longer represents anything but its own movement, and which makes these apparently arbitrary elements coagulate in a single continuous flow. (Deleuze 2004: 160)

Or as he puts it earlier on, 'it is as if the organisms were caught up in a whirling or serpentine movement that gives them a single "body" or unites them in a single "fact," apart from any figurative or narrative connection' (Deleuze 2004: 130–1).

This article combines the aforementioned passages and explores in detail Deleuze's analogy between the Michelangelesque figure and the Leibnizian monad. At the centre of the argument is the reference to the typically Mannerist *figura serpentinata*. Michelangelo held that the secret of beauty lies in the alternation of convex and concave forms, where the radius 'jumps' from inside to outside and vice versa, since in this way the figure becomes capable of rendering visible movement. Deleuze refers to the art historian Luciano Bellosi (Deleuze 2004: 196 n. 13), who argues that the *Doni Tondo* is Michelangelo's first Mannerist painting in so far as it breaks with Leonardo's classicist conception of the unity of composition:

> The movement of their inter-connecting arms forms a spiral that has something 'serpentine' about it … To get this spiral effect, Michelangelo twists the figures and makes their bodies bend in a movement that is difficult and complicated. … It is this quality of unease, unnaturalness, eccentricity and ambiguity that particularly characterises the Mannerist mentality. (Bellosi 1970: 8–10)

In addition, for Deleuze the serpentine figure also has a complex philosophical genealogy that can be traced back to the uncoiled serpent of Nietzsche's eternal return and to the ontogenetic, 'sinuous outline (*serpentement*)' in Ravaisson, Bergson and Merleau-Ponty. However, by taking the Leibnizian subtext in Deleuze and Guattari's account of art as the composition of blocs of sensation in *What is Philosophy?* as my starting point, I argue that it is first of all through Leibniz's theory of corporeal aggregates that we can grasp the meaning of the serpentine figure as an expression of sensory becoming. This choice is further legitimated by the fact that the Mannerist unease or disquiet, as mentioned by Bellosi, lies not only at the core of Michelangelo's work, but, as Deleuze emphasises, also constitutes the dynamic element or background (*fond*) of Leibnizian philosophy[2] (Deleuze 1993: 87).

II. Composition

In *What is Philosophy?* Deleuze and Guattari argue that, whereas philosophy puts forward concepts, art makes blocs of affects and

percepts stand up on their own. This difference coincides with the duality between form of expression and matter of expression:

> Conceptual becoming is heterogeneity grasped in an absolute form; sensory becoming is otherness caught up in a matter of expression. The monument does not actualise the virtual event but incorporates or embodies it: it gives it a body, a life, a universe. ... These universes are neither virtual or actual; they are possibles. (Deleuze and Guattari 1994: 177)

Whereas in *A Thousand Plateaus* artistic and philosophical creation are still approached similarly, Deleuze says that it was only with *The Fold* (1988), hence with Leibniz, that he was able to 'see better' what this distinction between concepts and figures amounts to (Deleuze 1995: 137). As he argues in this book, structured around the allegory of a two-storey baroque house, a form of expression is produced in a process of actualisation whereas a material is made expressive in a process of realisation. The two processes are irreducible to each other, in so far as actualisation relates to the reality of the virtual, whereas realisation relates to the existence of a possible world or universe, 'the possible as aesthetic category' (Deleuze and Guattari 1994: 177). This distinction can help us to get a better grasp on the relation between sensation and physical bodies.

In terms of Leibniz, the difference between the actualisation of the world in the appetitions and perceptions of individual souls and the realisation of the world in bodily interaction is not a difference between two kinds of substances, but between two ways of distributing the world, between the soul taken as a monad in itself and the body taken as a composite of several monads. A soul is an eternal individual unity whereas matter is a continuously varying multiplicity, an aggregation of aggregations ad infinitum. Since, for Leibniz, 'that what is not truly *one* being is not truly one *being* either' (To Arnauld, 30 April 1687, Leibniz 1989: 86), it follows that matter or extension does not exist. He thus subscribes to the idealist conviction that the extended world exists only in monadic perception.

However, Leibniz simultaneously says that no soul, except God's, can exist without a body, since the body that belongs to it is precisely what connects it with the rest of the world:

> Each distinct simple substance or monad, which makes up the center of a composite substance (an animal, for example) and is the principle of its unity, is surrounded by a *mass* composed of an infinity of other monads, which constitute the *body belonging to* this central monad, through whose affections

> the monad represents the things outside it. ('Principles of Nature and Grace', §3, Leibniz 1989: 207)

The external world is made up of what Leibniz calls 'secondary matter'. In terms of the Monadology, secondary matter is an infinitely divisible *masse brute*, made up of an unformed flux of monads chaotically traversing all kinds of interactions and compositions, its indistinct collectivities corresponding to the variability of the unconscious flux of perception ('disquiet' or 'confused murmuring') that is virtually included in every monad and that is the condition of all perception, action and thought ('New Essays', Preface, Leibniz 1989: 297). If the soul is nonetheless capable of extracting distinct perceptions from this insensible flux, this is because it possesses a mediating body or 'primary matter' capable of selecting and organising disparate individuals into the unity corresponding to its 'point of view'. For Leibniz the soul is the 'foundation' or 'form' of this organic composition, whilst the other monads that participate in it are merely its 'requisites' or 'material'. In fact, matter is present only through the organic body by which extensive phenomena are 'realised' and otherwise remains fully abstract and ideal. Matter does not 'exist', although in it is realised something that Deleuze calls 'presence': 'the pure presence of the body becomes visible at the same time that the eye becomes the destined organ of this presence' (Deleuze 2004: 52). For Leibniz this means that, in order for a phenomenon to be real – or, 'well-founded' – there must correspond to each of the soul's clear and distinct perceptions a fully evolved organ composed of other monads, such that a perfect 'resemblance' between form and content is guaranteed.

In Deleuze's reading, there is an 'almost schizophrenic tension' (Deleuze 1993: 33) between the idealist Leibniz and the realist Leibniz. There is a tension, for example, between the claim that God chose a certain world expressed by the individuals that populate it and the claim that each 'windowless' monad freely draws its perceptions from the folds of its own infinite background. For it implies that, if an actual soul is free to hallucinate about other possible worlds, it must be able to perceive other possible phenomena than those chosen by God which also strive to existence. On the level of actualisation, however, Leibniz is necessitated to exclude the reality of the possible, since it is precisely God's choice in bringing into existence this one actual world expressed in individual essences that guarantees the well-foundedness of the phenomenon. It is only on the level of realisation – where *de jure* harmony depends on a *de facto* organic perspective or union of body and soul – that Leibniz

allows, either within the organic body or at least open to it, more reality than the soul can express by itself. Here the infinitely divisible continuum of secondary or anorganic flux matter is not restricted by God's choice of the actual world and encompasses multiple possible worlds. Even if the law of pre-established harmony guarantees that the moral order of individual souls and the natural order of composite bodies fuse on a shared plane of composition, the actual does not therefore constitute the real, which must itself be realised in 'accidental', inter-monadic or inter-essential relations. Hence we see why the bodies in which hallucinations can be realised are not necessarily individual or essential and therefore do not necessarily exist. This is Deleuze's point in relation to the Baroque, the 'paradigm' of which he claims to be Mannerist (Deleuze 1993: 34, 36–7, 38):

> The essence of the Baroque entails neither falling into nor emerging from illusion but rather *realizing* something in illusion itself, or of tying it to a spiritual *presence* that endows its spaces and fragments with a collective unity. . . . The Baroque artists know well that hallucination does not feign presence, but that presence is hallucinatory.[3] (Deleuze 1993: 125)

Since the process of realisation does not bear on the virtual but on the possible, a body of sensation or matter of fact is always potentially a non-individual and abstract 'monument' for the presence of another possible world within the actual world.

III. The Serpentine Figure

According to Deleuze, 'including possible worlds in the plane of immanence, even in this very sketchy way, makes expressionism the counterpart of constructionism' (Deleuze 1995: 147; cf. Deleuze and Guattari 1994: 183–4). Following Leibniz's distinction between appetition and perception, he says that a possible world is embodied in a compound of affects and percepts (Deleuze and Guattari 1994: 164). Affects and percepts, however, are not the same as affections or perceptions, because they are not reducible to an individual form or soul whose lived organic experience they are. Already for Leibniz, a body can possess a 'plastic' consistency without being individual, since although organs are the perceptual-affective requirement of the development of the life of the individual monad to which a body belongs, the reverse is not the case.[4] Other material compositions expressing other, non-subjective and hence monstrous or other-worldly sensations are always possible. Only reasonable monads have a

so-called 'substantializing bond (*vinculum substantiale*)' attached to them by which, like a 'judgment of God', the organic compositions are morally bound to their unchanging foundations, whereas bodies belonging to animal souls are subject to the continuous transformations of 'the matter-flow as pure productivity' (Deleuze and Guattari 1987: 454), that is, they can always be developed into different possible worlds or folded into different and potentially mutant animals and thus into new composites of sensation (Leibniz, 'New System', Leibniz 1989: 141–2; 'Monadology' §72, Leibniz 1989: 222). Each sensation thus 'exists in its possible universe without the concept necessarily existing in its absolute form' (Deleuze and Guattari 1994: 178). Spinoza's observation is valid for Leibniz as well: we do not yet know what sensations a body is capable of. 'Even when they are nonliving, or rather inorganic, things have a lived experience because they are percepts and affects' (Deleuze and Guattari 1994: 154, translation modified). Hence Deleuze's claims, firstly, that blocs of sensation possess the autonomous and inorganic life of 'nonhuman landscapes' and 'nonhuman becomings' by which 'we become universes'[5] (Deleuze and Guattari 1994: 169), and, secondly, that the model of all art is a sensory becoming-animal, in other words, an animation – or 'animalization' (Deleuze 2004: 46) – of matter in non-human and non-individual ways.

If, moreover, perception is no longer necessarily subjective, then neither can it be reduced to an objective state of affairs. Rather, there is the unity of eye and matter in the becoming of the pictorial fact. Sensation refers not only to primary matter or content-matter, but also to the 'immense agitation' (Deleuze 2004: 137) of the secondary or flux matter of which it is composed and in which it is expressed. The body, detached from the individual soul and dispersed in flux, becomes a 'zone of objective indiscernibility or indeterminability' (Deleuze 2004: 157) and with it the well-founded phenomenon gives way to deformation. Whereas classical representation, as Deleuze says in *The Logic of Sensation*, 'takes the accident into an optical organization that makes it something well founded (a phenomenon) or a "manifestation" of essence' (Deleuze 2004: 126), the mannered postures of Michelangelo's deformed bodies are not fixed individual forms of content, but deform the very object form of human perception and representation governing over sensation, such that forms become 'accidental forms' (Deleuze 1993: 137) or forms of expression and thus sources of endless modifications or modulations. Hence the singular 'athleticism' of Mannerist figures: 'What makes deformation a destiny is that the body has a necessary relationship with the material structure:

not only does the material structure curl around it, but the body must return to the material structure and dissipate into it' (Deleuze 2004: 18). This deformation is reflected by the expressions of swooning, drunkenness, dizziness and vertigo employed by Leibniz to describe what occurs when accidental and essential aspects get confused. As becomes clear from a passage of his 'New System on Nature' that is particularly dear to Deleuze, this confusion is also exemplary of the Mannerist or Baroque unease characteristic of Leibniz's philosophy: 'After I established these things, I thought I was entering the port; but when I began to meditate about the union of soul and body, I felt as if I were thrown again into the open sea' (Leibniz 1989: 142). If classicism needs a solid and constant attribute for substance or body belonging to the soul, the fluidity of Mannerism that replaces the essentiality of the attribute therefore lies precisely in this indiscernibility between primary and secondary matter or between content matter and flux matter.

Now it is this objective indeterminability which Deleuze refers to both with the Michelangelesque ideal of the *figura serpentinata* and Artaud's concept of a body without organs – that is, not bodies stripped of organs, but bodies upon which organic figures are distributed in the form of multiplicities (Deleuze and Guattari 1987: 30). Leibniz says that although nature is not an organism and hence not everything is organic, organs are everywhere 'clothed with' or 'enfolded in' ('New System', Leibniz 1989: 141–2) the texture of secondary matter, for reason of which 'each part of matter can be thought of as a garden full of plants or as a pond full of fish' ('Monadology', §67, Leibniz 1989: 222). It follows that each organ is only a fold away from infinity, caught up in an abstract flux of entwined bodies, each of which already contains the germ of another possible world. Similarly, a serpentine figure such as *The Rape of the Sabine Virgins* (1574–82) by Giambologna, a student of Michelangelo, renders the pictorial fact in such a way that it constantly escapes from itself and dissipates in multiple becomings.

> In the history of art, it was perhaps Michelangelo who made us grasp the existence of such a fact most forcefully. What we call 'fact' is first of all the fact that several forms may actually be included in one and the same Figure, indissolubly, caught up in a kind of serpentine, like so many necessary accidents continually mounting on top of one another. … Certainly there is still an organic representation, but even more profoundly, we witness the revelation of the body beneath the organism, which makes organisms and their elements crack or swell, imposes a spasm on them, and puts them into relation with forces. (Deleuze 2004: 160)[6]

Put differently, the serpentine figure folds – in an 'unnatural' way – one bloc of sensation into another, 'folds over folds' (Deleuze 1993: 93), within a single body without organs. In *A Thousand Plateaus* or *What is Philosophy?*, Deleuze and Guattari prefer to speak in musical terms of relations of counterpoint by which various blocs of sensation resonate with each other, but their equivalent in the visual arts is the rhythmic *contrapposto* of material figures in a serpentine composition in which 'universes are linked together or separated on their lines of flight, so that the plane may be single at the same time as universes are irreducibly multiple' (Deleuze and Guattari 1994: 196). For what the serpentine figure renders visible – from the queerly elongated limbs or contrived and unstable spatial relationships in Mannerist works of art to the modernist 'shattering of lived perceptions into a sort of cubism' (Deleuze and Guattari 1994: 171) – is sensory becoming as a rhythmic counter-positioning of possible worlds on a single plane of composition or fractal line of infinite inflection.

Notes

1. Even if Deleuze never systematically developed a concept of Mannerism in the way he did for expressionism and the Baroque, his aesthetics is profoundly Mannerist. In 'Deleuze's Concept of Mannerism' (forthcoming) I provide an overview of the main components of Deleuze's concept of Mannerism, which includes aesthetic, but also logical, ethical and stylistic aspects.
2. For Alois Riegl's similar observation with regard to Michelangelo's Medici tombs, see also Vlad Ionescu's contribution to this forum.
3. For a differentiation of Mannerism from the Baroque, see Van Tuinen 2009.
4. For a more elaborate account of the plasticity of the body in Leibniz, see Hammond 2010.
5. Here we see how Deleuze's concept of the presence of the possible is also related to a Bergsonian concept of fabulation: 'Bergson analyzes fabulation as a visionary faculty very different from the imagination and that consists in creating gods and giants, "semi-personal powers or effective presences". It is exercised first of all in religions, but it is freely developed in art and literature' (Deleuze and Guattari 1994: 230). Just as Michelangelo relied on the power of his artistic mind to improve nature instead of merely imitating it, for example to extract from the 'alpine and living stone' of a Carrara mountain top the colossus that is hermetically confined in it and that will 'outlive its maker' (cited in Clements 1961: 12, 23–8), Deleuze and Guattari argue that 'percepts can be telescopic or microscopic, giving characters and landscapes giant dimensions as if they were swollen by a life that no living perception can attain', such that we may say that 'all fabulation is the fabrication of giants' (Deleuze and Guattari 1994: 171).
6. Interestingly, art historian Charles de Tolnay, although not mentioned by Deleuze, arrives at a stunningly similar conclusion: 'From Michelangelo's works emerges the fact that he had a profound knowledge of anatomy. But he was not interested in anatomy as a science *per se* – as was Leonardo. Rather it was for him, as was perspective, an auxiliary science, a means to a fundamental knowledge

of the structure of the human body, which the artist wanted to re-create in his works, not by copying this or that model, but by grasping the meaning of the human body in its original beauty and in the rhythmic power of its abundant life. … Even Michelangelo's "theoretical" studies of the human body are purely plastic. Obviously he was never able to regard the skeleton as a system which could be detached from the whole, when it was a question of representing the living body. Only the unity of the plastic bodily form existed for him, a unity in which the muscles and bones merely indicate the inner powers and tensions of the substance which they shape from within. They are not a hidden structure inside the body; on the contrary, bones and muscles are forces, and need the body's substance in order to manifest themselves. Away from the complexus of the body they have no life. The blood stream flows through these superhuman forms, and Michelangelo seizes its rhythm – a truly dynamic conception' (Tolnay 1964: 87).

The Sublime Conditions of Contemporary Art

Stephen Zepke

Abstract

Deleuze's relationship to Kant is intricate and fundamental, given that Deleuze develops his transcendental philosophy of difference in large part out of Kant's work. In doing so he utilises the moment of the sublime from the third Critique as the genetic model for the irruption of the faculties beyond their capture within common sense. In this sense, the sublime offers the model not only for transcendental genesis but also for aesthetic experience unleashed from any conditions of possibility. As a result, sensation in both its wider and more specifically artistic senses (senses that become increasingly entwined in Deleuze's work) will explode the clichés of human perception, and continually reinvent the history of art without recourse to representation. In tracing Deleuze's 'aesthetics' from Kant we are therefore returned to the viciously anti-human (and Nietzschean) trajectory of Deleuze's work, while simultaneously being forced to address the extent of its remaining Idealism. Both of these elements play an important part in relation to Deleuze's 'modernism', and to the discussion of his possible relevance to contemporary artistic practices.

Keywords: Sublime, Kant, aesthetic synthesis, transcendental philosophy, cinema, painting

The consequences of Conceptual art foreseen by Deleuze and Guattari in *What is Philosophy?* have come true. Art's plane of composition has become 'informative', on the one hand reducing sensation to human 'opinion', and on the other 'neutralising' the plane of composition by making a sensation reproducible to infinity (Deleuze and Guattari

Deleuze Studies 5.1 (2011): 73–83

www.eupjournals.com/dls

1994: 198). What is particularly sad – a kind of sad irony – is that it is precisely these aspects of contemporary art that have become associated with Deleuze and Guattari. After the relational turn art has embraced an 'immanent aesthetics' whereby the accumulation of things, concepts and experiences on a plane of composition detached from institutional, historical and medium specificities extends both the democratic tendencies of Conceptual art and their banality. Immanent aesthetics is the tyranny of the and..., its infinite and inoffensive production of 'rhizomatic', 'transversal' and 'nomadic' 'projects' in which art becomes life (but life stays as it is). This contemporary art, as Nicolas Bourriaud has put it, 'patiently re-stitches the relational fabric' of inter-subjectivity and social life (Bourriaud 2002: 36). Bourriaud draws directly on Guattari to argue that art's 'operative realism' has the 'modest aim' of rendering 'little services' and making 'little gestures' by creating 'convivial relations' and 'disconcerting situations' that 'contrast' and 'differ' from 'those structuring everyday life' and its 'communicational zones' (Bourriaud 2002: 35, 30, 31, 16). It is easy to see Bourriaud's modest ambitions for contemporary art as the fulfilment of Conceptual art's embrace of mass-media, and its resulting subsumption within the emerging world of communication technology as a 'creative' and commodified 'resistance'.[1] In this sense, and as Eric Alliez has put it, relational aesthetics is an 'aestheticisation of dissensus... [as a] post-political form of consensus beyond radicality' (Alliez 2010: 87).

The question then is how to re-radicalise both Deleuze's aesthetics and contemporary art? How are we to disabuse contemporary art practice of its belief that rhizomatic connectivity and its banal inclusiveness is not only 'political', but transformative? Today's reality is already rhizomatic, and novelty defines the market's vital rhythms of production. In our present age of constant deterritorialisation how can art be re-radicalised, and emerge as explosive and eternal returns of the new? The answer is already there in Deleuze's aesthetics, although it is largely ignored by his reception within contemporary art. Deleuze remains unfashionably Kantian (not to mention Modernist) in his insistence on sensation as the defining characteristic of art, and more especially in the ontological and aesthetic necessity of the sublime as the condition to any production of the new.

Deleuze's post-Kantian reading of the third Critique seeks what he calls the 'pure presence' of the 'difference of difference' through a transcendental or 'superior empiricism' (Deleuze 1994: 69). This presence emerges, he says, at a 'precise moment within Kantianism,

a furtive and explosive moment which is not even continued by Kant' (Deleuze 1994: 58). This is the moment when the form of time is introduced into thought. The result is a fracture of the *cogito*, 'an alienation in principle, insurmountable in principle' (Deleuze 1994: 58), between the passive receptivity of intuition and the active syntheses of the transcendental subject. Although the former is subordinated to the latter in Kant's account, Deleuze will affirm their difference – this 'schizophrenia in principle' – as the 'highest power of thought', a power that 'opens Being directly onto difference' (Deleuze 1994: 58). At this moment difference emerges for itself as what Deleuze calls 'real experience', a 'real experience' that directly participates in the process of ontogenesis. Real experience will turn against the self and its conditions of possible experience 'and smash it to pieces', emerging instead in the 'already-overman', a 'sublime image' that 'makes the sun explode' (Deleuze 1994: 89). For Deleuze, the third form of time – the future – is sublime, making the sublime, I would like to argue, not only the ontological crux of his aesthetics and the defining feature of 'art', but the real condition of the emergence of something 'new'.

Deleuze's reading of Kant begins from the post-Kantian philosopher Salomon Maïmon, who objected to Kant's use of ready-made faculties and relations, because these a priori principles were traced from the psychological structures of perception, and so failed to discover experience's real and genetic conditions.[2] In this sense, Deleuze writes, 'Transcendental philosophy discovers conditions which still remain external to the conditioned. Transcendental principles are principles of conditioning and not of internal genesis' (Deleuze 1983: 91). The only way to discover the transcendental principles of genesis is to begin from the passive intuition of sensation 'before' it has been synthesised by the subject's transcendental conditions of possible experience. As a result, and as Deleuze puts it, 'transcendental empiricism is the only way to avoid tracing the transcendental from the outlines of the empirical' (Deleuze 1994: 144). Showing generosity, Deleuze claims that the third Critique anticipates these objections 'at least in part', inasmuch as it 'uncovers the ultimate ground still lacking in the other two Critiques' (Deleuze 2002: 61). The ground it discovers is the faculties' 'free agreement, indeterminate and unconditional', meaning that 'with the *Critique of Judgment*, we step into Genesis' (Deleuze 2002: 68–9). But for Deleuze, Kant's most important discovery in the third Critique is the sublime, which, he will argue, is the way experience goes beyond its conditions of possibility and transcendental empiricism discovers difference as its real and genetic condition. In the sublime the

genetic conditions of experience emerge in themselves, as the difference between the faculties, a difference Deleuze raises to a higher power that overcomes the very possibility of common sense. What Deleuze calls 'real experience' is the repetition of the difference between the super-sensible and the sensible, its eternal return. Deleuze clearly hears the laughter of Zarathustra in the painful dissolutions of the sublime, turning the aesthetic synthesis discovered by Kant into the ontogenesis of the eternal return, and placing the repetition of difference at the heart of Kantian experience (Deleuze 1983: 52). Nietzsche, Deleuze writes, found 'a radical transformation of Kantianism, a re-invention of the critique which Kant betrayed at the same time as he conceived it, a resumption of the critical project on a new basis and with new concepts' (Deleuze 1983: 52). Nietzsche thereby takes Kantian critique beyond the point where it was 'exhausted in compromise' (Deleuze 1983: 89).

Deleuze's reading of the third Critique begins from what he calls the 'formidable difficulty' of understanding the 'mysterious' harmony of the faculties in common sense (Deleuze 1984: 22). This harmony requires the presupposition of aesthetic common sense, but, Deleuze says, this is an 'unsatisfactory solution' (Deleuze 2002: 60) because 'the Critique in general demands a principle of this accord, of the genesis of common sense' (Deleuze 1984: 22–3). The Analytic of the Sublime gives this 'genetic principle' (Deleuze 2002: 70) that demonstrates, for Kant, how reason secures the free indeterminate accord of the imagination and the understanding in the beautiful.[3] Deleuze however, reading Kant very literally on this point, will find in the sublime a transcendental genetic principle of discord or difference that will overcome common sense and its human, all too human sensibility.

The sublime, as Kant remarks, is 'beyond all comparison great' (Kant 1987: § 25), so it cannot be a measurable object of the senses. As a result, the sublime presents the imagination with an experience that is formless, and this forces it to confront its own limit, a limit beyond which the accord of imagination and sensible Nature is achieved in what Deleuze calls their 'dissension' (Deleuze 1984: 51). Imagination has no limit when it is apprehending successive parts because as long as it has established a unit of measure it can apprehend successive parts to infinity. But imagination does reach its limit when it attempts to reproduce simultaneously this infinity of parts, which it cannot synthesise into a single experience. Here Deleuze follows Kant's account of the aesthetic synthesis, which determines a unit of measure. An aesthetic synthesis is made up from subjective judgements, Kant claims, because its unit of measure is always our body. But in the face of the

'absolutely great' this aesthetic synthesis breaks down, forcing us to turn to the Ideas, which can think the infinity of the 'absolutely great' even if the imagination cannot apprehend it. Here, the sublime gives rise to 'a feeling of a super-sensible faculty within us' (Kant 1987: § 25), and reveals the super-sensible substrate underlying intuition. Nature is sublime in the phenomena that convey an Idea of their infinity, and in this we get, Kant tells us, 'infinity comprehended' (Kant 1987: § 26). Here we comprehend an Idea of Nature that is super-sensible and that underlies both Nature and our own faculty of reason.

The sublime, Deleuze notes with satisfaction, is 'truly paradoxical' (Deleuze 2002: 61) because reason is able to unite the sensible infinity of the world in a rational Idea, but does so only by exceeding the limits of the imagination. This gives what Kant calls the 'negative pleasure' (Kant 1987: § 23) of the sublime, where the imagination discovers its inaccessible super-sensible and transcendental ground, so making 'this very inaccessibility something which is present in sensible nature' (Deleuze 1984: 51; Deleuze 2002: 62).[4] Deleuze is fascinated by this contradictory harmony of the imagination and reason in the sublime, this 'vibration' or 'conflict' as Kant calls it (Kant 1987: § 26); this 'dissensus' (Deleuze 1984: 51), 'reciprocal violence' (Deleuze 1994: 321), or 'harmony in pain' (Deleuze 2002: 62) as Deleuze variously describes it. It is this painful harmony – what Nietzsche calls the pain of childbirth – that is the moment of superior or transcendental empiricism, the moment when the imagination is projected beyond its human, all too human conditions of possibility, to reveal what is beyond it and yet conditions it, the transcendental Ideas. Deleuze writes: 'each faculty communicates to the other only the violence which confronts it with its own difference and its divergence from the others. Kant was the first to provide the example of such a discordant harmony, the relation between imagination and thought which occurs in the case of the sublime' (Deleuze 1994: 146).

It is significant here that the sublime emerges in a reflective judgement. In a reflective judgement nothing is given by the active faculties, meaning raw intuition presents itself without really being 'represented' (Deleuze 1984: 60). In the judgement of the sublime raw intuition emerges for itself in an aesthetic synthesis – a sensation – that exceeds imagination, but in doing so reveals itself to be determined by the super-sensible Ideas.[5] As Deleuze puts it, reflective judgement 'manifests and liberates a depth which remained hidden' (Deleuze 1984: 60), a depth undetermined by a concept. As we have seen, Deleuze's account follows Kant's closely to this point, but now departing from Kant Deleuze argues

that the super-sensible depths of Ideas are differential and do not pre-exist their experience. A sensation in this sense gives an Idea of a 'world' formed from ramifying series of differential forces, as they construct an open totality which is simultaneously expressed in an actual experience.[6] In *Difference and Repetition* however, the transcendental Ideas are real conditions that remain distinct from real experience. This super-sensible realm – real without being actual – is, Deleuze writes, 'not a sensible being but the being of the sensible. It is not the given but that by which the given is given. It is therefore in a certain sense the imperceptible' (Deleuze 1994: 140). In Deleuze's superior empiricism the function of the sublime is to unleash the imagination from its transcendental conditions of possibility, allowing intuition to sense the transcendental Idea as its differentiating and genetic problem and incarnate its solution in 'sensation'. Sensation is therefore the unity of mind and nature, but this unity of mind and being, of sensible and super-sensible – and this is the lesson Deleuze draws from Kant's sublime – this unity is difference. As we will see, Deleuze's later work with Guattari will try to dissolve this still-Kantian difference in the immanence of matter and force.[7]

But let us return to the sublime realm of real experience to see how it is connected to aesthetics and more specifically to art. First of all, in the sublime aesthetic comprehension exceeds the body as phenomenological measure, and so gives rise to a new type of aesthetic synthesis, an inhuman synthesis in a state of continual variation.[8] As such, the aesthetic synthesis, according to Deleuze, is an 'evaluation of rhythm'. Here, Deleuze's method of ventriloquism is aggressive, finding in Kant the sublime germ that will grow to be the 'catastrophe' of his own system. This is what Deleuze says: 'We have seen that aesthetics – even though Kant does not say it, but it is what he is thinking of – was the grasping of rhythm as basis of measure and the unit of measure.' The result is appropriately dramatic:

> My whole structure of perception is in the process of exploding. Why? My whole structure of perception is in the process of exploding because we have seen that this whole perceptive synthesis found its foundation in aesthetic comprehension, which is to say the evaluation of rhythm. Here it's as if this aesthetic comprehension, as evaluation of a rhythm that would serve as a foundation of measure, thus the synthesis of perception, is compromised, drowned in a chaos. The sublime.[9] (Deleuze 1978a: 13)

The sublime is the mechanism by which genetic rhythms emerge from chaotic infinity, rhythms as aesthetic syntheses or sensations, rhythms as, to use Guattari's term describing the 'aesthetic paradigm', chaosmosis.

Similarly, in the Bacon book, what Deleuze calls the 'chaos-germ' is introduced by a painter's diagram, allowing the painter to 'embrace the chaos' in order to 'collapse' his or her 'visual coordinates'. The painter is able to turn chaos into rhythm, into a 'germ of rhythm', whereby Kant's sublime aesthetic synthesis – emerging we remember through the explosion of the human – directly expresses its material but nevertheless transcendental genesis. This is what Deleuze calls 'the new order' of a 'pictorial experience' (Deleuze 2003: 102).

Superior empiricism overcomes its Kantian conditions of possibility through 'a disorder of all the senses' (as Deleuze quotes Rimbaud), 'or rather an unregulated exercise of the faculties' (Deleuze 1984: xi). This sublime and superior empiricism is the real and genetic condition of art, a radical and transcendental condition, or as Deleuze puts it, 'a tempest in the depths of a chasm opened up in the subject' (Deleuze 1984: xii). The sublime, Deleuze argues, produces an inhuman sensation as the true destination of Kant's Critique, and the true destination of art. Here Deleuze follows Nietzsche's reading of Kant: 'The point of critique is not justification but a different way of feeling: another sensibility' (Deleuze 1983: 94). The passage from *Difference and Repetition* to the books written with Guattari will explore this 'different way of feeling'. In the earlier book the sublime unleashes 'free or untamed states of difference in itself', that 'create at once both the quality in the sensible and the transcendent exercise within sensibility' (Deleuze 1994: 144). Here it is the sublime that overcomes 'lived experience' and pushes us instead into a 'lived reality' where 'pure presence' appears with the ' "disparate" as its unit of measure' (Deleuze 1994: 69). In the later books, and most notably in *A Thousand Plateaus*, this 'disparate' measure of transcendental difference turns into rhythm as the aesthetic emergence of art and nature on a single plane of consistency. I'll come back to this.

We remember that Deleuze rather gleefully announced that in the sublime perception is in the process of exploding. This is *Anti-Oedipus* talk, where he and Guattari had already pronounced: 'The artist stores up his treasures so as to create an immediate explosion' (Deleuze and Guattari 1983: 32).[10] And in *A Thousand Plateaus*, going one better, the artist is described as 'a homemade atomic bomb' (Deleuze and Guattari 1987: 345). Indeed, affect and percept provide similar inhuman experiences, 'shattering lived perceptions', as they say in *What Is Philosophy?*, in hallucinatory 'visions' (Deleuze and Guattari 1994: 171). These visions are sensations qua artworks, rhythmical explosions of our human limits allowing us to 'become with the world', as they put it, to the point where 'We become universes' (Deleuze and Guattari

1994: 169).[11] Deleuze repeatedly insists that the third Critique is the 'hinge' between Classicism and Romanticism, which would make the sublime the genesis of romantic art, and the model for art in general, an art that, as Deleuze and Guattari formulate it, is a passage from the finite to the infinite (Deleuze and Guattari 1994: 180). In fact, this rhythmical sublime explosion of mystical and aesthetic effusion, of which Guattari was fond, is the figure of a Deleuzo-Guattarian aesthetics not only found in the meat of Bacon but in the cinema as well.[12]

In the *Cinema* books it is the breakdown of the sensory-motor scheme, as the condition of possible experience, that provokes the visionary emergence of the time-image. The time-image no longer cancels the Idea in its incarnation, but instead contains both finite and infinite, actual and virtual 'at the same time'; they are, Deleuze tells us, 'totally reversible' (Deleuze 1989: 69) and in 'continual exchange' (Deleuze 1989: 70).[13] The movement-image, by contrast, approaches the limit of the body-brain in a recognisably Kantian way, and filmmakers such as Vertov take us, Deleuze says, 'beyond the human limits of the sensory-motor schema towards a non-human world where movement equals matter.... It is here that the movement image attains the sublime' (Deleuze 1989: 40). This is also the classic expressionist story-line in which the dynamic sublime releases a formless power which overwhelms organic life. But as in Kant the dynamic sublime simultaneously produces a transcendental subjectivity, because Expressionism only takes us beyond the sensory-motor schema in order 'to discover in us a supra-organic space which dominates the whole inorganic life of things' (Deleuze 1986: 52). In all cases, Deleuze argues, 'the movement-image remains primary, and gives rise only indirectly to a representation of time' (Deleuze 1989: 40). In *Cinema 2*, which immediately and somewhat surprisingly condemns the movement-image as a cliché (Deleuze 1989: 20), time becomes unhinged, as Deleuze says in *Difference and Repetition* in his discussion of the sublime image of the third form of time, as time's 'relation to movement is overturned' (Deleuze 1994: 89). In the time-image, time becomes the sublime condition of a cinematic 'vision' that – as Deleuze very beautifully puts it – 'makes us grasp, it is supposed to make us grasp, something intolerable and unbearable. ... something too powerful, or too unjust, but sometimes also too beautiful, and which henceforth outstrips our sensory motor capacities' (Deleuze 1989: 18). Rossellini's *Stromboli*, for example, which climaxes in 'a beauty which is too great for us, like too strong a pain' (Deleuze 1989: 18). At the moment of the eruption ending the film, 'there are', Deleuze writes, 'no longer sensory-motor images with their extensions, but much more complex circular

links between pure optical and sound images on the one hand, and on the other hand images from time and thought' (Deleuze 1989: 47). This would be a materialist Kant-beyond-Kant that emerges in the sublime hallucination of the time-image, one shared with the 'haptic-visions' of Bacon, and the sensations of art.

It is tempting to see this transition of the sublime from limit to infinite in the *Cinema* books as expressing a wider shift in Deleuze's oeuvre. It is as if the Kant that emerges in *Difference and Repetition*, where the sublime escapes its human conditions but fixes genesis in the transcendental realm of the Ideas, remains recognizable, if only in a post-Kantian form. After meeting Guattari, and with his help, Deleuze attempts to take Kant beyond Kant by materialising the sublime difference in aesthetic syntheses, in rhythms. This would be the beginning of what Alberto Toscano has called 'transcendental materialism', and is the necessary starting point for any understanding of Deleuze's aesthetics and his theory of art.[14] It is precisely the ontological (and I would argue the political) necessity of overcoming the human conditions of possible experience that places the sublime at the forefront of any 'Deleuzian' contemporary art. 'And . . . ' is not enough, what we need are explosions.

Notes

1. See in this regard Alberro 2003.
2. Deleuze concurs with this view, claiming that because the 'object = x' is the correlate of the 'I think', Kant 'traces the so-called transcendental structures from the empirical acts of a psychological consciousness' (Deleuze 1994: 135). Maïmon's reading of the first Critique was also important for Deleuze inasmuch as it argues that the 'formal intuitions' of space and time are filled with matter as sensation, this sensation having an intensive magnitude determined by differentials. On Maïmon's account, sensation constitutes the *noumena* as Ideas of the understanding, while objects of experience are their *phenomena*. For Maïmon – and for Deleuze after him – difference is real, and as such can pass through the barrier Kant places between perception and the thing in itself. But whereas Maïmon makes these differential Ideas belong to the understanding, Deleuze identifies them as Ideas of reason – or thought – in a strictly Kantian sense.
3. This is the point that Jacques Rancière misses when he claims sensation is Deleuze's version of the Analytic of the Beautiful. Rancière argues that, like Deleuze's sensation, 'the beautiful is that which resists both conceptual determination and the lure of consumable goods' (Rancière 2010: 173), but he fails to point out that it is reason that conditions this resistance through the sublime, and so emerges for Deleuze – in significantly altered form – as the real condition of sensation. This means that it is Deleuze's re-reading of the transcendental Idea that is the most important aspect of his account of sensation, a fact Rancière implicitly acknowledges by his rather disappointing adoption of the Badiouian line arguing that Ideas transcend immanence, and his final condemnation of Deleuze in these terms: 'I fear . . . that the transcendence

instituted at the heart of Immanence, in fact, signifies the submission of art to a law of heteronomy which undermines every form of transmission of the vibration of colour and of the embraces of a fraternal humanity' (Rancière 2010: 182). As we shall see, this is certainly a problem for Deleuzian ontology, but one Deleuze and Guattari themselves seek to overcome.

4. As Deleuze explains at greater length: 'Yet with the sublime, according to Kant, the imagination is forced or constrained to confront its own limit, its *phantasteon*, its maximum which is equally the unimaginable, the unformed or the deformed in nature. Moreover, it transmits this constraint to thought itself, which in turn is forced to think the supra-sensible as foundation of both nature and the faculty of thought: thought and imagination here enter into an essential discordance, a reciprocal violence which conditions a new type of accord. As a result, in the case of the sublime, the recognition model and the form of common sense are found wanting in favour of a quite different conception of thought' (Deleuze 1994: 320–1). As Christian Kerslake aptly puts it in his recent and impressive study of Deleuze's relation to Kant: 'the very form of the transcendental, which *conditions* the possibility of experience, depends on the violation of the conditions of the possibility of experience' (Kerslake 2009: 81).
5. Deleuze: 'it is thus at the same time that the basis of the synthesis, namely aesthetic comprehension, and the underground of the synthesis, namely the sublime in so far as it overturns the base, is discovered' (Deleuze 1978b: 8).
6. As Deleuze explains, linking this once more to Nietzsche, 'each difference passes through all the others; it must "will" itself or find itself through all the others' (Deleuze 1994: 57).
7. As Edward Willatt and Matt Lee point out, *Anti-Oedipus* drops any mention of the faculties in favour of transcendental machinic operations, and so shifts transcendental genesis away from the Kantian realm of Ideas and closer to matter. 'They attempt to think in terms of processes in order to make what is anterior to conscious life immanent to that very life and to envisage within a machinic transcendental horizon a world prior to such life' (Willatt and Lee 2009: 9).
8. This is what Deleuze and Guattari will later call 'close' or 'haptic' vision, an entry into smooth space by way of the 'catastrophe' where all 'orientations, landmarks and linkages are in continual variation' (Deleuze and Guattari 1987: 493).
9. As Kant puts it, it is 'in its chaos, or in its wildest and most irregular disorder and desolation … that nature chiefly excites the ideas of the sublime' (Kant 1987: § 23).
10. We recall the incendiary lines on Turner: 'The canvas turns in on itself, it is pierced by a hole, a lake, a flame, a tornado, an explosion' (Deleuze and Guattari 1983: 132).
11. As Guattari puts it in direct relation to art: 'I find myself transported into a Debussyst Universe, a blues Universe, a blazing becoming of Provence. I have crossed a threshold of consistency. Before the hold of this block of sensation, this nucleus of partial subjectivation, everything was dull, beyond it, I am no longer as I was before, I am swept away by a becoming other, carried beyond my familiar existential Territories' (Guattari 1995a: 93).
12. As he says: 'I am God most of the time' (Guattari 1995b: 54).
13. As it must according to *Difference and Repetition*'s strict separation of the sensible and super-sensible realms: 'For difference, to be explicated is to be cancelled or to dispel the inequality which constitutes it' (Deleuze 1994: 228).
14. In the last chapter of his *The Theatre of Production*, Toscano gives a brilliant account of the transition from *Difference to Repetition* to *Anti-Oedipus* and its necessity in the face of Badiou's reading of Deleuze as a Platonist (see Toscano 2006).

Deleuze Modernist

Bram Ieven Utrecht University

Abstract

This article discusses the distinction between Figure and Form that Deleuze introduces in *Francis Bacon: The Logic of Sensation*. He uses the distinction to articulate the difference between two trajectories in modernist painting: the first focusing on sensation, the second on cerebral abstraction. I argue that the distinction between Form and Figure – and the disjunction of two types of modernist painting initiated by this distinction – is not as easy to maintain as might appear at first sight. Mapping the lineages of modernist painting from Paul Cézanne to Georges Braque and Theo van Doesburg, the essay argues that the sensuous forces operative in a painting of the Figure are equally at play in the painting of the Form. Modernist painting might therefore be understood as the continuous collapse between Figure and Form, rather than as their strict separation.

Keywords: Modernism, Form, Figure, sensation, abstraction, van Doesburg

According to Deleuze, 'painting has neither a model to represent nor a story to narrate' (Deleuze 2003: 2/12).[1] However, the turn towards abstraction is but one way in which modern painting will try to escape from narrativity and figuration. In order to undo its figurative and narrative capacity, painting will need to undergo a series of operations and transformations. These operations are what modernist painting is all about, according to Deleuze. Essentially, he argues, there are two ways to undo figuration. A first way is by means of abstraction. It leads to abstract art and to a painting of the Form. The second way is somewhat different, and although it will lead to a non-figurative form of art, it does

not lead to abstract art. This second approach Deleuze calls a painting of the Figure. Clearly it is of great importance to keep in mind the difference between the Figure and figuration, because despite the fact that a painting of the Figure can still be figurative, confusing the two would be to misunderstand the essence of the Figure, the central element of which is sensation. It is this concept that informs Deleuze's distinction between two traditions in modernist painting. Yet at the same time the distinction between form and sensation is harder to maintain than Deleuze suggests. The concept of Form from which the concept of sensation seeks to escape can be shown to play a pivotal role in the emergence of the Figure; and in return, there are paintings of Form that capture sensations in the same way as any painting of the Figure does. Both from a historical and a theoretical perspective the distinction between Figure and Form is hard to uphold, since both struggle with giving shape to sensation. Instead of distinguishing between two essentially different ways of painting in modernism, it may be more apt to understand modernist painting through the continuous collapse of the distinction between Form and sensation, between force and Form.

The painting of the Form and the painting of the Figure have their own distinct methods for escaping narrativity and figuration. They operate at different levels. Whereas the Figure establishes a direct and immediate connection to sensation, and hence to our physical and bodily awareness, abstraction is concerned with establishing a connection with the brain. In a fairly reductive characterisation one could argue that the Figure is concerned with the body whereas the Form is concerned with the brain, or the cerebral. In *Francis Bacon: The Logic of Sensation* Deleuze explains this as follows:

> There are two ways of going beyond figuration (that is, beyond both the illustrative and the figurative): either toward abstract form or toward the Figure.... The Figure is the sensible form related to a sensation; it acts immediately upon the nervous system, which is of the flesh, whereas abstract form is addressed to the head, and acts through the intermediary of the brain, which is closer to the bone. (Deleuze 2003: 34/39)

Deleuze does not oppose the Figure to abstraction, but to form. Or more accurately, the Figure is opposed to an abstract form, which Deleuze believes to be essentially different from the Figure. Abstract form works on the brain, and has a proximity to the bone. This implies an element of durability, even a-temporality, which Deleuze will eventually equate with a form of spirituality that is lacking (and remains absolutely undesired) in the painting of the Figure. It could be argued, however,

that all painting is confronted with the necessity to achieve clarity and durability. The painting of the Figure tries to capture sensation and to give it a certain durability without reducing it to a supra-sensuous, geometric form; the painting of the Form goes beyond the sensuous, and hence also beyond sensation and the forces that generate it, towards a form of durability that is entirely cerebral, or spiritual as Deleuze will say.

Since abstraction is associated with form, it would seem that the Figure will somehow be opposed to form. That, however, is not the case. It can be shown, I think, that Deleuze's concept of sensation in painting is equally concerned with the issue of form. The difference between Figure and abstract Form does not lie in their denial or approval of form, but in the different kinds of form they are concerned with. According to Deleuze, the Figure is concerned with a sensible form that will render sensation visible. Although sensation is direct and immediate, it is not spontaneous; it is intense, but not sensational. The intensity developed by a sensation is not of the order of the shocking, although it does give a violent jolt to our senses. And although sensations act upon the body, they are not located solely in the body. As Deleuze explains, the sensation occurs in between the object from which it originates and the body in which it takes effect:

> Sensation has one face turned toward the subject (the nervous system, vital movement, 'instinct', 'temperament' – a whole vocabulary common to both Naturalism and Cézanne) and one face turned toward the object (the 'fact,' the place, the event). Or rather, it has no faces at all, it is both things indissolubly, it is Being-in-the-World, as the phenomenologists say: at one and the same time I *become* in the sensation and something *happens* through the sensation, one through the other, one in the other. (Deleuze 2003: 34–5/39)

But for a sensation to take effect in painting it needs a form. For this reason Deleuze never talks about a painting of sensation but rather of a painting of the Figure. The Figure is the way in which a sensation is shaped or given form in painting; it is 'the sensible form related to a sensation' (Deleuze 2003: 34/39). The implication of this statement is that sensation, in order to garner effect and thus become what it truly intends to be, needs to be given shape; it needs a form.

At this point a brief detour into Cézanne's critique of impressionism, to which Deleuze repeatedly refers, will be instructive. According to Deleuze, Cézanne is the painter who gave the 'way of sensation in painting . . . an unprecedented status' (Deleuze 2003: 34/39). The reason why, for Deleuze, a painting of the Figure begins with Cézanne and

not, as is commonly argued in theories of modernist painting, with impressionism, has to do with the fact that the impressionists where unable to give sensation its necessary form.[2] Despite the fact that Claude Monet was one of the only living painters of his time he truly admired (Cézanne 1976: 291, 298), Cézanne criticised impressionism for its lack of 'duration and clarity' (Deleuze 2003: 112/106). According to Deleuze, Cézanne feels that the impressionists have 'remained at a confused state of sensation through their treatment of colour, and... the best of them, like Monet... have remained in an ephemeral state' (Deleuze 2003: 187/106). Sensation is therefore not simply colour. Although the use of colour will play a pivotal role in developing the Figure in painting, the use of colour alone is not a sufficient condition for its emergence. Hence the necessity of the Figure, which creates an order and a form through which sensation can emerge. In response to the question: 'What is your favourite colour?', Cézanne replied: 'General harmony' (Cézanne 2001: 101). For Cézanne there is no such thing as a single colour when it comes to sensation. Every colour has to be coordinated by a more general harmony between colours which gives them their intensity and beauty. This is precisely the argument Lawrence Gowing makes in his article 'The Logic of Organised Sensations', on which Deleuze extensively relies in his interpretation of Cézanne: 'For Cézanne the intrinsic reality of painting was not only the sense of colour that was inborn and confirmed from nature; it resided in the logic, the organisation, and the classification, which the sense of colour was subjected to'[3] (Gowing 1977: 63). In this respect, Deleuze has good reasons for signalling Cézanne as the starting point of a painting of the Figure. As Denis puts it, Cézanne's

> formulas are luminous, concise, and never abstract... He never comprises with abstraction the perfect balance between nature and style. All his labour consists of preserving the sensation. This sensation includes the identity of colour and of form, but his sensibility implies his style.[4] (Denis 2001: 178)

For sensation to become visible it needs a durability and clarity that can only be achieved by the Figure. Cézanne succeeds in his endeavour through a different use of geometric forms. He does not reduce them to their geometrical essence, but partly erases them and partly enhances them by use of contour and line. This allows for the colour to come out, for one colour to submerge into another without them blending into each other and becoming indistinct.[5]

From there, Deleuze argues, a painting of the Figure develops. It is characterised by an essentially different use of geometrical forms from

the one we find in a painting of the Form. By extension, the use of form is essentially different in these two traditions in modernist painting. The fact that Deleuze openly prefers a painting of the Figure does not necessarily imply that he is against form. As I argued above, the Figure itself is a form; it gives shape to sensation. But saying this does imply that Deleuze distinguishes between two different sorts of form. As Anne Sauvagnargues confirms in *Deleuze et l'art*, in Deleuze's aesthetics art is less concerned with 'repudiating form than it is with proposing a new conception of it as a material and sensory form, variable and intensive, and not as a given and abstract form' (Sauvagnargues 2005: 69).

Both abstract painting and a painting of the Figure confront chaos and attempt to overcome it, to catch its rhythms and forces, to give shape to them and generate counter-forces that will render sensation visible. Abstract painting, Deleuze argues, achieves this by reaching for what lies beyond and above chaos, what transcends and escapes it. It approaches chaos as something that needs to be undone, as 'a simple stream we must cross in order to discover the abstract and signifying Forms' (Deleuze 2003: 103/96). Abstraction 'offers us an asceticism, a spiritual salvation' (Deleuze 2003: 103/96). To achieve this spiritual level, abstract art must undertake a formal procedure or operation that is essentially different from that of a painting of sensation. Instead of heightening the sensuous to tap into the forces that form the basis of sensation – thus essentially affirming the chaos that Deleuze talks about – a painting of the Form works with the methods of reduction and minimisation. It reaches a spiritual level by interiorising all the sensuous, haptic and tactile elements that are central to the painting of the Figure. For this reason Deleuze sees an essential difference between a painting of the Form and a painting of the Figure. Whereas the painting of the Figure works on a tactile and haptic plane, abstract painting creates a new, purely optical space by interiorising the haptic qualities. This 'abstract optical space has no need of the tactile connections that classical representation was still organising' (Deleuze 2003: 103–4/97).

For Deleuze, this difference between haptic and optical space is motivated by yet another crucial distinction between a painting of the Figure and a painting of the Form: the difference between diagram and code. A painting of the Figure, he argues, starts from the aleatory marks and traits that the hand makes on the canvas. From these random marks a diagram emerges that will structure the painting. Deleuze defines the diagram as 'the operative set of asignifying and nonrepresentative lines and zones, line-strokes and colour-patches' (Deleuze 2003: 101/95). Since the painting will be built around the diagram, which itself is the

result of a contingent manual and tactile intervention, it will never loose touch with the haptic and tactile features that irreducibly belong to sensation. The diagram is both 'a chaos, a catastrophe' and 'a germ of order or rhythm' (Deleuze 2003: 102/95). For this reason a painting of the Figure will always be based on the diagram.

The abstract Form, by contrast, works with codes instead of diagrams. Deleuze defines the code as symbolic and digital. It is symbolic in the sense that the use of codes gives certain meanings to forms or colours in painting that are otherwise extrinsic to it; it is digital in the sense that the code groups together oppositions between forms. 'Abstract art', he writes, 'obviously proceeds by code and program, implying operations of homogenization and binarization that are constitutive for a digital code' (Deleuze 2003: 117/110). Here we can see how radically different the Figure is from the Form in Deleuze's interpretation. Whereas the diagram starts from a manual and tactile intervention that is asignifying whilst also structuring the picture plane, the code remains strictly conceptual and is significant, symbolic even. Codes have no material or tactile quality, but do carry symbolic significance. As such, coding loses all connection to sensation and the sensuous. It will operate on a purely cerebral level without any direct connection to the materiality of painting.

The problem with Deleuze's distinction between Form and Figure, as I see it, is not only that it seems difficult to defend it from a historical point of view. On a more conceptual level, the continuous collapse of this distinction seems to me a more accurate definition of modernist painting. The struggle to give shape to sensation, which means to give it a certain durability and clarity, has as its two extremes the colourist obsession and the geometrical obsession. In the first case, as Deleuze argues by means of Cézanne, sensation disappears because it lacks a form. In the second case, I would argue, we are not confronted with an essentially different use of form, or with a form of painting that works on a different, more cerebral level than does the painting of the Figure; instead, it makes more sense to talk about a tendency to hyperformalise sensation while retaining its dynamic. If successful, this will not lead to the development of a painting of the Form that is purely geometrical, interiorised, coded and spiritual. Its relation to the materiality of painting is just as real and tactile as that of a painting of the Figure. This, I submit, is what is at stake in Theo van Doesburg's thoroughly abstract and geometrical compositions and counter-compositions. Admittedly, it is also the dynamic nature of his work that would lead to the clash between van Doesburg and Piet Mondrian in 1924. The case of van Doesburg

is therefore somewhat different from Mondrian, who functions as the main protagonist for Deleuze's understanding of a painting of the Form. Still, in Theo van Doesburg we have a clear example of what Deleuze is referring to when he talks about a painting of Form: a purified, spiritual, formal and geometrical form of abstract painting that seems to erase all tactile and haptic aspects of painting. To maintain the distinction between Form and Figure would thus require us to demonstrate the formal differences between Theo van Doesburg's work and that of Cézanne or Bacon. In other words, we would need to be able to show that with Cézanne there begins a kind of painting that has no formal similarity to the painting of the Form that van Doesburg and De Stijl were concerned with. However, the formal similarities between the two are very real and even delineate the principles of modernist art. The operations undertaken by both Cézanne and van Doesburg are in many ways more alike and interrelated than would appear from the end product of their work. The mediator between these two was cubism.

Both Bacon and van Doesburg were influenced by the formal operations of analytical cubism, which in its turn was inspired by Cézanne's late work. Van Doesburg's *Composition VIII (The Cow)* (1918) is a clear example of abstract painting. The preliminary sketches he made allow us understand how he reached the abstract composition of this work.[6] The first sketches are mostly made with charcoal and represent a cow at pasture. After reducing the shape of the cow to diagonals, horizontals and verticals, van Doesburg leaves out the diagonals, in order to reach an entirely abstract composition made up out of large and smaller rectangles. The way van Doesburg decomposes the visual field and reduces it to a set of squares and rectangles – an operation he undertakes to escape narrativity and figuration – clearly shows the influence of analytical cubism on his work. Van Doesburg merely takes these formal procedures to the extreme. Like analytical cubism, the abstract composition is premised on the use of predominantly horizontal and vertical lines; yet unlike analytical cubism these are further reduced to primary shapes that no longer represent anything, such that the illusion of depth is cancelled. The sparse use of diagonal lines in analytical cubism is ruled out entirely in van Doesburg's work. But even though the cow itself is no longer recognisable, the essence of *Composition VIII (The Cow)* does not lie in the straightforward extraction of 'geometric form from representation' as Deleuze suggests (Deleuze 2003: 46/48). It is the dynamic interplay between the oblong shapes that is essential to the painting. This is perhaps most notable in the interaction between the smaller rectangles in

the lower right corner of the painting and the larger yellow square in the centre. The passage from the yellow square (and hence from the centre of the painting) to these smaller ones on the side is made via a slender black rectangle. Wandering from the centre to the right side of the painting, we are caught by a downward movement; our vision is literally pulled downwards, much in the same way as in the downward movement that Deleuze ascribes to the sensation. 'The fall is what is most alive in sensation, that through which sensation is experienced as living' (Deleuze 2003: 82/79). *Composition VIII (The Cow)* grapples with the same downward movement or fall that Deleuze attributes to sensation. If the Figure is able to grasp the force of sensation by giving it a form with which a counter-force can then begin to interact, then the painting of the Form is also able to catch something of the dynamic that is at play here by drawing from the same formal language as the painting of the Figure does. The downward movement that we experience captures the forces centred around the muscular neck of the cow at pasture. In that sense the essence of van Doesburg's painting is not the geometrical form but the dynamic movement generated between these forms. Van Doesburg's *Composition VIII (The Cow)* is a hyperformalisation of sensation.

This is not to say that there are no differences in approach between formal abstraction such as exerted by the representatives of De Stijl and the work of Francis Bacon. Van Doesburg's work is paradigmatic for the road to abstraction, and hence for a painting of the Form. But like Cézanne, and like Bacon after him, his work is struggling to render visible some of the forces of sensation. The geometrical reductionism of van Doesburg's work does not automatically place him on the side of the spiritual as opposed to the tactile or manual; and the claim, made by Deleuze, that abstract art interiorises 'in the visual the manual movement that describes the form and the invisible forces that determine it' (Deleuze 2003: 103/97) does not necessarily entail that it needs to code these forms. In the case of van Doesburg, and increasingly so when he moves on to his so-called counter-compositions in the 1920s, the dynamic tendency of his work is not a matter of code or symbolic meaning attached to colours or to specific compositional features, but can be experienced in the painting itself. The opposition between a dynamic and abstract transformation of the form, according to which Deleuze distinguishes between two paths in modern painting, is therefore difficult to defend in this case.[7] In that sense I see a more important connection between Cézanne's painting of the Figure and van Doesburg's painting of Form. Both try to capture sensation through the interplay between form and force; and both were concerned with the

interaction between a force that is given form by what Deleuze calls the Figure and a counter-force that is enacted by this process of giving form to sensation. Cézanne's painting of the Figure is simply mediated, and eventually pushed towards the Form, by analytical cubism, and later by van Doesburg's counter-compositions.

But to understand how form plays a predominant role in the articulation of sensation in modernist painting, up to the point that an essentialist stance on the distinction between Form and Figure becomes problematic, we need to grasp how Francis Bacon's work was deeply influenced by the formal procedures of analytical cubism as well. Several critics have analysed how Bacon's earlier works are deeply influenced by Picasso and synthetic cubism.[8] But the influence of analytical cubism, and even the return to some of the roots of cubism, is most obvious in Bacon's work from the 1960s and 1970s. When we compare a work such as *Three Studies of a Human Head* (1953) with the self-portraits he made in the 1970s, it is clear that the use of forms in the latter is quite openly derived from (early) analytical cubism.[9] The Figure, which Deleuze has defined as the form of sensation, needs to take its formal features from somewhere. As a result, the historical development of modern painting and its struggle with form becomes an irreducible element of a theory of the Figure. Deleuze centres his analysis largely around the use of the diagram, which emerges from the 'irrational, involuntary, accidental, free, random' traits and marks that Bacon makes on the canvas (Deleuze 2003: 100/94). Deleuze thereby stresses the inchoate and a-formal potential of modernist art. Yet what is attractive about the use of such accidental marks and traits, I would argue, is that they exemplify the contingency of modernist painting; that is to say, they enact the struggle between the contingent articulation of structure and the unavoidability of form and shape in this process. Contingent marks and aleatory traits are what modernist art both battles against (for example, in the case of Theo van Doesburg) and lives off (for example, in the case of Jackson Pollock). These traits, which are the clear marks of contingency that are so befitting to modern painting and its particular use of form, certainly take on a powerful presence in Bacon's later work. But it is difficult to argue, I believe, that the diagram that evolves from these aleatory marks and traits is what structures and shapes the canvas, uniting in itself the divergent rhythms that are set to work by sensation. A more consistent use of forms, derived from cubism, plays an equally important role in structuring Bacon's paintings.

Bacon himself acknowledges this in his conversations with David Sylvester, when he talks about his fascination for the later works of

analytical cubism (1912–13). What fascinates him in these later works is not so much the level of abstraction they achieve as the chaos and contingency that is articulated in their formal compositions. '[W]ith early analytical cubism', Bacon explains, 'you can just literally see the town on a hill and all that kind of thing – they've just been cubed up. But perhaps in the later ones Picasso knew what he wanted to do but didn't know how to bring it about' (Bacon and Sylvester 1975: 102). Bacon's work from the 1970s can be interpreted as an attempt to bring about what he feels Picasso seems to have wanted. As I argued above, Deleuze takes these marks and traits to be the points of departure for the diagrams that structure Bacon's paintings. Yet it should be noted that they are always intricately related to the cubist heritage of deforming and recomposing shapes. If anything, this exemplifies the inextricability of the formal and the sensuous, of Form and Figure, in modernist painting. To illustrate this formal influence one could compare Georges Braque's *Large Nude* (1908) with the central panel of Bacon's *Three Studies of Figures on Beds* (1978).[10] Ostensibly, and as has been remarked by numerous critics, this figure is based on a photo from Eadweard J. Muybridge of two men wrestling (Muybridge 1979). But the influence of Braque's *Large Nude* seems to me of equal importance in the specific form this recurring figure takes in Bacon's later work. In the case of *Large Nude* we see a woman standing upwards, whereas in the central panel of *Three Studies of Figures on Beds* we see a figure lying on the bed. But if we look beyond the upright and horizontal position (for example by tilting *Large Nude*) then it becomes clear that the shape and deformation of both figures shows an almost uncanny resemblance. The use of dark contours in both paintings is striking, as is the tendency to restructure and transform the shape of the leg and buttocks. The flesh that Deleuze singles out as central to Bacon's work is only brought out by the use of these forms. They give the rather undefined shape of the leg and buttocks in Muybridge's photo the necessary contour and materiality. It is this shaping of the body, as inspired by Braque, that gives form to sensation, that is to say that creates the Figure.

The aim of sorting out these influences on Bacon's work is of course not to decide which source was of greater inspiration, but to understand the intricate relation between sensation and form in modernist painting. *Large Nude*, which should be regarded as one of the first cubist paintings, provides a solution to the problem of modern painting: how to give form to sensation, and how to escape the necessity of form? Its solution follows in the line of Cézanne. It is, precisely, the solution to the problem of sensation *and* form. This answer, which Cézanne came

up with in his later work when he believed he had discovered the law of general harmony, is further developed in cubism and is eventually taken to the extreme in Theo van Doesburg's work, in which form is fully affirmed. The question of modernist art is indeed how to liberate the Figure from all forms of figuration (Deleuze 2003: 11/19). But since it is clear that this cannot be done without the use of form, the question becomes how to use form while battling against the essentialism of form.

The problem that Braque is grappling with, and for which he develops cubism as a solution, is precisely the problem that motivated Cézanne's work. Or, as William Rubin argues in his famous article 'Cézannisme and the Beginnings of Cubism', 'what Braque described as "a materialization of a new space – making space as actual, as concrete and as perceivable pictorially as the objects themselves" – was, in effect, the explicit articulation and radicalization of a Cézannian idea' (Rubin 1977: 169). The 'radicalization' to which he refers can be seen in the development of contour and line. This problem concerns the question of how to create a visual plane in which the colours are vibrant so that sensation comes across, yet without these colours becoming blurry and indistinct. Indeed, this goes back to Cézanne's criticism of impressionism, to which Deleuze repeatedly refers. What should be clear by now is that the critique Cézanne directed against the impressionists ultimately concerns their lack of form. For a sensation to become visible it needs a form, that is to say a Figure, that is to say a form, that is to say a continuous collapse between the two.

Notes

1. The first page number in the references refers to the English edition, while the second refers to the French edition.
2. This is where Deleuze's approach to modernist painting differs prominently from other canonical modernist critics such as Clement Greenberg, for whom impressionism marks the beginning of modernist painting. According to Greenberg, 'unique to Western pictorial art are, over and beyond the logical consequences to which it pushed naturalism, certain decorative, structural and delineatory principles. As far as these are concerned, the Impressionists remain more revolutionary than Cézanne, the Cubists or Mondrian, appearances to the contrary notwithstanding' (Greenberg 1993: 13–14). As a result, although he distinguishes between a painterly and a non-painterly tradition in modernist art, Greenberg is unwilling to distinguish between two essentially different traditions in the development of modernist painting. This marks another important difference between Deleuze and Greenberg. For a detailed comparison of these two and the birth of modernism, see Zepke 2005: 175–81.
3. As will be clear, the subtitle of *Francis Bacon: The Logic of Sensation* is a reference to Gowing's article.

4. Deleuze alludes to this quote by Maurice Denis when he talks about the different use of geometrical forms in Cézanne's work (Deleuze 2003: 187/107).
5. This is Cézanne's so-called use of *passages* in his later work. The term was coined by André Lhote (1956) and taken up by influential Cézanne scholars such as Erle Loran and William Rubin. A cogent definition of the passages technique and its effect on Cézanne's compositions is provided by Loran: 'It is an integrating factor of organisation contributing to the unity of positive and negative spaces and to the total balance of deep space in relation to the two-dimensionality of the picture plane' (Loran 1963: 132).
6. With the exception of two early sketches (which belong to the Centraal Museum, Utrecht) all of the preliminary sketches, as well as *Composition VIII (The Cow)*, are in the collection of the MOMA, New York. Reprints can be found in van Doesburg 2000: 215–18.
7. For the distinction between dynamic and geometric, see Deleuze 2003: 59/59.
8. See for example Berggruen 2004. Deleuze also mentions the influence of synthetic cubism on the development Bacon's work, but makes no mention of early and analytical cubism (Deleuze 2003: 119/112).
9. For an extensive overview of Bacon's portraits and self-portraits, see Borel 1996.
10. Braque's *Large Nude* is displayed at the Musée national d'art moderne, Centre Pompidou; Bacon's *Three Studies of Figures on Bed* is in a private collection. For a reproduction of Bacon's painting see Ades and Forge 1980.

When Caged Birds Sing: The Many-folded Subject in the Baroque World of Heian Japanese Women's Writing

Christina Houen Curtin University, Western Australia

Abstract

In this article, the world of Heian women's literature is interpreted through Deleuzian concepts of desire and becoming and figures of the rhizome, the Baroque fold and origami, supported by Elizabeth Grosz's concept of art as originating in the impulse to seduction. Within the constraints of movement, dress and behaviour imposed by a polygamous hierarchical court society, Heian women created a rich body of literature that celebrated and subtly critiqued their world. Through aesthetic intensification of form and imagination within a labyrinthine cloistered society, they folded their fictional and autobiographical subjectivities into intricate patterns of desire. The richly described and imagined world of their fictional and confessional literature, still read, translated and transformed into other art forms, celebrates the freedom of the imagination even in confined and controlled circumstances.

Keywords: Elizabeth Grosz, Heian Japanese women, life writing, rhizome, subjectivity, desire

I. Introduction

A body of literature created by women in the mid-Heian period of Japan (late tenth through the eleventh centuries AD) is here visited through a Deleuzian looking-glass. This writing includes poetic diaries

Deleuze Studies 5.1 (2011): 97–117

and long prose romance or *monogatari*. Heian women's literature is extraordinary, not only in the quality of the writing, but in terms of the circumstances in which it was produced, in a closed aristocratic society ordered by strict patriarchal hierarchy, polygamous marriage and elaborate aesthetic codes of dress, language and behaviour. In a world thus shaped by aesthetic principles and hierarchical codes, desire is folded into a sexuality that is driven by men's serial couplings with passive, cloistered female beauty, and women find their own forms of creative expression through artistic production. Within these constraints, Heian women writers created a rich body of literature that both celebrated and subtly critiqued their world, and that outshone and has outlasted the creative production of Heian men.

> Japanese women were writing poetry in the seventh century, and in the Heian period (794–1185) they were the principal producers of the singular art of fiction called the poem-narrative [*uta mongatari*]. Its masterpiece was *The Tale of Genji* (ca.1010), by the court lady Murasak Shikibu. (Ramirez-Christensen 2001a: 1)

Chinese was the official written language, used by men for 'official records, laws, and proclamations, as well as poetry and diaries' (Ramirez-Christensen 2001b: 51). It was women who developed a literature written in the vernacular, and a significant body of their prose and poetry is extant, still being read and translated. *The Tale of Genji*, arguably the world's first psychological novel, is, as its most recent translator into English, Royall Tyler, says, 'the oldest novel still widely recognised today as a masterpiece'. It has been transformed into other cultural products (opera, movies, plays, dance, modern novels, Kabuki, comic books or *manga*, musical theatre), translated into many languages, and continues to be read and enjoyed a thousand years after it was created (Tyler 2001: xiii). Apart from Tyler's translation, there were two English translations of the *Genji* in the twentieth century, by Arthur Waley (1933) and Edward Seidensticker (1976). Another famous Heian work is Sei Shonagon's *The Pillow Book*, available in translations by Ivan Morris (1967), Richard Bowring (1996), and Meredith McKinney (2006). The durability and transformativity of these and other works and their translations and metamorphoses bear out Grosz's argument that art 'participates in the (political) overcoming of the present and helps bring a new, rich, and resonating future into being' (Grosz 2008: 103).

Grosz's artistic manifesto implies that art is regenerative and transformative, not only by challenging and overcoming the present, but

by connecting the future with the past through the active performance of art and its audience. Life writing (in which I include fictional narratives) re-creates the present and imagines the future by visiting the past, whether our own or that of others. When we visit past worlds, we not only see them through lenses tinted by our present subjectivities and cultural fashions, we return to the present with eyes that see differently, our pupils dilated, letting in more light, allowing us to see shaded corners and views that had been obscured before. So for me – a twenty-first century woman born into the bourgeois world of Australian rural life in the mid-twentieth century – my understanding of what it means to be a woman, of how a woman is folded and how she can unfold and refold herself without destroying the materials she is given to work with, has been transformed by my journey into the looking-glass world of Heian women's writing. I invite you to accompany me on a journey back a thousand years, into a world in many ways the opposite of our 'developed' twenty-first century societies, where you will see reflections in the mirror that may strike you as different or exotic, and yet, when you look closer, bear striking resemblances to familiar folds of self and other.

On the plane of organisation of Heian court life, within the rigid segment of polygamous marriage, attractions and repulsions work themselves out, molar and molecular lines issue from each other, intermingle, entangle and are disrupted by lines of flight. The first volume of the *Genji* opens with a chapter called 'Kiritsubo', translated as 'The Paulownia Pavilion', a palace pavilion that has a paulownia tree in its garden. Here the reigning Emperor installs his favourite wife, known as the Kiritsubo consort. She is 'someone of no very great rank' yet, of 'all His Majesty's Consorts and Intimates, [she] enjoyed exceptional favor' (Tyler 2001: 3). This causes great resentment among his other women, who persecute her until she wastes away and dies. The Emperor's desire creates a rhizomatic connection that crosses the hierarchical lines of favour, upsetting both those women of superior rank and the lesser Intimates. When the son he fathers with Kiritsubo grows into a child of exceptional grace and beauty, the Emperor decides that rather than 'set the boy adrift as an unranked prince, unsupported by any maternal relative', he will have him serve as a commoner, with the name of Genji (Tyler 2001: 13–14). This strategy allows the young man to belong to both the imperial and the common realms, and gives him far more narrative scope as a character, as he is less constrained by official duties and protocols (Tyler 2001: xiii). Genji grows into a romantic hero whose brilliance outshines all other courtiers. He is

married young to Aoi, the daughter of a powerful courtier, but falls in love with his stepmother Fujitsubo, whom the Emperor chooses because of her striking resemblance to the Kiritsubo consort. Genji secretly makes love to Fujitsubo, and their son succeeds to the throne. This, and other lines of flight on Genji's part, disrupt and at times threaten to destroy the molar and molecular lines that make up his existence. At one stage he is forced into exile because of an affair with a daughter of his chief political enemy. But outside of the few official and many unofficial liaisons he forms, he longs for someone 'who can be his alone' (Tyler 2001: xiii). Murasaki, a ten-year-old child when he finds her, looks just like Fujitsubo, whom he still yearns for. He abducts her and brings her up in his household, and when she is old enough he marries her. She remains the love of his life until she dies. He dies broken-hearted not long after her, but in the course of their marriage, he knows many other women. Some of them are annexed into the molar lines of his life and live in the splendid complex, with four interconnecting mansions, he has built to house them; other women whom he pursues are outside or unofficial, anomalous or nomadic connections. The affair of the heart that he has with Murasaki combines all the lines, in that it begins as a line of flight – the abduction of a child who is without adequate protection – and becomes a molecular, private marriage, that is gradually recognised in court circles as a molar, public and honourable connection, though she never achieves the status of principal wife, because of the ambiguity of her origin and lack of powerful parental support.

Deleuze points out that this intermingling of the lines that fix and segment created forms with the lines that destabilise the assemblages and lead to the formation of new ones can lead to repression as much as to freedom:

> To the question 'How can desire desire its own repression, how can desire desire its own slavery?' we reply that the powers which crush desire, or which subjugate it, themselves already form part of assemblages of desire. (Deleuze and Parnet 1987: 133)

The shaping of a self is a process of subjectification that takes place on the material plane of organised forms, where we assume identities, roles, molar or fixed patterns within the assemblages created by desire. In the case of Genji and Murasaki, as we shall see, the lines of segmentation and destabilisation do, indeed, repress and enslave desire; in Genji's case, he is caught between the desire to make more conquests and his great love for Murasaki, who becomes increasingly unhappy and insecure because of the uncertainty of her position. Her plight is a poignant

dramatisation of the situation of women in a polygamous society. As in all patriarchal societies, women are shaped into patterns to conform to men's desire, and their desirability is subject to the erosion of favour and the destructive force of the ageing process.

A partial answer to the problem of the entrapment of desire within the matrix of forces on the plane of organisation is that that we can unfold and refold ourselves into different shapes through recognition of the forces that shape us and conscious manipulation of the forms we are given. We can transcend the given and attain agency by thinking creatively about the reality of our existence. I am not suggesting that Heian women, as they are represented in the literature, were able to exercise a high degree of agency in their daily lives, but that Heian women writers did achieve considerable creative freedom in their practice of the traditional forms of *monogatari* and the poetic diary. In *The Tale of Genji*, we see the *monogatari*, traditionally a romantic tale considered to be beneath men's dignity, developed into a complex narrative woven from many plot strands, with detailed and subtle characterisation and a multi-stranded point of view, shifting between the observing narrator's voice and the voices of male and female characters. Murasaki Shikibu and other writers developed the diary form, using it as a confessional medium as well as a record of the social and cultural life of their time. Both forms are used not only to observe and record but also to reveal the inner life of the personae and to critique the world they lived in. We are passively formed, but as thinking subjects we become active, as Ian Buchanan puts it, through the practices of everyday life (Buchanan 2000: 87). We can access the plane of immanence or desire and become-different. I say it is only a partial answer because change has its dangers, as Deleuze and Guattari frequently point out: if we are not careful always to keep a plot of ground to stand on, and if we do not work prudently to soften, suspend, divert and undermine the stratum, we risk outcomes that may once again entrap us in subjugated positions, or that may be destructive to ourselves and to others (Deleuze and Parnet 1987: 138).

Timothy Murphy argues that Deleuze has taken a line of flight from the dominant phenomenological line of descent of Western philosophy and created his own tradition; his main antecedents are Spinoza and Nietzsche, and his work resonates with the physical sciences (Murphy 1998: 212). Deleuze does not begin with the fact of the thinking subject, as Descartes and Kant do, but sees the subject as a component of energy and matter, produced as 'a complex fold in the infinite surface of times and spaces that, like origami, can be unfolded and refolded into different

shapes' (Murphy 1998: 226). The figure of origami is used by Deleuze to express what he reads as Leibniz's model of the universe: '[t]he model for the sciences of matter is the 'origami', as the Japanese philosopher might say, or the art of folding paper' (Deleuze 1993: 6).

Origami is an art that developed in Japan after the introduction of paper-making from China via Korea in the fifth century AD.[1] Origami's original use is believed to have been as *katashiro*, long chains of folded paper used in purification rituals around temples. Paper was scarce and valuable, and it was during the Heian period, when paper production expanded, that origami was developed as a form of religious and artistic expression and entertainment. The folded paper charms and woven straw streamers that decorated Shinto shrines were intended to shield and purify the sacred space and to contain the wishes of those who served and worshipped there. A Shinto priest who dedicates an offering to God always places a piece of folded white paper under the offerings on the dish. In rites of exorcism, bad spirits are transferred into a human paper doll and thrown into the water or burnt. Origami, therefore, is a practice or poiesis of desire. Folded paper both protects from evil and contains wishes. In the poiesis of desire, the materialisation of energy is potentially both destructive and creative, the two sides of everything. In Deleuze's application of the figure of origami to the universe of created forms, the tension between creativity and destruction – fixed forms, disintegration and re-formation, folding, unfolding and refolding – is elegantly and concisely expressed.

I find the image of the subject as a piece of origami powerful and poetic, in its suggestion of a created, artificial assemblage of desire that can be unfolded and refolded; it aptly describes the world of Heian courtly desire and the literature that celebrates it. Women can be seen as paper folded and refolded in shapes pleasing to the origami maker. This implies that women have no agency in the process. To some extent, this may have been true of medieval court women living in a polygamous hierarchical society. Yet the literature of these women shows that they took an active part in the creation of aesthetic figures of desire in their literature and other art forms and in their practice of daily life, while conforming to the ethical and aesthetic codes of the court. They were, to an extent that is unusual in patriarchal societies, the makers of their own origami.

For Deleuze, a figure closely related to origami is that of the baroque fold. I suggest that Heian life and literature can be interpreted through the style of the baroque, which, as Tom Conley argues, can be seen, not as a capitalised period with a genealogical structure, but as a lower-case

style found in diverse environments and periods of time (Conley 1993: ix–x). Deleuze identifies the central trope of the baroque as the fold – 'the Baroque fold unfurls all the way to infinity' – which can be seen in draperies, dermal surfaces of the body, domestic architecture, the novel, harmonics, philosophies, painting, and more; he compares the two levels of baroque construction, matter and the soul, with a labyrinth, in which the upper level, the soul, has no windows, and there is communication between 'the pleats of matter and the folds in the soul' (Deleuze 1993: 4). The infinite fold, which exists on the plane of immanence, separates or moves between matter and soul. Because it is a virtuality that never stops dividing itself, the line of inflection is actualised in the soul but realised in matter, each one on its own side (Deleuze 1993: 35).

Though some of the qualities associated with the baroque style in music, art and architecture – dynamic movement, exuberance and flamboyance – are not present in Heian creative arts and self-presentation, the qualities of constricted richness and controlled excess in their many-folded labyrinthine architecture, décor and fashion are baroque in the Deleuzian sense, as is the tension between constrained, conventional forms and intricate variations and elaborations (foldings) in ornamentation and expression. The classical formalism and closure of the frames within which men and especially women live in the court world is only apparent, for the screens and masks are permeable and shifting and the characters are self-aware and multi-faceted. Desire, in this universe, is always in excess, always baroque in its form.

The baroque fold of being and becoming links with another term developed by Deleuze and Guattari – assemblage. The French term, *agencement*, is translated as 'putting together', arrangement'; it expresses a process, not a product that is assembled according to a preconceived plan. However, as J. Macgregor Wise points out, it is not a random collection of things, for 'there is a sense that an assemblage is a whole of some sort that expresses some identity and claims a territory' (Macgregor Wise 2005: 77). Heterogeneous elements come together in particular relations that have a certain character and quality; but the key question is not what an assemblage *is* but what it can *do* (Macgregor Wise 2005: 78). In the Heian period in Japan, desire is actualised and assembled in cloistered and veiled female beauty and the built environment and arts of daily life; this is the field in which polygamy plays. The principle of unity, the abstract machine for these formations is the aesthetic quality of desire – a desire which is constructed as active in men and passive in women. In relation to art and culture, however, it is expressed actively by women in literature, calligraphy, style of dress

and self-presentation, music and other arts. Heian Japan drew many of the forms and codes of its culture from classical China, and the Chinese worldview was aesthetic, that is, the shaping of a life was a process of education and refinement according to *Tao*, the patterns of order that are both observed and created in the natural world (Solomon and Higgins 1995: 32–3). The assemblages of desire include clothes, furnishings and artefacts, the rituals and ceremonies of daily life, and the poems and romantic narratives circulated between women and men. These are affective and effective conduits between members of Heian society, vehicles for the flow of shared erotic, ethical and aesthetic experiences of being. The court women are themselves, on one level, assemblages of desire, packaged and constructed to please the men who circulate amongst them, to keep the machinery of desire working. On another level, in their literature and aesthetic life, these women construct their own assemblages of desire, especially in their copying, reading and writing of *monogatari* and poetic diaries. The men also connect with these assemblages. Within the constraints of their screened and masked lives, Heian women express their own desires by constructing a rich, often subversive, culture of ethical and artistic life.

The women whose lives are described in these texts are dressed to conceal and suppress their individuality and embodied selves and manipulated to remain hidden from men's eyes except in strictly defined circumstances and to yield passively to men's desires. Yet, beneath the mask, there is an inner life that can be, variously, passionate, playful, jealous, vengeful, power-seeking, resistant, nostalgic, lamenting, world weary, desirous of enlightenment. The lives lived behind the masks of desire are rich and intense for both men and women. The 'real world' of Heian court life created in literature has stood the test of one thousand years and still speaks vividly to readers today.

The multiplicity of masks of desire in the world of the Heian court can be interpreted in Deleuzian terms as simulacra that are not merely disguises or substitutes for the original or real thing, but have a strong life force of their own, producing the realer-than-real in a proliferating process of creation. In what follows, I will relate the concept of the fold as creative principle and the proliferation of simulacra to Elizabeth Grosz's Irigarayan-Deleuzian-Darwinian exegesis of art as affiliated to the animal force of sexual selection and the non-human, universal, chaotic forces that are exerted on matter, inorganic and organic (Grosz 2008: 101).

The allure of the Heian female body is intensified by the elaborate aesthetic process of enclosure and veiling to which it is subjected. This

intensification is repeated in the arts that surround the many-folded embodied selves of Heian women – the simulacra of music, painting, poetry, incense and romantic narratives. The concept of intensification through aesthetic practice is developed in Grosz's argument that art is generated by the impulse to seduction and produces constricted and intensified forms that materialise erotic energy (Grosz 2005). Art is the way in which life experiments with materiality, or nature, to bring about change (Grosz 2008). Following Luce Irigaray, Grosz grounds her work on the concept of 'the irreducibility of sexual difference', opening feminist theory to 'major ontological questions about matter, force, nature, and the real and to the vast explorations of a politics of difference' (Grosz 2008: ix). Heian women are themselves aesthetic assemblages that actualise cloistered and veiled female beauty. All the Heian cultural products, the most enduring of which is women's literature, are assemblages that actualise Heian aesthetic principles. Within and beyond this artificial and constricted aestheticism of a cloistered culture, Heian women's literature and other artistic creations have a radical energetic function of change and experimentation, contained though it may be. Their art both celebrates and subtly critiques the dominant polygamous hierarchical culture. Women have a more active role than men in the desiring-production of literature, though men have a more dominant and active role in defining and producing the assemblages of sex and love.

II. Eros and Excess in the Heian World

> [For Darwin] natural selection is about survival, and sexual selection . . . is largely about reproduction or about sexual seduction. And what I think is the origin of art, basically, is that impulse to seduction. So I take it that all forms of art are a kind of excessive affection of the body, or an intensification of the body of the kind which is also generated in sexuality. So it's something really fundamentally sexual about art, about all of the arts, even though they're very sublimated. What art is about is the constriction of the materials, so the materials then become aestheticised or pleasurable. The pleasure of those materials has to do with the intensification of the body. So this impulse to art is to not make oneself seductive but to make oneself intense, and in the process to circulate some of that eros that would otherwise go into sexuality. (Grosz 2005: n.p.)

Grosz's comments on art offer an explanation for the excess that we see in the natural world – in the abundance of beauty around us, in colours and textures of flowers and leaves, in plumage and songs of

birds, in shapes and markings of animals and insects – and in the human world, in the arts. The excess of erotic energy in life is constrained by form, transmuted into the materiality of the object, and transmits sensations of pleasure to the viewer. 'I think everything living has this artistic impulse to excess and to the revelry and the pleasure of that excess'; Grosz adds that only some of us have the discipline to impose form on that sensation and thus to give it life as art (Grosz 2005: n.p.). The literature of the Heian period depicts a leisured aristocratic society regulated primarily by aesthetic principles. In the small and select society of the Heian court circles, art is a way of life; men and women have the leisure and the means to celebrate the excess of erotic energy in the forms of poetry, romantic tales, music, dance, dress, incense, calligraphy. There are differences in the ways men and women express this excess, determined by the hierarchical, binary and asymmetrical structures of social and sexual life. Men orchestrate and perform displays and contests of music, dance, painting and poetry; women watch from behind screens. In general, women's artistic performances of music, poetry and *monogatari* are enacted in more secluded scenes, with female attendants present and sometimes (outside curtains) male admirers and visitors listening or exchanging poems and conversation through the media of screens and attendants.

The Heian period in Japan takes its name from the then capital, Heian-kyo, now the city of Kyoto. Heian Japan in the tenth century enjoyed political stability and advanced culture in a time when, as Ivan Morris puts it, much of Western Europe was experiencing 'one of the bleaker periods of cultural history' (Morris 1979: 12). In the seventh and eighth centuries, Japanese culture had developed under Chinese influence, but official embassies to China had ceased in 894 (Morris 1979: 20). In the Heian period, the wealth of the aristocracy came from large provincial estates held by absentee landlords. By mid-Heian times, the head of the realm, the Emperor, had only priestly and cultural functions. Real power was wielded by the northern branch of the Fujiwara family. Esperanza Ramirez-Christensen argues that the autobiographical turn in Heian women's literature, the 'quest for the self and the meaning of a life' that women's memoirs reveal, was engendered by a major loss of power and status when they were excluded in the main from holding positions in the local and central governing structures established by the *ritsuryo* legal reforms in the mid-seventh century (Ramirez-Christensen 2001b: 51).

Prior to these 'reforms', there had been a degree of equality in sexual relationships and property ownership, and the social structure was matrilineal and matrilocal. One of the *ritsuryo* changes was to identify the

male as the head of the household, even though women retained the right to own and administer property, and it was customary for a woman to live with her parents after marriage, and for her partner to visit or to reside with her family. Although the *ritsuryo* codes provided penalties for bigamy (Seidensticker 1973: 19), polygamy and the exclusion of women from public office were the norm in the Heian period, and women's dependency on men increased (Ramirez-Christensen 2001b: 52).

In the Heian period, women had only secondary status, and were confined to women's apartments behind screens, blinds and curtains and within many-layered garments (Ramirez-Christensen 2001b: 53). At the political and economic level, a daughter was 'a resource for the betterment or at least the maintenance of her father's position' (Ramirez-Christensen 2001b: 53). The ambition of a Fujiwara patriarch was to have his daughter chosen as imperial consort, so that he could be the father-in-law and ultimately the grandfather of the reigning sovereign. The policy was for emperors to abdicate early so that the father-in-law would become regent, and, when his grandson came of age, chancellor (Morris 1979: 65). Court society was based on a rigid system of grades, marked by the colours of the robes worn; rank was not determined by merit, as in classical China, but by a hierarchical network of favour and political power. It was an endogamous group of no more than two thousand individuals who were almost all related to each other, uninterested in everyone outside their own circle and sensitive in judging the social level of each member of the group (Morris 1979: 78–81). There was a hierarchy of consorts to the Emperor, from the principal wife down to the attendants who were recipients of the Emperor's casual attentions. The Emperor and his consorts were attended by women of the middle ranks of the aristocracy, the *zuryo*, from which came the provincial governors and the scholar-poets (Okada 1991: 171). These women had access to scholarship and were trained in all the arts of courtly life: poetry, painting, music, calligraphy, incense-making. 'Women's hand' (*onna-de*) was written in the vernacular, and 'male letters' in Chinese; men had access to both forms of writing, but *onna-de* was the only recognised form of writing for women (Moriyuki 2001: 244). It is from this educated group that the two most famous women writers of the period, Murasaki Shikibu and Sei Shonagon, emerged, along with several other women whose diaries and poetry are still extant.

The model of beauty for both males and females was a round white face, minute mouth, slits of eyes, and for a man, a tuft of beard at the point of the chin (Morris 1979: 156). Hair, especially for women, was a most important feature; women's hair was desired to be thick and

glossy, and reach the ground by the time they were mature. Eyebrows were plucked and women's teeth were blackened. Bodies were veiled in robes of at least twelve thin unlined silk layers, the patterns and colours of which were carefully blended. To show this blending to the best advantage, each sleeve was worn longer as it came closer to the skin (Morris 1979: 215–6).

The unveiled body was not pleasing to Heian men and women and was not regarded as an aesthetic or erotic object. In her diary, Murasaki describes a scene where two maids of honour are robbed of their clothes in the middle of the night; pandemonium reigns, and when order is restored, Murasaki describes the experience of witnessing their humiliation as 'dreadful' and the memory as frightening, though it had its 'amusing side' (Murasaki 1996: 45). As Grosz points out, the devotion of intense aesthetic effort to the veiling of the body is an erotic intensification of the body – in this culture, what is hidden or glimpsed is mysterious and alluring, while what is open and to view is unattractive and distasteful.

The style of Heian life as depicted in the literature is baroque; the excess of erotic energy is captured, controlled, constricted – aestheticised – in artistic forms, where matter is intricately folded like origami. The architecture of the Heian period is flexible, with boundaries that are flimsy and insubstantial. Wooden walls divide inner space from outer, but these are mostly removable screens, and behind are layers of blinds and curtains. Permeable boundaries are also a feature of inside space, yet there is a strong focus on the positioning of people, reflecting the 'cultural obsession with hierarchy and status' (Bowring 1996: xxvi–xvii). How does this architecture of daily life express the fold? The many screens are another layer of folding, and the maze of partitioned rooms forms a labyrinth designed to conceal and protect what is valued, cultivated and pursued – beauty and high rank. Valued individuals are surrounded by attendants of lesser rank who provide further layers of protection and concealment, though they also act as intermediaries between the inner and the outer – the female object of desire and the desiring male subject, or the holders of high rank and those who seek their favour. For instance, when the Rokujo Haven – a mature lady whom Genji has courted but more recently slighted – retreats to the Ise shrine with her daughter, who has been appointed priestess there, Genji, excited by her new inaccessibility, sends letters pleading for an audience. She agrees to receive him behind screens, but at first uses her attendants to converse with him. He protests:

> His appeal moved her women to intercede for him with their mistress. 'Yes, my lady,' they said, 'It is a shame to leave him just standing there; one must feel sorry for him.'
>
> Oh dear, she thought, I do not like the spectacle I am making – he can hardly think well of me for it; I would much rather not go out to him at all. She did not have the courage to treat him coldly, though, and at last she emerged amid reluctant sighs, delighting him with the grace of her form. (Tyler 2001: 194)

Tyler has a note here explaining that they were still separated by a blind, and Genji sees her silhouette through it. There are screens behind screens, many layers of veiling. In Heian architecture, decor, lived interior space and clothing, the labyrinth is horizontally rather than vertically arranged. Deleuze describes the quintessential baroque costume as 'broad, in distending waves, billowing and flaring, surrounding the body with its independent folds, ever-multiplying, never betraying those of the body beneath' (Deleuze 1993: 121). This is a perfect description of Heian costumes and the architecture that contains the heavily veiled and adorned human figures.

Deleuze says that 'the Baroque fold unfurls all the way to infinity', and he compares the two levels, matter and the soul, with a labyrinth (Deleuze 1993: 3). The upper level (or inner, to continue the horizontal translation) is the soul and has no windows, and the lower or outer level is matter; this differentiation encloses an entanglement of the two, and is reflected in baroque architecture: '[t]he infinite fold separates or moves between matter and soul' (Deleuze 1993: 35). The architectural metaphor applies also to subjectification. According to Conley, 'Deleuze suggests that the upper room and its folded furnishings become the imaginary space where subjectivation can be realized'; through thinking, we have agency of the self, 'doubling the outside with a coextensive inside' (Conley 1993: 176). I suggest that the elaborate outer layers of material and aesthetic folding that contain and conceal the Heian women as objects of desire intensify not only the pleasurable eroticism of their being, but the inner imaginary space where they fold themselves, from which new aesthetic-erotic-poetic becomings emerge. When everyday life is secluded, constricted and intensified, the imagination finds ways to 'temporise', to escape to other levels of reality. Temporising is a concept developed by Drusilla Modjeska in her essay, 'Writing *Poppy*'; it is a psychological manoeuvre that allows the subject to play with time, to slip into other time frames, to tell stories 'as a way of coaxing life into more controllable possibilities' (Modjeska 2002: 75). As A. S. Byatt, the English novelist, says: 'It's not nice not to be writing a book. It's not nice

not to have a more real world than the real world we inhabit' (Byatt 2005, n.p.). The caged bird sings sweetly, sometimes more so than its wild relatives. Many great books have been written in prison.

In Deleuzian-Leibnizian terms, the material folding of masks or layers is a labyrinth that both conceals and expresses, protects and actualises, solidifies and dissolves the hidden self. The solid fixed forms of material life are constantly being destabilised and re-formed by molecular lines of rhizomatic disconnection and connection and nomadic lines of flight. This instability is reflected in shifting points of view and the self-awareness of the personae we encounter in the literature. The screens that create the illusion of a secret inaccessible world are unstable, permeable and unreliable, and there is a constant unfolding and refolding of self and outward expression. The fluidity of the point of view is reflected in the structure of the narrative in *The Tale of Genji*, which folds, unfolds and refolds stories within stories, pulls back screens and curtains to reveal the inner lives of the inhabitants, and creates a *mise-en-abîme* of worlds within worlds: the outer world of the court, fixed in arborescent lines of power and influence and dominated by the male hierarchy, but criss-crossed by molecular lines of desire and subversion, such as Genji's amatory adventures and transgressions; the secret world of the interiors, constructed by men to contain their women, who entertain themselves, when they are not entertaining their admirers and engaging in family life, by reading, copying and telling stories of romance and betrayal and unsatisfied desire; and the deeper levels of secret thoughts and desires of the women and men who are caught in the webs of desire and power. The narrative is itself labyrinthine, convoluted, with layer upon layer of story created to divert and entertain the courtly audience, performing a subtle and sustained discovery and critique of desire in a rigidly hierarchical patriarchal world. The origami of the narrative is intricately folded and refolded, changing and flowing into new forms that repeat the themes of desire in multiple and different shapes.

Sexual desire in Heian court life – constructed around men's repetition of seduction and the pursuit of novelty in new/different embodied female selves – is baroque in its expression. The baroque comes from the creative tension between the old and the new, the familiar and the unfamiliar, the conventional stereotypical behaviour or artistic erotic expression and the new/different female object or modulations of affective experience. What is produced from the erotic excess that generates this creative tension is a proliferating series of simulacra, artefacts of desire in poetry, prose, music, dance, food, incense. For instance, when a man 'marries' a

woman by calling on her for three nights running and sending her a love letter after each visit, he celebrates and ritualises the union with a gift of special white rice cakes. When Genji lies with 15-year-old Murasaki as his bride for the third night, the cakes he has ordered are delivered:

> The gentlewomen knew nothing of all this, but when Genji had the box removed early the next morning, those closest to their mistress understood what had happened. . . . The little carved stands were so delicate and the cakes themselves so beautifully made – it was all as pretty as could be. (Tyler 2001: 168)

Women, too, are artefacts, assemblages or simulacra, whose carefully constructed individuality is expressed in the nuances of shading and layering in their clothing, the length, thickness and fall of their hair, the intonation and pitch of their voices, the elegance and character of their handwriting, their skill in turning an occasion into a poetic phrase with rich allusions, their grace, modesty and charm of posture. Again, the baroque energy comes from the marriage of the conventional with the individual embodiment of desire. For instance, when Genji visits Tamakazura, a young motherless woman he has 'adopted' as a daughter, in the west wing of his mansion, he is struck by how stylishly she has settled in there:

> Her brilliance banished every shadow until all was light and loveliness, and one wished only to gaze at her. Her hair thinned out somewhat toward the ends, perhaps because of the trials she had suffered, and it fell with a beautiful, clean grace. She was in all ways so striking that Genji keenly appreciated what he would have missed if he had not known her, and he also understood how little he would be able to let her go. Although accustomed to being with him this way, face-to-face, she felt on reflection that many matters still came between them, matters sufficiently awkward to give her manner a delightful reticence. (Tyler 2001: 433)

Her brilliance comes from the combination of the expected and the unexpected; she is dressed in kerria rose, a conventional layering of colours, and her hair, though thin at the ends, falls gracefully. Hair is admired for thickness and glossiness, but in her case, the thinned ends suggest youthful maturity and the triumph of beauty over suffering. Her reticence, a conventional quality of Heian femininity, makes her all the more alluring. She is a conventional young lady, but what makes the situation unconventional, risky and erotically exciting for Genji, is her ambiguous position as his adopted daughter, courted by other men, and her resistance to his charms. Within the subtle variations of beauty there is a high degree of similarity; Heian court women are different yet they

reflect each other, and their attraction lies in both registers – difference and repetition.

Both Norma Field and Richard Okada have argued that surrogacy is a driving force in the Heian court, as depicted by Murasaki Shikibu. Field says that Lady Murasaki's 'identity depends on what she is not' – not Fujitsubo, not a politically useful wife like Aoi, Genji's first wife, not a mother to Genji's child, like Aoi and the Akashi Lady (Field 1987: 173). Okada says that Genji's substitution of Murasaki for Fujitsubo is a metonymic pattern, 'the constant association serving to console an ultimately unfulfillable desire that nevertheless has been and remains realizable' (Okada 1991: 256). This argument can be misleading because it implies that the individuals in the chain of repetition are inferior copies of the original. This is not borne out by a considered reading of the texts through a Deleuzian lens. The problem with the words 'substitute' and 'surrogate' is the implication of inferiority and lesser status or worth in the repetitions, bringing us back to an essentialist, binary ideology. I find the term simulacra to be more useful, because it bypasses ideas of a hierarchy of value, from the original to the copy, and opens up a rhizomatous proliferation of individuations that are different in themselves. Deleuze rejects the Platonic notion of the simulacrum as a copy of a copy of the model, in a world of identity and order, in favour of a world made up of simulacra, which are different in their own right, not representative of a superior model, and have their own power to act (Roffe 2005: 250).

I acknowledge that in seeing Lady Murasaki and Tamakazura as simulacra rather than surrogates I speak from a Deleuzian perspective that was not imagined in the polygamous hierarchical society of tenth- and eleventh-century Japan, and I evoke from the *Genji* text *my* simulacrum of the subversive female writer, Murasaki Shikibu, who both presents and critiques a binary production of desire in her created world. Though she did not have a concept of simulacra available to her, there is evidence in the text that, beneath the surface appearances of rank and faithfulness to a model of desirability, she saw in her female characters (and in some of the male) a singularity of being, both unique and common, a site of difference and repetition (Conley 2005: 252). This vision is played out in the baroque tension in the *Genji* between principal/original and secondary/new which arises from the criss-crossing and intertwining of binary molar lines of rank and power and changing molecular and nomadic lines of favour and desire. So we have Genji's father the Emperor's preference for the Kiritsubo Lady over his other more powerful wives, and for Genji over his principal

son, and Genji's preference for Lady Murasaki over the principal wives of his youth and of his maturity. The desire for the conventional and acceptable is in tension with the desire for difference and the unexpected, and with the heart's desires, which do not follow molar pathways.

Why is Lady Murasaki more than a mere surrogate? Field traces the theme of surrogacy through the major plot and the minor ones, and interprets Lady Murasaki as 'the substitute realization of a fantasy', whose fate as such 'is to be not only homeless but imprisoned in this world' (Field 1987: 191, 198). In my reading, Lady Murasaki, as she is regarded by Genji and others, transcends the role of substitute through her unparalleled grace, beauty, good taste, loyalty and discretion. These qualities are constantly affirmed and celebrated in the text in the voices of Genji and other characters and in the voice of the narrator. Lady Murasaki achieves a status which, if not exactly that of 'official' wife, is recognised by Genji and by others who come into her sphere as that of a lady without peer. She is, as Tyler points out, designated as 'Tai no Ue', which approximates to: 'the mistress of Genji's household, who lives in the wing (tai) of his residence' (Tyler 2001: xxii). So although her status is defined through Genji, and is secondary to and dependent on his, she is nonetheless a star whose light reflects on those around her – and when she is gone, the shining prince himself does not long survive her. Moreover, from this reader's point of view, she develops into a three-dimensional heroine through her nuanced perceptions of Genji's behaviour and of her situation, and through her struggle to find a way of being that escapes from the prison her life has become.

I read Lady Murasaki's fate in terms other than that of the surrogate who has no 'true identity' of her own compared to the 'ideal' Heian court lady. In a world where all identity (including Genji's) is constructed and contingent on rank, favour and reputation, her decline into ill health and death is the outcome of the conflict between the hero's and the heroine's desire to be true to their love for each other and the hero's subjectification as a polygamous Heian aristocrat bound by the codes, obligations and expectations of court society. This subjectification is reflected in Lady Murasaki's own entrapment in these codes, passively constrained as she is to respect Genji's right to multiple partners, and to wait for him to return to her when he chooses. Her agency is limited by the roles prescribed for her; when the path she seeks as an alternative to that of neglected wife – holy orders – is denied her, she descends into an irreversible decline and dies.

Genji suffers deeply because of the fragile nature of his bond with Lady Murasaki and the transience of worldly pleasure, and he does not survive long after her death because he has no wish to live:

> Very little in this life has really satisfied me, and despite my high birth I always think how much less fortunate my destiny has been than other people's. The Buddha must have wanted me to know that the world slips away from us and plays us false. I, who long set myself to ignore this truth, have suffered in the twilight of my life so awful and so final a blow that I have at last seen the extent of my failings. (Tyler 2001: 768)

Genji's death is a hiatus in the text – he dies between chapters. This may be an accident of the fragmented and corrupted state of the text that survived into the thirteenth century, when two scholars set out to restore it (Tyler 2001: xviii–xix). However, the fact that the reader is denied the narration of Genji's last days has a strangely poetic and haunting effect; his absence casts a shadow over the rest of the narrative: 'His light was gone, and none among his many descendants could compare to what he had been' (Tyler 2001: 785). Both he and his favourite wife are trapped by the codes and conventions of Heian society, and both end their lives tragically, haunted by loss and regret; their fate overshadows the lives and loves of the other characters.

Lady Murasaki's tragic fate can be read as a critique of the polygamous society she and her lover inhabit. Haruo Shirane argues that the *Genji* is a highly wrought work that 'not only transforms plot conventions, established poetic motifs, and contemporary norms, it constantly reworks itself' (Shirane 1987: 151). Shirane explores how the social romance created in the early chapters is undermined and placed in perspective, and finally collapses. In the last part of the tale, which is the focus of Shirane's study, the themes of romance and marriage are 'given a new, and frequently ironic, twist' (Shirane 1987: 152). In her creation of a world more real than the real world she inhabits, Murasaki the author infuses the genre with tension, surprise, irony and tragedy by allowing her characters to deviate from and subvert Heian social and political codes, particularly those relating to marriage. In this way, through the intensification of the artistic process, the author herself attains agency, not in her 'real' life, but in the creation of a more real world through art.

III. Conclusion

Murasaki Shikibu is an artist who observes and mirrors the society she inhabits in a fictional world that is, to the reader, 'more real' than

the historical world of the Heian court, which we can never know except through indirect and fragmented reports, poetic diaries, and its fictionalisation in *monogatari*. *The Tale of Genji* is a complex and many-layered world of the imagination that we can enter as we turn the pages that number 1120 in the Penguin edition of Tyler's translation. Though the court women's diaries of the period give fascinating glimpses of this world, they remain glimpses, written from one point of view, discursive and sometimes fragmented.

The fictional and confessional narratives of Heian court women show the ambiguity of the female desiring self as *other* within the culture of men, outwardly conforming to rituals, representations and rules, yet inwardly resisting and escaping in subtle ways. One of these ways, their reading and writing of *monogatari* and poetic diaries, became, paradoxically, a flowering of cultural life that outshone and has outlived the works and lives of the powerful men who ruled their lives. They used a script, 'woman's hand', that, though it was used by men as well, became the vehicle for women's literature that dramatises Heian vernacular culture so powerfully that it has, as Okada says, 'come to be regarded as a great (if not the greatest) flowering of Japanese culture' (Okada 1991: 28).

The subjectivity of Heian women depicted in their literature is complex and many-folded, as are the costumes, architecture and artistic productions of court life. In the intricate layering of folds that surround them, the bodies and personae of women are erotically intensified. Behind the façades and rituals of their social life, subjectivity is folded from the immanent into the embodied self, and creativity is released from within the imaginary space of the inside into the outside of the material world. In this cloistered culture, the literature of Heian women celebrates the natural and artificial beauty of the world that surrounds them and critiques the codes of polygamy. *The Tale of Genji*, in particular, constructs a world in which women of middle rank are favoured above their higher-ranking rivals; in which the hero himself is of ambiguous birth but outshines all others; and in which the restrictive and repressive effects (especially for women) that are the cost of the liberty and variety enjoyed by men are vividly and poignantly enacted in the complications, losses, disappointments and tragedies of the characters' lives. The politics of difference is subversively and subtly enacted through art in a closed and constricted world. We can enter the looking-glass world of Heian women and be surprised and delighted by the similarities and differences between their lives and ours, and be inspired by the triumph of art, which, in experimenting with the

materiality of nature and culture, overcomes the present and imagines the possibility of a different future.

Note

1. My information on the art of origami and its meaning is derived primarily from conversations with Kosuke Araki, a maker of Japanese TV documentaries, now living in Australia. His special area of research is the lesser-known history of early Japan. I have supplemented this with information from www.yoshinoantiques.com.

The Interesting, the Remarkable, the Unusual: Deleuze's Grand Style

Dorothea Olkowski University of Colorado

Abstract

Gilles Deleuze takes up the challenge to create a philosophy of the interesting, the remarkable and the unusual. He does this in what Alain Badiou calls the 'Grand Style', the style of Descartes, Spinoza and Kant whose philosophies arise in relation to developments in the natural sciences and mathematics. Grounding himself in the molar-molecular pair, Deleuze sets out a new image of thought. He conceptualises an immanent but still relatively closed, deterministic, atomistic and reversible system that is not immediately reduced to entropic equilibrium because its processes take place on the molecular level, at speeds which he hypothesises are beyond the speed of light. He postulates a manifold, a sphere of immanence that is the entire universe and not merely the Earth or our solar system. It is a system governed by sensitivity to initial starting points and unstable boundaries, thus although it is chaotic as well as probabilistic, it remains a mathematically formal, deterministic system.

Keywords: molecular, molar, atoms, Kant, Descartes, vector field, calculus

I. Introduction: The Grand Style

What makes something interesting, remarkable or unusual for philosophy? What philosophy is capable of creating and characterising the interesting, the remarkable or the unusual? Such a philosophy, Deleuze has made clear, must set out a new image of thought, for

Deleuze Studies 5.1 (2011): 118–139

no two great philosophers utilise the same image of thought; that is, every great philosopher has thought differently and has changed what it means to think (Deleuze and Guattari 1994: 37, 51). For example, although Descartes, Kant, Husserl and Sartre all have an image of thought that may be characterised as a field of consciousness, each field is constituted as a unique type of Universal: the eidetic, the critical, the phenomenological, and that of radical empiricism (Deleuze and Guattari 1994: 47). Each of these philosophers establishes a new image of thought that distinguishes them from the philosophical functionaries who enjoy the use of 'ready-made thought', lacking even awareness of the efforts of the great philosophers who have devised the images they use (Deleuze and Guattari 1994: 51). This account is echoed by Alain Badiou who also argues that philosophers must resist the comfort of what he calls 'the little style', a philosophy that makes the interesting, remarkable or unusual an *object* of study, something that can be relegated to the pre-existing philosophical specialisations of epistemology or ethics or politics, there to be managed by the academic bureaucracy of teachers and researchers (Badiou 2006: 3). For Badiou, a typical exemplar of the little style grasps its object through historicisation, classification and endless commentary rather than through direct and dramatic affirmation of the ontological sovereignty of mathematics (Badiou 2006: 3, 4).

By contrast, there is a kind of philosophy carried out in the grand style. The grand style, according to Badiou, is the style of doing philosophy exemplified by Descartes, Spinoza, Kant, Hegel and Comte de Lautréamont (Badiou 2006: 8–13). What these apparently disparate figures have in common, Badiou claims, is something that Badiou himself has in common with Gilles Deleuze. 'In each case', Badiou writes, 'it is a question of giving thanks to *rigorous mathematics*. It doesn't matter whether the philosophy is conceived of as a rationalism tied to transcendence, as it is from Descartes to Lacan; [or] as a vitalist immanence, as it is from Spinoza to *Deleuze*' (Badiou 2006: 14, emphasis added). What matters is that each of these philosophies proposes that mathematics directly illuminates philosophy and that it does so through a *forced* or even *violent* intervention. Thus, Descartes is credited with finding, in arithmetic and geometry, the very model of philosophical certainty, while Spinoza confirms that 'to know is to be absolutely and universally convinced' (Badiou 2006: 8, 9). Kant's contribution is the a priori; Hegel's, a true conception of the infinite, and Lautréamont's, the undoing of all the categories of humanism (Badiou 2006: 10–13). Badiou's own contribution is proclaimed by the philosopher to be the idea that mathematics is ontology.

And Deleuze, what of Deleuze? In so far as Badiou believes that Deleuze's contribution, grand as it may be, is much too invested in the idea of the 'One' to satisfy his own demands for a mathematics that is a fundamental ontology of multiplicities, Badiou focuses on critique and mostly evades positive elaboration of this question. This leaves it to those of us who are interested in Deleuze's contribution to discover the answer for ourselves. Thus, we will inquire, in what manner and to what end does Deleuze create a philosophy in the grand style, a philosophy directly illuminated by mathematics through a forced if not violent intervention? In carrying out this project, we will attempt to follow Badiou's prescription, that is, rather than exerting a grip on our object through 'historicization and classification … [thereby to] characterize this object as a neutered mathematics', we will seek a direct encounter with Deleuze's mathematical formalism (Badiou 2006: 4). In doing so, we must acknowledge the difficulty of proceeding in this manner. Deleuze's grand style, his new image of thought, rests on what he refers to as the 'unlimited One-All' which includes all the concepts of his thought on one plane (Deleuze and Guattari 1994: 35). He calls this a plane of concepts or a plane of consistency, a single wave embracing multiple waves that are concepts, but concepts that must move at infinite speeds, thus faster than the speed of light, something physically impossible but, in the realm of thought, something that is thinkable.

We will seek a direct encounter with these concepts by first formulating the nature of this plane in mathematical and physical terms, by means of classical thermodynamics, which provides parameters for the plane of immanence. We will then examine the Ideas and the rules governing the plane which, utilising the mathematical term, Deleuze refers to as a vector field. We will examine Deleuze's use of differential calculus to organise vector fields. Then, in so far as Deleuze finds equivalents for these rules in Kant's transcendental logic, we will examine how they function logically as well as mathematically in order to discern how the law of non-contradiction and binary thinking are fundamentally implicated in the rules governing the plane of immanence. Finally, we will turn to Deleuze's account of the molar and the molecular to discern the extent to which this formulation of thought and physical reality addresses the question of binary thinking and Deleuze's proposal for a reformulation of binaries. The emphasis here will be on what Deleuze's philosophy can do and what its limits might be. It is to be hoped that this approach will be direct but also adequate to the task at hand.

II. The Second Law

Deleuze's notion of the plane of immanence can be said to take its direction from some consequences of the Second Law of Thermodynamics. The Second Law of Thermodynamics states that in a closed or isolated system, where no new matter or energy enters, disorder must increase. So, for the classical mapping of gas particles distributed in two chambers, there are far more disordered states (mixtures of particles in various states) than ordered states (mixtures of particles in a limited number of states). When there are many more ways for particles to be distributed evenly (in various states) than lopsidedly, the probable state of particles is one in which their energy – once unconcentrated – is of little use. For example, heat follows the arrow of time; it is of little use relative to the sunlight that generates it, a potentially depressing conclusion. In the world of time asymmetry, classical thermodynamics studies structures whose complexity decreases, machines that lose the capacity to do work. It studies closed and isolated systems that are sealed to incoming matter (Margulis and Sagan 1999: 34). Moreover, at equilibrium, when molecules are most disordered, that is, unstructured, everything is homogeneous and nothing interesting, remarkable or unusual can happen. In this state, what is often called 'complexity', meaning, the tendency towards order, is matched equally by the tendency towards disorder – heat and entropy (Devlin 1994: 79).[1] What interests us now is the examination of the philosophical import of these ideas for Deleuze. What image of thought, what plane of immanence, do they entail?

From a philosophical perspective, Deleuze takes up these developments in the natural sciences and mathematics. Turning away from open-system (non-equilibrium) thermodynamics, he conceptualises an immanent, therefore relatively closed and still deterministic, atomistic and reversible system that is not immediately reduced to entropic equilibrium because its processes take place on the molecular level, at speeds which he hypothesises are beyond the speed of light. He postulates a manifold, a sphere of immanence that is the entire universe and not merely the Earth or our solar system. In spite of being closed or immanent, it is a system governed by sensitivity to initial starting points and unstable boundaries, thus it is chaotic as well as probabilistic, where probabilistic means that the path of individual particles cannot be predicted, but their movement in aggregates can be predicted, and with a relatively high degree of probability. This is still a deterministic system, in other words; once established, once set in place, the rules governing

the field of thought do not alter. Deleuze proposes that such a system can be formalised mathematically by means of differential calculus and vector fields. Motion and change are particularly difficult to study mathematically, as the tools of mathematics – numbers, points, lines, equations – are themselves static. Calculus, 'a collection of methods to describe and handle patterns of infinity – the infinitely large and the infinitely small', made possible the use of mathematical tools to study motion and change without falling into paradoxes (Devlin 1994: 74). 'The basic operation of differential calculus is the process known as differentiation [whose aim is] ... to obtain the rate of change of some changing quantity. In order to do this, the "value" or "position" or "path" of that quantity has to be given by means of an appropriate formula' (Devlin 1994: 86).

Newton and Leibniz developed the rules for differentiating complicated functions by starting from the formula for a curve and calculating the formula for the gradient (or steepness) of that curve. The method involves using a grid defined by Cartesian coordinates, then taking minute differences in the x and y directions and computing the gradients of the resultant straight lines – the gradient function is called the derivative of the original function (Devlin 1994: 90). 'The crucial step ... was to shift attention from the essentially static situation concerning a gradient at a particular point P to the dynamic process of successive approximation of the gradient [of the curve] by gradients of straight lines starting at P' (Devlin 1994: 87, 88). It is crucial to remember, however, that the apparently dynamic motion can only be captured, mathematically, by a static function, and likewise, the dynamic process of closer and closer approximation to the gradient must also be captured in a static manner known as a limit, which is a sequence of approximations (Devlin 1994: 87, 88).

Nevertheless, to utilise and expand on the possibilities offered by differential calculus, Deleuze proposes what may be called a sublime Idea, an Idea in the Kantian sense, in so far as it arises from and regulates its field immanently (Deleuze 1994: 170–82/220–35).[2] 'Already Leibniz had shown that calculus ... expressed problems which could not hitherto be solved or, indeed, even posed (transcendent problems)', problems such as the complete determination of a species of curve or problems characterised by the paradox of Achilles and the tortoise (Deleuze 1994: 177/228–9).[3] But what if we wish to make determinations beyond a single curve, beyond a single trajectory? Is there a means to make 'a complete determination with regard to the existence and distribution of ... [regular and singular] points which depends upon

a completely different instance', an instance characterised in terms of a field of vectors? (Devlin 1994: 44; Deleuze 1994: 177/230). The goal here is to explicitly link differential equations and vector fields. A vector field is defined by Deleuze, in *Difference and Repetition*, as the complete determination of a problem given in terms of the existence, number and distribution of points that are its condition (Deleuze 1994: 177/229). This corresponds fairly well to the more or less standard mathematical definition in which a vector field is defined as associating a vector to every point in the field space. Vector fields are used in physics to model observations, such as the movement of a fluid, which include a direction for each point of the observed space. Let us try to flesh this out.

III. The Idea and the Rules: Association, Commutation, Distribution

If, as Deleuze claimed, it is the condition of a problem that it would be the object of a synthesis of the Idea, then what is this Idea? The problem, as set out by Deleuze, is that of the existence, number and distribution of points. This problem would be the object of a certain Idea, initially no more than the abstract Idea of a plane of immanence, a vector field, a model consisting of vectors (in physics, an abstract entity that has magnitude and direction in a plane or in three-dimensional space, or in a space of four or more dimensions) in vector space, from which may be projected an infinity of possible trajectories in spacetime (Devlin 1994b10: 44).[4] In mathematics (specifically linear algebra), the rules of *association, commutation and distribution* define vector space without reference to magnitude or directions. This allows for their use in a variety of fields whose terms are not material or physical. Additionally, the rules of association, commutation and distribution are the least restrictive set of linear rules that remain commutative; that is, for binary operations, any order is possible (Copi and Cohen 1990b4: 692).[5] They can also be understood to be the same the transcendental Ideas that govern Kantian practical reason, and this is because they tell us what actions are universal in their application.[6]

These rules have their equivalents in logic where association is an expression of logical equivalence permitting the valid regrouping of simple propositions; it governs the relations, which is to say, the connections between subject and predicate in the categorical proposition. In syllogistic terms, this would be expressed as the categorical relation (Copi and Cohen 1990: 694).[7] Commutation permits the valid re-ordering of disjunctive statements, which, using the logical rules of

transformation, can logically be recast as hypothetical propositions without a change of truth-value (Copi and Cohen 1990: 698).[8] The rule of generation of a vector field is commutative. In logic, this means that statements may initially be combined in any order. Given a hypothetical proposition, 'If there is a perfect justice, the obstinately wicked are punished', it consists of a relation between two propositions, 'There is a perfect justice', and 'The obstinately wicked are punished' and can be understood as intrinsically commutative (Kant 1965: A73–4, B98–9). Reformulated using truth tables, we arrive at its logical equivalent, 'There is *no* perfect justice *or* the obstinately wicked are punished, a proposition to which commutativity now applies ("The obstinately wicked are punished *or* there is *no* perfect justice")' (Devlin 1994b10: 46–8). This reformulation separates, tears apart, the causal order of the inference, making it possible to reorder the propositions, thus to disturb their causal linearity. The consequences of this move may be debated, but that will not be the most important consideration here. A third element of vector space is distribution. In deductive arguments, distribution permits the mutual replacement of specified pairs of symbolic expressions. In categorical propositions, it permits the distribution of a term if it refers to all members of a class (Devlin 1994: 86–7). In syllogistic logic, this would be expressed as conjunction or connection.

Deleuze, like Kant, argues that these rules, the rules for vector space, apply to nature; they govern nature. This means that they have ontological effects and that nature is associative, commutative and distributive. This is, indeed, the core of Deleuze's mathematical intervention in philosophy. Thus, mere association (x + x), as opposed to unity or totality, means that the laws of nature distribute parts which cannot be totalised, and that nature is conjunctive, expressing itself as this *and* that, this *or* that, rather than as Being, One or Whole. Following Kant's transcendental Ideas, the claim is that we can never have knowledge of nature as a whole. As in Kant, what has been called 'divine power' is simply the manifestation of the relation of disjunction. God or disjunction dis-joins the whole into diverse parts (places, species, lands and waters) organised in a system in relation to the ideas of self and world. Thus, each *self* is not identical to any other but is represented by the categorical relation of that self with an idea; and every body comprising the *world* consists of diverse matter, manifest in the hypothetical or causal relation between an idea and that diversity (Kant 1965: A333–6; B390–3 and A176–219; B218–66).[9] As such, nature is associative, commutative and distributive and our knowledge of it is limited to its immanent, regulative functions. If nature's immanent,

regulative functions are associative, commutative and distributive, each of these, as mathematical or logical operations, reflects a view of nature as the power of things to exist one by one without any possibility of them being gathered together in a unity (Deleuze 1990: 266–7).[10] Following these rules, whatever has been added together can be taken apart and reformulated. This is how becoming appears to be everywhere, for nowhere is anything gathered together into a totality. How then, if nothing is gathered together, is it possible to have a world or a concept of a world? In so far as we are still in the realm of classical thought, the answer may be clarified using Hume's method of association of ideas.

That things exist one by one without the possibility of being gathered together is the expression of purely external relations of association within an immanent field, relations of proximity that are further characterised in terms of the chance collisions of particles. However, the key to thinking through this aspect of the model proposed by Deleuze is that, at this point, the things that exist one by one are, in fact, gathered, but not into a Whole or a Totality governed by a Divine or transcendental principle of unity. They are, rather, gathered by means of the transcendental principle of differential relations, so that things are the effect of the differentiation of elements as constituted in differential calculus. Not surprisingly, the rules of vector space and the construction of vector fields are connected to the functions of differential calculus. That is, given a complete set of functions in a given space in differential calculus, each function in that space can be expressed as a combination of that complete set of functions, and functions with the property of completeness can form a vector space under binary operations.

Deleuze's task, throughout his work, but especially in *The Logic of Sense*, is to connect these mathematical concepts to nature, that is, to the physical world. Referring both to Lucretius and to classical physics, Deleuze argues that although the sum of atoms (or particles in physics) is infinite, they do not form a totality in the Kantian sense, an absolute and unconditioned totality for the series. Rather, atoms – which, it is said, are not sensible objects but objects of thought (since due to their size they are below the level of human perception) – fall in the void and collide with one another. The result of these collisions produces motion.

> [In the void], atoms fall with equal velocity … the velocity of the atom is equal to its movement *in a unique direction in a minimum of time* … [expressing] the smallest possible term during which an atom moves in a given direction, before being able to take another direction as the result of a collision with another atom. (Deleuze 1990: 269)[11]

Rather than a highly structured principle of causality, Deleuze argues that this collision, in so far as it takes place in a time smaller than the minimum of continuous time, a limit that approaches but never reaches 0, must be something else. Following Lucretius, Deleuze calls it a *clinamen*, the original determination of the direction of movement of the atom (Deleuze 1990: 269). The clinamen expresses the idea of looking for numerical and geometric patterns in a process of successive approximation. Long after Lucretius, the notation *dx* and *dy* came to be used to refer to infinitely small quantities or 'the velocities of evanescent increments, once called "fluxions", ultimately, "a dynamic process of successive approximations"' (Devlin 1994: 93). Differential calculus, we noted, allows one to begin with a differential relation (*dx*/*dy*), the expression of the infinitesimally small limits of motion in a specific direction; then, taking the derivative, to derive the formula for a curve, and then to calculate the formula for the gradient (slope or steepness) of that curve by taking small (infinitesimal) differences in the *x* and *y* directions and computing the gradients of the resultant straight lines (Devlin 1994: 92–3).[12] In this manner, a curved line can be measured as a continuous series of infinitely small straight lines or tangents.

Each derivative of a differential relation takes place each time in a minimum of time. No doubt, this is the ultimate, subtle form of disjunction/conjunction, which in the physical world may be taken for causality, as each collision determines the next direction of the atoms, and if we were to look at patterns, rather than individual atoms, clear patterns do, in fact, emerge, thus we can predict outcomes, not with absolute certainty, but with probability.

> In general, a differential equation arises whenever you have a quantity subject to change … Strictly speaking, the changing quantity should be one that changes continuously … However, change in many real life situations consists of a large number of individual, discrete changes, that are miniscule compared with the overall scale of the problem, and in such cases there is no harm in simply assuming that the whole changes continuously. (Devlin 1994: 92–3)[13]

In fact, the assumption is normal practice, thus space (and time) in a differential equation are defined as continuous. Defining a problem is thus always inseparable from recognising its ideal, objective nature (Deleuze 1994: 177/230).[14] This is why 'the ideal connections constitutive of the problematic (dialectical) Idea are incarnated in the *real* relations which are constituted by *mathematical theories* and carried over into problems in the form of solutions … the solutions are like the

discontinuities compatible with differential equations' (Deleuze 1994: 179/232, emphases added).[15] In other words, differential calculus is a mathematical instrument but the solutions or projections, the fields of operation of the mathematical instrument, may be mathematical, or they may be physical, biological, psychical or sociological. One begins with the abstract mathematical structure, then one projects it onto physical or psychical reality or onto different aspects of reality. So there are different orders of problem where each different order is a different expression, a different realisation or projection of the mathematical schema.

What Deleuze claims, however, is that one does not simply apply mathematics to other domains, rather each domain in which Ideas are incarnated possesses its own calculus, its own quantitability, qualitability, potentiality, processes of determinability, reciprocal determination, and distributions of distinct and ordinary points. This, he argues, is the true *mathesis universalis*, a system of multiple, non-localisable, ideal connections, a differential calculus corresponding to each Idea where each Idea differentiates the field, becomes the universal for individuals, differentiating each and every element (Deleuze 1994: 181/235).[16] The question that arises then is: how does this occur and what are its effects?

IV. The Persistence of Binaries

In *Difference and Repetition*, Deleuze provides several examples of Ideas differentiating a field – Ancient atomism as a physical Idea, the organism as a biological Idea, Marxism as a social Idea – but it seems as if it is not until much later in his work that he provides a structural solution to his own question, in fact, a structural solution that is mathematical (Deleuze 1994: 184–6/238–41). In *What is Philosophy?* Deleuze, along with Félix Guattari, argues that every trajectory in a vector field is an assemblage of affects and percepts connecting, disjoining and conjoining with one another. Contingency lies in particles; every assemblage of particles produces a different world, a different and unpredictable entity, but within the range of a particular pattern oriented by an attractor. An attractor is defined as a set of states, invariant under the dynamics, which neighbouring states in a given basin or arena approach asymptotically in the course of dynamic evolution.[17] This model underscores the difficulty if not impossibility of distinguishing object and world or subject and object. For this reason, every subject or object is an event, nothing but the result of the contingent encounters of affects and percepts, which are themselves independent of and exceeding any living being, standing on

their own, simply expressing a pure sensation – freeing it from objects and from states of a subject (Deleuze and Guattari 1994: 163–7). In addition, every event is an effect of concepts, prospects and functives (the objects of logic and mathematics). That is, forms of content (structured materialisations) and their forms of expression (structures) constitute and define one another. Were the world not an ongoing process of trajectories differentiating themselves, there would be no events and no intelligence either. It might at first appear that the binary thinking that arose most powerfully with the conception of an *ego cogito* has been overcome. And one of the most significant implications of overcoming this structure would be that all binaries, including those powerful cultural signs such as male-female, heterosexual-homosexual, rational-emotional, active-passive, etc., would have come undone. Deleuze, in particular, is quite specific about the mechanism by which the authority of binaries appears to have been overcome. However, as we will see, even for Deleuze, in mathematics and in philosophy binaries persist. What has actually changed is only that a layer of microstructures has been added to the conceptualisation, microstructures that give way ultimately to binaries and so remain within the logic and mathematics governing binaries.

In order to distinguish the micro and macrostructures of his system with respect to the thinker, Deleuze begins by citing the Cartesian will to distinguish doubt from certitude. He had argued previously that making this distinction presupposes the good will of the thinker and the good nature of thought, that is, the expectation that identity, analogy, opposition and resemblance will be accompanied by the 'I think', such that I conceive, I judge, I imagine, I remember and perceive become the four branches of the cogito and 'difference becomes an object of representation always in relation to a conceived identity, a judged analogy with other genera, an imagined opposition of predicates or a perceived similitude' (Deleuze 1994: 137–8/181). In this scheme, difference, differentiation and even repetition are impossible to think, and so are lost to recognition in a concept, distribution through analogy, reproduction in imagination and resemblance through perception (Deleuze 1994: 145/189). Although Zeno of Elea (450 BC), introduced a number of problems which were based on the infinite, and Archimedes used the method of exhaustion to find an approximation to the area of a circle (an early example of integration), no further progress in the development of mathematical differentiation was made until the sixteenth century. Descartes was aware of the development of a method for calculating maxima and minima when the derivative

of the function was 0, but it was Newton who first mathematically represented a particle tracing out a curve with two moving lines which were the coordinates. And it was Leibniz who thought of the variables *x*, *y* as ranging over sequences of infinitely close values. He introduced the symbols *dx* and *dy* to indicate differences between successive values of these sequences.[18] Lacking the full power of differential calculus, it would have been impossible for Descartes to think difference and differentiation in the manner made possible by Leibniz and Newton. Moreover, breaking away from the science and the worldview of the Ancient Greeks and many medieval thinkers meant breaking away from a worldview according to which the Earth is the centre of the Universe and material entities are conceived of in terms of a substance or genus that is the same as itself (identical) and in terms of the attributes of that substance, where there is and must be something identical from which those attributes differ (Aristotle 1970: X, 5, 1054b25). This, according to Deleuze, is something Descartes did not fully achieve.

Descartes' partial success accounts for the critique levelled against him regarding the various aspects of the *cogito*. The critique is that the I conceive, I judge, I imagine, I remember, I perceive, do nothing to disturb thought; they are clearly objects of recognition whereby thought recognises itself in things and in the comfortable certainties of the cogito when it thinks clearly and distinctly in the immediacy of a now moment. What is problematic is that truths generated in this manner are, in fact, no more than hypothetical, they assume or presuppose exactly what is in question and therefore lack certainty, or what Deleuze calls absolute necessity (Deleuze 1994: 139/182). But something, Deleuze maintains, forces us to think differently, some event leads us to ask about the conditions of Cartesian recognition and certainty, that is, about what makes recognition and certainty possible. What forces us to think differently arises through a violent disjunction, in the logical sense of this term. Disjunction refers to a logical proposition in the form of 'either x or not-x, but not both', a proposition, which, following logical rules of transformation, may be reformulated.

Deleuze points out that in *The Republic*, amidst the violence of Socrates' encounter with the sophist Thrasymachus, Socrates recalls the Idea of justice, an Idea that is not able to be remembered on the empirical level. Yet, influenced by empirical, moral motives, Plato is said to miss the opportunity to cast aside common sense and the empirical, and he thereby clouds thought. Faced with the claim that something is both just and unjust, a logical contradiction, Plato insists on making sense of the empirical realm and insists on the law of non-contradiction and the law

of excluded middle. The former establishes that for any proposition that proposition and its negation are never both true, and the latter that for a given proposition and its negation at least one must be true (Hass 2002: 75). Let us not forget that, symbolically, logical contradiction appears to be a structural relation of dominance and erasure because it constructs difference in terms of exclusion (Hass 2002: 76). The law of excluded middle or contrariety is less hierarchical in so far as a single term may have a variety of contraries that need not indicate the lack of a specific property, so that if both contraries are asserted, the system does not collapse. Yet, Plato and Aristotle generally presume that the contrary of a term is not a pluralistic set (such as bad, sad, or unrepentant, for the term good), but that the contrary of good is non-good, reinstating privilege and hierarchical unity (Hass 1998: 35–6).

Deleuze, as such, seems to use the idea of contrariety in this latter sense, as commensurate with non-contradiction. For Socrates, contrariety disrupts common sense and compels even the Socratic soul to probe, to problematise, 'arousing thought in itself' (Plato 1997: 524e).[19] But in the end, the sensible discordant encounter with contrariety must be harmonised. Coaxing Thrasymachus to become gentle, to give up his anger, Socrates upholds the law of non-contradiction and the law of the excluded middle, thereby affirming binaries and their hierarchical structures. Seeking to escape the fate of binaries, of disjunction (either x or not-x), although caught up in the same logical system, Deleuze proposes an alternative. As we noted above, he proposes a Kantian solution, a solution possible only after Plato and Aristotle, and even after Descartes, whose system of coordinates makes the new solution possible but does not yet completely abandon the Greek view. Deleuze proposes a spacetime manifold according to which nature, meaning physical reality, is associative, commutative and distributive, where association (x + x) is opposed to Aristotle's unity of a genus.

In this manifold, the laws of nature distribute parts that cannot be totalised, so that, as Kant argued, nature is conjunctive, expressing itself in the logical forms of this *and* that, this *or* that, rather than as Being, One, or Whole. As we have noted, that things exist one by one without the possibility of being gathered together into a totality comes about as the expression of purely external relations of association within this spacetime field, which is an immanent field, a plane of immanence. It is, in this sense, self-regulating, governed by its immanent laws. In this field, relations between things can be further characterised in terms of the sub-atomic particles that are *their* conditions, the chance collisions of particles that exist one by one and are not unified or governed by a divine

or transcendental principle of unification. Instead, they are connected by means of a transcendental principle of differential relations where the construction of vector fields is organised by the functions of differential calculus. In other words, Deleuze appears to propose a formal structure, a structure that allows him to bypass empirical and commonsensical arguments.

According this formal structure, the condition of possibility of those substances, those molar existences, those objects of recognition and representation, lies in the molecular.

> Molecular desiring-machines are in themselves the investment of the large molar machines or of the configurations that the desiring-machines *form according to the laws of large numbers*, in either or both senses of subordination … Desiring-machines in one sense, but organic, technical, or social machines in the other: these are *the same machines under determinate conditions*. (Deleuze and Guattari 1987: 287)[20]

Every physical entity is a 'molar' individual that denies atomistic individuality, meaning discernible particles invested with absolute properties. Possessing internal unity, inscribed in a part of space, resisting external influences through circular causality, thus immanent, the molar physical entity is an individual (Merleau-Ponty 1963: 138–9).

However, the molar is posited as the 'limit' of physical knowledge, mathematically, it is that towards which physical knowledge tends without ever reaching the limit. Molar structures are not real, that is, they are not physical, causal forces. They are, instead, an Idea, a signification common to an ensemble of molecular facts, expressed by all the facts but not contained in any one (Merleau-Ponty 1963: 143).[21] A version of this striking formulation is found in Deleuze, for whom the Idea provides, in general, an indication of the signification of what mathematics refers to as a dynamical system. A dynamical system consists of two elements. First, a playing space on which the motion of the system takes place, and second, a rule or rules (a vector field) determining what moves are possible. In addition, every dynamical system is also oriented by an attractor which fixes the overall behaviour of the system (Casti 1994: 26–7). For Deleuze also, each dynamical system is governed by a vector field and an Idea (attractor) which organises the realm it constitutes, whether the attractor is biological, political or any other realm. The rules (the vector field) that govern dynamical systems are the same for all of them and, for Deleuze, the rules of the physical field take on an ontological status. Deleuze ontologises the physical structure so that all realms of existence are

governed by its laws. This is his grand style. This becomes the basis of the claims, made by Deleuze and Guattari, that below Oedipus, or as its condition of possibility, we find a molecular unconscious; that beneath stable forms, there is functionalism; under familialism, polymorphous perversity. Molecular and molar are two aspects of the same system, the same classical molar structure, and every molar entity is an effect of molecular interactions in a dynamical system. So the molecular is simply the same entities or events removed one level to a smaller scale, which, Deleuze claims, makes possible our everyday molar and representational world. If we are to understand this we might want to ask, what is the distinction between the molecular and the molar, the microphysical and the statistical?

V. The Molecular and the Molar

In the most formal, mathematical sense of the term, the molecular refers to Avogadro's number, the number of atoms needed such that the number of grams of a substance equals the atomic mass of the substance; an Avogadro's number of substance is called a mole.[22] Avogadro's hypothesis was key to solving many problems in the chemical sciences in the 1800s. For chemistry, molecules and moles are a matter of physical relations, ascertaining that equal volumes of gases with the same pressure and temperature contain the same number of molecules. By analogy, these terms reveal several possibilities. First, that that 'the machine taken in its structural unity, the living taken in its specific and even personal unity, are mass phenomena or *molar aggregates* … merely two paths in the same statistical direction' (Deleuze and Guattari 1987: 286). From the point of view of molar or statistical aggregates in physical relations, *molar machines* may be social machines, technical machines, or organic machines. Physically, as statistical aggregates, they are machines that appear as single objects and living organisms that appear as single subjects.

And what of the molecular? *Desiring-machines* are of the molecular order. What does this imply? In the language of Deleuze and Guattari, 'desiring-machines *work according to regimes of syntheses* that have no equivalent in the large aggregates … the indifferent nature of the chemical signals, the indifference to the substrate, and the indirect character of the interactions' (Deleuze and Guattari 1987: 288). Deleuze states that what he calls the 'regimes' of molar aggregates, their coded organisation, is one with recognition and representation. In other words, these regimes were defined by Aristotle in terms of substance and its

attributes, and by Descartes as representations. By contrast, molecular desiring-machines work according to regimes of synthesis, but not those of the large aggregates. Their syntheses have functional properties – properties such as heightened coherence and efficiency that affect their operations – so that only on the level of fundamental structure does one discern the so-called play of blind or chance combinations. The key feature here is that the organisation of molecules occurs independently, they are not structured 'from above', by the large aggregates, the molar formations; quite the opposite. Molecular syntheses are the condition of the possibility of molar life. That particular molecular syntheses give rise to specific forms of molar life may certainly be a matter of chance, that is, a chance meeting of environmental factors which, nevertheless, gives rise to highly organised molar living structures.

In the grand style, this system involves violent interventions. The characterisation of proteins as the ultimate molecular elements in the arrangement of desiring-machines reveals the method at work here. The method requires that one goes *beyond* the molar to the molecular. How to reach this level, the level of analysis where all aggregates are broken down and reduced to their most fundamental components? If we begin with the regimes of recognition and representation, regimes encompassing thinkers from Plato and Aristotle to Descartes, regimes built on the identity of a genus or the identity of a *cogito*, then there is, for Deleuze, only one solution: 'Destroy, destroy. This is the task of schizoanalysis, which goes by way of destruction – a whole scouring of the unconscious, a complete curettage' (Deleuze and Guattari 1987: 311). A harsh solution, for by means of it, by means of destruction-reduction, we end up before the gates of a pure functionalism: that is to say, formalism, structure without context. Perhaps this is the ultimate equality a molar individual can achieve, the reduction of each and every one to molecules, nothing more abstract or more equal in the universe.

Like Spinoza, who set out his philosophy as a series of propositions, each one following from the previous, Deleuze's mathematical formalism constitutes his grand style. Mathematical formalism has been characterised as not merely 'Plato playing pleasantly with yesful youths … and getting them to say that they see lovely patterns laid up in heaven, but a tough game played against a tough opponent who is as skeptical as it is possible to be and will not let anything pass unless he absolutely has to' (Lucas 2000: 68, 69). Formalisation allows one to abstract the fundamental shape of a system in order to discern patterns without superficial and messy flesh (Lucas 2000: 70). Formalisation is built upon a frame of maximum cogency, meaning that, at every step, the premises

are true and hence the conclusion is undeniable, to the point where no alternative arguments can even be considered.[23] 'Formal systems minimize the demand made on both the intelligence and the cooperativeness of the opponent. The stock of symbols is small and the rules for manipulating them explicit', such that the average sensual man can recognize the pattern (Lucas 2000: 72).[24] Recall Deleuze's words cited above, that ideal connections constitutive of the problematic, that is, of the dialectical Idea, are incarnated in the real relations which are constituted by mathematical theories. This is the structure of a formal system.

Deleuze's disdain of half measures is palpable and brings to the fore the idea that his philosophy is truly philosophy in the grand style. His insistence upon requiring the constitution of real relations in mathematical theories is manifest in what he takes to be the failure of Plato's dialogues. 'In his development of the idea of dialectic, [Plato] came to think of the respondent as utterly bloody-minded, who would not be persuaded by anything less than the fear of inconsistency, since the one sanction capable of coercing every recalcitrant reasoner into conceding the validity of each step was self-contradiction' (Lucas 2000: 378). Plato was driven to this extreme, Deleuze implies, because he did not cast aside common sense and the empirical. Deleuze will not make this mistake, but will put into play his version of the dialectical or problematic Idea, with its ideal rather than empirical connections. Formalists, it is said, are prepared to respond to challenges, to respond to end-games, and to reach meta-mathematical conclusions based on what appears to be possible. For this reason, dialectical argumentation remains essential in order to extend cogent arguments to what exceeds finite demonstrations. In other words, dialectic allows one to respond to disputes, to examine claims about invalid steps in an argument, and to prove that they are valid. Moreover, if a challenger cannot find counter-instances, there is no need to justify claims about an infinite number of instances. 'Instead of having to go on for ever, waving our hand implausibly over an infinite number of instances, we can get our teeth into a definite, finite case, and chew through it to incontrovertible refutations' (Lucas 2000: 381).[25] Dialectical justifications enable us to demonstrate the validity of transfinite formalist arguments without appeal to only the law of non-contradiction.

In order to overcome the limitation of the Socratic appeal to non-contradiction, Deleuze proposes an image of thought unsullied by the opacity of physical existence, that is, an image set free from recognition, similarity, identity and analogy; it is, therefore, a molecular image. Qualitative opposition within the sensible is quickly tamed by common

sense which knows that contraries cannot coexist in the sensible object. The simultaneity of contraries violates the logical law of excluded middle, however, if we leave aside the sensible, if we merely think, if there is only *thought* unsullied by physical existence, then what is that thought? It is the thought that arises with Newton and Leibniz. It is a thought made possible by the calculus of infinitesimals. It is thought that is pure difference, differentiating itself in a continuous spacetime trajectory. It will be the same for memory, imagination, language, for all so-called faculties. This transcendental empiricism is empirical only in so far as it designates as imperceptible and unthinkable that which takes place at the empirical level and thereby immediately transcends it (Deleuze 1994: 144 [187]).[26] Opposition (contrariety), resemblance, identity and analogy are effects of this thinking in the empirical realm where common sense and the law of non-contradiction prevail. For the faculties, there is only violence, the violence of not harmonising or unifying one another but, instead, *disjoining* all that they encounter. Disjunction of the faculties is their discordant harmony. This is how its elements exist one by one without the possibility of being gathered together.

First, thought undergoes its clash with the unrecognizable *sign*, the being of the sensible, not with sensibility itself. The sign defies common sense and good sense, which is the 'coexistence of contraries, the coexistence of more and less in an unlimited qualitative becoming', which, for Deleuze, due to the law of non-contradiction, can never be sensible, which is always only given as a sign (Deleuze 1994: 141 [183–4]).[27] Then, in place of one's own sensibilities, all that is left is a violated 'soul', no longer a *cogito* but the fractured I that is forced to pose a problem, and in the trauma of this violence, to forget anything that can be recalled, anything seen, heard, imagined or thought, in order to think and recall that which has *never been empirical*, which is transcendental with respect to both sensibility and memory, thus, what is essentially *nonsense* and *forgetfulness*. In the midst of this original violence, the faculties themselves are forced to their limits, meaning, they are forced into discordant harmony, their *disjunction*, the open-ended disorder of the faculties, so that each may pursue its own 'essential' projects, the transcendental projects of thinking, willing, or imagining (Deleuze 1994: 40–141 [183–4]).[28] If a faculty is forced to its *limit*, this does not imply that it reaches some end, but rather that it moves on a trajectory, forever, closer and closer, towards some point, some Idea-attractor, without ever crossing it.

Transcendentally, in a purely formal sense, in the realm of thought, binaries continue to exist but the formal Idea, rather than determining

that something is male or female, animal or vegetable, can be left *indeterminate*, replicating the Kantian free play of all the faculties 'where each goes to its own limit and nevertheless shows the possibility of some sort of harmony with the others' (Deleuze 1984: xi–xii). For Deleuze, outside of the formal transcendental realm of thinking, willing and judging, we succumb over and over again to non-contradiction and the law of the excluded middle. Although the conception of the problematic Idea that undergoes continuous differentiation/differen*c*iation is a conception that undermines the recognition, representation, habituation, equalisation nexus of classical, modern thought, replacing it with the Idea of difference and the diverse, an important question remains.[29] Does it contribute to conceptions beyond the formal and external description of particles? Does it characterise sensible existence? Let us briefly examine this.

Classical physics – the work of Galileo, Kepler, Newton, Leibniz – first gave us the laws according to which particles move and interact with one another. Given any arrangement of the particles that make up the universe, and any choices for their initial motions, these laws can be used to predict the future. Different worlds are arrived at by starting with the particles in different positions. Every trajectory in each universe is defined by laws that specify the movement and interaction of particles. But even for dynamical differential systems, the rules of motion are given; what may be contingent are the particular particles themselves, that is: which particles enter into any given trajectory and in what order? Which affects, percepts, concepts, prospects and functives? In an immanent system, such as that proposed by Deleuze, a system sensitive to initial conditions and with unstable boundaries, as opposed to Newton's closed and certain universe, this cannot be predicted, thus every configuration of particles produces a deterministically chaotic world. This is because once the rules which specify the movement and interaction of particles are set in place, they do not alter –, this is what makes them deterministic. These rules, we have stated, are connection, conjunction and disjunction. Moreover, in the deterministically chaotic world, space and time are given, not emergent. They are, as Kant posited, the pre-given, pre-existent manifold, and time is simply a parameter of *any space whatever*, a fourth dimension, a means for differentiating different spaces, but not an emergent and unpredictable reality. Where the spacetime manifold is always, already given, creation per se disappears in so far as predictability is the goal of the system if not a requirement. The implication of this is that, as revolutionary as Deleuze's grand style may be, in so far as it is a projection of mathematical and

physical structures it can do no more than what they do. One can idealise, as Deleuze certainly does. One can imagine speeds beyond the speed of light that would interfere with the organising power of the rules governing the spacetime manifold, but there remain physical constraints on such ideas and limits, even for the grand style of philosophy.

Notes

1. I would propose that Husserl is utilising this model of differential calculus to solve exactly this sort of problem.
2. The first set of page numbers refer to the English translation, the page numbers following the slash refer to the French original. This will be the case throughout.
3. This is classic problem in mathematics as well as philosophy. See also Olkowski 2007: 207, 214.
4. 'If you have a collection of entities called vectors, an operation of addition of two vectors to give a third vector and an operation of multiplication of a vector by a number to give another vector, and if these operations have the [appropriate properties, they are associative, commutative, distributive and closed under vector addition], then the entire system is called a vector space' (Devlin 1994: 44).
5. For example: [(p v q) v r] may be replaced by [p v (q v r)] and [(p . q) . r] may be replaced by [p . (q . r)].
6. The relation between Kant's transcendental Ideas and Deleuze's rigorous mathematics has been worked out in Olkowski 2007: see especially Chapter 2.
7. For example: (p v q) and (q v p) as well as (p . q) and (q . p) may replace one another, they are logically equivalent.
8. For example: A (B + C) = A B + AC.
9. Deleuze refers to these Kantian syntheses in Deleuze 1990: 294–5/242–3. See also Olkowski 2007: 'What after all do we mean by self, world, god? How is it that certain Ideas correspond to the connective, the hypothetical, the disjunctive? Categorical syllogisms, "All men are mortal," represent the relations of a concept or idea to a subject. Hypothetical syllogisms "If the earth turns, then the sun will rise and set," are causal, manifesting the relation of a concept or an idea to the manifold of objects in the world of appearance, the synthesis of a causal series. Finally, there is the disjunctive relation, the disjunctive synthesis of parts in a system in relation to objects of thought, "Either the universe has a beginning or it does not." This is the relation of a concept or idea to all things in general' (63).
10. 'Nature is not collective, but rather distributive … Nature is not attributive, but rather conjunctive; it expresses itself through "and" and not through "is"' (Deleuze 1990: 267).
11. 'In their fall, atoms collide not because of their differing weights but because of the clinamen … it relates one atom to another … In the void, the velocity of the atom is equal to its movement in a unique direction in a minimum of continuous time' (Deleuze 1990: 269).
12. So, for example, the differential equation $dP/dt = rP$ describes uninhibited growth where (P)t is the size of some population and r is a fixed growth rate.
13. 'Most applications of differential equations in economics are of this nature: the actual changes brought about in an economy by single individuals and small companies are so small compared to the whole, and there are so many of them,

that the whole system behaves as if it were experiencing continuous change' (Devlin 1994: 93).

14. For Deleuze, the use of vector fields requires the complete determination of a problem so that 'if the differentials disappear in the result, this is to the extent that the problem-instance differs in kind from the solution-instance; it is the movement by which the solutions necessarily come to conceal the problem' (Deleuze 1994: 177–8/230).
15. Dialectical here refers to Platonic not Hegelian dialectics.
16. 'Differential calculus is not the unimaginative calculus of the utilitarian, the crude arithmetic calculus which subordinates thought to other ends, but the algebra of pure thought, the superior irony of problems themselves' (Deleuze 1994: 181–2/236). I have discussed the Idea differentiating itself in Olkowski 2007: 27–30.
17. http://mathworld.wolfram.com/Attractor.html. An asymptote is a line that continually approaches a given curve but does not meet it at any finite distance.
18. A concise account of these developments can be found at http://www-groups.dcs.st-and.ac.uk/~history/HistTopics/The_rise_of_calculus.html (accessed 15 July 2010).
19. Without contrariety and contradiction, would Platonic thought have been possible?
20. Determinate conditions are statistical forms (the larger the groups averaged, the less the variation). See note at the bottom of Deleuze and Guattari 1987: 287.
21. Merleau-Ponty emphasises the unity of the molar as opposed to the molecular aggregate.
22. http://scienceworld.wolfram.com/physics/AvogadrosNumber.html. The Avogadro Constant, L, is a constant number used to refer to atoms, molecules, ions and electrons. Its value is $6.023 \times 10^{23}\ \mathrm{mol}^{-1}$.
23. 'But that ideal of absolute cogency ... has proved unattainable.'
24. 'Even l'homme moyen sensuel can recognize it.'
25. For example, dialectical justification of recursion allows us to overcome the finitude of incontrovertibility and to show that it is an admissible form of argument. A recursive process is one in which objects are defined in terms of other objects of the same type. Using some sort of recurrence relation, the entire class of objects can then be built up from a few initial values and a small number of rules. See also: http://mathworld.wolfram.com/Recursion.html
26. 'Transcendental empiricism is the only way to avoid tracing the transcendental from the outlines of the empirical' (Deleuze 1994: 144/187).
27. It is the same clash as that decried by Plato, but this time without the resolution in harmony.
28. Deleuze believes that, without this forcing, we remain ignorant or minimally habituated.
29. Different/ciation indicates both the state of differential relations in the Idea and the qualitative and extensive series in which they are actualised.

Review

Simon O'Sullivan and Stephen Zepke (2008) *Deleuze, Guattari and the Production of the New*, London and New York: Continuum.

Dalie Giroux, René Lemieux and Pierre-Luc Chénier (2009) *Contr'hommage pour Gilles Deleuze. Nouvelles lectures, nouvelles écritures*, Québec: Presses de l'Université de Laval.

Books of essays devoted to the individual and/or joint work of Deleuze and Guattari usually explore their ideas in relation to a wide variety of areas. *Deleuze, Guattari and the Production of the New* and *Contr'hommage pour Gilles Deleuze* are no exception to this rule: there are contributions across the two volumes dealing with pure philosophy, intellectual history, the arts (painting, conceptual art, music, cinema and literature, though nothing on architecture), method in the social sciences, and cultural/political critique – especially modes of resistence to capitalism, above all in its post-industrial, 'cognitive' form. These areas often overlap within particular essays. As its title implies, the Laval volume only discusses solo Deleuze and the joint work, not solo Guattari, but its unity is primarily linguistic (it is in French) and geographic (it is very much a product of Québec). These two elements are not on the whole alluded to overtly in the book, but they do give it a distinctive underlying tone, since the concepts of '*peuple manquant*' and '*littérature mineure*' could be applied with some justification to the people and the culture of Québec, and the French language connection means that certain more 'authentic' aspects of Deleuze come through, above all his attitude to Marxism. Anglo-Saxon commentators do not always understand that the wrestling with Marx of such French philosophers as Merleau-Ponty, Derrida and Lyotard, as well as Deleuze, has the complexity of a lapsed Catholic's anti-clericalism. Even if this could be regarded as a limitation to be overcome, it still needs to be

Deleuze Studies 5.1 (2011): 140–149
© Edinburgh University Press
www.eupjournals.com/dls

understood. Overall, there is a coherent 'political' feel to the Laval volume, even when it is dealing with the arts.

The Continuum book draws many of its contributors from throughout the Anglo-Saxon world, but it also includes three Italians (although only one of them is still based in Italy), Eric Alliez, Stephen Zepke (also one of the editors) and an English translation by David Reggio of a *tranche* of 14 pages taken from the first chapter of *Cartographies schizoanalytiques* by Guattari.[1] This last item points to a salient feature of the volume, also indicated by its title: solo Guattari is given as much prominence as solo Deleuze or the joint work. The ideas of Deleuze and/or Guattari are discussed in relation to those of other philosophers or thinkers on quite a few occasions. These thinkers or philosophers include: Spinoza, Kant, Bergson, Whitehead, Arendt, Lacan, Foucault and Badiou. This is relatively rare in the Laval volume, where the contributors tend to construct arguments from more precise exegeses of Deleuzian and/or joint texts, although Alain Beaulieu does deal very well with Deleuze's approach to the history of philosophy, and there are some perceptive remarks by Erik Bordeleau about the affinities and differences between the joint work and Foucault. Not that such exegeses are entirely absent from the Continuum book: Eugene Holland's analysis of certain passages from *A Thousand Plateaus* is particularly impressive. The phrase 'the production of the new' in the title of the O'Sullivan and Zepke volume is very much a *leitmotiv* running through the essays it includes. What is especially subtle is not just that the production of the new is explored within contributions dedicated to different areas such as pure philosophy, avant-garde artistic practice or cultural/political critique, but that the very identity of the new or of different kinds of new is examined. This is particularly true as regards different strands within artistic modernism and Deleuze and/or Guattari's complex relationship with recent changes in capitalism, of which they may perhaps be as much symptoms as critics.

While the ideas of the two thinkers can indeed be applied to an astonishing number of different areas, the difficulties encountered in relating their ideas to specific ones can vary. Evidently, Deleuze was a 'professional' philosopher and Guattari a 'professional' psychoanalyst, and they both had a good grasp of the other's discipline. (Of course, psychoanalysis and philosophy are often very closely linked within modern French thought, Lacan and Kristeva being prime examples of this). However radical or subversive Guattari and/or Deleuze may be, their ideas have always been developed and matured in a complex dialogue with their philosophic or psychoanalytic predecessors,

who have been understood in an extremely thorough, if often very imaginative way. So the problems here are more to do with richness, depth and complexity than with lack of development, but this is not always the case when Deleuze and/or Guattari are dealing with areas outside their 'core competences', for example in relation to the arts. Both writers had sophisticated, 'intellectually progressive', more or less modernist taste in the arts,[2] but they are not critics, either conventional or more modern, or theorists. They are not even as close to criticism or theory as Derrida or Kristeva are. In a sense, this is their strength: what they write on the arts is fascinating because they do have subtle natural responses to them, but they are free from a kind of 'trained' processing of them or limiting preconceptions of what they could do. They liberate the arts by treating them as flows of philosophical or psychological process, and it is clear that their innovative philosophical and psychoanalytic ideas are very much connected to their engagement with aesthetic modernism, but their taste in the arts is personal, slightly what one might expect from the milieu and time in which they lived, and they did not stretch their taste or wrestle with material they did not like in the way that good practitioners or critics tend to do and they themselves did in relation to their own disciplines. Maintaining the umbilical cord that links Guattari and/or Deleuze with modernism prevents one from using their concepts to work through the paradoxes within individual nexuses of cultural history, for example Uccello as master of Renaissance perspective and representation *and* creator of surface play who appealed to the surrealists, or African arts as an important source for modernism *and* a vehicle for transmitting traditional values within the continent itself. Disjunctive synthesis can also be an excellent model for literally being able to think about apparently 'ridiculous' cultural juxtapositions, such as Mozart or Beethoven and Sénoufo or Peul initiation music: this kind of exploration could be a way of producing complexly textured globalised artistic products. It is worth adding that although Deleuze and/or Guattari do not have the acute and detailed type of perception gained from criticism or practice, they are much closer to this kind of perception than, say, Bourdieu, Baudrillard, Žižek and even perhaps Foucault are. There is a real possibility of combining elements from Guattari and/or Deleuze and '*nouvelle critique*', where the exhaustive internal analyses of artistic 'texts' in the latter could be yoked to the more 'advanced' philosophic and psychoanalytic ideas of the former.

The situation with regard to sociology and anthropology is similar, but the gap between Deleuze and/or Guattari and 'professionals' within these subjects is even more pronounced. Their references to theory in

this context are mostly anthropological – even though it was very much Deleuze who initiated the revival of interest in Gabriel Tarde – and those references are themselves fairly selective within the overall field of anthropological theory. They do use empirical studies, but again in a rather selective way: almost all of them relate to the anthropology of Africa. To a large extent, their approach to anthropology has to be understood in the context of their relationship to Marxism, above all their desire to go beyond the constraints of unreconstructed dialectical materialism. The problem is that they are engaging with work which would be seen as 'old-fashioned' by most modern anthropologists and sociologists, but their ideas, which in part come out of this engagement, on the construction and fluidity of identity and its relationship to nature, society and the cosmos could be very important for those very same modern specialists. Perhaps some kind of genuinely cross-disciplinary activity is necessary to bring Guattari and/or Deleuze 'back into the fold' of current sociology and anthropology.[3]

The position with regard to political theory is rather different: here a very coherent vision of the micropolitical and resistence to the monolithic or rigidifying macro emerges from the individual and joint work of the two thinkers; but, apart from Spinoza and Marx, they rarely deal with mainstream political theorists within the Western tradition, something that is not true of Derrida, for example.[4] Of course, this is what one would expect of Deleuze and/or Guattari's radically anti-establishment stance, but the difficulty of seeing precisely how their politics might work in practice might perhaps be overcome by the kind of wrestling with their predecessors that is characteristic of their psychoanalytic and philosophic work, which has a much more concrete quality.

The most beautiful and profound essay in either book – it is actually in the O'Sullivan and Zepke volume – is by Dorothea Olkowski. She tackles the problems of logic and paradox, depth and surface, and the psychoanalytic sections of Deleuze's *The Logic of Sense* with truly inspired passages of analysis, but she also makes an important detour via the work of Arendt, from whom she takes a valuable concept concerning the nature of thought: that it detaches humans from the world while they still remain part of it. This gives Olkowski a perspective that is immensely helpful for bringing out the disjunctive and asymmetrical qualities that are so essential to Deleuze and that make his work such a key corrective to any easy and self-deceiving 'rediscovery of the body' or 'fusion with the environment', where an unchanged thinking subject simply sees itself reflected in another medium. Joë Bousquet,

a significant figure in *The Logic of Sense*, is worth examining more fully in relation to the side of Deleuze that Olkowski explores. His extraordinary journey – reconstructing his shattered self, its connection with the world and the meaning of his past in different kinds of poetic language throughout roughly half his life – has everything to do with a response to disjunction and asymmetry.[5]

There are two further pure philosophy essays, by Daniel W. Smith and Steven Shaviro, in the Continuum volume, and three contributions that could be characterised as intellectual history across the two books: those of Alain Beaulieu, Sylvano Santini (both in Laval) and David Reggio (Continuum). Smith concentrates on *Difference and Repetition* and *The Logic of Sense*, giving an admirably lucid exposition of the mechanics of the relationship between identity, difference and novelty in Deleuze, his transcendental empiricism and his use of both Maimon's critique of Kant and mathematics, while Shaviro makes a sustained exploration of a kind of double causality of physical cause and conceptual purpose, mostly in Kant and Whitehead, though there are also some very illuminating passages on *The Logic of Sense*. Both essays are excellent, as also is the one by Beaulieu, which offers a very skilful blend of information about Deleuze's actual teaching practice and behaviour as an academic and an analysis of his approach to the history of philosophy, showing how he creates a sort of drama out of seeing his predecessors as friends, enemies and sparring partners. Santini's contribution is a well-researched account of the initial reception of Deleuze in the United States: it makes some valid points, but the relationship between 'French theory' and actual French philosophy is more complex and potentially more fruitful than Santini's arguments suggest. Reggio provides a short but valuable introduction to his excellent translation of a section from *Cartographies schizoanalytiques*, in which he mentions the various figures from the clinics of Saint-Alban and La Borde who were important for Guattari, as well as the valuable work of the philosopher Henri Maldiney, who also influenced Deleuze.[6]

There are five contributions across the two volumes primarily devoted to the visual arts: four in the Continuum book, by David Burrows, Eric Alliez, Claire Colebrook and Stephen Zepke, and one by Sjoerd van Tuinen in the Laval volume. Borrows' essay is the most fully satisfying of the five: he outlines Deleuze's and Badiou's philosophies of the event in a way that is contrastive but not *parti pris*, giving equal weight to the ideas of both philosophers, but when he uses these ideas to develop interpretations of the art of Duchamp, Pollock and Smithson, he does not try to fit the whole production of each

artist into one 'camp' or the other but rather shows how their works can be read from both perspectives. Burrows' approach also allows a kind of 'feedback' effect through which he can detect blind spots in the actual ideas of Badiou and Deleuze. The partisan dialectics that are absent from Burrows' contribution slightly mar the essays by Alliez and Colebrook. The former combines a Deleuzian and/or Guattarian vitalist interpretation of Matisse with a Lacanian one of Duchamp, but Alliez's sympathies are so strongly engaged that the arguments concerning Duchamp are underdeveloped, being used in part to dismiss what the artist did – although one should say that the passages relating to Matisse are very beautiful. Colebrook distinguishes between the presence in avant-garde art of a passive vitalism to be found in Deleuze and in the joint work and of an active Kantian one – again in a somewhat overly dialectal manner, though Colebrook makes perceptive links between these two vitalisms and the nature of the beautiful in different kinds of modern art. She also moves interestingly back and forth across the boundaries between artistic beauty and a beauty connected with pleasurable consumption or attractive physical appearance. Zepke argues very subtly for an alternative Guattarian idea of the readymade and its relevance to conceptual art, exploring the work of the Argentinian *Grupo de Artistas de Vanguardia*, Oiticica and Adrian Piper, and making some excellent points about how art can be political. Van Tuinen's essay is a little disappointing in that it does not do much more than bring together the passages on Mannerism from *Francis Bacon* and *The Fold*, but at least it does this in a very thorough way. A more fruitful approach might have been to pursue a sustained Deleuzian interpretation of a particular Mannerist artist, such as Lotto, Tintoretto, Pontormo, Rosso Fiorentino or Beccafumi. It would also be worth exploring the relationship between Mannerism and the neo-Platonism that it espoused as its philosophic base, but only if one adopts a Deleuzian attitude to the history of philosophy.

In the decades preceding the emergence of Berlusconi as a political force, Italy produced a type of left-wing culture that combined a Gramscian perspective on Marxism, sophisticated intellectuals who could 'work with their hands', a micropolitics of the regional, and a sophisticated use of the arts to foster collectivity. Obviously, there were parallels with comparable movements elsewhere, but the Italian version was distinctive and autonomous, with some splendid artistic and intellectual achievements. That is why the three excellent contributions in the Continuum volume by Bifo (Franco Berardi), Alberto Toscano and Maurizio Lazzarato are such a pleasure. All three essays broadly involve

a cultural/political critique of post-industrial, 'cognitive' capitalism and the shift from societies of discipline to those of control, while simultaneously negotiating the slightly contradictory relationship of Deleuze and/or Guattari to this historical development. There are, however, nuances of difference between each author's mode of 'spiritual resistance'. Bifo examines the notion of desire in Guattari and the joint work and eventually settles for the more resigned and muted old-age version of it in *What is Philosophy?* and *Chaosmosis*; Toscano argues for the importance of the Bartlebyesque quality of negativism in Deleuze and the joint work; and Lazzarato discusses Guattari's aesthetic paradigm, involving rupture and transversals, for the process of bringing together groups of people and creating situations. It is this last essay which comes closest to giving an idea of how a Deleuze-and-Guattarian world might be created, not simply how a non-Deleuze-and-Guattarian world can be resisted.[7]

Erik Bordeleau's very subtle and resonant essay in the Laval volume also explores the construction of alternative collectivities: he uses exegeses of the three references to China in *A Thousand Plateaus* as the *points de repère* in an outline of the overall spiritual journey of the book, showing its affinities with classical Chinese thought and art and distinguishing it very skilfully from the work of Foucault, whose relationship with solo Deleuze also features in two contributions in the Continuum volume, by Simon O'Sullivan and John Rajchman. The former makes some perceptive observations about technologies of the self and the production of the new in Bergson, Spinoza, Foucault and solo Guattari as well as Deleuze. O'Sullivan is also particularly good on meditation techniques. Of course, Deleuze brought out a book on Foucault in 1986, and this allows Rajchman to treat them as a composite philosophic figure, moving back and forth between the two in order to outline a kind of creativity that involves taking oneself away from oneself, learning by unlearning and going beyond the normative. The approach is a fruitful one, as it avoids being overly dialectical and therefore gets through to a continuum of ideas behind the 'positions' of the two philosophers. The possible application of the concept of the body without organs (BwO) to sociological theory and practice is proposed by Andreas Krebs in a very intelligent essay in the Laval volume. His reasons for wanting to employ the concept are perfectly valid: it will enable one to go beyond the discursive and/or intertextual into the area of affect. Krebs' exposition of the BwO is excellent, and he gives a reasonable picture of how it could be used in actual sociological fieldwork.[8]

There are four other worthwhile contributions on cinema, literature and music across the two volumes, two in the Laval book, by Serge Cardinal (cinema) and Dalie Giroux (literature), and two in the Continuum book, by Eugene Holland (music) and Darren Ambrose (cinema). Both the Laval essays are very impressive and have a distinctly political tinge to them. Cardinal offers a beautifully argued extended exegesis of a key phrase from *Cinema 2*, showing how cinema is initially closely bound up with capitalism but can 'take off' from it, disrupting the rotating system of equivalence it imposes on flow, and using crystalline circuits of the virtual and actual to conjure new modes of reality, with two different types of time being an essential factor here. The essay is especially good at emphasising how Deleuze does not simply reject capitalism but rather scrambles and reorganises its elements. The contrast between Max Brod's quasi-Freudian approach to Kafka and the anti-oedipal one adopted by Deleuze and Guattari in their book on him is the subject of Giroux's essay: her final presentation of the two authors' Kafka as politically subversive machine rather than angst-ridden individual is a very subtle one. Holland writes about jazz: his lengthy discussion of the concept of the refrain, the interpretation of the 'Fort/Da' phrase in Freud, and the idea of creative repetition in *A Thousand Plateaus*, which takes up over half his essay, is excellent. His characterisation of jazz as a Deleuze-and-Guattarian form of music is perfectly reasonable in a general sense, but he does not explore the fact that improvisation in the performing arts can often involve a high level of group pressure to conform and to give the audience what it wants. Ambrose deals impressively with the compositional grammar of film and its capacity to produce new images that capture the invisible forces of time (both of which are still evolving) via Deleuze's treatment of French Impressionist and German Expressionist cinema. This very important relationship between the structural engineering of Deleuze's philosophy and new types of compositional grammar in the arts also features in a piece of creative writing by Claudine Vachon in the Laval volume: two continuous texts run in parallel, one on the right-hand pages, the other on the left-hand ones. This means that if one reads the pages in numerical order, the two texts constantly intercut, and complex non-verbal resonances begin to emerge, all the more so because the two texts are quite different from each other, even if they seem to be linked because the third-person protagonist from the left-hand pages and the 'I' that speaks in the right-hand ones are both female and seem as if they are the same person. Nevertheless, the third-person text is a narrative, albeit a slightly mysterious one, containing a father–daughter relationship, a

female terrorist on the run, and a final act of intense but non-violent subversion in a work of performance art, while the first-person text is a stream of internal and body-situated-in-the-world consciousness, written in short, stylised phrases with a great deal of repetition, where the narrator listens to herself as an inner field of revolt open to the outside. Individually, both texts are accomplished, but the real strength of the piece lies in the creative interference and echoing that happen between them.

Overall, the combination of sustained intelligence, depth and variety throughout both volumes is remarkable. All of the essays deal with the transformational quality in the work of Deleuze and/or Guattari, but they do so from two slightly different perspectives: there is a greater sense of the collective in the Laval volume and in the 'Italian' contributions to the Continuum one, while much of the rest of the O'Sullivan and Zepke book is orientated towards the individual. Both perspectives are perfectly valid, but it is important to remember that what is precious about Deleuze and Guattari is that they eschewed both bourgeois individualism and the 'hard left' to point the way towards an extraordinary blend of fluid solidarity and interconnective sensitivity.

Notes

1. See Guattari 1989: 34–47. Comparison with the French text shows Reggio's translation to be a very intelligent one.
2. Solo Deleuze's treatment of the arts is well known, but that of solo Guattari rather less so. For the latter, one could do worse than start with the three essays on Genet, Witkiewicz and Balthus near the end of *Cartographies schizoanalytiques*. See Guattari 1989: 269–90, 303–10, 319–31. Guattari was also much more interested in Bakhtin than Deleuze was.
3. The main text in terms of anthropological references is *Anti-Oedipus*, although there is also a fair sprinkling of them in *A Thousand Plateaus*. For a concise discussion of the French Marxist anthropology that emerged in the late 1960s around the same time as Deleuze and Guattari were beginning their collaboration, see Bloch 1983/5: 146–172. For a recent attempt to relate Deleuze and/or Guattari to anthropology, see Viveiros de Castro 2009.
4. See in particular the recently published seminars by Derrida (2009, 2010), though the content of these two volumes very much relates to other work by Derrida. Nancy and Badiou are also much closer to mainstream political theory.
5. The ideas in Arendt which are used by Olkowski remind one of Merleau-Ponty, on whom she has co-edited an excellent book of essays: see Olkowski and Morley 1999. Bousquet comes into the twenty-first series of *The Logic of Sense*. For recent work on him, see Bhattacharya 1998, Gür 1998 and Gaudard 2000. Malabou (2009) is an absorbing work of original philosophy which discusses

accidental damage and personality change: there are references to Spinoza, Deleuze and the joint work.
6. Maimon's main text is now available in English: see Maimon 2010. For interesting books by figures from Saint-Alban and La Borde, see Oury 1989 and Tosquelles 2003.
7. For an impressive work of theoretical sociology that addresses the split between Reason, usually bound up with the state, and the Subject as private individual consciousness, and how to create new kinds of collectivity, see Touraine 1995, although there is hardly any mention of Guattari and/or Deleuze.
8. For two excellent recent books on *Anti-Oedipus*, see Cornibert and Goddard 2008 and Sibertin-Blanc 2010. For a rich philosophical work on Artaud and the body, see Margel 2008.

Call for Proposals (Papers)

Special Issue *Deleuze Studies* (Edinburgh University Press, Spring 2012) *The Smooth and the Striated*

In the context of the 3rd International Deleuze Studies Conference 2010, organised by the University of Amsterdam and the University of Utrecht, an exhibition and a debate with various researchers and artists reflected on the relationship between Deleuze's thought and contemporary art and media practice, with a particular interest in Deleuze and Guattari's chapter 'The Smooth and the Striated' from *A Thousand Plateaus* (See http://thesmoothandthestriated.wordpress.com). In continuation of this ongoing research and persistent interest in the meaning of 'smooth and striated spaces' in relation to Deleuze's thoughts on art, we are very happy to invite scholars from various practices to contribute to a special issue of *Deleuze Studies*, dedicated to a variety of issues evoked by the essay and its interpretations.

In 'The Smooth and the Striated' a characterisation of the 'smooth' and the 'striated' emerges from a look at various 'models' of interaction between these different kinds of space. While the nature of 'smooth space' is one of continuous development of form, 'striated space' produces an order and succession of distinct forms. 'Smooth' has a greater power of deterritoralisation, whereas 'striation' for Deleuze and Guattari, seems to denote a certain tendency to measure, categorise and solidify a particular state or situation. Important, for the authors, is the continuous reciprocal and entwined relationship between the two spaces: a smooth space elicits the emergence of a striated space and vice versa.

We would like to invite scholars to send a proposal for papers on topics related to the central theme of this issue of *Deleuze Studies*. We encourage authors to 'think with art' and thus to think about Deleuze's thought in relation to contemporary art and media practice. Topics for papers could include (but are not limited to) the following:

- How do artists reflect on the presence and representation of (historical) processes of smoothing and striation in our contemporary environment?
- What are the socio-political consequences of expanding striated spaces?
- How does memory relate to the ongoing interplay between the smooth and the striated?
- How do site specific art works integrate the smooth and the striated?
- How is art itself a way of smoothing (or striating) space?

Proposals (max. 500 words) can be send before 15 March 2011 to Patricia Pisters (p.pisters@uva.nl) and Flora Lysen (f.c.lysen@gmail.com). Deadline for full papers: 15 June 2011.

5th International *Deleuze Studies* Conference
Deterritorializing Deleuze

New Orleans, 25–27 June 2012

Hosted by Tulane University Department of Philosophy with Southeastern Louisiana University Department of History and Political Science.

The fifth annual *Deleuze Studies* Conference will continue to explore themes related to Deleuze and Deleuze and Guattari that have been the focus of previous conferences. In particular, this conference will bring together a wide range of researchers, writers, and artists who have each drawn inspiration from Deleuze's work. More to the point, this conference will explore the relationships between philosophy, science, and art, examining how each practice needs the deterritorializing influence of the other. A central question of this conference will be to explore the role the texts of Deleuze (and Guattari) have played in the emerging debates and discussions within and among philosophy, science, and art. A further question will be how work within the various philosophical, scientific, and artistic disciplines has in turn pushed Deleuze studies in new, promising, and unpredicted directions.

The 2012 *Deleuze Studies* conference will be held in New Orleans, on the campus of Tulane University. New Orleans is a unique city with a vibrant cultural life that will provide a perfect setting for a number of the evening events that will be planned in conjunction with the conference. Hosting the conference in the United States for the first time will also provide an opportunity for the ever-increasing number of people working on Deleuze in North America to present their work.

Possible topics for presentation at the conference can include, but need not be limited to:

- Philosophy and culture
- Architecture and urban planning
- Deleuze and analytic philosophy
- Neuroscience and philosophy of mind
- Aesthetics and artistic practice
- Globalism and the crises of capitalism
- Minor literatures and literary criticism
- Philosophy, ontology, and metaphysics
- Deleuze and the history of philosophy
- Gender and politics
- Problems in science and mathematics
- Historiography and philosophy

Length of presentations are to be limited to a maximum of 20 minutes. We welcome panel proposals. Submit your abstract or panel proposal (including abstracts) to the conference organizer by 1 February 2012.

Conference organizers: Professor Jeffrey Bell, Southeastern Louisiana University, and Professor Richard Velkley, Tulane University. For more information, contact Professor Bell at jbell@selu.edu.

Deleuze Camp

Preceding the conference students and scholars interested in the work of Gilles Deleuze are welcome to participate in Deleuze Camp 6 which will take place on 18–22 June 2012 in New Orleans. This venue will provide an opportunity for participants to engage with experienced scholars from different fields in readings of Deleuze's texts. The Deleuze camp will also include a student forum where participants can present their own work and ideas. Spaces are limited. For applications and more information, contact Professor Bell.

Signatures of the Invisible: On Schizoanalysis and Visual Culture

Phillip Roberts Cardiff University

This collection marks a critical juncture somewhere between Deleuze's studies of cinema (2005a; 2005b) and his schizoanalytic work with Félix Guattari (2004a; 2004b). Each essay in this collection positions itself in the field of discourse mapped out between each of Deleuze's projects; each acts as a little machine, redirecting the systems of discourse that pass between the constellations of Deleuze's thought so that they might break away onto new trajectories. Each of the essays here, in its own way, attempts to utilise a schizoanalytic conception of visual culture *in order to do something*. The task of this introduction is firstly, to sketch out the discursive field in which they are working – to determine where in the territory between Deleuze's two projects their little machines are set to work – and secondly, to consider what it is that these machines are doing. We are engaged here in the task of drawing up an inventory of these critical connections.

In two essays on schizoanalysis and cinema (2008; 2010), Ian Buchanan has already started to question what forms this connection might take, suggesting that although Deleuze himself was seemingly reluctant to construct his cinematic studies with the same systems of concepts that would inform schizoanalysis, there is nothing to stop us from putting these projects into communication ourselves. Deleuze's own silence on the connections between the two projects does not make such connections impossible or unnecessary, and 'doesn't mean', Buchanan says, 'we have to follow Deleuze in ignoring the questions he left unasked and unanswered' (2008: 2). This is the form that any successful intersection between schizoanalysis and cinema must take. In order to adequately determine what the field of discourse between the projects might look like, we must identify the spaces that Deleuze's own

Deleuze Studies 5.2 (2011): 151–162

© Edinburgh University Press
www.eupjournals.com/dls

lines of enquiry had failed to explore; find those questions that Deleuze's work left unasked and unanswered and to set our little machines to work. What this means is that rather than framing this collection as an attempt to *add* a schizoanalysis to Deleuze's work on cinema, we take this as an exercise of a different sort, that is, as a search for what is *missing* from this work that might be introduced through forcing Deleuze's cinematic toolbox into communication with the conceptual schema set forth by schizoanalysis.

Buchanan's work is useful in this respect, providing us with a provisional list of areas that the cinema books had failed to explore, lines of enquiry that Deleuze had not developed fully, and questions that were *beyond the scope of the strictly philosophical framework he set for himself* (2008: 2). Deleuze's analysis of cinema, Buchanan notes, is unconcerned with, and perhaps even unsuited to answering, questions of material film production: 'the interrelated questions of why we watch certain films and just as significantly why we pay money to do so' (2008: 2). He has seemingly little interest in film's effect on audiences or in its status as an industrial art, or in any form of cinema that might exist outside of those precious few examples that would demonstrate the potential of cinema as art. He does not at any point, Buchanan says, 'write about *Hell Behind Bars*, *Shaft*, *Night of the Living Dead*, *The Birds 2*, or even *Star Wars*' (2008: 11). In short: 'Deleuze refuses to draw any conclusions from his analysis of the sense of cinema about issues that do not pertain directly to cinema as a specific form of art' (2008: 3).

Buchanan is very clear on the spaces that he feels a schizoanalytic approach to cinema will help to fill, identifying questions relating to cinema as a mass culture object and setting his machines to work. But we can go even further than this, opening Deleuze's taxonomy of images to systems of art and advertising, fashion, photography, political reporting, professional athletics, media branding, pop music, celebrity magazines and association football. If, in *Cinema 1*, Deleuze would say that an atom is an image, or an eye or a brain or a body (2005a: 59), if he would frame *the universe as cinema in itself* (2005a: 60), then why stop at *Star Wars*? Why not open the image onto the world? Why not, as Guy Debord's theorisation of the image as spectacle would attest, conceive of 'a social relation between people that is mediated by images' (2009: 24) and develop the connections across Deleuze's work that would help us analyse this? This is precisely the reason why we have written *visual culture* rather than cinema on the front of this volume. Analysing the *social relations between people* is something that the schizoanalysis

books had already been doing, and as any communication between the two projects will demand that cinema opens itself to a bit of *relation to the outside* (as schizoanalysis asks), then any coupling of schizoanalysis *and* cinema must always be more than cinema – *Schizoanalysis and Visual Culture*.

So then, if we are to open Deleuze's studies of cinema onto the larger field of visual culture, then what spaces do we find in the discursive field between visual culture and schizoanalysis? What is missing and *why* is it imperative that we should bring this to light? By developing connections between the work in this way we can begin to ask those questions that Buchanan has already been driving towards and which in different ways had concerned much of the critical work on cinema prior to the writing of Deleuze's cinema books – questions of audience reception, of the cinematic apparatus, of ideology and, above all, of power. Paradoxically, Deleuze himself was to point out this absence in *Cinema 2*, dedicating a short section towards the end of the book to the functioning of a political cinema and to his admission that 'the people no longer exist, or not yet … *the people are missing*' (2005b: 208). This is perhaps as true of Deleuze's own work on cinema as it is of the films that he is analysing, as despite the richness of the few pages in which he explores the development of a third-world cinema, neither book is able to expand this political theorisation of the image in any significance. This is perhaps surprising given the concerns that these pages share with the schizoanalysis books, with Deleuze and Guattari's work on Kafka (1986), or even his book on Foucault (2006), published shortly after *Cinema 2* and directly concerned with the questions of power and visibility that could so easily have informed the preceding works.

We should perhaps be most surprised that even within his brief writings on third-world cinema, Deleuze would neglect to draw on the extensive work in this field that film criticism had produced in the years leading up to his cinema project. As such we find no mention of Third Cinema as a concept, of Solanas and Getino, or of Peter Wollen and Counter Cinema, both of which were relevant to Deleuze's position and available (and hugely influential) when he was writing his cinema books.[1] This not to say that Deleuze is blind to the existence of a wider cinema criticism; he is a great admirer of André Bazin, often refers to Christian Metz and marks Jean-Louis Comolli's political cinema as exemplary (although he refers to him only once and then only in his capacity as a film-maker). However, Deleuze's use of the great cinema theorists is restricted to the extent to which each coincides with his own

study of cinema as a philosophical exercise. He is seemingly unwilling to insert his work into a wider theoretical discourse on cinema, to see where a Bergson-inspired reading of cinema might sit along side the psychoanalytic, semiological and ideological studies that were prevalent at the time, to engage his toolbox of concepts in the problems that would inform each approach.

Given the scope and complexity of his cinema studies, we should perhaps not hold Deleuze to account for this too strongly, but rather set ourselves to the task of perverting his work so that it might be able to answer these very questions. If we are to apply Deleuze's thinking in this other work to *Cinema 2*'s few pages on political cinema, we should see how in constructing a people that do not yet exist, these films are engaged in the process of *making visible* a people that had been hidden. So when Rocha films his Brazil he isolates a lived experience beneath the myth of Brazilian cinema, making visible a new Brazil; when Sembene films his talking-cinema, he makes visible the African as story-teller, and contrasts this with the myth of the African as dancer (2005b: 214), thus constructing a reality that had not been made visible and providing an actually existing people with the tools to speak about their own political reality for the first time.

Buchanan is correct to highlight that Deleuze's conception of the cinematic image is already schizoanalytic (2010: 136); our questions of visibilities and discourse already direct us towards the formalism of *A Thousand Plateaus*. There is a conceptual equivalence, Buchanan says, in which the body without organs, the abstract machine and the assemblage, already inform the basic matrix of Deleuze's account of the cinematic image (ibid.). Schizoanalysis is already present within the cinema project, obscured in the spaces between the lines of Deleuze's strictly philosophical and aesthetic discussion of cinema. It is the task of our own critical machines, of each of the essays in the present collection, to discover it and reorder the points of intersection between the two projects so that we might begin to traverse the many important territories that Deleuze's work has not yet fully explored. We might direct our lines of enquiries towards questions of power in visual culture, towards mass culture or the material production of film, spectatorship, or innumerable other points in our field of critical discourse, and find that despite his apparent silence on any number of such issues, these systems of enquiry are already at work within Deleuze's cinema project – what we require of schizoanalysis is that it make these systems visible.

Tom Conley's contribution, which opens this collection, is engaged in this very act, developing Buchanan's suggestion that specific words and images function *in the manner of little machines* in order to explore an important (but surprisingly infrequent) dialogue between the works of Deleuze and Maurice Blanchot. Conley takes as his starting point an encounter between the two thinkers that an essay by Marie-Claire Ropars-Wuilleumier had already staged (2010), arguing that Ropars-Wuilleumier's reading of Blanchot's interventions into Deleuze's thought in *Cinema 2* alters and occasionally subverts his taxonomical and philosophical project. By this he means that Blanchot's formulation of the *outside,* a space that is irreducible to language, that resides between what is said and what is not said, confronts Deleuze's cinema of thought with an outside – an unthought. This outside is the spaces of discourse and visibility that have not yet come into emergence. It confronts Deleuze's cinema of thought with the spaces of what is not thought, the peoples that are yet to come, the systems of knowledge that are yet to be made visible, and should inform our reading of visual culture as not simply an ordering of what is seen and said but as a marker of what we do not yet have the tools to express. That is, as a confirmation of what is missing from the regimes of the visible.

Conley utilises his little machines as conceptual *diagrams,* recurring formulas of concepts that operate, he says, as machinic systems that we can set to work within Deleuze's thinking. A diagram is a map of forces; there is a diagram for every historical formation – a Napoleonic diagram or a Fordist diagram – one for every system of discourse or visibility. It is an abstract machine, Deleuze says, that 'communicates with the stratified formation, stabilizing or fixing it, but following another axis it also communicates with the other diagram, the other unstable diagrammatic states, through which forces pursue their mutant emergence' (2006: 71). Diagrams are tools that can help us to make visible the spaces within Deleuze's work – to bring it into contact with the *outside* of his thought.

Hanjo Berressem's incisive reading of a schizoanalytic Hitchcock will develop this idea further by addressing the use of montage in *Psycho* and *The Birds*. Schizoanalysis, we are reminded, presupposes that the machinic assemblages, the architectures of forms within which our diagrams will operate, are *systems of interruptions or breaks*. It is the cut that breaks the continuous material flow and at the same time produces a new one. It is this premise upon which the actual concrete machines and the virtual abstract machines, the formations of

matter and thought, are assembled. For Berressem this is quite literally montage – an arrangement of flows and cuts that mark the relation between the actual and the virtual. Here Berressem has drawn from what Tom Conley, in another article, would call *the mental map of classical cinema* (2009), framing the fields of forms and forces that Conley would discuss as actual forms and virtual forces – marking the actual/virtual cut as reminiscent of the thought/unthought diagram that would emerge from Deleuze's encounter with Blanchot. Here it is the virtual – the field of intensive events, of duration and memory, the breaks in the actual material and perceptual matter of film – that forms the basis of Hitchcock's cinematic arrangements; it is the spaces between the actual arrangements of form that are to reform the whole. We can certainly read the essay itself in similar terms, observing how Berressem's approach, in challenging the logic of what he feels is a critical fixation on an Oedipalised Hitchcock, seeks out the virtual fissures within the Oedipal interpretations of Hitchcock's films in order to reform the whole into a schizoanalytic Hitchcock of *pure optical and sound images*. This will make psychoanalysis into the actual matter into which the sensory shock of Hitchcock's cinematic form can cut. It will, Berressem says, make the material and contextual form of the films into optically and auditively assembled blocs of affect; the narrative continuity of *Psycho*, all its Oedipalised formations, even Marion Crane's early embezzlement narrative, all MacGuffins before Hitchcock's delivery of the film's ultimate visceral thrills in the motel shower scene.

Similarly, Nadine Boljkovac's fine essay engages in an analysis of the actual and virtual elements of Chris Marker's *Sans Soleil*, scouring the film for the forces and sensations that exist beneath the discursive systems and visibilities of the film itself. Boljkovac explores the regions of what is left unsaid, in order to make visible the relations between Deleuze's thought and the cinema of Chris Marker. Boljkovac again looks to explore the *outside* of thought that *Sans Soleil* draws out of its images – the virtual connections that occur between the actual forms of our world. Boljkovac approaches Marker's film as an exercise in virtual mapping – an ordering of forces that occur between the actual forms of the film. The material images of the film are assembled with the same virtual cut that Berressem will seek to draw out of Hitchcock's work. *Sans Soleil* foregrounds the cuts between its images. They are, Boljkovac suggests, fissures or cracks, dissociative forces or holes in appearances; they are the breaks within the visible substance of the film itself or between the concrete structures of the everyday world – the forces of time or memory or belief that intersect banality. This is a cartography

of cinema as diagrams of forces and sensations; little machines hidden in the spaces between forms that Marker can set to work, *making the territorial assemblage open onto something else*; making the concrete organisations of banality, both familiar and indecipherable, open onto the spiritual and cosmic worlds within our own.

This contrast between virtual worlds and actual forms is further interrogated by Richard Rushton, who attempts to re-insert the concerns of cinema theory into Deleuze's discourse on film, relating his actual/virtual conceptual framework to the concepts of the real and imaginary developed by the Lacanian and Althusserian film theorists of the seventies and eighties. Here Rushton questions the position of the imaginary in Deleuze's cinema works, suggesting that, perhaps contrary to our expectations, the imaginary is far from an absent concept. The imaginary is utilised by Deleuze, particularly in *Cinema 2*, but is eclipsed by his focus on the actual/virtual schema that informs his reading of movement and time. But what does this semi-neglected imaginary *do* in Deleuze's work, Rushton asks? What is its relationship to the Lacanian-Althusserian film theory that was prevalent at the time of Deleuze's project? And how might we utilise Deleuze to conceive of a different kind of imaginary, one that is not to be formulated as pure negativity or ideological fantasy? Rushton is thus engaged in a twofold project – to re-trace the position of the imaginary in Deleuze's writings and also to challenge the dominant reading of the imaginary in Baudry or Heath or Narboni and Comolli as negative fiction, a *false consciousness* that can be contrasted to a cinema of the real.[2]

What is at stake here are the same questions of power that would shape the theoretical discourses of certain kinds of film criticism. David Rodowick would choose to frame this as a film criticism of *political modernism*, 'the expression of a desire to combine semiotic and ideological analysis with the development of an avant-garde aesthetic dedicated to the production of radical social effects' (1994: 1). The *Cahiers du Cinéma* of Jean-Louis Comolli and Jean Narboni is particularly instructive in this respect, as they highlight in their famous editorial the political function of a cinema criticism that much of the world of film theory was to follow. This form of cinema criticism exists to root out the ideologies and ideological functions of the cinematic machine, say Narboni and Comolli, to challenge 'the necessity of reproducing things not as they really are but as they appear when refracted through ideology' (1976: 25). From the perspective of Deleuze's actual/virtual analysis the juxtaposition of an imaginary (ideological) representation to a real representation is problematic, and

exploring this difficulty is clearly Rushton's point. However, we can see how this very form of critical discourse – concerning the power relations through which the cinematic apparatus might address its viewer, the construction of discursive systems, the utilisation of visual media to produce and circulate ideological positions – is not at all alien to our concerns, despite Deleuze's own reluctance to draw from it in any significant detail. We have already addressed the productions of visibilities that our schizoanalysis/visual culture diagram might seek to produce. The cinematographic machine is engaged in the act of *producing* those images that make a people or a world or a system of discourse visible; it serves to actualise what is virtual, to make the possible into something that *is*. This political modernism of cinema criticism that Rushton takes as his starting point had discovered that cinema was producing something of these spaces between the actual forms of the material world, but had drawn from this only an *imagined* real that should be unfavourably contrasted with an actual concrete real. If, following Deleuze, we can show how these imagined forms are no less real than their actualised counterparts, then we can re-order the spaces within this political modernist criticism in order to find that there is something of value in these spaces, that what is not actual must not necessarily be aligned with what is ideological mystification; and this is surely the value of Rushton's work.

The final two essays in this collection, by Patricia Pisters, and William Brown and David Fleming, are more directly concerned with the interrelation of schizoanalysis and visual culture, and return us to the concerns expressed in Buchanan's work and, in particular, to the question of delirium. Buchanan had suggested that delirium should be taken as the basis of a schizoanalytic understanding of visual culture. He utilises Deleuze and Guattari in order to argue that cinema is suited to capturing the movement of madness, and that a schizoanalysis of cinema must seek to explain why this is so (2010: 136–46). If every delirium, as Deleuze and Guattari say, is the investment of a field that is social, economic, political, cultural, racist, pedagogical and religious, then how might we make an analysis of what is delirious about cinema in order to connect Deleuze's cinematic studies to the spaces in which these discourses circulate? If, as Buchanan would suggest, 'Deleuze and Guattari's reconceptualization of delirium as a *regime of signs* can be used to inaugurate a new kind of semiology of the cinema' (2010: 153), then how might we begin to make visible the systems of signs that connect the image to the world itself (and what problems might this help us to solve)?

Patricia Pisters suggests that we can read the contemporary state of cinema and visual culture as modelled by the schizophrenic brain. Clinical schizophrenia, she says, is the degree zero of schizoanalysis, and serves as the basis for a new conceptualisation of cinema that centres on what she calls the *Neuro-Image*, that is, a third image (following on from Deleuze's movement and time images) in which visual culture is determined by Deleuze's third synthesis of time and opens to the future – the spaces of what is possible but is not yet. Contemporary visual culture is a complex system of connections, of electronic signals and binary information, like the schizophrenic 'too much of everything' that Pisters would identify in another essay, the 'fundamental characteristic of the contemporary saturated world where there is always too much (or too little) of everything' (2008: 111). Indeed, Deleuze himself would highlight at the beginning of *Cinema 1* how cinema is ordered in this way, arguing that the visual apparatus of cinema acts like consciousness; that 'the whole cinematic consciousness is not us, the spectator, nor the hero; it is the camera – sometimes human, sometimes inhuman, sometimes superhuman' (2005a: 21). In this way we can begin to analyse how the marks of light that make up our perceptions of cinema and visual culture are organised as a system of thought; how does the visual form a system of discourse? How does it construct and disseminate a field of knowledge? A schizoanalysis of visual culture can help us to see how our own brains might open onto these systems; establishing a connection with those spaces of discourse that are outside of our own synaptic circuits – connecting us to the thought of the outside. 'What is on the screen is delirium in person', says Buchanan, 'what we see is always in somebody's head, and for that reason, it looks and feels real, even when it is not' (2010: 140). The cinematic delirium is not, as the film theorists of political modernism had objected, a falsified or imagined depiction of a real world, it is a fully real part of this world – it is real without being actual. We have seen the emergence of these virtual forms through Berressem and Boljkovac's work and can now draw our lines between Deleuze's projects with more certainty. We can find within the visual 'the feeling of having sensed something that does not belong to this world [...] something that can only be sensed, that cannot be put into words' (Buchanan 2010: 137). This is why Pisters had chosen to invert Comolli's statement that cinema is a machine of the visible; the cinematic apparatus and the systems of visual culture are, rather, *machines of the invisible* (2008: 113). They are systems that serve to make visible the virtual relations that lie beneath the surface of the actual forms of visual culture.

Brown and Fleming, in an insightful reading of *Fight Club*, attempt to trace the emergence of these virtualities even within a mainstream Hollywood blockbuster. What potentials for deterritorialisation might occur even in contemporary cinema of this sort, they ask? And furthermore, could it be argued that Deleuze himself has underestimated such potential in modern Hollywood? Or could we alternatively (or concurrently) suggest that schizoanalysis itself, to the extent that we can now find it in 'mainstream' cinematic forms, might have reterritorialised onto the imagined spaces of those same ideological discourses? We might also ask Brown and Fleming whether the same deterritorialisations, these same departures from the actual textures of light that make up our perceptions of cinema into the forces of the virtual, can be found in Coca-Cola commercials or in video games or what we might consider the everyday manifestations of visual culture. We might question whether these forms of images might construct, as Brown and Fleming suggest (following a 2009 article by Rushton), an image-viewer assemblage in which the spectator might connect with the systems of thought that visual culture composes, in order to constitute a new form of consciousness. If the systems of visual culture that we are attempting to open Deleuze's thinking towards might form a *contagious set of ideas*, then we shall need to consider how the formation and circulation of these ideas might be articulated by a schizoanalysis of visual culture. There is clearly much work to be done in this respect, but what I would like to suggest is that these final two essays might in some way help us to further illuminate this connection (between the image and the world; between cinema and delirium; between Deleuze's two projects) and in doing so, help us draw out these same connections in each of the other essays in this collection.

My own necessarily idiosyncratic readings should, I hope, help to sketch out a preliminary sense of how each of these essays relates to the development of a schizoanalysis of visual culture and how each of them might help us to sketch out some of the spaces that were left blank in the systems that make up Deleuze's own work. Doubtless there are other spaces within this volume that we have not explored; forces within each system of thought that we have not yet made visible. A schizoanalysis of visual culture is surely more complex and more open than we could have possibly done justice to here, and I have no doubt that the following essays will only serve to demonstrate this; to show what is not yet visible, but nonetheless present in Deleuze's thought; to find new spaces within this thought and set their little machines to work.

Deleuze and the Filmic Diagram

Tom Conley Harvard University

Abstract

This article aims to consider how the 'diagram' or 'little machine' is integral to the dissociative, at once polyvocal and polymorphous *writing* that marks the work of Blanchot and that, in turn, informs the disjunctive – hence critical and productive – operation within the register of Deleuze's writings on cinema. I shall consider a number of Deleuze's 'keywords' or recurring formulas *as* diagrams, that is, as intermediate configurations at once visual and lexical, in order to show how, like rebuses or ideograms, they form collisions and ruptures of voice and graphic form, in order to bring forward the 'outside' of thought – what cannot be put into language yet is conveyed in language.

Keywords: Blanchot, diagram, schizoanalysis, cartography, cinema

'Is a Schizoanalysis of Cinema Possible?' In the response to the question he poses in the title of his probing essay on Deleuze and film, Ian Buchanan argues that over the course of the author's work 'specific words and images' or 'diagrams' function 'in the manner of little machines' according to the context in which they are deployed (Deleuze 2010: 136).[1] Pertinent to one situation, then to another, and then to another yet again, diagrams migrate back and forth across the writing. They find optimum effect, he adds, in the reading of films, an operative process that applies to these various contexts. Buchanan suggests that what Deleuze *does with* film figures in a broadly based and highly effective political aesthetics. Neither holistic, reductive nor of thematic orientation, his reflections work towards a tactics of 'reading' cinema that draws on Deleuze's repeated insistence that film is a medium of simultaneously visual and lexical virtue. It is one that needs to be seen

Deleuze Studies 5.2 (2011): 163–176

and read in the same cognitive gesture. Right from the outset of *L'Image-mouvement*, writing of the rarefaction or saturation of the cinematic surface within the borders of the frame, Deleuze remarks that 'l'image ne se donne pas seulement à voir. Elle est lisible autant que visible' (the image is given not solely to be seen. It is as much legible as it is visible) (Deleuze 1983: 24).[2] And at the end of *L'Image-temps* he underscores how much 'la division du visuel et du sonore' (the division of sight and sound) helps us to see where the aesthetics and politics of film are interwoven (Deleuze 1985: 352). The diagram becomes ubiquitous. Modern cinema, he notes elsewhere, having killed the flashback, imposes a dissociation of sound images from visual images (364).

We begin to see how the identity, difference and repetition of the reciprocal identity of seeing and reading ramifies throughout the oeuvre. Such may be the cinematic diagram to which Buchanan refers. It is studied on similar grounds but from a different angle in 'Image or Time? The Thought of the Outside in *The Time-Image* (Deleuze and Blanchot)', Marie-Claire Ropars-Wuilleumier's epochal reading of the ways that Blanchot intervenes, alters and occasionally subverts what, at their outset, Deleuze had called the taxonomical and philosophical project of the two volumes.[3] Blanchot's reflections on the *dehors* or the 'outside' – a space beyond meaning or that cannot be put in words or that resists all ideation, she argued, bear directly on Deleuze's appreciation of cinema that confronts an 'outside' and an 'inside' independently of any spatial and temporal distance or interval. Thanks to Blanchot, his is a concept of cinema where 'thinking outside of itself' broaches the *impensée* or 'unthought' within *la pensée* or 'thought' itself. By way of Blanchot the project aimed at offering a 'tableau' or gridded picture, quite possibly a large-scale diagram of cinema is thrown awry. Thanks to the author of *L'Entretien infini* (The Infinite Conversation), cinema reflects on the limits of thinking wherever there is 'the absolute contact of an outside and inside that are infinite [*non-totalisables*], asymmetrical [*asymétriques*]', or the presence of what Deleuze calls an 'autonomous outside that is necessarily given as an inside' (1985: 363). As Ropars-Wuilleumier puts it succinctly, 'Suddenly appearing in an analytical detour, Blanchot's [force of] attraction quickens the strangeness of a Deleuzian text that does not follow its own declared program – thought-cinema – in taking the risk of letting thought escape the conceptual frame to which it attends' (2010: 28; translation slightly modified).

The paragraphs that follow seek to discern some of the affinities of Buchanan's and Ropars-Wuilleumier's readings in order to consider how the 'diagram' or 'little machine' is integral to the dissociative,

at once polyvocal and polymorphous *writing* that marks the work of Blanchot and that, in turn, informs the disjunctive – hence critical and productive – operation within the register of Deleuze's reflections on cinema. A working hypothesis is that recurring words, stylistic turns and the contours of various formulas pose creative obstacles to the formulation of concepts. As a corollary, they become quasi-cinematic 'icons' or filmic shapes where writing and cinema are of the same meddle. These icons bring together, in an oft-repeated *rupture de contact* – the formula is Blanchot's – philosophy, cinema and poetry. When they are embroiled in what Buchanan calls Deleuze's political aesthetics, they become especially operative.

For that end I shall consider a number of Deleuze's 'keywords' or recurring formulas *as* diagrams, that is, as intermediate configurations at once visual and lexical; that to a degree are what elsewhere, in his study of Francis Bacon, he calls 'an operative set of asignifying and nonrepresentative lines and zones', for what concerns painting, 'traits and color patches' that 'unlock areas of sensation'. The diagram is abstract in nature, and it is even a ordering of chaos, 'a catastrophe', but also the germ of rhythm, a violent disorder in respect to figuration (Deleuze 2003: 83). The diagram also belongs to a deeply embedded poetic tradition in which, like rebuses or ideograms, collisions and rupture of voice and graphic form, it brings forward the 'outside' of thought – that is, what cannot be put into language yet is conveyed in language.[4]

Ropars-Wuilleumier had shown that Blanchot offers a model for a cinematic writing of the 'limit' or 'outside', suggesting also that his 'Parler, ce n'est pas voir' may be the one essay in *L'Entretien infini* best informing the film theory. To see how it will suffice, first, we need to examine how it figures in Ropars-Wuilleumier's reading before, second, it can be studied in its own placement or *disposition* (in the loose but carefully designed order of Blanchot's work). For this purpose it is useful to determine how 'Parler, ce n'est pas voir' inflects the composition of *L'Entretien infini* from its own intermediate stage, in proof-form, to its final published version in 1969.[5] Keynote is to see how it 'works' as a 'zone' in a set of essays that owe their force more, as Blanchot elsewhere in the volume remarks of the poetry of René Char, to juxtaposition than to composition: therein are perhaps some of the elements of Deleuze's own film-writing.

At the end of *Cinéma 2* Deleuze asserts how a 'new time-image' locates visibility between the visual and the auditory' (360–4 and *passim*). He discerns a visibility of the invisible that is countenanced

in the texture of 'Parler, ce n'est pas voir', the essay that, according to Ropars-Wuilleumier, Deleuze radically 'inverts into a "to not speak (or a speaking at the limits of sound)" ' (2010: 18). Deleuze negates Blanchot's critique of vision that inheres in speech while calling 'into question the possibility of seeing the visible' (ibid.). The force of attraction of what Blanchot calls the 'outside' *dislocates* or estranges speakers or viewers from stable points of reference in their milieus. In her words, 'the outside obstructs the interiority of the inside and removes all spatial anchoring from exteriority itself' (19). In Blanchot's essay 'presence', what would be part and parcel of the 'present' of time and space assumed to be here and now, is shown to be outside or exterior to itself. Ropars-Wuilleumier, in establishing a threshold for her reading, further specifies the nature of Deleuze's understanding of Blanchot that emerges from his *Foucault* (1986). Quite possibly 'Deleuze has barely read Blanchot because he distorts his terms, does not retain what concerns time, and rejects the radical logic that places ontology into question' (ibid.): because in the *Foucault* that immediately follows *L'Image-temps* in 1986, Deleuze deploys the distinction of discursive and visible formations to sustain the hypothesis, gained from cinema, that the visible is irreducible to language (21). The dialogue with Foucault further allows him to develop fresh speculation about the nature of a 'diagram'. Via Foucault, Blanchot's outside is marshalled to show how an open-ended play of *force* emerges from the circumscriptions of *form*. 'L'histoire des formes, archive, est doublée d'un devenir des forces, diagramme' (the history of forms, the archive, is doubled by a becoming of forces, a diagram) (Deleuze 1986: 51, cited by Ropars-Wuilleumier 2010: 21).[6] History, taken to be an archive, is a recognisable architecture (*form*) whereas the diagram that both duplicates and exceeds the latter is an open and not entirely predictable 'becoming' (*force*).[7] It also draws the 'outside' into a welter of maps and issues of mapping. A diagram is at once a map and layering of maps superimposed upon one another from which an implied 'stratigraphy' is availed to the reader or archaeologist whose eyes move across them, one stratum over another, in order to discern where forces might be vectored from given coordinates in the archive or geology of 'forms' in which they seem to be concealed. From diagrams a regime of creativity, mutation and resistance becomes possible. Deleuze's recrafting of Blanchot through Foucault allows him to turn cinema into a map of becoming, or at least a medium endowed with potential of the kind suggested in the infinite substantive that is *le devenir*.[8] Telescoping Ropars-Wuilleumier's argument, we might say that a cautiously open-ended 'becoming' is identified with cinema, and

as a result the medium can be thought of in the manner of the 'new cartography' that Foucault is shown fashioning in the pragmatics of theory undergirding his archaeology and history.

The theoretical potential of the seventh art – the infinite possibility of its substance – is obtained circuitously. By diverse means coming to a same end, 'Parler, ce n'est voir' allows Deleuze to have the medium reach the limits of what can be seen and what can be heard. The outside is affiliated with off-screen space and voice-*off*, which can suggest disembodiment, and at the same time it can be suggestive of things whole or total. Using Bresson as Blanchot's double, Deleuze cites the filmmaker's *Notes sur le cinématographe* to affirm how a principle of non-coincidence or difference operates in cinema. 'Lorsqu'un son peut supprimer une image, supprimer l'image ou la neutraliser' (when a sound can suppress an image, suppress the image or neutralise it), it happens that 'le sonore sous toutes ses formes vient peupler le hors-champ de l'image visuelle, et s'accomplit d'autant plus en ce sens comme composante de cette image' (sound in all of its forms begins to populate the off-screen space of the visual image, and it is realised all the more in this way as a component of this image) (cited in Deleuze 1985: 306). Taking Ropars-Wuilleumier's reading along a different path, we might say that the essay becomes a 'passe-partout' or skeleton key that opens the door to the 'outside' and that remains a map for cinematic itineraries by which the viewer gains access to its threshold.

It suffices to discern the way that 'Parler, ce n'est pas voir' *becomes* what it is in the 'superimposition of maps' visible in the production of *L'Entretien infini* – specifically, in the relation of the page proofs of the book to its final printed form. By and large changes to this essay are minimal. Some of the spaces between the words are tightened or opened, and at others a comma and a colon are either inserted or removed. The shift of the force of the text in the whole or *tout* of the volume is found elsewhere, notably at the edge between the 'inside' and 'outside' of the book itself, in the paratextual matter of the cover, the initial page of five epigraphs (v). In addition, a prefatory note (vi–viii) serves as an introduction to the open-ended aspect of forty chapters, parsed into three sections ('La Parole plurielle', subtitled [between parentheses] 'parole d'écriture' (1–118); 'L'Expérience-limite' (119–420); 'L'Absence de livre', also bearing a subtitle title in parenthesis '(le neutre le fragmentaire)' (421–636). A short postface (637) that initially is a typescript insert in the proofs indicates that the author would like the 'moving, articulated-inarticulated' relation of the book to its play of form (what Blanchot admires in René Char) bear witness to items,

written from 1953 to 1965, that are more operative when remaining undated in the gist of the book itself. The absence of chronological markers seems to explain that the author holds 'them to be already posthumous' and shows why he is led 'to look at them as almost anonymous' (637). As the writings become more remote their author slowly disappears into the collective murmur of the language that conveys them. The writings

> [t]hus belong to everyone [*tous*], and [are] even written and always written, not by one alone, but by several, by all those for whom it is incumbent to maintain [*maintenir*] and to prolong the exigency to which I believe that these texts, with an obstinacy that today astonishes me, have ceaselessly sought to respond, up to the *absence of the book* that they designate in vain. (Ibid.)

These final words appear to confirm the reason why the author takes care to remove from the title page a parenthetical subtitle, '(recherches)' (searchings) set below *L'Entretien infini*, the title printed in appreciably higher case. What began in the name of 'recherches' in the proofs is now bereft of direction or of a projective geography of investigation. Or perhaps, faithful to the destiny of chance, any association with the famous epigraph that André Malraux once used for his psychological history of art might be avoided: Picasso's dictum (that Lacan elsewhere cited), 'je trouve mais je ne cherche pas' (I find but I do not seek). It can be inferred that research or repeated action of inquiry, what 'Parler, ce n'est pas voir' so stridently calls a *crisis*, need not be signalled from the title page but, rather, merely lost and 'found' (*trouvé*) when the reader proceeds by chance or … happens to discover in stumbling upon the chapter. Thus the incipit of the essay-dialogue responds to what has been erased:

> III
>
> *Parler, ce n'est pas voir*
> « Je voudrais savoir ce que vous cherchez.
>
> – Je voudrais le savoir aussi. Cette ignorance n'est-elle pas désinvolte?
> – Je crains qu'elle ne soit présomptueuse. Nous sommes toujours prêts à nous croire destinés à ce que nous cherchons, par un rapport plus intime, plus important que le savoir. Le savoir efface celui qui sait. La passion désintéressée, la modestie, l'invisibilité, voilà ce que nous risquons de perdre en ne sachant pas seulement. » (35)
>
> (I want to know what you're searching for.
>
> – I would also like to know. Isn't this unawareness slightly offhand?

> – I fear that it might be presumptuous. We're always ready to believe ourselves destined to find what we're seeking, through a more intimate relation, more important than knowledge. Knowledge effaces he or she who knows. Disinterested passion, modesty, invisibility; that's what we risk losing solely in not knowing.')

In the imaginary filigree drawn between the title and the text, *pas voir*, not to see, gives the reader to see – to see the visual echo of *savoir* as both verb and infinitive substantive. The two corresponding voices are *seen voice-off* or disembodied in the dialogical form in which they are cast. What one of the voices notes as our believing in being destined to find what we seek through a 'relation more important than knowledge' may be what the erasure of the subtitle to the book makes clear. When '(recherches)' vanishes in the transformation from proof to book the reader beholds an evanescing voice from which any sign of a search for certitude fades away. Or: *Voir, ce n'est pas sa . . . voir*? Perhaps in the way that the text makes *voir* and *savoir* become echoes of each other encodes Freud's *ça* and Mallarmé's *là,* the unknowable force and place (or musical note) of what cannot be named, and at the same time, *sa*, the acronym of the terror of absolute knowledge, of what the next shard of dialogue calls 'la terrible flamme du *s*avoir *a*bsolu' (the terrible flame of absolute knowledge) (34).

Reflection on searching turns to its contrary in finding, and therein the dialogue accrues even greater potential force. The second (or another) voice notes that '[il] y a ceux qui cherchent en vue de trouver, même sachant qu'ils trouveront presque nécessairement autre chose que ce qu'ils cherchent' (there are those who seek in view of finding, even knowing that they will almost by force find something other than what they seek) (ibid.). The remark prompts the interlocutor to reflect on the etymology of *trouver* without (or before) considering the form of the verb in its visual aspect:

> – Je me rappelle que le mot trouver ne signifie d'abord nullement trouver, au sens du résultat pratique ou scientifique. Trouver, c'est tourner, faire le tour, aller autour. Trouver un chant, c'est tourner le mouvement mélodique, le faire tourner. Ici nulle idée de but, encore moins d'arrêt. Trouver est presque exactement le même mot que chercher, lequel dit: 'faire le tour de'. (35–6)

> (I recall that the word to find doesn't first of all mean to find, in the sense of a practical or scientific result. To find is to turn about, go around, do a tourney. Here no idea of a goal, even less of arrest. To find is almost exactly the same word as to search, which means: to go around.)

The reader cannot fail to see the transcribed words of the speaking voice veering towards a musical appreciation of *trouver* and towards, too, the sense of an eternal repetition and return. Yet the remark leads to further reflection on the cinegraphic disposition of the verb. The voice utters, 'Trouver, c'est chercher par le rapport au centre qui est proprement introuvable' (To find is to search by way of the relation to the centre that cannot be found) (36). Seasoned readers of Blanchot recall that the epigraph to *L'Espace littéraire* (1955) asserted that no matter how fragmentary its composition may be, a book will betray a movement to and away from an imaginary centre, and that here too a geography of centre and circumference may be defining the space of the work before the reader's eyes.[9] But it also draws attention, in the gloss of the words when they are seen and heard in their montage, in accord with the sound- and image-tracks of writing, to *force* emanating from verbal *form*. In *trouver* the visual axis is the vowel *ou*, the homonym of *où*, or (*ou*) the 'where' about which *trouver* is said to turn. Or is the unconscious or unknown the *trou*, the hole or abyss written into the word? Can it be said that the troping, the *ver(s) où* that caps the word is also what opens it, leaves it *ouver(t)*, at the edge of a space 'outside' or beyond the bounds of meaning? Like what is seen in the erasure of *recherche* from the title page, the play about and around *trouver* indicates that the word is a diagram, a 'little machine', indeed a miniature map of forces that come forwards from the aural and visual matter embedded in its form.

The end of the essay may be a return to its beginning. But for a first and only time in the reflection does the abstraction of the movement find in the words what might be called a totemic echo:

> « – Voilà donc à nouveau la bizarrerie de ce tour vers … qu'est le détour. Qui veut avancer, doit se détourner, cela fait une curieuse marche d'écrevisse. Ce serait aussi le mouvement de la recherche?
> – Toute recherche est une crise. Ce qui est cherché n'est rien que le tour de la recherche qui donne lieu à la crise: le tour critique.
> – Cela est désespérément abstrait.
> – Pourquoi? Je dirais même que toute oeuvre littéraire importante l'est d'autant plus qu'elle met en oeuvre plus directement et plus purement le sens de ce tournant, lequel, au moment où elle va émerger, la fait étrangement basculer, oeuvre où se retient, comme son centre toujours décentré, le désoeuvrement: l'absence de l'oeuvre.
> – L'absence d'oeuvre est l'autre nom de la folie.
> – L'absence d'oeuvre où cesse le discours pour que vienne, hors parole, hors langage, le mouvement d'écrire sous l'attrait du dehors. » (45)

(Thus once again the strangeness of this turn towards … which is the detour. Whoever wants to advance has to turn away, and that makes for the curious movement of a crayfish. Wouldn't that also be the movement of research?
– All research is a crisis. What is sought is nothing other than the turning of research that gives way to the crisis: the critical turn.
– That's terribly abstract.
– Why? I'd even say that every important literary work is all the more so when it engages more directly and with greater purity the sense of this turning which, at the moment the work is about to emerge, uncannily causes it to teeter-totter, a work in which is held, like its ever off-centred centre, an idleness: the absence of the work.
– Absence of the work is another name for madness.
– Absence of the work in which discourse ceases so that there may come, outside of speech, outside of language, the movement of writing under the attraction of the outside.)

Whoever 'searches' only 'finds' when going about and around, or else backwards, in tracing an itinerary marking the path of a 'crisis' drawn about or from an unknown point of a moving axis. When one of the voices remarks that the movement goes 'like a crayfish', the image of the crustacean comes forwards in order no sooner to disappear. Its very name, *écrevisse*, anticipates the event of a *crise* that inheres in the intransitively critical and poetic operation of writing, as it is being suggested here, which is part and parcel of the seeing, reading and hearing that comprise the labour of cinema. Given that Blanchot writes within a tradition that reaches back to the Troubadours and the Trouvères, if it is licit to recall a *rondeau* by past master Clément Marot, the crayfish can be taken as a totem of the outside, of the occupant of a space at the edge of the world in so far as its etymon and its aspect recall the *crevice* or 'edge' or gap in the world.[10] For the poet and for Blanchot, *écrevisse* belongs to the complex tracking of *écriture*, of writing. Here the image of a fresh-water crustacean skipping along the bottom of a riverbed might be related to *ciné-écriture*. The crayfish is at once a *festina lente*, the subject of a latent blazon or emblem-poem, but crucially it is also a homonym of the imperfect subjunctive of *écrire*. The pun allows the crayfish to be assimilated into what *might have been written* … completely backwards.

By now it is clear that the gist of Blanchot's reflection 'turns' on seeing and reading at once at the edge or in the crevice of a divide between speaking and seeing. Writing, which in Deleuze's reading of Blanchot is tantamount to cinema itself, becomes what the first section

of *L'Entretien infini* calls 'La Parole plurielle', a plural and complex force of image and language perceived in the drift of sight and sound.

Thus it may be that the 'diagram' which describes cinema in much of *L'Image-temps* is found in the poetic register of the essay to which Deleuze turns and returns in his reflections on the 'components' (*composantes*) of the cinematic image at the end of *L'Image-temps*. To thematise or to make abstraction of Deleuze's film-writing might betray the force of the 'mapping' or of the *diagram* that inheres in its form. The writing bodies forth what might be called *la pensée de l'image* – the thought in and of the image – insofar as the moments where the writing turns about or 'seeks' itself in its own image is seen and heard *moving* and *becoming*, by virtue of the essay to which he so often refers, a writing imbued with cinema.[11]

By way of afterthought it is productive to return to the moment in *Cinéma 2* where Deleuze anticipates what he will note in *Foucault* about a diagram being a map of 'becoming' that doubles the archive from which it emerges and never entirely gets detached. Deleuze observes that Alain Resnais exhibits in his preparatory sketches for his features a taste for a 'detailed cartography of the places' that his characters frequent and the itineraries they take. His is 'un *établissement de véritables diagrammes*' (an *establishment of veritable diagrams*) (158; stress added) in which the sight and sound of 'establishment' are reminiscent of a Baroque *table* of figures on a landscape or in a garden like that of *Last Year at Marienbad*.[12] The diagram is 'l'ensemble des transformations d'un continuum, l'empilement des strates ou la superposition des nappes coexistantes. Les cartes et les diagrammes subsistent donc comme parties intégrantes du film' (the total array of the transformation of a continuum, the piling of strata or the superimposition of coexisting sheets [of time]. Maps and diagrams thus subsist as the integrating parts of the film) (ibid.). There results a mental or cerebral cartography where a given sheet (*nappe*) of the past causes a distinction of functions to correspond and an arrangement of objects: it is in this play of surfaces where *writing*, the writing of the kind affiliated with Blanchot and Deleuze's preferred poets (Mallarmé, Melville, Michaux and perhaps Marot) takes place through its identification with cinema.

Deleuze underscores the point in a sudden reflection where reading and seeing, *lire* and *voir*, bear for an instant on the *very creation of the film book before our eyes*:

> Il se peut que, quand nous *lisons* un livre, *regardons* un spectacle ou un tableau, et *à plus forte raison quand nous sommes nous-mêmes auteur* [...]:

> nous constituons une nappe de transformation qui invente une sorte de continuité ou de communication transversales entre plusieurs nappes, et tisse entre elles un ensemble de relations non-localisables. (161–2; stress added)
>
> (It may be that when we read a book, look at a spectacle or a painting, and even more strongly when we are ourselves [its] author [. . .]: we constitute a sheet of transformation that invents a kind of transversal continuity or connection among several sheets, and weaves among them an array of relations that cannot be located.)

The invocation of the 'we' – Deleuze *with* his interlocutors – as plural *author* spins off the art of seeing and reading. When we study cinema we produce and lose ourselves creatively in our relation with the medium and our memories of it, surely and clearly, but we also find ourselves by dint of gaining our bearings, by turning about and around in the midst of the multifarious signs, crevices, corners, edges and transformative sites of our own writing. The cinematic diagram would be the 'little machine' that plots and enables critical transformation. When Deleuze notes that we are their 'author' he joins the parade of *auteurs*, the great filmmakers, who think by writing with images. Can we assume that through his manner of thinking and writing he counts, as he notes in the last sentences of *Cinéma 2*, among 'les grands auteurs de cinéma [qui] sont comme les grands peintres ou les grands musiciens: c'est eux qui parlent le mieux de ce qu'ils font' (the great cinema auteurs [who] are like great painters or great musicians: it is they who best speak about their work) (366). Close reading tells us that the answer is affirmative.

Notes

1. 'Doing with' is indeed one of these 'specific words and images' or diagrams that would align Buchanan's Deleuze with his readings of the cultural criticism of Michel de Certeau, an author for whom what a reader 'does with' an issue belongs to a tactical operation. See Certeau 1975.
2. Here and elsewhere all translations from the French are mine.
3. 'Cette étude n'est pas une histoire du cinéma. C'est une taxinomie, un essai de classification des images et des signes' (This study is not a history of cinema. It is a taxonomy, an essay on the classification of images and of signs) (Deleuze 1983: 7).
4. In *The Culture of Diagram*, John Bender and Michael Marrinan provide a theoretical history of the first magnitude. For them the parabola of the diagram, 'a working object' (197) begins from the relation of image and text on the white surface of the pages of Diderot and D'Alembert's *Encyclopédie*. The space of the page becomes the ground of the correlation of words and images. The authors show how the visual and aural dimension of the philosophers' diagram and its claim to embracing an opened-ended totality give way to mathematical configurations that lead it to quasi-pure abstraction, far from visible forms, that

we now find in digital media. Although cinema remains outside of its bounds, their work on the 'diagram' serves as a backdrop for what follows.

5. The proof copy of *L'Entretien infini* is now in the Harvard Houghton Library (ms. Fr 794). Most of the major emendations – mostly additions – are found in typescript pages folded and placed between the folios where they are inserted. Now and again manuscript annotations are in the margins of the proofs themselves.
6. In English translation: 'forces are in a perpetual state of becoming [*devenir*], there is a becoming [*devenir*] of forces that doubles history.' For this reader, the translation loses sight of the points of reference and contention in the essay from which the words are taken.
7. By way of Foucault Deleuze rehearses the play of form and force that Derrida had set forward in 'Force et signification', the inaugural essay of *L'Ecriture et la différence* (1967). Originally published as a book review of Jean Rousset's *Forme et signification* (Paris: José Corti, circa 1962), the substitution of one letter in place of the other becomes a play of sight and sound (*c* in lieu of *m*) indicating a proclivity for 'play' or 'becoming' that opens the closed confines of a structure. The resemblance of *force* (that Derrida later turns towards *fors* and its cognate meanings) to *forme* varies on the famous relation he establishes between *différance* and *différence*.
8. In the French poetic tradition the infinite substantive is often deployed to call attention to the potential force that can be released or detonated when *res* becomes *verba*, that is, when it is conjugated into action or when the entity is 'cracked open'. The past master of the infinite substantive is Maurice Scève, in his *Délie* (Lyons, 1544). One of the most celebrated *dizains* of the work (the 77th of an arcane sum of 449) associates the poet with Prometheus. The incipit reads, '*Au Caucasus de mon souffrir lyé*' (On the Caucasus of my suffering [I am] bound), in which *souffrir*, an element of the author's own device (*souffrir non souffrir*) suggests infinite suffering in place of the name of the Titan god, chained to the rocky summit of Mount Caucasus, whose liver a vulture forever consumes. Gisèle Mathieu-Castellani studies the force of the formula in her contribution to Nash (ed.), *A Scève Celebration: 'Délie' 1544–1994* (1994).
9. 'Un livre, même fragmentaire, a un centre qui l'attire: centre non pas fixe, mais qui se déplace par la pression du livre et les circonstances de sa composition. [. . .] Celui qui écrit le livre l'écrit par désir, par ignorance de ce centre' (A book, even fragmentary, has a centre to which it is attracted: not a fixed centre, but that moves according to the pressure of the book and the circumstances of its composition) (5). Blanchot notes that the centre of *L'Espace littéraire* would be the essay on 'The Gaze of Orpheus', in other words, a musical body shown seeing what blinds it.
10. Blanchot treats it moreover in the way that a great former poet, Clément Marot, had done in the fitting form of a *rondeau*, a diminutive, machine-like poem that turns about in order to retrieve and lose itself in its form:

> Tout au rebours (dont convient que languisse)
> Vient mon vouloir, car de bon cueur vous veisse
> Et je ne puis par devers vous aller.
> Chante qui veult, balle qui veult baller,
> Ce seul plaisir seullement je voulsisse,
> Et s'on me dit qu'il faut que je choisisse
> De par deça dame qui m'esiouysse,
> Je ne sçauroys me tenir de parler,
> Tout au rebours.

Si responds franc, J'ay dame sans nulle vice
Aultre en aura en amours mon service
Je la desire & souhaitte voller
Pour l'aller veoir, & pour nous consoler
Mais mes souhaictz vont comme l'escreuice,
Tout au rebours.

(Always backwards (and it is fitting that I languish)
Comes my desire, for had I seen you with a keen heart
I could never dare to go before you.
Sing who may sing, dance who may dance,
I would wish solely for this pleasure,/And if they
say that I must choose,
Here or about a lady who affords me bliss,/I could
do no more than speak
Always backwards.
Were I to respond frankly, I have
a lady without any vice
Another will have in love my service,
I desire her and dream of flying
Off to see her, and to console ourselves,
But my dreams go like the crayfish,
Always backwards.)

in Clément Marot, *Oeuvres complètes 1*, ed. François Rigolot (Paris: Garnier/Flammarion, 2007) 134.

Following Guy de Terverant, Rigolot notes that the crayfish had symbolised 'contrary fortune'. Noteworthy is that *languisse* (languish) belongs to the same register because of the pun on *langue isse* (language seen issuing forth).

11. *La pensée de l'image* is also, pertinently, the title of a collection of essays (edited by Mathieu-Castellani) in which conflations of the written image and the thoughts it provokes are taken up in essays on Claudel, Deleuze, Melville and a host of others.
12. In the first paragraph of the third chapter of *Le Pli: Leibniz et le baroque* (1988), Deleuze takes care to note that the baroque is characterised by a flat surface on which tables and figures, indeed mathematical formulas, are written. In contrast to the idea of a painting that is a window on the world he proposes the 'table' to which, here, *établissement* seems related.

Actual Image | Virtual Cut: Schizoanalysis and Montage

Hanjo Berressem

Abstract

If a machine is something that cuts into a continuous flow, schizoanalysis can be read, quite literally, as an analysis of cuts. In cinematic registers, it is an analysis of montage. Looking closely at a number of modes and moments of montage in the work of Alfred Hitchcock, this paper shows how his strategies of 'reciprocally presupposing' actual image and virtual montage relate to a Deleuzian poetics and politics of the cinema.

Keywords: psychoanalysis, schizoanalysis, Hitchcock, *The Birds*, *Psycho*

> He tried to consider the complexities of editing.
> Don DeLillo, *Point Omega*

> The average public do not, or are not, aware of 'cutting' as we know it, and yet that is the pure orchestration of the motion-picture form.
> Alfred Hitchcock

> [It] is all in the style of cutting, never obvious, always tremendously effective and completely unique.
> François Truffaut

I. Propositions and Givens

A Deleuzian poetics and politics of the cinema may be developed from the way Deleuze's philosophy brings about an anoedipal 'attribution' – or, as Deleuze calls it in *Cinema 2: The Time-Image*, 'reciprocal presupposition' (Deleuze 1989: 69) – of the actual and the virtual. In developing this argument, I take 'the Oedipal' to not only refer

Deleuze Studies 5.2 (2011): 177–208
DOI: 10.3366/dls.2011.0017

www.eupjournals.com/dls

to the triangulation of desire that defines the logic of psychoanalysis. Especially in *Anti-Oedipus*, it is a code word for the general capture of desire within a network of interlocking psychoanalytic force fields and concepts, and thus for the general capture of the subject by the psychoanalytic machine. Against the psychoanalytic poetics and politics inherent in this capture, Deleuze and Guattari set a schizoanalytic poetics and politics.

Why choose Hitchcock, whose work has been relentlessly psychoanalysed, to talk about Deleuze and schizoanalysis, one might ask? Why return to psychoanalysis to talk about schizoanalysis? One reason is that Deleuze uses Hitchcock's work in reference to his concept of the crystal-image, which lies at the centre of the relation of the actual and the virtual. A second reason is that to develop an anoedipal Hitchcock from within and against a heavily psychoanalysed film studies is a bit like, for Deleuze and Guattari, to develop schizoanalysis from within and against psychoanalysis. In both cases, it is a question of deprogramming and of deterritorialising. If a clinical schizoanalysis implies to deprogram and to deterritorialise the 'subject of psychoanalysis', a critical schizoanalysis implies to similarly deprogram and to deterritorialise Hitchcock, whose movies film studies have often read as representations of highly Oedipalised family affairs.[1]

Before I get to Hitchcock, however, let me lay out the conceptual givens that form the parameters of my argument. I take the actual to denote the field of material, extensive matters-of-fact, of substances-as-being and of pulses of perception. Cinematographically, the actual is related to chronic time, to the sensory-motor arc and the movement-image. The virtual I take to denote the field of immaterial, intensive events, of relations-as-becoming and of lines of duration. Cinematographically, the virtual is related to aionic time, to memory and the time-image.[2]

The cinematographic attribution of the actual and the virtual – the somewhat paradoxical fact that they are each other's attribute – is not only a topic within *Cinema 1* and *Cinema 2*, it is directly embodied by their both conceptual and material complementarity. Although both books deal with the actual *and* the virtual, the focus of *Cinema 1* is the actual and processes of actualisation: the actualisation of perceptual systems, the actuality of corporeal movement and the actuality of physical change. The conceptual registers in *Cinema 1* are the trajectory of the sensory-motor arc and actual movement in space. Virtual time enters the equation only as an attribute of movement. The focus of *Cinema 2* is the virtual and processes of virtualisation: the virtualisations

of memory, the virtuality of acorporeal duration and the virtuality of psychic change. The conceptual registers in *Cinema 2* are the trajectory of memory and virtual movement in time. Actual movement enters the equation only as an attribute of time.

In the single volumes, therefore, the attribution of the terms – of the virtual to the actual and of the actual to the virtual – is asymmetrical. In fact, as single volumes the books literally do not make sense, and to say that one likes one of the volumes more than the other is like saying that in Deleuze's philosophy one likes the actual more than the virtual, or the other way around. It is only as a complementary couple that the two volumes come to form the full figure of Deleuzian philosophy. This pertains to their conceptual, virtual and thus intensive difference as well as to their material, actual and thus extensive difference; to their conceptual and to their material separation as single, separated volumes. In fact, the paradox of their reciprocal presupposition can only unfold properly when they are distributed on the surface of the 'projective plane' that defines Deleuzian thought. On the one-sided surface of this projective plane, *Cinema 1* forms the actual side, while *Cinema 2* forms the virtual side.

II. In Lieu of an Introduction: Motel Architecture 1

Living in complete, self-imposed isolation, Pangborn, the protagonist of J. G. Ballard's short story 'Motel Architecture' (1978), has been spending virtually every second of the last twelve years of his life analysing 'the shower sequence from *Psycho*' (Ballard 1982: 179), because the 'extraordinary relationship between the geometry of the shower stall and the anatomy of the murdered woman's body seemed to hold the clue to the real meaning of everything in [his] world, to the unstated connections between his own musculature and the immaculate glass and chromium universe' (179) of his apartment. 'The immaculate and soundless junction of the film actress's skin and the white bathroom tiles', he feels, 'contained the secret formulas that somewhere united his own body to the white fabric and soft chrome of his contour couch' (188). The only person allowed to disturb the world he has 'formed entirely from the materials of his own consciousness' (184) is the young cleaning-woman, Vera Tilley. The mosaic of TV screens Pangborn has assembled in his apartment, each of which shows a different fragment of the sequence, in fact redoubles Hitchcock's montage on a second-order plateau of relations, 'montagesquared': 'He had played the sequence to himself hundreds of times, frozen every frame and explored it in

close-up, separately recorded sections of the action and displayed them on the dozen smaller screens around the master display' (179).

Ballard relates Hitchcock and Freud by way of a pun that he does not need to actualise *in* the story because it is actualised *by* the story, which is about Pangborn performing, quite literally, a *psycho*analysis. In trying to make sense of the Hitchcock Motel through the montage of filmic cuts, however, Pangborn also performs, again quite literally, a *schizo*analysis in the sense that Deleuze and Guattari talk of 'schizzes' (Deleuze and Guattari 1983: 39) in their *Capitalism and Schizophrenia* project, a term that refers back to the Greek *skhizein*, which means 'to split' or 'to cut'. In this context, a detail about *Psycho* mentioned by Stephen Rebello takes on an almost emblematic status: 'Following the release of *Psycho*, the Hitchcock office and Paramount lodged a complaint with the Motion Picture Association of America about the registration of the title *Schizo* by none other than Hitchcock's old boss, producer David O. Selznick' (Rebello 1990: 53), who subsequently withdrew his claim to the title. Although he could have done it, however, Hitchcock, for better or worse, never got around to making a movie called *Schizo*.

III. Hitchcock: From *Psycho*analysis to *Schizo*analysis

In both *Psycho* (1960) and *The Birds* (1963), which will form the centre of my analysis, psychoanalytic readings have organised the filmic narrative around 'mother's voice' as an evil quasi-*acousmêtre* that can be heard through its demented ventriloquisations: in *Psycho*, when Norman Bates's voice modulates into a high-pitched whine. In *The Birds*, mother's shrill resentment of her son's desire can be heard in the angry twittering of the birds, although in this case 'mother' is still alive and indeed speaks for herself.

Despite this difference, in both cases the traumatic stain around which the narrative revolves concerns 'mother' or, more precisely, what Slavoj Žižek, whom I will use as a metonymical stand-in for a psychoanalytically informed film studies, has identified as the 'raw incestuous energy' (Žižek 2006) of the 'ferocious' (Žižek 1992a: 99), 'cruel and obscene' (18) maternal superego. In this reading, Žižek could rely on earlier work driven by psychoanalysis, such as Ian Cameron and Richard Jeffery's 'The Universal Hitchcock' (1986) or Margaret M. Horwitz's essay '*The Birds*: A Mother's Love', in which she notes that 'the wild birds function as a malevolent female superego' (Horwitz 1986: 281).

On this background, my argument is quite simple and straightforward. While psychoanalytic readings, which tend nowadays to be filtered through the work of Jacques Lacan, are conceptually organised around an Oedipal architecture of cuts that are centred around the traumatic stain of the Real, schizoanalytic readings are conceptually organised around a multiplicity of machines that, by cutting through both virtual and actual *phyla*, assemble heterogeneous elements into fragile assemblages that are not pre-formed or organised into sets of psychoanalytically and thus Oedipally overcoded structures. Against the psychoanalytical reading of movies as both thematic representations and formal figures of Oedipal machines, schizoanalysis sets the reading of movies as optical expressions and affective montages of relational changes between heterogeneous machinic systems; as optical and acoustic planes of consistency. While psychoanalysis looks for Oedipus under the optics, schizoanalysis looks for the optics under Oedipus.

A first relation between schizoanalysis and the cinema is that it is based on the general notion that all machinic assemblages are nothing but 'system[s] of interruptions or breaks'. A machine 'cuts into' (Deleuze and Guattari 1983: 36) a 'continual material flow (*hylè*)' (36); a 'phylum' (Deleuze and Guattari 1987: 406) that it 'cuts up into distinct, differentiated lineages, at the same time as the machinic phylum cuts across them all' (ibid.). As each flow is cut by machines and, at the same time, each of these cuts produces new flows, the diagram of the world consists of 'the thousand breaks-flows of desiring-machines' (Deleuze and Guattari 1983: 61).

It is on the background of the notion that both actual, and thus concrete, machines as well as virtual, and thus abstract, machines are infinitely assembled, that Deleuze and Guattari can talk of 'molecular biology' as being itself 'schizophrenic' (289). In Deleuze and Guattari, in fact, the terms 'schizophrenic' and 'schizophrenia' no longer refer narrowly to a psychoanalytically defined pathology; they designate any form of heterogeneous assemblage, whether that is the psychic assemblage of a phantasm or the physical assemblage of a molecular machine.

Schizoanalysis, therefore, concerns a much larger field than just the human or, even more restrictedly, the psychic one. To maintain that molecular biology is schizophrenic means that schizoanalysis concerns the logic of the 'assembly of life' – both human and non-human – in general. On the most general level, schizoanalysis concerns the analysis of the assemblage of self-organising machines. In the words of Deleuze and Guattari, it concerns 'chronogeneous machines engaged in their own

assembly (*montage*)' (266). Schizoanalysis, then, may be defined as an analysis of the ensembles and the dynamics of anoedipal machinic cuts and of the arrangements they produce. Complementarily, schizopolitics, which includes a critique of psychoanalysis as a political dispositif, may be defined as the practice of unfreezing Oedipal organisations and power-relations. When schizoanalysis addresses the human unconscious, it is not as something that is structured like a language but as a machinic system whose 'true activities' are 'causing to flow and breaking flows' (325).

One of the ways in which schizoanalysis is related to the cinema is that the assemblage of movie images is, like that of 'chronogeneous machines', quite literally a montage. Deleuze stresses this relation between chronogeneous and cinematographic machines when he states, in reference to the cinematographic ontology he develops in the cinema books, that 'the universe [is] cinema in itself, a metacinema' (Deleuze 1986: 59). On both cinematic and metacinematic levels, the analysis of flows|cuts concerns the relation between actual image and virtual cut: *schizo*analysis.

IV. Deleuze's Hitchcock

Symptomatically, when Deleuze talks about Hitchcock, he immediately brushes away any Oedipal reference. He is not interested in *psycho*grams but in 'the autonomous life of [. . .] relation[s]' (Deleuze 1986: 203) that are 'external to their terms' (x). There is no need to make Hitchcock 'a psychologist of the depth' (202), Deleuze notes in *Cinema 1*. Rather, Hitchcock is important as the inventor of 'the image of mental relations' (x). His movies consist of sets of images that are 'purely thought' (203). As Hitchcock himself said about the relation of thought and montage, 'a cut is nothing. One cut of film is like a piece of mosaic. To me, pure film, pure cinema is pieces of film assembled. Any individual piece is nothing. But a combination of them creates an idea' (Hitchcock 1995c: 288). Through their montage, the single actual images come to be woven into a virtual narrative that, as Deleuze states, 'changes in the evolution of the relations from a disequilibrium that they introduce between the characters to the terrible equilibrium that they attain in themselves' (Deleuze 1986: 203). In other words, Hitchcock's movies are about sets of weird circumstances and the erratic, devious developments these initiate. At some point – 'at an uncertain time and in an uncertain place', one might say – something unexpected, and potentially shocking, happens. Invariably, there is a first-minute deviation from the *habitual*

order of things.[3] Both the plot of *Psycho* and that of *The Birds* are set in motion by such an initial Lucretian 'clinamen'. In the novel *Psycho*, Marion Crane takes 'the wrong turn' (Bloch 1959: 15) on her way to the psychoanalytically overcoded village of Fairvale; in the movie, it is a sudden rainstorm that prompts her to stop at the Bates Motel. In *The Birds*, a single gull inclines from its horizontal flight, making two series or flows converge: the turbulent line created in the water by the boat's outboard motor, and the seagull's equally turbulent line of flight.

> Take, for example, the movement of water, that of a bird in the distance, and that of a person on a boat: they are blended into a single perception, a peaceful whole of harmonized Nature. But then the bird, an ordinary seagull, swoops down and wounds the person: the three fluxes are divided and become external to each other. The whole will be reformed, but it will have changed: it will have become the single consciousness or the perception of a whole of birds, testifying to an entirely bird-centred Nature, turned against Man *in infinite anticipation*. It will be redivided again when the birds attack, depending on the modes, places and victims of their attack. It will be reformed again to being about a truce, when the human and the inhuman enter into an uncertain relationship. (Deleuze 1986: 20; emphasis added)

Hitchcock's carefully premeditated arrangement of storyboard stills lays out, in advance, the complex dynamics of relational changes that develop from each specific inclination|clinamen within an equally specific cinematographic phase-space. It charts the diagram of the evolutions that are triggered by these unexpected machinic mutations. More importantly even, it lays out the optical, cinematographic organisation of these evolutions; their optical expressions. In these arrangements, two modes of relational change are superimposed: internal relations change through *actual* movements within single shots, such as the movement of the camera and of the actors, while 'the whole' changes through the *virtual* movement of the montage, which defines the movement of the cinematographic composition. These two movements invariably operate simultaneously:

> The frame is like the posts which hold the warp threads, whilst the action constitutes merely the mobile shuttle which passes above and below. We can thus understand that Hitchcock usually works with short shots, as many shots as there are frames, each shot showing a relation or a variation of the relation. (Deleuze 1986: 200)

The only exception to this logic is *Rope (1948)*, which has, at least ideally, no cuts at all, and in which Hitchcock remains *within* the level of internal relations, creating a kind a fluid montage within the shot.

Deleuze talks about the moments of initial deviation or inclination in terms of marks, which denote 'natural' relations, and demarks, which denote 'abstract' relations that are fundamentally enigmatic because they are new and unexpected. In order to avoid any misunderstanding, let me stress that by calling relations 'natural', Deleuze does not endorse an essentialist agenda. In fact, Deleuze considers nature in itself not as natural in the common sense, but as inherently machinic.[4] What Deleuze means, quite simply, is that natural relations are habitual, while abstract relations define the movement of elements that have detached themselves from the chain of habitual terms by violence – in the sense that it always takes a certain amount of violence to change a habitual setup – in order to link up with another series. The first gull that swoops down and 'strikes the heroine', for instance, 'is a demark, since it violently leaves the customary series, which unites it to its species, to man and to Nature' (Deleuze 1986: 204). It is unnatural for a gull to attack humans only in the sense that according to the 'natural order', it is not a general habit of gulls to attack humans. Similarly, it is not habitual for a crop-dusting plane to attack a human being, as it does in *North by Northwest* (1959).

Because of Hitchcock's investment in changes of relations, Deleuze positions him at the end of *Cinema 1*, 'at the juncture of two cinemas' (Deleuze 1986: x) and thus at the juncture of two regimes of the image: at the moment when the actual movement-image turns into the virtual time-image, the moment when every material action is immediately 'surrounded by a set' or swarm of virtual 'relations' (Deleuze 1986: 200). In terms of the topology of the cinema books, Deleuze positions Hitchcock's work at the crystal moment where the actual almost meets the virtual and vice versa. The only reason Hitchcock does not fully belong in *Cinema 2* is because of the logic of suspense, which relentlessly propels his plots forward and thus subjects time-in-general to movement-in-general. Invariably, however, these movements have already lost their internal coherence. The narrative goes off at tangents and follows minute inclinations as in *Psycho*, it goes into prolonged temporal cycles as in *The Trouble with Harry* (1955), or it is curiously randomised as in *The Man Who Knew Too Much* (1956).

It is in relation and in attribution to these brittle, demarked narratives that Hitchcock's relational and affective surfaces establish themselves. Affects, in fact, are themselves crystal in that they are corporeal, actual and extensive as well as ideal, virtual and intensive. As in a crystal-image, there is no continuous passage between the two 'affective' series. As Spinoza notes, '*the body cannot determine mind to think, nor can the mind determine body to motion or rest*' (Spinoza 2006: 63). Despite

this radical separation of the series, however, Spinoza maintains that affects and ideas of affects need to be adequate. It is in this context that Deleuze considered Hitchcock a master of relation. If the actual images and the virtual cuts need to be 'adequate', my question in the following is, whether Hitchcock's fragile optical and sound surfaces are 'contained' within a *psycho*analytic logic. Is psychoanalysis 'adequate'?

V. The Shower

Both murders in *Psycho* can only too easily be read as the lethal, backlighted impersonation of mother killing the object of her son's desire. Why 'only too easily'? To explain what I mean by this, I will first look at the production process of the movie. In the case of *Psycho*, this process assembles a complicated media ecology that reaches back to the real-life serial-killer Ed Gein, who used, on occasion, to wear a 'woman suit' made from human skin so he could impersonate the dominating puritan mother he had murdered. Robert Bloch relates Gein directly to Norman Bates in his 1959 novel *Psycho*, in which the narrator notes that '[s]ome of the write-ups compared' the killings 'to the Gein affair up north' (Bloch 1959: 149).[5] Bloch, in fact, lived only thirty-five miles away from Gein when he wrote the novel, which contains a veritable overkill of psychoanalytic references. Bates is a 'multiple personality with at least three facets' (154), *Norman*, *Norma* and *Normal*. He is a 'transvestite' (151), who is allegedly 'guilty of cannibalism, Satanism, incest, and necrophilia' (150). In his more lucid moments, he conveniently diagnoses himself as 'the victim of a mild form of schizophrenia, most likely some form of borderline neurosis' (84) and in one 'conversation' with mother, he in actual fact notes that their relation is 'what they call the Oedipus situation, and I thought if both of us could look at the problem reasonably and try to understand it, maybe things would change for the better' (12). Dr Nicholas Steiner, who examines Bates after his arrest, has no difficulty in tracing his pathology back to a primal scene; a moment when Norman 'walked in on his mother and [her lover] together in the upstairs bedroom' (153). Shortly after this traumatic encounter, Bates poisoned both his mother and her lover, but then he had felt guilty, 'dug her up' (154) and preserved her taxidermically in order to 'keep her alive'. In fact, Bates has made himself believe that she is not dead at all, but in a state of 'suspended animation' (136).

This psychoanalytically oversaturated and overdetermined story was subsequently rewritten for mainstream Hollywood cinema by Joseph

Stefano, who was responsible for the element of 'motivation', something Hitchcock, at least according to Stefano, was not really interested in, although he knew very well that motivation was a 'given' if you wanted to make a Hollywood movie, which meant a movie geared towards a mass-market that was raised on psychoanalytic clichés and that expected Hollywood movies to adhere to these clichés.[6] From the countless melodramas of the forties and fifties onwards, in fact, psychoanalysis had been relentlessly cinemascoped and sensurrounded. In fact, it had become a cinematographic cliché. Hitchcock, who hated clichés but loved to play with the audience's cliché expectations, was very aware of the power of psychoanalysis as a conceptual matrix for motivation, but he also had a highly ironic relation to it. In fact, he considered the story of *Psycho* somewhat of a joke. '*Psycho* is a film that was made with quite some sense of amusement on my part', he noted, 'to me, it's a fun picture' (Rebello 1990: 168).

If Hitchcock was not interested in catering to clichés, he was similarly uninterested in providing psychoanalytic verisimilitude. 'After all, it stands to reason that if one were seriously doing the *Psycho* story it would be a case history' (Thomson 2009: 144), he maintained. What Hitchcock was interested in was to create 'pure cinema'.[7] In this context, his somewhat apocryphal statement that he considered dialogue to be just another part of the soundtrack is more than just another witticism. Like his many comments about his uses and abuses of actors, it shows the degree to which he considered motivation to be subservient to the affects produced by pure cinema. As he noted, famously, '[w]hen an actor comes to me and wants to discuss his character, I say, "It's in the script." If he says, "But what's my motivation," I say, "Your salary" '.[8]

After Bloch, then, Stefano was responsible for 'psychoanalysis'. As Bloch had already put so many psychoanalytical references in place, however, Stefano only needed to streamline the story for Hollywood consumption. Ironically, this streamlining involved not so much adding psychoanalysis to the script, which would have led to a complete conceptual overkill, but subtracting some of the psychoanalytic references. To oversaturate the movie with psychoanalytic references would have taken away from the suspense Hitchcock was out to create on two counts. First, too much overt psychoanalysis would have made the movie too cerebral. Second, it would have made it inadvertently humorous. If the novel attempted to create a frightening verisimilitude by way of the accumulation of pathological details, the movie was to create suspense and shock-effects by means of 'pure optical and sound images' (Deleuze 1989: 15). Hitchcock's 'optical and sound images',

however, differ in one important aspect from the ones Deleuze describes in *Cinema 2*. While these designate optical and acoustic milieus that are suffused with virtual memory and in whose often 'uncut' atmosphere actual movement is curiously suspended, passive and without direction, Hitchcock's images are highly montaged, actively shocking and highly affective. Despite this difference, however, both versions decompose narrative movement into crystal blocs of suspended time.

The pervasive presence of psychoanalysis in the movie, then, is to a large degree owed to the distributed production processes that define the cinema – even *auteur* cinema – in general. These processes are generally not acknowledged by psychoanalytically informed readings, not even by Cohen, who reads Hitchcock's movies as disseminative 'signature machines' (Cohen 2005a: 8). While Deleuze's analyses of the cinema also remain centred around specific directors and their personal styles, a schizoanalysis of the cinema might well profit from an approach that embeds the 'director machine' into an ecology of other machines: other flowslcuts.

In the light of these distributed processes, psychoanalytical readings are defined by a curious chronological loop: 'The Trouble with *Psycho*'. If by the sixties both pulp fiction and Hollywood were fully suffused with psychoanalysis, it was strictly a pop version of psychoanalysis. Bloch and Stefano brought precisely this pop version of psychoanalysis to *Psycho*, which makes it somewhat ironic to observe Žižek retrieve 'deep Freud' from the most obvious of Hollywood treatments and appropriations. Not only does psychoanalysis find itself, as Jacques Derrida would say, it actually proves itself by way of its own pop-versions.

In fact, *Psycho* is a good example to show that the artistic attitude towards Freud tended to be quite debonair. Psychoanalysis had its uses, especially in a mass-market economy. Bloch, for instance, noted about his novel that

> in the late fifties, Freudian theories were very popular and [...] I decided to develop the story along Freudian lines. The big Freudian concept was the Oedipus fixation, so I thought, 'Let's say he had a thing about his mother.' (Rebello 1990: 9)

A similar, probably even more cavalier relation to psychoanalysis can be felt in the way the illustrator who designed the film's poster talks about his artistic rationale: 'The guy [in the novel] was quite cracked up, so, in the graphic, I cracked up the lettering to reinforce the title' (11). What these remarks show is that psychoanalytic readings of Hollywood often make a mistake when they take the presence of

psychoanalysis too seriously. In other words, psychoanalysis should take the modes of its own presence in Hollywood into account. In fact, a somewhat disturbing result of psychoanalysis finding itself in its Hollywood treatments is that it subscribes to its own popularisation, which means that it subscribes to its own cliché. Even Žižek, whose work is famously filled with jokes, does not show such conceptual self-irony. This is why he ultimately fails both as a cinematographic critic and as a psychoanalyst. From Hitchcock he retrieves only 'deep psychoanalysis', which is not fair to Hitchcock as a cinematographer; from Gein's deeply enigmatic and disturbing pathology he retains only Hollywood's sanitised, pop-cultured treatment, which is not fair to Gein as a case history.

In psychoanalysis's finding of itself, Žižek is the last in a long line of critics that goes from Raymond Bellour to Lee Edelman's psychoanalytic deconstructions.[9] Already in Bellour, the seriousness of the critical endeavour creates curiously blind spots. On the background of Hollywood's uses of psychoanalysis, it is in fact somewhat ironic that Bellour, in order to introduce scopic desire as the most appropriate and obvious cinematographic pathology into his analysis of Hitchcock's movies, refers to precisely one of the results of the hypervisibility of Freud in Hollywood cinema: the fact that the voyeuristic Norman is 'concealed, significantly, by a painting which prefigures the effect he is to produce: *Susannah and the Elders*' (Bellour 1986: 321). While Bellour sees the presence of the painting as a significant clue for the implementation and presence of the scopic regime in the movie, it might also be read as a witty, highly tongue-in-cheek detail of the movie's set design. How much more obvious, in fact, could one get? To let a voyeur look through a representation of voyeurism shows to what extent psychoanalytic concepts could be consciously used, as much for 'effect' as for 'irony'.

Something similar happens in Horwitz. Even though *The Birds* itself pre-empts a psychoanalytic reading in which the birds function as the projection of a maternal superego gone berserk when it has Annie, who seems, even within the movie's diegetic reality, to realise how easily people fall into the psychoanalytic trap, tell Melanie that Lydia is not possessive 'with all due respect to Oedipus' (Horwitz 1986: 282), Horwitz still reads the movie into a psychoanalytic register. Rather than reading this remark as another tongue-in-cheek play about the hypervisibility of Freud and the facility of Freudian readings, she chooses to read it as a denial, claiming that 'the text denies (repressed) contradictions to which it cannot admit on a conscious level' (282).

In fact, at this point, she reads the film as if it were a patient: Freud famously explained, in a beautifully laconic manner, the logic of denial by describing a hypothetical patient, who tells the psychoanalyst that he did not know the identity of a specific person in one of his dreams but that he was sure that it was not the mother: ' "You ask who this person in the dream can be. It's *not* my mother" ' (Freud 1925: 235). To which Freud, somewhat deviously, adds: 'We emend this to: "So it *is* his mother" ' (ibid.).

Similarly, when *The Birds* notes that it does not know what it is structured around, but that it is *not* the maternal superego, Horwitz emends this to: 'So it *is* the super-ego', thus turning a very conscious, tongue-in-cheek remark into a symptom of the return of the repressed. As if the film were saying: 'Do not read me psychoanalytically!' but in actual fact meant: 'Read me psychoanalytically!' As if the statement 'the key is not psychoanalysis' meant, in actual fact, 'the key is psychoanalysis'.

I have already noted that while Hitchcock was not really interested in personal motivation, he was obsessively interested in affect and in how to produce 'pure optical and sound affects' by way of cinematic means; in how to produce suspense and shock. Against this background, the story is a mere vehicle to lead up to the truly important moments, such as the two murders and the final discovery of 'mother'. What Deleuze notes in reference to Francis Bacon's work applies equally to Hitchcock's. In Bacon, all relations lead to, and are in the service of, sensations. While a predominantly narrative and conceptual art – the painterly equivalents being figurative and abstract painting – addresses the mind, a 'sensational' art like that of Bacon or Hitchcock addresses predominantly and directly the nervous system:

> As Valéry put it, sensation is that which is transmitted directly, and avoids the detour and boredom of conveying a story. [. . .] [T]he same criticism can be made against both figurative painting and abstract painting: they pass through the brain, they do not act directly upon the nervous system, they do not attain the sensation. (Deleuze and Guattari 1994: 33)

In Hitchcock's words, 'the impact of the image is directly on emotions' (Hitchcock 1995b: 216). As Hitchcock noted about *Psycho*, '[i]t's a pretty good film. But, more important, it's the first shocker I've ever made. This one *literally* shocks you' (Rebello 1990: 194). It is because he wanted to literally shock that Hitchcock spent one week and seventy camera positions in assembling a forty-five-second montage; one-eighth of the movie's overall shooting time on the visualisation of three

sentences, which, by the way, come much earlier in the novel than in the movie: 'Mary started to scream, and then the curtains parted further and a hand appeared, holding a butcher knife. It was the knife that, a moment later, cut off her scream. And her head' (Bloch 1959: 33).

Within the representation of the familiar psychoanalytic narrative, Hitchcock assembles with the shower sequence an extremely expressive, affective bloc of cinematographic space-time by way of an affective architecture of images and cuts. The aim of the montage was to create the highest 'dramatic impact' (Truffaut 1968: 334), and the proof that it worked was that the spectators were affected by the scene on a directly nervous level. As Truffaut adds, they were, on a directly 'physical' (350) level, 'aroused by pure film' (349).

Like cinema in general, the shower scene is mainly about the optical attribution of material matters-of-fact and immaterial events; actual images and virtual relations. The resulting affect concerns not so much the theatrical level addressed by psychoanalysis as it does the level of production addressed by schizoanalysis. Within the obvious frame of the representation of mother's derailed violence, Hitchcock orchestrates a meeting *with* and a direct expression *of* violent affect. If Hitchcock told Stefano that he was happy to leave motivation to him, Hitchcock was fully responsible for the scene's optical and acoustic arrangement, something that becomes very obvious in the heated controversy between Hitchcock and Saul Bass about 'who actually did what' during the filming of the scene.

In Hitchcock's murderous montage, the optical and acoustic affects are more important than the plot that frames and carries them. Both the narrative setup and the actors' incomputable movements and automatic spasms are, through the practices of the cinema, optically and auditively assembled into a series of blocs of affect. This process comprises both the virtual, narrative surprise of killing off the person who appears to be the heroine – a surprise that is even heightened because she is played by the 'star of the film' (Truffaut 1968: 340) whom the audience would never expect to die so early on – and the actual movements and bodies that form the given diagrams from within which the cinematographic machine of shock and suspense is created. In this dramatisation, the art lies in playing 'odd and even' with the audience, a game in which Hitchcock excelled because the public is 'represented by the camera' (328) and is thus at the mercy of the director's optical manipulations.

It is in this context that one should read the urban myth that seems not to have been true, but that is so convincing in its logic that it should have been true. Allegedly, Hitchcock turned, suddenly and unexpectedly

for Janet Leigh, the luxuriously hot shower to cold during the filming of the scene so that, like Marion Crane's body is attacked by a knife, Janet Leigh's body is attacked by the cold. Leigh's body becomes the site on which a double violence is performed: the virtual violence of Bates's attack, which is related to the field of expressive acting, and the actual violence of the energetic 'freeze frame', which is related to the field of impressive feeling. What better way to extract an 'adequate' response from Janet Leigh?

Even though the story about this physical version of method acting is really too good to be true, it may stand metonymically for the fact that beyond the all-too-expected psychoanalytic theatre of the Hitchcockian plot there lies a much more disruptive production and expression of pure affects which can be called the Hitchcockian *figure*; precisely the figure Pangborn is so obsessed with. The psychoanalytic narrative that psychoanalytic theory retrieves from Hitchcock's montage is merely the thematic carrier of a cinematographic architecture of affective expression. Arguably, in the shower scene this might have worked even better *without* the soundtrack, which was what Hitchcock had originally planned. The sounds – the water, the shrieks, the slashes – are probably the most adequate and affective soundtrack. The shrieks of the violins take away from the intensity of this soundspace because one can hear in them too easily Norman's mother's agitated, demented breathing.

VI. The Telephone Booth

Daphne du Maurier's story 'The Birds', unlike Bloch's *Psycho*, has nothing directly Oedipal about it. In England, a farmer and his family fight against birds that, for some enigmatic reason, have begun to attack humans. Both Deleuze's reading of the first gull as a demark and Hitchcock's 'real' interest in the story are actually very close to du Maurier, who poses the question not so much of *why* but of *how* the birds attack. 'Why do the birds attack?', on the contrary, is precisely the psychoanalytic question Žižek asks himself (Žižek 1992a: 97); as do the characters in the story and the movie. Once more, Žižek answers the question in terms of the movie's internal distribution of desire and its objects. At the end of his reading, it is clear why the birds attack: 'the terrifying figure of the birds is actually the embodiment in the real of a discord, an unresolved tension in intersubjective relation [...] the incarnation of a fundamental disorder in family relationships' (99). For Deleuze and Guattari, however, the question posed by desire is not so much about meaning and representation as it is about production and

assembly, and as such much more in tune with du Maurier and with Hitchcock: 'the question posed by desire is not What does it mean? but rather *How does it work*?' (Deleuze and Guattari 1983: 109).

It is very difficult, in fact, to find out *why* unexpected things happen. They happen all the time, whenever a habitual pattern is broken and a new machinic assemblage is created. Because of some built-in force – call it appetitus, conatus, libido or *élan vital* – living machines do not stop assembling and entering into complex arrangements and dynamics. Deleuze and Guattari call this force desire, which is why every living machine is a desiring-machine. If one remembers that evolution drifts and that living machines are self-organised rather than created 'in the image of someone or something', this force of desire does not represent something outside of itself. In causing processes of self-organisation, it is productive and directly involved in how living machines come about and how they work: 'The desiring-machines [...] represent nothing, signify nothing, mean nothing, and are exactly what one makes of them, what is made with them, what they make in themselves' (288).

On this background, Deleuze and Guattari develop their notion of the unconscious as productive rather than representative; as a factory rather than a theatre. It 'does not symbolize any more than it imagines or represents; it engineers, it is machinic' (53). When Deleuze and Guattari note that 'the whole task of schizoanalysis' is to 'overturn the theatre of representation into the order of desiring-production' (271), this is precisely to say that questions need to be shifted from *why* to *how*. In fact, Deleuze and Guattari 'reproach psychoanalysis for having stifled this order of production, for having shunted it into *representation*' (296). Quite programmatically, '[s]chizoanalysis forgoes all interpretation because it foregoes discovering an unconscious material: the unconscious does not mean anything' (180). Unfortunately, such statements have often led to the idea that Deleuze and Guattari are not interested in meaning at all. Nothing, of course, could be less true. The question is rather that of how meaning – or better, how sense – is assembled from and within a field of production, how it can remain attributed to that productive ground and how it is related to sensation.

As in Hitchcock's movie, in du Maurier's story the reason for the attacks is never given. The question is not one of a clear causation, but rather of 'How do the birds form a deviant assemblage?' In her detailed and loving description of this process, du Maurier contours a compelling image of swarm intelligence. The first phases of the process are assemblage and agitation. The birds are attracted to each other as

if they were following some gravitational pull. Their normal, habitual desires are redistributed within a communal desire for change. 'The birds are restless':

> Great flocks of them came to the peninsula, restless, uneasy, spending themselves in motion; now wheeling, circling in the sky, now settling to feed on the rich new-turned soil, but even when they fed it was as though they did so without hunger, without desire. Restlessness drove them to the skies again. (du Maurier 1952: 85)

The next phase is defined by the assembly of a new collectivity that comes to overrule and transgress former barriers between territories and populations. Birds that normally would not form alliances begin to assemble cross-population machines. Very carefully, du Maurier refrains from giving a reason for this behaviour. The birds act as if they were compelled to do so:

> Black and white, jackdaw and gull, mingled in strange partnership, seeking some sort of liberation, never satisfied, never still. Flocks of starlings, rustling like silk, flew to fresh pasture, driven by the same necessity for movement, and the smaller birds, the finches and the larks, scattered from tree to hedge as if compelled. (85–6)

In a third phase, the restless swarm turns into an army. Its self-organising movements are now directed towards an enemy: 'There were robins, finches, sparrows, blue tits, larks and bramblings, birds that by nature's law kept to their own flock and their own territory, and now, joining one with another in their urge for battle' (89). At some point, an enigmatic decision has been taken: 'Nor did they fly so high. It was as though they waited upon some signal. As though some decision had yet to be given. The order was not clear' (102).

The story will remain silent about where the order comes from. Certainly, it is not given by some individual 'birdleader' who controls the movement. Rather, it is a distributed order that spreads out within the multiplicity of birds. Towards the end of the story, the farmer – who had first thought that the birds were remote-controlled by some human agency such as the Russians – begins to suspect that the attacks have to do with a deeply enigmatic evolutionary, and thus also genetic, drift. '[H]ow many millions of years of memory were stored in those little brains, behind the stabbing beaks, the piercing eyes, now giving them this instinct to destroy mankind with all the deft precision of machines' (123), he wonders.

If one reads du Maurier's 'million years of memory' as another name for 'unconscious machine', the story describes how the birds assemble what Deleuze and Guattari call a war machine. In this context it is significant that du Maurier had extrapolated the attacks from real-life, actual attacks by aviatory versions of Ed Gein, and that Hitchcock had been, in turn, 'reminded of the story in the early sixties by reports – from California – of unusual bird behaviour and what might be interpreted as attacks' (Thomson 2009: 104).

For Hollywood consumption, du Maurier's story is treated by the American crime writer Ed McBain, writing as Evan Hunter. There might have been a certain surreal beauty in an American crime writer re-writing an English writer of romances, but in actual fact McBain did not so much rewrite the story, as change just about everything except the basic idea. The only two details Hunter takes over is the eye-pecking and the birds' mode of entry. 'Then they'll try the windows, the chimneys', du Maurier's farmer notes (105).[10]

McBain frames the story about evolutionary drift by a psychoanalytically informed narrative. Once more, a mother is trying to 'save' her son from his object of desire. One inhabitant of Bodega Bay, the village Mitch Brenner lives in and to which Melanie Daniels had come by boat, in fact accuses Melanie openly – though wrongly, as Robin Wood stresses – of being the direct cause of the attacks, because she and the birds have arrived at the same time; a synchronicity that is another internal psychoanalytic 'spoiler alert' because it links Melanie, Mitch and his mother to the attacks of the birds.

Žižek – as have many other commentators – immediately zooms in to the family clues that lie scattered amidst the bird attacks. Again he argues that the plot about the birds is only a means to distract the audience from the psychoanalytic truth of the story. As Žižek argues, the manifest narrative about the eruption of the birds' violence functions, somewhat like a screen memory, as a diversion from the narrative about the violent eruption of mother's anger. Thus Žižek's conceit of '*The Birds* without Birds' (Žižek 1992a: 104–6). The birdplot 'makes sense' precisely when it is discovered as a condensed and displaced representation of a both familial and familiar psychoanalytic narrative.

My argument is once more that the obvious family romance is merely the carrier for complicated meetings of the actual and the virtual and for the production of landscapes of violent, shocking affect. Is it not, in fact, that Hitchcock once more turns psychoanalysis upside down? Hitchcock's aim is to assemble a montage that approaches the actual affectively and architecturally. One of the strategies to do so has to

do with projective planes and optical superimpositions. In the famous 'Pearl Harbour scene', during which the birds attack first Bodega Bay's gas station and then Melanie, who has fled into a telephone booth, Hitchcock, in fact, creates a direct formal and thematic inversion of the shower sequence, with the birds taking on the function of the knife. Only this time, there is a translucent protective plane into which the birds crash before they can hurt Melanie.[11]

Although Žižek is always extremely aware of the formal aspect of Hitchcock's work, in his overall argument, he relates the 'projection' of the birds onto Bodega Bay – the fact that Hitchcock inserted the images of the birds into the scene during post-production – to a thematic, psychoanalytic layering of the birds' and mother's destructive energy. The formal layering, however, can also be read as an affective rather than a representative projection. In fact, the relation of the sequence in the telephone booth to the shower scene sequence is not only formal. Another way in which they are related is that, as Hitchcock noted in 'It's a Bird, It's a Plane, It's . . . *The Birds*', it took 'three months' (Hitchcock 1995a: 317) to assemble the extended scene, of which the sequence in the telephone booth is a part.

The most interesting and at the same time the most disconcerting optical characteristic of the scene is related to the fact that most of the images of the birds were added only during post-production. In terms of the filming of the scene and of acting in it, this meant that in a first temporal series, the actors had to run from and protect themselves from purely imaginary birds, as if the birdplot was indeed a communal phantasm. In their flight from the attack of invisible birds, the actors had to counter-actualise the complete affective bloc envisioned by Hitchcock, even though the birds, which made up the most important material objects in that bloc, were added to the image only at a later point. The actors, therefore, had to act into the future, as it were, and at the same time as if the birds were already there. They had to mime a presence yet to come, which made their task a subjunctive counter-actualisation reminiscent, although in a completely different context, of Žižek's conceit of *The Birds* without birds. Similarly, Hitchcock's camera had to continually anticipate the birds.

The optical result of this 'special effect' is a curious incongruity, to which the fact that the birds are *in front of* the actors, which are, optically, the back-projection, adds an extra layer. If one thinks of the usual back-projections in Hitchcock, such as those that define train or bus rides, in *The Birds*, the *Verfremdungseffekt* is even stronger because

the habitual figure–ground relationship is reversed. The lesson of this formal reversal is that the reality of Bodega Bay forms the ground to the figure of the reality of the birds, whose perspective the spectator is asked to take. Quite literally, the images are given from a 'bird's-eye' view.

In its weird optical alignments and de Chirico perspectives, the completed scene's optical architecture shows quite directly that there will always be an infinitesimal distance between the world of the birds and the world of the humans, even when they are projected onto the same movie screen.[12] This infinitesimal distance is embodied by the technological gap between the two plateaus of superimposed images. The world of the birds and the world of the humans are visually attributed in such a way that they are 'almost' on the same plane. Their eerie optical oscillation in fact recapitulates formally the incongruities of what happens in the movie. This, of course, is not to say that Hitchcock used the mode of projection as an intended strategy – we can assume he was after the most appropriately affective images within the set of given technical constraints – but to highlight the specific optical organisation of the film's images, which is seminal in producing their singular affective impact.

In a larger context, the optical layering of the scene is one of Hitchcock's cinematographic strategies to create crystal-images, which designate, within the internal architecture of the two cinema books, the 'smallest internal circuit' (Deleuze 1989: 70) between the actual and the virtual. They are images of the infinitesimal meeting of the actual and the virtual at the impossible, infinitely receding 'point at infinity' where the actual and the virtual become identical; the impossible moment when the two volumes of *Cinema 1* and *Cinema 2* would become one volume. When the distance between them would be reduced to zero.

It is only at this ideal point that the plane of the anonymous, actual movement of movement-images folds over onto the plane of the anonymous, virtual movement of time-images, where pure actual perception turns into pure virtual imagination. Where the sensory-motor arc turns into memory. As figures of the point-at-infinity on a projective plane, crystal-images measure out 'a place and its obverse which are totally reversible' (69). In the crystal of the image, one invariably sees 'the indiscernibility of the actual and the virtual' (87). Deleuze's philosophy develops within the conceptual space 'given' by the projective plane. Cinematographically, this projective plane is embodied by the movie screen, which is quite literally 'projective'.

In the scene that I have described above, Hitchcock superimposes two actual worlds. A similar superimposition on the virtual level, however,

plays itself out in the gap between the respective relational sets of the birds and of the humans. Unlike psychoanalytic readings, Hitchcock does *not* provide a link between the series of the actual attacks and the virtual series of the explanations of the attacks. Both formally and in terms of narrative, Hitchcock leaves the actual series and the virtual series disjunct but reciprocally attributed in terms of optical and sound situations: crystal cinema. What he provides are highly affective montages of the collision of the both actual and virtual worlds of the birds and of the humans.

Another eerie superimpositional attribution of the actual and the virtual defines Madeleine|Judy in *Vertigo* (1958), who oscillates between actual person and virtual projection. Ironically, in *Vertigo*, the cinematic assemblage terminates precisely at the point of their hallucinatory identification. This is even clearer in the novel than in the movie, in which Hitchcock sacrifices psychological for optical symmetry. Because the director does not move the action forward 'with psychoanalysis' but 'with a camera – whether that action is set on a prairie or confined to a telephone booth' (Hitchcock 1995b: 215), Hitchcock trades the ending of Pierre Boileau and Thomas Narcejac's novel *D'Entre les morts* (1954), on which the movie is based, for an ending that is optically and cinematographically more convincing, although it is both psychologically and narratologically much less so. In this ending, rather than having Flavières kill Renée, John 'Scottie' Ferguson returns once more to the vertiginous bell-tower, where Judy is killed purely by accident.

VII. The Politics of Birds

What one can say about the birds in *The Birds* is that they seem to follow at least three scripts: an evolutionary script, in which they embody an enigmatic eruption of a violent, instinctual aggression (du Maurier), an optical, cinematographic script, in which they are bodies related in an affective bloc created by vision and sound (Hitchcock), and an Oedipal script that functions as the narrative carrier and that provides motive (Hollywood).

But what about desire and its distribution? Up until now, I have neglected the level of the narration in favour of moments of the production of affect, and the level of politics in favour of the level of a poetics. Affect, however, is not only a product *of* the movies, it is also a topic *in* their narratives. To look at the distribution of desire in the movies addresses the difference between the Oedipal and

the anoedipal from a slightly different perspective. Quite obviously, both *Psycho* and *The Birds* are libidinally highly charged. While psychoanalysis reads their plots in the context of human sexuality, however, a schizoanalytic reading stresses how they assemble site-specific sexual landscapes according to 'the truth' that 'sexuality is everywhere' (Deleuze and Guattari 1983: 293), which means: in the non-human arena as well.

Although in both movies the deviant desiring-machines are assembled from under the shadow of Oedipus, there is an important difference between *Psycho* and *The Birds*. Norman's desiring-machine remains framed by a human perspective, while the birds widen the field of desire to the level of the non-human. More directly than Norman does, they show that, as Michel Serres states in *Genesis*, 'the cosmos is not a structure, it is a pure multiplicity of ordered multiplicities and pure multiplicities' (Serres 1995: 111). As such, they are more directly images of anoedipal schizo-machines.

Both in the story and the movie, the individual birds become first a swarm and then a bird collective: 'a war machine: a physics of packs, turbulences, "catastrophes," and epidemics' (Deleuze and Guattari 1987: 490). More than in du Maurier's story, however, in the movie this war machine is assembled against the background of the 'habitual' capture of birds by humans. Hitchcock plays with this not only in the movie's opening scene, which is set in a pet store amidst countless caged birds, but also in a trailer he made for the movie, which shows him narrating, with his usual ironic detachment, how utterly horribly humans have, throughout history, treated the species of birds.[13] A similar reason 'why the birds attack' is provided when Hitchcock notes that the film is about the 'reversal of the age-old conflict between men and birds' (Truffaut 1968: 360). Again, however, these explanations do not seem to be central to the movie. They are conceptual MacGuffins provided outside of the frame of the actual movie, which never directly addresses this aspect. In fact, in a scene that was later deleted, Melanie and Mitch were actually supposed to make fun of 'why' the birds attack: 'They joked about the fact that the birds have a leader, that he's a sparrow perched on a platform addressing all the birds and saying to them, "Birds of the world, unite. You've nothing to lose but your feathers" ' (364).

On another level, however, the change of the habitual relationship of birds and humans is addressed throughout the movie, especially in the way it charts the gradual production of the birds' war machine. Already in its opening scene in the pet store, the flirtatious conversation

between the 'lovebirds' Mitch and Melanie is drowned out by the nervous twittering of the caged birds that washes acoustically over the voices. In their acoustic insistence, the birds in the store have begun to no longer fit the image of the romantic lovebirds Melanie wants to buy. Already, they have become terrifying twittermachines whose decibel level quite materially disturbs the spectators in their attempt to make sense of the dialogue. Later, the motif of the cage is taken up by the caged bird Melanie carries on the boat, and by the way Hitchcock sets up the scene in the telephone booth. As Hitchcock notes, 'Melanie Daniels takes refuge in a glass telephone booth and I show her as a bird in a cage' (Truffaut 1968: 360).

After the first gull's aggressive inclination, the birds, as if they had collectively read Althusser, assemble around the school, as one of the most effective institutions of Oedipalisation, where they congregate, in an inexorably slow fashion, on the telephone wires, in a scene that, quite ironically, superimposes two modes of information transfer: one human, the other aviatory. Rather than being a figure of human desire, is the movie not, therefore, much more the figure of a fight between caged desire and free desire? A fight between the two equally real series of birds and humans? A reversal of series: the birds are free, the humans are caged.

In the movie's tracing of the birds' assembly of a war machine, their attacks become figures of a desiring-machine that is fuelled by a pure, anoedipal and thus unrestrained energy; an energy that defines the movie's central affective spaces, from the first inclination to the various endings, in one of which the final image should have been of the birds 'covering' the Golden Gate Bridge.

The birds' desiring-machine, therefore, is not, as in Žižek, a stain that embodies an impossible, real sexuality that is excluded from the subject's psychic reality and thus from the space and interest of psychoanalysis except in its very negativity *as* excluded. Rather, it sets up, on a machinic level below any Oedipal organisation, a complex energetic force field that might be said to embody what Deleuze calls, in *Difference and Repetition*, the field of 'passive syntheses' (Deleuze 1994: 74). As a war machine, the birds re-distribute their relation to the overall environment on a level of a material anoedipal production on an 'unconscious' level below and beyond the level of the human. As Deleuze and Guattari state in *Anti-Oedipus*, 'we do not deny that there is an Oedipal sexuality, an Oedipal heterosexuality and homosexuality, an Oedipal castration, as well as complete objects, global images, and specific egos' (Deleuze and Guattari 1983: 74). But then, they make a crucial distinction, declaring

that '[w]e deny that these are the production of the unconscious' (74). The productions of the unconscious are quite literally swarms of desiring-machines.

Once more, Hitchcock is not really interested in the birds' ultimate motivation or in the birds as figurations of Oedipal violence. Rather, he is interested in the gradual optical superimposition of the birdmachine onto the Oedipal machines that define Bodega Bay, and in the ways it brings about their violent deterritorialisation. The smooth sky, waves of birds, in revolt against the striated bay. As such, the birds' war machine resonates with the war-machine aspect of schizoanalysis, which is directed against the Bodega Bay of psychoanalysis. As Deleuze and Guattari note, 'schizoanalysis must be violent, brutal: defamiliarizing, de-oedipalizing, decastrating; undoing theater, dream, and fantasy; decoding, deterritorializing' (381).

Importantly, the birdmachine is not a natural machine, because, as I noted before, nature itself is not natural. It is always 'machinic' and thus 'montaged', which brings me back to du Maurier's notion that the birds follow an evolutionary instinct. Deleuze and Guattari emend this to the more radical idea that 'desire is never an undifferentiated instinctual energy', but 'a highly developed, engineered setup rich in interactions' (Deleuze and Guattari 1987: 215). The real desire is to build machines: 'Assemblages are passional, they are compositions of desire. Desire has nothing to do with a natural or spontaneous determination; there is no desire but assembling, assembled desire' (399). The birds assemble a molecular, non-human *schizo*machine – as Deleuze and Guattari note, '[t]he desiring micromultiplicities are no less collective than the large social aggregates' (Deleuze and Guattari 1983: 340) – and as such they come to embody the positive productions of a material unconscious; a field in which

> [s]exuality is no longer regarded as a specific energy that unites persons derived from the large aggregates, but as the molecular energy that places molecules-partial objects (libido) in connection, that organizes inclusive disjunctions on the giant molecule of the body without organs [...] and that distributes states of being and becoming according to domains of presence or zones of intensity [...] For desiring-machines are precisely that: the microphysics of the unconscious. (183)

The birds' mycrophysical dynamics actualise the tensors of an enigmatic evolutionary drift that goes far beyond the 'ecological' (Žižek 1992a: 97) narrative mentioned by Žižek. The birds become a thousand tiny

sexes, uncontrollable emanations of a deterritorialising energy field that unleashes itself over the Oedipal bay:

> for the two sexes imply a multiplicity of molecular combinations bringing into play not only the man in the woman and the woman in the man, but the relation of each to the animal, the plant, etc. a thousand tiny sexes. (Deleuze and Guattari 1987: 213)

In this context, the difference between swarms and families can be read as that between anoedipal war machines and war machines that are operationalised and Oedipalised by the state, such as the Oedipal war machine that defines the symbolic order of Bodega Bay.

While Norman is unable to untangle his sexual war machine from his highly Oedipalised environment, the birds' war machine succeeds in completely destabilising the overall Oedipal machine: the thousands of birds assemble a desiring-machine that 'is the production of a thousand sexes, which are so many uncontrollable becomings' (278–9). It is much easier, therefore, to be on the side of the birds than to be on the side of Norman. They do not discriminate. They are not after anybody specific. They simply show that, according to a schizoanalytic logic, every Oedipalised family romance can be deterritorialised into a more comprehensive, more complex and more anonymous chemical romance; into the field of libidinal micro-machines that an Oedipal sexuality has repressed and organised in order to come into being. Below Oedipal sexuality, $n-1$ sexes, below stable structures, $n-1$ sets of unstable, dynamic relations: 'Go, Birdies, go!' or, in the rhetoric of Deleuze and Guattari: 'Destroy, destroy. The task of schizoanalysis goes by way of destruction [...] Destroy Oedipus' (Deleuze and Guattari 1983: 311). In Žižek, the birds are the hallucinations of a real sexuality that enters human sexuality only as a traumatic stain. In Deleuze, the birds are part of the non-human world's sexual diagram that engages with the human world's sexual diagram in a fully machinic, deterritorialising manner.

Symptomatically, the soundtrack of *The Birds* is literally synthesised from the acoustic reservoir of actual twitterings and wing-flaps: from the actual twittermachine. As Hitchcock notes, it is a true *sound*-track: 'We used only sounds for the whole of the picture. There was no music' (Truffaut 1968: 369). The acoustic effect Hitchcock aimed for was 'a menacing wave of vibration' (371); a purely affective, non-musical landscape of birdsound.[14]

Let us come back to the question of the 'meaning' of it all. From a psychoanalytic angle, the birds' attacks are projections or embodiments

of the protagonists' psychic attitudes, which is why the question about the reasons for the attacks can be answered from within the conceptual architecture of psychoanalysis. Quite literally, the birds attack because 'mother is afraid of being left alone' and *only* because mother is afraid of being left alone. The agency, therefore, lies with mother. Her maternal superego quite literally wills the birds into being.

If psychoanalysis can resolve the problem 'without a rest', Wood maintains that the question cannot be answered at all, stating that '[t]he question we are left with, "What do you suppose made it (the seagull) do that?" is not meant to have an answer' (Wood 1989: 159). For Wood, the meaning of the birds lies precisely in their meaninglessness: 'The film derives its disturbing power from the absolute meaninglessness and unpredictability of the attacks' (162).[15] Here, the agency lies solely with the birds. Both of these approaches miss the middle ground on which the bird series intersects with the human series. Both fail to address the diagram of the complex relations that pertain between the two fields and thus the poetics and the politics of their interaction. Already in *Anti-Oedipus*, Deleuze and Guattari had stated that the cinema 'is not analytical and regressive, but explores a global field of coexistence' (Deleuze and Guattari 1983: 274).

VIII. In Lieu of a Conclusion: Motel Architecture 2

In Ballard's 'Motel Architecture', Pangborn begins, at some point, to feel that he is being haunted by a stranger who first stabs Vera Tilley to death in the shower and then attempts to kill Pangborn. In the end, in fact, the stranger indeed does succeed in killing Pangborn, but then the stranger is of course Pangborn himself. Ballard's narrative twist defines the final act of murder as a schizo-suicide. The final image is of Pangborn 'rais[ing] the knife to his happy heart' (Ballard 1982: 194). As on a projective plane, on the narrative surface of 'Motel Architecture' actual musculature and virtual consciousness enter into a complex arrangement that remains as enigmatic as Gein's personal killing machine or as real-life death by bird.

The only truth of Ballard's story, as well as of Hitchcock's movies, is that of the dramatisation of the adequate optical attribution of matters-of-fact and relational architectures; the enigmatic, affective truth of Ballard's and Hitchcock's motel architectures: their schizoanalyses. In fact, Ballard is extremely Deleuzian in his reading of a schizoanalytic Hitchcock, and thus of a poetics and politics of the cinema in which the movie screen becomes a projective plane on which the actual and

the virtual converge by way of crystal-images: a screen on which virtual surface and actual points, bodily affect and the idea of the affect meet at infinity.

A more recent literary variation on the *Psycho* theme, Don DeLillo's *Point Omega* (2010), stresses, like 'Motel Architecture', the affective power of the movie and the crystal relation between the actual and the virtual series. The text consists of a narrative that is framed by two scenes, called 'Anonymity' and 'Anonymity 2', that describe a nameless male person watching – as obsessively as Pangborn watches *Psycho* – Douglas Gordon's real-life installation *24 Hour Psycho*, which decelerates the movie from its original 109 minutes to a running time of 24 hours. The narrator describes this installation as something akin to a weightless sculpture made purely from light. 'The screen was free-standing, about ten by fourteen feet, not elevated, placed in the middle of the room. It was a translucent screen' (DeLillo 2010: 3).

The man is especially obsessed with the affects the slowed-down images extract from the narrative. As the third-person narrator notes, '[t]his was the point. To see what's here, finally to look and to know you're looking, to feel time passing, to be alive to what is happening in the smallest registers of motion' (6). In the slow-motion projection, which shifts the focus quite literally from the movement-image to the time-image, narrative and meaning dissolve into floating moments of memory and affect, isolating details such as the 'flurries of trembling light' (ibid.) or the 'four rings spinning slowly over the fallen figure of Janet Leigh, a stray poem above the hellish death' (9) from the flow of the narration. Watching is no longer about signification, interpretation or about making *sense*. It is about making *sensation* and about being affected by the images of a pure cinema. Like Pangborn, the man is literally suspended in the space of Hitchcock's pure cinema, in the sense that suspense comes from the Latin *suspendere*. When two visitors enter the room, whom the man imagines to be two professors, he notes that an academic, hermeneutical – and, I would add, a psychoanalytical – approach must inevitably miss the affective dimension of the movie: 'their vocabulary of film [. . .] could not be adapted to curtain rods and curtain rings and eyelets' (10).

For the nameless spectator, the film becomes, in its deceleration, 'pure film, pure time' (6). The images slow down into arrangements of purely optical affect. In their separation from the narrative movement, they become pure crystal-images:

> She is running into darkness, a beautiful thing to see, decelerated, the woman running, shedding background light as she comes, face and shoulders slightly shaped, total dark falling in around her. This is what they ought to talk about here, if they talk, when they talk, light and shadow, the image on the screen. (110)

For the spectator, it is ultimately a question of how to literally move into the projective plane of the screen: 'He wanted the film to move even more slowly, requiring deeper involvement of eye and mind, always that, the thing he sees tunneling into the blood, into dense sensation, sharing consciousness with him' (115). How to literally seep into the screen, or let the images seep into him: 'Or was the film thinking into him, spilling through him like some kind of runaway brain fluid?' (109). How to occupy the projective space between fiction and life? When another visitor of the installation goes to stand behind the screen and acts out Bates's movements, the man wonders 'what made this side of the screen any less truthful than the other side?' (4).

The middle section of *Point Omega* is a first-person narrative by Jim Finley, a filmmaker who plans to make a documentary starring Richard Elster, an academic who was involved in the American government's organisation of the war in Iraq. The two men, who are now identified as the two men who had walked into the installation in the 'Anonymity' section, are staying in a house in the desert, where Finley tries to convince Elster to participate in the documentary. At some point, Elster's daughter Jessie joins them. When she vanishes, the two men and the police search for her, but all they find is a knife. After a time, the two men return to New York.

In the middle of this story, Finley voyeuristically watches Jessie first in the bathroom and later on in her bedroom. After this, she vanishes. Has he killed her? Has he been re-enacting Bates? The story does not tell. In the final section, 'Anonymity 2', the male spectator's dream of meeting a woman in the installation becomes true. The woman is reminiscent of Jessie. The two talk for a while, they leave the installation together, but the meeting does not lead anywhere. The man goes back to the installation and 'returns his attention to the screen, where everything is so intensely what it is' (116). He thinks about his mother: 'pure literature'.

IX. To recapitulate

The poetics and politics one might develop from the above readings is one of affects: of the attribution of bodily affects and mental affectations

that are, in Hitchcock, realised optically as crystal-images. Hitchcock's movies are not so much adequate equations of an Oedipal logic. Rather, they are adequate optical equations of the infinitely complex diagram of the world, and of the human and non-human stressors and tensors that make up this diagram. They are adequate optical equations of the world's circumstances and its enigmatic dynamics that cut across an Oedipal logic. In this shift, the psychoanalytic stain becomes a smear that dissolves in the fluid dynamics of this world. Invariably, Hitchcock's optical arrangements are figures that form complex affective landscapes shot through with enigmatic, anonymous affects that wash over bodies and minds equally.

Let me close with a final rhetorical question, a stylistic device I have hijacked for this essay from Žižek, who likes to use it for his more outrageous claims. Here, then, is my outrageous claim: Is not psychoanalysis the ultimate MacGuffin in Hitchcock's work? Is not it merely a random object that exists only in order to get the schizoanalytics of Hitchcock's optical, cinematographic machine running?

Notes

1. For such deprogrammings see Ishii-Gonzáles 2004; Buchanan 2002, 2006; Conley 2009.
2. See also Conley's (2009) discussion of Deleuze's differentiation between the archive and the diagram as the fields of form and force, respectively: 'actual form' and 'virtual force'.
3. As Truffaut notes, Hitchcock 'hinge[s] the plot around a striking coincidence' (Truffaut 1968: 15).
4. '[T]he state of nature is always already more than a simple state of nature' (Deleuze 1991: 39).
5. Cf. Thomson 2009.
6. 'He was not interested in characters or motivation at all. That was the writer's job' (Rebello 1990: 41). See also Hitchcock's disinterest in the real-life story: 'It was the story of a man who kept his mother's body in his home, somewhere in Wisconsin' (Truffaut 1968: 338).
7. '[T]he thing that appealed to me and made me decide to do the picture was the suddenness of the murder in the shower, coming, as it were, out of the blue. That was about all' (Truffaut 1968: 338). Wood also maintains that Hitchcock's films 'derive their value from the intensity of the images – an intensity created and controlled very largely by context, by the total organisation – rather than from the creation of "rounded" characters' (Wood 1989: 164).

9. Edelman deflects the psychoanalytic machine into the field of queer studies, reading the birds as embodiments of 'the arbitrary, future-negating force of a brutal and mindless drive' (Edelman 2004: 127). For a critique of psychoanalytic readings of Hitchcock, see Cohen, who maintains that 'it is insufficient to declare Hitchcock, or *Psycho*, simply anti-Oedipal [. . .] any more than one can hustle

to the Lacanian prop box to retrieve "maternal superego" to plaster over birds that have, as clearly as possible, deflected anthropomorphisms or family plots' (Cohen 2005b: 83). Against Žižek's 'painfully conventional' (Cohen 2005a: 47) mapping of 'the psychoanalytic facade' (Cohen 2005b: 78) and Deleuze's presumed 'relapse [...] into a logic of symbolization' (Cohen 2005a: 45) and 'figuration' (48), Cohen sets the grammatological play of the signifier.

10. In *Spellbound* (1945), the treatment is equally loose, although *The House of Dr. Edwardes* (Beeding 1928) contains deeply Oedipal moments. As Hitchcock notes, '*Spellbound* is based on complete psychiatric truth' (Hitchcock 1995d: 114). In the movie, the plot of the novel is significantly altered, and the staging of the dreamwork famously 'outsourced' to Salvador Dalí.
11. Thomson notes that the scene is 'the equivalent of the shower murder in *Psycho* – shot as lovingly as a romantic scene' (Thomson 2009: 109). See also Wood 1989: 153.
12. For a discussion of the optical technology see Wood (1989: 157, 159) and Žižek (1992b: 200, 236–7).

Signs Without Name[1]

Nadine Boljkovac Independent Researcher

Abstract

This paper argues that Chris Marker's 1982 film *Sans Soleil* derives its affective force from doublings and 'faces' of horror and beauty that reveal a twofold synthesis of actual and virtual. While a focus upon the material, ever in relation to transient yet lingering sensations, cannot discharge the power and force of the film, this paper endeavours nevertheless to assess and evoke Marker and Deleuze's own interrogative methods that thoroughly explore, in the manner of a revelatory 'schizoanalysis' or empiricism, molecular and variable operations beneath our 'molar' structures and organisations. As *Sans Soleil*'s voiceover states, 'If they don't see happiness in the picture, at least they'll see the black', a provocative remark that invokes indefinable singularities and the darkness of a wound, cracking of time and splitting of self in film, life and death. Considerations of death, consciousness and subjectivity extend this paper's examinations.

Keywords: Marker, affect, sensation, becoming, force, counter-actualisation, subjectivity

> 'Poetry is born of insecurity: wandering Jews, quaking Japanese; [. . .] moving about in a world of appearances: fragile, fleeting, revocable, of trains that fly from planet to planet [. . .]. That's called "the impermanence of things".'
>
> *Sans Soleil* 1982; hereafter *SS*

> The artist tells him- or herself that this world has had different aspects, will have still others, and that there are already others on other planets; finally, the artist opens up to the Cosmos in order to harness forces in a 'work'.

> (*SS*)

A seemingly otherworldly, fleeting yet haunting series of visual, voice and sound assemblages amassed with the 'relentlessness of a bounty hunter' constitute the opening moments of Chris Marker's *Sans Soleil* (1982) during which the narration announces: 'He wrote: I've been round the world several times and now only banality still interests me.' At once specific, explicit and cryptic, the film's narration and images of time deftly manifest doublings and paradoxes of life, creation and experience: death and survival, memory and forgetting, horror and beauty, fragility and indestructibility, joy and loss, layers of life that simultaneously, collectively comprise, as *Sans Soleil* suggests, familiar *and* indecipherable aspects of existence that the film seeks to momentarily glimpse and distinguish. Via its embrace of spiritual cosmic 'worlds' within our own whose language of 'electronic graffiti' delineates 'the contours of what is not, or is no longer, or is not yet' (*SS*), Marker's film sensorily evokes a melancholy whose disembodied wounds bespeak the loss of actual limits and survival of virtual remains. By such affecting embodiment, *Sans Soleil* effectively unearths the untranslatable and impermanent, that invisible *between* or 'poignancy of things', the 'Japanese secret' that implies 'the faculty of communion with things, of entering into them, of being them for a moment' so that, 'in their turn[,] they should be like us: perishable and immortal' (*SS*).[2]

Persistently, *Sans Soleil* attempts to convey paradoxically enduring yet evanescent sensations and melancholies, those poignant 'immobile shadows' (*SS*) begot by disembodied wounds. At the margins of our world between all things past and future, visible and invisible, the film then encounters that ceaselessly double process, coincidence or *between* of forces as it glares at the 'partition that separates life from death' and that 'last state – before their [actual] disappearance – of the poignancy of things' (*SS*). This pursuit, that is, of *Sans Soleil* and all Marker works through their respectively innovative and new means is, as insists *Sans Soleil*'s narration, 'not a search for contrasts' but a 'journey to the two extreme poles of survival'. Yet whilst *Sans Soleil* purportedly examines the two 'extremes' of Japan and Africa, it more profoundly contemplates

the dynamic movements of actual-virtual relations with their doublings and faces of horror and beauty that reveal the two sides of all things, that twofold synthesis of actual and virtual split continually into two like time's past-future divide itself.

Microscopically and intensely, the film pursues the 'virtual counterpart' (*SS*) and poignancy of all things corporeal and incorporeal, seen and unseen; through the unexpected and ever-transitive, *Sans Soleil* discerns virtual extensions, *thisnesses* that defy name, and *signs* that forever impinge upon the soul that line the actual mundane quotidian. 'He wrote me: coming back through the Chiba coast I thought of Shonagon's list, of all those signs one has only to name to quicken the heart, just name' (*SS*). A sign, as Deleuze through Spinoza proposes, 'can have several meanings' but is always 'an *effect*', 'the trace of one body upon another' (Deleuze 1997: 138). With regard to the impossibility of naming or affixing affective experience, *Sans Soleil* respectively remarks: 'To us, a sun is not quite a sun unless it's radiant.' In quest then of the ineffable, of signs without name or dynamic unfoldings and revelations of the routinely imperceptible, of *thisnesses*, haecceities and piercing moments 'held [. . .] at arm's length, [. . .] zoom's length, until [. . . their] last twenty-fourth of a second' (*SS*), *Sans Soleil* perseveres. 'If they don't see happiness in the picture, at least they'll see the black' (*SS*).

'The *white or black screen*, finally', writes Ronald Bogue à propos modern cinema, 'is the interstice made visible' (Bogue 2003: 179). 'The first image he told me about', begins *Sans Soleil*, 'was of three children on a road in Iceland, in 1965. He said that for him it was the image of happiness and also that he had tried several times to link it to other images, but it never worked' (*SS*). *Sans Soleil*'s first series of unlinked images, that of three Icelandic children, a US war plane and finally 'a long piece of black leader' (*SS*), indeed overtly exposes, in direct relation to Marker's 1962 *La Jetée*, the screen and the filmic cut, that *between* of images that potentially becomes, as Deleuze explains, the screen itself.

In relation to the means through which *Sans Soleil* foregrounds the cuts between its images, as through its long piece of black leader in these opening moments of the film, it is vital to return to Deleuze's writing on modern cinema and the postwar time-image. For, once more, Deleuze identifies

> [a] reversal where the image is unlinked and the cut begins to have an importance in itself. [. . .] there is no longer linkage of associated images, but only relinkages of independent images. [. . .] one image *plus* another [. . .]. The cut may now be extended and appear in its own right, as the black screen, the white screen and their derivatives and combinations. (Deleuze 1989: 213–14)

Through this method of between or AND – what Deleuze terms a 'whole new system of rhythm' or 'serial or atonal cinema' – modern cinema, moreover *Sans Soleil* itself, gives rise to not only the emergence of a direct presentation of time but also the time-image's direct encounter with the limits of thought itself (Deleuze 1989: 214).

For this encounter between thought and image, as staged throughout many of Marker's films, also discovers particular significance via *Sans Soleil*. Unlike Marker's *La Jetée* as well as the early films of frequent collaborator and friend Alain Resnais that each emerge from a certain definitive horror – the Holocaust, Hiroshima, an atomic apocalypse – *Sans Soleil* shifts towards a more comprehensive, layered interrogation of both strangely familiar *and* indecipherable aspects of life that exist ever in relation to sufferings past and yet to come. *Sans Soleil*'s acute scrutinisation of the banal does indeed reveal unexpected horrors and excesses that bespeak not a single monumental historic event but countless unique injustices and sorrows and their everlasting reverberations.

To reiterate a primary contention of this paper and Deleuze's cine-philosophy, the time-image in effect 'puts thought into contact with an unthought, the unsummonable, the inexplicable, the undecidable, the incommensurable' (Deleuze 1989: 214), that breakdown or crack we confront as our corporeal *and* incorporeal reality, which death's virtual/impersonal, actual/personal aspects most profoundly embody. Engendered in response to the actual horrors of our world, their lingering affective effects and our complicity, complacency and banality, the modern cinema's expression of an 'impotence' or powerlessness precipitated the breakdown of the cinema's sensory-motor organisation, the method of linear, rational or 'sutured' continuity championed in classic cinema. What modern cinema of the time-image 'advances', claims Deleuze, 'is not the power of thought but its "impower"' (Deleuze 1989: 166).

Modern cinema in effect encounters what Deleuze by way of Artaud recognises as the 'powerlessness at the heart of thought', that which Deleuze through Artaud believes cinema 'essentially suited to reveal' (Deleuze 1989: 166). For the cracks or cuts of the image in modern cinema expose, as Deleuze maintains, time's fissure of an actual present into both future and virtual past, that domain of all past events that doubles or mirrors the present, as well as the self's own confrontation with the very limits of rational thought that fracture the limits of the self and effect its personal-impersonal split. 'What the modern cinema forces

thought to think is the outside, that dispersive, spacing force that passes into the interstice', Bogue writes (2003: 176).

At the 'two sides of the limit' of the self and of thought demarcated by the irrational cut, 'thought outside itself and this un-thought within thought' (Deleuze 1989: 278), *Sans Soleil*'s long piece of black leader and the disjointed images of its sequences correspond then to the fundamental importance of the 'interstice between two images' and the irrational, autonomous cuts that mark neither beginning nor end (200). The 'object of cinema', declares Deleuze,

> is not to reconstitute a presence of bodies, in perception and action, but to carry out a primordial genesis of bodies in terms of a white, or a black or a grey (or even in terms of colours), in terms of a 'beginning of visible which is not yet a figure, which is not yet an action'. (201)

This making perceptible of the imperceptible is a reversible process of becoming or movement through which novel actualisations and virtual differentiations surface. My larger project devoted to Marker and Resnais's films newly interrogates the multiple forces and interpenetrating bodies, *thisnesses* and things that comprise our world (see Boljkovac 2009b); its analyses reveal what Deleuze acknowledges as the cinema's 'essence', or at least 'one of its essences: a proceeding, a process of constitution of bodies from the neutral image, white or black, snowy or flashed' that ultimately, vitally, restores 'our belief in the world' (Deleuze 1989: 201), *this* world.

For despite Deleuze and Marker's seeming invocations of worlds beyond our own, their poetic cine-philosophy crucially examines creative means of becoming and living in *this* world through revelations of the virtual, untimely affects, forces and singularities of our incorporeal sensations and events and their corporeal effects. 'The problem', Deleuze asserts, 'is *not* that of a presence of bodies, but that of a belief which is capable of restoring the world and the body to us on the basis of what signifies their absence' (202). The problem, that is, is not one of appearances but of 'inconspicuous perceptions' (Deleuze 1993: 89) that make visible the invisible, the interstice, the *between* two images. To repeat Deleuze's words through Godard, 'make the indiscernible, that is the frontier, visible' (Deleuze 1989: 180), and so stare directly, once more, into the 'partition that separates life from death' whilst surveying that 'last state', before their disappearance, 'of the poignancy of things' (*SS*).

What we alternatively recognise as whole–continuous "'images in a chain . . . an uninterrupted chain of images each one the slave of the next", and whose slave we are'–merges again with that which Blanchot calls 'the force of "dispersal of the Outside" ' (Deleuze 1989: 180). This fissure, crack or ' "dissociative force" ', a ' "hole in appearances" ' (Deleuze 1989: 167), forever fractures that which *Sans Soleil* terms our own 'world of appearances', which parallels imperceptible worlds of disappearances. As it perceives this doubling of 'worlds' through its 'constant comings and goings' about the globe (*SS*), and through which we encounter the self's impossibility or impotence at the limits of habitual thought, chronological time and assured subjectivity, the film's epistolary narration remarks: 'In a way the two worlds [of appearances and disappearances] communicate with each other. Memory is to one what history is to the other: an impossibility.'

'The first image he told me about was of three children on a road in Iceland, in 1965.

He said that for him it was the image of happiness.' (*SS*)

Sans Soleil's title screens, in vivid red, purple and yellow, Russian, English and French, respectively, silently follow the film's opening sequence with its fleeting glimpses of a T. S. Eliot quotation, 'Because I know that time is always time / And place is always and only place',[3] three Icelandic children, US war-plane base and black leader that concludes the sequence. The pervasive blackness of both the leader and lengthy interstices between the disparate images underscores, as aforementioned, the film's explicit confrontation with the ineffable limits of cinema and thought that pushes, as Bogue contends through Deleuze with regard to the limits of cinema, 'the visible "to a limit which is at once invisible and yet can only be seen" ' as it discloses a speech that ' "is at once, as it were, the unspeakable and yet what can only be spoken" ' (Bogue 2004: 23; see also Deleuze 1989: 260). If 'thought, in cinema', that is, may be 'brought face to face with its own impossibility', as Deleuze states through Jean-Louis Schefer, thought draws from this powerlessness 'a higher power of birth' through a '*suspension of the world*' and '*disturbance*, which, far from making thought visible [. . .] are on the contrary directed to what does not let itself be thought in thought, and equally to what does not let itself be seen in vision' (Deleuze 1989: 168).

How then can cinema make visible the invisible through images of time and movement? How does *Sans Soleil* pierce, rupture, reverberate and sensuously affect *beyond* any categorisation, recognition or 'image

of happiness' through its haunting pursuits of life's doublings and paradoxes, and what does this portend for film, life and its intercessions with 'the web of time' (*SS*) and death? 'What becomes essential in modern art', Daniel Smith maintains, 'is no longer the matter-form relation, but the *material-force* relation' (Smith 1996: 43), that which makes us sense unsensible forces, those forces of the Outside beyond apprehension and reproduction that compromise reason and effect the pre-individual.

Such a violent encounter with the intolerable and unthought that, once again, precipitates the cinema's sensory-motor break gives rise to that 'confrontation of an outside and an inside' through thought itself, that which, once more, is 'born from an outside more distant than any external world' and which 'confronts an inside, an unthinkable or unthought, deeper than any internal world' (Deleuze 1989: 278). At the frontier of the self's crack or disintegration and the cinema's own break with indirect representation, empirical and chronological succession (see Deleuze 1989: 155) via its irrational cut that foregrounds the 'two sides of the limit' (278), new kinds of subjectivity emerge which open to a freedom and 'joy' of life.

Through collision with the outside or limit from which they derive, these subjectivities or 'folds' of outside and inside, world and self, engender nonhuman becomings. Despite conventional readings of the film, *Sans Soleil*'s myriad disjunctive connections, or 'relinkages of independent images', do not then, again, convey a contrast between certain homogenised peoples and lands by way of a multi-level narrative or protagonist frequently regarded as a 'fictional stand-in for Marker' (Alter 2006: 103).[4] Rather, *Sans Soleil*'s deterritorialisations of once-historicised images expose the singularities, forces and relations that unfold through actualisations at various levels, before and beyond human consciousness and experience, and that comprise individualities. This break from a phenomenology as grounded in subjectified, clichéd perception (see Deleuze and Guattari 1994: 150) seeks to expose the effects of the virtual relations underlying our states of affairs and bodies that we commonly fail to perceive.

In other words, Marker and Deleuze, with Resnais and Guattari, advance thinking beyond the subject and consciousness as they realise a force of becoming through pure optical and sound descriptions in cinema and concepts in philosophy. These cinematic affects and percepts, and philosophical concepts, evoke both the before and after via the enduring prominence of the interstice or frontier itself through which a direct presentation of time surfaces, a continuum that senses pure duration

and directly captures invisible force, *thisness* and sensation – *red*ness, not blood (see Smith 1996: 46). How then does the artist's material, as Smith persists, 'become capable of "bearing" the sensation?' (42).

With specific regard to the cinema, we must again then also consider what Deleuze claims as 'the essence of cinema – which is not the majority of films' (Deleuze 1989: 168). For the essence of cinema, Deleuze contends, 'has thought as its higher purpose, nothing but thought and its functioning' (168) which operates by way of affect and sensation. '[A]s soon as it takes on its aberration of movement', Deleuze continues, the cinematic time-image

> carries out a *suspension of the world* or affects the visible with a *disturbance*, which, far from making thought visible [...] are on the contrary directed to what does not let itself be thought in thought, and equally to what does not let itself be seen in vision. [...] thought, in cinema, is brought face to face with its own impossibility, and yet draws from this a higher power of birth. (ibid.)

Once more, this 'experience of thought', which 'essentially (but not exclusively) concerns modern cinema' and which is 'a result of the change [or break from sensory-motor organisation] which affects the image' (169), requires 'not imaginary participation' (168). Rather, as my exploration of *La Jetée* also reveals through *thisnesses* and 'things that quicken the heart' (*SS*; see Boljkovac 2009a), this experience of thought corresponds to 'the rain when you leave the auditorium'; it is 'not dream, but the blackness' (Deleuze 1989: 168). This 'encounter with the unthinkable' (171) through sensation pertains to the capture of *thought outside itself*, a self-less seeing and becoming from which *pure* visual situations and a *free indirect discourse* emerge to disclose a new relation between film and thought. The artist's task is always sensation itself, not the sensational, not 'Happiness' but 'the black' that may bear the sensation, should it 'not let itself be seen' (*SS*).

The cinema's interaction of two *unlinked* images then that trace 'a frontier which belongs to neither one nor the other', as Deleuze writes with regard to a modern cinema such as Godard's (181), again distinguishes dimensions of *thisnesses* that can only be sensed, that something in the world 'not of recognition but of a fundamental *encounter*' that forces thought (Deleuze 1994: 139) and 'reach[es] the body before discourses, before words, before things are named: the "first name", and even before the first name' (Deleuze 1989: 172–3). Might we name the unnameable, 'those signs one has only to name to quicken the heart, just name' (*SS*)?

'What then', persists *Sans Soleil*, 'shall we call this diffuse belief, according to which every fragment of creation has its invisible counterpart?' (*SS*). In pursuit of these 'things' or *thisnesses* that quicken the heart, *Sans Soleil*'s experimental foray across intersecting virtual-actual lines of dynamic movements and relations encounters not forms and subjects but what Deleuze and Guattari may term 'a mode of individuation' that is 'very different from that of a person, subject, thing, or substance', and for which they reserve the name *haecceity* (see Deleuze and Guattari 1987: 261–3).

And so, from the rhythms, masks, chants and crowds of an African festival to outer space, an ocean's depths and the performativity of a Japanese parade, *Sans Soleil* traces the frontiers of our globe with an eye seemingly attuned to the exuberant yet more evocative of the minute. For, with 'a sort of melancholy comfort [derived] from the contemplation of the tiniest things', the film locates its heartbeat in these 'neighbourhood celebrations' (*SS*), between the liberated elements – speeds and affects – of forms, subjects and things that flash across the interstices of the film and its audio-visual forces, and through which the oft-indiscernible yet persistent pulsation of a heart, as resonant even through the sounds of a ferry, train or festive parade, may be heard and even felt. 'It might suffice', *Sans Soleil*'s world traveller adds, 'to pick up any one of the telephones that are lying around to hear a familiar voice, or the beating of a heart' (*SS*). Yet, how to name this ubiquitous throbbing of a 'chaotic universe',[5] the uprooted materials and affects of events and becomings, the assemblages, 'climates, winds, seasons, hours' 'we' and all things and animals populate (Deleuze and Guattari 1987: 263), the 'unthinkable which cannot even be spoken' (Deleuze 1989: 171)?

If the limit or ineffable itself as a force of becoming, again what Deleuze terms the 'power of the outside', passes into the interstice to directly realise time in the image (181), each interstice is then, as Bogue concludes, 'an expression or unfolding of the outside' (Bogue 2003: 176). Once more at the limit of personal and impersonal, this force of thought and becoming effects a becoming-imperceptible, a becoming-molecular, becoming-animal, becoming-child, before self-apprehension, memory, language – a '*becoming everybody*': 'For everybody / everything is the molar aggregate, but *becoming everybody / everything* is another affair', maintain Deleuze and Guattari,

> one that brings into play the cosmos with its molecular components. Becoming everybody / everything (*tout le monde*) is to world (*faire monde*), to make a world (*faire un monde*). [. . .] To be present at the dawn of the world.

> [. . .] To reduce oneself to an abstract line, a trait, in order to find one's zone of indiscernibility with other traits, and in this way enter the haecceity and impersonality of the creator. (Deleuze and Guattari 1987: 279–80)

In relations of speed and slowness, *Sans Soleil*'s traveller-becoming-world skirts from one end of the globe to another across planes and spaces of territorialisation, deterritorialisation and reterritorialisation, those destructive yet also productive movements of social change that the film assesses and towards which it imparts positive force. 'Here', *Sans Soleil* interjects, 'to place adjectives would be so rude as leaving price tags on purchases' (*SS*). 'Japanese poetry never modifies', the narration continues; '[t]here is a way of saying boat, rock, mist, frog, crow, hail, heron, chrysanthemum that includes them all.' Hence, the story of a man from Nagoya who lost his love and killed himself; inasmuch as 'Happiness' exceeds and resists articulation, 'They say he could not stand hearing the word "Spring" ' (*SS*).

As *Sans Soleil* continues to trace and 'map out' the limits of actual-virtual frontiers, the doublings or foldings of life through which one lives 'in two times, at two moments at once' (Deleuze 1990: 158), the film gives rise to liberative dissolutions as truths of memory and history falter and life-affirming 'powers of the false' (see Deleuze 1989: ch. 6) and foreignness emerge within the familiar.

> He wrote me that the pictures of Guinea-Bissau ought to be accompanied by music from the Cape Verde islands. That would be our contribution to the unity dreamed of by Amílcar Cabral. Why should so small a country – and one so poor – interest the world? [. . .] They traumatized the Portuguese army to such an extent that it gave rise to a movement that overthrew the dictatorship, and led one for a moment to believe in a new revolution in Europe. Who remembers all that? History throws its empty bottles out the window. (*SS*)

If the truthful man wants 'nothing other than to judge life', as Deleuze argues through Nietzsche (Deleuze 1989: 137), to impose morality as a truth and right to self-appointed justice and repressive sovereignty, *Sans Soleil*'s making strange or 'world' via images that disclose a coalescence between virtual and real (see Deleuze 1989: 68) shatters any ideal of truth, and with it our world of appearances whose essential message is 'the code'. '[I]t's a coded hypocrisy', claims *Sans Soleil*; '[t]he code is the message. It points to the absolute by hiding it. That's what religions have always done' (*SS*). The following pages rather find that the 'essential point', as Deleuze sees it, is 'how the new regime of the image (the direct time-image)' shatters such censoring 'truths' in our actual world

and states of affairs as it forges a metamorphosing power of the false (Deleuze 1989: 134–5).

By way of an inclusive method of between through exhaustion (see Boljkovac 2009b: ch. IV; Deleuze 1997: 157–8), and to repeat Deleuze's words once more, what remains are bodies, forces, as Deleuze insists, 'nothing but forces' and their relations, 'the power to affect and be affected', 'the shock of forces, in the image or of the images between themselves' (Deleuze 1989: 139). As these forces of relations, visions of the unseen, or pure affects and percepts, once again encounter an outside, '*the outside* of language, but [...] not outside it' (Deleuze 1997: 112), they forge a foreign language in the interstices, cracks and breaks of the film that gives rise to a vital space of creative becoming and productive reinvention within the actual pre-existent world.

For *Sans Soleil*'s travels about the globe effectively happen *between* or *outside*; they encounter effects and affects, *thisnesses*, that pass or happen 'between two as though under a potential difference', not one term or thing becoming the other but each encountering the other, 'a single becoming which is not common to the two' but again *between* the two, something between or 'outside the two, and which flows in another direction' (Deleuze and Parnet 2002: 6–7). This 'double capture' of the conjunction AND is once more 'neither a union, nor a juxtaposition, but the birth of a stammering, the outline of a broken line' (9–10) and the creative emergence of an *anomalous*, minor people of geography, of 'orientations, directions, entries and exits' (2) and 'very varied lines' (10), an unpeopled people of desert islands,[6] of waves that fold into each other, of people 'populated by tribes' yet deserted and alone in a continual process of self-perceiving perception that forever repeats defining identity whilst defining movements of difference. 'The desert, experimentation on oneself', to repeat Deleuze's declaration, 'is our only identity, our single chance for all the combinations which inhabit us' (11).

As the following sections will discover, *Sans Soleil* effects its own becoming through a dynamic image of itself that engenders a perpetual movement and 'pure consciousness' (Deleuze 2004: 10) through an immanent, connective process of bringing together differentiating and identifying relations. This process of transforming identity through difference lies through an *auto*-perceptibility, of perceiving and being perceived, and affectivity, of affecting and being affected, across, through and over lines of remembering and forgetting, separation and creation.

The nomads of *Sans Soleil*, and the film's nomadic correspondent 'himself', occasion a 'movement [that] does not go from one point to another' but that rather 'happens between two levels as in a difference of potential' (Deleuze and Parnet 2002: 31), in a space of 'involution' or of being 'between' (29), a space of becoming, a deserted space of neither evolution nor regression, past nor future, nor even present, a space in the middle created and reached 'by losing, by abandoning, by reducing, by simplifying', by purifying oneself of one's self through a consciousness that precedes one's self and through which one becomes, a personal-impersonal process of actual contact and potential separation, a vital line, *a* life. Written in the interval before his own death, Deleuze's final essay, 'Immanence: A Life', a piece that resurfaces throughout my explorations of Marker and Resnais's cinemas, gives life to Deleuze's life's doctrine as it renews *Sans Soleil*'s own open-ended becoming.

> *A* life is everywhere, in all the moments that a given living subject goes through and that are measured by given lived objects: an immanent life carrying with it the events or singularities that are merely actualized in subjects and objects. This indefinite life does not itself have moments, close as they may be to another, but only between-times, between-moments; it doesn't just come about or come after but offers the immensity of an empty time where one sees the event yet to come and already happened, in the absolute of an immediate consciousness. (Deleuze 2001: 29)

Across and through the islands of deserted peoples it discovers, through nomads who have only geography and so have 'neither past nor future' as they exist 'always in the middle' without history (Deleuze and Parnet 2002: 31), *Sans Soleil* probes the *inverse* or *underside* of the actual as it inevitably identifies and yet sees newly while stuttering and pushing the terms of its cinematic means and 'language' 'to its limit, to its outside, to its silence' (Deleuze 1997: 113). As *Sans Soleil*'s journey 'to world' becomes a quest to chart and attain *pure sensation* in terms of remembering and forgetting, repetition and re-creation, Tom Conley's remarks regarding Deleuze's own 'multi-faceted or multi-layered ground plan of the relation of sensation and imagination to location' (Conley 2005: 209) resonate remarkably. For *Sans Soleil*'s rhizomatic, experimental mapping expresses virtual potential – those qualities of possible sensations that defy name: Happiness, unhappiness, emptiness, thirst, Spring, war, the 'great orchestral masses and accumulation of details', 'overcrowded, megalomaniac, inhuman', 'rhythms, clusters of faces', horror and beauty, both of which have 'a name and a face' (*SS*).

If *Sans Soleil* may be conceived as a series of performative encounters, an intensive map via its living screen of intensities and affects, its mapping is 'entirely oriented toward an experimentation in contact with the real' as opposed to any 'tracing'; for a map, as Deleuze and Guattari propose, is that which remains 'open and connectible in all of its dimensions' (see Deleuze and Guattari 1987: 12–15). While the cinema can re-present and re-fortify identity through redundancy, a practice that transforms a map into image, or 'rhizome into roots', *Sans Soleil* alternatively looks to the microscopic events, 'hallucinatory perceptions' and synaesthetic sensations that 'extricate themselves from the "tracing" ' and 'balance of power' (Deleuze and Guattari 1987: 15) as it endlessly finds itself in an interval between geography and history, the seeing and non-seen.

Of those unseen, *San Soleil* demands: 'How can one claim to show a category of Japanese who do not exist? [...] their real name – eta – is a taboo word, not to be pronounced. They are non-persons. How can they be shown, except as non-images?' (*SS*). In ways parallel to Deleuze's creative lines of thought, *Sans Soleil* pushes repeatedly towards limits, towards the '*sentiendum*', '*memorandum*', '*cogitandum*' (Deleuze 1994: 141) or, as Bogue writes, 'the insensible that the senses alone can experience', 'the immemorial that memory alone can remember', 'the inconceivable that understanding alone can conceptualize' (Bogue 2004: 23). To render these paradoxes, to again push cinema, to repeat Deleuze's description, 'to a limit which is at once invisible and yet can only be seen' (Deleuze 1989: 260), should one speak then, as Deleuze suggests, of 'a nonstyle' or the ' "elements of a style to come which do not yet exist" ' (Deleuze 1997: 113), of new foreign means of reaching limits of language and cinema through a people and microscopic events yet to come, of rhizomatic maps, networks and fissure-veins in worlds beyond our sight and sun? 'He wrote: Tokyo is a city crisscrossed by trains, tied together with electric wire she shows her veins' (*SS*).

> [I]t is because this world is intolerable that [... thought] can no longer think a world or think itself. The intolerable is no longer a serious injustice, but the permanent state of a daily banality.
>
> (Deleuze 1989: 170)

> 'I've been round the world several times and now only banality still interests me. On this trip I've tracked it with the relentlessness of a bounty hunter'.
>
> (*SS*)

> [A]nd if the writer is in the margins or completely outside his or her fragile community, this situation allows the writer all the more possibility to express

> another possible community and to forge the means for another consciousness and another sensibility.
>
> (Deleuze and Guattari 1986: 17)

'Art, and especially cinematic art', declares Deleuze, 'must take part in this task: not that of addressing a people, which is presupposed already there, but of contributing to the invention of a people' (Deleuze 1989: 217). On the margins of the communities he observes, *Sans Soleil*'s nomadic correspondent witnesses 'a people of wanderers, of navigators, of world travellers' whose fragile indestructibility ceaselessly fascinates him (*SS*). 'He didn't like to dwell on poverty', admits the film's narration, 'but in everything he wanted to show there were also the 4-Fs of the Japanese model. A world full of bums, of lumpens, of outcasts, of Koreans.' More specifically, he speculates: 'how to film the ladies of Bissau?' (*SS*).

Whilst he negotiates the two poles of survival, again, no more Japan and Africa than the intolerable in the everyday and unthinkable in thought, *Sans Soleil*'s global journeyman gives life to a 'being of thought which is always to come' (Deleuze 1989: 167) as he envisions the world and our becomings through it in ever-new ways. 'We are not in the world, we become with the world', suggest Deleuze and Guattari; 'we become by contemplating it. Everything is vision, becoming. We become universes. Becoming animal, plant, molecular, becoming zero' (Deleuze and Guattari 1994: 169; see also Zourabichvili 1996). As an 'alien thinker within the thinker' (Bogue 2003: 177)[7] in the process of becoming-other, a *spiritual automaton* with dismantled, paralysed speech and sight torn from any individualised perspective, *Sans Soleil*'s unseen protagonist perceives, reports and facilitates new kinds of selfless subjectivity, life and worlds that fold into themselves inasmuch as 'memory lines forgetting' (*SS*).

For as the protagonist encounters the film's worlds they fold into this wandering traveller so that 'he' and 'we' are enveloped in an affective, nonhuman becoming-other, a zone of 'indetermination, of indiscernibility' (Deleuze and Guattari 1994: 173) from which emerge pure affects, intensities and sensory becomings – 'otherness caught in a matter of expression' (177). Which is to say, while the film's actualisations of virtual events participate in, incorporate and embody the virtual giving it a body, a life, a universe (Deleuze and Guattari 1994: 177), the actualisation yet emanates a virtual excess and force of the new which gives rise to new ever-differing worlds; such is, as *Sans Soleil* reveals, 'the impermanence of things' (*SS*). 'It is the edge of

virtual, where it leaks into actual, that counts. For that seeping edge', claims Brian Massumi, 'is where potential, actually, is found' (Massumi 1996: 236). In this respect, *Sans Soleil*'s voyaging seer peers into the realm of the imperceptible and incommunicable as he interrogates the 'partitions', 'thresholds', 'poles', 'rifts', limits, frontiers and borders, the *folds* and 'coexistences' of our world with its 'subterranean tunnels that [...] run parallel to the city' and youth, the 'baby Martians', who 'live in a parallel time sphere' (*SS*).

These doubles and other dimensions of time forever newly repeat or refold to produce new becomings, interactions and transformations within our world, foldings, unfoldings and refoldings that *Sans Soleil* strives to assess and express. And so, as the virtual escapes the permanent, its immanent potential is in fact its impermanence and endless vitality, escape and excess in that *between*, zone or passing – again, that 'something passing from one to the other' – through which 'living beings whirl around', write Deleuze and Guattari, 'and [that] only art can reach and penetrate [...] in its enterprise of co-creation' (Deleuze and Guattari 1994: 173).

The 'walls between the realms are so thin', *Sans Soleil* reflects, 'that one can in the same breadth contemplate a statue, buy an inflatable doll, and give the goddess of fertility the small offering that always accompanies her displays' (*SS*), perhaps while also beginning to perceive the virtual-actual realms and dimensions of the imperceptible, that zone of doublings and indiscernibility that *Sans Soleil* constructs with 'blocs' of affects and percepts. To perceive the imperceptible while becoming-imperceptible, to perceive one's own self-perception while becoming-other and self-less, is to enter into relation with the 'undeterminable, the unreferable [...] "the reverse side of thoughts", which itself is what dreams come up against and rebound, break' (Deleuze 1989: 167). Such is to confront the 'two poles of survival' (*SS*) and, by so doing, free and bear witness to *a* life 'in this world as it is' (Deleuze 1989: 173).

This encounter with the limits of self and thought at once invokes a painful actualisation and virtual potential whereby the '*intolerable*', as Smith indicates, is 'a lived actuality that at the same time testifies to the impossibility of living in such conditions' (Smith 1997: xliii). In *Sans Soleil*, such lived actuality or 'everyday banality' (*SS*) attests to the importance of the banal in its continuous form. As with the ultimate event of death, so too may *affect* be experienced punctually as 'localized in an event', as writes Massumi; yet, to repeat Massumi's observation, 'it is also continuous, like a background perception that accompanies every event, however quotidian' (Massumi 1996: 229). The

virtual-actual two-sidedness to which Massumi refers, the 'simultaneous participation of the virtual in the actual and the actual in the virtual, as one arises from and returns to the other' (228), is nothing other than *Sans Soleil*'s affective, self-perceptive and continuous contemplation of these two poles of survival, the two sides of all things that manifest a synaesthetic participation of the senses in each other.

And so, as the film cuts abruptly from its title screens to an image of a loudspeaker affixed to a boat, we suddenly experience the film's roaming eye whose nonhuman perception, as split from any subjective positioning, releases a *percept*, an impersonal seeing. Water visible below comprises much of the shot, an image punctuated by the noise of the soundtrack with its intense rhythm redolent of *La Jetée*'s own quickening heartbeat and audible pulsations. 'He wrote: I'm just back from Hokkaido, the Northern Island. Rich and hurried Japanese take the plane, others take the ferry. Waiting, immobility, snatches of sleep. Curiously all of that makes me think of a past or future war' (*SS*).

The world traveller, whose letters the film's narrator reads, writes of the 'small fragments of war enshrined in everyday life' that he perceives (*SS*). The 'fragility of those moments suspended in time' embody thresholds of reality, sleep, dream and fantasy that bespeak reality's twofold oscillation and exchange between actual-virtual dynamic relations, the two poles or sides of all things that fundamentally speak to potentials and dangers of existence, and *Sans Soleil*'s own revelatory becoming and movement between a 'world of appearances' and its incorporeal transformations (*SS*).

As *Sans Soleil*'s unearthing eye discharges affect from a world of appearances, the earthly and commonplace, it interrogates such reversible relations between actual-real and virtual-real – the ephemeral excesses of experience, the extraordinary beyond ordinary, beauty through horror, life through death – as the film takes on an ethereal, otherworldly sensory quality that exceeds any individualised perspective or place. For through the film, affect becomes an imperceptible yet deeply penetrating force[8] that manifests itself in *Sans Soleil*'s moments of greatest resonance and poignancy that are at once profoundly banal and surreal, intimate and unearthly. Despite all disjunctions, violences between and within the image, the film exudes a grace as it stares, and stares often, in an 'invisible' style evocative of Mr Yamada's 'action cooking', whose way of 'mixing the ingredients' in a restaurant in Nishi-nippori could usefully apply, *Sans Soleil*'s voyager conjectures, to 'certain fundamental concepts common to painting, philosophy, and karate' (*SS*).

If 'Mr Yamada possessed in his humble way the essence of style' through use of his 'invisible brush' (*SS*), *Sans Soleil*'s own style, or *nonstyle*, again exposes the foreign within the familiar as it endlessly pushes towards the invisible, that invisible counterpart of all things on the other side of actual. At the margins of the fragile communities he observes, the frontiers between a world of appearances and 'swarm of appearances', *Sans Soleil*'s disembodied visionary indeed expresses new potential worlds 'before the fall' through worlds 'inaccessible to the complications of a Puritanism whose phoney shadow has been imposed on it by American occupation' (*SS*); through worlds beyond our 'castrating censorship' and televised, 'portable and compact [. . .] already inaccessible reality' (*SS*); through worlds wherein participants within and without the film – viewer, Marker and those yet to come – enact and construct new truths and consciousnesses via transformative *becoming-others* in that passage between translatable and untranslatable, truth and 'Happiness'.

> 'I paid for a round in a bar in Namidabashi. It's the kind of place that allows people to stare at each other with equality; the threshold below which every man is as good as any other – and knows it.'
>
> (*SS*)
>
> All consciousness is a matter of threshold. [. . .] If life has a soul, it is because it perceives, distinguishes, or discriminates, and because a whole world of animal psychology is first of all a psychology of perception.
>
> (Deleuze 1993: 88; 92)
>
> 'It was in the marketplaces of Bissau and Cape Verde that I could stare at them again with equality.'
>
> (*SS*)
>
> In fact, the self is only a threshold, a door, a becoming between two multiplicities.
>
> (Deleuze and Guattari 1987: 249)

Like the drunken man the film observes directing traffic at a crossroads, *Sans Soleil* materialises at a crossroads between 'roads' or ways of common perception. For through its encounters with the thresholds of actual-virtual processes and borders between thought and non-thought, the film's expression of the people, animals and worlds it experiences exposes the minute, particular and imperceptible perceptions we fail to commonly perceive through our molar or macro apprehensions. We hear, for instance, as Deleuze writes, a sea's sound, those 'conscious,

clear, and distinct apperceptions' and 'macroperceptions' to which we are 'overly accustomed', yet not the 'murmurs of each wave' (Deleuze 1993: 86–7).

As *Sans Soleil* then strives to discern the 'pricklings', 'murmurings' and 'little foldings' of molecular perceptions to effect its own *becoming-animal* and so extract affects and percepts from conventional limited perception, the film cuts from a close-up of an emu to a graphic close-up match of a young African woman, a 'match' or becoming that at once evokes a new transformation via a 'becoming-emu' or animal of woman that suggests a 'phenomenon of bordering' and 'affectability [. . .] no longer that of subjects' (Deleuze and Guattari 1987: 245, 258). For the graphic match moves beyond a representation of resemblance or analogy, beyond what may be seen, interpreted and faithfully reproduced, towards the liberation and extraction of the virtual sense or pure affects and sensations of an *anomalous* animal, an 'animal' at the edge, fringes, borderline or *between*.

This is not to say that the woman becomes animal. 'Becomings-animal are basically of another power', explain Deleuze and Guattari, 'since their reality resides not in an animal one imitates or to which one corresponds but in themselves, in that which suddenly sweeps us up and makes us become – a *proximity*, *an indiscernibility* that extracts a shared element from the animal' (Deleuze and Guattari 1987: 279). The relations between animal and human throughout the film, in other words, and as foreshadowed by this early graphic match, express *Sans Soleil*'s becoming, its intensive production of ever-new virtual potentials and multiplicities of affects that exceed the thresholds and borders of our rigidly defined perceptible existence with its visible-invisible controls that perpetuate our illusory truths and freedoms.

'[L]et us at least say that there is counterinformation', to repeat Deleuze's intervention, if people may move ' "freely" without being at all confined yet while still being perfectly controlled' through communication and information 'we are told [. . .] we are supposed to be ready or able to [. . .] believe' (Deleuze 1998: 18). Alternatively, the *anomaly*, non-individuality, singularity or becoming of the animal and woman that manifests neither an individual nor a species is 'affect in itself' (Deleuze and Guattari 1987: 259), a becoming-animal 'which arrives and passes at the edge' (244) to forge means for new ways of thinking and seeing, for 'another consciousness and another sensibility' (Deleuze and Guattari 1986: 17).

To see and think ever-newly through such revolutionary means, as presented by *Sans Soleil*, Deleuze and Guattari, is not to look,

gaze or stare and concede to power-relations and terms of equality as hierarchically, historically constructed and articulated, but to free life's flow of images and perceptions from our reductive apprehensions of their actualised forms. Perception, by this impersonal, living, non-representational and non-interpretational sense, is always a new mode of becoming – a *becoming-animal* – that senses virtual elements before and beyond recognisable distinction, designation and actualisation. The release of such virtual potential through perception creates new worlds and releases inconspicuous perceptions at the road, threshold or crack between perceptible and imperceptible, communicable and incommunicable.

How then to communicate 'the simplicity' and 'lack of affectation' of the couple who came to perform the rite that would 'repair the web of time' so that their runaway cat Tora would be protected (*SS*); how to film a 'people of nothing' and 'emptiness' (*SS*); how to convey the 'built-in grain of indestructibility' of the women who choose their fiancées and deny 'the magical function of the eye' at the centre of all things (*SS*); how to conceive of survival, unity and equality alongside happiness, beauty and an ever-proliferating population of cats and animals?

'He wrote me that in the Bijagós Islands it's the young girls who choose their fiancées. He wrote me that in the suburbs of Tokyo there is a temple consecrated to cats' (*SS*). The film cuts from the close-up side profile of an emu in France gazing off screen right to a woman in Guinea-Bissau gazing off screen left to a cats' temple in Japan with its Maneki Neko cats aligned in rows beckoning off screen right. The assemblage of audio-visual images at once takes 'the temporal form of an instantaneous counteractualization' (Deleuze 1995: 170) as the images counteract and deterritorialise a notion of difference as entrenched in nationalistic and colonialist discourses.

By *Sans Soleil*'s global 'mapping', the film again, that is, as 'open and connectible in all of its dimensions', does not so much contrast 'African time to European time and also to Asian time' as it newly reconfigures these 'extreme poles of survival' through evocations of their singularities, affects and virtual possibilities (*SS*). Africa, Europe and Asia become undefined landscapes of a 'deterritorialised world', a world again wherein '[a]ll faces envelop an unknown, unexplored landscape' (Deleuze and Guattari 1987: 172) and exist within a time of the Aion, a 'floating', 'nonpulsed' time 'against pulsed time or tempo, experimentation against any kind of interpretation', a 'state where forms dissolve, and all that subsists are tiny variations of speed between movements in composition' (267).

Upon this virtual imperceptible plane or surface of consistency or immanence, a field or space of possibilities, becomings and productive interactions on the other side of the plane of organisation, development or transcendence, liberated 'particles of an anonymous matter' communicate

> through the 'envelope' of forms and subjects, retaining between them only relations of movement and rest, speed and slowness, floating affects, so that the plane itself is perceived at the same time as it allows us to perceive the imperceptible (the microplane, the molecular plane). (Deleuze and Guattari 1987: 267)

Here too the face is an open surface and series of layers, a white or blank 'map' that may become a deterritorialised space and intensive map of progressive new becomings and potentials through which may emerge a people of nomadic thinkers and survivors. '[T]he face is a map', exclaim Deleuze and Guattari (1987: 170), and while the film's traveller acknowledges 'the unbearable vanity of the West, that has never ceased to privilege being over non-being, what is spoken to what is left unsaid' (*SS*), *Sans Soleil* never ceases to ascertain revolutionary becomings through the faces of the lands, peoples and animals it encounters, the 'face-landscapes' that perceive and are perceived.

> 'The entire city is a comic strip; it's Planet Manga. How can one fail to recognize the statuary that goes from plasticized baroque to Stalin central? And the giant faces with eyes that weigh down on the comic book readers, pictures bigger than people, voyeurizing the voyeurs'.
>
> (*SS*)

> I see that behind the sockets of the eyes there is a region unexplored, the world of futurity.
>
> (Deleuze and Guattari 1987: 171)

> '[T]he more you watch Japanese television . . . the more you feel it's watching you.'
>
> (*SS*)

> Now the face has a correlate of great importance: the landscape, which is not just a milieu but a deterritorialized world.
>
> (Deleuze and Guattari 1987: 172)

The film cuts to a shot of a volcano whose conical mountain seems an island itself above the clouds. On the islands of Cape Verde, *Sans Soleil*'s faceless explorer confronts the faces of other wanderers, navigators, world travellers, a 'people of nothing' and 'of emptiness' (*SS*), and as we stare openly with the film's vagabond, the faces compellingly return our glares. Immediately preceding this early sequence in the film, a series

of 'frozen' still shots exemplifying such perceiver-perceived relations are presented, each image 'stilled' upon a staring face: that of a young African woman upon a boat who glances ever briefly towards the camera before lowering her gaze ('How can one remember thirst?'); an elderly man who stares for a moment at the camera in the bar in Namidabashi ('the kind of place that allows people to stare at each other with equality; the threshold below which every man is as good as any other – and knows it'); and the two women at the jetty on Fogo in the Cape Verde Islands who forthrightly glare at the lens. Each 'frozen' still shot punctuates its sequence's end as it ironically reiterates the 'great concrete freeing of nonpulsed time' that Deleuze and Guattari suggest (Deleuze and Guattari 1987: 269) through a seeming pause or halting of time in the image.[9]

Prior to the third of the frozen still shots, *Sans Soleil*'s narrator remarks: 'Frankly, have you ever heard of anything stupider than to say to people as they teach in film schools, not to look at the camera?' This act of looking and being looked at repeatedly surfaces throughout *Sans Soleil* and Marker's entire oeuvre yet these relations between perceiver-perceived emerge perhaps with greatest force and intensity in *Sans Soleil*. For through the auto-perceptive doubling or folding of gazes whereby the perception of an other becomes also a perception of one's self and self-dissolution, we once again experience a perceptual perpetual process of identity and separation.

There is potential for reinvention of one's self *or* the reclamation of a self's identity that occurs, that is, whenever 'Marker's camera', the nomadic traveller's gaze, chances to rest upon a gaze that explicitly returns 'his' own, be it human, animal or otherwise. While a mirroring gaze may repeat organising determinations and our great redundancies of human segregation and classification, those a face most outwardly announces at its most blank, male/female, black/white, it potentially also realises and facilitates a self's separation and becoming-other, becoming-animal, becoming-imperceptible.

> I see her; she saw me; she knows that I see her; she drops me her glance, but just at an angle where it is still possible to act as though it was not addressed to me and, at the end, the real glance, straightforward, that lasted a twenty-fourth of a second, the length of a film frame. (*SS*)

If this is the stare of equality to which *Sans Soleil* ultimately refers, the glance and look of a face exacted from a woman of Bissau, the market lady of Praia, such 'equality' may then be the reflexive, transitive equivalence relation between perceiver-perceived – film, screen, camera,

viewer, filmmaker – as all bodies become-other through each other in an a-parallel or non-parallel evolution not of imitation or assimilation but of a differing doubling, a 'double capture' through which ' "what" each becomes changes no less than "that which" becomes' (Deleuze and Parnet 2002: 2–3). 'One might say', as does Deleuze, 'that something happens between them, at different speeds and with different intensities, which is not in one or other, but truly in an ideal place', such as the 'zone' of *Sans Soleil*,

> which is no longer a part of history, still less a dialogue among the dead, but an interstellar conversation, between very irregular stars, whose different becomings form a mobile bloc which it would be a case of capturing, an inter-flight, light-years. (Deleuze and Parnet 2002: 15–16)

On the 'landscape of another planet' *Sans Soleil*'s seeing nonhuman, unseen eye sees in fact the face of 'our future', a world wherein 'to call forth a vision, to be moved by a portrait, to tremble at the sound of music, can only be signs of a long and painful pre-history' (*SS*). Such a world, the film's narration suggests, could be told through 'one who has lost forgetting', such as the protagonist of 'the film to come' *Sans Soleil* describes who, at each moment through his impossible memory, might seem able to 'comprehend' (*SS*), as Deleuze proposes, 'all violence in a single act of violence, and every mortal event *in a single Event*' (Deleuze 1990: 152). Yet, as such is the ultimate task, to will, embrace and become worthy of all that happens to us, to remember yet always also to forget, '[n]aturally', as *Sans Soleil* concedes, this protagonist of 'the film to come' will fail. 'The unhappiness he discovers is as inaccessible to him as the poverty of a poor country is unimaginable to the children of a rich one' (*SS*).

To survive, to live, one must always, to repeat Deleuze's own repetitions, achieve a productive balance *between*, between the 'incorporeal crack at the surface' and the 'thickness' of a body, or risk self-destruction (Deleuze 1990: 156).

> If there is a crack at the surface, how can we prevent deep life from becoming a demolition job and prevent it from becoming it as a matter 'of course'? [. . .] [I]s it possible to limit ourselves to the counter-actualization of an event [. . .] while taking care to prevent the full actualization which characterizes the victim or the true patient? (Deleuze 1990: 157)

Is this then the 'secret' to which *Sans Soleil* repeatedly refers, 'the poignancy of things [that] implied the faculty of communion with things, of entering into them, of being them for a moment' (*SS*), the

poignancy, the *between*, the balance, the survival and proliferation of life which demands always a remembering and a forgetting, and an always becoming-other through a double becoming of the virtual-actual aspects of our bodies that are forever 'perishable and immortal' (*SS*)?

Sans Soleil relates the only recourse remaining for this would-be protagonist of the film to come,

> that which threw him into this absurd quest: a song cycle by Mussorgsky. [. . .] [I]t was then that for the first time he perceived the presence of that thing he didn't understand which had something to do with unhappiness and memory, and towards which slowly, heavily, he began to walk. (*SS*)

While the imperceptible presence of *Sans Soleil* admits, '[o]f course I'll never make that film', he has nonetheless given it a title, 'indeed the title of those Mussorgsky songs: *Sunless*'.[10] How far must we go between life and death to shed light on the 'sunless' whilst preserving the 'secret' of the *between*, of survival and 'happiness'? 'How long will it take to forget the secret?' (*SS*).

> Like the pyramid, the desert island exists before and after the advent of human or their incursions in the world. The island is a '[c]onscience of the earth and the ocean (. . .), ready to commence the world' [Deleuze 2004: 11].
>
> (Conley 2005: 214).
>
> 'Is it a property of islands to make their women into the guardians of their memory?'
>
> (*SS*)
>
> There remains the possibility of the author providing himself with 'intercessors' [. . .] of taking real and not fictional characters, [. . .] putting these very characters in the condition of 'making up fiction', of 'making legends', of 'story-telling'. The author takes a step towards his characters, but the characters take a step towards the author: double becoming.
>
> (Deleuze 1989: 222)
>
> 'I think of a world where each memory could create its own legend.'
>
> (*SS*)

On the desert island of Sal, 'a salt rock in the middle of the Atlantic' bestowed with seemingly countless days of unrelenting sun (*SS*), *Sans Soleil*'s voyager writes again to the film's female, faceless, nameless voice. Like the travelling 'he' of the film, 'she' is often also referred to as a 'me', a self, never individualised, always other, who exists between viewer and the nomad wanderer. As a 'character' himself, seeing but unseen, the

travelling, letter-writing nomadic 'man' and our correspondent through the film's excursions is 'continually becoming other, and is no longer separable from this becoming which merges with a people' (Deleuze 1989: 152), a becoming or folding that imbricates the filmmaker Marker himself. For inasmuch as 'each film-maker is a movement in himself', in this sense Marker 'too becomes another' (221) 'as he takes real characters as intercessors and replaces his fictions by their own story-telling, but, conversely, gives these story-tellings the shape of legends, carrying out their "making into legend" ' (152).

Through their becomings, fabulations or makings into legend, the people of *Sans Soleil* strive to intercede in the intermission or interstice between life and death as they acknowledge that 'moment that is only that of *a* life playing with death' (Deleuze 2001: 28), when quotidian life takes on an impersonal, singular life. 'Tokyo is full of these tiny legends, and of mediating animals' (*SS*), and as the people's rituals and legends take flight to reveal something more to do with happiness and forgetting than unhappiness and memory, their spiritual becomings temporarily free the film from its melancholy contemplations. If '[l]egends are born out of the need to decipher the indecipherable' and '[m]emories must make do with their delirium, with their drift' (*SS*), *Sans Soleil* derives a certain joy and anarchic madness through the signs of memory and sacred signs it senses and encounters that break through the 'wall' of a hierarchically signified stratified face.

And so, while we become implicated and other through these foldings, layers and reinventions of filmmaker, narrator, wanderer and character, a *free indirect discourse* arises, as through *La Jetée* (see Boljkovac 2009a). Through this pure act of speech torn from visual association and self, we hear *Sans Soleil*'s narrator obtain an 'original irreducible dimension' that resists the first person, even as she speaks in first person (Deleuze 1989: 242). This female voice of a becoming-other, becoming-woman, becoming-animal beyond the dominant authoritative male voice of ethnographic documentary film and majoritarian univocality[11] is *Sans Soleil*'s voice of the 'fourth person singular' (Deleuze 2004: 143; see also Deleuze 1990, Deleuze and Parnet 2002). The voice assumes Deleuze's general description of such a voice in modern cinema that, again, 'speaks as if he [she] were listening to his own words reported by someone else, hence achieving a *literalness* of the voice, cutting it off from any direct resonance, and making it produce a free indirect speech' (Deleuze 1989: 242).

The visual and sound images of *Sans Soleil* then become pure, 'autonomous components of a single, truly audio-visual image' that

'depends on a more complex link between the visual image *and* the sound image' (Deleuze 1989: 252). To once again reiterate Deleuze's thought, becoming is always a matter of *AND*, the making of a line between two bodies, an encounter between two, not of the two, in the two or common to the two, for in fact the two relations have nothing to do with each other (Deleuze and Parnet 2002: 7); rather, a joyful, wondrous encounter and becoming is an encounter with the animals, affects, intensities, movements, sensations and vibrations that move, touch, pierce and wound us; we are never the same. We are islands, Japan-becoming Africa, Africa-becoming Japan .... 'We are deserts', writes Deleuze, 'but populated by tribes, flora and fauna' (Deleuze 2004: 11). Back on the desert island of Sal, 'He wrote me: I've understood the visions. Suddenly you're in the desert the way you are in the night; whatever is not desert no longer exists' (*SS*).

In Bissau, 'where the magical function of the eye was working against [him]' (*SS*), *Sans Soleil*'s wanderer again contemplates the African women whose faces escape that magical eye, the 'faciality machine', as Deleuze and Guattari conceive it, whose 'social production of the face', as based upon '[o]ur semiotic of modern White Men, the semiotic of capitalism', would assimilate the women's faces to dominant signification and subjectification (Deleuze and Guattari 1987: 181, 182). 'All women have a built-in grain of indestructibility. And men's task', *Sans Soleil* observes, 'has always been to make them realise it as late as possible. African men are just as good at this task as others' (*SS*). As the women throughout the film glare at the camera, their collective corporeal polyvocality, vitality and force shatters any pretence of face, exotic mystery, ethnic othering or fetishisation as the intensities and affects of their faces and bodies resist capture. '[A]fter a close look at African women', the unseen or faceless female voice continues, 'I wouldn't necessarily bet on the men' (*SS*).

If the women, children, animals and islands of *Sans Soleil* that see and are seen then embody virtual worlds or potentials, 'desert islands' as populated with actual bodies and virtual anomalous survivors, these bodies form asubjective, 'collective assemblages of enunciation' that still evince the fragilities and insecurities of actual bodies. 'Such a creature on a deserted island would be the deserted island itself, insofar as it imagines and reflects itself in its first movement', Deleuze writes (Deleuze 2004: 11). As the peoples and lands of *Sans Soleil* constitute such double becomings of self-consciousness and renewal, reinvention and *fabulation* as *a people yet to come*, a singular people of more than 'twelve million anonymous inhabitants' (*SS*), their vital becoming-imperceptible and

immanence perhaps lies through the spiritual, sacred worlds of the islands the film discovers. We might proclaim with Deleuze that this is the 'constitution or reconstitution of a people, where the film-maker and his characters become others together and the one through the other, a collectivity which gradually wins from place to place, from person to person, from intercessor to intercessor' (Deleuze 1989: 153).

Islands, their cities and people in *Sans Soleil* become then sites of the double, retrospective, auto-perceptive becomings of filmmaker, narrator, wanderer and character whose folds envelope us. 'The *élan* that draws humans toward islands extends the double movement that produces islands in themselves', Deleuze notes (Deleuze 2004: 10). This double movement of separating and creating extends again and as well to a remembering and forgetting, repetition and difference, a 'dreaming of islands [... that] is dreaming of pulling away, of being already separate [...], of being lost and alone' whilst 'dreaming of starting from scratch, recreating, beginning anew' (Deleuze 2004: 10); as James Williams elsewhere writes, '[t]o connect and to discard are joint actions – we cannot do well at one without doing well in the other' (Williams 2003: 5).

Once more then, the doubling process is always one of a repeating difference that produces the effect of a counter-actualisation, a doubling of actual self and virtual impersonal other as doubled by a memory-image's doubling of each perception-image, a virtual doubling of present launched simultaneously towards future and past, that whole virtual past of our memories, experiences and 'images already affected by the moss of time' (*SS*) that *Sans Soleil* strives to perceive. 'I've spent the day in front of my TV set, that memory box', 'he' writes, whose commercials seem 'a kind of haiku to the eye' with their gazes that forever return his own (*SS*).

Like the whole of time itself, memory, as Bogue writes through Bergson and Deleuze, 'is not inside the individual mind, but each mind is inside memory, like a fish in the ocean. The ocean of memory is the virtual past, which gushes forth at each present moment in a perpetual foundation of time' (Bogue 2003: 119). As *Sans Soleil*'s traveller journeys across ocean from island to island listening to 'all the prayers to time' issued throughout his trip whilst 'collecting' materials for the film to come he will 'never make', he increasingly perceives his self's existence within time, within the 'zone' or 'web' (*SS*) of perpetual time, within which all life moves, lives and changes.

Through these travels across lands and lines of time, the film encounters layers and strata of landscapes and faces that expose the paradoxes and strange doublings of this stratigraphic, archaeological time as well, the junkyards with inoperative vehicles in a city of incessant transport; the imposed names and other faces of 'horror' that flicker and flash in incessant waves upon Japanese television; the anachronistic faces of a megalopolis that, at nightfall, 'breaks down into villages, with its country cemeteries in the shadow of banks, with its stations and temples', each district 'once again a tidy ingenuous little town, nestling amongst the skyscrapers' (*SS*).

Against his increasing perception of his self within time, and as the face-landscapes he discerns forever stare back, the film's correspondent visits a small bar in Shinjuku that reminds him 'of that Indian flute whose sound can only be heard by whomever is playing it. He might have cried out if it was in a Godard film or a Shakespeare play, "Where should this music be?" ' (*SS*). This again is 'the impermanence of things', a release and perception of affect through a singular body's encounter with the world. What remains imperceptible to representation and recognition becomes sensate through a self's othering and openness to worlds and sensations beyond its own, the worlds of an other. Although always between two, the process of becoming, creation or life itself is always also a solitary affair 'because, when it comes down to it, you are always alone, and yet you are like a conspiracy of animals. [. . .] you have never been more populated'; such solitude is once more 'a means of encounter' with the self and its always becoming-other that arises *between*, between one AND an-other (Deleuze and Parnet 2002: 9).

We then are oceans around islands, deserted bodies and waves of encounters encountering other deserted bodies, either deserted islands of 'collective imagination, [which is] what is most profound in it, i.e. rites and mythology' (Deleuze 2004: 11), or islands of deserts whose deserts offer no means for possible life. We encounter other bodies whose affects either affirm our power and make us become, that is, or that reduce us to a powerlessness and incapacity for new life. Once again, '[w]e know nothing about a body until we know what it can do', to restate Deleuze and Guattari's declaration,

> what its affects are, how they can or cannot enter into composition with other affects, with the affects of another body, either to destroy that body or to be destroyed by it, either to exchange actions and passions with it or join with it in composing a more powerful body. (Deleuze and Guattari 1987: 257)

The uncommon in *Sans Soleil*, the mystical, cosmic, spiritual and sacred worlds and rites of the people-islands it discovers, reveal the solitary collectivity of becoming Deleuze identifies. The 'people' and consciousnesses of the film's various reflective screens and surfaces, the faces of the television sets, billboards, the eyes of all the worlds the traveller confronts, engender a movement, not of human transport but the 'very moment of things' (Deleuze 2004: 10), a consciousness of pure duration itself, an *élan* that produces the desert and our 'beings' as deserted for, as Deleuze discerns, 'humans do not put an end to desertedness, they make it sacred' (10). 'Those people who come to the island indeed occupy and populate it', he continues,

> but in reality, were they sufficiently separate, sufficiently creative, they would give the island only a dynamic image of itself, a consciousness of the movement which produced the island, such that through them the island would in the end become conscious of itself as deserted and unpeopled. The island would be only the dream of humans, and humans, the pure consciousness of the island. (Deleuze 2004: 10)

The 'uncommon humans' of *Sans Soleil* with whom the Noro, or Japanese priestess, communicates – the spectres, monsters, spirits, 'gods of the sea, of rain, of the earth, of fire' (*SS*) – are resonances and reverberations of the virtual, again that invisible counterpart of every fragment of creation that may only be accessed through the uncommon 'beings' that outwardly bare their singularities – the women, children and animals of *Sans Soleil* who effect our own becoming-woman, becoming-animal, *becoming everybody*, *becoming world*.

> I learned that, as in the Bijagós, it is through the women that magic knowledge is transmitted.[. . .] Everyone bows down before the sister deity who is the reflection, in the absolute, of a privileged relationship between brother and sister. Even after her death, the sister retains her spiritual predominance. (*SS*)

> To that question so dear to the old explorers – 'which creatures live on deserted islands?' – one could only answer: human beings live there already, but uncommon humans, they are absolutely separate, absolute creators, in short, an Idea of humanity, a prototype, a man who would almost be a god, a woman who would be a goddess, a great Amnesiac, a pure Artist, a consciousness of Earth and Ocean, an enormous hurricane, a beautiful witch, a statue from the Easter Islands. There you have a human being who precedes itself. (Deleuze 2004: 11)

> 'And then in its turn the journey entered the 'zone', and Hayao showed me my images already affected by the moss of time, freed of the lie that had prolonged the existence of those moments swallowed by the spiral.'
>
> (*SS*)

In Iceland, a volcanic island in the northeastern Atlantic bestowed with few days of unrelenting sun and where 'he' had 'laid the first stone of an imaginary film', *Sans Soleil*'s voyager writes again: 'And that's where my three children of Iceland came and grafted themselves in' (*SS*). The traveller becoming-filmmaker retrieves the shot, adding the footage he had cut, 'the somewhat hazy end, the frame trembling under the force of the wind beating us down on the cliff, everything I had cut in order to tidy up', only to discover that the remnants, the discarded shots and debris of the 'tidied' version 'said better than all the rest what I saw in that moment, why I held it at arm's length, at zoom's length, until its last twenty-fourth of a second' (*SS*).

The children observe the camera curiously as it ventures towards their blissful lack of self-apprehension and recognition; sensing the risk, the impermanence and fleetingness of the irrevocable, ephemeral moment with its affective aura of peacefulness that might at any moment vanish in time, the camera remains at a distance, an arm and zoom's length away from grasping the forgotten, the immanent unseen on the other side of seen. 'Small children', writes Deleuze, 'through all their sufferings and weaknesses, are infused with an immanent life that is pure power and even bliss' (Deleuze 2001: 30). Earlier on, again, as the age-weary traveller watches the youth dance in the park at Yogogi, he shares in their secret: 'The youth who get together every weekend at Shinjuku obviously know that they are not on a launching pad toward real life [. . .] they are life, to be eaten on the spot like fresh doughnuts' (*SS*).

Left to this world, a world also of sufferings and weaknesses whose profound difference from that of a child's lies through a self-consciousness cultivated as a means for narcissistic self-interest rather than reinvention, *Sans Soleil* then 'performs its own Dondo-yaki', its own fiery 'farewell to all that one has lost, broken, used' (*SS*) in pure Markeresque style. As the film's images enter Hayao's zone of 'electronic graffiti', the first transformed image a Maneki Neko cat from the shrine in Japan, the voyager remembers: 'Cat, wherever you are, peace be with you' (*SS*). The electronic ashes fill the film's final frames as the images assume new life. While the contours of their actual forms dance in flames or flashes of light, *Sans Soleil* at last honours the deserted islands of its journey, its virtual spirits and collective souls whose magic secret may simply be the name for happiness.

Notes

1. With grateful thanks to Charlie Blake, Ian Buchanan, Tom Conley, Ian James, James Williams and Emma Wilson for their inspiration and support.
2. As I have noted elsewhere (see Boljkovac 2009a and 2009b) Deleuze's filmic analyses face accusations of a partiality towards a canonical hierarchy of modernist 'art-house' cinema. Yet this seeming preference principally reflects Deleuze's fascination with the capacities of certain films to directly present not merely the flow of non-localised movement but also time itself through time-images or signs that liberate a human body from its self-imposed limits as it begins to perceive its world and self differently through select cinematic experiences. Interestingly however, despite evident admiration for the works of Marker's collaborators and friends, notably Alain Resnais, Deleuze's writings do not acknowledge Marker's cinema although Marker's films remarkably exemplify Deleuze and Guattari's considerations, as does Marker's persona itself.
3. Such newly repeats Deleuze's account of the time-image as that which 'always gives us access to that Proustian dimension where people and things occupy a place in time which is incommensurable with the one they have in space' (Deleuze 1989: 39). This Eliot *Ash Wednesday* quotation appears in the English version of the film; a Jean Racine quotation appears in the original French version. For both film versions and text of the complete quotations, see the 2007 Criterion Collection DVD collective release of *La Jetée* and *Sans Soleil*, under exclusive licence from Argos Films, and 'Racine/Eliot' in its accompanying booklet (DVD booklet 2007: 31).
4. Several assessments of *Sans Soleil*, by Nora Alter and Catherine Lupton, for instance, present such an argument. Whilst their extensive analyses of Marker's works are very thorough and useful, Lupton's position pertaining to what Jon Kear (1999: 15) terms a 'structure of reflective consciousness', and what Lupton regards as a 'process of sorting things out and linking them together' via 'a kind of global, disembodied consciousness', seems to propose a cohesive structure for the film through an *embodied subject* or *subjects* located in the film's albeit 'multivocal properties' (Lupton 2005: 149–57). Elsewhere in a nuanced analysis extending to animals and places, Sarah Cooper ventures beyond notions of the film's cohesion to problematise continuity *and* change within *Sans Soleil* (see Cooper 2008: 116–18). Conceptualisations of selfless consciousness, point of view and the author/creator/filmmaker/'Marker' himself will continue to be assessed throughout this paper.
5. Smith writes: 'Divergences, bifurcations, and incompossibles now belong to *one and the same universe*, a chaotic universe in which divergent series trace endlessly bifurcating paths: a "chaosmos" and no longer a world' (Smith 1997: xxvi). (See also Boljkovac 2009b, ch. II; Deleuze and Guattari 1994: 204.)
6. See Deleuze's 'Desert Islands' (Deleuze 2004: 9–14) and Tom Conley's 'The Desert Island' (2005).
7. See Deleuze 1989, ch. 7, also Bogue 2003, with regard to Deleuze's concept of the 'spiritual automaton'.
8. With regard to the 'autonomy of affect', or, once more, 'that which is imperceptible but whose escape from perception cannot but be perceived, as long as one is alive', Massumi's analyses again are valuable (1996: 229).
9. Such stillness recalls the stills of Resnais's *Nuit et Brouillard* (1995) and Marker's *La Jetée* (1962), and Marker and Bellon's *Le Souvenir d'un Avenir* (2001) (see Boljkovac 2009b, chs II, IV, VI).

10. Of Mussorgsky's *Sunless* Cycle, James Walker notes that 'Mussorgsky's remarkable talent for observing and truthfully conveying in music the innermost movements and moods of the soul' may be found in all the songs of *Sunless*, although Mussorgsky's 'inspiration understood best the moods of pain and unhappiness' (Walker 1981: 387).
11. For further discussion pertaining to minoritarian 'voices' and faces, see MacCormack 2000.

A Deleuzian Imaginary: The Films of Jean Renoir

Richard Rushton Lancaster University

Abstract

This article contrasts the notion of a Deleuzian imaginary with that articulated by various film theorists during the 1970s and 1980s. Deleuze offers us, I argue, a way to conceive of the imaginary in the cinema in a positive way; that is, as something which opens up new expressions of the real. By contrast, for film theorists of the 1970s and 1980s, the imaginary was primarily conceived as a negative concept, as something which offered merely escapes or fraudulent distortions of the real. A Deleuzian imaginary for the cinema can be articulated, I argue, by way of the films of Jean Renoir.

Keywords: Imaginary, cinema, time-image, crystal-image, Jean Renoir

The 'imaginary' (or Imaginary with a capital 'I') emerged as one of the central terms of film analysis during the 1970s and 1980s. Especially under the influence of Lacanian psychoanalysis, film scholars like Christian Metz, Jean-Louis Baudry and Stephen Heath made the imaginary crucial for their analyses of cinema. For most of these scholars (although I count Metz as an exception in this regard), the imaginary was (and is) a bad thing indeed (see Metz 1982; Heath 1981, 1992; Baudry 1985). Louis Althusser's appropriation of the category of the imaginary was crucial here, for the delusions of the imaginary were held responsible for the ideological captivation of the subject (Althusser 1971). Althusser's political analyses were extended in brilliant ways in film studies by Baudry, Heath, Jean-Louis Comolli and others such that the political lesson of such analyses was that the spectators of popular

cinema were – or are – constructed as ideological subjects while watching films (see Comolli 1985; Comolli and Narboni 1990). That is to say, the function of popular – especially Hollywood – cinema was (and is) to produce ideological subjects: bourgeois subjects of capitalist ideology. The cinema apparatus could achieve this operation of ideological fixity because it encouraged imaginary identifications in its spectators – in Metz's wonderful formulation, 'What is characteristic of the cinema is not the imaginary it may happen to represent, but the imaginary that it *is* from the start' (Metz 1982: 44).

The short version of this story might therefore be: the imaginary is bad and because popular cinema encourages identification at the level of the imaginary, then it too is bad, or it enforces 'badness', where badness ultimately means something like 'ideological manipulation'. The task of film theory, therefore, in response to the dominant ideological manipulations of the imaginary, was to support and advocate modes of filmmaking that worked to break down imaginary identifications, and it fell to overtly political or avant-garde filmmakers, from Straub and Huillet, to Jean-Luc Godard and theorist-filmmakers like Comolli and Laura Mulvey, to achieve this goal. Thus was a 'counter-cinema' posited against the popular cinema. (What I offer here in an extremely condensed manner is extended at some length in chapter 1 of my book on *The Reality of Film*; Rushton 2011: 20–41.)

It is within this environment that Deleuze wrote his *Cinema* books. And yet, if we look there, we will find no discussion of the imaginary nor of ideological manipulation. Indeed, in relation to cinema, Deleuze is fairly dismissive of such notions. '[I]s "the imaginary" a good concept?' he asks at one point, and he goes on to answer this question in the negative (Deleuze 1995: 66). Yet if he is dismissive of the imaginary as a concept appropriate for cinema (more on this later), then he might also sense that it is inappropriate for other reasons. The imaginary, certainly insofar as Lacan or Althusser conceive it, is predicated on a notion of doubled consciousness: the imaginary is a false or distorted replica of real things – as is made explicit by the notion of 'false consciousness'; a false consciousness is an imagined, untrue consciousness which hides or covers over a true or real consciousness beneath it. Therefore, the imaginary as a concept posits mental apparitions – such as ideologies – that offer false representations of real things (or, in Althusser's very precise formulation, 'ideology represents the imaginary relationship of individuals to their real conditions of existence'; Althusser 1971: 109). We can perhaps see how, for many scholars, such a schema was felt so easily applicable for the cinema: films

offer us only false representations of the real world, representations that become embedded inside or 'at the back of' our heads.

The relation to theories of consciousness is key, for the imaginary cannot merely be understood as an aesthetic category but must also be considered as part of a theory of consciousness. For Deleuze, we can link 'the imaginary' with some other terms he criticises forcefully in *Difference and Repetition*: recognition and representation. Deleuze criticises what is called 'thought' in the name of recognition: to merely recognise something, Deleuze argues, does not mean one is thinking. Recognition merely reprises things that one has already known and cannot bring consciousness or thought face-to-face with the new. For Deleuze, it is the encounter with the new that defines what thinking is. Furthermore, recognition does not *disturb* thought; in other words, recognitions do not *force us to think*. With recognition, and Deleuze's critique of it, we can discern an operation conceived in terms of an imaginary matching: does the thought I am now having – that I imagine in my mind's eye, insofar as that 'mind's eye' is separated from and distinct from the object of thought – match a thought I have had before or which I have encountered elsewhere? Does this object, for example, which I can represent to myself by way of my ability to imagine it in my mind's eye, which has a flat top and four legs, match other objects like it which I have seen and conceived in the past? Is it a 'table', and thus does it also match with that signifier which in English is called a 'table'? Such is the process of 'the imaginary' that leads to signification. What I am trying to describe here is the penchant for the imaginary, as an ability of the 'mind's eye', as a process of things (images) deposited in the mind, which belongs only to a logic of recognition or representation (I *re*cognise these objects; I *re*present them . . .). For Deleuze, this is not what should be hoped for so far as thinking goes: *to think* should have greater aims than this:

> The 'I think' is the most general principle of representation – in other words, the source of these elements and of the unity of all these faculties: I conceive, I judge, I imagine, I remember, and I perceive – as though these were the four branches of the Cogito. On precisely these branches, difference is crucified. (Deleuze 1994: 138)

Recognition, representation and, along with these, 'the imaginary', insofar as they are posited as elements integral to thought and consciousness, can only lead to a repetition of the same, and never to the kinds of difference Deleuze wishes to discover in repetition. As a result,

for Deleuze, notions like recognition, representation and the imaginary cannot serve as markers of what he calls 'thought'.

For most readers, these must be very familiar Deleuzian themes, but what I want to pursue here is the relation between the imaginary conceived as an aesthetic category, on the one hand, and the imaginary as in some way constitutive of thought, on the other. Everywhere so far, we have only seen Deleuze's negative view of the imaginary. And yet, we must also bear in mind that for Althusser, for some Lacanians and definitely for film studies, the imaginary was (and is) also a negative category (for a contemporary Lacanian rendition of such arguments, see McGowan 2007). What, therefore, might Deleuze bring to a discussion of the imaginary which might allow us to conceive it in a different light? To add grist to the mill, film-studies scholars who mobilised the notion of the imaginary in the cinema did so with a view to criticising it as an aesthetic mode (there were, for these scholars, specific techniques which fostered the imaginary identifications of popular cinema [again see Baudry 1985, Comolli 1985]) at the same time as it enabled a critique of a specific kind of subjectivity – a masterful, fixed, bourgeois subject, 'captured' and fixed by the structure of representation so nonchalantly fostered by popular cinema (on this point see Heath 1992). Now, such a critique does not sound too far away from the kinds of criticisms we can get from Deleuze: the imaginary is a bad category because it does not enable a subjectivity true to thought and difference. Instead, the logic of the imaginary – fostered by recognition and representation – can only ever foster a return to sameness, a fixed consciousness impervious to thought. What, then, does Deleuze offer which might enable us to conceive of a different kind of imaginary, or at least an imaginary that need not be destined to negativity and a moribund subjectivity?

Of course, an additional question needs to be asked: Why would I want to flesh out a Deleuzian notion of the imaginary when it appears Deleuze is so hostile to such a conception? There are two immediate answers. First of all, Deleuze actually does invoke a notion of the imaginary, especially in *Cinema 2*, most importantly as a way of defining the difference between the movement-image and the time-image. So, on that score, there might be yet something useful to extract from a Deleuzian conception of the imaginary. A second reason is that, by coming into contact with a 'Deleuzian imaginary', we might more closely discern both the similarities and differences between Deleuze's approach to the study of film and that which is typically associated with the breakthrough film theories of the 1970s and 1980s. By comparing and

contrasting each position's approaches to 'the imaginary', a clearer sense of Deleuze's overall project can be uncovered.

As a first step, therefore, where and how does Deleuze refer to the imaginary in the *Cinema* volumes? In *Cinema 2* (1989), the 'imaginary' is invoked in contrast with the 'real'. However, what is distinctive about the time-image, and of the subset of the time-image known as the crystal-image, is that, according to Deleuze, for these images, the real and the imaginary become indiscernible. As is well known, a great many things become indiscernible in the time-image, not the least of which are the virtual and the actual, so might we immediately gain some ground by conjoining the real with the actual and the imaginary with the virtual? Such an equation is no doubt one of Deleuze's intentions, though we must also bear in mind that the virtual is no less real than the actual (one of its definitions is that it is 'real without being actual'). And so, this, too, is one of Deleuze's points: with the time-image, what is imaginary should be considered no less real than that which is supposedly real. Or, to put this another way, under the conditions of the time-image, the imaginary is as real as any other reality – such is the point of declaring their 'indiscernibility' as a fundamental factor of the time-image. What is important, therefore, for the time-image, is that there is no need to make distinctions between what is imaginary and what is real, for that is a distinction which ceases to make sense for the time-image. There, then, is a first point: for the time-image, the 'imaginary' need not be erased so that the 'real' can come to the fore. Instead, the very gesture of making a distinction between what is real and what is imaginary ceases to matter for the time-image. (Again, these are points I make at some length in chapter 5 of *The Reality of Film*; Rushton 2011: 126–47.)

By contrast, films of the movement-image are organised by their attempts to make clear distinctions between the real and the imaginary. In Sergei Eisenstein's *The Battleship Potemkin* (1925), an excellent example of the movement-image, the imaginary or 'unreal' elements of the film are several: the actions of the ship's doctor who insists the crew eat the maggot-infested meat; the priest whose duplicity Eisenstein famously emphasises; the ship's officers whose quarters and meals are far finer than those of the lower-ranked sailors and whose actions lead to the death of the sailor, Vakulinchuk; and the troops who massacre the crowds on the Odessa steps. These are all characters who have chosen false courses of action, according to the logic of the film, and who worship imaginary gods. By contrast, what is real for this film are the mutinous actions of the ship's crew, the mournful support of the townspeople, and the pleas for brotherhood ('Will they or won't they

shoot?') when another battleship threatens to attack the *Potemkin* and put down the mutiny. *The Battleship Potemkin* resolves itself on the side of reality (by contrast with a film like *Strike* [1925], whose conclusion is a triumph of the unreal, imaginary forces of oppression): the battleship does not attack the *Potemkin*, and the real forces of brotherhood and unity prevail over the imaginary ones of exploitation and oppression. For the movement-image, therefore, the real is asserted over the unreal, the real is clearly distinguished and contrasted with the imaginary that is declared unreal, bad, false or wrong.

On the other hand, an iconic time-image film, Welles's *Citizen Kane* (1941), refuses to make clear distinctions between the real and the imaginary. Where we might expect that the conflicts between the testimonies of those who remember Kane will, in some kind of final reckoning, be clarified in order that the 'true' stories of his life be clearly separated from the 'false' impressions – that is, that the 'real' be distinguished from the 'imaginary' – this is not at all what occurs. Rather, what we are left with at the end of the film is a series of possible truths, of possible imaginings about the life of Kane: nowhere is the line between what is real and what is imaginary clearly drawn. They remain 'indiscernible'.

This indiscernibility is not a problem for the time-image – it is not a shortcoming of the time-image that the real and the imaginary become indiscernible. For films of the time-image, it is instead merely something that is not at stake; or, at the very least, films of the time-image try to understand that the world or reality need not function by way of making clear distinctions between the real and the imaginary. Indeed, many of the world's problems, deficiencies and dead ends are a result of an all too disturbing quest to divide the real from the imaginary (to divide whites from blacks, rich from poor, Christians from heathens, men from women, bosses from workers . . .).

I. Renoir

How does the time-image function for one of the cinema's great auteurs, Jean Renoir? Renoir introduces a very particular mode of the time-image, which image, as we shall see, Deleuze refers to as a 'cracked crystal'. Before we get to that, however, an initial outlining of the form or shape of the films can be drawn. Renoir's films concentrate on describing how a person or group of people are stuck in a reality which is in various ways inadequate, compromised, or downright nasty. The challenge the films set is therefore this: how can the characters get out of the real as

it is currently defined so as to discover a new real, a different reality composed in an entirely different way?

Generally considered Renoir's finest film, *La Règle du jeu* (1939) manages this composition in an exemplary way. Each of the characters is stuck in a reality that is unsatisfying and frustrating in various ways: they are all trapped in the 'rules of the game', and they seem fated to follow the rules of a game that each is reluctant to play for one reason or another. As a result, each character tries to find his or her way out of the game – that is, they imagine ways in which the rules of the game might be broken so that the real as it is might be smashed and a new real take its place. And that is the key: against the sterility of reality are posited various imaginary ways out: the imaginary affirms itself as a mode of escaping from the 'rules of the game'. Christine, for example, will dream of fleeing with the pilot, André Jurieu, or perhaps with Octave (as she momentarily decides late in the film); Lisette will dream of an affair with Marceau; Jackie falls in love with Jurieu; Marceau dreams of being a *domestique*; Schumacher imagines a life of self-sufficiency in Alsace, of living happily-ever-after with Lisette; Geneviève wants her love for Robert to continue .... Overall, there is a sense in which no one is quite sure what they want or how to get what they want. But one thing they all seem sure of is that *what is* is not what they want. It is here that the real and imaginary become indiscernible, for any attempt by the characters to define what they really want from what they imagine they want is futile. For the second half of the film – especially for the costume ball which is the climax of the group's stay at the château – the real and the imaginary become jumbled to the point of indiscernibility.

There are key moments in *La Règle du jeu* upon which we can focus. The first occurs when Christine spots Robert – her husband – passionately kissing Geneviève. This happens while the guests whom Robert has invited to his country house are engaged in a hunt, and Christine has borrowed a small spyglass or field glass in order to observe certain aspects of nature (a squirrel nestling in a tree, for example, over which ensues a discussion about whether they are beautiful animals or pests). Reframing her view, she observes Robert and Geneviève via the crystal clarity of the telescope. And this is indeed Renoir's version of the crystal-image: it is the all too clear vision of a reality that is flawed. Christine sees the reality of her husband's infidelity, and thus is inserted into reality a crack that will slowly and surely widen throughout the duration of the film. By way of this crack, questions arise for Christine: can she be reconciled with Robert and forgive him (as she indeed tries to make peace with Geneviève)? Or is a way out of this reality available

by fleeing with Jurieu (especially when Lisette assures her the affair between Robert and Geneviève has been going on since before Robert and Christine were married)? Or might she even escape with Octave? Christine's spying of her husband opens the crack in reality by which she begins to imagine various ways of getting out of that reality: she yearns for an escape into an imaginary which will give rise to a new real.

The other key moment I want to emphasise here is that of Schumacher's shooting dead of Jurieu in the mistaken belief that he, Jurieu, is about to make his escape with Lisette (Schumacher's wife). Again we are being shown a cracked crystal, the ways in which reality is flawed: Schumacher has been dismissed from the household by Robert for firing a gun inside the château, so he now seeks revenge for his misfortune, with the addition that he is still suspicious and resentful of his wife's motives and infidelities. His vengeful shooting of Jurieu is not, however, a way of opening up the cracks in the crystal. On the contrary, it is a way of sealing up the cracks: Schumacher shoots as a way of *preventing* escape, of barring Jurieu's and Christine's escape into the new real (for it is indeed Christine and not Lisette with whom Jurieu is attempting to escape). To then proclaim the incident an 'accident', as Robert does, is to reassert the rules of the game, to re-impose a real without the possibility of escape. The film's end entails a closure and repudiation of the crack – as one member of the party quips, 'a new definition of "accident" '.

Thus are evident Renoir's strategies: that of displaying a cracked crystal which can lead either to a new real – if one makes one's escape via the crack – or to a spiral of decay, corruption and death, if, on the contrary, the crack is sealed up and the inadequacies of the real re-established. Deleuze describes this process in the following way:

> In Renoir, the crystal is never pure and perfect: it has a failing, a point of flight, a 'flaw'. It is always cracked. And this is what depth of field reveals: there is not simply a rolling up of a round in the crystal; something is going to slip away in the background, in depth, through the third side or the third dimension, through the crack. (Deleuze 1989: 85)

My argument here is that we may equate the 'cracked crystal' with what I want to call a Deleuzian imaginary: if the real is flawed or cracked, then a way out of that crack can be found by invoking the imaginary. In short, the imaginary provides a way out of the real as it is currently structured – those are the stakes of a Deleuzian imaginary. This is a big contrast to the film theorists of the 1970s and 1980s who

criticised anything and everything that was imaginary because it took one away from everything that was real (the structures of reality, its contradictions): for those writers, one had to dismantle the structure, not get away from it.

Additionally, it should be noted that Deleuze is quite simply wrong to argue that it is Schumacher who shatters the crystal and opens up the crack (he has been too influenced by Bamberger's argument; see Deleuze 1989: 85). And he perhaps asks the wrong question, too (which is to say he is too influenced by Truffaut). The question should not be: 'who fails to play by the rules of the game?' but rather: 'how does one break the rules of the game?' All of the characters try, in one way or another, to break the rules, to find ways of getting out of the game they are in. However, and largely as a result of Schumacher's shooting of Jurieu, no one succeeds in breaking those rules and the rules are firmly re-established. In that regard, then, Deleuze is certainly correct to call *La Règle du jeu* 'pessimistic' (Deleuze 1989: 85).

Renoir constructs worlds or 'the real' in his films only in the hope that his characters might then find ways out of that real or those worlds. The crystal-image only shines or dazzles in order that a way out if it might be found. Ways out of them do happen in the films which have optimistic endings: the soldiers manage to escape into Switzerland in *Grand Illusion*; the revolution gains momentum in *La Marseillaise*; the criminal justifies his escape and continues on his way in *The Crime of Monsieur Lange*; Boudu continues on his merry way in *Boudu Saved from Drowning* . . . .

II. 'The Crack-Up'

As I have already mentioned, Deleuze, writing with Guattari, borrows the notion of the 'crack' from F. Scott Fitzgerald, especially from the formulations in his essay on 'The Crack-Up'. The most important small excerpt from that essay on which Deleuze and Guattari concentrate is this:

> The famous 'Escape' or 'run away from it all' is an excursion in a trap [. . .]. A clean break is something you cannot come back from; that is irretrievable because it makes the past cease to exist. (Fitzgerald, quoted in Deleuze and Guattari 1987: 199)

I have certainly referred to the notion of 'escape', especially with regard to *La Règle du jeu*, so we need to ask ourselves whether what was aspired to there were escapes or whether the attempts to get away from the rules

of the game were variants of the clean break; for example, we might wish to ask, were Christine and Jurieu making for an 'escape' or a 'clean break'? An escape, according to Deleuze and Guattari's formulations, is merely the denial of an encounter or confrontation: an escape will not lead to a new real but will be merely a 'getting away' within the same real. Or, to put it another way, the escape implies the eventual inevitability of a return: one may escape briefly or temporarily, but in the end the real will return; the real will re-impose itself and the emergence of the new will be thwarted. By contrast, the 'clean break' is something you cannot come back from. There, any return to the real *as it was* is impossible: the clean break establishes a genuine opening onto a new real.

And yet, the distinction between the escape and the clean break is only part of the story – at least so far as Deleuze and Guattari construe it. Deleuze and Guattari discover three lines of break in Fitzgerald: the break, the crack and the rupture. The former is 'a line of rigid segmentarity' (Deleuze and Guattari 1987: 198), and as such, is entirely predictable within the context of the social structure within which it occurs (we might note that someone like Lévi-Strauss was a master at charting these kinds of breaks within a society which designated their inner structures). The crack, on the other hand, begins to pull apart the structure, but it does so in a very specific way. The rupture, finally – what Fitzgerald referred to above as the 'clean break' – is a total disintegration of the structure, a complete breaking apart of the structuring coordinates.

The kinds of processes being referred to here are constants across Deleuze and Guattari's writings even where myriad different terms of designation are used (from the 'body-without-organs', to smooth and striated spaces, to disjunctive and conjunctive syntheses, positive absolute deterritorialisations – and so on), but the parameters of those processes remain fairly constant, it seems to me. At one end of the spectrum is a rigid social formation that is more or less unchanging, while at the other end of the spectrum is a complete disintegration of any sense of structure, a zero degree of absolute 'disformation' (of something *informe*). That is to say, on the one hand, we have formations which, at their most extreme, are fascistic, while on the other, we have a stateless lack of formation, chaos or anarchy, a revolution or a complete obliteration of the markers of meaning. If, therefore, one end of the spectrum is constituted by 'breaks' – that is, by social demarcations which rigidly structure a society – then the other end of the spectrum is constituted by 'ruptures', the disintegration of structures

from which there is no going back to the way things were. If the 'break' and the 'rupture' constitute the two extreme poles, then the 'crack' lies somewhere between these poles.

We do not need to look very far to see these kinds of formations occurring in Renoir's films: we find rigid social structures in *La Règle du jeu*, in the workplace and community of *La Bête humaine*, in the small village in *Toni*, in the colony of *The Golden Coach*, the small town of *Swamp Water*, the household of *The Diary of a Chambermaid*, in the neighbouring families of *The River*, in the bourgeois household of *Boudu*, in the empty displays of *Elena et les hommes*, in the European community of *Le Déjeuner sur l'herbe*, the monarchy of *La Marseillaise* (and in the small village courtroom at the film's beginning), and in the tormented community from which Lange escapes in *The Crime of Monsieur Lange*, in the horrific social divisions of *The Little Match Girl*.... Rigid, stultifying, crippling social formations are everywhere in Renoir. At the other pole, we have the moments where these social structures begin to shake apart – in various partial ways in *La Règle du jeu*, the attempts to rebel against outdated modes of life in *Toni* and *La Bête humaine*, in the Bastille Day celebrations and the flight of the chambermaid in *The Diary of a Chambermaid*, in Alexis's newly discovered lust for life in *Déjeuner*, in the acts of revolt and the swelling choruses of *La Marseillaise*, in Lange's getaway in *Lange*, the young girl's coming of age in *The River*, in the young man's revenge on the town in *Swamp Water*, in Boudu's continued reinvention of himself in *Boudu* – and even in the pitiful denouements of *The Little Match Girl* and *Elena*. But do any of these constitute a rupture? Or do they indicate, rather, the 'crack' to which we have already referred? How is it that we can characterise what occurs in these films?

Let us think about what happens to Christine in *La Règle du jeu* when she spies her husband's infidelity through the spy-glass. This moment, as I have already suggested, brings about the emergence of the 'crack': reality, at this point, begins to develop a 'chink', a fissure for which Christine had been unprepared and with which she does not immediately know how to deal. And this is certainly one of the key aspects of the 'crack' in Fitzgerald: that it 'happens almost without your knowing it' (as Ronald Bogue argues; see Bogue 2003: 159). 'Such fissures', continues Bogue, 'disintegrate old certainties and identities [...], leaving one without discernible coordinates for future action' (Bogue 2003: 159–60). Such is the crack Christine experiences, something that hits her unawares, leaving her with the sensation of not knowing quite what to do.

If the crack or rupture happens in this way, then the challenge is how to deal with it: what does one do now? For Christine, first of all, she tries to maintain her composure, to act as though the real has not been ruptured so that it can be repaired without any significant damage. Thus, she calls a truce with Robert in the hope that perhaps, after all, this crack will merely function as a break: the cuts and lines of reality *as it is* – the rules of the game – will remain undiminished and life will go on much the same as before. In terms that Deleuze and Guattari variously refer to as 'subjectification' in *A Thousand Plateaus* (1987) as an extension of the kinds of (transcendent) 'disjunctive synthesis' encountered in *Anti-Oedipus* (1977), what Christine engages in is a process of conforming subjectivity: she does not want to fall out of line with the rules of the game and thus maintains degrees of appropriateness – what Deleuze and Guattari call, at one point, a 'double turning away, betrayal, and existence under reprieve' (Deleuze and Guattari 1987: 129). These points are as close as Deleuze and Guattari get to declaring something akin to an Althusserian subject of ideology.

And yet, the crack widens, especially when Lisette tells Christine that Robert's affair with Geneviève has been continuing for a number of years – and that they had been lovers since before Christine and Robert were married. Here, something closer to a rupture becomes inevitable, so that during the costume ball, Christine decides she must get away at all costs: with Jurieu, with Octave, with whomever or however, for now is the time to make a clean break and enter a new real. We might note that, near the end of the film, Christine seems without the specific traits of subjectivity, but instead flitters from one suggestion to the next, as though determined now by the chaos which surrounds her rather than by a defined and anchored subjectivity. If we were to argue that Christine has made herself – or at the very least tries to make herself – something akin to a body-without-organs, then we can appreciate that she is looking for the kind of spark, a future, a possibility, a 'life', or an intensity or intensities that will set her free. Reading with Deleuze and Guattari:

> This is how it should be done [that is, this is how to make yourself a body-without-organs]: Lodge yourself on a stratum, experiment with the opportunities it offers, find an advantageous place on it, find potential movements of deterritorialization, possible lines of flight, produce flow conjunctions here and there, try out continuums of intensities segment by segment, have a small plot of new land at all times. (Deleuze and Guattari 1987: 161)

By virtue of the crack, then, Christine enters a mode of experimentation, becomes subject to a series of proposals or potential adventures of which she is willing to be a part, even if things do not turn out as she had planned. That the crack has the potential to open up or release these activities and potentialities is what is central both to Renoir's films and to Deleuze's theorisation of the 'cracked crystal' in those films.

And these cracks appear all over Renoir's films: right at the beginning of *Chambermaid*, when Celestine is abhorred by the butler's dismissal of the old maid: here, she throws herself into this job with a will to find a line of flight out of it, the 'small plot of land' she will cultivate. Or when the poacher-prisoner jumps through the window of the courtroom at the beginning of *La Marseillaise*: rejecting the rule of the petty landowners, he makes a 'clean break' and discovers the revolution. Or the arrival of the American in *The River*: as though out of nowhere, he opens up new possibilities and new worlds for the young girl. And the rescue of Boudu in *Boudu*: wanting to end it all, suddenly he gets another chance, and he rides that chance as far as he can, until he finds another plane to jump onto, another territory to explore. Or Alexis's happening upon the bathing Nénette in *Déjeuner*: in her he discovers a different world, a completely different way of conceiving of things (and of 'conception', as it were).

III. Renoir's Forms

We are in a position to map what occurs in Renoir's films, such as they can be conceived in terms of a three-stage pattern. First of all, reality *as it is* is mapped in a way that makes it intolerable: diseased, corrupted, unbearable. Strictly speaking, this is how Renoir forms his crystal-images: the dazzling display of his crystals is merely a show of decrepitude and social stagnation. Secondly, the crack or rupture in the crystal offers a way out of the real – and into an imaginary, as I have been trying to insist – by means of which the real can be reinvented. Reality is here broken apart, smashed to bits – call it a deterritorialisation or a body-without-organs (depending which Deleuzo-Guattarian schema one finds oneself in). Thirdly, once reality has been stripped bare and cracked up, then new 'shoots' of reality can emerge, reality can begin again, as something entirely new. This 'new real' which can (supposedly) emerge from the crack or rupture will not lead to the formation of 'subjects' (in, say, an Althusserian sense of interpellation – or in the sense Deleuze and Guattari give to 'transcendent disjunctive syntheses' in *Anti-Oedipus*). Rather, the hope – for Deleuze and Guattari, and for Renoir, too, we

must assume – is to produce a properly schizophrenic subjectivity. If we conceive of these processes in this way, then, following Deleuze and Guattari, the body-without-organs is envisaged as a surface, a blank surface which exists in something approaching a 'zero degree' state. For this state is something that occurs as a result of the crack or rupture: a blasting apart of all coordinates so all that remains is a nascent state of potentiality. There will be points on this surface, however, where 'breaches' occur; elements of one sort or another will intersect this surface (for example, Octave will make a suggestion to Christine; Robert will accept her wish to flee . . .). These intersections might be something we call *subjects*, but if this is a subject, then it is a subject (so claim Deleuze and Guattari) 'defined by the states through which it passes' (Deleuze and Guattari 1977: 20). Thus, this subject is being re-born with each new state, with each new intersection on the body-without-organs. Here, there is no ego, no 'I', no self, no 'subject' in the traditional sense. Rather, what we have are what Deleuze will later call 'pre-individual singularities' and 'non-personal individuations' (Deleuze 2006: 351).

Some of the finest formulations of these quasi-subjective states emerge in Deleuze's last published works. The notion of a 'transcendental field' replaces earlier formulations (though with different emphases) like the body-without-organs or deterritorialisation and, for me, it is a far more precise conception. A transcendental field refers neither to an object nor a subject but is instead 'a pure stream of a-subjective consciousness, a pre-reflective impersonal consciousness' (Deleuze 2001: 25). We might merely call this a set of a priori conditions (or preconditions) that comes before any subject or any state of things, the kind of notion Foucault took so brilliantly from Kant (see Foucault 1984), and which, for Deleuze, were extremely valuable in his later writings (beginning, it seems to me, with the *Cinema* books along with his book on Foucault [Deleuze 1988]). And yet, Deleuze still finds room to criticise traditional notions of subjectivity: if there is a transcendental field that defines the conditions of possibility for the emergence of a subject or object, then, necessarily, any subject will 'come out of' this field. As Deleuze puts it: 'Consciousness becomes a fact only when a subject is produced at the same time as its object, both being outside the field and appearing as "transcendents" ' (Deleuze 2001: 26). A very Kantian formulation indeed (which is to say that Deleuze's criticisms of Kant continue to the end), for here the subject requires 'reflection': the subject must stop, reflect and be held in place in order to think in this way. And this is why reflecting is something that transcends the transcendental field (as Deleuze claims): '[Consciousness] is expressed, in fact, only when it is

reflected on a subject that refers it to objects' (ibid.). To put it simply, then, Deleuze's operations for subjectivity can be divided into those acts, aspects or events that occur *on* or *in* the transcendental field, where such events are only ever the processes of pre-individual subjectivities; or there will be operations which result in subjects as such: out of and beyond the transcendental field, the doubled consciousness of subjectivity exposes itself as a subject of reflection.

In this late essay (on 'pure immanence') Deleuze contrasts the doubled consciousness of subjectivity with what he calls '*a* life'. In doing so, he makes a virtue of the moments or incidents that occur outside our subjective consciousness, those aspects of 'a life' which fall beyond the purview of 'subjective understanding' (using 'understanding' here very much in a Kantian sense). Why would Deleuze wish to do such a thing? Precisely because these are the moments which contain the seeds of change: they open up a space for change because they are not (or they are not yet) subject to the workings of the understanding; they are virtual moments, as distinct from actual ones. We can certainly conceive of these moments as ones in which subjectivity itself is shattered – cracked – so that non-subjective, pre-conscious impulses come to the fore. If a reflective subjective consciousness can be conceived in a crystalline way, then we can also conceive of such subjects as open to cracking and cracking up, and to crack the subject is precisely what Deleuze endeavours to do.

IV. *The Golden Coach*

The final part of the puzzle then is this: pre-individual singularities occur at the level of the virtual, while subjectivities are products of the actual. When writing of Renoir, Deleuze reserves his highest praise for the 1952 film, *The Golden Coach*. For Deleuze, it is in this film that Renoir's themes are taken to their 'highest point' (Deleuze 1989: 56). And it is true that in *The Golden Coach*, there are cracks all over the place: the Viceroy finds one in Camilla who awakens him from the court rituals he despises; Ramon, the bullfighter, also finds a crack in Camilla as he dreams of a celebrity marriage with her (they will be the celebrity couple of the colony); while Felipe is drawn to discover a new kind of life with the Indian tribe he encounters (a 'small plot of new land', to invoke the claims of *Anti-Oedipus*). Camilla herself discovers three cracks arising from her despondency with the theatre and her disillusionment at arriving in the colony to find it run down and shambolic (there are certainly no streets paved with gold to be found!).

For Camilla, the Viceroy offers an entry to another world of opulence, glamour and wealth, as symbolised by the glittering golden coach itself, the most glaring of Renoir's crystal figures. But Camilla also senses in Ramon, the bullfighter, the possibility of another kind of union, with a strong man, a 'real' man as she calls him at one point. Felipe she admires deeply, but she fails to share his dream; indeed, Felipe brings out her inability to decide, that characteristic of protagonists of the time-image who are destined to observe and contemplate, without quite knowing how to act.

Camilla's great sacrifice at the end of the film – her donation of the golden coach to the Church – is to have saved each of her suitors while at the same time being unable to save herself. Her only way out now is to return to the stage, the stage she had temporarily abandoned in the hope of discovering success in (the so-called) 'real life'. She returns, as it were, to the point of her original crack-up at the beginning of the film: upon the stage, she will continue to experiment, to discover and rediscover herself, to invent and reinvent herself. 'At the end of *The Golden Coach*', writes Deleuze, 'three characters will have found their living role, while Camilla will remain in the crystal, to try still other roles in it, one of which will perhaps make her discover the true Camilla' (Deleuze 1989: 87). If the three characters she has saved – the Viceroy, Ramon and Felipe – have discovered subjectivities which they can now comfortably inhabit, then Camilla herself has discovered no such subjectivity and remains destined to continue to try out roles, to be intersected by pre-individuated singularities, to inhabit the 'transcendental field' of the stage, in the quest to discover a new reality.

When writing on Renoir, Deleuze makes a number of key claims which, I would like to think, substantiate many of the claims I have been trying to make here:

> For Renoir, theatre is primary, but because life must emerge from it. Theatre is valuable only as a search for an art of living [...]. 'Where then, does theatre finish and life begin?' remains the question always asked by Renoir. We are born in a crystal, but the crystal retains only death, and life must come out of it, after trying itself out. (Deleuze 1989: 86)

> According to Renoir, theatre is inseparable – for both characters and actors – from the enterprise of experimenting with and selecting roles, until you find the one which goes beyond theatre and enters life. (Ibid.)

> Everything happens as if the circuit served to try out roles, as if roles were being tried until the right one were found, the one with which we escape to enter a clarified reality. (Ibid.)

> [T]hrough the development of an experimentation, something will come out of the crystal, a new Real will come out beyond the actual and the virtual. (Ibid.)
>
> [S]omething takes shape inside the crystal which will succeed in leaving through the crack and spreading freely. (Ibid.)
>
> From the indiscernibility of the actual and the virtual, a new distinction must emerge, like a new reality that was not pre-existent. (Ibid: 87)

There are three points to consider here:

1. *Life must come out of the crystal*. The crystal dazzles and shimmers, but its forms are moribund: its glittering is merely an invitation to pass through so that one might find a new life. If we conceive of the crystal as virtual, as something located on or in the transcendental field, then it is life which intersects the transcendental field in much the same way as cracks will cut into the crystal and open up paths to new modes of life. It is thus only by 'jumping into' the virtual, by going through the crack in the crystal, that one might emerge into a new reality. At the end of *The Golden Coach* Camilla remains within the crystal, looking for new cracks and new ways out in order to discover a new life.
2. *The development of an experimentation*. Life, a new real, and thought, depend on experimentation. Camilla, for example, can only discover a new real if she is determined to try out roles, to experiment. Thus, by jumping into the virtual, by experimenting, one might indeed be doomed to failure (as occurs in *Toni*, *La Bête humaine*, *The Little Match Girl* and others . . .). Such are the risks of '*a* life': the new will only be encountered through the development of an experimentation.
3. *A new real emerges beyond the indiscernibility of the virtual and the actual*. Films of the time-image are characterised by an indiscernibility between the actual and virtual. It is only as a consequence of this indiscernibility that a new real can emerge. The time-image does not affirm the virtual over and above the actual, but rather celebrates their indiscernibility. By opening herself up to the virtual – to experimentation, to playing out roles, to entering the transcendental field – Camilla enters a zone where the distinction between the actual and virtual ceases to be relevant. Only by going through this zone of indistinction (the kind of zone which in other contexts Deleuze and Guattari will

> call 'deterritorialisation') might Camilla then emerge into a newly defined zone of reality, a reality that has never existed before.

One must enter the transcendental field in order to then discover new realities, and the challenge for Deleuze, it seems, is to keep discovering new realities. The transcendental field is virtual, so that, if we transfer Deleuze's concepts into (Deleuze's own) cinematic terms, the crystal-image is riven by the virtual crack through which a new real can be discovered. Only by entering the crystal and trying to find ways of leaving the crystal through the crack, will a new real become available. In *The Golden Coach* Camilla makes a number of attempts to leave via the cracked crystal, only to find herself, in the end, back in the crystal, upon the stage, where she will try out new roles in the hope of finding new ways out of the crystal.

At the film's end, therefore, Camilla is left to experiment – it is no wonder Deleuze praises *The Golden Coach* so highly. This opportunity for experimentation, it seems to me, can be conceived as a Deleuzian imaginary (the consonance between the virtual and the imaginary is something I have already hinted at). By imaginary I mean: an openness to what happens to one, even beyond one's imagination, that one could not foresee. This, for Deleuze, as much as for Renoir or Fitzgerald, is the *crack*: that which forces one to change direction, to change coordinates – in short, for Deleuze, this is what it means to think.

Some readers might still believe it a stretch to call this a Deleuzian 'imaginary' when the Deleuzian 'virtual' is clearly appropriate. Nevertheless, calling upon a Deleuzian notion of the imaginary allows me to stress how different Deleuze's imaginary is from the imaginary typically posited by film studies. The latter always claims that the imaginary in cinema is bad because it fails to do justice to reality; it fails to properly convey the stakes of reality. Instead, it gives us only imaginary solutions. Deleuze endeavours to refute such conceptions. For him, films do not offer fraudulent realities. Rather, if the cinema offers anything that can be called 'imaginary', then it does so only as a way of closing down or getting away from the real: if the cinema has the capacity to show us the real, then it also has the ability to show us how we might get out of that real and enter a new real. For Deleuze, the way to do this is not by criticising the imaginary, but rather by embracing the imaginary and following it so as to enter a new real. Those who criticise the imaginary are all too keen to draw distinctions between what is real and what is imaginary; and this is the blind spot so characteristic of so much commentary on the cinema: that bad cinema is imaginary,

while good cinema lays bare the real in all its bitterness or glory (even where realism itself is criticised, it is only ever in the name of a higher reality, for realism is only reality dressed in the clothes of the imaginary [on this point, see MacCabe 1985]). That is what Deleuze can give to films studies: an imaginary that does not need to be banished to moral (or political) decrepitude. Instead, Deleuze gives us an imaginary to be celebrated and praised – and above all, an imaginary with which we can experiment, an imaginary by means of which the cinema itself allows us to discover new dimensions of reality. If the film theories of the 1970s and 1980s wanted to break down the imaginary so that the real would be exposed – and so that escapes from the real would be quashed – then Deleuze advocates the opposite: let the real as it is be cracked apart so that the imaginary might then have the opportunity to shape new realities. It is on this point that Deleuze definitively goes against the dominant arguments of film theory.

Synaptic Signals: Time Travelling Through the Brain in the Neuro-Image

Patricia Pisters University of Amsterdam

Abstract

This essay presents some thoughts on schizoanalysis and visual culture around the proposition that cinema survives in the digital age as a type of image that, after the movement-image and the time-image, could be called the neuro-image. By considering clinical schizophrenia as 'degree zero' of schizoanalysis in a more critical sense, a reading of *The Butterfly Effect* unfolds the temporal dimensions of schizoanalysis as typical for a definition of 'the neuro-image'. The argument is that the neuro-image speaks from the (always speculative) future.

Keywords: schizophrenia, the neuro-image, *Difference and Repetition*, third synthesis of time, the future

I. Introduction

Schizophrenia is intimately connected to our times. As a neurological disease, schizophrenia differs from neurosis, as Deleuze and Guattari emphasise in *Anti-Oedipus* (Deleuze and Guattari 1984: 122). Neurosis is based on a repression complex related to a reality principle that remains intact. In schizophrenic psychosis, the reality principle no longer holds and is replaced by the internal reality of the brain. Deleuze argues that neurosis is not an adequate model for understanding the contemporary world. By contrast, the (schizophrenic) brain can provide us with a model for our contemporary existence, especially in relation to electronic and digital images:

Deleuze Studies 5.2 (2011): 261–274
DOI: 10.3366/dls.2011.0020
© Edinburgh University Press
www.eupjournals.com/dls

> Neurosis is thus not the consequence of the modern world, but rather of our separation from this world, of our lack of adaptation to this world. The brain, in contrast, is adequate to the modern world, including its possibilities of the expansion of electronic or chemical brains: an encounter occurs between the brain and colour, not that it is enough to paint the world, but because the treatment of colour is an important element in the awareness of the 'new world' (the colour-corrector, the electronic image . . .). (Deleuze 1989: 317, n. 20)

Deleuze explains his statement by referring to Antonioni's project 'Technically Soft', which shows an exhausted man who is on his back dying and looking at 'the sky which becomes ever bluer, this blue becoming pink' (Deleuze 1989: 317, n. 20). Deleuze's conjunction of the brain, image technology and an aesthetic effect is remarkable and demands to be unpacked. Could this awareness of a 'new world' by the treatment of colour relate to the reality of the brain-screen and to a schizoanalysis of cinema? To investigate this further I propose to look at *The Butterfly Effect* (2004) and propose productive connections with Deleuze's work on cinema, with the (schizophrenic) brain and with Deleuze's philosophy of time. This will allow me to see if, by way of a schizoanalysis of cinema, I can distinguish a new type of cinematic image. After the movement-image and the time-image, I suggest to call this new type of image the 'neuro-image' (see also Pisters 2008, 2011).[1]

The main character of *The Butterfly Effect*, Evan Treborn (Ashton Kutcher), suffers from a neurological disease that he inherited from his father and that was enhanced by a traumatic childhood experience.[2] Through this narrative, the film addresses the problem of time and the desire to change our destinies by travelling back and forth in time. The film's tagline is 'Change one thing, change everything'. This tagline refers to chaos theory and to how chaos relates to the natural state of being in the human brain. The film's emblematic title image is a brain scan that very subtly suggests the flapping wings of a butterfly, combining in this emblematic image the link between chaos theory and modern neuropsychology that the film plays with. On the DVD extras, scientists explain how chaos theory in physics has learned that a very tiny difference (such as a slightly different position in space) can create enormous differences in resulting movements and outcomes that are unpredictable. Psychologists explain how this insight from physics has also changed the practice of psychology, acknowledging the unpredictable effects of the smallest events on our brain-screens and mental life.[3] *The Butterfly Effect* takes these insights of modern science and grounds them with a knowledge of psychiatric disorders and the

real traumatic impacts that human beings can have upon each other. It then gives this experimental grounding a more fantastic spin, allowing its main character, who suffers from epileptic seizures and blackouts, to travel through time, change one little thing in the past, and thus change the future present.[4]

As Deleuze has shown with his cinema books, the problem of time is intrinsically related to the medium of film and has metaphysical dimensions.[5] In the second part of this article, I will return to the philosophical questions of time and the brain with respect to the neuro-image. In fact, a new relation to time will be a crucial argument in the conception of the neuro-image, which, as I will argue, has the future as its basic form of time; speculations about the future determine its present and past. First, however, I want to remain close to the film, its specific temporal experiments, and its clinical and scientific references to the brain, so as to consider it as just one possible experiment (among many possible others) in connecting a different conception of time to the delirious schizo-brain. In this sense, *The Butterfly Effect* offers not only an imaginative take on a contemporary neurological condition, but could also be read in a more allegorical way about our 'times'.[6]

II. The Temporal Architecture of the Schizoid Brain

The story of the film is told from three moments in Evan's life: Evan at the age of seven when he and his friends Lenny (Elden Henson), Tommy (William Lee Scott) and Kayleigh (Amy Smart) have a traumatic (incestuous) experience orchestrated by Mr Miller (Eric Stolz), who is Kayleigh and Tommy's father; Evan at the age of thirteen, when the four friends cause an accident; and Evan at the age of twenty, when he is in a mental institution in severe states of delusion, where the film starts. The plot moves back and forth between these different moments of time. But the time layers are interwoven with other possible pasts and their respective futures to which Evan wakes up in changed presents. In his blackouts Evan seems to be able to change the past. Wanting to save Kayleigh from a known future in which she is traumatised, depressed and lonely, working in a diner, he goes back to the moments of their childhood, makes different choices and returns to a present where Kayleigh has changed, differently, into: a sorority girl; then a heroin junky prostitute; and also an earthy type of hippy, depending on the impact of different changed pasts. But the destinies of all other characters, including his own, change in each temporal alteration as well, and in some cases very dramatically (in one version, Evan saves Kayleigh

but kills Tommy; in another, he causes Lenny's institutionalisation; in yet another, he prevents the accident when they are teenagers but is wounded himself, and he wakes up in a present where he has no arms and his mother dies of lung cancer because she starts chain smoking after Evan's accident).

Aesthetically, the images of the time travel and memory flashes also have different colour saturations and densities, which create patterns of recognition. Furthermore, a special shade of red, called 'Miller red' in the director's commentary, indicates the presence of danger. 'Institutional green' is connected to Evan's father's insanity and thus the hereditary legacy of his seizures and frightening abilities. We see here quite literally what Deleuze, as quoted earlier, has called 'an encounter occurring between the brain and colour' that is 'an important element in the awareness of a "new world" '. The brain and film aesthetics are interconnected, indicating that the combination creates new worlds. *The Butterfly Effect* suggests quite literally that the brain should be seen as a film: 'Think of your life as a film, rewind, go back, re-edit', the doctor in the mental hospital tells Evan when he tries to recover what happened during one of Evan's blackouts. The problem is that the complexity of the brain itself (and chaos) does not allow us to foresee all the consequences and implications of our choices, in spite of our desire for control. But the film strongly emphasises that all these different worlds have a mental reality on Evan's brain-screen and as such is pointing to the reality of our contemporary screen culture.

Throughout the film, Evan Treborn is put in an fMRI scanner several times and the unusually excessive plasticity of his brain is discovered mostly in the outer layers of the cerebral cortex where haemorrhaging and massive neural reconstruction can be noticed.[7] 'Forty years of memory in one year', Evan says of his own brain, 'it's an overloaded city, like a reprogrammed brain'. In these sequences, he is referring to neuroscientific insights about the abnormal plasticity and 'wild' synaptic connectivity of schizophrenic and epileptic brains (DeLisi 1997: 119–29). Epilepsy can be considered another modern affective brain disorder that is an important reference in elaborating schizoanalysis. Gary Genosko has demonstrated that Guattari was especially interested in Marco Bellocchio's film *Fists in the Pocket* (1965) because of its treatment of epilepsy. Genosko compares this film to Anton Corbijn's film *Control* (2007), about Joy Division's lead singer Ian Curtis who suffered from severe epileptic attacks and finally committed suicide. Genosko points out that the affective intensities of epileptic seizures have the potential to create new visions, new aesthetics (Genosko 2009: 167–73).

I would like to emphasise here this understanding of epilepsy as a form of schizophrenia in which neural connections are made much too quickly. In *The Aesthetics of Disappearance*, Virilio refers to 'pyknolepsy', a mild form of epilepsy in which a person is disconnected from reality and misses parts of the ongoing, over-saturated present. In pyknolepsy and even more in epilepsy, the brain operates too quickly, makes too many connections at the same time, causing literal overload resulting in seizure (see Virilio 1991).

The medical data in *The Butterfly Effect* thus correspond more or less to recent neurological findings about schizophrenia. Research has also shown that schizophrenia is generally more common in urban populations, which, considering the urbanisation of the contemporary world, makes it all the more a symptom of today's hyperstimulated culture (Sundquist et al. 2004; March and Susser 2006). By predicting at the end of *The Time-Image* new image-types as omni-directional brain cities that are overloaded with information, Deleuze's cinematographic brain-screens resonate as well quite literally with the scene described above from *The Butterfly Effect* (see Deleuze 1989: 265). Moreover, the wild time-travelling in Evan's seizured brain corresponds with neuroscientific perspectives according to which 'the temporal architecture of schizophrenia is characterised by bursts of complex, nonlinear phenomena alternating with truly random events' (Paulus and Braff 2003: 3). It is this temporal architecture of schizophrenia that I take as an important indication to explore the temporal dimensions of contemporary cinema. My point here is not to look for exact correspondence or proof in scientific discourse, but to make productive connections between different fields that all give important indications for the necessity of a schizoanalysis of contemporary screen culture. The temporal architecture of schizophrenia leads us back to the problem of time and Deleuze's philosophy of time as developed in the cinema books and in *Difference and Repetition*. A return to these books can give more clarity in the temporal dimensions of the schizoid brain-screen in *The Butterfly Effect*.

III. Difference and Repetition: The Third Synthesis of Time and the Neuro-Image

Time is an important aspect in Deleuze's film books and together *The Movement-Image* and *The Time-Image* can cover the whole range of the actual and the virtual (or matter and memory), the indivisible plane of immanence of Deleuzian philosophy. Movement-images and

time-images relate both to the actual and the virtual but they do so in different ways, as is clear from the difference between flashbacks (in the movement-image) and crystal-images (in the time-image). In this sense there seems to be no need for a third type of image, a neuro-image as I am proposing. There are, I believe, many instances that justify the neuro-image as simply an extension or intensification of the time-image. However, a return to *Difference and Repetition* can allow us to distinguish yet other metaphysical dimensions of time, and to make a distinct case for the conception of the neuro-image as a third type of image, or in any case a third dimension of the image.

Difference and Repetition is a book that poses the problem of the virtual and the actual in terms of difference and repetition, and addresses the complex problems of the conditions of appearances, things, life forms as they differ and are repeated. As James Williams has indicated, a consciousness of repetition is proposed by Deleuze in terms of certain variegated syntheses of time. Williams argues that Deleuze's syntheses offer a 'complex but deeply rewarding and important philosophy of time [that] will, no doubt, come to be viewed as one of the most important developments of [Deleuze's] philosophy' (Williams 2003: 85). In chapter 2 of *Difference and Repetition*, Deleuze develops the idea of the passive synthesis of time. As in the cinema books, Bergson is the main reference here, although the starting point of Deleuze's reflections is Hume's thesis that 'repetition changes nothing in the object repeated, but does change something in the mind which contemplates it' (Deleuze 1994: 70). Repetition has no in-itself, but it does change something in the mind of the observer of repetitions: on the basis of what we perceive repeatedly in the present, we recall, anticipate or adapt our expectations in a synthesis of time. This synthesis is a passive synthesis, since 'it is not carried out by the mind, but occurs in the mind' (Deleuze 1994: 71). The active (conscious) synthesis of understanding and memory are grounded upon this passive synthesis, which Deleuze, referring to Bergson, calls duration and which occurs on an unconscious level.[8] So although Bergson refers to the observation of our inner life in duration as consciousness, the temporal contractions that generate it are largely unconscious. Deleuze distinguishes different levels of passive syntheses that have to be seen in combinations with one another and in combination with active (conscious) syntheses:

> All of this forms a rich domain of signs which always envelop heterogeneous elements and animate behavior. Each contraction, each passive synthesis, constitutes a sign which is interpreted or deployed in active syntheses.

> The signs by which an animal 'senses' the presence of water do not resemble the elements which the thirsty animal lacks. The manner in which sensation and perception – along with need and heredity, learning and instinct, intelligence and memory – participate in repetition is measured in each case by the combinations of forms of repetition, by the levels on which these combinations take place, by the relationships operating between these levels and by the interferences of active syntheses with passive syntheses. (Deleuze 1994: 73)

The first synthesis that Deleuze distinguishes is that of habit, the true foundation of time, occupied by the passing present. But this passing present is grounded by a second synthesis of memory: 'Habit is the originary synthesis of time, which constitutes the life of the passing present. Memory is the fundamental synthesis of time, which constitutes the being of the past (that which causes the present to pass)' (80). As Williams explains, the first synthesis of time occurs because habits (repetitions) form our anticipations based on what we have experienced before, 'as in the passive assumption that something will occur' (Williams 2003: 101). The second synthesis, Williams calls archiving, 'as in the passive sense of the present passing away into the past as a stock of passing presents' (ibid.). The second synthesis of time is equivalent to Proust's involuntary memory (Deleuze 1994: 85). In the description of these two syntheses of time, Deleuze refers explicitly to Bergson. The first and second syntheses rely on each other as in the alliance of the soil (foundation) and the sky (ground), but they also have their own characteristics.[9]

The conception of the syntheses of time is incredibly sophisticated and complicated and I cannot do justice to the richness of the arguments Williams and others have constructed around them so powerfully and convincingly. Nevertheless, I take that it is possible to argue that the first synthesis of time, habitual contraction, can be recognised as movement-images that Deleuze describes as the sensory-motor aspects of the brain-screen. Similarly, I consider that the second synthesis of time can be related to the dominant form of time in the time-image, where the past becomes more important and the ground of time manifests itself more directly. It has to be noted that each synthesis of time has its own relation to other times. The first synthesis of time as the living or passing present relates to the past and the future as dimensions of the present. In this way, the flashback (and flashforward) in cinema can be seen as the past and future of the movement-image that is based in the present. In the movement-image, we always return to the present. In the second synthesis of time, the past becomes the ground, the time within which

time operates, and thus the present and the future become dimensions of the past. So, instead of the synthesis of a particular stretch of duration, the present now becomes the most contracted degree of all of the past, the 'pure past'. In *The Time-Image* the different time-images that Deleuze distinguishes are grounded in Bergson's conception of the 'pure past'. As such, time-images become dimensions of the second synthesis of time; the present and the future become dimensions of the past as its crystallising points, and the virtual becomes more indistinguishable from the actual than in the movement-images that have the present as their founding dimension.[10]

However, in *Difference and Repetition*, Deleuze also distinguishes a third synthesis of time: the third synthesis of time is the future as such. 'The third repetition', he writes, 'this time by excess, [is] the repetition of the future as eternal return' (Deleuze 1994: 90). In this third synthesis, the foundation of habit and the ground of the past are 'superseded by a groundlessness, a universal ungrounding which turns upon itself and causes only the yet-to-come to return' (91). In this third synthesis, the present and the past are dimensions of the future. 'In the work of the third passive synthesis', Williams explains, 'there is the sense of the openness of the future with respect to expectancy and archiving' (Williams 2003: 101). This openness and its risks also imply the possibilities of change (making the future different from the past and the present). It is the condition for the new. The third synthesis is complicated since it does not simply repeat the past and the present, but instead cuts, assembles and orders from them, to select the eternal return of difference in a series of time: 'Identities, or the same, from the past and the present, pass away forever, transformed by the return of that which makes them differ – Deleuze's pure difference of difference in itself' (103).[11] The three syntheses of time together account for Deleuze's philosophy of time.

Addressing the third synthesis of time, Deleuze breaks off from Bergson as Nietzsche becomes the main point of reference. In *The Time-Image*, Bergson also seems to disappear in favour of Nietzsche's appearance, though in the cinema books, Nietzsche is not explicitly connected to the question of time. Chapter 6 of *The Time-Image*, for example, discusses Orson Welles and the powers of the false, and Nietzsche is the important reference for understanding the manipulation of such powers. These powers are discussed, however, as a consequence of the direct appearance of time, which is mainly elaborated in terms of the pure past of the second synthesis of time. At the end of the discussion of Welles's cinema, the powers of the false are connected to

the creative powers of the artist and the production of the new (though not explicitly to the eternal return and the future). Also, the series of time are mentioned in *The Time-Image*, especially in the chapter on bodies, brains and thoughts (ch. 8). Here the bodies in the cinema of Antonioni and Godard relate to time as series. In the conclusion of the book, Deleuze explains this chronosign of time as series:

> the before and after are no longer themselves a matter of external empirical succession, but of the intrinsic quality of that which becomes in time. Becoming can in fact be defined as that which transforms an empirical sequence into series: a burst of series. (Deleuze 1989: 275)

We can see that after all the insistence on the Bergsonian temporal dimensions of the movement-image and the time-image, this form of time (series of time) remains rather underdeveloped on a theoretical level in the cinema books. Referring back to *Difference and Repetition*, we can now consider that the powers of the false and the series of time that can be sensed in some time-images might belong to this third synthesis of time. Taking this logic one step further, what I suggest is that this third synthesis of time that already appears in the *Time-Image* (in a more or less 'disguised' form) is the dominant sign of time under which neuro-images are formed.[12] The neuro-image belongs to the third synthesis of time, the time of the future (though this certainly does not exclude the other times, as the past and the present now become dimensions of the future).[13] Moreover, it has to be noted that each synthesis also opens up to the other syntheses (each with their own respective dimensions of time). So we get here a complex architecture of time, that is played out with ever greater consciousness on our brain-screens in the neuro-image.

IV. The Schizoid Brain: Perspectives from the Future

So how does all this relate to *The Butterfly Effect*? Is it possible to see this film as based upon the 'third synthesis of time'? As was clear from the plot descriptions that I gave, the film is preoccupied with time. The various pasts could be seen as flashbacks dependent on a present where Evan is at high school, and thus considered as based on the first synthesis of time. However, this present is actually too unstable and does not form the foundational basis of the traditional flashback which investigates the past from a centre in the present (think of the famous flashbacks in Marcel Carné's *Daybreak* [1939], where all events

lead to the situation in the stable present where Jean Gabin has locked himself up in an apartment). Could the variations of the past then be explained as dimensions of the pure past and thus be based in the second synthesis of time? There are arguments to be made for that; after all, the present situation depends on what happened in the past (the children at age seven and at age fourteen). And so we could consider everything that happens as indistinguishable crystals between the virtual and the actual, never knowing exactly when we have left one domain and entered the other. But that does not explain the series of time that the film produces. Rather, I suggest, the past and the present are dimensions of the (always speculative) future imagined on Evan's schizoid brain-screen. Each moment Evan changes something in the past, the present changes (in unpredictable ways) accordingly. This is what happens when we are in the third synthesis of time: the past and present are 'recut' with different speeds, intensities and orders. The third synthesis of time is related to the creation of the new, to hope for the future, an eternal recurrence of 'difference', but also to death (death is the future for all of us, but also calls for rebeginnings). After Evan has revisited 'all of the past' and 'all of the present', like a database of options of 'new worlds' from a future perspective, we return to the beginning of the film where Evan is in the psychiatric hospital and is told that the diaries (that give him entrance into his pasts) are nothing but fantasies to cope with his guilt (of having killed Kayleigh in what is most likely to be the 'real' version of the past and the present). Here the director's cut of the film differs significantly from the theatrical version.

In the theatrical release of *The Butterfly Effect*, several scenes were deleted which were re-edited in to the director's cut ('Thank God for DVD,' the directors exclaim with relief). In the first deleted scene, Evan finds documents in an old shoebox that indicate he inherited his disease from the male side of his family. Not only his father but also his grandfather had been hospitalised for the same mental illness. In another scene, he learns from his mother that he was actually her third baby; two others were stillborn before him. This leads to the ending that the directors originally planned, where Evan, after so many variations of the past and its futures in the present all go wrong, decides to go back to the moment before his birth and strangle himself with the umbilical cord, preventing his own birth. His mother then, this cut suggests, will have a daughter from another husband (breaking the male insanity heritage) and Kayleigh will marry somebody else. The studio did not want this ending, considering it too dark.[14] It is a dark ending indeed. But apart from being dark, it is also a mysteriously powerful narrative option that

in fact can only be explained as an 'insane' solution to the question of (im)possible futures. But metaphysically it is the absolute zero degree of the third synthesis of time: to have died before birth, in order to create a new present – all from the point of view from the future. *The Butterfly Effect* is told from the perspective of the future and shows the pathological (deadly) dimensions of this Time of the Future that is Now.

But as I want to argue in the larger project, the neuro-image has also more creative and political aspects that relate to a productive form of schizoanalysis that acknowledges the affective and illusory realities of our contemporary brain-screens (Pisters 2011). One can think of the ways in which contemporary Hollywood cinema often quite literally speaks from a future perspective, *Minority Report* (2002) with its precogs characters and pre-emptive crime fight being the most obvious example. On a narrative level, many films start from a point in the future. Here *Inception* (2010) is the most notable case in point, where we enter the main character's brain architecture from a moment in the future where he is old and dying. One can also think of *Avatar* (2009) as a neuro-image that speaks from a speculated future of the planet. But one can also think of political cinema, such as the Palestinian film *The Time that Remains* (2010) that remixes political reality in order to 'gain time' for the future, to sustain in the creation of imaginative realities. Contemporary culture is full of neuro-images that are based in the third synthesis of time. But we need schizoanalysis to understand its many possible dangers and empowerments.

Notes

1. In the first volume on Deleuze and schizoanalysis of cinema (Pisters 2008), I make an explicit like between schizophrenia as disease and schizophrenia as (cultural and political) process or strategy. In this volume I will depart again from pathological schizophrenia but discuss its temporal and metaphysical dimensions. All this is more elaborated in *The Neuro-Image* (Pisters forthcoming).
2. When referring to schizophrenia, I will propose an inclusive definition of mental illnesses as 'delusional or affective illnesses' that are defined as brain disorders by contemporary neuroscience, including neurological diseases such as epilepsy, autism and (manic) depression.
3. I refer to the director's cut of the film as distributed on DVD, which is commented upon by the filmmakers and which contextualises the film with both scientific theories and insights and film historical backgrounds *(The Butterfly Effect: The Director's Cut* 2004). Besides the directors' commentary, the DVD contains notable extra material such as 'The Science and Psychology of Chaos Theory' and 'The History and Allure of Time Travel Films'.

4. In the DVD extra, *The Butterfly Effect* is framed within the genre of time-travel movies.
5. Freud defines the unconscious in terms of displacement, condensation, and repression, all related to sexuality. The Deleuzian unconscious is based on Bergson and related to the synthesis of memories and duration (see Kerslake 2007). In *Difference and Repetition*, Deleuze relates Eros specifically to the second synthesis of time (Deleuze 1994: 85).
6. Garrett Stewart discusses time and memory in *The Butterfly Effect*, as well as in *Donnie Darko* (2001), as a Hollywood Gothic science fiction, as opposed to the European uncanny humanism of films such as *The Double Life of Veronique* (1991) and *Swimming Pool* (2003) (Stewart 2002: 327–50).
7. fMRI stands for functional magnetic resonance imaging, which is a non-invasive brain scanning technique that measures changes in blood flows related to neural activity. It is one of the most recent and commonly used neuroimaging technologies.
8. Deleuze's argumentation is complex and extended. For insightful and very precise discussions of *Difference and Repetition*, James Williams (2003) and Joe Hughes (2009) are indispensible references.
9. Deleuze gives the ground of the past the characteristics of the sky: 'the foundation concerns the soil, it shows how something is established upon this soil [. . .] whereas the ground comes rather from the sky, it goes from the summit to the foundations [. . .]' (Deleuze 1994: 79).
10. Alia Al-Saji (2004) elaborates on the influence of Bergson in *Difference and Repetition*, referring mainly to the second synthesis of time.
11. Elsewhere, he clarifies this differently: 'When thinking of the future (F) as different from the past (P), we may be tempted to think that the difference lies between P and F. But Deleuze's point is that in a selection we move from an assembly P/F to a new assembly P′/F′. We select a new past and a new future. So any difference is between P/F and P′/F′' (Williams 2006: 112).
12. Alain Resnais's cinema, for instance, can be considered as 'neuro-images avant-la-lettre'. It is important on the one hand to acknowledge the fact that Deleuze has already mapped out the contours of the neuro-image in his cinema books. On the other hand, it also allows us to see how Resnais's cerebral screens anticipate the digital logic of our contemporary screens as a will to art (and thus indicate a resonating link between the neuro-image's brain-screen and the digital age in a non techno-deterministic way). See for an extended analysis of Resnais's cinema as early neuro-image, chapter 4 of *The Neuro-Image* (Pisters forthcoming) or the online lecture 'Signs of Time: Cerebral Metaphysics of the Neuro-Image' at http://vimeo.com/11779080.
13. Richard Rushton also refers to the syntheses of time in connection to cinema, indicating how the virtual and the actual can be read as the first and second synthesis of time in the movement-image in *Letter from an Unknown Woman* (1948). His focus (in a discussion with Mark Hansen) is on spectatorship, and he relates the time-image to the third synthesis of time and the dissolution of the subject (Rushton 2008). I propose a more meta-theoretical perspective by arguing that the movement-image, the time-image and the neuro-image are each based in a different synthesis of time, each has their own relations to past, present and future, and each opens up to the other syntheses.
14. In the theatrical version, Evan scares Kayleigh away the first moment they meet when they are seven so that they never cross paths again. The film ends eight years in the future where Evan recognises Kayleigh in a crowded city streets but after a moment of hesitation lets her pass by. All versions of alternative endings can be viewed on YouTube.

Deterritorialisation and Schizoanalysis in David Fincher's *Fight Club*

William Brown and David H. Fleming
Roehampton University/University of Nottingham, Ningbo

Abstract

Taking a schizoanalytic approach to audio-visual images, this article explores some of the radical potentia for deterritorialisation found within David Fincher's *Fight Club* (1999). The film's potential for deterritorialisation is initially located in an exploration of the film's form and content, which appear designed to interrogate and transcend a series of false binaries between mind and body, inside and outside, male and female. Paying attention to the construction of photorealistic digital spaces and composited images, we examine the actual (and possible) ways viewers relate to the film, both during and after screenings. Recognising the film as an affective force performing within our world, we also investigate some of the real-world effects the film catalysed. Finally, we propose that schizoanalysis, when applied to a Hollywood film, suggests that Deleuze underestimated the deterritorialising potential of contemporary, special effects-driven cinema. If schizoanalysis has thus been reterritorialised by mainstream products, we argue that new, 'post-Deleuzian' lines of flight are required to disrupt this 'de-re-territorialisation'.

Keywords: schizoanalysis, *Fight Club*, mind–body, digital, de-/re-territorialisation

I. Introduction

In *Anti-Oedipus* (1983), Gilles Deleuze and Félix Guattari advanced a radical conception of desire, no longer shackled to absence and lack, but based on a productive process of presence and becoming. Rather than the old 'Oedipalising' models of psychoanalysis, whereby the subject is constituted or gains an identity through identification with something that is always already lost (identity as having a fixed goal, *telos*, or, in another sense, a reified *essence*), Deleuze and Guattari proposed that identity constantly undergoes shifts and changes, in response to, or in accordance with, the situation in which it finds itself. The process of becoming (as opposed to the 'thing' of being) that Deleuze and Guattari describe, then, is one in which the conventional distinctions between inside and outside, actual and virtual, and even between self and other significantly blur. To comprehend and understand the world thus, as well as the works of art it contains, is known as *schizoanalysis*.

In this essay, we employ a schizoanalytic approach to expose the radical potential for deterritorialisation (that is, the upsetting of those conventional distinctions listed above – and perhaps even the upsetting of distinctions *per se*) to be found in David Fincher's *Fight Club* (1999). As we shall show, this potential for deterritorialisation is located at the level of form and content, and in the effects the film displays in the real world (that is, on spectators). In other words, we shall explore not only what happens in the narrative (its content), but also how the film itself is put together (its form) and functions in the world. Particular attention will be paid to the film's construction of photorealistic digital spaces and composited images, before examining the actual (and possible) ways in which audiences relate to the film, during and after screenings. Finally, we shall adventurously propose that schizoanalysis, when applied to a Hollywood film as here, suggests one or both of two things: that Deleuze underestimated the deterritorialising potential of contemporary, special effects-driven cinema, and/or that schizoanalysis has itself been reterritorialised if found in mainstream products. In this manner, we highlight how new, 'post-Deleuzian' lines of flight are required to disrupt this 'de-re-territorialisation'.

II. *Fight Club*

Fight Club has already garnered much academic attention, being schizophrenically read through a plethora of critical and discursive lenses/paradigms. Amongst others, it has been read as a film dealing

with, or invocative of: a/the contemporary 'crisis of masculinity' (Taubin 1999; Giroux 2001; Friday 2003), capitalism and consumerism (Giroux and Szeman 2001; Ta 2006; Lizardo 2007), violence and pain (Windrum 2004; Gormley 2005), fascism and anarchy (Dassanowsky 2007; Chandler and Tallon 2008), auteurism (Orgeron 2002; Swallow 2003) and the gaze (Church Gibson 2004). While some discussions of the film make mention of Deleuze's work – for example, Grønstad (2003), who concentrates on masochism – only Patricia Pisters (2003) has treated the film to an (albeit brief) Deleuzian analysis to date, illuminating an absent people's becoming, a political mobilisation of a *class of violence*, and an expressive interplay between time- and movement-image regimes. We should like to acknowledge the validity of all of these heterogeneous analyses, for the film is rich enough to allow for their co-existence, but we should also like to extend these much further, particularly Pisters's interpretation, to see what feedback the film offers to help us (better) understand Deleuze (and Guattari).

Based on Chuck Palahniuk's novel (1999), *Fight Club* tells the story of an unnamed narrator, often referred to as Jack (Edward Norton), who suffers from insomnia and convinces himself he is ill. Initially, a cynical doctor sardonically advises he attend therapy groups for disease sufferers, so he can see real suffering. Attending the sessions allows him to find a strong emotional release, and he is again able to sleep – that is, until a woman called Marla Singer (Helena Bonham Carter) begins attending the same groups and re-activates his sleeplessness.

The narrator's day job as an insurance recall co-ordinator finds him evaluating whether it will be cheaper for his car company to recall faulty products or settle lawsuits in or out of court. This involves extensive travel across the USA, and during one trip he encounters the enigmatic anarchist Tyler Durden (Brad Pitt). Thereafter, he returns home to find his apartment destroyed by an explosion seemingly ignited by a gas leak. He contacts Tyler, who invites him to stay at his dilapidated house, but not before asking the narrator to punch him. Reluctantly, the narrator hits Tyler, and they begin scrapping. By degrees Fight Club is born. The ennui of modern life and a/the crisis in masculinity mean that other disaffected males are drawn to the nocturnal fights. Since participants find these physical experiences immensely satisfying, the clubs begin to proliferate. For the narrator, actively fighting allows him to sleep again more than simply observing and sharing in others' suffering. In time, Tyler turns Fight Club into Project Mayhem, a covert organisation driven to overthrow late capitalism – initially through minor acts of

vandalism, which escalate into a terrorist plot to destroy financial corporations and blow up their headquarters.

Aware the narrator is no longer attending therapy sessions, Marla contacts him to find out why. She initially hams up an attention-grabbing suicide attempt, which the narrator ignores, but to which Tyler responds. As a result, Tyler commences an intensely sexual relationship with Marla, which the narrator finds distasteful, as he does Project Mayhem, from which Tyler likewise excludes him. As the narrator attempts to retard Project Mayhem, he increasingly discovers many of the men involved in it, impossibly, know him, even though he remains convinced he has never met them. As the terrorist plot inexorably heads towards its cataclysmic apogee, the narrator finally realises the members of Project Mayhem do know him, but not as the famous founder of Fight Club, but because he *is* Tyler Durden. As Tyler, the narrator *has* met them before.

Realising *he* has been the architect of Project Mayhem, the narrator tries to bring about its end by killing the part of himself that is Tyler – by shooting himself in the head. The bullet dislocates his jaw, but the gesture is seemingly enough to 'kill' Tyler. However, this action does not prevent the organisation from achieving its anarchic goals. The film ends, therefore, as several corporate towers collapse, and as the final credits begin to roll, a six-frame splice-in of a man's penis is inserted into the film – evidence, seemingly, that Tyler is in fact not dead, since we know from the narrative that he habitually inserted single frames of pornography into films whilst working as a projectionist.

III. Against Mind–Body Dualism

Below, we argue *Fight Club* features deterritorialisations that enable becomings through the body as well as deterritorialisations that enable becomings through the brain. By the latter, we mean the images we see might depict the thoughts of the narrator (thoughts that take bodily form are embodied in the cases of the other figures that we see onscreen), and by the former, we mean the film features moments in which the narrator's visible physical state can lead to new thoughts, as perhaps is most recognisable in the case of insomnia, where a physical state (prolonged waking) induces fantasy hallucinations. Both becomings imply that brain and body are not as easy to separate as we might believe, if we were to adopt a 'classical' Cartesian mode of thought. However, in order to commence our schizoanalytic reading of the film, and in order to break down the binary opposition between body and brain, we should like to spend some time elaborating what this means

at the level of content, before turning our attention to the corresponding themes built into the form/style of the film.

Gaining momentum in the 1990s, those involved in cognitive approaches to cinema attempted to put distance between psychoanalytic and Marxist readings of films, particularly those inspired by 'post-structuralist' thought (see Bordwell and Carroll 1996). In the crossfire between cognitive and 'post-structuralist' approaches, Deleuze came to be associated with the latter more than the former, perhaps due to his status as a 'continental' philosopher. As such, scholars like David Bordwell (1997: 116–17; 2010), while usefully identifying some limitations of Deleuze's film scholarship, go too far by dismissing it altogether. Although this is neither the time nor the place to rehearse in detail the reasons for and in particular against Deleuze's association with post-structuralist thought and his distantiation from cognitive approaches, we should like to say that recent developments in neuroscience and other disciplines that often form the theoretical basis for cognitive approaches seem to suggest that Deleuzian models of mind–body parallelism were not far off the mark. Neuroscientists such as Antonio Damasio (1994; 1999) and philosophers like George Lakoff and Mark Johnson (1999) have argued that not only is there no 'homunculus' directing thought, but the brain is embodied and 'basic' or 'lower-level' processes, from homeostasis to galvanic skin responses, are influential on emotions and feelings, which in turn are deeply influential on thoughts. Thus, the brain is not uniquely a rational disembodied tool that disregards 'irrational' phenomena like emotions and visceral responses (or affects). Rather, whatever rational thought the brain is capable of is dependent almost entirely upon what happens in the body and the fact that we have bodies at all.

Were cognitive film studies to look beyond its 'continental' and 'post-structuralist' thought prejudices, it might find Deleuze a useful ally precisely for his articulation of a body–mind parallelism, something symbolised in his overlap with Antonio Damasio via their shared Spinozian interest (see Deleuze 1988; Damasio 2003), as outlined by William E. Connolly (2006). In *Spinoza: Practical Philosophy*, Deleuze describes how parallelism disallows any primacy of the brain over the body, or of the body over the brain, which would be just as unintelligible (Deleuze 1988: 18). Mind and body are here freed of hierarchical relations, so that the brain becomes a partial machinic-component that sends efferent signals to the body, while the body simultaneously sends afferent orders to the brain, of which it is just a part and, correlatively, which is just a part of it. Spinoza's dictum 'Give me a body then'

comes to take on new meaning, as it can be through the body that new thought is achieved, with new physical states being matched by new neuron connections in the brain. In Deleuze's cinematic paradigm, to think becomes 'to learn what a non-thinking body is capable of, its capacity, its postures. It is through the body (and no longer through the intermediary of the body) that cinema forms its alliance with the spirit, with thought' (Deleuze 2005b: 182). The scene in *Fight Club* where Tyler inflicts a chemical lye burn on the narrator epitomises best this non-hierarchical relationship between the feeling body and the thinking mind – and visually actualises a direct relationship between bodily senses (feeling) and brain activity (thought).

The scene starts as an action-image. Tyler holds the narrator and administers powdered lye to a wet-kiss upon his hand. The excruciating bodily pain caused by the chemical burn immediately catalyses a visceral thought-image montage that vies for prominence amongst the action-images. The film here displays what we might call a motific re-folding of brain and body cinemas as the feelings and sensation of the physical burn directly stimulate thought. The narrator initially attempts to apply meditation to escape the intense pain, and viewers are presented with serene images of a green forest. After returning to a close-up of the hand, now bubbling as his flesh chemically dissolves, mental images (opsigns) of fire and intertitle-like images isolating words like 'searing' and 'flesh' intermix with sounds of intense burning and crackling (sonsigns). These compete with Zen-like images of trees, birdsong and the narrator's healing cave as he attempts to escape these overwhelming feelings and sensations. This begins to illuminate a powerful parallel-image sequence, wherein a brain-cinema montage overlaps performative action-images and affective bodily close-ups. The fact that Tyler is also coded as a mental manifestation serves to introduce another level of actual/virtual folding within the meniscus of the image. Thus, the images push and pull in two simultaneous directions that underscore a parallel relationship between mind and body, feeling and thought. As this relationship surfaces throughout the film, the model of parallelism increasingly becomes related to a process of immanent deterritorialisation.

IV. Deterritorialising the Body

When analysing films, it is often hard to separate form from content. As such, while we shall examine how *Fight Club*'s content (that is, its plot) involves the deterritorialisation of the narrator's body in such a way that schizoanalysis offers a suitable framework through which

to understand it, we shall also make explicit reference to the filmic form – although we reserve a prolonged analysis of form for a later section. To better understand how the body is deterritorialised within the film, we respectively analyse the roles insomnia, hunger, cancer and violence play, as well as considering the various ways in which these deterritorialising forces allow the narrator to enter a liminal state wherein the boundaries between fantasy and reality, inside and outside, thought and action, begin to blur.

In a Deleuzian-inflected engagement with insomnia narratives, Patricia Pisters argues that 'it is only when one is exhausted or "paralysed" that the sensory-motor action gives way to pure optical sound situations [and that] one enters into a dream world or visionary otherworldliness' (Pisters 2003: 136). After being sleepless for six months, the narrator laments: 'with insomnia nothing's real. Everything's far away. Everything's a copy of a copy of a copy'. These subjective experiences are aesthetically reflected by images drained of colour, depth and sound, as well as expressively and expressionistically distorted effects, such as crackling electrical charges that overlap edits, distended sounds that warp entire scenes, and 'single-frame' subliminal flashes of Tyler that flicker within the *mise-en-scène* prior to his 'real' introduction. Here, the exhaustion created by the narrator's insomnia provides the conditions for distorted formal images and sounds that viewers perceive. Although these are implied hallucinations, it is hard to tell these 'fantasy' elements apart from the narrator's 'real' perceptions.

The film often depicts the narrator performing mundane tasks like brushing his teeth or going to the toilet, but barely shows him eating. Significantly, when he opens his fridge, we see it is bare. While it is never explicitly stated he is hungry or deliberately fasting, the *mise-en-scène* becomes suggestive of an ascetic drive that becomes another condition aiding his entry into a warped, dreamlike world where bodily experiences become inseparable from those of the brain (thought, or fantasy, becomes indistinguishable from reality). In an essay on 'The "Fasting Body" and the Hunger for Pure Immanence', psychotherapist Jo Nash argues that fasting enables

> an altered state of consciousness [to arise] that permits a collapsing of the dualistic affective divisions between subject and object, within and beyond, to enable an experience of transversal, trans-Oedipal desire to enjoy both, at one and the same time [...]. Binary divisions of inner and outer, self and other, mind and body, thought and feeling, are overcome, through a conscious decision to resist the desire to consume. (Nash 2006: 325–6)

The narrator's lack of consumption on the physical level is eventually succeeded by his refusal to consume on what we might call a capitalist level later in the film. But while these initial conditions of insomnia and hunger set the scene for a primary deterritorialisation of the self through the body, the narrator finds himself reterritorialised by the physical and spiritual release he experiences by attending disease support groups in acts of 'misery tourism'.

The narrator's new-found ability to sleep and cry is in particular enabled by his physical interaction with a testicular cancer sufferer called Bob (Meat Loaf Aday) who has developed (what the narrator calls) 'bitch tits' as a result of his orchiectomy and subsequent chemical imbalance. While the narrator attends therapy groups for genuine victims of cancer, he is of course only a tourist among these sufferers. However, once Marla arrives and begins to infiltrate all the groups, not only can he no longer sleep again, but it is as if Marla becomes a kind of cancer that infects him: 'If I had a tumour, I'd call it Marla.' While this no doubt encourages a reading relating to the film's surface misogyny and exclusive treatment of masculinity, an issue to which we shall return, it is important to establish how Marla, in particular Marla-as-cancer, triggers a second level of deterritorialisation that will only be eased – temporarily – by the advent of Tyler.

Beyond toying with the notion of calling his tumour Marla, there are several other ways in which Marla can be understood to operate in a cancerous fashion. Her consistent smoking (even in cancer recovery sessions), for instance, along with her claims of actually having cancer during an attention-seeking 'suicide' attempt ('my tit is rotting off') thematically associate her with cancer and its causes. Furthermore, her gothic appearance – black eyeliner, black clothes – also grant her a form of necrotic presence that begins spreading everywhere. As a cancerous force, Marla becomes another active agent in the narrator's deterritorialising process. This notion is signalled during a support group scene where the narrator joins terminally ill sufferers in guided meditation, whereby they retreat into their 'healing caves'. Typically, the narrator finds his 'power animal' there, a computer generated imagery (CGI) penguin that encourages him to 'slide'. However, once Marla arrives, she replaces the penguin, and, exhaling smoke, implores him to 'slide', or, for the sake of this argument, deterritorialise. In other words, Marla begins to assert her presence in both the narrator's waking and dream life.

By degrees, the narrator quits the groups, meets Tyler and begins Fight Club. Mirroring the initial affect and effect of the support groups, the

physical experience of violence functions as a physical and psychological release that allows him to sleep. But, where the therapy sessions helped reterritorialise the narrator, in that he could sleep safe in his IKEA catalogue-like apartment, here the violence is part of a prolonged and temporarily more satisfactory deterritorialisation. Losing his home, the narrator joins Tyler in an abandoned house, and begins to lose teeth and turn up at work with a bruised face and body. Seduced by Tyler, he eventually rejects the consumerist lifestyle that characterised his earlier existence. The violence therefore serves as a deterritorialising force; as Pisters argues, it equals 'the shocks in the brain' and is 'connected to a strategy of deterritorialisation' (Pisters 2003: 97–8). We can locate another echo of a body and mind parallelism in Pisters's equation of cerebral and physical violence here, but we should presently like to spend some time sorting through the complexity of this deterritorialisation.

We have argued the narrator's flirtations with danger serve a deterritorialising end, and that this process is subsequently rounded off by a reterritorialisation signalled through his ability to sleep. However, if his misery tourism and initial forays into violence are undertaken with the goal of reterritorialisation, then what *real* deterritorialisation is going on? That the deterritorialisation is undertaken with a specific goal in mind suggests that this is only a reterritorialising deterritorialisation. But in fact this reterritorialisation that lies at the heart of the narrator's first and superficial attempts at deterritorialisation occult – at least at first – a more profound deterritorialisation. For it will ultimately turn out that the narrator has not been asleep (or 'reterritorialised') at all. As Tyler, the narrator has been escalating the violence of Fight Club to ever-greater levels, culminating in Project Mayhem. As this is only revealed at the climax of the film (when we watch it for the first time), the continued deterritorialisation that takes place in spite of the appearance of reterritorialisation (he seems happier/can sleep) must be manifested in different ways. How is this so?

The continued, 'deeper' deterritorialisation is manifested through the reappearance of Marla and the appearance of the Project Mayhem goons who move in with Tyler and the narrator. Here, the analogy between Marla and cancer can be extended: in the same way that she is a continued and persistent 'cancerous' presence in the film, so, too, does the increased presence of other black-clad and nameless figures in the *mise-en-scène* reinforce as much. Like a cancer growing, the Project Mayhem goons come to represent the continued but evolving deterritorialisation of the narrator's world. Their dilapidated home thus becomes the body in which these malignant, or terrorist, 'cells' take

their place; according to the narrator, the house becomes 'a living thing, wet inside with so many people sweating and breathing'. It is from this base that the terrorist organisation mounts its attack on the surrounding organs of the embedding culture. That is, Fight Clubs and terrorist cells begin to crop up everywhere across the US, and these are organised by Tyler, who takes advantage of the narrator's travels to coordinate Project Mayhem. It is important to stress, then, that even though we do not know as much until near the film's end, Tyler is also part of the deterritorialisation of the narrator, and utilises the rhizomatic web of national airline routes to spread Project Mayhem (cultural cancer) in a way similar to a disease travelling around the body's circulatory and cardiovascular system.

Finally, the increased, 'deeper' deterritorialisation of the narrator taking place without his (or the first-time viewer's) knowledge, is also marked in an affective scene depicting unhinged violence waged against an unconscious opponent, Angel Face (Jared Leto). While there are several scenes of ritualised violence in the film, which collectively witness the body become an affective threshold of intensity, in this scene both form and content synergistically interface to affectively frame a deranged attack, which transcends the (diegetically) established ritualised codes. Framed from the victim's position and scored with affective sounds of pounding flesh and crunching bone, the scene formulates a gruesome unflinching visceral experience, in which the narrator reveals that all is not well and that he, too, needs to go further and become more deterritorialised if he is to find peace or happiness again.

Between insomnia, hunger, cancer and violence, then, we get a sense of the central role that the body plays in *Fight Club* and particularly in the narrator's deterritorialising line of flight from bourgeois consumerist conformity to anarchistic terrorist. However, as we indicated above, the body is not alone in this process. If insomnia and hunger can help break down the boundaries between reality and illusion, between self and other, and if cancer can do the same, in that a cancer is both alien and within us, and if violence can also change our thoughts by making marks on and modifying our bodies, then the parallel brain, too, must equally be involved in this process.

V. Deterritorialising the Brain

We explained earlier that the narrator's insomniac experiences are conveyed expressively via a combination of sound and *mise-en-scène*:

warping distortions and washed-out lighting trouble our ability to tell what is real and what is not, and expressionistically reflect the narrator's experiences. While *Fight Club* does feature a now-famous twist ending whereby the narrator discovers he *is* Tyler and the mastermind behind Project Mayhem, we might initially suspect that the end sees the narrator reterritorialised as 'himself', in that Tyler is 'dead', despite the fact that Project Mayhem appears to have destroyed the banks. We have already mentioned, however, how the closing splice-in of a penis hints that Tyler is, in fact, still at large. While this is seemingly so, we should like to extend the argument somewhat further, by suggesting that there is very little in the film that we can truly claim to be 'real' or 'outside' of the narrator's brain. This is manifest in that final splice-in: Tyler, should he be the perpetrator, does not splice the penis into a film *within Fight Club* (as happens earlier). Rather the film into which the penis is spliced is *Fight Club* itself. In other words, not only might Tyler and other elements of the *mise-en-scène* be figments of the narrator's imagination, but so might the *whole film*. How can we mount such an argument?

We shall make this argument by looking specifically at the character of Marla, and posit that she, too, is as much a figment of the narrator's imagination as Tyler. 'And suddenly I realised that all of this, the guns, the bombs, the revolution had something to do with a girl named Marla Singer,' says the narrator after the film's opening shots. Although we may not take note of the importance of these words during an initial viewing, they become the first clue hinting at Marla not being a real person. Indeed, not only is it logically unlikely for a woman to attend therapy sessions for testicular cancer sufferers (or to smoke at an emphysema victims group), but, when the narrator addresses her on the issue, she walks away, crossing a road to pawn some stolen clothes. (Narrator: 'Let's not make a big thing of this.' Marla, walking away: 'How's this for not making a big thing?') Marla crosses the road, effortlessly missing speeding vehicles that intercut her path. The narrator, however, steps forward to encounter car horns, screeching brakes and skidding tyres. Is the fact that Marla ghosts across without a problem, whilst the narrator is nearly killed, also an indicative clue hinting that Marla does not exist? As a virtual image, Marla may well function as a fantasy manifestation and embodiment of the narrator's guilt and unease at being a tourist at the support groups. Viewing Marla as another virtual splitting of the narrator is also verbally hinted at, when the narrator informs us that 'her lie reflected my lie'.

The narrator lies awake in bed imagining approaching Marla to demand she stop attending the groups; when he 'actually' approaches her, however, Marla quickly announces she has seen him practising this, suggesting that she, like Tyler, might know everything he thinks and feels. Furthermore, when the two finally barter to divide up the groups, Marla tellingly says she wants the 'brain parasite' and 'organic brain dementia' meetings. This also prompts the narrator to respond: 'You can't have the whole brain!' This exchange not only reinforces the possibility that Marla is a brain-screen image (an embodied manifestation of a thought), but it also creates a circuit with another scene where Tyler discusses his desire to kill off *his* 'loser alter ego' (the narrator) in order to take over the whole brain.

Through a series of visual rhymes and thematic reflections, Marla is also linked to the virtual image of Tyler, serving to reinforce the sense that she is not 'real'. As Marla's introductory vignette ends, for instance, she is framed in silhouette walking into the depth of the frame. A subliminal flash of Tyler is momentarily introduced so their bodies occupy the same position onscreen. Both also wear dark sunglasses (whilst indoors) when we first see them, and both are in the habit of stealing things (Marla steals clothes and food, while Tyler steals human liposuction fat to make soap and bombs). Both characters also smoke and circle mysteriously around the crowds at group therapy sessions and Fight Club meetings, where couples come together to hug or fight respectively. While we have already mentioned how Marla manages to infiltrate the narrator's 'healing cave', it might also be worth mentioning that she literally seems to fuse with Tyler during a sex scene which is the product of the narrator's imagination: their coital bodies rendered in a blurry CGI sequence that Fincher discusses as a Francis Bacon version of Mount Rushmore (Swallow 2003: 130).

What might be the significance of identifying Marla as another (earlier) virtual image/character on a par with Tyler? Deleuze and Guattari may provide an illuminating answer, when they contend that it becomes 'the special situation of women in relation to the man-standard' that accounts for the fact that all becomings initially pass through a 'becoming-woman' (Deleuze and Guattari 2004: 321). Here, it would appear Marla formulates the first virtual threshold of the narrator's becoming process; somewhat ironically introduced during the 'Remaining Men Together' testicular cancer meeting, that is an event attended by castrated males. Marla enters as the narrator hugs Bob (a man in a physical process of becoming-woman with his aforementioned 'bitch tits'). If *Fight Club* can be accused of forwarding

a masculinist narrative, then, this becoming-woman process might conceivably highlight how the film does not respect boundaries between inside and out, and between self and other, in that not only is Tyler revealed to be the projected and embodied fantasy of the narrator, but so is Marla. What is more, rather than allow these figures to be re-centred around/reterritorialised within the male narrator, we would posit a further, deterritorialising ambiguity: these are not so much projections of the narrator as *also the narrator*. Marla is not some 'female' aspect of a 'male' narrator, then, but rather the narrator is both sexes, male and female, at once, and potentially a whole lot more (including Bob who is somehow both female – castrated and with breasts – and male, while not quite being either at the same time). Tyler, Marla, Bob: they are not 'part of' the narrator; they *are* the narrator, such that we cannot attribute sex or gender except as a means of simplifying for the sake of argument what he/she/it is. In this way, masculinist or misogynist readings of the film become hard to sustain: the boundary between genders is not one the film observes, then, but one it troubles, even if instinctively we feel tempted to 'reterritorialise' it within traditional gender(ed) interpretations.

VI. The Form of *Fight Club*

The above examples provide a good link into a discussion of *Fight Club*'s filmic form. That is, while the narrative content tells the story of a character whose bodily experiences are impossible to distinguish, or are cut in fluid fashion with, 'his' mental experiences, we can recognise these same themes reflected by the film's formal and aesthetic construction. We shall highlight this by investigating the film's expressive lighting scheme, its depiction of bodies, and the new forms of space generated by digital technologies.

Fight Club has a very stylised look, as was intimated by our discussion of the expressionistic use of colour to affectively convey the psychological effects of insomnia. Throughout, the film's aesthetic is further blocked using a dark, saturated Technicolor palette, with the underground Fight Club spaces having a chthonic appearance that contrasts with the electric blue over-world office spaces. In order to hold and capture the film's low light levels, Fincher and cinematographer Jeff Cronenweth used non-anamorphic spherical lenses and various development processes to render a style that visually echoes the film's key themes. As Fincher says:

> We talked about making it a dirty-looking movie, kind of grainy. When we processed it, we stretched the contrast to make it kind of ugly, a little bit of underexposure, a little bit of re-silvering, and using new high-contrast print stocks and stepping all over it, so it has a dirty patina. (Swallow 2003: 143–4)

The dark spaces often feature the greatest amount of bodily action (the brawls), while the contrasting washed-out lighter spaces reflect the affected spiritual or cerebral dimensions of the film. In keeping with the above discussion of a mind and body parallelism, Amy Taubin argues the film's use of light provides 'such a perfect balance of aesthetics and adrenaline [... that it feels] like a solution to the mind–body split' (Taubin 1999: 18). Significantly, actors' bodies are depicted as lean, muscular and 'taut', especially Brad Pitt's as Tyler. Pamela Church Gibson (2004) argues that this clearly fetishises and commodifies the male bodies, highlighting a 'gaze' that becomes ambiguous, upsetting a normative (straight) viewing position without reinscribing an overtly 'oppositional' or 'gay' one.

We shall return to the spectator of *Fight Club* shortly, but first turn our attention to the film's editing and, in particular, how it uses digital technology to create spaces that can be navigated with a new (total) ease. The film opens with a virtuoso two-and-a-half minute tracking shot beginning in the fear centre of the narrator's brain (although we do not necessarily know this on first viewing), moving backwards past firing synapses and floating cells of bodily matter, before accelerating outwards via a pore, past a giant drop of sweat dribbling from his pate amidst giant, looming bristles of hair, down his face and along the barrel of a gun. As the 'camera' passes the gun's sights, it comes to a rest. The focus changes and what previously had been only an affective rush of colour is pulled into focus to become recognisable as the face of Edward Norton with gun in mouth.

Instants later, while the narrator is explaining the nature of Project Mayhem's plot, an illustrative camera rushes vertiginously down the outside of the skyscraper from the top floor, down through the pavement and ground into a basement car park which houses a bomb nestled alongside a concrete column. The camera then changes trajectory, heading sideways – again at breakneck speed – through areas of solid earth until it reaches another subterranean car park, in which the camera races towards a van, through a bullet hole in its rear window, performing a circling close-up of a bomb counting down to destroy the buildings we have just impossibly and rapidly travelled through. Both shots are in part constructed through the use of CGI and animation – since it

would be physically impossible to manipulate a material camera to pass from the inside of a human actor's brain to the outside, while changing its focal range so we see individual synapses at one moment and a face in focus the next. Similarly, one could not easily drop a material camera thirty-one storeys, through the ground, across an underground space, through a bullet hole and around a bomb in one continuous fluid movement.

That these examples are computer generated is formally important, as we shall see, but it is the continuity of the shots that we should like to emphasise at present. For while, as discussed above, the shots of the lye-burning are intercut with images of green woods and words from dictionaries, such that we switch perceptibly from an image of what is happening in the diegetic world to images of thoughts, here the distinction between the two is not so clear cut. While the montage sequence of the lye-burning happens rapidly – so quickly, that we cannot *count* the shots but must simply get caught up in the speed of the film itself – we can still tell that we are seeing a montage of shots cut together. When the 'camera' (which is not really a material camera) passes from the inside to the outside of the narrator's brain in the film's opening, we cannot so easily separate inside from outside by breaking the sequence into shots. Rather, the inside of the brain and the outside 'physical' world are rendered 'impossibly' as one single continuum. It is not that fantasy and reality are presented as binary opposites, then. Instead *Fight Club* shows that fantasy continues into reality and vice versa in such a way that we can no longer tell them apart.

The subsequent plunge taken by the CG 'camera' into the basement achieves a similar effect. Since we start with a shot of Tyler from outside the building while they wait for the bombs to detonate, we might believe that this is an 'objective' shot of the action. However, since the camera responds to the narrator's voice-over and takes us down to the bomb, it becomes clear the film is responding to his thought processes: we see what the narrator wants us to see – meaning that the film is not 'objective' at all, but rather highly subjective (if we can distinguish the two). However, where Fincher could easily have cut directly from Tyler to the bombs, he does not. The refusal to cut has an added effect: by showing the space between Tyler, the narrator and the bombs, Fincher shows us their connected nature. This similarly blurs the boundary between the objective and the subjective, in a way that is more troubling than using cuts, since we cannot but *falsely* impose a boundary between where the film becomes 'subjective' or 'objective', if the lack of a cut means that *there is no boundary*. In cinematic terms, this

is not necessarily new, since *Citizen Kane* (1941) features similar camera movements in the famous shot where the camera travels through the El Rancho nightclub's neon sign before descending through a skylight into the bar where a drunk Susan Alexander (Dorothy Comingore) slouches. The impression of continuity across two shots is here achieved through a dissolve, but the film fails to present a truly convincing continuous space, since the angles between the first and second shot do not exactly match. The continuous spaces in *Fight Club*, meanwhile, are free of such mismatches, in part because they are created using 3D digital spaces which negate the need for changing material camera positions, and because the movements can be so much faster than those of *Citizen Kane*. This speed of the movement is important, not just in terms of moving too fast for viewers to notice 'flaws' in continuity, but also in terms of the camera movement arguably appearing as 'fast' as a cut. Whereas film has perhaps long since had the ability to 'move' at the speed of thought via editing, here the 'camera' can achieve this effect *without* editing, meaning the boundary between thought-images and pro-filmic 'reality' becomes blurred.

In other words, *Fight Club* is shot in a style that makes form reinforce content: in a narrative in which we shall finally not be able to tell apart the narrator from Tyler from Marla, such that they all form a 'schizophrenic' continuum (in a similar manner to Deleuze and Guattari's thesis that 'at root *every name in history is I*' [Deleuze and Guattari 1983: 85–6]), so, too, is the space in the film shown as a schizophrenic continuum, that passes literally from inside to outside of the brain as if there were no division between the two, and from seemingly objective to subjective shots as well. As Fincher has said, in a way that is reminiscent of Deleuze's call for cinema as a depiction of thought:

> It's like, pfpp, take a look at it, pfpp, pull the next thing down [. . .]. It's gotta move as quick as you can think. We've gotta come up with a way that the camera can illustrate things at the speed of thought. (Quoted in Smith 1999: 58)

These sequences of intense continuity differ, slightly, from the 'intensified continuity' of contemporary cinema noted by Bordwell (2002). Bordwell describes the increased cutting rate of contemporary cinema, while here we are describing a cinema that does not (seem to) cut at all. However, it is not that these sequences, and others like it, including the narrator walking through an IKEA catalogue, and the camera becoming the gas spreading around the narrator's apartment

before it is destroyed, are 'better' than the lye-burning sequence that uses montage. Indeed, the use of montage during the lye-burning heightens the tension and invasive violence of that particular moment. Rather, in *Fight Club* the camera (and the film) seems capable of doing whatever it wants; it does not have to use *either* montage or continuity; it can use both as and when it desires and for expressive purposes. Again, the option of using montage and/or continuity has long been available to filmmakers, but the ability to pass through solid objects (skulls and walls), the ability to change scale (neurons and entire heads in the same shot), and the speed with which this is rendered onscreen intensifies the blurred boundary between the imaginary and the real, particularly when continuity is taken to these extremes.

Earlier we mentioned a moment wherein the narrator hugs Bob, significantly at the same moment Marla is introduced. We in fact encounter this sequence twice within the film. The first time formulates the initial jump backwards into a sheet of past which kick-starts the entire flashback – as if the narrator deliberately wanted to return to this moment (of becoming-woman) as the starting point for the story of his deterritorialisation. In the second occurrence, the now-familiar image is replayed, but we find Marla enter at the exact moment when the narrator forms a hugging assemblage with Bob's 'bitch tits'. This is the moment of forking time that orients and justifies the first flashback. Significantly, in the space of the 'Remaining Men Together' group, we can perceive how Marla, or the becoming-woman process in general, is related to and formulates an assemblage with the concept of organic sickness and disease, and thereafter continues to inform the nature of the immanent deterritorialisation process (becoming-cancer). These instances of repeated shots and recurring time loops, often with minor differences, also go to show that the film is edited in such a way as to be the thought of the (unreliable) narrator, and thus offer us a strange but original form of time-image that infests a narrative that might otherwise be considered an action-image.

The digital nature of many of the images can reinforce this sense. For, when the digital 'camera' can pass smoothly through walls and human heads, or change scale at will, then these continuous digital spaces call for new modes of thought and action because these kinds of continuities have been hard if not impossible to achieve (at least photorealistically) without the digital technology used to create them. As such, the digital nature of these shots is linked to new ways of thinking about time and space. In this film, both time and space are presented as a fluid continuum: space can be traversed in spite of the nature of

the supposedly material objects that fill it; time, likewise, can be crossed like a space – backwards and forwards, sideways, in whichever direction the narrator's brain takes us and without obstacles. In other words, these sequences present us with any-spaces-whatever, except that, unlike the 'traditional' any-spaces-whatever described by Deleuze, these are supermodern or, what William Brown (2009) might term 'posthuman' any-spaces-whatever. We propose this because of the continuity between inside and outside that is (digitally) presented: since the 'camera' can and does go anywhere, our sense of identifiable spatial coordinates is undermined – and, what is (retroactively) understood as the inside and then the outside of the narrator's head/brain becomes a vertiginous rush of changing colours.

Again, the form here matches the content, since much of the narrator's life is spent in airports and anonymous hotels, the kind of non-places described by Marc Augé (1995), and which have been linked by Réda Bensmaïa (1997) to Deleuze's concept of the any-space-whatever (even if, *contra* Bensmaïa, Deleuze does not himself refer to Marc Augé in his work, but to Pascal Auger, a former student [Deleuze 2005a: 112]).[1] Production designer Alex McDowell tried to ensure that locations like 'the airliner interior, the hotel rooms, the office and Jack's [*sic*] apartment all used the same palette of colours and fabrics, suggesting the "sameness of life outside the Fight Club" ' (Swallow 2003: 128). In other words, the film consciously tries to anonymise and homogenise the spaces in which much of the narrative takes place, making these non-places also become any-spaces-whatever, and demanding new modes of thought and movement.

VII. The *Fight Club* Spectator

While we have thus far often mentioned the viewer and the spectator (sometimes referring to these as 'we') in relation to *Fight Club*, we should now like to turn our attention more particularly to the film's viewer(s). For, while *Fight Club* might in content be a film about bodies which depicts not only thoughts (inserts of the narrator's brain patterns) but thought itself (the *process* of thinking, as demonstrated in the film's style/form), then what does this say of the spectator? Firstly, we should like to say that *Fight Club* affects its spectator in much the same way that the characters seem to be affected in the film. That is, *Fight Club* is for the spectator both a *physical* (visceral, or affective) experience, and an experience that can inspire new forms of thought.

Earlier, we mentioned the scene in which the narrator disfigures Angel Face in a fight ('because I wanted to destroy something beautiful'). We mentioned the way in which the sequence is shot from the victim's point of view and how the sound of the violence is affectively amplified: cartilage and bones crunch, skin slips and splits as the narrator mangles the young man's visage. As in the lye-burning scene in which we see images of skin searing, the shots of the narrator's face being torn apart when he shoots himself in the jaw, and the fights more generally, here, too, the filmmakers are interested not just in showing spectators what is happening, but in placing viewers 'within' the action such that they experience the film not just in a detached, visual manner, but *physically*, viscerally even. And if the film is designed to affect the spectator in a physical manner, one might say that *Fight Club* does to the viewer what it depicts happening to the characters. That is, the film enacts a physical form of violence that is deterritorialising and puts viewers' bodies through new experiences that call for new modes of thinking and movement, and allow us to become, as opposed to simply being: we experience insomnia with the narrator via the distorted sound, colour and flickers of Tyler across the screen; and we watch not just Tyler splicing pornographic frames into other movies, but also, pornographic frames being spliced into *this* movie. The narrative actively seeks to affect its viewers directly as opposed to merely telling a story about someone who terrorises film viewers.

Fight Club's narrator offers us technical explanations about 'cigarette burns' or 'changeover' marks, which we see in movies when a projection reel has nearly run its course and needs switching. As he explains this in voice-over, Tyler illustrates by pointing to an actual 'cigarette burn' that features in/on *Fight Club* itself. Furthermore, Tyler rhapsodises about the woes and taunts of contemporary consumerist lifestyle, addressing the camera directly and even managing to dislodge the film itself from its projector, revealing the celluloid image's sprockets. These examples suggest that *Fight Club* not only wants to affect us physically, but also mentally, assaulting any passive spectatorial engagement. That is, as it becomes harder to tell apart the diegetic from the non-diegetic, where the film world begins and ends, not least because we are directly spoken to and because we apparently – impossibly – see the very film that we are watching being ripped from its projector, *Fight Club* seeks to induce challenging new modes of thought. Schizoanalytically speaking, it seeks to induce schizoanalysis: not only can the viewer not tell apart the narrator from Tyler (from Marla) within the film, but the film also pays no attention to the supposed boundary between the fictional world and

our real world. *Fight Club* might be a fictional film, but its physical affects and the new modes of thought that it inspires are genuinely *real* experiences, and so perform modes of cinematic becoming.

In this manner, what 'shocks' the film achieves on our body, it perhaps also inflicts on our brain. In other words, while *Fight Club* is a film that moves at the 'speed of thought', darting from one moment in time to the next, across spaces at breakneck speed, it also sets up three intertwined and parallel time frames reminiscent of the time-image (the three-minute countdown to the towers exploding as the film commences, the dilated flashback memory embedded within this short period, and the viewing time of the film itself). Although ostensibly an action film, *Fight Club* does, as Pisters argues, involve movement-images that expressively toy with time-image regimes. Rather than a straightforward film that tells the story in chronological order, the 'cerebral' nature of the narration effectively unsettles our relationship with time and seeks to make us aware of the non-linear processes entailed in thought and memory.

Beyond its crystalline treatment of time, the film is also a 'twist' movie designed to be re-viewed and re-experienced after an initial, 'naïve' viewing. On account of this, a powerful cinematic consciousness surfaces that knows more than any of the characters embedded within the diegesis. The film's formal construction thus becomes responsible for introducing a virtual and actual circuit into the narrative, since upon subsequent viewings, each spectator retains a memory (a virtual 'past-that-is-preserved') of their initial viewing that overlaps and contrasts with the actual images perceived during a second or third encounter. *Fight Club* therefore plays with time on a meta-cinematic level, and illustrates how time can bring the 'truth' of an image into crisis. In other words, *Fight Club* is not a one-off phenomenon, but a film to be re-viewed and which makes its presence felt in the 'real world' such that fiction and reality become indiscernible.

Mark B. N. Hansen (2004) has argued Deleuze did not give enough weight to the spectator, and suggests that recent neuroscientific findings in fact go *against* some of his arguments concerning the cinema viewing experience. However, Richard Rushton (2009) has recently brought the 'Deleuzian spectator' to prominence: film viewers are not so much conscious of a film but conscious *with* a film. We 'fuse' with it when viewing in such a way that the film-viewer assemblage constitutes a new form of consciousness, a new form of thought. Viewing *Fight Club* not only involves such a process (since this process happens *de facto*, albeit with differing degrees of intensity), but it quite self-consciously involves such a process, as the über-rapid movement in any and all directions

and across time, together with the direct address to the audience, makes clear. To paraphrase the narrator, 'I am Jack's brain' might be a useful starting point for us to articulate what happens when watching the film. But we can go further than this: I become Jack's brain, such that Jack and the film and I (the viewer) cannot be distinguished anymore. We have become a new consciousness that fundamentally deterritorialises us from our 'normal' selves and allows us to *become*. Since the film involves people whose altered physical states (through fights, burns, etc.) lead to new modes of thought (that is, changes in the body lead to changes in the brain – as a result of mind–body parallelism), so is this true for the viewer with regard to the physical states in which the film puts *us*. Robert Sinnerbrink (2008) has called for something like a *rapprochement* between the 'affect' and the 'brain' Deleuzians, and a schizoanalysis of *Fight Club* allows us to put this into effect: not only within the film do physical experiences lead to new modes of thought for the characters, but the film itself is for the spectator a physical and mental experience that leads to new modes of thought, new becomings.

As such, Pitt describes the film as a 'virus' because it is not 'a film you can just *watch*; it's a contagious set of ideas [... that] will make you feel *something*' (Swallow 2003: 143–4). One might say, then, that the film involves a 'cancerous' becoming, but not necessarily with the negative connotations that this typically entails. 'Marla is like one of those sores on the top of your mouth that you wished would go away but can't help tonguing', says the narrator as he finds Marla in his 'healing cave'. In a manner akin to the becomings that Steven Shaviro (1993) has described in David Cronenberg's work, the disease-virus-cancer-sore that is *Fight Club* involves a becoming that may not be uniquely pleasurable, but is a becoming in which we are profoundly involved nonetheless – and it is up to us to use this becoming positively (in effect, to treat this 'cancer' as a part of our newly constituted selves, to nourish and not deny it). Palahniuk (2005) writes that both his novel and the film (more particularly the film) have spawned many real-life Fight Clubs: if he is to be believed (if reality is, as Palahniuk titles his memoir, *Stranger than Fiction*, then perhaps we can schizoanalytically believe nothing), then it would seem that not only does the film affect us in theory or during viewing, but it can also lead to new movements and thoughts in real life.

VIII. Conclusion: *Fight Club* as Hollywood Film

We have endeavoured to use schizoanalysis to interpret *Fight Club* not just as a film *about* a narrator undergoing deterritorialising experiences

that lead to new becomings (starting with the becoming-woman signified through the presence of Marla Singer), but as a film that *enacts* a form of schizoanalysis on or with the viewer. The potential for schizoanalysis is in any and every film (we become conscious with all films, perhaps with the world itself at each and every moment), but in *Fight Club* this potential is realised and brought to the fore with an intensity that is often unseen in mainstream Hollywood cinema.

While *Fight Club* is a narrative that critiques the unthinking nature of the consumerist lifestyle, the film is itself a commodity designed to make money, not just in the theatre, but through DVD sales and so on. Like Tyler himself, the film perhaps betrays megalomaniacal and fascistic leanings as much as it is a critique of these processes. The narrator may seek to prevent Tyler from destroying the corporate consumerist world, but he fails (Tyler is still at large come the film's closing; the banks *are* destroyed). But this failure is not necessarily matched by any change in the real world. Even if real Fight Clubs have been created as a result of the film, does the film-as-commodity in fact reinforce as much as it seeks to overthrow the consumerist lifestyle? If schizoanalysis as a process seeks to disrupt the 'unthinking' modes of thought consumerist modernity might impose upon us, has schizoanalysis ultimately failed when it has been co-opted into or become 'axiomatised' within mainstream Hollywood filmmaking?

While we might speculate that Deleuze would be unimpressed with *Fight Club* had he seen it, does the above analysis suggest that Deleuze overlooked the schizoanalytic potential of the mainstream? Or does it suggest that (a version of) Deleuzian thought has itself become mainstream, meaning that we must now seek to find even 'newer' ways of thinking and moving in the world – new experiences that will enable newer becomings? If *Fight Club* is a product of capitalism, which always seeks to produce new others precisely so as to consume them and to be able to grow, then is it really revolutionary at all? We suspect that the answer is both: *Fight Club* realises a potential that Deleuze may not have seen in mainstream, action-image cinema, while it also must to a degree undermine the power of that potential, perhaps by virtue of that potential being realised in and of itself. However, rather than being a negative thing, we can also read this as a new fold in Deleuzian thought: *Fight Club* may reterritorialise schizoanalysis, but this reterritorialisation of deterritorialisation is simultaneously a deterritorialisation of the modes of thought that reify and reterritorialise Deleuze. *Fight Club* is famous for its so-called rules, the first rule being that you do not talk about Fight Club. The law may condemn behaviour

that is deemed unethical (from the point of view of the law, Tyler Durden is a criminal), but 'the man who obeys the law does not thereby become righteous; on the contrary, he feels guilty and is guilty in advance, and the more strict his obedience, the greater his guilt' (Deleuze 1989: 84). In contrast to obeying the law, then, and beyond good and evil, we say that when it comes to finding out what a body can do, there are no rules. Let us schizoanalyse schizoanalysis, deterritorialise deterritorialisation, and unlock the potential for becoming that lies not just in *Fight Club*, but in each and every encounter we have.

Note

1. Pascal Auger's name is misspelt when Deleuze first mentions the concept of the any-space-whatever in *Cinema 1* (Deleuze 2005a: 112). Paris VIII has published online transcripts and recordings of Deleuze's seminars on cinema, and these include one in which Deleuze credits Pascal Auger with the concept of the any-space-whatever, and in which Auger himself also talks about the term in relation to Michael Snow's *Wavelength*. However ingenious (and still valid) the link between Marc Augé and Deleuze, it was not one intended by Deleuze himself. See Deleuze 1982 for more.

Literature and the Parasite

Anders M. Gullestad University of Bergen

Abstract

J. L. Austin's claim that language 'used not seriously' is 'parasitic' upon 'normal use' has proved a puzzle to literary scholars, who have often taken this to mean that they are not allowed to apply the insights of speech-act theory to their own object of research. This article explores how, when read together, Michel Serres' definition of the parasite as a 'thermal exciter' and Deleuze's concept of 'minor literature' bring out the hidden potential inherent in Austin's claim. More specifically, the article argues that Austin's reference to literature as a parasitic entity might become a promising conceptual gift, allowing us to generate a new model for approaching the world-shaping potential of literary texts.

Keywords: parasite, parasitic, literature, J. L. Austin, Michel Serres, Ilya Prigogine, Richard Dawkins

For those who would like to explore the world-shaping abilities of literary texts, the set of conceptual tools offered in J. L. Austin's *How to Do Things with Words* (1962) is in many ways *gefundenes Fressen*, allowing us to pursue the question of how language plays a part in the creation of reality. However, literary scholars who want to apply these tools to their own object of research immediately encounter a serious problem: Austin specifically forbids them from doing so. More precisely, in distinguishing between language which is meant to be taken literally and the sort which is not, he casts the latter – of which literature is perhaps the best example – outside the boundaries of speech-act theory:

> as *utterances* our performatives are *also* heir to certain other kinds of ill which infect *all* utterances. And these likewise, though again they might be brought into a more general account, we are deliberately at present excluding. I mean,

> for example, the following: a performative utterance will, for example, be *in a peculiar way* hollow or void if said by an actor on the stage, or if introduced in a poem, or spoken in soliloquy. This applies in a similar manner to any and every utterance – a sea-change in special circumstances. Language in such circumstances is in special ways – intelligibly – used not seriously, but in ways *parasitic* upon its normal use – ways which fall under the doctrine of the *etiolations* of language. All this we are *excluding* from consideration. Our performative utterances, felicitous or not, are to be understood as issued in ordinary circumstances. (Austin 1980: 21–2)

To the frequent consternation of literary scholars, literature is here not just claimed to be a *terra incognita* for speech-act theory (at least 'at present'), but also '*in a peculiar way* hollow or void', as well as of a *parasitic* nature. Not surprisingly, this claim has proved a puzzle, and has for example – as every reader of the heated debate between John Searle and Jacques Derrida will know – caused a great deal of ink to flow from both sides of the divide between analytic and Continental philosophy: in 1977, *Glyph* published a translation of Derrida's 'Signature Event Context' (later reprinted in *Limited Inc*), where the question of parasitism was raised in order to criticise Austin's lack of attention to language being defined by its ability to be repeated in all sorts of contexts, non-serious ones not excluded. This provoked a reply from Searle, who argued that Derrida had completely misunderstood Austin's attitude towards 'parasitic discourse':

> Derrida supposes that the term 'parasitic' involves some kind of moral judgement; that Austin is claiming that there is something bad or anomalous or not 'ethical' about such discourse. Again, nothing could be further from the truth. The sense in which, for example, fiction is parasitic on nonfiction is the sense in which the definition of the rational numbers in number theory might be said to be parasitic on the definition of the natural numbers, or the notion of one logical constant in a logical system might be said to be parasitic on another, because the former is defined in terms of the latter. Such parasitism is a relation of logical dependence; it does not imply any moral judgement and certainly not that the parasite is somehow immorally sponging off the host (Does one really have to point this out?). (Searle 1977: 205)

Searle's claim is far from convincing. Not only does it ignore the very widespread and strongly negative connotations attached to the term 'parasite', it also overlooks Austin's use of the word 'etiolations'. Pointing out that the latter means 'making pale, sickly, by exclusion of sunlight', Jonathan Culler, for example, argues that the quotations' fusion of the two terms 'activates the negative connotations of "parasitic": literature as sickly parasite on healthy normal linguistic

activity' (Culler 2007: 146). To say the least, if Austin's intention was to convey the idea that non-serious utterances were no better and no worse – just different – from those 'issued in ordinary circumstances', the choice of terms can hardly be said to be successful. As such, coming from somebody otherwise known for his eloquence, this awkward wording would in itself merit interest.

To give an example from the opposite camp, in her *The Scandal of the Speaking Body: Don Juan with J. L. Austin, or Seduction in Two Languages* (1980), Shoshana Felman takes Austin's analytic followers to task for not realising that the statement is (or at least could be) a joke:

> It is on the basis of such quotations that Austin is deemed to be caught red-handed defending 'seriousness,' what is 'considered normal,' as opposed to the 'parasitism,' the 'unseriousness' of poetry, play, or joking, which thus find themselves excluded. However, when Austin says, using his favorite first-person rhetoric, 'I must not be joking, for example,' is it certain that we must – that we can – *believe him*? Coming from a jester like Austin, might not that sentence itself be taken as a denegation – as a joke? (Felman 2003: 95)

Felman is certainly correct that one would have to be pretty humourless not to even consider that someone as thoroughly irreverent and funny as Austin – and moreover, someone so fond of supporting his claims with examples that by his own criteria would have to be counted as parasitic – might be joking. This is especially so if one takes into account that in his article 'A Plea for Excuses' (1956), Austin had argued that the abnormal is much more interesting than the normal, as well as capable of explaining the latter.[1] It might very well be asked why the same should not also hold for the relationship between 'abnormal' literary language and 'normal' serious language. As such, there is good reason to at least hold open the possibility that Austin's own intentions might be far from what later analytic philosophers have made them out to be.

Even though I agree more with Felman than with Searle in this regard, I here want to propose an altogether different solution: instead of trying to explain away the fact that Austin labelled literature 'parasitic' – either by saying, as Searle does, that he did not mean anything bad by it, or, as Felman does, that he was only joking – what if we were actually to take him at his word? What would happen if, rather than concentrating on his intentions, we set to work exploring where the concept of literature as parasitic can take us and what new insights might be gained in the process?

As I will argue, one of the things a model based upon the relationship between parasite and host might be capable of is to let us approach anew the world-creating ability of literary texts through the creation and installation of aesthetic affects in the readers. The fact that this creative potential inherent in Austin's claim has not yet been realised very likely has to do with the widespread understanding of parasites as worthless, degenerate creatures; a view which, in fact, is a remnant from the early phase of parasitology in the last half of the nineteenth century. Even though later scientists have realised that such a view is extremely simplified, bordering on the outright erroneous, they have not managed to shake off the very deeply ingrained negative associations the term still brings to mind. Rather than let these negative connotations continue to function as a barrier limiting thought, what we should do is directly confront them. In the following, I will therefore argue that Michel Serres' definition of the parasite opens the way for an understanding more nuanced and better adjusted to the realities of parasitical relations in nature than the common-sense, negative one. Elaborating on this through a closer look at Gilles Deleuze's writings on the 'becoming-minor' of literature – both in his own texts and in those written together with Félix Guattari – I will show how the Serresian approach to the parasite intersects in a number of interesting ways with the concept of 'minor literature'. Reading them together might therefore help shed new light on both, as well as help us better understand what actually happens when literature does function in such a way as to play a part in the creation of newness. Before this can be accomplished, though, there is one fundamental question that will have to be addressed: when we refer to parasites, what exactly is it we are talking about?

I. What is a Parasite?

The answer might at first seem rather straightforward. A fairly standard attempt at a definition can for example be found in Bernard E. Matthews' *An Introduction to Parasitology* (1998), where it is claimed that 'for our purposes I suggest we consider parasites as being animals that live for an appreciable proportion of their lives in (endoparasites) or on (ectoparasites) another organism, their host, are dependent on that host and benefit from the association at the host's expense' (Matthews 2005: 12). Even if Matthews strangely omits plants, his description might still be seen as a good working definition. Even so, there are certain problems it is not capable of properly dealing with. As we will see, this

is something it has in common with most (if not all) other attempts to clearly distinguish between parasites and non-parasites.

First, one could ask what Matthews means by the term 'animals'. Coming from the Latin term *animalis* – meaning 'with soul' – it usually refers to the members of the kingdom *Animalia*, to which *Homo sapiens* belongs. Does this mean, then, that humans can be parasites? While the definition certainly seems to point in this direction, most of those working in the natural sciences would probably agree that this is not the case, or at least not in the same sense as with other animals. A common view would be that while one can very well talk of people as parasites, this is only a figure of speech, not a description of reality, as in the case of lice or tapeworms. In other words, if man is a parasite, he would seem to be so only by metaphorical association, as attested to by the following part of the definition of a (social) parasite from the Oxford English Dictionary: 'a person whose behaviour resembles that of a plant or animal parasite' (OED Online).[2]

This view, though, overlooks how the content of the term 'parasite' has drastically changed throughout history. Readers of J. Hillis Miller's seminal article 'The Critic as Host' (1979), for example, will be well acquainted with the etymology of the word. Stemming from the Greek *parasitos*, consisting of *para* (besides) and *sitos* (the grain), the word originally referred to someone who was next to the food along with the host: 'A parasite was originally something positive, a fellow guest, someone sharing the food with you, there with you beside the grain. Later on, "parasite" came to mean a professional dinner guest, someone expert at cadging invitations without ever giving dinners in return' (Miller 2004: 179).[3] While not an entirely precise description – Miller neglects to mention that the parasite was originally a holy figure in Greek antiquity, and has little to say about its important role as a stock character in Greek and Latin comedy – the point is otherwise succinct: what was originally viewed positively over time became known as the opposite, namely a guest, often of the uninvited sort, out to acquire a free dinner.[4]

As a matter of fact, until the mid-seventeenth century (when it also came to designate plants living on other plants), the term 'parasite' was used solely for people, and it was only after the natural sciences of the early nineteenth century adopted the term that it became applied to sponging animals and insects.[5] In combination with various important scientific advances, this adoption eventually resulted in the creation and institutionalisation of the new scientific field of parasitology sometime during the last half of the century.[6] What this means is that the

foundation upon which the scientific study of non-human parasites rests was adapted from relations among humans: it is not the human parasite which was modelled on the animal one, but the other way around. This can also be seen in how the scientific language of parasitology is suffused with remnants of the human origins of its object of study; as Michel Serres puts it in his *The Parasite* (1980):

> The basic vocabulary of this science comes from such ancient and common customs and habits that the earliest monuments of our culture tell of them, and we still see them, at least in part: hospitality, conviviality, table manners, hostelry, general relations with strangers. Thus the vocabulary is imported to this pure science and bears several traces of anthropomorphism. (Serres 2007: 6)

The supposedly clear-cut distinction between human and non-human parasites is further complicated if one also takes into account what is known as 'the immunological problem of pregnancy', formulated by British zoologist Peter Medawar in his 'Some Immunological and Endocrinological Problems Raised by the Evolution of Viviparity in Vertebrates' (1953). Since all mammals share half of their genes with each parent, this means that the human embryo has to find its habitat in and draw its nourishment from a being whose immune system would normally consider it a threat to be disposed of – just as it would with any foreign body. Later scientists working along similar lines have pointed out that the relationship between embryo and mother can therefore be said to resemble that between parasite and host. Luis P. Villarreal, for example, argues that embryos actively suppress the mother's immune reactions much the same way as parasites do when they manage to outsmart their hosts:

> Mammals, being viviparous, pose an interesting immunological dilemma. They have highly adaptive immune systems that fail to recognize their own allogeneic embryos. In a sense, mammalian embryos resemble parasites that must suppress their mother's immune recognition systems to survive. (Villarreal 1997: 859)

The implications are clear: contrary to the common-sense view where social parasitism is seen as a metaphorical extension of a biological phenomenon, not only were humans the original carriers of the title parasite, but we also all start our lives in such a way that scientists will have a hard time explaining why exactly we (at least prior to birth) should not be considered as full members of the class of parasitic entities.

In addition, there are also other reasons for the difficulty of reaching an unambiguous definition. For even if one solely focuses on non-human

spongers, parasites are not a natural class or group, but must be defined by other criteria. One consequence is that in the case of closely related species – such as different species of wasps – some might be considered parasites, while others are not. The inverse is also true: creatures that in themselves have almost nothing in common – such as the barnacle *Sacculina carcini* and the cuckoo – are both defined as parasites. What is more, the commonalities that do exist between the two only come into view if you treat these creatures in relation to those species upon which they sponge – the common crab, in the case of the former, any bird in whose nest it can deposit its eggs, in the case of the latter. As Jonathan Z. Smith argues, parasitism therefore is relational, through and through:

> Rare for biology, here is a subdiscipline devoted not to a natural class of living things but, rather, to a relationship between two quite different species of plants or animals. It is the character of the difference and the mode of relationship that supplies both the key characteristics for classification and the central topics for disciplinary thought. (Smith 2004: 253)

The question of where and how to draw the line between membership and non-membership in the category is further complicated when one points out that parasites will often go through non-parasitic stages during their lifecycles, leading to the question: how much of one's time has to be spent sponging on a host organism to qualify as a proper parasite? And what about such creatures – certain leeches, for example – that are part-time predators (on smaller animals) and part-time parasites (on larger ones), how should they be defined? Obviously, answering such questions requires a certain degree of approximation, to say the least.

Then there is also the question of which branches of the tree of life are to be included in definitions: traditionally, only eukaryotes have been, but in fact – as there is no fundamental difference between the modes of existence of parasitic eukaryotes and those of bacteria and viruses – this was so only by convention.[7] Since viruses are not really alive at all, a more internally coherent definition would therefore cause the set of parasitic entities to be extended all the way across the divide between life and non-life. But even without counting bacteria and viruses, the number of parasites is still vast; in the words of Carl Zimmer: 'Scientists . . . have no idea how many species of parasites there are, but they do know one dazzling thing: parasites make up the majority of species on Earth. According to one estimate, parasites may outnumber free-living species four to one. In other words, the study of life is, for the most part, parasitology' (Zimmer 2001: xxi).

Combining all the aspects discussed so far, one begins to grasp the immense difficulty of properly defining clear criteria for distinguishing parasites from non-parasites. In practice, of course, this is seldom a problem for those working in the field – they recognise a parasite perfectly well when they see one. It is only when they are forced to attempt a definition that they run into problems. A perfect example of this can be found in *Parascript: Parasites and the Language of Evolution* (1993) by Daniel R. Brooks and Deborah A. McLennan: starting out by running through a wide range of historical attempts at finding characteristics that would unambiguously define parasites, as well as pointing out the inherent failures of each of these, in the end, the authors see no other way out of the problem than joking it away: 'We conclude, only somewhat tongue in cheek, that the only unambiguous definition is that parasites are those organisms studied by people who call themselves parasitologists' (Brooks and McLennan 1993: 5).

One definition they do *not* touch upon in their list is the one found under the heading 'The Best Definition' in Michel Serres' *The Parasite*. As part of a truly idiosyncratic approach to the topic in question, it reads as follows: 'The parasite is a thermal exciter' (Serres 2007: 190). Differently put, to Serres it is an element which causes the temperature to rise in a thermodynamic system. While probably of little use to most parasitologists, what I want to argue is that by focusing on what the parasite brings about, rather than on how it differs from non-parasites, Serres actually manages to avoid many of the problems more orthodox definitions are bound to run into. As such, his definition also allows us to come to terms with a problem that the parasitologists of today have inherited from their predecessors: that of the low status of their object of research.[8]

Briefly summarised, what happened when the term parasite was taken up by the natural sciences was that first the negative ethical implications of an unequal relationship among humans were transposed to nature, causing many nineteenth-century scientists to understand non-human parasites as somehow engaged in an unethical activity.[9] Then, in a circular movement, the term was applied as a metaphor for humans acting in a similar manner to these biological spongers. In the process, people claimed to be like parasites were judged as no better than biological entities perceived to be of the very lowest and most useless kind.

Besides the ease with which this new conception could be taken advantage of by those in power as a rhetorical tool for dehumanising their opponents,[10] there is an additional problem with such a view:

whereas people such as Drummond and the famous evolutionary biologist E. Ray Lankester were confident that parasites were the primary example of an evolutionary tendency whereby too easy an access to food and shelter would lead to a degenerative reduction of complexity,[11] later scientists have realised that such an understanding has very little to do with parasitical relationships as they are found in nature – relationships that are far more complex than this thoroughly prejudiced conception is capable of grasping. One could for example ask, as does Claude Combes, why it is that the simplification of a structure should necessarily be seen as a negative aspect from an evolutionary perspective:

> The losses of organs have led to the frequent discussion of evolutionary 'regression' in parasites. We should be wary of this term because it is not obvious why abandoning organs that have become useless in order to allocate the energy thus saved to other functions should not be perceived as progress, from the standpoint of adaptation. Although parasites give the impression of being morphologically simplified, they have only become progressively adapted to their lifestyle, and they are in fact more highly evolved than their free-living ancestors. (Combes 2005: 34)[12]

As Combes stresses, being a successful parasite involves a very high degree of specialisation, as well as the ability to constantly modify your behaviour in order to adapt to an ever-changing habitat bent on your destruction. Those that are not able to do so will finally be exterminated by their hosts, whose immune systems are in a constant battle with the intruders. As such, parasites do not only have to evolve if they want to stay ahead, they can also be seen as forcing their hosts to do the same. While some parasites do indeed cause a lot of damage, even – in the case of parasitoids – killing their hosts, a lack of parasites should therefore not be understood as a sign of health, but rather the opposite, pointing to a world out of balance.[13]

The problem is that this has not registered with wider audiences, who have still not been able to shake off the image of the parasite – both human and animal – that came into existence alongside the scientific field of parasitology in the last half of the nineteenth century. This is where Serres may be of help. In his analysis, he distinguishes between three different meanings of the word 'parasite'. In French it can refer to people (as social parasites), non-humans (biological parasites) and to noise, as in the expression *bruit parasite* (background noise). Building on the way systems theory understands noise, this third meaning allows Serres to stress the important role of foreign bodies in causing the systems

they are introduced into to evolve. He thereby opens the way for an understanding that allows us to see that parasites bring a very important contribution to the table of the host:

> The parasite is an exciter. Far from transforming a system, changing its nature, its form, its elements, its relations and its pathways the parasite makes it change states differentially. It inclines it. It makes the equilibrium of the energetic distribution fluctuate. It dopes it. It irritates it. It inflames it. Often this inclination has no effect. But it can produce gigantic ones by chain reactions or reproduction. (Serres 2007: 191)

Serres' definition thus allows us to see the parasite as a motor of evolution, causing newness to come into being, and life to endlessly proliferate through bringing about yet new (re)configurations. In itself, this is neither good nor bad – whether a given mutation is valuable or not can only be decided in retrospect and on a case-by-case basis. For this reason my argument should not be understood as entailing a heroicisation of parasites. What is important is that defining them a priori as 'bad' and 'degenerate' simply will not do, precisely because it blinds us to the properly *creative* element involved in their work.

II. The Becoming-Minor of Literature

If one takes such an understanding into account, Austin's claim – no matter what his intentions may or may not have been – suddenly begins to make more sense, giving us a new framework from which literature's active, world-shaping capabilities might be pursued. One of the best ways of exploring what insights such a model might generate is via Gilles Deleuze, whose perhaps foremost contribution to literary studies lies in the way he pursued the fundamental insight that literature should be understood not in terms of what it *is*, but of what it *does* and how it *functions* – how it is involved in the continual creation of the new or the not-yet. In his own words, in 'Literature and Life' – the first chapter of *Essays Critical and Clinical* (1993): 'Writing is a question of becoming, always incomplete, always in the midst of being formed, and goes beyond the matter of any liveable or lived experience. It is a process, that is, a passage of Life that traverses both the liveable and the lived' (Deleuze 1997: 1).

As he then goes on to explicate, echoing his earlier writings on the topic, the becoming in question is of a special sort: 'Writing is inseparable from becoming: in writing, one becomes-woman, becomes-animal or vegetable, becomes-molecule to the point of becoming-imperceptible'

(Deleuze 1997: 1). What the examples Deleuze refers to have in common is that they are all stages of one and the same process. As such, they can be seen as different versions of what he termed *becoming-minor*, representing a fundamental openness towards the open-ended. It is therefore not a question of moving towards a given *telos*. On the contrary, becoming is without any goal other than the continual affirmation of the creativity of life and its possibility of entering into new connections: what counts is the process itself. The minor can thus be seen as that which undermines the prerogatives of the given and fully formed. Through setting itself up as a norm, such a *major* or *majoritarian mode* will end up limiting or, at the extreme, stopping altogether the process of becoming. To put it in somewhat over-simplified terms: whereas the major equals stagnation, the minor equals continual movement. The following description of becoming-animal from Deleuze and Guattari's *Kafka: Toward a Minor Literature* (1975) can therefore be said to hold just as well for becoming-minor as such:

> To become animal is to participate in movement, to stake out a path of escape in all its positivity, to cross a threshold, to reach a continuum of intensities that are valuable only in themselves, to find a world of pure intensities where all forms come undone, as do all the significations, signifiers, and signifieds, to the benefit of an unformed matter of deterritorialized flux, of nonsignifying signs. (Deleuze and Guattari 2006: 13)

What *Kafka: Toward a Minor Literature* shows is that the creation of literature and art should be seen as part of the very same general process of the becoming of life. It is here that the concept of a 'minor literature' is introduced as new way of understanding Kafka's *oeuvre*. Refusing to treat the content of a given work as crucial, Deleuze and Guattari instead stress the question of *expression*, which for them is related to how the continual, non-personal becoming of life lets itself be known and felt, rather than to any individual expressing his or her feelings:[14]

> Only expression gives us the *method*. The problem of expression is staked out by Kafka not in an abstract and universal fashion but in relation to those literatures that are considered minor, for example the Jewish literature of Warsaw and Prague. A minor literature doesn't come from a minor language; it is rather that which a minority constructs within a major language. (Deleuze and Guattari 2006: 16)

Due to the fact that Kafka was a Jew living in Prague, yet writing in German, such references to 'minorities' as found in the quotation can easily be misunderstood, seeming to indicate that minor literature is in some way bound up with social groups that are not politically

dominant. That this is not the case becomes increasingly clear in Deleuze's subsequent writings; as Ronald Bogue puts it: 'already in *Dialogues* it is evident that for Deleuze minor literature is less a specific subdivision of literature than a name for literature when it functions as it should' (Bogue 2003: 162). Properly speaking, it is not a question of numerical minorities and majorities, but of managing to use any given language in a minor way: for Deleuze, this is the real criterion for deciding which writings deserve to be grouped under the title 'minor literature' (or simply 'literature') – and as he indicates, this is fairly rare.[15] It would perhaps even be possible to go as far as saying that, to him, a truly minor usage of language should be seen as a defining mark of literary greatness: as an actualisation of what is yet only virtual, becoming-minor is indeed the case for all masterpieces of literature.

So far, the exact relationship between a major language and a minor usage has not been clarified: in practice, how are we to distinguish between the two? One way of doing so is by looking at Deleuze's use of spatial imagery. For example, in 'Literature and Life' – referring to Proust's claim that 'Great books are written in a kind of foreign language' – he states that literature 'opens up a kind of foreign language within language, which is neither another language nor a rediscovered patois, but a becoming-other of language, a minorisation of this major language, a delirium that carries it off, a witch's line that escapes the dominant system' (Deleuze 1997: 5). To Deleuze, minor literature is therefore not external, but internal to a major language, yet at the same time 'foreign' to it – it is both identical and not identical to language, both an integral part of it and a foreign body.

Minor literature is internal to language because it is made up of it, since it is bound to find at least most of its tools in the latter: words, expressions, syntax, and so on. What separates the two – indicating the foreign character of minor literature – is that the minor approach will apply these raw materials in new and unexpected ways, purposefully breaking and bending the rules of normal speech for artistic effect. Especially in those cases where it is taken the furthest, a minor use of language will constantly be in danger of being perceived as utter nonsense, madness or as noise, and thereby defined as void of meaning, belonging in the same category as animal sounds, the glossalalia of the infant and the ramblings of the mad. On the other hand, if a minor style is not radical enough, it will easily end up being assimilated into the major which it tries to set in motion through its flight. In terms of the reading experience, for us to return to certain books, there must be something in them that draws us back, something which eludes our

attempts at understanding or arriving at a final definition. Yet, on the other hand, neither should the work be perceived as totally without meaning, so that we feel there is nothing to be gained by making the effort. Optimally, then, minor literature should straddle the divide between inclusion into and exclusion from major language in such a way that it be perceived as pure nonsense no more than as sense. As Deleuze puts it in regard to Louis Wolfson's schizophrenic writings: 'the problem is not go beyond the bounds of reason, it is to cross the bounds of unreason as a victor' (Deleuze 1997: 20). There is no one way of doing so, rather different authors must find their own, individual ways – in his analyses, Deleuze enumerates several: Kafka, who 'abandon[s] sense, render[s] it no more than implicit; he will retain only the skeleton of sense, or a paper cutout' (Deleuze and Guattari 2006: 20–1); or Lewis Carroll, who 'allowed nothing to pass through sense, but . . . played out everything in nonsense' (Deleuze 1997: 22), etc.

What is important is that, for Deleuze, when literature manages to be truly minor, it functions as an inner 'exciter' – as an irritant, causing language as a whole to be set in motion in new directions: 'Language seems to be seized by a delirium, which forces it out of its usual furrows' (Deleuze 1997: 5). This movement is directed against the borders of language, pointing to its outside: 'a foreign language cannot be hollowed out in one language without language as a whole in turn being toppled or pushed to a limit, to an outside or reverse side that consists of Visions and Auditions that no longer belong to any language. These visions . . . are not outside language, but the outside of language' (Deleuze 1997: 5). They are not outside language, because they are made up of it, but they are 'the outside' because their content does not confirm to the structures by which language shapes our understanding of reality. Minor literature thus performs a form of violence on language as a whole, forcing it to shift and expand its borders through a hollowing out from within.[16]

III. The Parasitism of Minor Literature

We are now in a position to begin to understand why Serres' notion of the parasite is intimately related to the Deleuzian one of 'minor literature', criss-crossing and intersecting with it in a number of interesting ways, and why taken together the two may help us understand Austin's claim in a new light. A hypothesis may even be ventured: the defining mark of the relation between a major language and minor literature is that it is parasitic, in Serres' sense of the word.

If we were now to explicate some of these similarities, first it should be pointed out that in both cases – both when it comes to the (endo)parasite in regards to its host, and minor literature in regards to major language – it is a question of an entity which is part of (something perceived as) a totality, yet without properly belonging to it. As we have seen, minor literature straddles the border between language and its outside, and similarly, parasites are both a part and not a part of the host's body, neither entirely self nor non-self. Endoparasites, in particular, can be said to represent a special challenge to any Cartesian conception of the subject as a stable and coherent entity: believing man is the sovereign lord of his own manor can become quite difficult if it turns out that one is carrying around, say, a tapeworm nourishing itself in and on your intestines, especially if this guest is capable of fending off the counter-attacks launched by your immune system or even of modifying your behaviour to its own ends. Just as with minor literature, if the parasite is to spread, it should be neither too easy to read for the host (in which case it will eventually be defeated) nor too difficult, so that it comes to completely eradicate its habitat: evolutionary speaking, it is not in the parasite's best interest to be too detrimental to its host population as a whole, as can be seen when changes which result in access to hosts becoming more difficult cause parasites to become less virulent.[17]

The most interesting similarity, though, is the way in which Serres' definition allows us to more clearly perceive the effects of minor literature: standing in a parasitic relation to major language, the minor forces it into a state of continual becoming. In itself, it does not change language, but it 'dopes' it, 'irritates' it or 'inflames' it so as to make it flow in other directions, just as the effect of the parasite on the host is one of irritating it into evolving still further on a road with no end. As such we can be said to be hosts to parasitic entities on several different levels – biological ones affecting our bodies, as well as textual ones affecting our minds. This can help explain why equilibrium is no more common in language than in nature; or as Ilya Prigogine and Isabelle Stengers – influences on, as well as influenced by both Deleuze and Serres – argue in their *Order Out of Chaos* (1979): 'In the world that we are familiar with, equilibrium is a rare and precarious state' (Prigogine and Stengers 1984: 128).[18] Both parasitic minor literature and the biological parasite should therefore be seen as agents ensuring that any equilibrium, be it in language or in nature, is bound to be of an unstable kind, likely to deteriorate, forcing its host or its host system to constantly readjust. Since this relationship does not follow a causal logic, exactly what sorts of creative becomings these agents will set in

motion cannot be told in advance.[19] This is of less importance than the fact that they *happen*, and can therefore be used as a model for thinking about how all sorts of language acts – and perhaps especially the type that Austin termed parasitic.

So far, we have been looking only at the relationship between literature and language as a whole, without saying anything about the role of individual readers and authors in the process by which language comes to be pushed beyond its boundaries. This question of how literature, along with the other arts, can be said to act concretely upon those perceiving it was addressed by Deleuze and Guattari most thoroughly in their last collaborative work, *What is Philosophy?* (1991). Here they clarify how the differences between philosophy, science and art can be thought of in terms of their respective relationships to chaos, understood as 'a void that is not a nothingness but a *virtual*, containing all possible particles and drawing out all possible forms, which spring up only to disappear immediately, without consistency or reference, without consequence. Chaos is an infinite speed of birth and disappearance' (Deleuze and Guattari 2009: 118).

In other words, chaos is the totality of all that is, yet in a state in which nothing is foregrounded, where everything is equally important or unimportant. It is existence in its unbearable fullness, and for us to be able to make sense out of this existence, chaos has to be reduced by imposing some sort of order to it. Through the creation of concepts, philosophy attempts to do so by '*giving the virtual a consistency specific to it*' (Deleuze and Guattari 2009: 118). With the help of functions capable of calculating regular states of affairs, science, on the other hand, tries to slow chaos down to a manageable speed. Finally, what art does is to capture a slice of chaos in a specific material, so as to make it concrete and tangible: 'Art struggles with chaos but it does so in order to render it sensory' (Deleuze and Guattari 2009: 205). It preserves a given combination of sensations or intensities, the artist endowing these with a life of their own, so to speak ripping them out of the progress of time (at least until the material in which they have been given life should be destroyed). To Deleuze, what art offers is therefore exactly such combinations, made up percepts and affects, which have acquired an existence of their own: 'What is preserved – the thing of the work of art – is *a block of sensations, that is to say, a compound of percepts and affects*' (Deleuze and Guattari 2009: 164).

Torn free from its creator, it is this autonomous block, then, which can be said to act upon those experiencing the work of art or literature. While no noticeable reaction will often occur, in certain cases the work

will have a strong physical impact, almost as if the reader had been violently torn out of quotidian life.[20] Our 'molar' identities are thus dislocated, opening up for the emergence of something else. Rather than saying that it is minor literature as such which is parasitic, perhaps it would therefore be better to say that it is the percepts and affects it produces which makes it function in a parasitic manner.

This allows us to see interesting similarities with, but also important differences from, Richard Dawkins' theory of the *meme*, first formulated in his *The Selfish Gene* (1976). The meme was here introduced as the cultural equivalent of a gene, that is, as a cultural product capable of replicating and spreading. Just as evolution can be viewed from the gene's point of view – namely, as a continual progress through which genes manage to replicate themselves for their own sakes and not for that of their host organisms – so can culture be viewed from the standpoint of our ideas and practices. Meme theory therefore inverts the ordinary way of viewing the relation between people and ideas: rather than seeing the latter simply as tools that we use for our own ends, Dawkins proposes treating them as entities which use us in order to spread as effectively as possible. Very effective memes might even cause people to behave in ways not beneficial for themselves, as in the case of a suicide bomber who is willing to give his own life for the propagation of the ideas he serves. Interestingly, Dawkins explicitly describes the process by which a meme manages to copy itself into a new brain in terms of the parasite: 'When you plant a fertile meme in my mind you literally parasitize my brain, turning it into a vehicle for the meme's propagation in just the way that a virus may parasitize the genetic mechanism of a host cell' (Dawkins 1989: 192).

Now, this is very similar to what happens when a work of minor literature manages to implant a specific block of sensations into the minds of those who perceive it, but here the differences between Deleuze and Dawkins start to come into view. Even though the latter – through his insistence on replication as an imperfect process where divergences and errors are eventually bound to appear – can account for the fact that memes will often end up changing over time, for him, the process through which they spread is still thought of in terms of *imitation*: 'Just as genes propagate themselves in the gene pool by leaping from body to body via sperms or eggs, so memes propagate themselves in the meme pool by leaping from brain to brain via a process which, in the broad sense, can be called imitation' (Dawkins 1989: 192).[21] Dawkins' theory can therefore be said to be bound to a mimetic view which might be capable of explaining how 'ordinary' ideas with a clear and reproducible

content spread, but equally incapable of approaching the functioning of art, where it is a question of shaping a concrete material through the artist's individual style in order to transmit sensations, rather than of transmitting a specific content.[22] Or to put it differently: what matters in art – or at least in art the way Deleuze understands the term – is not the similarity to an original, as in Dawkins' view of replication, but rather the creation of something radically new and dissimilar.

For this reason, describing the effects of art's blocks of sensation as parasitic might actually be more correct than in the case of Dawkins' replicating memes. This has to do with the fact that a successful parasite, as previously indicated, has to be able to constantly adapt to its living habitat in order not to be eradicated by the host's immune system – in other words, as Marlene Zuk has put it in regards to the sneaky strategies of parasitic pathogens, such as STDs, 'from the parasite's perspective, it is best not to have too obvious an effect on one's host.... So it should pay for the pathogen to become cryptic' (Zuk 2007: 114).[23] For a potential host, it would therefore be easier to avoid memes which fulfil Dawkins' third criteria for a 'high survival value' – what he terms 'copying-fidelity', the ability to replicate as accurately as possible – than to avoid the parasitic blocks of sensation created by minor literature, which might not correspond to anything the host has come across before.

This leads us to one of the most important questions for Deleuze in regards to literature and art: the question of health. For as he reminds us, addressing the relationship between literature and medicine: 'the writer as such is not a patient but rather a physician, the physician of himself and of the world. The world is the set of symptoms whose illness merges with man. Literature then appears as an enterprise of health' (Deleuze 1997: 3). To him, literature has this role exactly because it enables life to flow, removing blockages, letting it be fuller and richer than it would otherwise be. Similarly, the existence of parasites is crucial to the health of the ecosystem; in Carl Zimmer's words: 'A healthy ecosystem is riddled with parasites, and in some cases, an ecosystem may even depend on parasites for its health' (Zimmer 2001: 218). We need parasites, just as we need minor literature, for what they achieve, which actually amounts to the same thing – causing life to renew itself.

Now, there is nothing to indicate that any of this was on Austin's mind when he gave the lectures that were to become *How to Do Things with Words*, but this is of less importance than the fact that he unwittingly offered literary scholars a promising conceptual gift – one which, even though it is as yet unwrapped, enables a radically different approach to that very question he opens up, only to seemingly close off when

delimiting the boundaries of speech-act theory: that of the ways in which literature can be said to act in the world, bringing newness into being. Austin's error was therefore not to have labelled literature as parasitic. On the contrary, his error lies in having drawn the conclusion that this meant literature could safely be excluded from consideration, when he should have realised that precisely these parasitic traits constitute one very good reason why literature should be studied. Read with an awareness of the immense importance of parasites to the continual evolution of life, Austin's claim therefore allows us to conceptualise the truly parasitic aspects of that literature which deserves the name 'minor'. In fact, there is a precise correspondence between his 'doctrine of the etiolations of language' and Deleuze's description of minor literature's 'hollowing out from within' of language: is not such a carving out from within exactly the work performed by the parasite – be it biological or textual – when it causes its host to set off along ever new 'lines of flight'?

Notes

1. As he puts it: '[T]o examine excuses is to examine cases where there has been some abnormality or failure: and as so often, the abnormal will throw light on the normal, will help us to penetrate the blinding veil of ease and obviousness that hides the mechanisms of the natural successful act' (Austin 2007: 179–80).
2. When scientists address the question of the ontological status of man as a parasite (in a metaphorical sense), as opposed to 'real' parasites, the result is often a fundamental ambiguity. For example, in *The Art of Being a Parasite* (2001), Claude Combes claims that 'if we *extend* the concept of parasitism to all cases of a lasting exploitation of one organism by another, we would not hesitate to classify as intraspecific parasitism well-known cases among several birds... in which females deliberately lay several eggs in the nest of a neighboring pair. And one *would surely be licensed* to study "social parasitism" among humans, the subject of several generations of social scientists' (Combes 2005: 7, emphasis added). As the wording shows, Combes here manages to avoid properly answering the question by simultaneously saying that a) humans can be studied as parasites, and b) but that to do so, one both has to 'extend' the concept and somehow also receive 'license' for this (probably from those dealing with the 'authentic' parasites).
3. Miller's starting point in 'The Critic as Host' is M. H. Abrams' citation of Wayne Booth's claim that the 'deconstructionist' reading 'is plainly and simply parasitical' on the obvious reading of a text (Miller 2004: 177). While Miller does not mention Austin in the article, in a later work he connects the two: 'Austin's use of the term "parasitic," I note in passing, may conceivably be the source of Meyer Abrams's well-known assertion that a deconstructive reading is parasitic on the "normal," commonsensical reading, to which I tried long ago to respond' (Miller 2001: 36).
4. The specifics of the parasite's early historical stages are treated more thoroughly in my article 'Parasite', forthcoming in *Political Concepts: A Critical Review* (and in Hebrew in *Mafte'akh: Lexical Review of Political Thought*).

5. According to the *Oxford English Dictionary*, the use of the adjective 'parasitical' in regards to plants dates back to Sir Thomas Brown's *Pseudodoxia Epidemica* (1646) (see Brown 1658: 78). As a noun, 'parasite' was first applied to plants in Ephraim Chambers' *Cyclopædia* (see Chambers 1728: 351).
6. No definite agreement exists as to the exact genesis of the new field. In his *Parasites and Parasitic Infections in Early Medicine and Science* (1959), Reinhard Hoeppli dates it to around 1850; Arthur William Meyer's *The Rise of Embryology* (1939) suggests the period 1840–70; John Farley's 'Parasites and the Germ Theory of Disease' (1989) dates parasitology, as distinct from the earlier and much smaller field of helminthology, to the 1880s; whereas Michael Worboys' 'The Emergence and Early Development of Parasitology' (1983) operates with three periods: the field's prehistory (the mid-nineteenth century to 1900), its emergence (1900–18), and finally its proper establishment (in the interwar period).
7. For an analysis of the historical reasons for the institutional divide which came to separate the study of parasites and bacteria, see Farley's 'Parasites and the Germ Theory of Disease': 'Before the 1880s, intellectual differences had kept parasitology isolated from medicine, but by the turn of the century institutional differences came to play the most significant role. Parasitology in Britain and the United States became established as a discipline outside the mainstream of medicine. It became segregated from the modern medical field of bacteriology; it concentrated on naming and describing nonbacterial parasites and their life cycles and became increasingly irrelevant to work on bacterial diseases' (Farley 1989: 65).
8. See my 'Parasite' (Gullestad, forthcoming) for a more thorough discussion of this point.
9. One of the clearest examples of how the parasite comes to be conceived in ethical terms foreign to nature can be found in Henry Drummond's *Natural Law in the Spiritual World* (1883): 'Why does the naturalist think hardly of the parasite? Why does he speak of them as degraded, and despise them as the most ignoble creatures in Nature? . . . The naturalist's reply to this is brief. Parasitism, he will say, is one of the gravest crimes in Nature. It is a breach of the law of Evolution. Thou shalt evolve . . . – this is the first and greatest commandment of nature. But the parasite has no thought for . . . perfection in any shape or form' (Drummond 2008: 158).
10. In this modern conception of the parasite, man and animal come to be tied together so thoroughly that in certain cases it can be said to lead to the creation of a new creature – a *Homo parasitus*, so to speak – finding its most radical expression in the National Socialists' use of the image of the Jew as parasite as a means of legitimising the concentration camps (cf. Bein 1964). As I argue in 'Parasite', the convergence between social Darwinism and various theories of degeneration found in Drummond's work, as well as many of his contemporaries in the late nineteenth century, played an important role in clearing the ground for the National Socialists' redeployment of the term.
11. As Lankester puts it in 'Degeneration: A Chapter in Darwinism': 'Any new set of conditions occurring to an animal which render its food and safety very easily attained, seem to lead as a rule to Degeneration; just as an active healthy man sometimes degenerates when he becomes suddenly possessed of a fortune; or as Rome degenerated when possessed of the riches of the ancient world. The habit of parasitism clearly acts upon animal organisation in this way. Let the parasitic life once be secured, and away go legs, jaws, eyes, and ears; the active, highly gifted crab, insect, or annelid may become a mere sac, absorbing nourishment and laying eggs' (Lankester 1890: 27).

12. He then goes on to add something Lankester and Drummond seem to have overlooked, namely that 'regression and disappearance of organs are among the most normal processes of evolution' (Combes 2005: 34).
13. Cf. Zimmer's *Parasite Rex* (2000) and Marlene Zuk's *Riddled With Life* (2007) for a plethora of concrete examples of why life without parasites would neither be advantageous nor possible.
14. Cf. Brian Massumi's introduction to *A Shock to Thought*: 'There is no entity to expression. There is no super-subject behind its movement. Its emerging into words and things is always an *event* before it is a designation, manifestation, or signification propositionally and provisionally attached to a subject' (Massumi 2006: xxiii–xxiv).
15. On the scarcity of true literature, cf. the last sentence of 'Literature and Life': 'If we consider these criteria, we can see that, among all those who make books with a literary intent, even among the mad, there are very few who can call themselves writers' (Deleuze 1997: 6).
16. On the violence of thought (of which art is one form) in Deleuze, cf. *Proust and Signs*: 'The act of thinking does not proceed from a simple natural possibility; on the contrary, it is the only true creation. Creation is the genesis of the act of thinking within thought itself. This genesis implicates something that does violence to thought, which wrests it from its natural stupor and its merely abstract possibilities' (Deleuze 2008: 62).
17. Becoming less virulent in this case meaning that the parasites that cause less harm to their hosts will be more effective in reproducing, which over time will ensure that this trait comes to define the parasite population.
18. On the relationship between Serres and Prigogine, cf. Neubauer 2003; on that between Deleuze and Prigogine, cf. May 2005: esp. 92–5.
19. Importantly, for Serres the work performed by the parasite is 'irreversible': 'The flow goes one way, never the other. I call this semiconduction, this valve, this single arrow, this relation without a reversal of direction, "parasitic"' (Serres 2007: 5). This should be read in connection with Prigogine's attempt to shift the focus of thermodynamics from reversible to irreversible processes occurring far-from-equilibrium, where there is no logical necessity connecting the initial and the final state of the process (see Prigogine 1997).
20. Good examples of the latter are the sort of reactions to works of art – involving dizziness, fainting and hallucinations – commonly grouped together as the 'Stendhal syndrome', as a reference to Stendhal's description of a similar experience during his visit to Italy in 1817. The term was coined by the Italian psychiatrist Graziella Magherini after treating numerous such cases among visitors to museums in Florence. For a brief treatment of the syndrome in regards to Deleuze, see Shaviro 2009: 6.
21. For a work that pursues the question of how we should understand this 'broad sense' of imitation Dawkins is here referring to, see Susan Blackmore's *The Meme Machine* (1999). The fundamental premise of her book – for which Dawkins wrote the foreword, and which he strongly endorses – is that it 'is our ability to imitate' which sets humans apart from animals (Blackmore 1999: 3). In a fairly reductive manner, this trait is then used as a basis for understanding all forms of cultural transmissions.
22. This overvaluation of content at the expense of form in Dawkins is likely linked to what Elizabeth Grosz has claimed is a widespread neo-Darwinian overvaluation of natural selection at the expense of sexual selection. Criticising the famous Austrian scientist Konrad Lorenz for his understanding of such traits as bright colouring in fish as resulting from natural selection alone, Grosz points out how he – unlike Charles Darwin himself – thereby loses sight of the creative

excess of life: 'Like other neo-Darwinians, he [Lorenz] reduces sexual selection to natural selection, thereby simplifying and rendering evolution monodirectional, regulated only by the selection of randomly acquired characteristics and not by the unpredictable vagaries of taste and pleasure that sexual selection entails. For Darwin himself, however, these markings [bright colours, and so on], which he acknowledges may serve aggressive functions, are *not* the conditions of territoriality but the raw materials of sexual selection, excesses that are produced and explored for no reason other than their possibilities for intensification, their appeal' (Grosz 2008: 67).

23. This resonates well with Deleuze and Guattari's point in *A Thousand Plateaus* (1980), when, discussing how all becomings can be said to start with becoming-woman, they stress the importance of camouflage for the line of flight to avoid detection so as not to become reterritorialised: 'When the man of war disguises himself as a woman, flees disguised as a girl, hides as a girl, it is not a shameful, transitory incident in his life. To hide, to camouflage oneself, is a warrior function, and the line of flight attracts the enemy, traverses something and puts what it traverses into flight: the warrior arises in the infinity of a line of flight' (Deleuze and Guattari 1994: 277).

Sense, Category, Questions: Reading Deleuze with Ryle

Peter Kügler University of Innsbruck

Abstract

Gilles Deleuze's notion of sense, as developed in *Difference and Repetition* and *The Logic of Sense*, is meant to be a fourth dimension of the proposition besides denotation, manifestation and signification. While Deleuze explains signification in inferentialist terms, he ascribes to sense some very unusual properties, making it hard to understand what sense is. The aim of this paper is to improve this situation by confronting Deleuzian sense with a more or less contemporary, but otherwise rather distant philosophical conception: Gilbert Ryle's theory of categories and category mistakes. The leading idea is that to understand the sense of a proposition regarding X is to know the category of the concept X, which requires that one knows which questions may appropriately be asked with regard to X. Thus, sense, category and questions are intimately related to each other. Finally, it seems to be consistent with Deleuze's views to assume that abstract signification is contextually generated by concrete sense.

Keywords: Deleuze, sense, signification, Ryle, category, question

I. Denotation, Manifestation, Signification and Sense

What Frege called 'sense' (in German, *Sinn*) other philosophers preferred to call 'meaning'. What Frege called 'meaning' (*Bedeutung*) others preferred to call 'reference'. Thus, meaning became distinguished from reference and identified with sense. For Gilles Deleuze, however, meaning and sense are two different things and both must be kept apart

Deleuze Studies 5.3 (2011): 324–339

from reference and manifestation. Following the English translations of Deleuze's books *Différence et répétition* and *Logique du sens*, I will use 'denotation' (which renders the French *désignation*) instead of 'reference', and 'signification' instead of 'meaning'. In this terminology, then, we have to consider denotation, manifestation, signification and sense.

Denotation and manifestation, however, are of minor importance in the present context, so it will suffice to look at them rather briefly. Deleuze's account of these notions is in accordance with established theories in linguistics and the philosophy of language. Denotation, he writes, 'is the relation of the proposition to an external state of affairs (*datum*). The state of affairs is *individuated*; it includes particular bodies, mixtures of bodies, qualities, quantities, and relations. Denotation functions through the associations of the words themselves with *particular* images *which ought to* "represent" the state of affairs' (Deleuze 2004b: 16). This passage includes some controversial claims. Not all philosophers would describe denotation in terms of images and representations. Nor would they choose normative vocabulary like the word 'ought' (French *doivent*, from *devoir*). But nevertheless, what Deleuze says about denotation lies within the range of existing views, or at least is very close to some of these views.

The same goes for the second notion, manifestation: 'It concerns the relation of the proposition to the person who speaks and expresses himself. Manifestation therefore is presented as a statement of desires and beliefs which correspond to the proposition' (Deleuze 2004b: 17). A person who asserts that p thereby expresses the belief that p, as well as the intention (desire) to express this belief. This is not to say that the person actually does believe that p. She could also express a belief that she does not have. In that case the statement would be a lie. Yet even then we would assume that the person intends to express this belief, for this is what lying means: intentionally expressing a belief one does not have. Also, as Deleuze adds to the above, expression/manifestation is a matter of causal inference. If we have no reason to assume a lie, we may assume that the assertion that p has been caused by the person's belief that p.[1]

Let me now turn to the third notion, signification. In the late 1960s, when the above mentioned books by Deleuze were first published, inferential semantics was not as popular as it is today. It is therefore remarkable that Deleuze's account of signification is of an inferentialist kind:

> From the standpoint of signification, we always consider the elements of the proposition as 'signifying' conceptual implications capable of referring to other propositions, which serve as premises of the first. Signification

> is defined by this order of conceptual implication where the proposition under consideration intervenes only as an element of a 'demonstration,' in the most general sense of the word, that is, either as premise or conclusion. . . . Demonstration must not be understood in a restricted, syllogistic or mathematical sense, but also in the physical sense of probabilities or in the moral sense of promises and commitments. In this last case, the assertion of the conclusion is represented by the moment the promise is effectively kept. (Deleuze 2004b: 18)

According to inferential semantics, to grasp the signification of a proposition is to learn how to use it in the context of inferences, where 'inference' must be taken in a theoretical as well as in a practical sense. Michael Dummett describes this as follows:

> Learning to use a statement of a given form involves, then, learning two things: the conditions under which one is justified in making the statement; and what constitutes acceptance of it, i.e. the consequences of accepting it. Here 'consequences' must be taken to include both the inferential powers of the statement and anything that counts as acting on the truth of the statement. (Dummett 1981: 453)

On this view, the signification of a statement is composed of justification conditions and of consequences, the latter including commitments and entitlements to say or to do certain things.[2] It may help to give a (somewhat trivial) example to illustrate the basic idea. A person who sees that a window is open is *justified* to assert that the window is open. By making this assertion, she is also *committed* to agree that the room has at least one window. And under appropriate circumstances she may be *entitled* to close the window. If she has additionally promised to close the window, she will even be *committed* to doing so.

As *questions* will be coming into focus later, it is important to note that one part of the signification of a statement is the entitlement to ask certain questions. A person who says that the window is open is thereby entitled to ask, for example, who opened the window or for how long it has been open. One must add, however, that other factors may prevent the person from actually asking these questions. It may be impolite or forbidden to do so in a particular situation, or inappropriate in some other sense. After all, the entitlement conveyed by a statement is just one of the forces that act in a social situation and it may be overruled by others.

Since inferential semantics is usually presented as a rival theory to truth-conditional semantics, it may be misleading that Deleuze defines signification also as '*the condition of truth*, the aggregate of conditions

under which the proposition "would be" true' (Deleuze 2004b: 18). But the context makes clear that here Deleuze does not appeal to truth-conditional semantics, that is, to the view that the signification of a proposition is given by its truth conditions. Again we must think of inferential relations, which can be understood as concerning *possibly true propositions*. A deductively valid inference, in particular, is one whose conclusion *would be* true if the premises were true. Neither the premises nor the conclusion need to be true in reality. This is probably why Deleuze mentions truth conditions at all, and why he refers to signification 'as the possibility for the proposition to be true' (Deleuze 2004b: 22).

As to *sense*, in Deleuze's theory, we get a first understanding of this notion by considering some features that distinguish it from signification. Deleuze, following the terminology of traditional syllogistics, explains that sense is neutral as to the quality, quantity and modality of a proposition. 'Quality' refers to the distinction between affirmation and negation; hence a proposition has the same sense as its negation. Differences in quantity do not count either; hence a proposition about *all* things of a kind does not change its sense when 'all' is replaced by 'some'. And finally, 'p' has the same sense as 'possibly p' and 'necessarily p', as these are just differences in modality.

Deleuze even goes so far as to say that sense is affected neither by the order of subject and predicate nor by that of antecedent and consequent. Referring to the work of Lewis Carroll, he gives examples such as 'cats eat bats' and 'bats eat cats', as well as 'I breathe when I sleep' and 'I sleep when I breathe'. Another quite surprising claim is that inconsistent propositions like 'squares are round' have sense but no signification (Deleuze 2004b: 41).[3]

In the face of these statements, it does not seem helpful to express the sense of a proposition by means of another proposition. If you do not know what the sense of 'cats eat bats' is, you will not gain much if you are told that it is identical to the sense of 'bats eat cats', 'cats *do not* eat bats', or 'cats *possibly* eat bats'. Deleuze therefore tries some alternative approaches, indicating that the sense of a sentence could perhaps also be expressed in infinitive, participial or interrogative form (Deleuze 2004a: 194). For example, the sense of 'The sky is blue' might be rendered as 'the being-blue of the sky' or 'Is the sky blue?'

It is tempting to assume that these ways of expressing sense add up to an account of *propositional content*. 'The sky is blue' arguably has the same propositional content as 'the being-blue of the sky' and 'Is the sky blue?'[4] However, propositional content cannot be what Deleuze has

in mind. For the propositional content of an utterance is affected by the difference between affirmation and negation, by differences in quantity and modality, as well as by the exchange of subject and predicate or of antecedent and consequent. If sense were propositional content, the sense of p could not be identical to that of not-p. The same goes for the other examples mentioned above: possibly.../necessarily..., all.../some..., 'cats eat bats'/'bats eat cats', 'I breathe when I sleep'/'I sleep when I breathe'. Each of these pairs combines two different propositional contents.

So it seems that we cannot identify sense with propositional content. This result correlates with Deleuze's assertion that it would be a mistake to construe sense as a 'neutralized double of the proposition' (Deleuze 2004b: 38; see also 2004a: 195). Sense is not identical to propositional content, nor can we refer to it by using phrases that resemble propositions, phrases like 'the being-blue of the sky' or 'that the sky is blue'. These, too, are just 'doubles' of the proposition 'The sky is blue'. And this also holds for the corresponding question, 'Is the sky blue?' There is still too much resemblance between questions and propositions. But although the question is just another double of the proposition, Deleuze suggests that replacing the latter by the former is a first step towards a better analysis of sense, as questions are closely associated with *problems*:

> the interrogative formula has at least one advantage: at the same time as it invites us to consider the corresponding proposition as a response, it opens up a new path for us. A proposition conceived as a response is always a particular solution, a case considered for itself, abstractly and apart from the superior synthesis which relates it, along with other cases, to a problem as problem. Therefore interrogation, in turn, expresses the manner in which a problem is dismembered, cashed out and revealed, in experience and for consciousness, according to its diversely apprehended cases of solution. Even though it gives us an insufficient idea, it thereby inspires in us the presentiment of that which it dismembers.
>
> Sense is located in the problem itself. Sense is constituted in the complex theme, but the complex theme is that set of problems and questions in relation to which the propositions serve as elements of response and cases of solution. This definition, however, requires us to rid ourselves of an illusion which belongs to the dogmatic image of thought: problems and questions must no longer be traced from the corresponding propositions which serve, or can serve, as responses. (Deleuze 2004a: 195f.; see also 2004b: 139)

Sense is located in the problem, constituted in the complex theme. 'Problem' and 'theme' are just two of the terms Deleuze uses to refer

to sense.[5] Another one is 'idea', one of his examples being the idea of physical atomism (Deleuze 2004a: 232f.), which is the idea that matter consists of particles some of which are indivisible. Here we are using a propositional clause, 'that matter consists of particles'. But Deleuze denies that the idea is itself a proposition or something akin to it. Rather, the idea is a problem, and the problem is a set of questions. Strictly speaking, 'The problem is a set of questions' is a kind of slogan that we may use for the sake of convenience. It would be more precise to say that the problem is an entity in its own right whose various parts or aspects can be grasped by asking appropriate questions.[6]

The problem of physical atomism includes questions like the following: 'Does matter consist of atoms?', 'What types of atoms exist?', 'What shapes do atoms have?', 'What masses do they have?', 'Do they move?', 'In which ways do they move?', 'Why does a particular atom move?', and also, 'What is an atom?'[7] Any one of these questions could be answered by an appropriate proposition, and this proposition would be a partial solution of the problem, solving that part of the problem which is covered by the question. For example, the question 'Do atoms move?' is answered by the proposition 'Atoms move'. But in order to understand more of the problem, it is not enough to ask this single question. We must also have an understanding of other questions associated with the problem of atomism.[8]

II. Categories and Questions

In the preceding section, the notion of sense has been partly clarified by distinguishing it from the related notions of denotation, manifestation and signification. This clarification did not go far enough, of course. We have learned more about what sense is not than what it is. In order to supplement our negative concept with a positive one, we could take the usual way of Deleuze interpretation and appeal to those philosophers who Deleuze himself refers to in developing his position. But I will take a path that, to my knowledge, has not been pursued before. It will lead us to Gilbert Ryle, who is not mentioned by Deleuze, although his best-known book, *The Concept of Mind*, was published twenty years earlier than *Logique du sens*. If we had to sketch something like a map of philosophical temperaments and opinions, we would probably have to place these two philosophers on opposite poles, which makes this comparison even more interesting.

What I want to show in the following is that the notion of category as developed by Ryle is a close analogy to Deleuzian sense. My hypothesis is

this: to understand the sense of a proposition regarding X is to know the category of the concept X. The latter, in turn, requires that one knows which questions may appropriately be asked with regard to X. But first let us see what Ryle has to say about categories:

> To determine the logical geography of concepts is to reveal the logic of the propositions in which they are wielded, that is to say, to show with what other propositions they are consistent and inconsistent, what propositions follow from them and from what propositions they follow. The logical type or category to which a concept belongs is the set of ways in which it is logically legitimate to operate with it. (Ryle 1949: 8)[9]

Here, Ryle is concerned with inferences that involve propositions containing the respective concept. These inferences, he argues, determine the category of the concept. This seems to lead us back to the concept of signification, defined in inferentialist terms by Deleuze. Inferentialists usually maintain that the meaning of a word is given by its contribution to the meanings of the propositions in which it occurs. Referring to Wilfrid Sellars, inferentialist Robert Brandom writes: 'To grasp or understand a concept is, according to Sellars, to have practical mastery over the *inferences* it is involved in – to know, in the practical sense of being able to distinguish, what follows from the applicability of a concept, and what it follows from' (Brandom 1994: 89). Against this inferentialist background, we might be tempted to read Ryle in the following way: 'Category' is for concepts what 'signification' is for propositions. The first denotes the meaning of a concept, the second that of a proposition. Both are to be analysed in inferentialist terms, for the logical relations between propositions determine the meanings of concepts as well as those of the propositions.

However, although this picture of the relation between signification and category is theoretically appealing, it fails to address an important point. The difficulty is that 'signification', construed inferentially, is an abstract concept that covers a large number and variety of inferential relations, including justification conditions as well as consequences (that is, commitments and entitlements) of various kinds. Most of these will be irrelevant in typical conversational situations. Furthermore, it is certainly not possible for a single speaker to know all these inferences or to draw all of them in practice. Thus, it is neither necessary nor possible to know the 'complete' signification of a proposition. This concept is a construction of linguistic theory, an abstract entity, which is too 'big', as it were, for ordinary speakers. What they need to know is which inferences are actually relevant in a particular context.

Consider again the example of the window from section one. The proposition 'The window is open', in conjunction with the premise that most windows are rectangular, implies that the open window is probably rectangular, having a diagonal of a length that is the square root of $a^2 + b^2$, where a and b are the sides of the rectangle. This is a remote geometrical consequence that has no relevance at all in typical cases in which the proposition 'The window is open' is used. It might be important in a classroom, say, as part of a mathematics exercise. But usually we would not assume that a person must know how to calculate the length of the diagonal in order to know the meaning of 'The window is open'. The same goes for the *word* 'window'. In order to know its meaning, one need not be aware of the question as to how the length of the diagonal is to be computed from the lengths of the sides.

The inferences Ryle utilises in his book to explain the notion of category form only a subset of all the inferences that make up the complete signification of a proposition. How is this subset determined? What makes some inferences relevant and others not? In the following, I will argue that this subset of inferences is delineated by *questions*. Thus, as far as categories are concerned, the asking and answering of questions is the type of operation that counts. In fact, Ryle frequently exhibits the category of concepts by discussing questions.

Before we go on with Ryle, however, let us see whether Deleuze's philosophy of sense provides any indication of a theory of categories. The place to look for it is in Deleuze's discussion of paradoxes which draws on the work of Lewis Carroll. As in other areas of philosophy and science, the investigation of pathological cases helps to illuminate the 'normal' ones. Nonsense, the absence of sense, can teach us something about sense. In the preface of *The Logic of Sense*, Deleuze even purports to present 'a series of paradoxes which form the theory of sense' (Deleuze 2004b: ix).

At least some of Carroll's violations of sense discussed by Deleuze can be interpreted as category mistakes as envisaged by Ryle. The following is an instructive example from *Alice in Wonderland* (quoted by Deleuze 2004b: 31):

> '... and even Stigand, the patriotic Archbishop of Canterbury, found it advisable–'
>
> 'Found *what*?' said the Duck.
>
> 'Found *it*,' the Mouse replied rather crossly: 'of course you know what "it" means.'

> 'I know what "it" means well enough, when *I* find a thing,' said the Duck: 'it's generally a frog or a worm. The question is, what did the Archbishop find?'
>
> The Mouse did not notice this question, but hurriedly went on, '– found it advisable to go with Edgar Atheling to meet William and offer him the crown. . . .' (Carroll 1994: 32)

The wit of this little dialogue rests on the confusion of *finding a thing* and *finding something advisable*. As these belong to different categories, it is not appropriate to ask 'What did the archbishop find?' instead of asking 'What did he find advisable?' A comparable example is given by Ryle: ' "She came home in a flood of tears and a sedan-chair" is a well-known joke based on the absurdity of conjoining terms of different types' (Ryle 1949: 22). Classical rhetoric registers this figure of speech as *zeugma* or *syllepis*. On Ryle's account, the rhetorical effect is caused by a category mistake.

Another paradoxical case from *Alice in Wonderland* mentioned by Deleuze (2004b: 38; 2004a: 195) is the well-known grin of the Cheshire Cat:

> 'All right,' said the Cat; and this time it vanished quite slowly, beginning with the end of the tail, and ending with the grin, which remained some time after the rest of it had gone.
>
> 'Well! I've often seen a cat without a grin,' thought Alice; 'but a grin without a cat! It's the most curious thing I ever saw in all my life!' (Carroll 1994: 78)

Ontologically speaking, a grin is not a substance that can exist by itself. It is rather an accident, a property of the substance (the latter being the cat or its mouth). So if this is what is meant by 'a grin without a cat', we are facing another category mistake.

Suppose a person places a word in a category to which it does not belong. If that person does not intend to create a rhetorical, perhaps humorous effect, we would probably conclude that he or she does not understand the word – as the confused duck does not understand the phrase 'to find it advisable'. Assuming that to understand a word is to know its sense, we may conclude further that to know the sense of a word requires that one know its category.[10]

When Ryle discusses examples of categories and category mistakes, he also explains how one can recognise that two words belong to different categories. In particular, words of different categories cannot be connected by the word 'and', as in the above joke of the lady in the sedan-chair, or as in 'he bought a left-hand glove, a right-hand glove and

a pair of gloves'. Put in positive form, Ryle's criterion is the following: 'When two terms belong to the same category, it is proper to construct conjunctive propositions embodying them' (Ryle 1949: 22).

However, Ryle's primary method of determining categorical sameness or difference is the asking of questions. He often notes that certain questions are not appropriate with regard to concepts of a particular category. It does not make sense to ask 'Where is the pair of gloves?' when you see the two gloves. This question is improper because it implies that the pair is something apart from its components. It conflates the whole with its parts: the word 'pair' which denotes the whole belongs to a different category than the word 'glove' which denotes the parts.[11]

III. The Contextual Generation of Signification

The lesson to draw from Ryle's treatment of categories is that knowing the category of X amounts to knowing which questions it is appropriate to ask about X. At this point, the connection to Deleuze's notion of sense becomes visible. As already explained, Deleuze correlates sense and problem, and the problem can be characterised as a set of questions. Furthermore, although sense is said to be a 'dimension of the proposition' (Deleuze 2004b: 22), it is also addressed as *idea*, *problem* and *theme*. And the problem '*is not* propositional, although it does not exist outside of the propositions which express it.... The problem is neutral with respect to every mode of the proposition' (Deleuze 2004b: 140).

This applies to Ryle's categories as well. Categories are sub-propositional entities. We are talking of the category of a concept – 'window', 'glove', 'atom' and so on – not of that of a proposition. A concept can appear in propositions of various kinds. This is the reason why propositions that differ in quality, quantity or modality can be assigned to, or subsumed under, the same category. While the category itself is not propositional, 'it does not exist outside of the propositions which express it'.

Hence the discussion of sense shifts from propositions to words. We may still say that sense is 'a dimension of the proposition', but only because propositions include concepts like 'window', 'glove' and 'atom', and because we can ask to which categories these concepts belong. The notion of 'sense' primarily applies to constituents of propositions. This is obscured by Deleuze when he describes sense as a dimension of propositions, along with denotation, manifestation and signification. At the end of the day, however, the fact that the two propositions 'The window is open' and 'The window is not open' have the same sense

traces back to the fact that both contain the word 'window', and that both are therefore associated with questions like 'What is a window?', 'Is there a window?', 'Is it open?', 'Why is it open?', and so on.

However, with which questions a proposition is associated depends on the context in which it is used. It is easy to imagine circumstances in which the negative proposition 'The window is not open' triggers the question 'Is the window open?' which, if answered positively, causes the next question, 'Why is it open?' This could happen when the questioner does not trust the person who said that the window is not open. In other cases where there is no reason to doubt the speaker's claim, these questions would not arise. There would be other questions or none at all.

The context in which a proposition is being used is defined, at least to a considerable degree, by the questions that are taken to be relevant by the persons involved. In a way, we do not know what that context is unless we know which questions are being asked. This also suggests a new view of the relationship between sense and signification. We have seen that 'signification' is an abstract concept comprising a potentially infinite set of inferential relations. This concept is derived from concrete cases of language-use by steps of extrapolation and generalisation. Signification is supposed to consist of those inferences that are relevant in actual cases or could be relevant in potential ones. In a particular conversational situation, speakers operate only with small subsets of all the relations that make up signification, and these subsets are determined by sense, by a set of relevant questions.

In sum, then, signification is generated by pragmatic, contextual conditions that are set by sense. Deleuze ascribes to sense a 'generative' role, which is to 'engender the logical proposition with its determinate dimensions (denotation, manifestation, and signification)' (Deleuze 2004b: 138). And in a text written in 1986, he characterises his 'empiricism' in the following way:

> the abstract does not explain, but must itself be explained; and the aim is not to rediscover the eternal or the universal, but to find the conditions under which something new is produced (*creativeness*). In so-called rationalist philosophies, the abstract is given the task of explaining, and it is the abstract that is realized in the concrete.... Empiricism starts with a completely different evaluation: analysing the states of things, in such a way that non-preexistent concepts can be extracted from them. (Deleuze and Parnet 2006: vi)

Of course, as always, the quotation is taken out of its context. Deleuze's notion of empiricism is of a special kind, but this is not our issue.

What makes the quotation interesting for us is that it gives an idea of the relation between sense and signification. First comes the analysis of sense in contexts of language-use. This analysis yields a set of questions, which enables the identification of the problem around which the situation is organised. The notion of signification, in turn, is derived from these cases. In Deleuze's terms, it is a 'non-preexistent concept' that is 'extracted' from sense. Signification is 'the abstract' in comparison to which sense is 'the concrete'. When this abstraction is retrospectively applied to the concrete, then sense, as expressed by questions, is conceived as part of signification, more exactly, as that part which exists in the respective context.

The function of questions in this process is to make certain inferential relations relevant. Roughly speaking, the relevant inferences are those which connect the answers of the questions to a particular proposition. To explain this, let us return to Ryle's example of the two gloves. Suppose that these gloves are lying on opposite ends of the couch in front of you. There is also another person present to whom you say, 'There are two gloves on the couch'. The question whether the gloves belong together need not arise in this context. If it does not arise, the relevant part of the signification primarily concerns perceptual justification conditions. Your perceiving the gloves justifies your statement 'There are two gloves on the couch'. By uttering this proposition when perceiving the gloves, you prove your mastery of this part of the signification. It is a rather basic part, to be sure. But as I have described the situation so far, there is no reason to look beyond it.

Next, suppose the question arises as to whether the two gloves belong together, whether they form a pair. It does not matter who raises this question, but *if* it is raised, the question broadens our scope of the signification of 'There are two gloves on the couch'. Now it becomes relevant whether you know which answers to the question might be appropriate. This task is still quite simple, of course. You are confronted with a yes/no-question: 'Do the two gloves on the couch belong together?' So you only need to know that the answer is 'Yes, they do' or 'No, they do not'. Yet, however simple this task may be, by giving one of these answers you would prove that you know, in a concrete, practical sense, another part of the signification of the proposition 'There are two gloves on the couch'.

Additional questions might arise. Someone might want to know *why* the gloves are lying on the couch or to *whom* they belong. Thus, other parts of the signification would be generated, and the actors in the situation would become aware of possible ways of answering these

questions. If they lacked the requisite information, their answers would only be rather general. For example, they might say that the gloves are lying on the couch because someone who has been in this room before has put them there; that the gloves on the couch belong to some person, probably an adult (as they are too big for a child), and so on. Those who know more about the gloves could give more specific answers.

This interplay of assertions, questions and answers concerns inferential relations and therefore signification. The questions alluded to in the glove example are inferentially related, in a certain way, to 'There are two gloves on the couch', which is the proposition that started the conversation by raising the 'problem of the two gloves'. It should be noted, however, that questions are not directly related to propositions, but only by their *propositional contents*. For instance, the content of the yes/no-question 'Do the two gloves on the couch belong together?' can be expressed by the proposition 'The two gloves on the couch belong together'.[12] In the case of questions with interrogative words, we obtain the propositional content by replacing 'why', 'who', 'where', and so on, by a suitable variable. To choose just two examples, this replacement yields 'The gloves are lying on the couch because p' as content of 'Why are the gloves lying on the couch', as well as 'The two gloves on the couch belong to X' as content of 'To whom do the two gloves on the couch belong?'

Inferentialism has it that the signification of the proposition 'There are two gloves on the couch' is given by the inferential relations this proposition is involved in. Among these relations are those which exist between the proposition itself and the propositional contents of the above questions. The proposition is inferentially related to 'The two gloves on the couch belong together', 'The gloves are lying on the couch because p' and 'The gloves on the couch belong to X'. This proves that the propositional contents of the questions, and therefore indirectly the questions themselves, bear inferential relations to the proposition we are dealing with. And these relations make up a subset of the complete signification of the proposition.

Following Ryle, I have chosen somewhat dry examples concerning windows and gloves. These do have the advantage of familiarity, but nevertheless we shall end with one of the more appealing cases. Lewis Carroll's story of the Cheshire Cat involves a category mistake that has been made on purpose. Its paradoxical nature owes to the fact that we are prompted to imagine a grin without a something that is grinning (which John Tenniel could not picture in his famous illustrations, so he decided to draw the cat's head fading). The question arises as to *who*

it is that is grinning, and this question makes certain answers relevant. The reader of *Alice in Wonderland* knows that from 'There is a grin' it follows that there is *someone* who is grinning. The context of the story even suggests the more specific answer that it is the Cheshire Cat who is (still) grinning. Yet since the cat is said to have vanished, the story turns into a piece of nonsense.

We know why. The story defies a part of signification: the inference from 'There is a grin' to 'The Cheshire Cat is grinning', the latter being our best answer to 'Who is grinning?' This is one of the questions that constitute the problem of the Cheshire Cat's grin and the sense of the inferentially related propositions.

Notes

1. The nature of this causation arguably depends on the ontological nature of mental states, but we need not go into this here. This article is mainly concerned with an interpretation of Deleuze's philosophy of language; ontological issues will be touched upon only tangentially.
2. In the above quotation from *The Logic of Sense*, Deleuze just talks of theoretical inferences (syllogistic and mathematical demonstration, physical probabilities) and practical commitments, such as the commitment to keep a promise. He does not mention entitlements, but these can safely be added to his account.
3. Deleuze does not substantiate the claim that inconsistent propositions lack signification. Perhaps he relies on the fact that these propositions cannot enter into inferences as possibly true statements. Classical logic, however, does ascribe an inferential role to them, if only a rather trivial one: *ex contradictione sequitur quodlibet*.
4. I am using 'propositional content' roughly as in Chapter 2.4 of Searle 1969. Although an utterance of 'the being-blue of the sky' is at best an incomplete speech act, it works as an 'indicator' of propositional content, as Searle would say. Searle, however, prefers that-clauses for indicating propositional content ('that the sky is blue'). Note also that for him a 'proposition' is the propositional content of a speech act, whereas Deleuze's usage of that term is wider.
5. The term 'event' belongs to this list, too, as sense is said to be 'an incorporeal, complex, and irreducible entity, at the surface of things, a pure event which inheres or subsists in the proposition' (Deleuze 2004b: 22). Another 'surface entity' is the concept, which 'speaks the event' (Deleuze and Guattari 1994: 21). 'All concepts are connected to problems without which they would have no meaning [*sens*]' (16). Except that concepts are supposed to be solutions of problems, they have much in common with the latter. In particular, they are 'not propositional' (22). To keep the discussion simpler, however, I refrain from considering these notions of event and concept. I will reserve the word 'concept' for Ryle who uses it for a linguistic entity.
6. As indicated in the previous note, sense inheres or subsists, but does not exist. Furthermore, it is a dual entity on the border between world and language: 'It is rather the coexistence of two sides without thickness, such that we pass from one to the other by following their length. *Sense is both the expressible or the expressed of the proposition, and the attribute of the state of affairs*. It turns

one side toward things and one side toward propositions' (Deleuze 2004b: 25). Thus, sense is something very peculiar, to say the least.

7. A superficial reading might suggest that Deleuze rejects questions of the type 'What is X?' *per se*. But in fact he only rejects the Platonic-Socratic tradition in which these questions are understood as aiming at essences. Apart from that, Deleuze acknowledges their propaedeutic function in the Platonic discourse: 'Once it is a question of determining the problem or the Idea as such, once it is a question of setting the dialectic in motion, the question "What is X?" gives way to other questions, otherwise powerful and efficacious, otherwise imperative: "How much, how and in what cases?" The question "What is X?" animates only the so-called aporetic dialogues – in other words, those in which the very form of the question gives rise to contradiction and leads to nihilism, no doubt because they have only propaedeutic aims – the aim of opening up the region of the problem in general, leaving to other procedures the task of determining it as a problem or as an Idea' (Deleuze 2004a: 236f.).
8. It would lead us too far astray to discuss in detail how these questions are related to each other. A possible point of departure could be what Sylvain Bromberger calls a 'cluster of questions' (Bromberger 1966: 602). According to Bromberger, a cluster of questions is raised by some proposition, and a question belongs to this cluster if it stands to the proposition in a relation of mutual implication. That is, if the proposition is true, the question must have a correct answer, and conversely.
9. In his article 'Categories', published about a decade before *The Concept of Mind*, Ryle prefers to talk of 'concepts' without the adjective 'logical' (Ryle 1937/8). I follow him in this. Others may choose to replace 'logical' by 'ontological', as differences between logical categories are arguably related to ontological differences. This logical/ontological ambiguity of 'category' seems to correspond to the two-sidedness of sense mentioned in note 7 above. Compare Deleuze's distinction between the logical and the ontological proposition in *The Logic of Sense* (Deleuze 2004b: 138).
10. Here, 'to know' does not necessarily refer to knowing-that, that is, knowledge expressible in propositional form. There are cases in which it is possible to say *that* a word means such-and-such, thus giving the meaning of the word by using other words. But the knowledge in question is primarily a linguistic kind of *knowing-how*. A person who knows the sense of a word knows how to use it in the course of utterances, in accordance with its category.
11. The glove example suffices for our purposes, but in *The Concept of Mind* cases not based on a part-whole relation are more salient. In particular, there is the distinction between occurrences and dispositions which, in Ryle's opinion, provides a solution (or rather, dissolution) of the mind-body problem. There are questions about occurrences that cannot be asked about dispositions.
12. Thus, we could analyse the question as consisting of two parts, the first one expressing its content: 'The two gloves on the couch belong together. Yes or no?'

One of Deleuze's Bergsonisms

Rossen Ventzislavov City College of New York

Abstract

In this article I attempt to reveal some continuities between the anti-psychoanalytic stance adopted by Gilles Deleuze in his later work and Henri Bergson's early philosophy. On account of these continuities I hope to provide a glimpse into what I believe is a century-old tangent of philosophical resistance to the methods and theories of Freudian psychoanalysis. In order to achieve this, I start with a brief meditation on the challenges and benefits of cross-generational inheritance and collaboration in philosophy. The purpose of this is twofold – to explore some general conditions for such collaboration and to tease out some of the implications of these conditions for the substantive argument my specific reading of Bergson via Deleuze occasions. I then expound on Bergson's theory of duration and some of the uses to which Deleuze puts it in the latter part of his career. In this I outline several fecund similarities between Bergson's critique of associationism and Deleuze's attack on Freud. Finally, I attempt a partial evaluation of Freudian psychoanalysis from the joint, albeit naturally disjointed, perspective of my primary sources.

Keywords: Bergson, Deleuze, Freud, anti-psychoanalysis

I. Creating and Inheriting Insight

It is not clear whether philosophy unveils knowledge which is already there or whether it creates new knowledge. One clue to an answer may lie in the historical fact that philosophers talk and write about other philosophers. This fact can be considered of some evidential value to

Deleuze Studies 5.3 (2011): 340–357
DOI: 10.3366/dls.2011.0025
© Edinburgh University Press
www.eupjournals.com/dls

the supposition that philosophising is more about elaborating on prior knowledge than about inventing. But, then, how obscure and in need of commentary can a thinker's writing be? Why do we so often need one person to reveal and expound on the tenets of another person's thinking? If we prefer to be charitable to the predecessor figure in general, we could say that his/her commentator simply provides an 'update'. If, to the contrary, we decide to give more justice to the commentator, we will have to admit that commenting is rich with revelation; that is, if successful, it will amount to an 'upgrade'.[1]

I hope that it will not be too much of a rhetorical stretch to say that the category of the *new* in art is to a large extent analogous to the *new* in philosophy. The *new*, in both cases, generally presents itself as a riddle, a riddle that stops being considered new when it is solved. The solution, it is important to note, does not simply make the new riddle old, but tries to make sure the riddle is altogether no more. In art, this posing and solving of riddles accounts for changes in artistic styles, as in the case of Picasso's distinct periods. But what if a philosopher attempts to solve his or her own riddles? Many have tried. Descartes, for whom the idea of a new philosophy was programmatic, is one good example of a thinker who wrote with a view to all potential objections that could arise from the direction of his critics. He thus wrote mostly backwards, not in the sense of consulting prior philosophy, but in the sense of always trying to pre-empt any future critique of his own. The example of Descartes shows that there are thinkers whose heritage can remain mostly theirs. One is always tempted to say that philosophers who write *in stone*, like Descartes, are the truly great ones. This would mean that they did the philosophers' job better than most of their colleagues. But, then again, is the philosopher's profession that of a restorer or that of an inventor of knowledge? And is it not strange that we would readily admit that Descartes was clearly a creator of new (first) philosophy, but at the same time we recognise the antiquarian effort his oeuvre demands of Cartesian scholars?

The example of Descartes gives us a better clue to answering my initial question. There must be philosophers of both kinds – those who create knowledge and those who dissect the knowledge passed on from their predecessors. There is, of course, also the salient distinction between those whose heritage opens up to unpredictable discourses and those whose philosophy comes with strict directives for future use. Not surprisingly, any number of the four nodes of the above distinctions could then be expected to converge in the character of any specific philosopher. And, to make the life of the consumer of insight even

more difficult, many philosophers have been prone to switch between extreme nodes or recombine them throughout the course of their writing careers.

II. One of Several Bergsonisms

The two philosophers I am here interested in are Henri Bergson and Gilles Deleuze. They both belong to a category of 'difficult thinkers' because they readily display all of the above mentioned extremes in all combinations possible at different periods in their careers. The challenge in comparing two such philosophers is that, in the common ground they cover, they would appear too similar or too unlike on different occasions. With both of them at different times knowledge is in-the-making, but also ready-made; it is available to the reader, but also remains locked. On the positive side, we are right to expect that such comparison will yield productive ways of checking Bergson through Deleuze, or vice versa. Still, in reading them there remains the salient danger that the creativities of both our subjects taken together can at any point collide into some sort of philosophical anarchy.

The special focus of my comparison will be on the sources of Deleuze's anti-psychoanalytical discourse as found in Bergson's *Time and Free Will: An Essay on the Immediate Data of Consciousness*. As difficult as it is to admit of a strict continuity between the two philosophers' theories, there are many moments in both that resemble strangely collaborative, if not derivative, efforts. In a parallel reading of Bergson and Deleuze their similar liberal attitudes to knowledge-making and knowledge-revealing may give rise to an impression of contemporaneity. I thus prefer to see Bergson not as Deleuze's predecessor, but rather as Deleuze's co-conspirator. Concerning the ways in which Bergson can be tentatively said to have influenced Deleuze there are two major thematic strands – Bergson's theory of *time* (which refers to duration, intensity, space and consciousness), and his theory of *multiplicity* (which deals with virtuality, repetition and the body). Another distinction which could be made is that between Deleuze's efforts to claim Bergson's heritage on the one hand and his incorporation of this heritage into the process of creating fresh insights on the other. I see the values in these distinctions not in opposition to one another, but as concurrent branches.

In terms of positioning Deleuze as Bergson's heir, the first branch to follow would be the philosophical, analytic one of the earlier years, before and at the time of *Difference and Repetition* (1968). In this

work and those preceding it, Deleuze can be said to employ Bergson by means of quotation, trying to develop his ideas, or just using them as a backdrop. Philosophical also because at this stage Deleuze seems eagerly engaged with prior philosophy in general, with Kant, Hegel, Nietzsche, Heidegger and many others. In the preface to *Bergsonism*, he boasts an intimacy with the philosophers he has written about, the result of which is, in Deleuze's words 'a child, which would be his [the philosopher discussed] and which would at the same time be a monster' (Deleuze 1988: 8). One of many proofs for the relevance of the metaphor lies in the chain formed by Deleuze's treatment of Bergson's treatment of Kant's doctrine of the faculties.[2] This could be looked upon as Deleuze's formative period, when he gradually weaned himself away from earlier philosophy and developed his own philosophical voice.

The second branch, the one that interests me here, is the interdisciplinary, inventive one, particularly as present in works like *Anti-Oedipus*, *A Thousand Plateaus* and *What is Philosophy?* – that is, in Deleuze's collaborations with Guattari. These works are far less analytic, far less 'philosophically correct'. Here Deleuze unleashes a new 'Deleuzian' vernacular, with concepts uniquely his own. These are arguably also the books whose influence has spread outside of philosophical discourse (detectable in many contemporary architects' writings, in the catalogue of the Mille Plateaux record label, and so on). What makes them Bergsonian is the attention they apportion to the method of intuition. It is also here that Bergson's notions of multiplicity, virtuality and the body are mobilised for a new purpose, new to both philosophers and, in all probability, for philosophy in its totality. The innovation in question is Deleuze's drawing out of the anti-psychoanalytic implications of Bergson's philosophy. As a Bergsonism, this is distinct from the historical version manifest in the greater part of Deleuze's early work and from the conceptual/creative one presented in his books on cinema. While these other engagements with Bergson are just as valuable, and often draw on the same sources, the anti-Oedipal Bergsonism I am concerned with here is much less explored. My extraction of a new virtual dialogue between Bergson and Deleuze on a new topic thus aims at making two contributions – first, to honour the two philosophers' creative approach to reading philosophy and, second, to carve out a place for a particular Bergsonism which merits further attention.

III. Bergson's Playing Field

In the conclusion of *Time and Free Will*, Bergson attempts to recapitulate the points he has made about duration and its informing connection

to free will. Throughout the essay Bergson has avoided recognising the possibility of any layering of consciousness. While consciousness is on the agenda, there is a specific angle from which it is looked at, that of psychophysics. All talk of the intensity of conscious states therefore assumes a flat conscious plane rather than a mass of layered bricks. Moreover, according to Bergson any spatial model of consciousness, (be it Leibniz's pre-established harmony between conscious states and extended objects, or Bergson's own vignette of the 'invisible musician playing behind the scenes while the actor strikes a keyboard the keys of which yield no sound', is doomed to assume more than is scientifically provable (Bergson 2001: 147). Bergson does not deny the existence of the unconscious and all things associated with the Freudian picture. He just marginalises them and the possible ways of classifying them to the speculative edges of inquiry.[3]

The important pre-Deleuzian move in the conclusion of *Time and Free Will* is Bergson's criticism of the associationist conception of the mind. The latter is often mentioned in the book as an outcome of the theory of psychological determinism concerning the causal concatenation between successive states of consciousness (Bergson 2001: 148, 155). What Bergson has against such theory turns out to be analogous to what Deleuze would later reject in Freudian psychoanalysis. The mistake a determinist makes is to establish a causal link between physical movement and conscious states. Even more fatally, a determinist of the associationist type would claim that one conscious state causes the next such state immediately following.

What this implies, according to Bergson, is that the workings of consciousness are indeed traceable, pseudo-kinetic. He realises that with associationism what is apparently true is taken for scientifically correct. A state of determination about any action does *seem* to follow from a previous state of consciousness where the object of determination shaped up, but we cannot fully know the extent to which one causes the other. Experience shows, Bergson points out, that many times we are sure of what we are going to do in a certain situation where action is called for, but *we like* to keep wondering what the best way to act would be. In this and other ways, there can be states of consciousness strangely inconsequential for the ones immediately following. To no surprise, Bergson's verdict is that associationism is another example of the confusion between temporal and spatial terms. In his conclusion, he writes: 'Intensity, duration, voluntary determination, these are the three ideas which had to be clarified by ridding them of all that they owe to the intrusion of the sensible world and, in a word, to the obsession of the idea of space' (Bergson 2001: 224). The way space talk creeps into the

associationist's discussion of consciousness is through the inappropriate admission of a homogeneous medium of psychic states. It is far easier to distinguish psychic states from one another against an imaginary screen of distribution of psychic functions. However, Bergson cautions that this is not only pre-scientific, it is also dangerously unfaithful to the observable phenomena themselves. It is a case of what he calls 'substituting the symbol of the ego for the ego itself' (Bergson 2001: 226). Bergson's whole theory of duration is aimed against such habitual substitutions. Duration, for him, has two completely different lives in theory and in actuality, lives that are compatible only if and to the extent that theory has the humility to curb its 'findings' at a safe distance from the hope of general application.

There is a traceable line of thought in Bergson that seems to connect his major philosophical concerns, or at least paves a way conspicuously through the plethora of his creations. This line comes in his extensive work on duration but also in other different arguments, like an avenue chaining distinct city blocks, but uniformly, as a healthy obsession. It can be broadly defined as the recognition of false substitution in philosophy of the *easy* for the *difficult*. The sense in which the latter two terms are used here is that of extremes on a line where *common sense* occupies the middle point. It is only of minor interest to Bergson to bestow ethical judgements upon anyone's choice of position along the line. The *easy* is not necessarily condemnable, the *difficult* is not always commendable. Whenever Bergson chooses one over the other he does it only to demonstrate the fact that they are clearly distinct. What I here call the *easy* is science and the faculties of abstraction associated with it. The *difficult* is metaphysics, a meta-something-or-other that dislodges philosophy from the empirically inescapable.

In Bergson's theory of duration in particular, both physics and metaphysics are given their share. It is only fair to have both; he believes that space and time are inherently problematic because of their easy surrender to common sense, which in its turn is largely inadequate in dealing with them. Common sense is the turning point, the place where the mistake of space/time substitution takes place. This is why for Bergson metaphysics was born with the articulation of Zeno's paradoxes. A simple phenomenon like motion is there treated as spatially discrete by science and as spatially indeterminate by common sense. Only metaphysics can and should, according to Bergson, treat motion as what it is – 'a full and mobile experience' (Bergson 1968: 17). As the philosopher makes clear in his *The Creative Mind*, science has always looked for positive attributes in space and not time. Since science

struggles to foresee, it can only focus on time *passed*, not time unfurling. Consequently, it is the calling of metaphysics to clear knowledge of spatial metaphor and restore duration as the 'unceasing creation, the uninterrupted upsurge of novelty' that it is (Bergson 1968: 17).

A peculiar theoretical spillage occurs when traditional scientific analysis becomes blind to the differences of the ontological values of kind vs. degree, quality vs. quantity, duration vs. space, psychophysical entity vs. the symbol for it. Bergson points out that general ideas (be they easy, difficult, or commonsensical) are most often thought of within a homogeneous medium like space. The main reason for this is the promise of order that spatiality gives and always seems to deliver. It is, for instance, a consequence of this 'symbolism of science' that perception is regarded as incapable of registering duration (Bergson 1968: 18). To counter this, Bergson reminds us that the alleged failure of perception is such only if duration is analytically chopped up into regular successive pieces. In Deleuze's words, 'duration is in no way indivisible, but is that which cannot be divided without changing in nature at each division' (Deleuze and Guattari 1998: 483). Again, perception and consciousness in general are nowhere properly *apart* from duration except within theory. In the case of the associationists' view of consciousness, Bergson notices the same error in 'replacing the concrete phenomenon which takes place in the mind by the artificial reconstruction of it' and, ultimately, of 'confusing the explanation of the fact with the fact itself' (Bergson 2001: 163). Bergson points out that the latter mistake was firstly made by Kant and then inherited by the associationists (Bergson 2001: 232). To round off a historical polemic, it is my purpose here to show how a mistake of a similar kind was committed by Sigmund Freud and duly criticised by Deleuze.

IV. Anti-Oedipus and Bergson

As a Bergsonian, that is, as a difficult philosopher in his own right, Deleuze has his own just claim to metaphysical innovation. In spite of its originality, *Difference and Repetition* reads as if it has picked up where Bergson's theory of duration had left off. It is not difficult (and I hope not presumptuous) to trace Deleuze's conception of difference back to Bergson's picture of pure duration. For one thing, since my present interest lies elsewhere, it can be noted that both *Difference and Repetition* and *Time and Free Will* work towards restoring the 'meta' in metaphysical. The later Deleuze has a very different plan for philosophy.

In collaboration with Guattari he opens an anti-psychoanalytical discourse which, through multiple series of philosophical manoeuvres, connects to aesthetic theory, a new critique of capitalism, and a new perspective on anthropology.[4] If all this sounds strangely ambitious even for a two-headed philosopher, we have to be reminded of how much Bergson attempted and accomplished on his own. The question of what Guattari did for Deleuze, however tangential for the present inquiry, is for me as important as that of what Deleuze contributes to Bergson. Judging by the primary sources, if Bergson had had the choice of writing in collaboration with any one of his contemporaries it would have been either Sigmund Freud or Albert Einstein. The first, because consciousness was always on Bergson's agenda, and the second because science in general and duration in particular were of major concern to him. Since Bergson *did* have his try at Einstein with *Duration and Simultaneity*, it remains a mystery what would have become of a potential encounter between Bergson and Freud. Deleuze, with Guattari's help, steps in to lay bare the possible dynamics of such an encounter.

In *Difference and Repetition*, Deleuze discusses what he calls 'the image of thought', an inaugural perpetuum mobile, a mechanism of honorific assignments which are bestowed upon the practices of thinking and knowledge. Here he also offers his answer to the question we asked at the outset: Does philosophy update or upgrade knowledge? For Deleuze, philosophy most often does the first but ought to do the second. The philosopher's predicament is to fall prey to common sense, the middle ground, a safe place. But 'common sense shows every day . . . that it is capable of producing philosophy in its own way' (Deleuze 1994: 135). In Deleuze's opinion, this is where the Cartesian *cogito* comes from, a general idea of good sense that appeals to the mundanely undeniable. Thus, if there is Descartes the *doctor scientiae*, who looks for philosophy-as-principle, there is also Descartes the folk thinker, who appeals to the age-old recognition of thought-as-law.

According to Deleuze, the symbolic gesture of the Cartesian *cogito* is far surpassed in brashness by Deleuze's arch-enemy Freud and his theory of the unconscious. If it is not altogether safe to say that Deleuze's anger towards Freud comes from the same place as Bergson's anger with the associationists (however much we are inclined to recognise an affinity of affective character between the two respective attitudes), it seems true enough that Freud's obsession with Oedipus commits the associationists' error of substitution. In the two volumes of *Capitalism and Schizophrenia*, Deleuze and Guattari[5] break into the theatrical stage set of the Freudian unconscious. What displeases them in their findings

is the predatory backwardness of Freud's reliance on common sense and the aggressive spatiality of the Oedipal model.

The most direct attack on Freud in the entire two-volume project of *Capitalism and Schizophrenia* is found in the second book under the title 'One or Several Wolves?' This short chapter restages the famous case of Freud's Wolf-Man as a failure of Oedipal dramaturgy. The patient in question, Sergei Pankejeff, is represented through a series of psychotic episodes whose 'meaning' Freud believed he had deciphered. The finality of a cure, in Freud, is argued to be a function, and in this case the felicitous outcome, of such meaning extraction. The process that leads Freud to such a declaration, of a method and its success, is not far from literary analysis – after all, on some level the Wolf-Man's psychotic episodes are *stories*, and we should not forget that Oedipus was once just a story, too. Deleuze alludes to the latter fact by introducing his chapter with the fictive statement 'That day, the Wolf-Man rose from the couch particularly tired' (Deleuze and Guattari 1998: 26). But are these merely stories and are they as unequivocally transposable as Freud believes? Starting out with Pankejeff's dream of six or seven wolves, with the help of Freud's retroactive dramatic apparatus, the plot, so to speak, thickens to accommodate the inclusion of kid goats, an episode of inadvertent voyeurism, two dogs, and, ultimately, the castration of the patient's father.[6] This reduction, according to Deleuze, commits the cardinal sin of replacing a dynamic multiplicity with a persistent singularity. Wolves, as Deleuze reminds us, come in packs – not in the sense that wolves always come in groups operating on a common plane or with a common purpose, but in the sense that the generic for 'wolf' presupposes a multiplicity, even when used in the singular.

Deleuze's concept of multiplicity here is partially borrowed from both Bergson and Riemann. From Bergson comes the distinction between 'numerical or extended multiplicities and qualitative or durational multiplicities' (Deleuze and Guattari 1998: 33). For Deleuze, the patient's pack of wolves belongs to both categories. The significance of the above distinction between different multiplicities for the Freudian picture is that it renders Freud's 'numerical fragment of a lost Unity or Totality' suspect (Deleuze and Guattari 1998: 32). Even in a numerical multiplicity there is never simply the One, a lone signifier, a father and so on. Instead, there are accumulations of singularities, momentarily discernible and even countable but, also, ever-shifting. The pack of wolves seems the perfect model for this resistance to unity that Deleuze posits – it makes little sense to speak of *the* leader of a pack, of *the* centre of a pack, of *the* pack at all.

The One, on the other hand, emerges as a fiction of singularity, an individual whose name is in constant danger of being edged out by a new one that better fits the story. The impression of a happy end is set in motion by the healthy transition of the Wolf-Man back into Sergei Pankejeff, when purportedly cured. But such neat reversal, as Deleuze points out, is impossible if the patient and his ailment have become many and, as the (hi)story goes, have sucked all manner of subsequent doctors and treatments into the natural loop of their multiplication.[7]

As to the second kind of multiplicity, Deleuze insists that it is not the other side of a duality but rather the intensification of all processes of re-distribution, re-mapping and de-individualisation characteristic of numerical multiplicity. The Freudian unconscious is, for Deleuze, a prime example of this intensive multiplicity. And, consequently, where Freud sees an individual Deleuze sees a crowd. Singularity presupposes a negation, a lack of some sort, by virtue of which it accommodates repression, while for Deleuze 'the unconscious knows nothing of negation' (Deleuze and Guattari 1998: 31). Going back to the Wolf-Man's psychotic episodes, if they are read the Freudian way, 'making sense' of them surely gains something from the substitution of a familial theatre for a schizoid multiplicity. But the editorial effort involved is clearly arbitrary and what remains on the cutting-room floor might just turn out to be *the* ever-changing story itself.

It is interesting that in Freud the normative seems to prey on the phenomenological. Even in name, things such as a bad dream, a nightmare and a psychotic episode have a built-in normative charge. If one should inquire into the difference between a dream and a bad dream, Freud is very likely to offer an explanation that, firstly, posits a difference in kind between the two phenomena (rather than degree, or intensity as Deleuze will have it), and, secondly, will bestow different valences to each phenomenon relative to the degree to which each one conforms to the analyst's valuative system. Deleuze detects the same procedure in Freud's differentiation between neurosis and psychosis, an operation that starts out as a promising analysis of intensive multiplicity, possibly even 'the greatest art of the unconscious', but soon after gets bogged down by the Freudian reductive procedure (Deleuze and Guattari 1998: 27). As to the normative charges implied, Keith Ansell Pearson contributes a great observation on the continuity between Bergson and Deleuze in opposition to Freud: 'This explains Bergson's interest in the *anomalies* of the life of "spirit", one that will come to inform Deleuze's analyses in the two *Cinema* books, such as deliriums, dreams, hallucinations, and so on, which, Bergson insists, are "positive facts"

that consist in the presence, and not in the absence, of something: "They seem to introduce into the mind certain new ways of feeling and thinking" ' (Ansell Pearson 2005: 5). Freudian reduction, however, makes no provision for such 'positive facts', which undermines Freud's claims to both an understanding of the *meanings* of these phenomena and to possible convalescence through psychoanalytic transference.

If we take a step back to Bergson, we could recall that for him any scientific model is based on the notion of space. Freud, however, recoils from the possibility of becoming a scientist. His magnitudes, sections of the human psyche, do not even properly *measure* the unconscious but merely subordinate it to a theoretical master plan: Freud himself, as Deleuze notes, recognises the multiplicity of libidinal 'currents that coexist in the Wolf-Man':

> That makes it all the more surprising that he treats the multiplicities of the unconscious the way he does. For him, there will always be a reduction to the One: the little scars, the little holes, become subdivisions of the great scar or supreme hole named castration; the wolves become substitutes for a single Father who turns up everywhere, or wherever they put him. (Deleuze and Guattari 1998: 31)

Bergson sees Freudian psychoanalysis (in theory and practice) as evidence for the existence of an 'integral conservation of the past' on the threshold between science and common sense (Bergson 1968: 88–9). What he means by this are the above mentioned tendencies of science to focus predominantly on what has passed and the things of common sense – on things extended in space. Thus, the hybrid tangible past subsists as a constant point of reference in psychoanalysis. It is curious, or perhaps only to be expected, that Deleuze distinguishes a function of memory which he calls the 'conservational' and associates with any pickled memories that work towards a relocation of the self into the past (Deleuze 1994: 80–3). It would be only fair to note here that the Oedipal past shares some traits of the Bergsonian (and Deleuzian) past, most importantly its ontological value. For both Freud and his two critics the past *is*, it subsists, it is never lost, it is an *everpast*. The major difference, however, is that the access to it is furnished in different ways in Freud on the one hand and in the two French philosophers on the other.

For Freud, the unconscious represents a record inscribed on the psyche, it is rewritten every moment, but always remains the same. What keeps an eye on the process is the Ego, an unwelcome answer to the Bergsonian present, the Deleuzian body without organs. The body without organs is a locus of becoming, the home of multiplicity, and the

repudiation of organic unity. Both the Ego and the body without organs are *now*, never two minutes ago or tomorrow. Even though Deleuze rarely writes of the body without organs in temporal terms, what he writes has a recognisable parallel to Bergsonian duration. The body without organs performs an ousting of the past, it makes a difference from the past the way in Bergson pure duration involves the aforementioned 'upsurge of novelty' at every stage. In one place, Deleuze explains that 'the body without organs is what remains when we take everything away' (Deleuze and Guattari 1998: 151). Deleuze qualifies this suggestion by making an important distinction – proper organisms perform the 'connective syntheses of production' while the body without organs takes care of the 'disjunctive synthesis of recording' (Deleuze and Guattari 1983: 12). The past is available to the body without organs through 'aberrant paths of communication between non-communicating vessels, transverse unities between elements that retain all their differences within their own particular boundaries' (Deleuze and Guattari 1983: 43). There is a record, but it is inconstant; the past is a body that continuously changes, the way in Bergson matter is subject to continuous alteration. In the process of becoming – which encompasses all of duration, space, and body for Bergson and Deleuze – the present is the true psychological existence, a present, as it were, untouched by the past except through the alterity of selective memory and an impetus for action.

Freud reserves the present for the Ego, the corrector of the past. When he asserts that the Ego is 'the coherent organisation of mental processes' he admits the possibility of such organisation after the fact (Freud 1999: 17). It is but a small step from here to the associationists' spatial model of consciousness. Space, for Bergson and even more for Deleuze, is the stuff of conquest and regularity. Deleuze criticises Freud severely for his letting the Ego supervene over the unconscious. The symbolism of riders-whipping-horses, the present becoming an excuse for past trauma, the layering of the psyche, presuppose a jump between simultaneity and space. The memory of the past for Freud is not selective, but solid; it does not call for action, but for retrograde psychosis. The subdivisions of the psyche (Ego, Id, Ego Ideal, and so on) line up in a strict hierarchy where everything follows neatly from everything else. It is a theatre, a place rather than a time.

V. Oedipus Unravelling

The Freudian theatre is very aptly demystified by George Dimock in his 'Anna and the Wolf-Man: Rewriting Freud's Case History'

(1995). In his article Dimock revisits the Wolf-Man's case through the double lens of the patient's late life memoirs and also of scholarship on the case after Freud. From these texts there emerges considerable evidence that Freud's reading of the patient's neurosis was marked by an unproductive tendency to over-simplify and twist the patient's variegated past experience. Following clues from Pankejeff's life story as told by Pankejeff himself, Dimock reinstates the patient's sister, Anna, as a key presence and possibly a key psychological determinant in the development of the Wolf-Man's disorder.

The first and seemingly least reliable clue Dimock pursues is a childhood photograph of the patient with his sister. Even in this dubious piece of evidence Dimock is inclined to find a peculiar filial bond indicative of co-dependency and, possibly, salient neurosis. The photograph, one among a few that Dimock discusses and reproduces, exemplifies the highly stylised but deliberate approach of turn-of-the-century family portraiture. The tight conventions it follows, however, make the accidental and the personal all the more indicative of the psychological dimension, which the sitters apparently share. Dimock admits that the photograph can only be used as a metaphorical tool – its undeniable presence does not constitute immediate fodder for analysis but it can very well be used, together with the other photographs reproduced, in considering alternatives to Freud's analytic conclusions.

The shared psychological dimension in question is one that Dimock calls the 'interpersonal', which he opposes to the 'introspective'. The interpersonal is where the entire history of the Wolf-Man's life branches out to include other actual persons (family, friends, a nanny and the larger population), their relevant experiences, and the subjective complications they occasion for each other and, of course, for the analysand. The introspective, on the other hand, refers to the subjective experiences to which each of us has privileged access. At this stage of his discussion Dimock introduces another parallel distinction through the words of Pankejeff himself: 'The Wolf-Man proclaims that what he writes is "something like a short family novel", which favours the "epic" over the "sentimental or the theatrical".'[8] The epic here assumes a parallel function to Dimock's interpersonal dimension, while the theatrical is associated with the introspective. At first glance this looks like a curious reversal of the Deleuzian sense of Freud's family theatre – the latter, after all, is seen by Deleuze as what amounts to a calcified interpersonal diorama. Dimock, however, makes it the purpose of his essay to show that Freud's dioramas *assume* an interpersonal dimension but fall short of following through with the theoretical

and practical demands this dimension makes of psychoanalysis. To go back to Dimock's photographic examples, the images undeniably represent the relevant stage sets on which respective interpersonal confluences are played out. Each photograph, however, is also markedly resistant to psychoanalytic interpretation just because it is not, by itself, a complete signifier – its claim to dramatic importance is both reinforced and undermined by its belonging to the enormous variety of episodes, attitudes and simultaneities which constitute the larger family epic.

For Freud, on the other hand, the family epic and its persistent percolations into the patient's psyche remain mostly out of reach. Dimock cites Freud's indirect apology for not having provided a fuller picture, but as Dimock notices this is not necessarily Freud's major misstep – it is rather the tendentiously static reading of Pankejeff's life that distorts Freud's search and the findings thereof. Freud's process of critically selecting bits of the narrative and endowing them with special significance must have been completely arbitrary if he ignored so much of the Wolf-Man's history.[9] By way of proof, Dimock makes a convincing case that the Oedipal theatre is just one of many dramatic stencils that fit the bill. He finds fast connections between Pankejeff's introspective reports and the cultural reality the patient grew up in. It is thus that Tolstoy's wolf-hunt scene and the subsequent reconciliation between brother and sister in *War and Peace* constitutes a rival narrative that, if transposed on Pankejeff's neurotic episodes, promises to help explain much more than Freud's trusty Oedipus ever would (Dimock 1995: 67).

For the literary to become literal, one has to have a particularly conservative approach to story-telling and story-making. Freud's approach is to look for scraps of Oedipus in the ruins of his patient's life – the Wolf-Man *also* has a suicidal sister and an erotically charged nanny, but Freud remains content with regarding such actors as superfluous to the 'real' drama of the Oedipal triangle. Another symbolic triangle – that of the number three mentioned by the patient, which Freud eagerly and entirely speculatively attributes to Pankejeff's pre-conscious memory of witnessing his parents engage in intercourse three times, might just as well be related to the three wolves that appear in a photograph of Pankejeff and other family members after, yet again, a wolf hunt. The psychoanalyst's ambition to make sense of a psychological ailment begins to look unrealistic against the plentiful muddle of such associative clusters. A possible way out is suggested but not properly theorised by the Wolf-Man himself.

What does the patient mean when he says that his memoirs favour the epic over the theatrical? One reading, as offered by Dimock, is the imperative of telling the whole story without the convenient omissions so typical of Freud's editorial approach to trauma and drama. Another interpretation, which does not contradict Dimock's but builds on it, comes from the work of Bergson and Deleuze. The metaphysical mistake of attributing spatial features to durational phenomena is very useful in deciphering Pankejeff's suggestion. If theatre is understood as a space, or at least the possibility of re-enacting the same story, Freud's fixation with applying the dramatic arch of Oedipus Rex to all and sundry psychological signposts constitutes an intrusion of a spatial model upon a variety of durational occurrences. (One does not need to be reminded of Giulio Camillo's memory theatre to be able to recognise the mixed blessing of tampering with the lived structure of mnemonic experience or any experience whatever. Camillo's claim that the memory theatre will make it possible for anyone to converse with the erudition of a Cicero belongs to the same utopian genre as Freud's ambition to make sense of man, survival, and civilisation all on the purported force of a universally applicable theatrical stencil.) The epic, on the other hand, is at least superficially easier to identify with the Bergsonian/Deleuzian notion of intensive multiplicity – the epic is most often a long literary work which relates a significant story in all aspects of its unfolding; it also represents a battlefield upon which literary licence and historical accuracy never cease to fight. Most importantly, however, the family epic Pankejeff chooses to write becomes, with its intensive multiplicity of actors, scenes and episodes, the most faithful representation of the factors that the Wolf-Man's unconscious is ever so mysteriously predicated on. This does not mean that the Wolf-Man himself would, just by writing the story, acquire the coveted clarity about these factors and the workings of his own unconscious – but writing the story anew does reconfirm the durational character of both neurosis and life, in short, of all manners of becoming.

Like Bergson's begrudged associationists Freud believes that by locating the coherence between disparate mental phenomena one is afforded an easy, commonsensical, objective way out of, and never into, becoming. As Bergson himself ingeniously puts it, 'this actual and not merely virtual perception of subdivisions in what is undivided is just what we call objectivity' (Bergson 2001: 83). Coherence is the promise of objectivity, of the divisible truth, the conquerable psyche. According to Deleuze, these tendencies are all the fault of humanity's obsession with unity, the wish to step outside of oneself and look back at oneself with

an air of Kantian disinterestedness. Both Bergson and Deleuze believe that such detachment from and spatial appropriation of different aspects of mental life is often inescapable, but always harmful.[10] They both belong to the species of philosophers Deleuze calls *doctores angelici*, abortionists of unity and angel makers (Deleuze and Guattari 1998: 6). In contrast, the associationists make determinist machines and Freud invents the theatre of stasis. Or, perhaps, they do not even invent anything but only reproduce the script and the mistakes of some prior story.

VI. The Riddle of the New

The preceding philosophical worries, if granted the interest and validity I would claim for them, yield an important meta-philosophical consequence. The consequence I refer to is that Freud's reading of his patient's story finds its place within my discussion not only with reference to the work of Bergson and Deleuze, but also with reference to the broader methodological context of Deleuze's manner of reading Freud via Bergson. Within the latter context, Freud seems to occupy an unenviable place on the continuum between creating insight and inheriting it. What Freud chooses to learn from his patient's story is precisely what fits his own intellectual and narrative constructs prior to ever meeting the patient. This resistance to novelty is neatly mirrored in Freud's substantive theory itself. Deleuze's misgivings, via Bergson, about the stagnant spatialisation of the Oedipal model seem to be, in part, misgivings about Freud's reactionary brand of interpretation. Only through such limited interpretation does it become possible for Freud to declare therapeutic success where there is none – a success which registers more as an act of appropriation than as an act of understanding. Ultimately, the Wolf-Man's psychological inscriptions are redacted so that they can be folded neatly into the jealous inheritance of the self-contained Freudian scroll.

This approach is the exact opposite of how Deleuze engages with Bergson's heritage. In his application of Bergsonian notions of duration, multiplicity and becoming to his anti-psychoanalytic project Deleuze simultaneously honours Bergson's insight and writes it anew. As an example of referring to a past, be it in psychoanalysis or its philosophical counterpart, what Deleuze does mirrors the theoretical underpinnings of Bergson's theory – just as Bergson insists on the dynamic nature of the past's continuous redrawing, Deleuze insists on the dynamic reconsideration of prior thought. The possibility of reading Freud

through Bergson is undoubtedly one that Deleuze creates. Among the virtues of taking such a licence is that it opens the way for subsequent commentators to multiply the particular chain of interpretation even further.

Notes

1. 'Update' is here used in the sense of a restorer's effort, while 'upgrade' is associated with the work of the inventor.
2. Kant's doctrine of the faculties was apparently influenced by Leibniz's idea of pre-established harmony. In his *Kant's Critical Philosophy* Deleuze picks up on Kant's fascination with Leibnizian harmony and tries to show that Kant's enhancement of Leibniz's meaning has the limitation of allowing apriority to suffocate the free accord of the faculties (cf. Deleuze 1993: 22–4). It is in no way bizarre that a similar treatment of the same topic lurks behind Bergson's exposition in *Time and Free Will*.
3. One emblematic mention of the unconscious in Bergson is found in his *Matter and Memory*: 'And we have expressed how the cerebral lesion may effect this weakening, without the necessity of supposing any sort of provision of memories stored in the brain. What the injury really attacks are the sensory and motor regions corresponding to this class of perception, and especially those adjuncts through which they may be set in motion from within, so that memory, finding nothing to catch hold of, ends by becoming practically powerless: now, in psychology, powerlessness means unconsciousness' (Bergson 1988: 176).
4. Deleuze and Guattari's attempt to reserve a genre slot for their contribution to philosophy reads: 'RHIZOMATICS = SCHIZOANALYSIS = STRATO-ANALYSIS = PRAGMATICS = MICROPOLITICS'. To this, a page later they add 'POP ANALYSIS' (Deleuze and Guattari 1998: 22–4).
5. May any omission of Guattari's name with reference to the two works not be regarded by the reader as discounting Guattari's contribution, but as a matter of mere brevity.
6. 'This operation is accomplished by associating the dream with the tale, "The Wolf and the Seven Kid-Goats" (only six of which get eaten). We witness Freud's reductive glee; we literally see multiplicity leave the wolves to take the shape of goats that have absolutely nothing to do with the story. Seven wolves that are only kid-goats. Six wolves: the seventh goat (the Wolf-Man himself) is hiding in the clock. Five wolves: he might have seen his parents make love at five o'clock, and the roman numeral V is associated with the erotic spreading of a woman's legs. Three wolves: the parents may have made love three times. Two wolves: the first coupling the child may have seen was the two parents *more ferarum*, or perhaps even two dogs. One wolf: the wolf is the father, as we all knew from the start. Zero wolves: he lost his tail, he is not just a castrater but also castrated. Who is Freud trying to fool?' (Deleuze and Guattari 1998: 28).
7. '[I]t is at the highest point of this depersonalisation that someone can be *named*, receives his or her family name or first name, acquires the most intense discernibility in the instantaneous apprehension of the multiplicities belonging to him or her, and to which he or she belongs' (Deleuze and Guattari 1998: 35).
8. 'Whatever else these terms may signify, they point away from introspection toward the interpersonal, away from psychoanalysis toward the broader social and historical arena' (Dimock 1995: 54).

9. 'With respect to the full range of human experience, a single dream at four years of age and its latent content, a primal scene at one and a half, cannot be presented as inexhaustibly meaningful without becoming narratologically oppressive by virtue of what they exclude from consideration. Freud's psychoanalytic drama leaves no room for, among other things, intersubjectivity in the form of family history. The Wolf-Man's memoirs address, however inadequately, the casualties of this exclusion' (Dimock 1995: 59).
10. In Bergson's discussion of free will, we read: 'But the moments at which we thus grasp ourselves are rare, and that is just why we are rarely free. The greater part of the time we live outside ourselves, hardly perceiving anything of ourselves but our own ghost, a colourless shadow which pure duration projects into homogeneous space. Hence our life unfolds in space rather than in time; we live for the external world rather than for ourselves; we speak rather than think; we "are acted" rather than act ourselves' (Bergson 2001: 231).

A Deleuzian Cineosis: Cinematic Semiosis and Syntheses of Time

David Deamer Manchester Metropolitan University

Abstract

In *Cinema 1* Deleuze creates the taxonomy of the movement-image by extending Henri Bergson's account of the sensory-motor process in *Matter and Memory* through the semiotic system of Charles Sanders Peirce. Through this nexus of Bergson and Peirce, Deleuze can account for each image and sign, their impetus and their relationship to one another. In contrast, the taxonomy of the time-image, the focus of *Cinema 2*, is given no such genesis. Rather, the images and signs appear *in situ*, as if ready-made. This article proposes that the impetus for the taxonomy of the time-image lies in the account given of the three passive syntheses of time in *Difference and Repetition*, and that the nine aspects of the passive syntheses can be seen to correspond to the nine proper signs of the time-image.

Keywords: active syntheses, cinema, cineosis, Deleuze, movement-image, three passive syntheses, time-image

What is the underlying structure of Deleuze's time-image? Asking such a question may be considered controversial, heretical even. The assertion that there is any underlying structure to unearth in the *Cinema* books may at first appear as an allegation. Yet it is clear where Deleuze gets the concepts for the movement-image. He begins with the sensory-motor process described by Bergson in *Matter and Memory* (perception→affection→action) and then extends the typology through certain iterations of the semiotic systems of Peirce. This provides an underlying structure, no matter how much Deleuze may trouble or deterritorialise it, through any number of variances and contradictions.

Given this, should we accept that the time-image concepts and their organisation have fallen from the sky? To put this another way, can we simply say that all the various components of the time-image come directly from Deleuze's observation of modern(ist) cinema as an expression of the Bergsonian concept of pure memory (different in kind to Bergson's sensory-motor process)? My argument is that there is indeed an underlying organisation, or structure, to the time-image concepts, and one that precedes the Bergsonian inspiration.

There is enough evidence to justify taking such a claim seriously. For instance, in the 'Preface to the French Edition' of *Cinema 1*, Deleuze writes that the book is 'a taxonomy, an attempt at the classification of images and signs. But this first volume has to content itself with determining the elements, the elements of only one part of the classification' (Deleuze 2002a: xiv). Does this not hint that the second volume will determine its elements as another part of the classification? Indeed, in *Cinema 2* Deleuze writes that the time-image is a 'second dimension of pure, non-linguistic semiotics... a whole series of new signs' (Deleuze 2001: 34). The taxonomic creation is a central aspect of both *Cinema* books. Consider, for example, Deleuze's response to a question by Bonitzer, Narboni et al.:

> [Q:] *What strikes us in your two books on cinema is something that one already finds in your other books, but never to this extent, namely, taxonomy – the love of classification. Have your always had this tendency, or did it develop over time? Does classification have a particular connection to cinema?*
>
> [A:] Yes, there's nothing more fun than classifications or tables. They're like the outline of a book, or its vocabulary, its glossary. It's not the essential thing, which comes next, but it's an indispensible work of preparation. Nothing is more beautiful than the classifications of natural history... For example, I'm attempting a classification of light in the cinema. (Deleuze 2000: 367–8).

Deleuze, it is clear, does not fear being held to account for his tendency towards taxonomy, for his tendency towards structure. As Philippe Mengue has recently commented, in another context, Deleuze's 'philosophy is thought to constitute an unrestricted apology for all forms of deterritorialisation. But that is a partial and partisan view.' Mengue believes 'we are entitled to think that Deleuze does not disdain the problem of unity' (Mengue 2008: 237). In other words, Deleuze is concerned with the way in which structures arise, come atumbling, and are reconstituted, the way in which territories are deterritorialised

and reterritorialised (cf. Parr 2005: 67). As Deleuze and Guattari put it in another terminological register: 'there are knots of arborescence on rhizomes, and rhizomatic offshoots in roots . . . The important point is that the root-tree and canal-rhizome are not two opposed models' (Deleuze and Guattari 2004: 22).

Take Ronald Bogue's wonderful *Deleuze on Cinema*. In chapter three, 'Eighteen signs (more or less)', Bogue writes:

> At a minimum, the signs of the movement-image are fourteen . . . At most, they number twenty-three . . . But obviously, the tally is insignificant, for Deleuze is no ordinary system builder . . . his taxonomy is a generative device meant to create new terms for talking about new ways of seeing. But if the minute terminological differentiations are unimportant, the concepts and logic of their creation are crucial. (Bogue 2003: 104)

Prior to this, Bogue has, astutely, compiled comparative tables of the movement-image concepts from the text of *Cinema 1*, its glossary and recapitulation in chapter two of *Cinema 2*. The tables show variations, variations which seemingly have a number of inconsistencies. This inconsistency (I would guess) leads Bogue to his conclusion that 'the tally is insignificant'. However, how are we to square this with the claim that 'the concepts and logic of their creation are crucial'? Surely taking stock of the movement-image signs, the very concepts themselves, *is* the logic of their creation and therefore a significant part of understanding them? As Deleuze writes, it is their 'differentiation' and 'specification' (Deleuze 2001: 29).

At this point, it perhaps becomes apparent that, due to Deleuze's procedures, unearthing any underlying structure will necessarily involve an act of reconstitution, the reverse engineering of a machine that was never fully constructed and so is open to a certain amount of interpretation. An act of reterritorialisation? Is this a bad thing? Or is it not this that makes it essentially a creative endeavour? After all, did not Deleuze (famously and perhaps too often quoted) conceive his own approach to 'the history of philosophy as a kind of buggery . . . '?

> I imagined myself getting onto the back of an author, and giving him a child, which would be his and which would at the same time be a monster. It is very important that it should be his child, because the author actually had to say everything I made him say. But it also had to be a monster because it was necessary to go through all kinds of decenterings, slips, break ins, secret emissions, which I really enjoyed. (Deleuze 2002b: 8)

My own monstrous enjoyment of the *Cinema* books can be called a cineosis, an attempt at a reconstitution of the underlying structures of

the two-fold cinematic semiosis: the signs of the movement-image and the time-image.

If Bogue resists the lure of resolving the taxonomic tables for the movement-image, there is not even an attempt at tabulating the time-image. This is not surprising. Unlike the movement-image, Deleuze does not hint at an underlying schema. But what if such exists, hidden away, so to speak? One way to explore this possibility is to identify and specify the concepts proper to the time-image. This, I believe, can only be done by picking up where Bogue has left off. In other words, reconstituting and resolving the movement-image taxonomy, and seeing what is, so to speak, left over. This is an essential first step towards figuring out the time-image taxonomy. Yet simply tabulating the signs of the movement- and time-image is not the crucial issue. What is critical is that the tabulation of the time-image concepts (their number, their organisation) reveals their impetus, their source. Just as the movement-image has its beginnings in Bergson's sensory-motor process extended by Peirce's semiotic system, could some equivalent, some pre-existing organisation, be the stimulus for the time-image? The underlying system, I argue, is the three passive syntheses of time that first appear in *Difference and Repetition*. As Deleuze has stated: '*Difference and Repetition* was the first book in which I tried to "do philosophy". All that I have done since is connected to this book, including what I wrote with Guattari (obviously, I speak from my own point of view)' (Deleuze 2004a: xiii).

I am not the first to propose such a link between the *Cinema* books and the three passive syntheses. D. N. Rodowick, for instance, in his seminal exploration of the philosophical antecedents and connectives of Deleuze's work on film, writes: 'Cinematic movement-images emerge from the regime of universal variation where "matter = image" ... Alternatively, time-images emerge from what Deleuze calls, in *Difference and Repetition*, the three passive syntheses of time' (Rodowick 1997: 127). Rodowick leaves it, more or less, at this. More recently David Martin-Jones, Richard Rushton, Joe Hughes and Patricia Pisters have gone on to explore, in their own way, connections between the *Cinema* books and the three passive syntheses. As we will see a little later, they all reach very different conclusions. Yet all agree on one point, that some, or all, of the three passive syntheses are aligned with components of the movement-image.

I follow Rodowick in my approach. In so doing I will explore how the particular concepts, images and signs of the time-image can be said to have their foundation in the three passive syntheses. Further, while Bergson's concepts of the sensory-motor process and pure memory

in *Matter and Memory* provide the visible framework of the *Cinema* books, it is Deleuze's own work in *Difference and Repetition* that constitutes a hidden structure. For the three passive syntheses operate in consort with what Deleuze calls the active syntheses, which can in turn be seen as a general conceptual figure for the movement-image taxonomy.

I. Taxonomy of Time-Images: From Bergson to Simondon, Nietzsche, Heidegger

For Deleuze, what marks the emergence of the time-image is an explosion of the signs of the action-image which cohere the co-ordinates of the movement-image and – as a consequence – delinks affection-images, perception-images and mental images. This delinkage is achieved through the reintroduction of aberrations which the movement-image (from the early days of cinema) attempted to annul (through, for example, an integrated soundtrack, naturalistic colour, invisible montage, and so on). In this way filmmakers discovered pure optical and sound situations, situations where characters no longer act (no longer resolve the chaos). But this is only the intimation of a new kind of cinema. Something else needs to happen. The pure optical and pure sound situations – opsigns and sonsigns – need to be relinked differently and a new cinema built from this ground up. According to Deleuze, opsigns and sonsigns are relinked in a number of ways. The actual (on-screen) image is coerced to open up to its virtual component creating hyalosigns. These 'mutual images' are combined as narratives resulting in the emergence of chronosigns (Deleuze 2001: 78). Chronosigns operate by creating non-linear or serial narratives and go on to 'constitute a new image of thought' (Deleuze 2001: 215). This new image of thought Deleuze names the noosign which tears thinking away from habitual (movement-image) mental images. In this way time-images are also lectosigns, visual and auditory concepts that must be read rather than simply seen.

The etymologies of the names of the time-image offer a way of exploring them in more detail. Opsigns and sonsigns are simply contractions of the terms optical sign and sound sign, pure optical and sound situations which defy classification through the movement-image taxonomy. Hyalosigns are inspired by the work of Gilbert Simondon, who uses the idea of the crystal (from which the prefix *hyal* – meaning 'glass' – is derived) as a parallel for the process of individuation.[1] Chronosign seems to be a neologism. However, as a synonym for the

time-image the concepts it describes (memory as aspects of the past, present and future) can be seen to emerge from Bergson's *Matter and Memory*. Noosigns are inspired by Martin Heidegger and his discussion of the nature of thought (Heidegger 1972: 3; Deleuze 2001: 156, 156 n2, 308). Finally, lectosigns appear to be yet another of Deleuze's neologisms and refer to the process of reading time-images, from the Latin *lecto*. All interesting stuff. However, while Deleuze's concepts can be seen to display a philosophical consonance in the way he deploys them in *Cinema 2*, it is clear that looking at the various sources of these cinematographic concepts betrays no contingent structure between the different images. Rather, the first clue to uncovering the underlying structure of the time-image is that only hyalosigns, chronosigns and noosigns – not opsigns/sonsigns or lectosigns – can be decomposed into triadic sign structures.

For instance, hyalosigns seem to be decomposed into avatars which describe properties of crystalline formations. Deleuze takes the example of the crystal and identifies how filmmakers have reflected the multiplicitous facia of crystals and the growth of a crystal from a pre-crystal. He identifies three broad trends which form the avatars of the hyalosign: 'two mirrors face to face', 'the limpid and the opaque' and 'the seed and the environment' (Deleuze 2001: 71). Each perform exchanges between the actual on-screen image and its virtual connections off-screen (on the brain screen).

The avatars of chronosigns have a more direct relationship with the properties of pure memory discussed by Bergson in *Matter and Memory*, but are also extended by Nietzsche's concept of the 'will to power' (Nietzsche 1967; Deleuze 2001: 141). Deleuze specifies three types of chronosign that correspond to the three aspects of time in-and-for-itself. 'Sheets of the past' explore the way in which memories are 'no longer confused with the space which serves as its place' (Deleuze 2001: 100). Instead memories explore time itself – no longer functioning as a repository of the present, but as a product of the present. 'Points [or peaks] of the present' explore the way in which any present moment is fundamentally divided between the present-in-itself, the past and the future (Deleuze 2001: 100). It is this aspect that can make time 'frightening and inexplicable' for the possibility of action is torn between living in the moment, reacting to the influences of the past and acting for future effects (Deleuze 2001: 101). Deleuze refers to these two aspects of chronosigns as the 'order of time' in that they undermine the linear chronology of past, present and future (Deleuze 2001: 155). The third avatar of the chronosign – which is orientated towards the future – is the

'power of the false' and Deleuze delineates this function as the 'series of time' (Deleuze 2001: 126, 155, 133, 136). A serial organisation disconnects the continuity of time that constructs the character in the film as locked into a narrative where the present is a product of the past and the future a consequence. Rather than this closed circuit, a serial organisation is one in which time is organised into images in-and-for-themselves which while independent have a multiplicitous virtual presence with each other. Deleuze puts it thus, 'the power of the false exists only from the perspective of a series of powers, always referring to each other and passing into one another' (Deleuze 2001: 133). As in serialism in music, which attempts to overthrow traditional harmonics without descending into chaos, fundamental elements are continuously re-arranged exploring the difference in repetition.

Finally, the avatars of the noosigns would initially seem to emerge directly from cinema itself. How does a filmmaker of the time-image capture thought on-screen? To use mental images (relation-, recollection- and dream-images, expressions of thought, habitual memory) would mean a return to the coordinates of the movement-image. Methods other than this must be found. Indeed, for Deleuze, the answer seems beguilingly simple. On the one hand, thought appears through the environments of the *mise-en-scène*. As Deleuze writes in *Cinema 2*, 'landscapes are mental states', thus the *mise-en-scène* is 'the brain' (Deleuze 2001: 188, 205). On the other hand thought appears through the body of the actor (Deleuze 2001: 205). Deleuze sees the body as having two poles: those of 'attitude' and 'gest' (Deleuze 2001: 188, 205): Gest, a term taken from Brecht, describes the way in which an actor can foreground gesture and performance. Attitude describes a body that does not act, that is displayed in its everydayness.

That only the time-images of hyalosigns, chronosigns and noosigns can be decomposed into specific signs is more than a detail. It intimates not only the way in which the components of the time-image are organised, but also the difference at conceptual level between them and opsigns/sonsigns and lectosigns. Opsigns and sonsigns describe the actual visual and auditory components of a time-image film in general, after the collapse of the coordinates of the movement-image. Deleuze writes 'we gave the name opsign (and sonsign) to the actual image cut off from its motor extension' (Deleuze 2001: 69). They are 'slivers', the images resulting in the despecification of movement-images prior to rejoining each other as time-images (hyalosigns, chronosigns and noosigns) (Deleuze 2001: 69). Similarly, it is clear in Deleuze's discussion of lectosigns that this term is used for the way in which time-images

Table 1.1. Time-image: images and signs

Images	Signs		
0 Opsigns and sonsigns			
1 Hyalosigns	Mirrors	Limpid and opaque	Seed and environment
2 Chronosigns	Sheets of the past	Peaks of the present	Powers of the false
3 Noosigns	Body of *gest*	Body of attitude	Brain
			Lectosigns ∞

(again, in general) need to be read rather than be seen. This is the 'final aspect of the direct time-image, the common limit' (Deleuze 2001: 279). Thus, if opsigns and sonsigns are actual material images appearing on screen decoupled from each other to instead give on to the virtual, lectosigns are virtual images appearing on the brain screen as an effect of the actual filmic process, the former from the point of view of the image, the latter from the point of view of the film as a complex nexus of powers. In this way, the domains of the time-image that appear between opsigns/sonsigns and lectosigns can be called the three time-images proper. Hyalosigns, chronosigns and noosigns are, on the one hand, complex compositions of opsigns and sonsigns. On the other hand, the images and signs of the time-image constitute a decomposition of lectosigns.

The time-image proper: three times three. Nine signs. Three connected concepts, each with three sub-categories. Where do we see such a structure in Deleuze's other work? The answer, of course, is in the three passive syntheses of time and the three dimensions of each as originally set out in the second chapter of *Difference and Repetition*. As Jay Lampert summarises:

> While in one sense there are three distinct logics of time corresponding to the forms of present, past, and future – the logic of succession, the logic of co-existence, and the logic of dark precursors, respectively – the logic of succession has its own way of conceiving the present, past, and future, and the logics of co-existence and of precursors each have their own way of conceiving all three. As a result, there exist nine forms of present, past, and future . . . (Lampert 2006: 8)

But is this any more than coincidence?

II. Deleuze, *Difference and Repetition* and the Three Passive Syntheses

The central concern of *Difference and Repetition* is to attack concepts of identity and overturn philosophies of representation in order to set free an alternative 'image of thought' (Deleuze 2004a: 164). Deleuze's approach is to conduct a number of sorties into the many and varied instances of identity and representation from Aristotle via Hegel to Freud and beyond. The concept of identity, for Deleuze, is problematic because it relies upon reconstituting the same at the expense of the different. It is a concept that depends upon annulling difference in-itself. It is a concept that depends upon exclusion. It is a concept that relies upon negativity – this is this because it is not that. The concept of identity is fundamental to representation which proposes – firstly – an object and its representation as separate but – secondly – a verisimilitude between the two. Representational relationships pretend to truth through identity. Deleuze's programme is to replace the philosophy of representation with expression, another kind of image of thought that arises through an alternative series of philosophies, from the Stoics to Spinoza, Nietzsche and Bergson (Deleuze 2004a: 346). Fundamental to achieving this is replacing identity with difference and repetition: the repetition of difference, the difference in repetition, taking the concepts of difference and repetition 'together rather than separately' (Deleuze 2004a: xiii). For Deleuze both concepts have suffered the same fate, which is to say, neither had been fully developed as concepts in-and-of-themselves. Both concepts, in their own way, have been developed in relation, opposition and subordination to the concept of identity. Setting these concepts free is thus the first major activity of the book. Deleuze approaches this from a number of directions (though, crucially, they are not designed to 'add up' so much as create a nexus). One of the most famous of these approaches is the section where Deleuze explores (after Kant and Husserl) the three passive syntheses of time.

How does an organisation such as a body emerge out of the dark chaos of the universe? According to Deleuze a body exists through spatial stability and temporal fusion. A body is spatial in the sense that it is a contraction of the matter of the universe, a synthesis of physical stuff. A body is temporal in that it perseveres in some way in the present, past and future. These are the extensive and intensive dimensions of a body. Historically, philosophy has tended to focus upon the spatial (which results in identity) rather than the temporal (which relates to difference and repetition). Deleuze thus concentrates upon this temporal dimension

and specifies three domains, the time of the present, the past and the future. First, the self is temporal through the contraction (synthesis) of different instants into a now. Second, the self is temporal because it has stored up compacted (synthesised) moments as memories. Third, the self is temporal through a continual reencountering (synthesising) of the permeable wall of the future. These three aspects – or syntheses – of time form the temporal nexus of the self prior to consciousness. In this way the self is a passive temporal entity before locating itself spatially in a body in a universe, prior to the active awareness of consciousness (Deleuze 2004a: 100). Deleuze names this temporal primacy the three passive syntheses of time. Each passive synthesis has its own domain. Thus, each of the passive syntheses has own way of constituting the past, present and future, as decomposing into a past, a present and a future. Consequently there are three aspects to each of the domains of the three passive syntheses. In other words, there are nine dimensions of time. The Deleuzian self is a complex repetition of temporal manifestations of difference.

The first passive synthesis of time (the 'originary synthesis') is that of the 'lived, or living, present'. It is the ever-present now, the nowness of the now . . . a 'succession' or 'repetition of instants' (Deleuze 2004a: 91). The primary aspect of this contraction is that each autonomous present instant appears seamlessly as a flow. However, this flow also depends upon the future and the past, for the present negotiates the flow of future instants into past instants. So, for Deleuze, the first passive synthesis of time has the present in ascendancy and 'to it belong both the past and the future', they are aspects, or facets of the present (Deleuze 2004a: 91). So future and past are not distinct entities, but the future of the present and the past of the present with respect to the present of the present. This contraction of time both foresees the future and preserves the past but only in as much as it gives 'direction to the arrow of time' (Deleuze 2004a: 91). The past is a form of the present through 'retention', a reservoir of present instants synthesised in the service of the present, for the present. The future is a form of the present as 'expectation', that the next now will follow this now. Thus, for Deleuze, this passive synthesis 'constitutes our habit of living', it is the 'thousands of habits of which we are composed – these contractions, contemplations, pretensions, presumptions, satisfactions, fatigues; these variable presents' (Deleuze 2004a: 94, 100). 'This self', Deleuze makes clear, 'is by no means simple' (Deleuze 2004a: 100).

The second passive synthesis of time is deduced from the first. 'The paradox of the present', writes Deleuze, is to 'constitute time while

passing the time constituted', thus a 'necessary conclusion – *that there must be another time in which the first synthesis of time can occur*. This refers us to the second synthesis' (Deleuze 2004a: 100). Deleuze contrasts the first and second syntheses in this way: if the first synthesis is the 'foundation' of time, the second is 'ground', and the 'ground' might be thought of as the aspect of time which supports the 'foundation' (Deleuze 2004a: 100). Another image: the first synthesis of time is the present, it flows from the now to the past, and from the future to the now – like a river, and the river flows over an earth which supports it. This is the second passive synthesis of time, the ground which allows the present to pass. If the present was the now, and gave direction to time, the past is a chasm of the then. Deleuze names the second passive synthesis 'memory' (Deleuze 2004a: 101). Memory, in this way, is the 'pure, general, *a priori* element of all time' (Deleuze 2004a: 103–4). It is more than just memory in the common usage of the term (just as the first passive synthesis – as will be explored a little later – extends beyond the common sense usage of habit). This pure past is a dominion of paradoxes: 'first paradox: the contemporaneity of the past with the present that it *was* ... Second paradox ... *all* of the past coexists with the new present', the present is merely the razor's edge of generalised past (Deleuze 2004a: 103). Further – third paradox – 'the pure element of the past in general pre-exists the passing present' (Deleuze 2004a: 104). Final paradox, there are an 'infinity of levels' to the past (Deleuze 2004a: 105). From the second paradox we see that the past's relationship with the present is one of domination, the weight of the past bears down on a present which is merely the focal point. This is what leads Deleuze to call the present of the past 'destiny' (Deleuze 2004a: 105). The future of the past, as we have seen with the third paradox, is the way in which we can 'penetrate' the second passive synthesis (Deleuze 2004a: 106). Deleuze calls this 'reminiscence', and – he makes this clear – reminiscence is 'involuntary' (Deleuze 2004a: 107). And this is where the power of the future of the past lies. Thus the infinite levels of the fourth paradox.

It is the power of the future in the past that leads to the conclusion there must be a third passive synthesis. Thus, if the passive synthesis of habit threatens towards consistency and the passive synthesis of memory threatens to close in upon itself, it is a third passive synthesis that 'fractures' this line and closure, which opens up the passive syntheses to life, the universe and everything (Deleuze 2004a: 109). It is a 'caesura' (Deleuze 2004a: 111). It does this because while the first passive synthesis has the future as expectation and the second passive synthesis has it as reminiscence, the third passive synthesis has the future

Table 2.1. The nine dimensions of the three passive syntheses of time

Passive syntheses		Dimensions	
First passive synthesis	Past of the present	**Present the living present**	Future of the the present
Habit	(retention)		(expectation)
Second passive synthesis	**Past the pure past**	Present of the past	Future of the past
Memory		(destiny)	(reminiscence)
Third passive synthesis	Past of the future	Present of the future	**Future the empty future**
Caesura	(experience)	(metamorphosis)	

as an 'empty form of time' (Deleuze 2004a: 108). If the first passive synthesis of time constituted the ground, the second the foundation, the third has 'overturned its own ground' (Deleuze 2004a: 111). The future is unknowable, 'dark', but there are possibilities, 'precursors' (Deleuze 2004a: 145). Its dimensions are the past of the future, this is the past as 'experience', but not one of completion, rather of an experience that is incomplete and reeks of the 'act that is too big' (Deleuze 2004a: 112). The dimension of the present of the future Deleuze names 'metamorphosis', a change or 'a becoming-equal to the act' (Deleuze 2004a: 112). This is the way the empty future allows the present to vary. This is freedom, of a kind.

In summary, the first passive synthesis of time constitutes, for Deleuze, the 'lived, or living, present' and views the past as retention and the future in expectation (Deleuze 2004a: 91). The second passive synthesis of time constitutes, for Deleuze, the 'pure past' and views the present as a destiny and the future as a reminiscence (Deleuze 2004a: 99). The third passive synthesis of time constitutes, for Deleuze 'the pure and empty form of time' which is essentially 'belief in and of the future' and views the past as experience and the present as metamorphosis (Deleuze 2004a: 108). Habit, memory and belief. To be, being and becoming. Foundation, ground and ungrounding. Time's arrow, circularity and eternal return. The three domains of passive synthesis.[2]

What has all of this to do with the cinema? My argument is that Deleuze structures the three domains of the time-image proper (hyalosigns, chronosigns and noosigns) and their nine constituent signs on the three repetitions of the passive syntheses of time and the nine dimensions of temporal difference and repetition. Such a claim must, of course, be tested. The domains of the time-image and the dimensions of

the passive syntheses must be mapped. Some kind of correspondence at conceptual level must be demonstrated.

However, before confronting the devil of such detail, we should first anticipate an objection. It might be posed thus: surely the first passive synthesis of time, the passive synthesis of habit, corresponds to Bergson's habitual memory, the crib and grave of the sensory-motor system... surely the first passive synthesis of time relates to the movement-image? This objection must be addressed, for it seems, on the face of it, quite unarguable. Indeed, a number of writers have put forward just such, or very similar, proposals. In a short discussion in *Deleuze, Cinema and National Identity*, David Martin-Jones argues that the first passive synthesis of habit aligns with the movement-image components of perception-, affection- and action-images; while the second passive synthesis of memory aligns with the mental image category of recollection-images discussed early on in *Cinema 2*. Thus, the third passive synthesis of time aligns with the time-image (Martin-Jones 2006: 60–2). Correspondingly, in a more sustained argument, Richard Rushton, in 'Passions and Actions: Deleuze's Cinematographic Cogito', sees the spectator of the modern cinema encountering film through the third passive synthesis (Rushton 2008). Joe Hughes' 'Schizoanalysis and the Phenomenology of Cinema' is a very different kettle of fish. In a very sophisticated argument that takes in not only *Difference and Repetition* but also *The Logic of Sense* and *Anti-Oedipus*, Hughes schematises thus:

1. Material field	(plane of immanence)
2. First passive synthesis	(perception-image)
3. Second passive synthesis	(affection-image)
4. Third passive synthesis	(action-image)
5. Failure of the third synthesis	(crisis of the action-image)
6. Pure thought, empty time	(pure thought, empty time)

(Hughes 2008: 25)

Hughes is persuasive, his approach anchored within phenomenological coordinates, exploring not only the aforementioned texts but also Kant, Husserl, and Husserl's reading of Kant's *Critique of Pure Reason*, both the A and B editions. The most recent – and radical – contribution comes from Patricia Pisters in 'Synaptic Signals: Time Travelling Through the Brain in the Neuro-Image', and, more fully, in *The Neuro-Image: A Deleuzian Film-Philosophy of Digital Screen Culture*. Pisters aligns the movement-image with the first passive synthesis; the time-image with the second passive synthesis; and creates a new

image – the 'neuro-image' – for the third passive synthesis. This exciting conceptual creation describes, for Pisters, the 'temporal dimensions of schizoanalysis' (Pisters 2011: 261).

Thus, before we can suggest that the three passive syntheses correspond to the three types of time-image, we must initially demonstrate that the first passive synthesis of time does not align with the movement-image, nor indeed, with Bergsonian habitual memory. This will take us a rather circuitous route. However, this is all for the good. Doing so will allow us to propose another, very different, relationship between the syntheses of time and the movement-image.

III. The Dualism That Constitutes a Continual Upheaval in Philosophy

To begin with, let us briefly remind ourselves of the organising principles of the movement-image. Deleuze sets up a correspondence between Bergson's concepts that describe the world of matter (perception→affection→action) and the films of the so-called classical cinema. These movies organise themselves around the sensory-motor response: a character sees, feels and reacts and the act changes the world of the film. From this correspondence Deleuze formulates the initial coordinates of the movement-image: perception-images, affection-images and action-images. Perception-images: images in long shot, describing the vision of a character or a camera consciousness. Affection-images: close-up images of the face, or images in close-up that evoke an emotional response. Action-images: images in medium shot, duels, investigations, discoveries. Together these three different types of images make possible the description of different types of film, but are not enough to describe the classical cinema. Deleuze needs more coordinates, a larger audio-visual conceptual toolkit within this framework. He finds inspiration in the semiotics of C. S. Peirce.

Deleuze evokes a correspondence between the Bergsonian philosophy of matter and the semiotic system of Peirce: first the image affects us; second, we act upon the image; third, the image enters into thought. Yet this correspondence is not without some give. For instance, Peirce's topography begins with how an image affects us, whereas this is not the first category in Bergson, which is perception. Also, Peirce's schema passes beyond action, seemingly the final category in Bergson. In order to reconcile the differences between the two schemas Deleuze invents corresponding terms for each of the other's concepts. He labels Bergsonian perception as having 'zeroness' in reference to Peirce (saying

Peirce takes perception as a given). Peircian thirdness, for Deleuze, describes 'relation' in reference to Bergson and can be thought of as 'the closure of deduction' (Deleuze 2001: 32). In Bergsonian terms this can be seen as a labelling of what Bergson calls 'habitual memory' (Bergson 1991: 85). For Bergson, habitual memory underpins the sensory-motor schema (perception→affection→action) causing recognition and invoking automatic responses. The automatic response is a habit stored up in the body but 'set in motion... by an initial impulse' (Bergson 1991: 80). Simply put, our bodies obey habitual laws based upon a repetition of the perception→affection→action chain. Deleuze uses this compound of Peircian thirdness (thought) and habitual memory (relation) to designate the cinematic concept of the mental image. Mental images have three coordinates. Relation-images, which represent the thoughts of characters on-screen in objects and symbols. Recollection-images, which represent thought through flashbacks. And dream-images, which represent thought as hallucination, from fantasy to nightmares. Thus, for Deleuze, the classical cinema can think in a number of ways. In the first instance 'action, and also perception and affection, are framed in a fabric of relations... [a] chain of relations' (Deleuze 2002a: 200). Another way of representing thought on screen is through the flashback which indicates 'a causality which is psychological, but still analogous to a sensory-motor determinism, and, despite its circuits, only confirms the progression of linear narrative' (Deleuze 2001: 48). Finally, with dream-images there is a weakening the bonds between perception, affection and action yet at the same time they are reconstituted in another narrative in an elsewhere. As Deleuze comments 'dream-images... project the sensory-motor situation to infinity... but we do not, in this way, leave [it] behind' (Deleuze 2001: 273). Mental images are thus expressive images within the domain of the movement-image, classical images of thought. As Peirce puts it, in his description of thirdness (in what could be a parody of a scene from an early German synchronous sound picture):

> our [man], unable to shut out the piercing sound [of a whistle], jumps up and seeks to make his escape by the door... but the instant our man opens the door let us say the whistle ceases. Much relieved, he thinks he will return to his seat, and so shuts the door, again. No sooner, however, has he done so than the whistle recommences. He asks himself whether the shutting of the door had anything to do with it; and once more opens the mysterious portal. As he opens it, the sound ceases. He is now in a third state of mind: he is Thinking. That is, he is aware of learning... and learning is the means by which we pass from ignorance to knowledge (Peirce 2004).

For Deleuze, 'thirdness perhaps finds its most adequate representation in relation' (Deleuze 2002a: 197). Yet the mental images of recollections and dreams also operate in this domain: recollection-images 'seize a former present in the past and thus respect the empirical progression of time' while dream-images conjure up a 'metamorphosis of the situation' by linking dream situation to waking situation and so negotiating the latter through the former (Deleuze 2001: 273). While it is not difficult to assign these mental images to three aspects of time – the present (relation), the past (recollection) and the future (dreams) – they remain in the movement-image, they are spatialised, materialised images of time. So the question remains the same (though seems to have taken on more force): do not mental images – Bergsonian habitual memory – correspond exactly to the first passive synthesis of time? The first passive synthesis constitutes, for Deleuze, the 'lived, or living, present' and views the past as retention and the future as expectation (Deleuze 2001: 91). It is time's arrow, the passive synthesis that gives direction to time, that structures the past, present and future in succession. Is this not recollection-image, relation-image and dream-image? Is the first passive synthesis not the classical image of thought that Deleuze sets up in order to overturn it with the second and third passive synthesis?

Perhaps not.[3] Despite initial appearances, mental images (traditional images of thought that reinscribe the perception, affection and action of the movement-image) are not cinematographic concepts that align with the first passive synthesis of time . . . though this is not to say that mental images and the first passive synthesis are not closely related. Indeed, unpicking these relationships is essential. Let us return to *Difference and Repetition* and listen closely to what Deleuze has to say of the first passive synthesis of time, and the way in which it extends itself. On the one hand – and as we have already seen – it extends into the second and third passive syntheses. From the habituation of the present to the pure memory of the past and finally to the empty, creative future. On the other hand – and this is crucial – the first passive synthesis also extends into active syntheses. At the same time that the first passive synthesis of time is happening, something else occurs: 'the past is no longer the immediate past of retention but the reflective past of representation, of reflected and reproduced particularity'. And 'the future also ceases to be the immediate future of anticipation in order to become the reflexive future of prediction' (Deleuze 2004a: 92). The past of the present (retention) and the future of the present (expectation) become – in active synthesis – reflective. Time (the first passive synthesis thereof) is spatialised. Deleuze summarises thus: 'in

other words, the active syntheses of memory and understanding are superimposed upon and supported by the passive synthesis' (Deleuze 2004a: 92). There are thus two types of the habitual successive present, the active psychological present and the first passive synthesis of the present. As Deleuze puts it: 'it concerns not only the sensory-motor habits that we have (psychologically), but also, before these, the primary habits that we are; the thousands of passive syntheses of which we are organically composed' (Deleuze 2004a: 95). This organic body is not simply a psychological subject, but a body without organs, or as Deleuze puts it before he has appropriated this concept 'a soul must be attributed to the heart, to the muscles, nerves and cells' (Deleuze 2004a: 95). Thus, while the first active synthesis is carried out by the mind, 'this living present or *passive synthesis* which is duration' rather 'occurs in the mind which contemplates, prior to all memory and reflection' (Deleuze 2004a: 92, 91).[4]

This is the crucial point. There is a double aspect to the three syntheses of time: the temporal layers of the three passive syntheses and the spatialised structure of the active synthesis that is built upon them. The first passive synthesis of time 'redeploys in the active synthesis of a psycho-organic memory and intelligence (instinct and learning)' (Deleuze 2004a: 93). And this redeployment occurs for both the second and third passive syntheses as well:

> We must therefore distinguish not only the forms of repetition in relation to passive synthesis but also the levels of passive synthesis and the combination of these levels with one another and with active syntheses. All of this forms a rich domain of *signs* which envelop heterogeneous elements and animate behaviour... Each contraction, each passive synthesis, constitutes a sign which is interpreted or deployed in active synthesis. (Deleuze 2004a: 93–4)

We are now in a position to interpret this as follows: rather than the first passive synthesis of time corresponding to the movement-image, the movement-image corresponds to active syntheses. In other words, the active and passive syntheses are another way of figuring Bergson's '*two forms of memory*', habitual memory and pure memory (Bergson 1991: 79):

> the past appears... to be stored up... under two extreme forms: on the one hand, motor mechanisms which make use of it; on the other, personal memory-images which picture all past events with their outline, their colour and their place in time... the first, conquered by effort, remains dependent upon our will; the second spontaneous. (Bergson 1991: 88)

On the one hand, habitual memory, which underpins the sensory-motor schema and is of the movement-image and specified by relation-, recollection- and dream-images. On the other hand, pure memory, which underpins the time-image. The time-image is 'non-chronological time, Cronos and not Chronos', which corresponds to the movement-image (Deleuze 2001: 81). The difference is marked by the absence of a single consonant. So close, so difficult, perhaps impossible, to separate. Deleuze chooses to use these similar (and often confused) terms in *Cinema 2*, rather than the more familiar Chronos and Aion. This interaction is one of the fundamental themes running throughout Deleuze's work. For instance, in *The Logic of Sense*, written at the same time as *Difference and Repetition*, a book of 'paradoxes', which examines the 'play of sense and nonsense', of 'chaos-cosmos', takes as its central paradox the Stoics' 'two kinds of things' (Deleuze 2004b: ix, 7). The first kind of thing is the body, the second kind of thing is 'impassive' entities. 'There are two times' and their division is figured in this way: 'one is cyclical, measures the movements of bodies and depends upon the matter which limits and fills it out; the other is a pure straight line at the surface, incorporeal, unlimited, an empty form of time, independent of all matter' (Deleuze 2004b: 71).

> Whereas Chronos expressed the action of bodies and the creation of corporeal qualities, Aion is the locus of incorporeal events, and the attributes which are distinct from qualities. Whereas Chronos was inseparable from bodies which filled it out entirely as causes and matter, Aion is populated by effects which haunt it without ever filling it up. (Deleuze 2004b: 189)

Deleuze writes that 'this new dualism of bodies or states of affairs and effects or incorporeal events entails an upheaval in philosophy' (Deleuze 2004b: 9). It is this upheaval that Deleuze, in all his work, is keeping alive.[5] Chronos and Aion (Cronos) from the Stoics, matter and memory from Bergson; the active and passive syntheses of *Difference and Repetition*, the movement-image and time-image of the *Cinema* books.[6]

IV. Mapping Passive Syntheses and Time-Images

Yet it is not simply the case that the three time-images proper exemplify the three passive syntheses of time in general. The correspondence could be much deeper than this. It can be shown that the philosophical concepts of the nine dimensions of the past, present and future are embodied as the cinematographic concepts of the nine signs of hyalosigns, chronosigns and noosigns.

Hyalosigns can be seen to correspond with the first passive synthesis of time. This first passive synthesis is that of the 'lived, or living, present', the 'thousands of habits of which we are composed' (Deleuze 2004a: 91, 100). Hyalosigns are cinematographic images that appear in the now, where 'the actual [image] is cut off from its motor linkages', instead exploring 'the coalescence of an actual image and *its* virtual image' (Deleuze 2001: 127). This image in the now, this hyalosign, is a crystal-image and Deleuze identifies three aspects. First, the actual image describes a mirroring: 'oblique mirrors, concave and convex mirrors and Venetian mirrors', 'two facing mirrors', and a 'palace of mirrors' (Deleuze 2001: 70). Here the body and environment appear in the mirror, indiscernible (is this the actual? is this the virtual?). These crystalline images describe the thousands of habits of which we are composed – the contraction of the fragmentation that we are, our living present. Second, actual and virtual images enter into an exchange: one becoming limpid as another becomes opaque. Back and forth, an 'exchange' that is (once again) indiscernible. The actual image is in the present, but the virtual image is a past of the present, a retention. The virtual image appears with the actual image, constituting the 'smallest internal circuit' (Deleuze 2001: 70). Third, actual and virtual images appear as the seed and the environment. The present is the seed, the future of the present an environment in relation to that seed, an expectation, an anticipation – though not as a sensory-motor extension (actual chronological succession) but rather as an indeterminate (virtual) illumination. The future is now: 'as pure virtuality, it does not have to be actualised' (Deleuze 2001: 79). The three images of the hyalosign thus describe the three dimensions of the first passive synthesis of time: the living present, the past as retention and the future as expectation. 'What we see . . . in the crystal is time, in its double movement of making presents pass, replacing one by the next while going towards the future, but also preserving all the past, dropping it into an obscure depth' (Deleuze 2001: 87).

Chronosigns can be seen to correspond with the second passive synthesis of time. This second passive synthesis is 'memory', the 'pure, general, *a priori* element of all time' (Deleuze 2004a: 101, 103–4). Chronosigns, unlike hyalosigns which appear as images in the now, are narrations as narratives. Narratives after narration: the film is a reconstitution involving the dimensions of the past. As Deleuze puts it, chronosigns 'no longer concern . . . description, but narration', a narration of 'false continuity' where 'crystalline narrations will extend crystalline description' (Deleuze 2001: 127). These false continuities take

three forms. First, the 'coexistence of all the sheets of the past' which disrupt the order of time (Deleuze 2001: 99). The film resists linear organisation but jumps between circles of the past. The film is the pure past, an 'infinity of levels' (Deleuze 2004a: 105). Second, some films are chronosigns in that they explore the present of the past, as Deleuze puts it, the peaks of the present. He writes: 'narration will consist of the distribution of different presents to different characters, so that each forms a combination that is plausible and possible in itself, but where all of them together are "incompossible"' (Deleuze 2001: 101). This kind of film also disrupts the order of time, 'gives narration a new value, because it abstracts it from all successive action' (Deleuze 2001: 101). Rather, the narrative appears in the repetitions of the different presents. In this way the past(s) dominate(s) the present(s). This is the past as the destiny of the present – not in the sense of prescribed fate (a retroactive now which would require an unambiguous and actualised linear trajectory) but rather in the sense of 'setting time free' (Deleuze 2001: 102). Destiny is freedom. And freedom is choice, the choice between 'inextricable differences' (Deleuze 2001: 105). Third, films can also explore the power of the false. Narration 'becomes fundamentally falsifying', it 'ceases to be truthful, that is, to claim to be true' (Deleuze 2001: 131). Crucially, as Deleuze puts it 'this is not a simple principle of reflection or becoming aware: "Beware! This is cinema." It is a source of inspiration' (Deleuze 2001: 131). This chronosign is no longer content simply to disrupt the order of time, instead the narrative strategy is one of 'a series of powers, always referring to each other and passing into one another' (Deleuze 2001: 133). Difference and repetition, the repetition of themes, events, symbols, bodies, positions, objects, environments in difference: serialism. Reminiscences – the past in service of the future, interweaving, transformational memory. The three images of the chronosign thus describe the three dimensions of the second passive synthesis of time: the pure past, the present as radical destiny, and the future as energetic reminiscence. Chronosigns are narratives that 'shatter the empirical continuation of time, the chronological succession, the separation of before and after' (Deleuze 2001: 155).

Noosigns can be seen to correspond with the third passive synthesis of time. This third passive synthesis is a 'caesura' exploring the future as an 'empty form of time' (Deleuze 2004a: 111, 108). Noosigns are thus events which 'force . . . us to think', events which 'force . . . us to think what is concealed from thought, life' (Deleuze 2001: 189). While hyalosigns are images and chronosigns are narratives, noosigns are events that occur through the bodies and environments of the film: the

mise-en-scène and actors. Thought, then (our thought, the spectator's thought), is not engendered as a consequence of a sensory-motor linkage between the character and the situation, and the concomitant identification of character to subject and filmic situation to real milieu, but rather through the absence of such relationships. In the absence of such a link, thought becomes us. These thought images can occur in three ways. First, the actor does not perform an act of mimesis, but adopts 'the everyday body', a body of 'daily attitude' (Deleuze 2001: 191). This involves strategies such as exposing the fatigues, the ticks, the inabilities of the body. Here the body is circumscribed by experience, the future of this body is a secretion of its past. Second, the actor can foreground a performance, execute a 'ceremonial body' (Deleuze 2001: 191). This is the body of the 'gest' and 'carries out a direct theatricalisation of bodies' (Deleuze 2001: 192, 194). These bodies occur 'independently of the plot' and in this sense are in the present, a direct performance orientated towards the future as metamorphosis. The body is not a function of the situation, but transforms the situation from the outside. The final image of the noosign involves the *mise-en-scène*, the environment. It does not depend upon the physical presence of an actor, but the backgrounds, the lighting, the colours and sounds of the world of the film. Deleuze names this the 'cinema of the brain'. For Deleuze, certain films explore the 'identity of the brain and world' where 'landscapes are mental states, just as mental states are cartographies' and form a reciprocal 'noosphere' (Deleuze 2001: 205). The noosphere is a zone of nothingness that fractures the coordinates of the film. It is here, in this final aspect of the noosign, in this final aspect of the time-image, that cinema explores the future as terrifyingly dark, as an unending night… and conversely, as infinitely open. For the environment is immense, without horizon, without bounds. The three coordinates of the noosign thus describe the three dimensions of the third passive synthesis of time: the past as experience, the present as metamorphosis, and the future as infinitely empty. Noosigns are the events of cinema that transpire between bodies and environments: 'the brain gives orders to the body which is just an outgrowth of it, but the body also gives orders to the brain which is just a part of it' (Deleuze 2001: 205).

V. By Way of Conclusion…

What to make of this attempt to isolate and tabulate the elements of the time-image? I wanted to discover what would happen if I did not accept the signs and images of the time-image as arbitrary, or conjured

Table 4.1. The nine dimensions of the three passive syntheses of time and the nine signs of the time-image

Images		Dimensions and signs		*Passive syntheses*
1 Hyalosigns	Past of the present (retention)	**The living present**	Future of the present (expectation)	**First passive synthesis**
	Limpid and opaque	Mirrors	Seed and environment	Habit
2Chronosigns	**The pure past**	Present of the past (destiny)	Future of the past (reminiscence)	**Second passive synthesis**
	Sheets of the past	Peaks of the present	Powers of the false	Memory
3 Noosigns	Past of the future (experience)	Present of the future (metamorphosis)	**The empty future**	**Third passive synthesis**
	Body of attitude	Body of *gest*	Brain	Caesura

from modernist cinema. But then where did they come from? Was there an unarticulated framework? By specifying the cineosis of the *Cinema* books, tabulating movement-images and time-images, this served as a clue that led me on to explore the continuities with Deleuze's earliest foundational work, *Difference and Repetition*, and in turn to consider the categories of the time-image as being engendered by Deleuze's three passive syntheses of time. Indeed, the production of this mapping has also suggested an alignment of the movement-image with the active syntheses, the psycho-organic subject that is superimposed upon the passive syntheses of habituation, memory and empty future. Hence my claim that before Bergson's *Matter and Memory* provides the visible framework of the cinema books, it is the syntheses of time explored in Deleuze's own *Difference and Repetition* that constitute their embedded originary structure.

Notes

1. For references to Gilbert Simondon see Deleuze and Guattari 2004: 46, 66n11, 19, 573–4); see also Deleuze's 'On Gilbert Simondon' (Deleuze 2004b: 86–9).
2. I refer the reader to James Williams' *Gilles Deleuze's Difference and Repetition* (2004) and Jay Lampert's *Deleuze and Guattari's Philosophy of History* (2006). Both set out, in very different ways, to explore proofs and critically engage with *Difference and Repetition*. Both are great books.
3. Jay Lampert intimates just such a view:

> Many treatments of Deleuze describe in appealing ways his account of time, but little work has yet been done to analyse his arguments for it. As a result, Deleuze's first synthesis of time, the time of organic succession, is not as well known. When discussed at all, succession is generally treated as the false or superficial notion of time that co-existence is meant to replace. But Deleuze's philosophy does not devalue the categories of life and desire that characterise temporality of succession . . . Furthermore, Deleuze's description of succession is not merely a standard account of time setting the stage for his original contributions concerning coexistence; it is full of provocative and original arguments in its own right. (Lampert 2006: 12)

4. Towards the end of his exploration of the first passive synthesis Deleuze writes, regarding Samuel Becket: 'it is undoubtedly one of the more profound intentions of the "new novel" to rediscover, below the level of active synthesis, the domain of passive syntheses which constitute us' (Deleuze 2004a: 100). Correspondingly, in *Cinema 2* Deleuze aligns the 'new novel' with the 'new cinema': 'if the new cinema, like the new novel, is of considerable philosophical and logical importance, it is first of all because of the theory of descriptions it implies' (Deleuze 2001: 45).
5. For a wider discussion of the way in which the Stoic conception of time impacts the *Cinema* books, particularly in regard to cinema history and history in general, see Deamer 2009.
6. We must tread carefully here. I am not suggesting that films of the movement-image = the active syntheses of time; and that films of the time-image = the passive syntheses of time. This would be an extraordinary and unsustainable

claim, amongst other things collapsing philosophical and artistic thought (see Deleuze and Guattari 2009 for their discussion of the three great types of thought). Film in-itself is a complex weft and weave of chronos and cronos, of the actual and the virtual, of passive and active synthesis. Patricia Pisters' *The Matrix of Visual Culture: Working with Deleuze in Film Theory* (2003) is exemplary in this regard, exploring how movies interweave passive and active affects. I am simply arguing that the philosophical concepts of the syntheses of time inspire the filmic concepts of the *Cinema* books, and that the concepts and components of the three passive syntheses of time can be seen to echo the structure of the conceptual framework of the time-image taxonomy.

Becoming-Rhythm: A Rhizomatics of the Girl

Leisha Jones Penn State University

Abstract

I appropriate Deleuze and Guattari's concept of the refrain for a feminist analysis of the girl because it offers more insight into the ways girls construct themselves as performative networks than the death-by-culture or at-risk model preferred by such feminists as Jean Kilbourne, Carol Gilligan, and even Susan Bordo. I proffer that it costs women everything to practise a politics of difference that is by definition reactionary, a reaction to the cultural refusal of leaky gendered bodies that must be overcome. Girl is mapped through such alternations as powerful aggregates of the tremulous, roaming emissions of monstrous particles most desired and desirous.

Keywords: feminism, woman, girl, girl studies, rhythm, refrain, style, becoming, women's studies, girl branding, feminist cultural studies

Theorists configure the contemporary figure of girl as either a smaller version of woman, replete with a naturalised status of victim or at least victim-in-training, or as a totally 'othered' teenage beast whose hormones make her even more out of control than her grown-up counterpart. What do girls and women have in common besides essentialised and mystified erogenous zones, and less money in their pay packets? Where do the contours of the girl merge and diverge from the contours of woman? How might referencing and championing the mark of the girl mean something more than an ageist erasure or backhanded compliment? In an attempt to map those legs as they walk, dance and stomp through the 'problem with no name', I deploy Deleuze and Guattari's notion of the refrain, and parse and explore its rhythms in order to render a feminist rhizomatics of the girl. The generation of

a feminist analytical model for girls that does not reduce them to abject objects of study culturally constructed to the point of despair requires that this rhizomatics begin with a teasing out of girl from the rubric that surrounds her – woman.

Deleuze and Guattari don't spend much corpus time worrying over the question of molar woman (or woman in 'real life'), the one who is subject to structural devaluations of her cultural production. They spend even less time on the girl, though she is configured as an appropriated Alice in *The Logic of Sense*, and as 'the becoming-woman of each sex' in *A Thousand Plateaus* (Deleuze and Guattari 1987: 277).[1] They prefer to focus on the molecular, and use 'woman' as one categorical outsider (among others) who has the capacity to mutate, and to block the machinery that creates and maintains the subject (man). Molar woman, who has a body, functions, and an assigned subjectivity, must disarticulate herself, enter into a microfemininity of particles that is becoming-woman in order to bypass the quagmires of psychoanalytic failings. *Becoming-woman* is distinct from *being* a woman. Woman belongs to a category of subjects, a noun, with parameters, distinctions, pre-determined limits. Becoming-woman is a process, a verb, a shape-shifting capacity whose inception offers more possibility than the exemplar of feminism's social constructions. In '1730: Becoming Intense, Becoming-Animal, Becoming-Imperceptible...' a multi-levelled chain of becomings is outlined in which becoming-woman precedes becoming-animal, to conclude with becoming-imperceptible – the immanent end of becoming (Deleuze and Guattari 1987: 279). Woman herself is a mere phase on the way to some elsewhere.

There are many concerns feminists have brought to bear upon Deleuze and Guattari's philosophies regarding women. Luce Irigaray in *Ce sexe qui n'en est pas un* (1977) and Alice Jardine in *Gynesis* (1985) both launch critiques of the 'body without organs' and 'becoming-woman'. Jardine concludes that '[i]f these men were to accept the challenge of their own work, they would see that it is up to them to requestion their assumptions about Desire (capital D)... It is of course up to women not to disappear from that space of exploration' (Jardine 1985: 223). Rosi Braidotti's trenchant analysis highlights a disturbing effect becoming-woman produces as a through-way:

> one cannot deconstruct a subjectivity one has never been fully granted... in order to announce the death of the subject one must first have gained the right to speak as one; in order to demystify meta-discourse one must first gain access to a place of enunciation... We must rethink feminist theory starting

> from the insight of post-structuralist philosophy, especially that of Deleuze, without however being confined by its often disappointing conclusions and implications. (Braidotti 1991: 122; 146)

In *Volatile Bodies*, Elizabeth Grosz lists the advantages and drawbacks of deploying Deleuze and Guattari for a feminist philosophy of woman (Grosz 1994: 173–83), cautiously weighing in favour of a 'selective reading and use of their work . . . to capture and put to work valuable methodologies, questions, insights that may lead in directions Deleuze and Guattari may not go or even may not accept' (Grosz 1994: 180). Tamsin Lorraine suggests that becoming-girl and becoming-woman hold a privileged relation to the unconscious realm that might resonate with Irigaray's notion of the feminine, but Deleuze and Guattari's failure to account for the risk involved in the dissolution of an identity that is already in peril describes a masculine becoming with a masculine bias (Lorraine 1999: 186). Dorothea Olkowski devotes a whole chapter to these critiques ('Can a Feminist Read Deleuze and Guattari?') in which she explicates other feminists' concerns before moving on 'to what in Deleuze and Deleuze-Guattari I can make use of in my own work' (Olkowski 1999: 58).

Building on the works of Jardine, Braidotti and others mentioned, the primary feminist critiques of Deleuze and Guattari's configuration of woman and becoming-woman, as articulated throughout the essays of Buchanan and Colebrook's edited collection *Deleuze and Feminist Theory* (2000), emphasise that (1) just when women finally obtain the status of the subject it is rejected as a viable category from which to conceptualise a framework for possibility, and (2) the appropriation of 'woman' for a category of becoming not only situates woman once again in the service of man, but renders her a vector one moves through and leaves behind on the way to becoming-elsewhere.

Deleuze and Guattari do give a nod to the matrix of power relations 'real' women must negotiate in order to act in the world, with a strong warning against the weight of a subject congealing: 'It is, of course, indispensable for women to conduct a molar politics, with a view to winning back their own organism, their own history, their own subjectivity: "we as women. . . " makes its appearance as a subject of enunciation. But it is dangerous to confine oneself to such a subject, which does not function without drying up a spring or stopping a flow' (Deleuze and Guattari 1987: 276). In advocating the inclusion of Deleuze and Guattari's philosophy in a contemporary feminist toolbox, Claire Colebrook suggests that 'feminism has a different type of

theoretical heritage, where questions have always been voiced in terms of what thought might become (rather than the correctness of this or that model)' (Colebrook 2000: 10). In an attempt to honour this feminist heritage, and instead of trying to instantiate the presence of feminist trajectories in Deleuzian thought or simply trying to get Deleuze and Guattari right, I am appropriating Deleuze and Guattari's concept of the refrain for a feminist analysis of the girl because it offers more insight into the ways girls construct themselves as performative networks than does the death-by-culture model preferred by such feminists as Jean Kilbourne,[2] Carol Gilligan,[3] and even Susan Bordo.[4] Deleuze and Guattari's iterations on sound, living creatures, habitats and habits prove more descriptive of the territories of girl than do their brief nod to the slightly more privileged portal of becoming-girl.

As a feminist, such a project offers me a tenable way to enter into the discourse of the girl armed with a 'becoming' that is not reliant upon a psychoanalytical configuration of woman. By theorising outside this overdetermined box, one begins with action, deploying powerful rhythmic flows. In other words, girls produce rhythmic tactics for becoming: ways to hack cultural significatory regimes by learning to recognise, hover upon, flow around and through the contours that will shape them into subjects. Their liminal status allows for and assures their molecular configurations. A feminist rhizomatics of girl also traces interventions in the production of subjectivities – the ways in which becoming troubles the primacy of the subject as mode of being. Like Deleuze and Guattari, however, I do not argue for the entire abandonment of feminine modalities, but rather that the project of feminism needs to reconfigure embodiments of gender through becoming something other than Subjects or their lacking binary counterparts; and that rhizomatic practices of flow through contagions of non-Oedipalised becomings may offer feminists more than a womb with a view.

I. If Woman is the Refrain, Rhythm is the Girl

My rhizomatics of the girl begins here, with woman. If girl is rhythm, she exists as a vibratory assemblage engendered by a refrain. She is the exuberance of molecular immanence that gives shape and movement to and between milieus. Girl and woman share related contagions of femininity and vectors of desire. Woman is an actor; girl is a pack. But what is woman? Deleuze and Guattari's notion of the refrain does much to describe the shape of woman, her capacities to fix and flow, to straddle chaos as nutcracker, footprint and bridge. It is her proclivity to touch

the big black hole, join with it, break away, survive, and do it again that colours her not beautiful but contaminated. What bleeds but does not die? The Deleuzian refrain proper refers to animals in their habitats as well as the sounds of music. Woman as refrain is another name for force, a sonorous beast of possibility. I claim neither essential physical nor emotional characteristics for woman except for her ability to act and to engender. If woman is refrain, then her role is territorial. She demarcates and assembles. Her landscapes are 'amorous, professional or social, liturgical or cosmic' (Deleuze and Guattari 1987: 312). She builds tunnels, decorates bedrooms, opens gateways, locks boxes, connects structures, jettisons to elsewhere. She taps the forces of chaos, constructs deflectors and one-way signs. She ties packages with ribbons and bows. She is girl's modal counterpart, recognizable in metered pace and measured step. Woman as refrain, generator of home and mitigator of chaos, occupies the privileged status of a Deleuzian becoming while negotiating the material concerns of an embodied subject.

For Deleuze and Guattari, milieus and rhythms are born out of chaos. Milieus are the vibratory constituting walls that comprise living things or territories. Exterior milieus make up flesh, surface and exoskeleton; interior milieus are generative materials such as blood and bile; intermediary milieus function as permeable membrane; and annexed milieus host energy sources, impulse and stimulation. Milieus communicate, pass in and out of each other, and maintain contact with the chaos that is ever threatening.

One effect produced by milieus' exposure to chaos is rhythm, the in-between-ness or liminal force of chaos becoming:

> Between night and day, between that which is constructed and that which grows naturally, between mutations from the inorganic to the organic, from plant to animal, from animal to humankind, yet without this series constituting a progression... In this in-between, chaos becomes rhythm, not inexorably, but it has a chance to. Chaos is not the opposite of rhythm, but the milieu of all milieus. There is rhythm whenever there is a transcoded passage from one milieu to another, a communication of milieus, and coordination between heterogeneous space-times. Drying up, death, intrusion have rhythm... [R]hythm is the Unequal or the Incommensurable that is always undergoing transcoding. (Deleuze and Guattari 1987: 313)

Rhythm is the girl. She is found in the flow between constituents. The refrain of woman territorialises milieus that exist because they are performed again and again, milieus such as home, food, pleasure. As Judith Butler claims in *Bodies That Matter*, a reiterated acting 'is power

in its persistence and instability... a process of materialization that stabilizes over time to produce the effect of boundary, fixity, and surface we call matter' (Butler 1993: 9). For Deleuze and Guattari 'It is the difference that is rhythmic', and here that one can find the girl in every refrain (Deleuze and Guattari 1987: 314). The productive repetition of the refrain is not *re*-productive, does not birth the girl. Girl is the proper name for becoming, a 'surplus value' of the territorialising or bridging role of the refrain.

The rhythm of a refrain sometimes engages with something quite tangible, that of the Territory of a Body. From savage media accounts to protective sociologies of girls and popular culture, the girl body is defined as an exploited and contested territory precisely because it is read as malleable, controllable, decidable and effectless. Why is this body so over-determined? How does one even locate the body of a girl? The whole of the girl body is built of milieus and marked by indexes referring to still more milieus. It becomes recognizable as a territory when its components change from being directionally constitutive (acting, responding, organising) to dimensionally expansive (marking, signing, performing), 'when they cease to be functional to become expressive' (Deleuze and Guattari 1987: 315). With the becoming-territory of organs and desire, the body is readable to us as surface, as signature. The rhythm that is girl performs this body as a feminine refrain, makes it a girl body through a transcoding of indexes both historically gifted and made up on the fly. This territory glistens with cultural residues – thick smears of lubricating wax buffed to shine, to bind, to uniform and to preserve that body which is ripening-fruit perishable. We traverse the codes of her territory and read pink, smelly, delicious, vicious, in-flux. We are coated in Taylor, Rihanna, Hannah Montana or Miley Cyrus.

II. Menstruating and Bleeding: Girl Planes of Function and Expression

The girl marks; the territory is established. The refrain or territorialisation that produces territory and expressiveness is an act of rhythm. A becoming-expressive of rhythm generates both the plane of functions and the plane of expressions. The plane of functions is organised or created because it is territorialised, not territorialised because of its a priori existence. This plane of girl bodies occurs because it is organised (territorialising refrain). Girl, girl, girl, girl again produces possibility. Neither internal nor external forces organise the girl body

in response to its functions, or the possibilities created by them: girl is not an originary unruly bloody mass of desire that must be corralled and sequestered. Girl functions as a result of the feminine refrain she performs for herself not as agent but as transient. This is important to note because hegemonic 'societal' and familial forces are tapped as chief architects in the actual construction of girls' bodies. In this version of the chicken and the egg story, there is no girl around which to found Rapunzel's tower. She is not born as a clean slate, ready to actualise the desires written upon her verbatim. She functions because of her own rhythm and engages with desires of all kinds. It is her performance of the functions that challenges the nature/culture divide.

One example of how the plane of functions works on the literal body involves the arrival of a new function. A 'function' or capacity a girl's body often develops through puberty is the capacity to reproduce. If the girl body reaches this moment through her own genetically and environmentally inflected hormonal clock, then she will most likely experience menarche. She menstruates because she is an aggregate; she is not a girl because she menstruates. Menarche as a function occurs whether or not the girl has been informed about its nature, whether she has been taught to perform it as celebration or curse, whether she is nine or eighteen (see Camporesi 1991). Cultural cues about appropriate responses to menstruation do not alter the fact that she menstruates (see Leigh and Sasser-Cohen 1996: 37–58). The girl may choose to control this function using hormonal therapies engineered to suppress menstrual flow, she may use pads to avoid touching the insides of her body, or a cup to measure a day's fluid output. We can read her performance of menstruation on the plane of expressions.[5] It is on this plane that the girl bleeds. The plane of expressions constituting girl bodies marks that function.

Again, rhythm occurs on two planes, one of expressions and one of functions. The plane of expressions runs rings around the functional. Girl marks are visible, tangible evidence of a presence. We have developed systems of codification for evaluating them, including why they are generated, what this evidence might mean, who is responsible for the variety of 'unhealthy' marks girls make, and how we can interfere with the repetition of sign productions that make us uncomfortable. I believe this vector to be currently so seductive to critics because it is overwhelmingly comprised of practices that manifest themselves visually. In his comprehensive treatise on visuality, *Downcast Eyes: The Denigration of Vision in Twentieth-Century French Thought* (1993), Martin Jay situates the ascendency of the visual as primary conduit

and receptor of information, including the complicated relationship between sight and language. 'The remarkable ability of images originally construed as mimetic representations or aesthetic ornaments to be transformed into totemic objects of worship in their own right also bespeaks vision's power to evoke hypnotic fascination' (Jay 1993: 11). Dissection, interpretation and evaluation of girl images de-centers the girl, her desires, and her capacities from her own mark-making.

The 1960s and 1970s liberation movements in the US effected pedagogical changes in the framework for conceptualising public modes of expression. No longer limited to those with sanctioned rarefied talent, self-expression became as easy as breathing, wearing your politics on your sleeve. We are all special, and are encouraged to reveal our uniqueness through consumer choices.[6] Does expressing oneself constitute the practice of art making? If the becoming-expressive of rhythm is art, that would mean the territory, or for our purposes here the girl body, occurs as a result of art. Deleuze and Guattari write of this phenomenon in the context of coral fish:

> The expressive is primary in relation to the possessive; expressive qualities, or matters of expression, are necessarily appropriative and constitute a having more profound than being. Not in the sense that these qualities belong to a subject, but in the sense that they delineate a territory that will belong to the subject that carries or produces them. These qualities are signatures, but the signature, the proper name, is not the constituted mark of the subject, but the constituting mark of a domain, an abode. (Deleuze and Guattari 1987: 316)

For all living creatures, including girls, becoming expressive marks the territory that is an aggregate body. If art creates the body, the functioning unit comprised of planes and milieus, then the body is a signature of affect-appropriation, bricolage, sheddings and flow. One can read the effects of engagement with the world upon its surface, its construction, like flashing neon atop a building.

Postmodern artists use such processes to create art in a time when everything has already been done before, and the sign of innovation is the capacity to de-contextualise ready-mades and generate endlessly iterable 'fakes' in order to make them sign differently. The most famous examples include Marcel Duchamp's 'Fountain' and Andy Warhol's soup cans. Sherrie Levine's feminist approach is to appropriate paintings, photographs and sculptures created by blockbuster artists such as Walker Evans and Constantin Brancusi to question the status of art object as rarefied fetish and artist as master/genius/male. 'I try to

make art which celebrates doubt and uncertainty. Which provokes answers but doesn't give them. Which withholds absolute meaning by incorporating parasite meanings. Which suspends meaning while perpetually dispatching you toward interpretation, urging you beyond dogmatism, beyond doctrine, beyond ideology, beyond authority' (Walker Art Center 1991).

III. Generating the Territory of the Girl Body from Mark-Making to Branding

Girls categorically mark their territories in similar ways. Expressiveness makes their bodies visible, functional, readable. They are not merely responding to seductive ploys from advertisers, parental imperatives, or peer pressure. Responses to these external stimuli more often take an emotional, subjective form that does not inspire action. Girl cannot sign as if she were a mirror or a saturated and leaking sponge. Her expressive qualities, those that so capture what we have come to define as girl, are 'auto-objective'. According to Deleuze and Guattari, they 'find an objectivity in the territory they draw' (Deleuze and Guattari 1987: 317). In other words, art as a generative process cannibalises, reorders and produces a sign that is 'objectively' recognizable and repeatable for the artist. The toddler draws a circle. 'Pig', she says. Twenty minutes later she draws another circle, 'Ball'. A day later she makes another, 'Sun'. She finds difference in the same gesture with each performance. This is the auto-objective act of territorialisation. It does not matter that all you see is circle.

Korean-American filmmaker Grace Lee interrogates the 'generic Asian girl' expressive pack constituted by her namesakes in the *Grace Lee Project* (DVD, Women Make Movies, 2005). Assumptions about the aggregate 'Grace Lee' are both confirmed and dispelled through surveys and interviews with women and girls named Grace Lee. According to the 398 survey respondents from 23 countries, Grace Lee as a multiple unit is statistically Korean or Chinese, in her twenties or thirties, with combination skin and pets, who has studied piano for five or more years.[7] While these statistics are culled from participants who have access to and interest in contemporary art and/or documentary films, they do reflect a 'brand' the girls have encountered, initiated and responded to themselves. The ready-made Graces under consideration mark through preset codes of 'petite', 'gentle' and 'smart', a culturally wrought ethnic identity of difference in the same, a collective counter-sign expression that complicates the distinctions between the production

of 'real' identities and bodies, and the mis-performed or fake. For the Graces and the conceptual persona girl, they come to know their territories as they draw them, using what appears to be the same closed set of readable marks as signs whose referents remain in flux.

Mark-making remains an incontrovertible gesture of visibility as the practice heralds a co-signing of symbols and movements already in play. But what of the amalgam of marks known as a brand? Anita Harris addresses the two most prevalent twenty-first-century girl 'brands' or current identity categories: the 'can-do' girl and the 'at-risk' girl. Can-do girls 'are identifiable by their commitment to exceptional careers and career planning, their belief in their capacity to invent themselves and succeed,... their display of a consumer lifestyle,... and a desire to put off childbearing until "later".' The 'low ambition' at-risk girls suffer from 'a lack of a sense of power or opportunity,... inappropriate consumption behaviors', mental health problems, and earlier pregnancies (Harris 2004: 14). While there is corroborated worry over the fate of both brands of girls, the key to tracing, tracking or theorising them lies more in the marks or brands they themselves exert and amass across a smear of surfaces than in intra-brand cohesions.

I argue that the refrain provides another way to look at the phenomenon of branding that is not unique to any specific group of girls. The so-called insidious forces of popular culture are often blamed for damaging girls' self-esteem and putting them 'at-risk' by flaunting impossible supermodel bodies in ad campaigns that turn girls away from important practices, such as studying, playing sports and eating/eating well, in favour of body maintenance and self-objectification. But as girls willingly and unwillingly submit themselves to thousands of ads each year, they do produce ways of critically engaging the content, complicating divisions between current girl uberbrands. These at-risk girls can-do rather automatically. For example, a sample of young teen girls in the 2000 documentary *What a Girl Wants* claims to distinguish between Britney Spears as marketing creation and as an actual girl. They are critical of her image as girl diva and suggest that it might be dangerous to affix 'girl' so tightly to 'sex object'. Most of them aren't yet interested in having sex or revealing their bodies in similar ways. However, they also say she is pretty, has money and power, and these things are very attractive – what girl doesn't want money, power and recognition?

The Britney brand has taken quite a hit since then. After her 'bad mommy' photos, heavily reported underpantless romps and shaved-head

breakdown, she is no longer considered a teen role model. Though currently climbing back up via attempts at reinvention, the brand fell to an all-time low in 2007, with *Salon* reporting on a website that offered a DIY Britney Halloween costume:

> Choose your 'Britney character', decide what to buy or what to use from your closet. People with small budgets can easily find a skirt and an Oxford shirt that they can 'crop' by tying ends together to be 'One More Time Britney.' A short blue dress with a few additions can be turned into 'Toxic Britney.' More money and more creativity may be involved to make 'Slave Britney' or 'Oops Britney' . . . Avoid 'Crazy Britney.' It's probably not the best idea to go trick-or-treating with a shaved head and a baseball bat.[8]

It seems that instead of being awash and drowning in an impenetrable pool of images, these girls recognise advertising brands such as 'Britney' as generated for them but not reflective of them, and they can critically negotiate the tensions between 'real life' and 'imagined life', while acknowledging the seductiveness of the image. They record brand loyalties as bodily refrains, torquing through gesture rather than reproducing through mimicry. Girl rhythms supersede predications of congealed identity categories, whatever their brand, rendering can-do and at-risk refrainless, the same in the same.

Girl brands exist on the surface of virtual and actual bodies. When does the signature effect of girl body become style? Shifts between the inner milieu of 'impulses' and the exterior milieu of 'circumstances' elaborate a style that is independent within its own relations of production. Just as the desire to draw and name connects up with a geometry of bodies and objects for the toddler to produce her own landscape of circle creatures, so do internal impulses or drives intersect with external prescriptives and experimental engagements to produce a personalised surface for the girl. Expressions function as posters, establishing the territory in flat saturated colour like coming attractions on a theatre marquee. We recognise girl most often here as an amalgam of parts. Style emerges as an expression of engagement between the territory and its outer and inner stimuli. Girl style is a complicated topography that reflectively changes shape as the becoming-expressive of rhythm runs through and out, not simply around, the girl body. Girl style is the very capacity to sign in three dimensions, much like the mutable children's sculpture that appears when one presses a face or finger into the palate of shifting pins, pulls back and gapes at the imprint – one's face or finger – only to turn it over, erase, and begin again.

IV. Anatomy of Girl Group Style

The territorialisation of girl bodies creates a distance between bodies, demarcates the differences between girls, and keeps the forces of chaos at bay. When threatened, girls may strap on prefabulated territorial refrains to protect themselves from dissolution like homeless hermit crabs crawling into abandoned shells during a thunderstorm. 'Slut' or 'Jock' may become more comfortable to wear than something nameless or something one must invent. In the film inspired by Nathaniel Hawthorne's classic on girl branding (among other things), *The Scarlet Letter* (1850), Olive in *Easy A* (2010) also dons a scarlet 'A' on her bustier à la Hester Prynne to signify her own rumoured status as sex-having slut. She initially prefers the notoriety the category affords her before its constraints push her once again to the outside of most social groups at school. The parameters for such categories as slut are well established and knowable, at least from the surface.[9] Girls may mark their territories with actual symbols such as tattoos (permanent or removable) in an attempt to measure and elaborate differences in signatures, the distance between two indistinguishable bodies.

The territory of one girl body makes possible the territory of another. For Deleuze and Guattari, the territory 'not only ensures and regulates the coexistence of members of the same species by keeping them apart, but makes possible the coexistence of a maximum number of different species in the same milieu by specializing them' (Deleuze and Guattari 1987: 320). Take the demarcation of girl body-territories in a high school milieu as an example. In Rosalind Wiseman's groundbreaking guide for parents *Queenbees and Wannabes: Helping Your Daughter Survive Cliques, Gossip, Boyfriends, and Other Realities of Adolescence* (2002), she claims that most girls aggregate in packs or cliques – families of peers they construct and maintain for themselves as a way to ensure their survival through the turbulent waters of adolescence. A becoming-rhythm of a territorialised group generates its sign, a poster, and in Girl World it reads: 'plastics/populars', 'band geeks', 'cheerleaders', 'stoners', 'goths/punks/artists', 'jocks', 'anorexics', and more.

The poster is one effect produced by this process of territorialised grouping as a way to distinguish one particular group's attributes from other groups comprised of very similar members: we are all sexually active girls, but our girls are intercourse-havers and those girls are born-again virgins and those other girls are blow-jobbers only, and so on. Each group not only makes space for itself to function as a

sub-group within a group, its very existence is predicated on the presence of the others. The separation of girl group sub-territories makes possible the widest array of girl group territories.

The whole of each girl group territory is comprised of the interior, intermediary and exterior milieus that make it function. Modal girls as milieus within the territories often perform territorial refrains that are labelled in Wiseman's rubric as Queen Bee, Sidekick, Banker and Floater (Wiseman 2002: 25). Performing these refrains properly ensures the success of the group as a functional unit or body. (1) The Queen Bee acts as a central organising force through which all other refrains are possible. She performs an unspeakable charismatic power, persuading others in her group to offer their allegiance and homage. She must continually feed off their gifted energies while proving her superior status in order to maintain her position. (2) The Sidekick fashions herself in the image of her beloved. At the group's core, the interior milieu, the Sidekick shores up the power of the Queen Bee by backing her unconditionally. Her refrain is one of mimicry that functions to elaborate and expand upon the power of the one. Successful mimicry produces a contagion of power that may ebb and flow depending upon the proximity of relations. (3) The intermediary milieu in a girl group territory is occupied by the Banker. She squirrels away gossip-nuts obtained from group members and others both to eat because they're tasty and to trade on the open market. This innocuous-appearing intermediary seduces information out of girls under the guise of friendship, offers nuggets to the Queen Bee in exchange for the goods of the hive, but retains the juiciest ones for herself. Because she controls the group's currency, she has almost as much power as the Queen Bee. As milieu, the Banker is its immune system, ready to dispatch info-troops to annihilate any invaders, interlopers, or other members who might threaten her status within the unit. (4) The Floater circles the surface of the territory like a dancer. The inner core holds little attraction for her – she is most interested in the placard. Her primary function as intergroup emissary is to maintain the distances in-between the different girl group territories. She absorbs what she wants from each group as she moves along the perimeters, distributing a little chaos in her wake. The presence of one or more Floaters suggests that the group's refrain is tight and productive enough to invite improvisation.

The interaction between milieus produces the group's style. Unlike the style that is performed through becoming-expressive of girl, which is readable off the surface of her body, group style is private. You have to earn your secret-decoder ring before gaining access to the codes

generated between the milieus. But the distance between these territories may be charted through the groups' attenuating rhythms.

The rhythms between bodies oscillate and respond to the advances and retreats of others. A territory opens up a little; the courting for the arrival of an Other begins. For example, in the movie *Mean Girls* (2004), based on Wiseman's *Queen Bees*, Cady has just returned from living on the African plains to attend a suburban high school. She encounters for the first time the animal-pack behaviours of the students, how they travel to protect themselves, wear specific clothes to demarcate difference of species, how they court, eat and play. She visualises this through a series of wide-focus shots in which the teens behave like animals in trendy pants, morphing at one instance from a hang-out session at the mall to a romp in the jungle – they scratch, sniff, nibble and smack each other while making jungle animal sounds. Teenage pack behaviours are dependant upon rhythmic interactions between territories bearing posters that read 'Desiring-Machine A', 'Desiring-Machine B', and 'We're Number One'.

Mean Girls' Cady trades outsider misfit codes for cool as she tries to infiltrate the girl group territory of the Plastics, not to belong but to unmask its codes and the girls who produce them as mere puffery. She proves herself worthy by replicating the group poster marks as best as she can until she is permitted access to the group's style. Once in possession of this highly coveted array of gestures, the seduction of Plastic group style overcomes her 'true authentic self' and she *becomes* popular, here equated with soulless puff. No longer on her way to elsewhere, she is disquieted by the territory she now creates. Cady takes the most obvious line of flight away from the vertigo of girl group style by joining the Mathletes (geek boys). This film shows us that the only way girls make vibratory space for becomings-other is to exit the territory of girl brands entirely. The regulatory end-game gesture of individualism may provide closure for viewers who find girl territories and styles distasteful, impenetrable or even immoral. *Mean Girls* isn't mean enough to showcase the intricate rhythms of girls without incorporating cultural imperatives for niceness.

In conclusion, by conceptualising girl beyond her status as some woman yet-to-be, this Deleuzian model unmoors her from the negative adhesions of modal woman while maintaining the contiguity of the feminine, rhythm to refrain. My feminist intervention in the well-intentioned debates between 'at-risk' and 'can-do' girl brands shifts the problem at hand towards an examination of the material and virtual planes on which girls constitute themselves, whatever their individual

or collective expressive marks may be. The development of girl as a conceptual persona allows for a reconceptualisation of her as not only a map of things she has done, but as a guide to the potentiality of girl capacities. The relationship between girl and woman, separate but related, is illuminated through the connections between the rhythm of the girl and woman's refrain. Girl's plane of expressions trumps the plane of functions because her expressive marks, coded as girl style, produce her as curious aesthetic sideshow for the academy and the most desired of marketplace demographics. My conception of girl as the positive difference that drives expressive territorial refrains is just one offshoot among others in the construction of a rhizomatics of the girl.

Notes

1. The original Alice refers to Lewis Carroll's 1865 novel *Alice's Adventures in Wonderland*. Dorothea Olkowski explicates the Deleuzian Alice in 'After Alice: Alice and the Dry Tail' (Olkowski 2008).
2. *Killing Us Softly: Advertising's Image of Women Series*, Documentary Vol. 1 (1979), Vol. 2 (1987), Vol. 3 (1999). These documentaries are standard fare for most Women's Studies students. See also Kilbourne's 1999, 2008.
3. Gilligan's *In a Different Voice: Psychological Theory and Women's Development* is in its sixth edition and has been translated into seventeen languages (Gilligan 1993). See also Gilligan 2003 and Gilligan et al. 1991.
4. See Bordo 2003.
5. Even though I had read books about menstrual events to come, as a pre-menstrual girl I hatched a plan to delay the inevitable array of changes that frightened me simply because I would be forced to perform them and didn't get to choose their time or kind of arrival. I thought that somehow I would magically know when I was ovulating for the first time, and that I would simply become pregnant to avoid the whole bloody thing. I was not even kissing boys nor aware of the birthing, care and maintenance of a baby. But somehow all this seemed more tenable because I could choose it and invent responses to it rather than having it simply occur at random.
6. I spent a few classroom sessions with young teen girls who had volunteered for Roberta Hammett's fieldwork on girls and computing for her dissertation *Adolescent Women, Identity, and Hypermedia Composing* (1997). She was helping them to develop websites for themselves as part of her computer literacy practicum. While their computer skills needed some tooling up, it seems the girls had already learned a lot about advertising, marketing and consolidating a brand name. They all used corporate logos from their favourite products as a way to articulate who they 'really are' and to mark their 'unique' styles through trademarked moods and experiences. 'I'm a Nike, Old Navy, Diet Coke with a little Sporty Spice on the side.' 'I am more Punky Brewster Crispy Crème meets Volkswagen Beetle.' I asked them why they used product logos (literally on the webpage, hierarchically organised in a field of black space) as descriptions of themselves they made for others to see. They claimed that 'everyone knows what kind of girl shops at Benetton's', and by appropriating and consolidating trademarks most teens (their target audience I suppose) could read the surface of the marks together to form a more articulated portrait of themselves than

anything they could say or draw. This predates and prefigures Facebook's 'like' plug-in, in which users can give digital thumbs-up on participating websites that will in turn provide handy content links back to their sites from Facebook user pages, sometimes including an array of the likers' photos. Not only can Facebook pages be festooned with a corporate presence girls invite, they can help generate traffic for these websites for free simply by participating in a social network that subtends critique and creates virtual patronage via affirmative self-branding. These constituting rhythms express a savvy business acumen that trended in business literature's self-help section such as Tom Peters' *The Brand You, or Fifty Ways to Transform Yourself from an 'Employee' into a Brand that Shouts Distinction, Commitment, and Passion*! (1999). Girls harness the cultural capital of big budget advertising as a nuanced way of marking their surfaces. They do not believe themselves to actually be a pair of Nike shoes, or that Nike shoes come with specially advertised powers like a pair of Dorothy's ruby slippers gone 'street'. The corporate traffic generated by 'liking' an item seems irrelevant to its role in creating individual girl brands. They clearly recognise the presence of the sign as cultural icon, its seductiveness as desirable object, and the practice of the signature as expressive production. I offer this as evidence of and testament to girl's capacity to produce her own rhythmic surface through a transcoding of others' marks. According to her very own self-representational construction, there is no actual girl beneath an image, nor is she available in 'authentic' representations. She is found in the surface play across marks. She becomes a signature brand.

A Note on the Relation between Étienne Souriau's *L'Instauration philosophique* and Deleuze and Guattari's *What is Philosophy?*

Leonard Lawlor Penn State University

From the beginning of his career, Deleuze always denounces confusions. This is especially evident in his 1968 study *Expressionism in Philosophy: Spinoza* (Deleuze 1990: 46, 47, 48; 1968: 37, 38, 39). Thus it should not be surprising to see this theme reappear in his last great work (with Guattari), the 1991 *What is Philosophy?*: 'It is essential not to *confuse* the plane of immanence and the concepts that occupy it' (Deleuze and Guattari 1994: 39; 1991: 42; emphasis added).[1] It is perhaps impossible to understand *What is Philosophy?* if one confuses the plane of immanence with concepts. To help us understand this difference, Deleuze and Guattari use different words to indicate what thought does in relation to the plane of immanence and in relation to concepts. In relation to the plane of immanence, thought 'institutes', while in relation to concepts it 'creates': 'Philosophy is at once concept *creation* and *instituting* of the plane' (Deleuze and Guattari 1994: 41/43–4; emphasis added). Note the different French nouns used here: 'création' and 'instauration'.

Now, as we can see, the English language translation of *What is Philosophy?* uses the word 'instituting' to render the French 'instauration'. There is no question that 'institution' correctly translates 'instauration', and one can only ever feel sympathy for any translator since their task requires making the most difficult choices among words and their nuances. Here however, the translation of the French 'instauration' by the English 'institution' perhaps covers over an important difference. Later in *What is Philosophy?* (in Chapter 4, 'Geophilosophy'), when

Deleuze Studies 5.3 (2011): 400–406
DOI: 10.3366/dls.2011.0028

www.eupjournals.com/dls

Deleuze and Guattari say that 'we moderns possess the concept but have lost sight of the plane of immanence', the French word 'institution' appears. The English translation also renders this word as 'institution.' Yet the French 'institution' appears in relation to what we moderns resort to, since we seem unable to 'instaurate' a plane of immanence: 'English law is a law of custom and convention, as the French is of contract (deductive system) and the German of institution (organic totality). When philosophy is reterritorialised on the State of Law, the philosopher becomes philosophy professor; but for the German this is by institution and foundation [*institution et fondement*], for the French it is by contract, and for the English it is solely by convention' (Deleuze and Guattari 1994: 106/101). Because the English translation renders both 'institution' and 'instauration' as 'institution', the English-language reader might think that throughout *What is Philosophy?* Deleuze and Guattari are really German professors. The English translation seems to imply that the laying out or tracing – these gestures or activities – of a plane of immanence is what Germans do when they are philosophy professors in the State of Law.[2] This confusion between institution and instauration is not likely and therefore not serious. There is, however, another confusion caused by the English translation that is more likely and therefore more serious. What must be distinguished, what must not be confused, are concept creation and plane instauration. The question is: what is the difference between creation and instauration?

When Deleuze and Guattari speak of 'concept creation and the instauration of the plane' (Deleuze and Guattari 1994: 41/43–4, translation modified[3]), they cite what is today an obscure book: Étienne Souriau's 1939 *L'Instauration philosophique*.[4] In the note they say: 'Aware of creative activity in philosophy, [Souriau] invoked a kind of plane of instauration as the soil of this creation, or "philosopheme," animated by dynamisms' (Deleuze and Guattari 1994: 41n6/44n6, translation modified). Then they cite pages 62–3 of *L'Instauration philosophique*. On these pages, Souriau says (and I quote at length in my own translation since no work of Souriau exists in English):

> In philosophy there are beings, and these beings are the purpose of the activity that the philosopher, insofar as he is a creator, deploys. The philosophical labour results in the work [*œuvre*], and the work, by passing the shock back, illuminates the world from which it came. And there, in this double relation, resides something (so to speak) mysterious that is very essential to the very nature of philosophy. For, all we need is a little reflection to sense that the drive, the current that draws the macrocosm towards the microcosm in which it is in some way expressed, towards the philosopheme, is not

> contained within the framework of the relation of cause and effect. . . . The philosopheme is not a simple result of the collection of activities and circumstances from which it came. Moreover, it is not . . . a simple making conscious. When placed at the intersection of a variety of the multiple currents in which he bathes spiritually, the philosopher-subject is not content with intimate contact and interior knowledge of those currents that run over him. He, so to speak, grasps them, and elevates them outside of himself in order to make them concrete and separate in a closed world, in a being that is more or less sufficient unto itself. Do you know how one used to make those beautiful tissue papers that would cover capricious little glitzy ornaments? One poured into a bucket of water some buoyant colours that one moved with a reed, making the colours undulate with the movement of the water. And when the colours looked good, one collected them up with the sheet of paper, which was then dried. Even to suppose that the philosopher attracts only a reflection – the shimmering in his mind from thinking of the multiple actions of the world upon him and of him in his reactions – still it is necessary that he capture it, this reflection, and posit it separately in this microcosm of the philosopheme. The gesture that brings, that reconstitutes, that constitutes in a separate and completely spiritual world, that posits all these reflections at the end separately in being, this is the philosophical gesture par excellence. The meditation moves, tosses and orders somehow or other a cosmic content. The instauration grasps, filters, retains and posits separately the essential acts that structure this meditation. And it manages to be able to present them in a separate monument, as in a paradigm, by means of which one will then be able to see the world again. In any case, intuition, meditation and reflection itself are still only preparatory acts. They are unleavened bread: imperfect sketch, existence that has not yet undergone the essential test of emancipation and of autonomous subsistence. (Souriau 1939: 62–3)

In this passage, we see several similarities with Deleuze and Guattari's descriptions in *What is Philosophy?* First, the philosopheme, like the plane of immanence and its diagrammatic features, depends on something like an intuition, a meditation, or a reflection (Deleuze and Guattari 1994: 40/42). Second, the philosopheme is based on a reflection of a 'cosmic content' similar to a reflection on chaos, chaos being suggested by the figure of the undulating water (Deleuze and Guattari 1994: 42/44). But most importantly, there are actions of instauration – grasping, filtering, retaining and positing – which resemble the action of laying out and tracing, making a map of the plane of immanence. These actions, being the philosophical gesture par excellence, are not mere intuitions. They posit the structure of the meditation or intuition in a 'separate monument'; they give subsistence and reality to the plane of immanence, a reality, according to Souriau, that is spiritual.

Souriau uses the word 'instauration' throughout his book because he thinks it expresses the spiritual being of philosophy better than the word 'creation', and it allows him to avoid the latter. I am going to quote at length again a passage from *L'Instauration philosophique*. This is the only time in the book that he pauses over the word 'instauration':

> It is certainly not useless to have noted... this constitutive characteristic of philosophical thought, namely, that philosophical thought tends towards the work [*œuvre*] – towards the monumental, towards a singularity, towards a being that constitutes the philosophical *ousia*. Philosophical thought belongs therefore to the genre of instaurative thought. This word 'instauration', which is here being used without it being stressed, avoids the word 'creation', which is full of traps. From one viewpoint, man creates nothing. Nature itself creates nothing. The opening of the bud does not create the rose. All of its material conditions were there. The form is the sole thing that is new. Novelty is immaterial and, naturally, the immaterial is alone new. (Souriau 1939 : 73–4)

The trap that creation involves for Souriau lies in the belief that what is created is material. But even the materiality of creation is not what Souriau is really trying to avoid with the word 'instauration'. We understand what he is trying to avoid only in a note that he adds to the passage just quoted:

> From the semantic viewpoint it is possible to observe a very interesting nuance in regard to this word ['instauration']. In the modern usage, its sense is that of 'solemn establishment', of an institution, a ceremony, a function, a way of making or doing, in short, a not strictly material reality. But in Latin 'instauratio' and 'instaurare' imply the idea of a restoration, of a recommencement, of a renovation, or better, of a resumption, definitive this time, of what had not been able to be brought to fruition the first time. *Instaurativi ludi* (restorative games) are those games that are celebrated in place of those that had been interrupted. The modern use is easily understood in contrast to 'restore', a contrast that has pushed 'instaurate' to the side of: to establish for the first time. But it is legitimate to preserve in its meaning, from the Latin origin of the word, the idea that creation is not what is at issue, that the inventive or anecdotally first is not what is in question, that to instaurate means less to establish a thing, a moral or a physical being, temporally than to establish it spiritually, and to constitute it, to grant to it reality in its own kind. (Souriau 1939: 73, n1)

In this quote, we again see Souriau stress the spirituality of instauration: unlike instauration, creation is material. Yet, when he distinguishes the modern sense of the word from the Latin sense, we see that something else is at stake. The modern sense of the word 'instauration', especially when it is contrasted with 'restore', ends up on 'the side of

to establish for the first time'. In other words, it looks no different from creation. His insistence on the Latin sense shows us that the distinction between creation and instauration is the distinction between temporal establishment and spiritual establishment. It seems to me that this distinction in Souriau corresponds to Deleuze and Guattari's attempt to separate philosophical time from the history of philosophy. The history of philosophy (or history itself) is succession, while philosophical time (what Souriau is calling spiritual establishment) is coexistence and superposition. So, we might think that Deleuze and Guattari intend 'instauration' to refer to this sense of spiritual establishment ('becoming' in Deleuze and Guattari's terminology) that characterises philosophical time. 'Instauration' would refer to superposition and co-existence (becoming), while creation would refer to succession. Yet, when Deleuze and Guattari speak of the creation of concepts, they clearly do not mean the sense of temporal establishment from which Souriau is trying to distance himself, a sense of creation that seems to assume independent points of succession: the first time, the second time, and so on. The instauration of the plane of immanence *and* the creation of concepts, both of these activities, result in co-existence, not succession. They both have spiritual reality.

What then really distinguishes the instauration of the plane from the creation of concepts in Deleuze and Guattari? Let us return to the sentence in the note where Souriau presents the Latin sense of 'instauration': 'In Latin "instauration" and "instaurare" imply the idea of a *restoration*, of a *recommencement*, of a *renovation*, or better, of a *resumption*, definitive this time, of what had not been able to be brought to fruition the first time' (my emphasis). What Souriau wants to retain from the Latin sense of the word is the idea of doing something over again. Succession not only *includes* independent points, it also *excludes* repetition. Although we would have to think that concept-creation in Deleuze and Guattari would have to *include* repetition – after all Deleuze wrote a book called *Difference and Repetition* – we are approaching an answer to our question. Let us quote one more time the same sentence about the Latin sense of 'instauration', but this time with different emphasis: 'In Latin "instauration" and "instaurare" imply the idea of a restoration, of a recommencement, of a renovation, or better, of a resumption, definitive this time, of *what had not been able to be* [*qui n'avait pu être*] brought to fruition the first time.' In instauration and creation, the repetition is necessary. Yet, in instauration, the necessity arises not only because nothing can be produced without using previous traits, functions and features. The necessity also arises because the

instauration *was not possible the first time*. It is this 'not possible' or this 'what had not been able to be' that distinguishes instauration from creation in Deleuze and Guattari. In *What is Philosophy?*, Deleuze and Guattari think that concepts have been and *can be* created; creation is possible; it can be achieved. To lay out a plane of immanence without any transcendence whatsoever, that is impossible – or, as Deleuze and Guattari say, it happened 'once, in order to show, that one time, the possibility of the impossible. Thus Spinoza is the Christ of philosophers' (Deleuze and Guattari 1994: 60/59). In other words, if we leave to one side the extraordinary case of Spinoza, instauration leads to a very different experience than that of creation, or, better, it leads to the experience that is at the root of concept-creation. Instauration leads to the experience of the impossible: 'We shall say that THE plane of immanence is, at the same time, that which must be thought and that which *cannot* be thought' (Deleuze and Guattari 1994: 59/59, original capitalisation of 'the', my emphasis of 'cannot').[5] Because the plane of immanence is never able to be completely achieved, since the planes of immanence that have been laid out can never be the best (except, once more, for that of Spinoza, and perhaps Bergson [Deleuze and Guattari 1994: 48–9/50]), the plane of immanence always requires another (albeit necessarily insufficient) instauration. Therefore, we shall conclude by returning to our translation problem. If we were going to translate the title of Souriau's book into English, we would have to render it in this way: not as 'Philosophical Creation', not as 'Philosophical Instauration', but only as 'Philosophical Restoration'.

Notes

1. Hereafter references will be made to Deleuze and Guattari 1994, with the second page number referring to the French edition.
2. One should be aware that Merleau-Ponty in the 1950s had used the word 'institution' to characterise his own thinking. He used this word to render the Husserlian or phenomenological term, 'Stiftung' (see Merleau-Ponty 2010). While in certain respects Deleuze's idea of instauration resembles Merleau-Ponty's institution, the two differ (at least at the most superficial level) in so far as instauration is non-historical in Deleuze, while institution is the very definition of history for Merleau-Ponty.
3. The word 'instauration' exists in English as in Francis Bacon's 'The Great Instauration'.
4. See Souriau 1939. It appears that at the time of his death in 1979, Souriau was already very much forgotten. Today it looks no different (see de Vitry Maubrey 1985).
5. See also Deleuze and Guattari 1987: 269; 1980: 329.

On the Mode of Existence of Technical Objects

Gilbert Simondon Translated by Ninian Mellamphy, Dan Mellamphy and Nandita Biswas Mellamphy

I. The Notion of Phase Applied to Becoming: Technicity as Phase

This study postulates that technicity is one of the two fundamental phases of the mode of existence of the ensemble constituted by man and the world. By phase, we do not mean one temporal moment replaced by another, but an aspect that results from a division of being and that is opposed to another aspect. This sense of the word phase is inspired by the notion of phase relation in physics; one cannot conceive of a phase except in relation to another or to several other phases; in a system of phases there is a relation of equilibrium and of reciprocal tensions; the present system of all the phases taken together is the complete reality, not each phase, itself since a phase is a phase only in relation to others, and it is distinguished from them in a manner that is totally independent of notions of genus and species. Finally, the existence of a plurality of phases defines the reality of a neutral centre of equilibrium in relation to which the phase-shift exists. This schema is very different from the dialectical schema, because it implies neither necessary succession nor the intervention of negativity as engine of progress; moreover, in the schema of phases, the opposition exists only in the particular case of a biphase structure.

The adoption of such a schema founded on the notion of phase is destined to put in play a principle according to which the temporal development of a living reality proceeds by division from an initial active centre and then by regrouping after the advance of each separate reality

Deleuze Studies 5.3 (2011): 407–424
DOI: 10.3366/dls.2011.0029
© Edinburgh University Press
www.eupjournals.com/dls

resulting from the division. Each separate reality is a symbol of the other, just as one phase is a symbol of the other or of others; no phase, as phase, is in equilibrium in relation to itself, nor does it have complete truth or reality: every phase is partial, abstract, and unbalanced; only the system of phases is in equilibrium at its neutral point; its truth and its reality are this neutral point, the procession and conversion in relation to this neutral point.

We suppose that technicity results from a phase-shift of a central, original and unique mode of being in the world, the magical mode; the phase that balances technicity is the religious mode of being. Aesthetic thinking emerges at the neutral point between technics and religion, at the moment of the division of primitive magical unity: this is not a phase but, rather, a permanent reminder of the rupture of the unity of the magical mode of being and a search for a future unity.

Each phase in turn divides into a theoretical mode and a practical mode; there is thus a practical mode of technics and a practical mode of religion, as well as a theoretical mode of technics and a theoretical mode of religion.

Just as the distance between technics and religion generates aesthetic thinking, so the distance between the two theoretical modes (the technical and the religious) generates scientific knowledge as mediation between technics and religion. The distance between the practical technical mode and the practical religious mode generates ethical thinking. Aesthetic thinking is therefore a mediation between technics and religion that is more primitive than science and ethics, for the birth of science and ethics requires a prior division within technics and religion between the theoretical mode and the practical mode. From this results the fact that aesthetic thinking is truly situated at the neutral point, extending the existence of magic, whereas science on the one hand and ethics on the other are in conflict in relation to the neutral point, since there is the same distance between them as there is between the theoretical mode and the practical mode in technics and in religion. If science and ethics could have converged and united, they would have coincided in the neutral axis of this genetic system, thereby providing a second analogue of magical unity, over and above the incomplete aesthetic thinking that is its first analogue, incomplete because it allows the phase-shift between technics and religion to subsist. This second analogue would be complete; it would replace at once magic and aesthetics; but perhaps it is only a simple tendency playing a normative role, since nothing proves that the distance between the theoretical mode and the practical mode can be completely bridged.

In order to indicate the true nature of technical objects, it is therefore necessary to resort to a study of the entire genesis of the relations between man and the world; the technicity of objects would then seem to be one of the two phases of the relation of man to the world engendered by the division of primitive magical unity. Should technicity then be considered as a simple moment in a genesis? – Yes, in a certain sense: there is certainly something transitory in technicity, which itself becomes divided into theory and practice and participates in the subsequent genesis of theoretical thinking and of practical thinking. But, in another sense, there is something definitive in the opposition of technicity to religiosity, because man's primitive way of being in the world (magic) can be thought to provide inexhaustibly an indefinite number of successive contributions that can be divided into a technical phase and a religious phase; in this manner, although effectively there is succession in genesis, the successive stages of the different geneses are simultaneous within culture, and there are relations and interactions not only between simultaneous phases but also between successive stages; hence, technics can encounter not only religion and aesthetic thinking but also science and ethics. Now, if one adopts the genetic postulate, one notices that a science or an ethics can never encounter a religion or a technics on a truly common ground, since the modes of thinking that are different in degree (for example a science and a technique) and that exist at the same time do not constitute a single genetic lineage, do not issue from the same surge of the primitive magical universe. True and balanced relations only exist between phases of the same level (for example a technical ensemble and a religion) or between successive degrees of genesis that are part of the same lineage (for example between the stage of technics and of religions in the seventeenth century and the contemporary stage of science and of ethics). True relations exist only in a genetic ensemble balanced around a neutral point, envisaged in its totality.

This is precisely the goal to be reached: reflexive thinking has a mission to redress and refine the successive waves of genesis by which the primitive unity of the relation of man to the world becomes divided and comes to sustain science and ethics through technics and religion, between which aesthetic thinking develops. In these successive divisions, primitive unity would be lost if science and ethics were not able to come together at the end of the genesis; philosophical thinking is inserted between theoretical thinking and practical thinking, in the extension of aesthetic thinking and of the original magical unity.

Now, to make possible the unity of scientific knowledge and of ethics in philosophical thinking, the sources of science and of ethics have to be

of the same degree, contemporaneous one with the other, and must have arrived at the same point of genetic development. The genesis of technics and of religion conditions that of science and of ethics. Philosophy is its own condition, for as soon as reflexive thinking begins, it has the power to perfect whichever of the geneses that has not been entirely achieved, by becoming aware of the sense of the genetic process itself. So, to be able to pose the philosophical problem of the relations between knowledge and ethics in a profound manner, it would be necessary first of all to complete the genesis of technics and the genesis of religious thinking, or at the very least (for this task would be infinite) to know the real meaning of these two geneses.

II. The Phase-Shift of Primitive Magical Unity

In order to understand the true relation of technics to other functions of human thinking, one must start with the primitive magical unity of the relations of man and world; through this examination it is possible to understand why philosophical thinking should complete the integration of technical reality into culture, which is only possible by freeing the sense of the genesis of technics, by the founding of a technology; so, the disparity between technics and religion subsides, harmful as it is to the intended reflexive synthesis of knowledge and ethics. Philosophy must found technology, which is the ecumenism of technics, because if ethics and the sciences are to meet up in reflection, a unity of technics and a unity of religious thinking needs to precede the division of each of these forms of thinking into a theoretical mode and a practical mode.

The genesis of a particular phase can be described in itself; but it cannot be really known in its sense and, consequently, understood in its postulation of unity, unless it is repositioned in the totality of its genesis, as a phase in relation to other phases. This is why in trying to understand technicity it is not enough to start with constituted technical objects; objects emerge at a certain moment, but technicity precedes and surpasses them; technical objects result from an objectification of technicity; they are produced by it, yet technicity is not exhausted in these objects and is not entirely contained in them.

If we eliminate the idea of a dialectical relation between successive stages of the relation between man and the world, what could be the engine of successive divisions during which technicity emerges? It is possible to appeal to the theory of Forms, and to generalise the relation that it establishes between figure and ground. Gestalt theory draws its

basic principle from the hylemorphic schema of ancient philosophy, applied to modern considerations of physical morphogenesis: the structuring of a system would depend on spontaneous modifications tending towards a stable state of equilibrium. In reality, it seems that a distinction should be made between a stable equilibrium and a metastable equilibrium. The emergence of the distinction between figure and ground results from a state of tension, from the incompatibility of the system in relation to itself, from what one could call the oversaturation of the system. But the structuring is not the discovery of the lowest level of equilibrium: stable equilibrium, in which all potential would be actualised, would correspond to the death of any possibility of further transformation; so, living systems, precisely those that manifest the greatest organisational spontaneity, are systems of metastable equilibrium. The discovery of a structure is at least a provisional resolution of incompatibilities, but it is not the destruction of potentials; the system continues to live and to evolve; it is not degraded by the emergence of structure; it remains tense and capable of being modified.

If one agrees to accept this corrective and to replace the notion of stability with that of metastability, then it seems that the Theory of Forms may account for fundamental stages in the evolution of the relation between man and the world.

Primitive magical unity is the vital relational link between man and the world, defining a universe at once subjective and objective prior to any distinction between object and subject, and consequently also prior to any emergence of the separate object. The primitive mode of the relation of man to the world can be thought of as not only prior to the objectification of the world, but even to the segregation of objective unities in the field that will become the objective field. Man finds that he is bound to a universe that is experienced as a milieu. The emergence of the object can only happen through the isolation and fragmentation of the mediation between man and the world; and according to the principle proposed, this objectification of a mediation must have as correlative, in relation to the primitive neutral centre, the subjectification of mediation. The mediation between man and the world becomes objectified as a technical object, in the same way as it is subjectified as a religious mediator; but this objectification and this subjectification, contrary and complementary, are preceded by a primary stage of the relation to the world, the magical stage, in which the mediation is as yet neither subjective nor objective, neither fragmented nor universalised, and is the simplest and most fundamental structuring of the milieu of

a living being: the birth of a network of privileged points of exchange between the being and the milieu.

The magical universe is already structured, but according to a mode that is prior to the segregation of object and subject; this primitive mode of structuring is the one that distinguishes figure from ground by marking key-points in the universe. If the universe were deprived of every structure, the relation between the living being and its milieu could occur in a continuous time and a continuous space, without privileged moment or place. In fact, preceding the segregation of unities, a reticulation of space and time is established that highlights privileged places and moments, as if all of man's power to act and all the capacity of the world to influence man were concentrated in these places and in these moments. These places and these moments possess, concentrate, and express the forces contained in the ground reality that supports them. These sites and these moments are not separate realities; they draw their force from the ground that they dominate; but they localise and focalise the attitude of the living vis-à-vis its milieu.

According to this general genetic hypothesis, we suppose that the primitive mode of existence of man in the world corresponds to a primitive union, prior to any division, of subjectivity and objectivity. The primary structuring, corresponding to the emergence of a figure and a ground in this mode of existence, is what gives birth to the magical universe. The magical universe is structured according to the most primitive and most fecund of organisations: that of the reticulation of the world into privileged places and privileged moments. A privileged place, a place that has a power, is one which draws into itself all the force and efficacy of the domain it delimits; it summarises and contains the force of a compact mass of reality; it summarises and governs it, as a highland governs and dominates a lowland; the elevated peak is the lord of the mountain,[1] just as the most impenetrable part of the wood is where all its reality resides. The magical world is in this way made of a network of places and things that have a power and are bound to other things and other places that also have a power. Such a path, such an enclosure, such a *temenos* contains all the force of the land, and is the key-point of the reality and of the spontaneity of things, as well as of their accessibility.

In such a network of key-points, of high-places, there is a primitive indistinction regarding human reality and the reality of the objective world. These key-points are real and objective, but in them the human being is immediately united with the world, both to be influenced by it and to act upon it; they are places of contact and of mixed, mutual

reality, places of exchange and of communication because they form a knot between both realities.

Yet magical thought is the first, because it corresponds to the simplest, most concrete, most immense and most supple structuring: that of reticulation. In the totality constituted by man and the world there emerges as the primary structure a network of privileged sites that make possible the insertion of human effort, and through which exchanges between man and the world are carried out. Each singular site concentrates within itself the capacity to have control over a portion of the world that it specifically represents and whose reality it conveys in communication with man. These singular sites could be called *key-points* controlling the man-world relationship in a reversible way, for the world influences man just as man influences the world. The summits of mountains or certain narrow passes are in this way naturally magical, because they govern a region. The heart of the forest and the centre of a plain are not just geographical realities metaphorically or geometrically designated: they are realities that concentrate natural powers as they focalise human effort: they are figural structures in relation to the masse that supports them and that constitutes their ground.

In general, we look to superstition when we want to find an example of the schemas of magical thinking in the actual conditions of life. In fact, superstitions are faded vestiges of magical thinking and, in a search for its real essence, they can only be misleading. On the other hand, to understand the meaning of magical thinking, it is advisable to resort to high, noble and sacred forms of thought that require a clear and insightful effort. That, for example, is the affective, representative and voluntary substratum that supports an ascent or an exploration. Perhaps the desire for conquest and the sense of competition underlie the motivation that makes it possible to move from everyday existence to exceptional acts; but certainly when the desire for conquest is invoked, it is a matter of making an individual act legitimate for a community. In fact, in the individual being or in the group limited to those who perform the exceptional act, the thinking implemented is much more primitive and much more elaborate.

Ascent, exploration, and, more generally, every pioneering act consists in adhering to the key-points that nature presents. Climbing a slope in order to go towards the summit is to make one's way towards the privileged place that commands the entire mountainous massif, not in order to dominate or to take possession of it, but to enter into a friendly relationship with it. Man and nature are not strictly speaking enemies before such accession to the key-point, but strangers to one

other. Until it has been climbed, the summit is only a summit, a place higher than the others. The ascent gives it the character of a place that is more fully developed, elaborate and non-abstract, a place where this exchange between the world and man occurs. The summit is the place from which the whole massif is seen in an absolute way, while views from all other places are relative and incomplete, making one wish for the summit point of view. An expedition or a navigation that makes it possible to reach a continent by an established route does not conquer anything; nevertheless, in magical thinking they are valid in that they make possible contact with the continent in a privileged place that is a key-point. The magical universe is made up of the network of places providing access to every domain of reality: it consists of thresholds, summits, boundaries and crossing points that are connected to one another by their singularity and their exceptional nature.

This network of boundaries is not only spatial but also temporal; there are notable dates and privileged moments to begin one action or another. Besides, the very notion of beginning is magical, even if every particular value is denied on the date of the beginning; the beginning of an action that is to last and the first act of what should be a long series ought not to have in themselves a particular majesty and power of direction, if they were thought to be controlling the entire duration of the action and the whole sequence of efforts, propitious or otherwise; dates are privileged points of time that make possible an exchange between human intention and the spontaneous unfolding of events. These are the temporal structures by which man is inserted in natural becoming, just as the influence of natural time affects each human life, becoming destiny.

In civilised life today, a great many institutions concern magical thinking but are hidden by utilitarian concepts that indirectly justify them; in particular, time off, festivals and vacations compensate with their magical charge for the loss of magical power imposed by civilised urban life. Thus, vacation trips, that are thought to provide rest and diversion, are in fact a quest for key-points old or new; these points can be the big city for country people, or the countryside for city dwellers, but more generally they are not any particular site in the city or the countryside; it [–the key-point–] is the shore or the high mountain or even the border crossed on the way to a foreign land. Public holidays are related to privileged moments of time; occasionally, a conjunction of singular moments and singular sites is possible.

So, ordinary time and ordinary space serve as ground for these figures; dissociated from the ground, figures would lose their meaning; time off and celebrations are not a release from ordinary life by suspending

ordinary life, but a search for privileged places and dates in relation to the continuous ground.

This figural structure is inherent in the world, rather than detached; it is the reticulation of the universe in privileged key-points at which exchanges happen between the living being and its milieu. Now, it is precisely this reticular structure that goes out of phase when there is a shift from the original magical unity to technics and to religion: figure and ground separate by becoming detached from the universe to which they adhered. The key points become objective, retaining only their functional mediatory characteristics, becoming instrumental, mobile, capable of efficiency in any place and at any time; as figure, the key-points, detached from the ground for which they were the key, become technical objects, transportable and abstracted from the milieu. At the same time, the key-points lose their mutual reticulation and their power of distant influence on the reality that surrounded them; as technical objects they have only one action upon contact, site by site, instant by instant. This rupture of the network of key-points frees the characteristics of the ground, and these in turn become detached from their own ground, narrowly qualitative and concrete, in order to hover over the whole universe, throughout space and throughout time, in the form of detached powers and forces above the world. While the key-points become objective in the form of concretised tools and instruments, the ground powers become subjective by becoming personified in the form of the divine and the sacred (Gods, heroes, priests).

The primitive reticulation of the magical world is thus the source of an objectification and a subjectification that are in conflict; at the moment of the rupture of the initial structuring, the fact that the figure becomes detached from the ground is expressed by another detachment: figure and ground themselves are freed from their concrete adherence to the universe and take contrasting pathways; the figure becomes fragmented, whereas the ground qualities and forces become universalised: this break-up and this universalising are forms of becoming, the figure becoming an abstract figure, and grounds becoming a single abstract ground. This phase-shift of the mediation into figural characteristics and ground characteristics translates into the emergence of a distance between man and the world. The meditation itself, instead of being a simple structuring of the universe, takes on a certain density; it becomes objectified in technics and becomes subjectified in religion, making the first object appear in the technical object and the first subject appear in divinity, when previously there had been a single unity of the living and its milieu: objectivity and subjectivity emerge between the living and its

milieu, between man and the world, at a moment when the world does not yet have a complete status as object nor man a complete status as subject. Moreover, it can be affirmed that objectivity is never completely coextensive with the world, and that subjectivity is never completely coextensive with man. It is only when the world is envisaged from a technicist perspective and man is envisaged from a religious perspective that one can be called a complete object and the other a complete subject. Pure objectivity and pure subjectivity are modes of the mediation between man and the world, in their first form.

Religion and technics are the organisation of two symmetrical and contrasting mediations; but they form a couple, since each is but one phase of the primitive mediation. In this sense, they do not have a definitive autonomy. Furthermore, even when taken in the system that they form, they cannot be considered as enclosing all the real, since they are between man and the world, but do not contain the entire reality of man and of the world, and cannot apply to it in a complete way. Because of the gap between these two opposing aspects of mediation, science and ethics deepen the relation between man and the world. With regard to science and to ethics, the two primitive mediations play a normative role: science and ethics are born in the interval defined by the gap between technics and religion, by following the median direction; the precedence that religion and technics have to science and ethics is of the same order as the precedence that lines limiting an angle have to the bisector of that angle: the sides of the angle may be indicated by short segments, whereas the bisector can be extended indefinitely. Likewise, from the gap that exists between very primitive technics and a very primitive religion, a very elaborate science and very elaborate ethics can be progressively constructed without being limited by, but only directed by, the basic conditions of technics and religion.

The origin of the division that created technical thinking and religious thinking can be attributed to a primitive structure of reticulation that is truly functional. This division separated figure from ground, figure providing the content of technics, and ground providing that of religion. Whereas in the magical reticulation of the world, figure and ground are reciprocal realities, technics and religion emerge when figure and ground become detached from one another, in this way becoming mobile, divisible, displaceable, and directly open to manipulation because disconnected from the world. Technical thinking retains only the schematism of structures, of what makes up the efficiency of action on singular sites; these singular sites, detached from the world of which they were the figure, detached also from one another, losing their

immobilising reticular concatenation, become divisible and receptive as well as reproducible and constructible. The elevated place becomes an observation post, a watchtower constructed in the plain, or a tower placed at the entrance to a gorge. At the beginning, technics are often content to develop a privileged place, as when constructing a tower at the summit of a hill, or placing a lighthouse on a promontory at the most visible point. But technics can also successfully create the functionality of privileged sites. Of natural realities technics retain only the figural power, not the site and natural localisation on a determined ground given prior to any human intervention. Dividing the schematisms more and more, it makes something into a tool or an instrument, that is to say, a fragment detached from the world capable of working efficiently in any location and under any conditions, site by site, according to the intention that directs it and at the moment when man so wishes. The accessibility of the technical thing consists in its being freed from servitude to the ground of the world. Technics are analytic, operating progressively and by contact, leaving aside connection by influence. In magic the singular place permits action over a whole domain, just as talking to the king is enough to win over a whole people. In technics, on the other hand, all of reality must be examined, touched and treated by the technical object, detached from the world and available for use in any site at any moment. The technical object is distinguishable from the natural being in the sense that it is not part of the world. It intervenes as mediator between man and the world; it is, therefore, the first detached object, for the world is a unity, a milieu rather than an ensemble of objects; there are in fact three types of reality: the world, the subject and the object, which is an intermediary between the world and the subject, the primary form of which is the technical object.

III. The Divergence of Technical Thinking and of Religious Thinking

Technical thinking, which results from the rupture of the primitive reticular structure of the magical world, and which retains those figural elements that can be deposited in objects, tools, or instruments, gains from this detachment an accessibility that makes possible its application to every element of the world. However, this rupture also produces a deficit: the tool or the technical instrument has retained only its figural characteristics, and figural aspects that are detached from the ground with which they had once been directly connected since they came from a primary structuring that caused figure and ground to spring up as a

single and continuous reality. In the magical universe, the figure was the figure of a ground and the ground the ground of a figure; the real, the unity of the real, was at once figure and ground; the question of a possible lack of effectiveness of the figure on the ground or of the influence of the ground on the figure could not have arisen, since figure and ground constituted a single unity of being. On the other contrary, in the case of technics, after the rupture, what the technical object retained and established of figural characteristics finds any ground whatever anonymous and foreign. The technical object has become a bearer of form, a remnant of figural characteristics, and it tries to apply that form to a ground that is now detached from the figure, because it has lost its intimate inherent relationship and because it can be informed by any form encountered, but in a violent, more or less imperfect manner; figure and ground have become strangers and abstract in relation to one other.

The hylemorphic schema does not solely describe the genesis of living beings; it might not even describe it essentially. Perhaps also it does not derive from a well-thought-out and conceptualised experience of technics: before the knowledge of the living being and before reflection on technics, this implicit adequacy of figure and ground is broken by technics. If the hylemorphic schema seems disengaged from technical experience, this is because it is more a norm and an ideal than an experience of the real. Technical experience, making use of vestiges of figural elements and vestiges of ground characteristics, revives the primary intuition of a mutual adherence of matter and form, of a coupling preceding any division. In this sense, the hylemorphic schema is correct, not because of the logical use of it in ancient philosophy, but as an intuition of the structure of the universe for man before the birth of technics. This relation cannot be organised as a hierarchy: it cannot have in it increasingly successive and increasingly abstract stages of matter and of form, because the real model of the relation between matter and form is the primary structuring of the universe as figure and ground; now, this structuring is true only if it is not abstract, if it is at one stage only; the ground is really ground and the figure really figure, and it cannot become ground for a higher figure. The manner in which Aristotle describes the relations between form and matter, in particular the supposition that matter aspires to form (matter aspires to form as the female to the male) is already far from primitive magical thinking, for that aspiration can only exist if there had been an earlier detachment; so, it is a single being that is at once matter and form. Furthermore, perhaps one should not say that only the individual being is made up of matter and form; because the emergence of a figure-ground structure is prior to

any segregation of units. The mutual relation of correspondence between a given key-point and a given ground neither presupposes the isolation of the key-point from the network of other key-points nor the discontinuity of this ground from other grounds: it is a universe that is structured in this way, not an ensemble of individuals. The first detached beings to emerge after the rupture of the primitive reticulation are technical objects and religious subjects, and they are responsible for figural characteristics as they are for ground characteristics: therefore, they do not fully possess matter and form.

The dissociation of the primitive structuring from the magical universe entails a series of consequences for technics and religion, and through them it conditions the later development of science and of ethics. In fact, unity belongs to the magical world. The phase-shift that makes for an opposition between technics and religion, in an irreducible way leaves technical content with a status lesser than unity and leaves religious content with a status greater than unity. This causes all the other consequences. A proper understanding of the status of the technicity of objects depends on its being grasped in terms of the development that put the primitive unity out of phase. Religion, retaining its ground characteristics (homogeneity, qualitative nature, indistinction of elements within a system of mutual influences, long-range action across space and time resulting in ubiquity and eternity), represents the implementation of the functions of totality. A particular being, a precise object of attention or of effort, is always considered in religious thought to be smaller than real unity, inferior to the totality and included within it, exceeded by the totality of space, and preceded and followed by the immensity of time. Whether subject or object, the object, the being, the individual is always understood to be less than unity, to be dominated by a presaged totality that infinitely transcends it. The source of the transcendence lies in the function of totality that dominates the particular being; in the religious view of things this particular being is understood in relation to a totality in which it participates, because of which it exists, but which it can never completely express. Religion universalises the function of totality, which is dissociated and consequently freed from any figural attachment that limits it; the grounds connected to the world in magical thinking, and consequently limited by the very structuring of the magical universe, become in religious thinking a limitless background, spatial as well as temporal. They retain their positive ground qualities (forces, powers, influences, quality), but rid themselves of their limits and the adherence that attached them to a *hic et nunc*. They become absolute ground, totality

of ground. Advancement in the universe begins from liberated and, to some extent, abstract magical grounds.

Religious thinking, after the disjunction of ground and figure, retains the other part of the magical world: the ground, with its qualities, its tensions, its forces; but this ground, too, like the figural schemas of technics, becomes something detached from the world, abstracted from the primitive milieu. And just as the figural schemas of technics, freed from their adherence to the world, are affixed to tool or instrument in the course of becoming objectified, the qualities of ground that technicity makes available in the mobilisation of figures are affixed to subjects.

Technical objectification leading to the emergence of the technical object, the mediator between man and the world, has a counterpart in religious subjectification. Just as technical mediation is instituted by means of something that becomes a technical object, so religious mediation emerges as a result of the affixing of ground characteristics on subjects, real or imaginary, divinities or priests. Religious subjectification normally leads to mediation by the priest, while technical mediation leads to mediation by the technical object. Technicity retains the figural characteristics of the primitive complex of man and the world, while religiosity retains the ground characteristics.

Technicity and religiosity are neither degraded forms of magic nor relics of magic; they issue from the division of the primitive magical complex, the reticulation of the original human milieu into figure and ground. It is through their coupling that technics and religion are the heirs of magic, not through each on its own. Religion is not more magical than technics; it is the subjective phase of the result of division, whereas technics are the objective phase of the very same division. Technics and religion are contemporaries of each other, and, when each is taken separately, they are more impoverished than the magic from which they emerge.

Religion, therefore, has by nature the vocation to represent the exigency of the totality; when it divides into a theoretical mode and a practical mode, through theology it becomes the exigency of a systematic representation of the real as an absolute unity; through morality, it becomes for ethics the exigency of absolute norms of action that are justified in the name of the totality and superior to all hypothetical, that is to say particular, imperatives; to science as to ethics, religion brings a principle of reference to the totality, which is the aspiration to the unity of theoretical knowledge and to the absolute character of the moral imperative. Religious inspiration constitutes a permanent reminder of the relativity of one particular being with respect to an

unconditional totality exceeding every object and every subject of knowledge and of action.

Conversely, technics have a content that is always subordinate to the status of the unity, because the schemas of efficiency and the structures resulting from the fragmentation of the primitive network of key-points cannot be applied to the totality of the world. By nature, technical objects are multiple and divided; technical thinking, enclosed in this plurality, can progress, but only by multiplying technical objects, without being able to recapture the primitive unity. Even when multiplying technical objects endlessly, it is impossible to find an absolute adequacy to the world, since each of the objects attacks the world in one place only and in one moment only; it is localised, particularised; adding technical objects one to another can neither remake the world nor regain contact with the world in its unity, which was the aim of magical thinking.

In connection with a specific object or with a specific task, technical thinking is always inferior to unity: it can present several objects and several means, and select the best; but nonetheless, it always remains inadequate to the wholeness of the unity of the object or of the task. Each schema, each object, each technical operation, is controlled and guided by the whole from which it derives its ends and its orientation, and which provides it with a never attained principle of unity that is expressed by combining and multiplying its schemas.

Technical thinking has by nature the vocation to represent the point-of-view of the element; it adheres to the elementary function. Once technicity is admitted into a domain it breaks it up and starts a chain of successive and elementary mediations governed by the unity of the domain and subordinated to it. Technical thinking conceives the operation of an ensemble as a chain of elementary processes working point by point and step by step; it localises and multiplies the schemas of mediation, always remaining lesser than the unity. The element in technical thinking is more stable, better understood, and in a certain way more perfect than the ensemble; it is really an *object*, whereas the ensemble always remains to a certain extent inherent in the world. Religious thinking finds the opposite equilibrium: in it, the totality is more stable, more powerful, and more viable than the element.

In the theoretical domain as in the ethical domain, technics are concerned with the element. In the sciences the contribution of technics consisted in making possible a representation of phenomena one by one by breaking them down into simple elementary processes similar to the operations of technical objects; such is the role of the mechanistic

hypothesis that enabled Descartes to represent the rainbow as an overall result of the point by point trajectory taken by each luminous corpuscle in each drop of rain in a cloud; and it was also according to the same method that Descartes describes the functioning of the heart by breaking down a complete cycle into simple successive operations and showing that the functioning of the whole is the result of the play of elements necessitated by their particular disposition (for example, that of each valve). Descartes does not ask himself why the heart is made in this way, with valves and cavities, but how it works given how it is made. The application of schemas drawn from technics does not account for the existence of the totality, taken as a unity, but does account for the point by point and instant by instant functioning of that totality.

In the ethical domain, technical thinking not only introduces means of action that are fragmentary and tied to the capacities of each object that is becoming a utensil, but also a certain reduplication of the action by technicity; a specific human action, considered with respect to its results, could have been accomplished by a specific technical functioning going through various stages; elements and moments of action have their technical analogue; an effort of attention, of memory, could have been replaced by a technical operation; technicity provides a partial equivalence to the results of action; it accentuates awareness of the action by the being who brings it to completion in the form of results; it broadcasts and objectifies the results of the action through comparison with those of the technical operation, breaking down the action into partial results, into elementary completions. Just as in the sciences technicity introduces the search for the *how* by a breaking down of ensemble phenomena into elementary operations, so in ethics technicity introduces the search for a breaking down of the overall action into the elements of action; because the total action is envisaged as that which produces a result, the breakdown of the action generated by technics considers the elements of the action as gestures that achieve partial results. Technicity assumes that an action is limited to its results; it is not concerned with the subject of the action taken in its real totality, nor even with an action in its totality, to the extent that the totality of the action is founded on the unity of the subject. In ethics concern with results is the analogue of the search for the *how* in the sciences; result and process remain subordinate to the unity of the action or to the ensemble of the real.

The postulation of an absolute and unconditional justification which religion directs towards ethics translates into a search for the intention as opposed to a search for the result that is inspired by technics. In the

sciences, religious thinking introduces an appeal for absolute theoretical unity that requires a search for the sense of becoming and the existence of given phenomena (hence responding to the *why?*), whereas technical thinking offers an examination of the *how?* for each of the phenomena.

Because its content is inferior to unity, technical thinking is the paradigm for all inductive thinking, both in the theoretical order and in the practical. It contains this inductive process in itself, prior to any separation into practical and theoretical modes. Induction, in fact, is not merely a logical process in the strict sense of the term; any process can be considered to be a process of the inductive type if its content is inferior to the status of unity, if it strives to attain unity or, at least, if it tends towards unity from a plurality of elements, each of which is inferior to unity. What induction takes hold of, what it starts from, is an element that in itself is not sufficient and complete, and does not constitute a unity; so, it exceeds each particular element by combining it with other elements that are themselves particular, in order to find an analogue of unity: in induction there is a search for the ground of reality from figural elements that are fragments; to try to find a law beneath phenomena, as in the induction of Bacon and Stuart Mill, or to try to find only what is common to all individuals of a given species, as in Aristotle's induction, is to postulate that beyond the plurality of phenomena and of individuals there exists a stable and common ground for reality, that is the unity of the real.

It is no different in ethics that would directly derive from technics; to want the whole duration of life to be a series of moments, to extract from each situation what is pleasant in it, and to want to construct the happiness of life by accumulating its agreeable elements, as did ancient Eudaimonism or Utilitarianism, is to proceed in an inductive manner, by trying to replace the unity of the duration of life and the unity of human aspiration with a plurality of instants and with the homogeneity of all successive desires. The elaboration to which Epicureanism submits desires has one goal only, which is to incorporate them into the continuity of an existence that proceeds in an accumulative manner: for this, each of the desires must be dominated and surrounded by the subject, made lesser than unity, so that it can be treated and manipulated as a genuine element. This is why the passions are eliminated, since they cannot be treated as elements; they are larger than the unity of the subject; they dominate it, they come from farther away than it and tend to go farther on than it, obliging it to exceed its limits. Lucretius tries to destroy the passions from within, by showing that they are based on errors; in fact, he fails to account for the element of tendency in

passion, that is to say, for the force that is inserted into the subject and yet is more extensive than it, a force in relation to which it seems to be a very limited being; tendency cannot be considered to be contained within the subject as a unity. Wisdom, having restored the forces at the origin of action to a status of inferiority with respect to the unity of the moral subject, can organise them as elements and reconstruct a moral subject within the natural subject; however, this moral subject never completely attains the level of unity; between the reconstructed moral subject and the natural subject there remains a void impossible to fill; the inductive approach remains in plurality; it constructs a network of elements, but this network cannot amount to a real unity. All ethical technics leave the moral subject unsatisfied because they ignore its unity; the subject cannot be content with a life that would be a series, even an uninterrupted series, of happy moments; a life that is perfectly successful element by element is still not a moral life; it lacks what makes it the life of a subject: unity.

But conversely, religious thinking, the foundation of obligation, creates in ethical thought a search for unconditional justification which makes every act and every subject appear to be inferior to real unity; when related to a totality that expands endlessly, the moral act and subject derive their significance solely from their relation with this totality; the communication between the totality and the subject is precarious, because at every moment the subject is drawn back to the dimension of its own unity, which is not that of the totality; the ethical subject is de-centered by religious exigency.

Excerpted from a translation in progress of Gilbert Simondon, *On the Mode of Existence of Technical Objects* (1958); this particular excerpt being Chapter One, 'The Genesis of Technicity', of Part Three, 'The Essence of Technicity'.

Toward a Minor Theory of Music?

Brian Hulse and Nick Nesbitt, eds. (2010) *Sounding the Virtual: Gilles Deleuze and the Theory and Philosophy of Music*, Aldershot: Ashgate.

In his essay in this volume entitled 'Thinking Musical Difference: Music Theory as Minor Science', Brian Hulse states that a 'benefit of applying Deleuzian difference to music is that it opens up possibilities for thinking-hearing music in new ways' (49). It is from this starting point that Hulse and fellow editor Nick Nesbitt have proceeded to gather together the set of essays that make up *Sounding the Virtual*. It's an ambitious project and one that explores a number of directions in Deleuze's work in relation to the practice and theory of music; but one that also ultimately poses a more interesting question about the very possibility of applying or using Deleuze as a means of approaching musical analysis.

Hulse puts forward a set of criteria for using Deleuze as a means to interrogate and reconfigure our understanding of music in ways that conventional music theory does not allow. His chapter largely draws on Deleuze's *Difference and Repetition*, working through the familiar theme of difference as repetition-without-concept, and drawing an analogy between the musical event and repetition. Hulse's analysis of the opening of bars of Beethoven's Symphony No. 5 demonstrates the way in which an analytical application of Deleuze's idea of repetition with difference can help us to look again at a familiar piece of music and possibly glimpse (or indeed hear) a manifestation of the eternal return.

The relationship between the musical event and difference as such is a theme that re-occurs throughout *Sounding the Virtual* as does the notion of music as an analogue of thought, but the question of how to apply Deleuze's thought to music is perhaps the most pressing. In her

Deleuze Studies 5.3 (2011): 425–437

essay 'Logic of Edge, Wolfgang Rihm's "Am Horizont"', Judy Lochhead puts forward the question, 'What is the relation between Deleuze's philosophy and Bacon's art?' (182). We could very well extend this further and ask, 'What is the relation between any creative practice, including music, and philosophy, in particular Deleuze's philosophy?' As part of her analysis, Lochhead asks 'who are the intended recipients of critical writing on art and how can writing about art affect its apprehension and production?' (183) These are key issues that concern any analysis of Deleuze's work in relation to music, and are issues that Hulse and Nesbitt's selection of essays throws up time and again. What are we hoping to gain from applying Deleuze's ideas to music? *Can* we apply Deleuze's theories to music as an off-the-shelf set of analytical tools? What do we hope to gain as theorists, composers, players and listeners?

One of Hulse's intentions is clearly to set in motion 'a practical application of Deleuzian analytics to music' (37), whereas Lochhead discusses the importance of using Deleuze as an exhortation to go beyond the usual confines of musical analysis and to understand a broader context of thinking about and listening to music. As she says: 'An address of "function"', then, is an account not simply of the technical details of creation, but, for instance, of how the affects of an airy flute or smoky harmony work together with the percepts of a floating melody and an adamant rhythm to create the sensations that give the work its unique sense' (185).

Christopher Hasty's contribution frames the problems of using Deleuze as an analytic apparatus when he describes the process of analysis as a 'descent into empirical balancing' (14). Hasty contends that Deleuze's ideas could be used to position the non-representational nature of music as an analogy of the thought process itself. Again with reference to *Difference and Repetition*, Hasty describes the way in which music can be seen as an antidote to the limitations of the Image of Thought as defined by Deleuze, and goes on to suggest that music is an aesthetic realisation of the interaction between the virtual and the actual.

Hasty's own analysis of Chopin in relation to 'The Idea of Music' is interesting but problematic in a way that he himself acknowledges. Performing a *Deleuzian* analysis is not as simple as applying Deleuze to music theory, since it is music theory that needs to change. Hulse articulates the problem in this way: 'the truly problematic doesn't presuppose its solution. The truly problematic asks for the articulations of problems as such' (28). The difficulty is that conventional approaches to music analysis presuppose their answers in the nature and manner

of the question, and although there is a clear understanding of the problematic nature of these investigations and analyses, the question of whether the contributors to *Sounding the Virtual* successfully redesign music analysis or simply apply the given musical-theoretical terms through Deleuze is a recurrent one.

If, in Hasty's reading, music is a representation of the interaction between the virtual and the actual, then truly thinking about the 'Idea of Music' would bring into question the very substance of music itself. By pre-figuring and anticipating that the virtual must be actualised as music, the 'Idea of Music' comes across as something of a Platonic conceit. It is here, for example, that the implementation of Deleuze itself becomes problematic, since if we were to rigorously apply the logic of the virtual, then we would need to accept the ultimately contingent nature of music, rather than try to find its antecedent in the virtual. If we were to assume that the *virtual* in some ways anticipates things like music, then this would immediately make it un-*virtual*, in that the virtual as far as Deleuze is concerned is pure concept-less difference.

In the chapter 'A Deleuzian Noise/Excavating the Body of Abstract Sound', Sean Higgins puts together a convincing critique of Noise, through his re-reading of Henry Cowell's essay 'The Joys of Noise'. It is here, and elsewhere in essays by Bruce Quaglia and Ildar Khannanov, that the writers do indeed engage with Deleuze's ideas in a way that helps to create new perspectives from which to view music.

Higgins' discussion of the way in which 'noise is unrecognisable' (58) analyses the nature of thinking in Deleuzian terms, wherein the 'act of thought is the thinking of a dynamic field of relations, an immersion into the multivalent noise of a different sort of empiricism' (60). Higgins works through the now familiar theme of the contingency of thought by asserting that *noise as such* is ungraspable, and that as soon as we perceive it, it loses the virtual potential of noise. In making the comparison with Cowell's empirical analysis of sound, Higgins reads noise as potential, as something that informs perception, but which in itself remains unperceivable: 'the true act of thought, to Deleuze, is driven by the violence of that which is unrecognisable to common sense' (54).

In 'Transformation and Becoming Other', Bruce Quaglia's discussion of Luciano Berio's music and conceptual framework for musical composition greatly accelerates the potential for using Deleuzian theory and terminology within musical discourse. Throughout the chapter, Quaglia makes strong reference to Berio's own apprehension and appropriation of Deleuze's ideas and works through the relationship

between Berio's view of music and music discourse as a set of 'texts' (232) and Deleuze's formulation of assemblages. One of the most engaging elements of Quaglia's chapter is his argument that both Berio and Deleuze operate beyond the confines of conventional (post)structuralist hegemony. For Quaglia, Berio's 'Poetics of Analysis' allow him to go beyond what Berio calls the 'domain of signs' in the same way that Deleuze seeks to theorise beyond the 'regime of signs' (234). Both men saw 'circularity' in the correlationist approach of structuralist and poststructuralist thought, and what is interesting about Quaglia's work is that he is able to identify Berio's move towards Poetics as a means of going beyond a system of signification.

Having established the connection between Berio and Deleuze, Quaglia proceeds to apply a series of tactics that make procedural connections between both men's work in terms of positioning Berio's views on analysis within a 'creative' rather than 'reductive' paradigm (233). Within this analysis, Quaglia moves towards his assertion that what Berio's 'Poetics of Analysis' resembles is in fact Deleuze's theory of minor literature, in that Berio's ideas about poetics/analysis reveal an interrogational/deterritorialising approach to composition and listening. His works aren't simply based on a pre-given set of codes or even a passive set of musical materials that can be adapted using an extant formula into new works. Rather, it is Berio's contention, and thus Quaglia's assertion, that Berio's Poetics are intrinsically minoritarian in nature: these are not works that proceed with anything other than the impulse to *repeat* and to create new assemblages.

Similarly, in the final chapter 'Line, Surface, Speed: Nomadic Features of Melody', Ildar Khannanov puts forward a set of ideas based on an initial appraisal of melodic form and harmonic development in a Bashkirian nomads' song and a subsequent analysis of Chopin's Ballade No. 2, Op. 38 and Mazurka No. 68, Op. 4, in terms of Deleuze's theories on nomadism and the war machine. As with Quaglia, what makes Khannanov's work compelling is the manner in which he applies Deleuze to the task in hand. Khannanov initially discusses at length Bashkirian nomadic culture and applies ideas of movement and non-sedentary behaviour to both melodic form as well as to experience and perception more generally. In doing so, Khannanov is able not only to put forward a set of suggestions as to what has informed the nomadic/non-sedentary impulse for the particular melodic fragment that he discusses, but also to go further and suggest that although Western music is very much sedentary (250), in that the codes and processes by which it can be constructed and measured are now the result of a

much more stable/altered set of values, it is also, so he claims, based on nomadic systems and drives. This he asserts by way of an analysis of two passages from Chopin, wherein the harmonic progression is compared to what could be called 'nomadic musical theory' within which the importance of metric rhythmic and formal harmonic progressions are destabilised/unseated in order to be rebalanced by a nomadic temporal flow that bears more resemblance to what Khannanov has discussed in relation to the Bashkirian fragment.

Ultimately, although the appropriation of Chopin feels slightly forced, Khannanov's real success lies in the way in which he, like Quaglia, is able to theorise music in relation to Deleuze, not simply adopt the terminology and apply it. Khannanov's approach interrogates Deleuze by analysing the source material for the latter's own thoughts. The result is a piece of work that makes the comparison of Chopin's compositional technique to Deleuze's war machine, the specific articulation of a harmonic progression as a line of flight, and a reading of the passage as an example of non-arborescent thought realised in music, both convincing as well as useful. Another thread in Khannanov's essay that is also of interest – especially from a musical analyst's perspective – is the critique of Schenkerian analysis. In this regard, it's clear that Khannanov, in a similar way to Hulse, is seeking to use Deleuze, or at the very least make use of his radical style of theorising, to unseat established musical-analytic paradigms.

Other notable chapters in the book take historiological approaches to reading Deleuze in terms of his own influences. Martin Scherzinger, in 'Enforced Deterritorialization, or the Trouble with Musical Politics', puts forward a detailed comparative analysis of Pierre Boulez's Serialist composition techniques and post-Webern musical aesthetics in relation to Deleuze and Guattari's conception of rhizomatic tendencies within thought, being and culture. Scherzinger undertakes a musicological analysis of the relationship between rhizomatic theory and Boulez's ideas, and basically contends that Deleuze and Guattari's theories are in many ways a translation of Boulez's thought into a philosophical mode.

Amy Cimini, in her chapter 'Gilles Deleuze and the Musical Spinoza', takes a similarly historiological approach by placing Deleuze's thoughts on music – or more precisely, his views on the ontology of sound – in the context of Spinoza's work on Cartesian Dualism. What emerges is a reading that exposes, as with the earlier transposition of Boulez's Serialism into philosophy, some of the limits of Deleuze's theorising. In attempting to graft a double articulation of the movement of sound in terms of both musical form and the underlying form of life, as well as

then extrapolating from this a potential ethics on how to conduct one's life (130), Cimini identifies some of the problems with such a wholesale co-option of Spinoza's thought.

From Cimini's comparison between Deleuze's ontological theorising and the composer Iannis Xenakis' insights into the movement of sound (the discussion of sound particles is particularly well done), the fact emerges that Deleuze's thought, although inspired by music and music-related thinking, can by no means be used unequivocally as a method of analysis. There is a recognition here of the distance between a conventional empirical approach to working with sound, as embodied in Xenakis' work on granular synthesis, and Deleuze's more radical view of material experience and immanence (140–2).

This conflict neatly encapsulates the difficulty that a book such as *Sounding the Virtual* by its very nature encounters, which is how to write about Deleuze and Music, without turning Deleuze's work into a majoritarian science – a 'science' of music as it were – itself. Hulse's own description of the 'Minoritarian practice' (47) of musical analysis potentially appropriates (or 're-territorialises') Deleuze's theory as Majoritarian science. The move to apply Deleuzian thought (and even the term 'Deleuzian' moves towards a majoritarian conception) to music as a tactic for analysis runs the risk of turning these ideas into the very opposite of what they were supposedly intended to achieve, that being the liberation of thought from meta-narrational containment and stricture.

In using Deleuze as a starting point for theory and as a reminder of the need to create a new way of thinking rather than simply adopt a pre-given set of circulatory codes, Khannanov fully explores the minoritarian potential of working with Deleuze. Among the successes of *Sounding the Virtual* – which includes some useful and necessary discussions and explanations, as well as some powerful historical and biographical insights into the roots and antecedents of a number of key areas in Deleuze's thought – this is perhaps the most obvious, and yet most important achievement. Deleuze did not establish a complete, ready-to-use analytic toolkit; rather, he argued for the importance of non-representational thinking, and of recognising the essential role of creativity within thought. Although flawed in places, *Sounding the Virtual* offers several insights into how a potential overhaul of musical analysis might be achieved.

A Missed Encounter?

Reidar Due (2007) *Deleuze*, Cambridge: Polity.

The appearance of Reidar Due's *Deleuze* has the benefit of provoking questions concerning the intellectual challenge of Deleuze today. Due's volume is just one among many texts offering an introductory guide in a marketplace approaching saturation point, and for this reason it prompts, however implicitly, the question of how Deleuze and Guattari's ideas should, under current conditions, be communicated and taught. It is now roughly a decade since the great wave of Deleuze's influence first broke within the Anglophone academy, but the nature of the pedagogical encounter adequate to the complexity and density of his work has yet to be determined. If we can agree with Gregg Lambert that 'Deleuze and Guattari's works were never intended for the institution, or to become institutionalized' (Lambert 2006: 11) then the fact of their becoming-institutionalised is, surely, the very line of flight we should be now exploring. If we do not, we run the risk of producing a sort of image of thought – in step with the critique of ivory towerism mounted by Badiou, Hallward and others – in which the revolutionary promise Deleuze offers is redeemable only on condition that the compromise foisted on it by its institutionalisation remain a repressed source of bad conscience, a sort of 'dirty little secret'. If this intersection of thought, pedagogy and institutionalisation is the context in which Deleuzianism today must proceed this is so not only because of the historical contingency of its institutional uptake, as Lambert points out, but also, and more importantly, because Deleuze's metaphilosophical critique is concerned with diagramming the very processes by which thought is captured by power.

The question, then, is whether any introductory textbook on Deleuze and Guattari written today can simply avoid this kind of intersection – dare I say dialectic? – of form and content, of historical contingency and conceptual necessity, through pedagogical sleight of hand, or whether the anomaly of an institutionalised Deleuze and Guattari should be embraced. To be fair to Due, he makes a brave attempt at a short potted history of the intellectual context out of which Deleuze emerged – emphasising cogently the political and intellectual salience of the various poststructuralist challenges to Cartesianism and humanism – but this only serves to highlight his ultimate evasiveness when he points to 'the lack of agreement among scholars about the

nature and direction of Deleuze's thought' regarding especially 'the relationship between its general conception of reality and the mind and its possible practical applications'. Due counsels, somewhat obtusely, a 'middle course', asserting that 'Deleuze's philosophy is neither so abstract as to be divorced from practical relevance nor . . . in any way directly "applicable" to experience' (Due 2007: 4–5). Now, this evasion, as innocent as it sounds in an introductory text, arguably hinders rather than aids a reader wishing to know just what Deleuze's philosophy is about and what it is good for, especially since Due asserts, in the same breath, the political and philosophical radicalism of the Deleuzian position. If Due's volume is a poor one, this is in large part because it argues for Deleuze's radicalism while simultaneously disavowing and disowning it. This leads to inconsistencies at the level of the argument, as we shall see.

Due's contention is that Deleuze's primary contribution was to give us an entirely new conception of subjectivity, an 'alternative subject' founded not on 'self-consciousness and rational mental capabilities but on the temporal and creative passage that a human being may undergo'. If the subject is no longer based in self-awareness or self-directedness, then it nevertheless has access to a field of understanding via the role of affects which register the forces constituting it: 'an affect does not entail the concept of subjective self-awareness. To understand an affect is to see it as a *force*, a particular type of energy, and this energy does not presuppose self-consciousness'. Subjective experience is seen to be one with the material world of forces and energies. Having established the Deleuzian subject on the unthinking immediacy of forces, there nevertheless remains, in Due's account, an activity which does not seem very different from the kind of self-conscious rationality we might have thought had been banished: 'The questions we ask about affects are: how do they combine? What affects is the mind capable of? What thoughts are generated by affects? In the philosophical perspective, the mind is a site of thoughts rather than a centre of consciousness' (Due 2007: 10). The alternative this rendering presents to the more traditional subject of philosophical inquiry is, I would argue, not entirely clear.

Further on, however, in a chapter titled 'Social Ontology', Due clarifies his position, arguing that Deleuze rejects all subjectivism in favour of a thought which seeks a genetic understanding of the actual determinations generating our position in the world. This genetic view is to be radically opposed to any experiential view of that position (Due 2007: 61). This in effect allows for a more disinterested, indeed,

rational, account of social reality than those of the phenomenological and psychoanalytic schools:

> an absolutely formal process of thinking that does not, in any way, derive its categories from lived experience. The quasi-mathematical vocabulary used to describe social being in *A Thousand Plateaus* pursues this same ideal of abstraction: in order to make sure that one is not prejudiced by the ontological categories entailed by experience one has to produce an absolutely abstract conceptual language. (Due 2007: 131)

Deleuze's philosophy, then, 'moves . . . close to Absolute Idealism' (Due 2007: 169). This conclusion, appearing in the final pages, seems to accept that the rationality banished from the self-conscious subject returns, albeit without any kind of structural system, such as that entailed by Hegelian absolute knowledge, to support it. The role of immanence here serves to differentiate Deleuze from the self-conscious rationality of the philosophical tradition: the immanence of thought to the world is to be contrasted with those philosophies that view consciousness as a means to generate representations by which we can conceptualise worldly objectivity from a position of transcendent judgement. But Deleuze's philosophy still has to be rationalistic, since it is self-justifying and autonomous of the objective contents of consciousness, and this is so despite its genetic origins in the material world of forces. According to Due's argument, then, the return of rationality occurs without the phenomenological mediation of an experiential subject capable of determining recognisable objects. The determinations of Deleuzian thought stem from reality itself, of its immanence to that reality, and not from the structures of subjectivity. This is what distinguishes Deleuze from Hegel. This abandonment of a mediating subjectivity, is, as Due notes, most apparent in *Anti-Oedipus* and *A Thousand Plateaus*, in that the requirements of thinking social being render the experiential object form inadequate: 'vitalities, production, stratification are not given in experience. They are genetic principles that do not resemble objects that we can encounter within conscious experience' (Due 2007: 169).

What has happened to the Deleuzian subject here? What, precisely, is its radicalism? Due's argument fails to address these questions, and this raises a number of problems for his account of the relation Deleuze's work seeks to establish between thought and the outside world. Due's earlier evasion is telling here, as the determination of this relation is central to the basic problematic of immanence: how is thought, as noematic attribute, produced from a material flux which subsequently

functions as the limit of the thinkable? If thought and the world are internal to one another such that each demonstrates the same creative process (monistic life), how does the world become thinkable without us falling prey to representations which portray the world as a dead objectivity, essentially unknowable except through the constructs a subject gives to itself? Due writes that Deleuze enables us to think 'genetically parallel to the process of actual determination in reality. Even if one did not actually know the sufficient reason for each thing, one could approach such a knowledge by finding equivalents in thought for the elements that constitute this genetic process' (Due 2007: 43–4). But this simply flattens the epistemological onto the ontological – a trick, effected by the terms 'parallel' and 'equivalents', which conjures away the essential question of thought and its outside. We are left within the realm of 'correlationism', which entails, according to Quentin Meillassoux, that 'we only ever have access to the correlation between thinking and being, and never to either term considered apart from one another' (Meillassoux 2008: 5).

Can we be satisfied with this, or should we, rather, insist that for Deleuze the relation between thought and the world is never presupposed, prepared or 'correlated' in advance, but is the object of a determinate encounter? If correlationism is a danger in the interpretation of Deleuze, it is because it suggests that it is enough for us simply to abolish representation, leaving in its place a sort of vague 'parallel' or 'equivalence' between thought and the world which threatens to reintroduce the insufficiencies of the philosophy of representation. Deleuze's philosophy aimed to debunk any conceptualisation of the world which maintained a representational link between concept and object, and argued instead that the creation of concepts was one with, or immanent to, the creations of worldly life. The creation of concepts proceeds in the midst of the world and in tandem with its creatures. But Deleuze's method of critique demands that the abolition of representation cannot simply be settled once and for all and put behind us, rather it needs to be repeated at every step, and repeated, precisely, as difference, which is to say, as an encounter which dramatises the interaction between thought and its outside. The very immediacy of this encounter is what Deleuze understood by the 'violence' of signs, in that a sign is generated through the shock or rupture characterising the emergence of the new. What replaces representation, then, or to be more precise, what attends its repeated abolition via critique, is something quite determinate and real, a practical activity carrying with it the full semiotic potency of the encounter, what Deleuze calls creation.

Due's final chapter is devoted to the questions raised by immanence and creation as the distinguishing characteristics of Deleuze's philosophy. What the immanent creation of concepts means is that there is no external guarantor of a reality represented to us by concepts. Instead, concepts and reality are embroiled in one and the same activity of self-creation occurring on an immanent plane. We cannot presuppose any separation of concept and world, rather, the philosophical activity of thought implies their necessary unity by presupposing itself:

> The plane is itself internal to philosophy. Philosophy creates the medium (plane) in which it invents concepts... So, rather than having external conditions, philosophy invents its own conditions... The old logical term 'petition of principle' indicates the circularity that an argument produces when it implicitly uses a principle it sets out to prove. This kind of circularity is, Deleuze would argue, a necessary condition of philosophy. (Due 2007: 152)

Due's argument began, as we saw, with the material unity of being and experience, impersonal affects being produced prior to any self-conscious separation of object and subject. But the benefits of this unity are reaped only at the level of a more profound separation, in which thought is able to reach a sufficient degree of abstraction only at the expense of lived experience. This is why Due's argument has to end, ultimately, with the assertion that for Deleuze thought is autonomous from the world and thus self-fulfilling. In Due's reading, then, the encounter between thought and the world is simultaneously approached and evaded. This is unfortunate, because the essence of what Deleuze means by creation lies in this encounter.

Philosophy, in the form demanded by Deleuze's metaphilosophical method, and contrary to what Due suggests, never invents its own conditions, it is always forced to think under conditions alien, even hostile, to it. Deleuze and Guattari are quite explicit about what concept creation entails: the philosopher creates concepts on a plane, but this plane does not come to us ready-made, rather, it needs to be 'instituted' or 'laid out' – and not created or invented – by a 'prephilosophical' or 'nonphilosophical' encounter which is both contingent and necessary. What philosophy presupposes as its condition is neither philosophy nor concepts but a nonphilosophical and nonconceptual understanding (Deleuze and Guattari 1994: 40–1). The plane of immanence, then, is not created, in the way concepts are, nor does it spring magically from concept creation, since, if it did, Deleuze's conception of philosophy would remain trapped by the dogmatism of a pure thought subject

to itself alone and to its own propitious conditions. This is why there is always a determinate, practical, i.e. ethically and politically grounded, element – an encounter, in other words, around which concepts crystallise. This encounter is the very objectivity that grounds philosophy in the world. Deleuze characterised his empiricism as 'one which treats the concept as object of an encounter, as a here-and-now, or rather as an *Erewhon* from which emerge inexhaustibly ever new, differently distributed "heres" and "nows"' (Deleuze 1994: xx). It is only on this basis that learning and pedagogy can proceed: 'to learn is indeed to constitute this space of an encounter with signs, in which the distinctive points renew themselves in each other, and repetition takes shape while disguising itself' (Deleuze 1994: 23).

It is unfortunate, then, that Due's book draws back from the pedagogical encounter. There are other, less crucial flaws. At points, Due's sentences seem to conceal at least as much as they communicate, such as when he writes that 'at the general ontological level of sense, the logic of sense is the embodiment of thought forms upon the immaterial surface of sense' (Due 2007: 57). On two occasions, he writes 'barbaric' when what he means is primitive or savage (Due 2007: 105, 108). He refers throughout to Deleuze's first book on Spinoza as *Spinoza and the Problem of Expression*, arguing that the title of the English translation is 'less accurate' (Due 2007: 171). However accurate, there is no book titled *Spinoza and the Problem of Expression*, and the pedantry here is misleading rather than helpful. Due's style throughout is gnomic, and this, though not a problem in itself, leads to some unfortunate caricatures, for example of Nietzsche's concept of eternal return which is described as 'a cosmological cycle of variation in which a stock of invariants are recycled, selected and combined in different combinations through history, thus engendering superficially different historical epochs and individual lives' (Due 2007: 33). This gloss, while one may be able to defend it as accurate, is insensitive to the crux of Deleuze's reading of Nietzsche, and in fact is completely at odds with it. Due's volume, then, is disappointing on a number of levels and fails to distinguish itself as a contribution to the growing body of pedagogically oriented Deleuze scholarship.

Introduction: Prophetism and the Problem of Betrayal

Nir Kedem Tel Aviv University

Anyone studying Deleuze often faces a double-edged problem: how to read Deleuze, that is, how to make sense of what he was saying, but particularly how to do that under the compelling Deleuzian decree 'don't interpret!'. While this problem is not foreign to anyone studying French thought after World War II or post-structuralism in general, only in Deleuze does interpretation appear as the worst faux pas, being an expression or an execution of the logic of representation. The problem intensifies when one wishes to apply Deleuze's concepts and ideas, whether in the field of philosophy or in any other discipline: how to apply his philosophy without first determining what it is? How to 'do theory' with a theory that resists interpretation, hence systematic methodology? This problem may also be summed up as a question of loyalty: how does one apply Deleuze's thought while remaining loyal to his principles? How can one be Deleuzian without betraying the decree 'don't interpret!'? Addressing this problem early on in his work, Ian Buchanan suggested that given the role of creativity in Deleuze's philosophy, a possible way out of this paradox is to realise that 'to be Deleuzian one must abandon Deleuze' (Buchanan 1997: 382). Creativity is what makes this form of disloyalty or betrayal possible and desirable; it enables the fabrication of new readings, concepts and procedures, indeed, the production of differences.[1]

Approaching a theme like 'Deleuzian Futures' presents us with similar difficulties: how to make sense of what Deleuze said about the future, and make use of it? In other words, can the future be foreseen from a Deleuzian perspective, and can it be brought into existence or changed? It seems that once thought is directed towards the future, even the most secular of scholars finds him- or herself entangled with the theology

of divination. But in fact, it is with 'divinatory analysis' that betrayal reveals itself to be all the more crucial for Deleuze studies, as will be explained in what follows. These somewhat pious tones may be disconcerting for some of us, but we actually should not shy away from the idea that Deleuze's thought can be seen as prophetism. After all, what is it that a prophet does? 'He anticipates and detects the powers (*puissances*) of the future, rather than applying past and present powers (*pouvoirs*)' (Deleuze and Guattari 1987: 124), and this is precisely what Deleuze entrusted us with: new ways to think what we can still become, to fabricate new futures by exploring the powers of life, powers that we are yet to encounter. Indeed, the prophetic value of Deleuze's philosophy is in ethics, and it takes its cue from Spinoza.[2]

If we believe therefore that Deleuze's work could be used to analyse present issues in order to better understand and change our future – that is, if it holds a prophetic value for us – then in a sincere act of loyalty our prophet must be betrayed. Betrayal, Deleuze and Guattari say, marks a distinctive regime of signs, a semiotics in which a line of flight is drawn and acquires a positive value, 'as though it were effectively occupied and followed by a people who find in it their reason for being or destiny' (Deleuze and Guattari 1987: 121). This positive, productive moment of deterritorialisation enables the formation of new relations between always-already predetermined, fixed terms (fixed since they are signs defined by and subjected to one rule: to refer to other signs ad infinitum as their only content). It is with prophets that 'betrayal has become an idée fixe' (124), and 'it is the regime of betrayal . . . in which the true man never ceases to betray God just as God betrays man, with the wrath of God defining the new positivity' (123). Betrayal is the best expression of loyalty for it anticipates God's will: 'even the prophet, unlike the seer-priest, is fundamentally a traitor and thus fulfills God's order better than anyone who remained faithful could' (123). God turned away from the prophet (like Jonah) and from the true man (like Cain or Judah), and they turned away from him; and that is what sets in motion processes of creativity and change, 'this double turning away that draws the positive line of flight' (123).[3]

But how, then, do we betray Deleuze without becoming 'interpretive priests' (Deleuze and Guattari 1987: 114)? What would be the right way to betray Deleuze, and is it possible to infer it from Deleuze's writings? This special issue opens with Ian Buchanan's essay, which takes on this ethical question and focuses on its crucial role in shaping the future of Deleuze studies by asking: what would be the right thing to do from a Deleuzian perspective? Betrayal here takes the form of a reading both

critical and creative, and is commensurate with Deleuze's readings of other philosophers, his own betrayal in his 'prophets'.[4] But rarely have Deleuzians put both their readings of Deleuze and their applications of his philosophy (or 'Practical Deleuzism' as Buchanan terms it) to the test of ethics. And if they did, says Buchanan, more often than not has it been done by way of false reasoning, that is, by 'mov[ing] from how things are to how things should be'. Buchanan's primary case in point is Foucault's misreading of the concept of desire in Deleuze and Guattari, which leads him to the conclusion that there is 'nothing at all within Deleuze and Guattari's theory of desire that can tell us either how we should live or how we should treat others'. But, according to Buchanan, this is all the more reason to revaluate and re-examine the models with which we have been working so far to read Deleuze, and to create an ethical discourse from which practical, Deleuzian solutions to burning issues could be created.

At this point this issue's rationale can be made clearer: it is nothing but a provisionary map, indeed, a pro-visionary, non-exhaustive map of directions or tendencies that could or should be pursued in the field of Deleuze studies. Buchanan's ethical demand-dilemma constitutes a critical juncture, where essays concerned with readings of Deleuze and essays concerned with applying Deleuze's thought conjoin and form a series defined by a logic of betrayal. It is always that atemporal moment of deciding how Deleuze *should* be read (that is, betrayed), which shapes and conditions all the ways Deleuze *could* be read and *could* be applied (two related but different expressions of that same betrayal: sometimes it is the question of reading which is implied in an actual application as its past, whereas in other cases it is the question of application which is implied in an actual reading as its future). Deleuzian Futures is explored here as the future of Deleuze studies.

Gregg Lambert's essay contextualises the ethical problem of 'what is the right thing to do from a Deleuzian perspective?' in his discussion of the experience of drugs. Deleuze and Guattari's concept of pharmacoanalysis is offered here as a way to resist a pervasive misconception of desire, which is used to generalise the idea of desire *for* drugs, and thus ultimately misses the dangers specific to drugs. Relating this problem to a critical investigation of consciousness as a threefold seat of illusion, Lambert suggests that ethical experimentation, not moral judgement, should be appealed to when attempting to determine what is the right thing to do (next).

Daniel W. Smith gives his own take on the concept of desire, this time as a question of flows, and its correlative terms 'code' and 'stock' as

they are worked out in Deleuze and Guattari's *Anti-Oedipus*. The future of Deleuzians working in the field of socio-political philosophy lies in developing a theory of flows, for this is the fundamental thesis at the basis of the entire *Capitalism and Schizophrenia* project, Smith suggests. Here, the 'right', or adequate, analysis of contemporary socio-political situations is dependent upon determining actual relations between flows, defined as the movement or exchange of economic value; codes, defined as the system which record or inscribe the flows, and as a necessary means of grasping them; and stocks, defined as portions of flow understood in terms of possession or ownership.

The next three essays share an interest in futuristic Deleuzian concepts, and relate to Deleuze's third synthesis of time in different contexts. Henry Somers-Hall discusses Deleuze's concept of the future through Hamlet's famous formula, 'time is out of joint'. As long as time is understood to be based on an underlying rational structure (as is the case with Plato's and Kant's conceptions of time), time is 'in joint', that is, tied to cardinal points which make it the measure of primary, and essentially rational, movement. This metaphysical conception of time, argues Somers-Hall, is implicit in classical drama, but overturned with Hamlet's famous hesitation, which expresses an alternative understanding of time as pure and empty form: a time out of joint, or duration, which is no longer subordinated to movement, hence allowing for the creation of something genuinely new.

Ronald Bogue addresses the third synthesis of the Future as the time of fabulation, the infinite Now which results in the creation of 'a people to come'. Fabulation for Deleuze indicates an act of legending, Bogue explains, 'an irreducibly temporal process of becoming-other that is open-ended, and if it is a process of summoning forth a future people, it is one that cannot move beyond itself without involving the participation of a collectivity in its action'. After meticulously examining the concept of fabulation, Bogue offers an intriguing analysis of the manifestation of fabulation in the science fiction of Octavia Butler.

Is contemporary media culture commensurable with Deleuze's typology of images constructed in his cinema books? Patricia Pisters examines a possible third type of image based on the third synthesis of time, which she names 'the neuro-image'. Precursors of the third image category, expressing a digital logic before digitality, can already be traced back to the cinema books themselves, and Pisters elaborates on Deleuze's analysis of the films of Alain Resnais to advocate this claim. She then turns to discuss the American television series *FlashForward* as a typical example of contemporary neuro-images.

The collection concludes with one of Deleuze's least favourable forms of negotiation: an interview that Constantin V. Boundas conducted with Jean-Clet Martin, philosopher and one of France's most prominent readers of Deleuze (by Deleuze's own admission).

The interview took place on the occasion of Martin's new book on Hegel and *The Phenomenology of Spirit* published in France last year, and offers a preview into the main issues and concerns discussed in the book. But why would a special issue on Deleuzian Futures conclude with a discussion of a new book on Hegel, the most repudiated of all philosophers who inspired Deleuze? 'I cannot stop reading Hegel in a Deleuzian way,' admits Martin, and Boundas explores the ramifications of such a seemingly improbable Deleuzian reading of Hegel. For instance, could it be that Martin's reading implies that Deleuze was wrong to distance himself from Hegel? Could Martin be making the Hegelian Concept work in the same way the Deleuzian Concept does? Is Hegel truly an enemy to Deleuze?

This is where betrayal comes full circle: with the philosopher-friend questioning his loyalty not simply by submitting it to moral judgement ('Deleuze was wrong'), but by forming alliances with his Hegelian enemy, or, more precisely, by re-examining the old Hegel–Deleuze rivalry and by changing its defining relations. A line of flight is drawn, where both the cherished philosopher and his nemesis are subject to new understandings. At the final moment of this series, that is, at the event of negotiation, a different figure to embody the logic of betrayal is revealed: not that of a biblical prophet but that of a sapling-warrior, like the young Neoptolemus.[5] As the etymology of the name suggests, he was the wager of 'new war', the introducer of *polemos*. What he actually did was to create a new war machine, enabling him to become the site of a new, strange alliance between rivals (Philoctetes and Odysseus). Neither parting with his friends nor subscribing to any one side of a polemic, Neoptolemus is the emblem of negotiation in which loyalty takes the form of relating-anew, of creating difference.[6] Our Deleuzian futures may very well depend on that.

Acknowledgements

I would like to thank Ian Buchanan for inviting me to guest edit this special issue of *Deleuze Studies*, and for guiding me through the challenges of editing. I would also like to thank Mike Blanchard and David Savat for their invaluable help. Three of the essays included here (by Bogue, Buchanan and Pisters) were first presented at the *Deleuzian Futures* conference held at Tel Aviv University in May 2011, generously sponsored by The Porter Institute for Poetics and Semiotics. I would like

take this opportunity to extend special thanks to Orly Lubin, head of The Porter Institute, my PhD supervisor and a dear friend, for her endless support and inspiring wisdom.

Notes

1. Later, in a book 'built around the twin problem of reading Deleuze and reading with Deleuze' (Buchanan 2000: 7), Buchanan creates his own difference in the field of Deleuze studies, 'an *other* reading of Deleuze that would enable his work to be systematically applied' (Buchanan 2007: 8; emphasis in the original).
2. 'It is Spinoza who has elaborated the profoundest theory of prophetism' (Deleuze and Guattari 1987: 123).
3. For an illuminating discussion of prophets and betrayal in Deleuze and Guattari, see Bogue 2004.
4. Michael Hardt (1993) makes a similar point when he characterises Deleuze's philosophy as apprenticeship: a method of selection and transformation of philosophical materials.
5. 'The warrior is in the position of betraying everything' (Deleuze and Guattari 1987: 354).
6. It is worth noting that Deleuze and Guattari do not have Neoptolemus's image in mind when discussing the warrior, but only that of the 'old heroes' trapped in between two poles: that of the Old State, represented by Agamemnon, and that of the Modern State, represented by Odysseus (which they call by his Roman name, Ulysses). In Sophocles' *Philoctetes*, it is the young warrior who seemed trapped between two poles or two orders, not the 'old hero' (Philoctetes): on the one hand, he is a descendant of Achilles, a noble hero (which places him on the side of Philoctetes, whom he will truly befriend despite deceiving him), and on the other hand, already a member of Odysseus's party on its way to Troy, and key player in his ruse (but he does not hesitate to reach to his sword when Odysseus attempts to prevent him from returning the bow to Philoctetes). His entrapment 'in between' expresses the revolutionising of *philia* relations, which might offer us a different path to think the war machine operating between the two States, with its politico-ethical implications.

Desire and Ethics

Ian Buchanan University of Wollongong

Abstract

This paper argues that it is problematic for the future of Deleuze studies that it is difficult if not impossible to answer the question 'what is the right thing to do?' from a Deleuzian perspective. It then argues that one of the key reasons Deleuze studies has made limited progress in this area is its over-emphasis on desire and the corresponding tendency to extrapolate 'ought' from 'is', which as Hume showed is a category mistake. It proposes that to develop a workable ethical discourse from Deleuze's work we need to rethink how we read his work and approach it afresh.

Keywords: ethics, desire, Deleuzism, Deleuze studies, Dworkin, Foucault

> The question [of revolution] has always been organisational, not at all ideological: is an organisation possible which is not modelled on the apparatus of the State, even to prefigure the State to come?
>
> (Gilles Deleuze and Claire Parnet, *Dialogues*)

There is a certain irony in this statement because one would look in vain in either Deleuze's or Guattari's writings, whether alone or together, for any attempt to deal with the specific organisational difficulties of bringing about social and cultural change, much less a full-scale revolution. Their position is that changing the composition of desire is itself revolutionary, and as recent events have shown the transformation of desire on both an individual and collective level (however it is accomplished and whether for progressive political reasons or not) is not something that necessarily requires planning. Often, as was the case with May '68, or more recently the so-called 'Arab Spring' of 2011, change occurs spontaneously and in a manner that no one could have

predicted.[1] Deleuze and Guattari proclaim themselves to be against both revolution and reform, a fact that would seem utterly inconsistent with the idea that social and cultural change is ultimately organisational. They are also wary of aligning themselves with any particular political or ideological position and tend to view all established political positions with a high degree of ambivalence, thus making it very difficult to determine what kind of a political organisation they would actually support. For example, they are clearly anti-capitalist as well as against the idea of the State, yet it is by no means clear what their preferred alternate economic and political models would be. We might thus content ourselves by saying that their politics is ultimately undecidable, but I want to argue that is precisely what we must not do.

That said, I do not mean to imply by this that I agree with critics like Alain Badiou and Peter Hallward who seem to think Deleuze and Guattari's work has nothing concrete to offer social and political activists engaged in the ongoing struggle to develop more effective strategies for reshaping the real world.[2] However, while I disagree with Badiou and Hallward's conclusions, I fully support the critical spirit in which they engage with Deleuze and Guattari's work, though I would add that in my view we should read them – and indeed all philosophers – creatively *as well as* critically; that is to say, we should read with an eye both to identifying weaknesses in their work and to bringing forward something new and useful to our own purposes, even if the authors in question would not recognise themselves in what we do with their thought. This was essentially what Deleuze meant when he famously said that he saw his readings of other philosophers – Hume, Bergson, Nietzsche, Kant and Leibniz – as producing monstrous progeny (Deleuze 1995: 6). This is why he spoke of Bergsonism, for example, because his reading of Bergson was intended to create an application of Bergson's thought, or better an apparatus that could be deployed to give thought to problems and circumstances Bergson himself did not and perhaps could not have considered himself. Bergsonism is in this sense simultaneously faithful to Bergson and a departure from him, without being a negation.[3] Deleuze's two books on cinema best exemplify this achievement – they simultaneously claim Bergson was wrong about cinema *and* that his work is perfectly adapted to thinking about the specificity of cinema as an art of the moving image. It is exactly this kind critical *and* creative approach that I want to call 'Practical Deleuzism'.

There are a great many questions such an approach to Deleuze (and Guattari's) work might want to address, but the one that will concern me here is this: how would one decide what the 'right thing to do' is

from a Deleuzian perspective? This is of course a rather clichéd question, but as Michael Sandel's work amply demonstrates, it is nevertheless a very productive question because in trying to answer it one is forced to think through in a very precise way what one would mean by 'right' or 'wrong' in a given situation, and whether or not one would want to stipulate that a particular 'right' or 'wrong' is universally 'right' or 'wrong' or in some way dependent on context or situation.[4] For example: is abortion right or wrong? If it is wrong, are there exceptions? If it is right, are there exceptions? Is it possible for abortion to be right some times and wrong at other times? And of course the crucial question that interests me here is how would Deleuze and Guattari go about deciding whether abortion is right or wrong? Sandel, in his discussion of abortion, argues that one cannot engage this issue without taking into account the theological concerns relating to the definition of 'life' and dismisses the idea that it can be resolved on a neutral basis by relating it solely to questions of freedom (Sandel 2010: 251). Is this how Deleuze and Guattari would approach it? If not, then what would be their focus? We can imagine that Deleuze would most likely start by asking, 'What kind of a problem is abortion?' But from there it is difficult to conceive how he might answer that question. The difficulty one has in dealing with the many practical permutations of this particular ethical question from a Deleuzian perspective in any precise way is, I think, indicative of how little work has been done with respect to Deleuze and Guattari's ethics. I cannot think of a single instance of anyone speaking in the kind of practical and prescriptive terms one finds in contemporary the moral and ethical philosophy of people like Dworkin, Nagel, Rawls, Sandel and Scanlon.

The reason for this is not hard to fathom. For many Deleuze and Guattari scholars it would be contrary to the spirit, if not the letter, of Deleuze and Guattari's thought to speak in such tightly drawn prescriptive terms as a Dworkin, Nagel, Rawls, Sandel or Scanlon. That said, the secondary literature on Deleuze and Guattari has not ignored the moral and ethical dimension of their work altogether. But it tends to make the classic error (first identified by David Hume) of trying to argue 'ought' from 'is'.[5] For example, Rosi Braidotti's work makes exactly this move: she explicitly claims that the ontology of Deleuze and Guattari's concept of desire can serve as the foundation for an ethics constructed in their image (Braidotti 1994: 202–4). There are two problems with this move: the first, as I have already mentioned, is that it is faulty reasoning to move from how things are to how things should be. The fact that desire functions in the way it does is not reason enough to stipulate that

that is how desire should be, or rather should be allowed to function. It would amount to saying that the only ethical position with respect to desire is one in which desire is given everything that it wants. The second problem is that (as virtually the entire history of Western philosophy has always argued) it is impossible to conceive a model of ethics on the basis of 'desire' because insofar as desire is thought of as an urge or impulse (whether conscious or unconscious) it exists outside of, or at least at the extreme border of the realm of rational judgement and thought.

To my mind, the most egregious instance of the error of arguing 'ought' from 'is' in relation to Deleuze and Guattari's work, is Michel Foucault's famous preface to the English translation of *Anti-Oedipus*. Foucault writes that he thinks that Deleuze and Guattari's work can best be thought of and read as an 'art of' or 'how to' book, and not as either a new theory or new philosophy ('*Anti-Oedipus* is not a flashy Hegel,' he said). His claim is that it can be read as an exegesis on the question of 'what is the right thing to do?' But, in laying out his reading of *Anti-Oedipus* Foucault clearly makes the error of basing his conception of Deleuze and Guattari's ethics on their ontology of desire. The problem with this, as I aim to show here, is that it leads to a critical dead end, my implication being that any quest to develop Deleuze and Guattari's ethics must start elsewhere and proceed by other means. Foucault's reading of *Anti-Oedipus* starts as follows:

> I would say that *Anti-Oedipus* (may its authors forgive me) is a book of ethics, the first book of ethics to be written in France in quite a long time (perhaps that explains why its success was not limited to a particular readership: being anti-oedipal has become a life style, a way of thinking and living). How does one keep from being fascist, even (especially) when one believes oneself to be a revolutionary militant? How do we rid our speech and our acts, our hearts and our pleasures of fascism? How do we ferret out the fascism that is ingrained in our behaviour? (Foucault 1983: xiii)

Foucault proposes that we read *Anti-Oedipus* as a contemporary version of Francis de Sales's *Introduction to the Devout Life* and re-christens it *Introduction to the Non-Fascist Life*. He lists seven principles of this new mode of devout life, which will ideally be an 'art of living counter to all forms of fascism, whether already present or impending' (Foucault 1983: xiii):

1. Free political action from all unitary and totalising paranoia.
2. Develop action, thought, and desires by proliferation, juxtaposition, and disjunction, and not by subdivision and pyramidal hierarchisation.

3. Withdraw allegiance from the old categories of the Negative (law, limit, castration, lack, lacuna) and prefer instead what is positive and multiple. Believe that what is productive is not sedentary but nomadic.
4. Do not think that one has to be sad in order to be militant, even though the thing one is fighting is abominable. It is the connection of desire to reality that possesses revolutionary force.
5. Do not use thought to ground political practice in Truth or political action to discredit thought. Use political action instead to intensify thought.
6. Do not demand of politics to restore the 'rights' of the individual, as philosophy has defined them. The individual is the product of power. What is needed is to 'de-individualise' by means of multiplication and displacement, diverse combinations.
7. Do not become enamoured of power. (Foucault 1983: xiii–xiv)

If we accept Foucault's framing of *Anti-Oedipus* as a kind of philosophical manual for how not to be a fascist, then we are presented with a substantial problem. In contrast to Francis de Sales's work, Foucault's instructions only specify what we should *not* do, and say nothing at all about what we should do. Foucault's framing of *Anti-Oedipus* offers only a set of negative injunctions. Non-fascist living is surely a virtuous mode of living, but it is a virtuous mode of living for which no precise programme or model exists. On the basis of Foucault's guide alone, it is literally impossible to say what would constitute a virtue in Foucault's view of things, that is, an action which is not merely non-fascist but good in and of itself. It is very difficult to even describe what being non-fascist in this affirmative sense would be like, since all the characterisations of it that Foucault gives are themselves couched in the negative: don't be paranoid, don't be hierarchical, don't be sad, don't ground thought in truth, don't demand the restoration of rights, and don't become enamoured of power! If we reverse these various injunctions into their affirmative opposites, it soon becomes clear just how vacuous they are: what is the opposite of paranoid? Stable? What is the opposite of hierarchical? Flat? Equal? What is the opposite of sad? Happy? Joyous? And so on. Even if we stay with the negatives, one is still forced to wonder just what kind of a person would have all these attributes? Can one think of a single historical figure that could live up to this set of prescriptions?

In beginning this way I want to make two points: first, I think we need to re-evaluate the way we read Deleuze and Guattari. I do not just

mean we should try to read them more carefully or more rigorously, though I am not against that; rather, I mean we should re-evaluate the modality of our reading. I think we let Deleuze get away with too much by going along with his insistence that philosophers must be allowed to ask their own questions. In interviews, he often cites this principle as his reason for not wanting to give interviews in the first place and to excuse, I suppose, his failure to answer adequately the questions he is asked. But if one looks at the interviews, it is also clear that he is never asked questions that are not in some way commensurate with his own thinking, leaving him at liberty to respond to them in his own terms. Unlike Foucault, Deleuze evidently never agreed to speak to interviewers he knew would be either hostile or unsympathetic – one thinks here of Foucault's interview with the young Maoists, and their heated disagreement concerning the role and nature of people's courts in the establishment of popular justice (Foucault 1980). It appears Deleuze was never subjected to this kind of grilling, not in print anyway. And in one respect, Deleuze is clearly right to take the stance he does, because philosophy gains little – if anything – if it does nothing more than go over old ground, repeating the same old questions again and again. But that does not mean philosophy is better off constantly seeking new coordinates, as Deleuze and Guattari appear to be doing with their battery of new concepts, because in doing so, it isolates itself from the intellectual history and tradition that gives it both its depth and interest.[6]

Second, in addition to asking Deleuze and Guattari new questions, that is, questions Deleuze and Guattari have not generated for themselves in one way or another, I think we also need to ask ourselves new questions. By this I mean we need to be bold enough (and for those of us who have been publishing on Deleuze and Guattari for quite a while, humble enough) to re-examine all the established readings of Deleuze and Guattari, and see whether or not they really hold up. As the great nineteenth-century American satirist Mark Twain famously said, it is not the things that we don't know that get us into trouble, it is the things we know for sure that aren't so. I think Deleuze Studies as a field has reached the moment when it needs to go back over its early attempts to understand difficult concepts like becoming, the body without organs, desiring-machines and so on and see whether or not the working definitions we have for these terms are really sound. This may seem to contradict my point above that I think we should read Deleuze both creatively and critically, so some further clarification may be in order. I do not subscribe to the view that there are 'no wrong readings' of Deleuze – I am on record as disagreeing with a number of interpretations

of Deleuze's work.[7] That said, I am fine with those readings of Deleuze that take creative licence with his concepts and take them off on their own line of flight, just so long as they do not claim to be anything other than what they are, namely, appropriations, or what Harold Bloom usefully and with no pejorative intent calls 'strong misreadings'. DeLanda's so-called 'Deleuze 2.0' would be a perfect example of this latter type (DeLanda 2006: 4). But as I said above, I also think our readings of Deleuze should challenge the weaknesses and gaps in his work; however, instead of simply pointing out these weaknesses and gaps I think we should try to create our own solutions.

To further illustrate my main point, here, that it is difficult to determine what the right thing to do is from a Deleuzian perspective, let me give you an example of a practical question of the kind that I think (or at least want) Deleuze and Guattari's work should be able to help us answer. Dutch journalist Linda Polman opens her recent book on international aid with the following thought experiment:

> Imagine. You're an international humanitarian aid worker in a war zone and faithful to the principles of the Red Cross, as any good humanitarian should be. In other words, you're impartial, neutral and independent. It's your responsibility to relieve human suffering, irrespective of the people involved and the situation on the ground. This time your mission has taken you to a refugee camp in Darfur. You do what you can for the victims, but soldiers exploit your efforts. They demand money for every well you dig and levy sky-high taxes, thought up on the spot, on all sacks of rice and tents and medicines you arrange to have flown in. They consume a slice of your aid supplies and sell another slice. Among the items they buy with the proceeds are weapons, which they use to drive yet more people into your refugee camp or even into their deaths. What do you do? (Polman 2010: 1)

I know there are numerous questions one could raise at this point about whether or not the Red Cross is a good humanitarian organisation, or whether international aid is a good or bad thing, and so on. For example, Dambisa Moyo in *Dead Aid* makes a convincing case that international aid not only does not work, but also helps to sustain the very regimes whose kleptocratic style of government creates the very crises aid is supposed to relieve (Moyo 2009). But given that Foucault casts *Anti-Oedipus* as an art of living directed at the individual subject (two words he forces us to place under erasure, as it were), we are entitled to think that Deleuze and Guattari can and should be able to tell us what to do in a complex situation like this. To put it another way, what would it mean in these circumstances to, as Foucault says we

should, withdraw allegiance from the old categories of the negative and prefer instead what is positive and multiple? If the choice is as simple as staying and trying to do the best one can for the victims or deciding that the situation is hopeless and leaving, can Deleuze and Guattari help us to make that decision? I do not think there is any way we can answer this question using Foucault's prescriptions. This is not because it is a bad question; indeed, I would say it is a vital and necessary question – what is the point of having an art of living if it cannot help us to decide what the right thing to do is? Moreover, if Foucault is right in saying that *Anti-Oedipus* is a book of ethics, then by that very definition should it not empower us to decide – or, at the very least, empower us to begin a discussion about the best way to go about deciding – which is the most ethical way to act in all situations, even if complex and indeed fraught political situations like the one Polman imagines?

If the question is not bad, then why can Foucault not answer it? The short twofold answer is that Foucault attempts to derive Deleuze and Guattari's ethics from their ontology of desire, and to make matters worse misunderstands and misapprehends their concept of desire. This is evident in the way he collapses two planes – the virtual and the actual – into one, and uses ideas and concepts drawn from each of these levels interchangeably, perhaps unaware that there are two rigorously distinct systems at work in *Anti-Oedipus*. One can see this in his statement that we need to develop action, thought and desires by proliferation, juxtaposition and disjunction, and not by subdivision and pyramidal hierarchisation: action, thought and desires do not all belong to the same plane; therefore, they are not commensurate concepts in the way Foucault assumes them to be and cannot be used interchangeably. As I will explain in more detail in what follows, one set of terms refers to the internal processes of the psyche, while the other refers to the external processes of micropolitics, and while the two processes are interlinked, they are nevertheless distinct from one another. Indeed, Deleuze and Guattari's principal grievance with psychoanalysis is that Freud confuses these two systems when he claims that the unconscious is formed in the image of Sophocles' Oedipus (Lacan makes the same kind of error when he claims the unconscious is structured like a language). But there is a bigger problem, here, and that is the very premise of Foucault's reading: he uses Deleuze and Guattari's ontology of desire to construct his art of non-fascist living. He takes their analysis of how things are and turns it into a statement of how things should be.

Foucault thus turns the ontology of desire into an ethos, or programme for living. This move will always be brought undone by the

fact that Deleuze and Guattari's conception of desire is not inherently virtuous – they do not conceive of desire as a virtue. Deleuze and Guattari make it clear that as they see it desire can be either 'empty' (bad) or 'full' (good) and is usually some mixture of the two. In other words, desire is not inherently good or bad, but has the potential to be both at the same time. One thinks here of the stories of the concentration camp guards who murdered thousands of people by day and were good, loving family men or women by night. Hence Deleuze and Guattari's evocation of Primo Levi's concept of the 'gray zone' to describe such ethical conundrums (Deleuze and Guattari 1994: 107). So how do Deleuze and Guattari conceive of desire? The most straightforward answer I can give to this question (which I shall explain in more detail in what follows) is that for Deleuze and Guattari desire refers to the operation of the unconscious in conjunction with what Freud called the perception system, which includes both external and internal modes of perception. As such, it refers to what are essentially involuntary processes of the mind and the nervous system and therefore cannot form the basis of either an ethical or a moral discourse.

Everything hinges, in this regard, on how one understands the notion of production because that is the real key to understanding Deleuze and Guattari's concept of desire. It would not be wrong to say that desire and production are synonymous; in fact, one could say the basic hypothesis of *Anti-Oedipus* is that desire should be conceived as production (hence the concept of desiring-production). But that still begs the question of what they mean by desire. I want to answer this question in four ways. First, in the negative, so to speak: Deleuze and Guattari are quite clear that desire should not be thought of as an undifferentiated instinctual energy (Deleuze and Guattari 1987: 215). Second, we have to look to delirium to understand desire as production. Delirium is the royal road to understanding desire because it shows us what the unconscious is capable of producing – a set of visions, feelings and so on that however false are utterly real to the person experiencing them. This point is crucial. Deleuze and Guattari insist over and over that if desire produces then its product is real, and not, it goes without saying, either imaginary or symbolic (Deleuze and Guattari 1983: 26). Deleuze and Guattari reject Lacan's compartmentalisation of the psyche into three separate spheres of production – the famous triad of the imaginary, symbolic and real.

> [The] real truth of the matter – the glaring, sober truth that resides in delirium – is that there is no such thing as relatively independent spheres

> or circuits: production is immediately consumption and a recording process (*enregistrement*) without any sort of mediation, and the recording process and consumption directly determine production, though they do so within the production process itself. Hence everything is production … (Deleuze and Guattari 1983: 4)

In place of Lacan's model, Deleuze and Guattari offer a unified model of the psyche whose operation consists of three types of interrelated syntheses: the synthesis of production, the synthesis of recording (registration) and the synthesis of consumption. By synthesis of production Deleuze and Guattari mean the work of the unconscious to produce what Kant refers to as intuitions. My reference to Kant here is by no means accidental – Deleuze and Guattari themselves point us in this direction. Kant, they argue, was one of the first to conceive of desire as production, but he botched things by failing to recognise that the object produced by desire is fully real (Deleuze and Guattari reject the idea that superstitions, hallucinations and fantasies belong only to the realm of 'psychic reality' as Kant would have it) (Deleuze and Guattari 1983: 25). If the synthesis of production refers to the production of intuitions, then by extrapolation we can deduce that the synthesis of registration (or recording) refers to the mind's uptake of these intuitions, or the imagination, while consumption is the transformation of these intuitions into concepts, or the understanding.[8]

If this Kantian reading seems surprising, it is nevertheless confirmed by Deleuze and Guattari's critique of Lacan, which brings me to the third point. Lacan makes essentially the same mistake as Kant, Deleuze and Guattari argue, in that he conceives desire as lacking a real object (for which fantasy acts as both compensation and substitute). Deleuze and Guattari describe Lacan's work as 'complex', which seems to be their code word for useful but flawed (they say the same thing about Badiou). On the one hand, they credit him with discovering desiring-machines in the form of the *objet petit a*, but on the other hand they accuse him of smothering them under the weight of the Big O (Deleuze and Guattari 1983: 310). As Žižek is fond of saying, in the Lacanian universe fantasy supports reality. This is because reality, as Lacan conceives it, is deficient; it perpetually lacks a real object. Deleuze and Guattari see the same fault in Baudrillard's work – hence their cryptic snipe that the concept of fantasy does not 'compel psychoanalysis to engage in a study of gadgets and markets, in the form of an utterly dreary and dull psychoanalysis of the object: psychoanalytic studies of packages of noodles, cars, or "thingumajigs"' (26). If desire is conceived this way, as a support for

reality, then, they argue, 'its very nature as a real entity depends upon an "essence of lack" that produces the fantasized object. Desire thus conceived of as production, though merely the production of fantasies, has been explained perfectly by psychoanalysis' (25).

But that is not how desire works, according to Deleuze and Guattari, because it would mean that all desire does is produce doubles of reality, creating dreamed-of objects to complement every real object. This subordinates desire to the objects it supposedly lacks, or needs, thus reducing it to an essentially secondary role. Nothing is changed by correlating desire with need either.

> Desire is not bolstered by needs, but rather the contrary; needs are derived from desire: they are counterproducts within the real that desire produces. Lack is a countereffect of desire; it is deposited, distributed, vacuolized within a real that is natural and social. (Deleuze and Guattari 1983: 27)

This rejection of Lacan confirms what might be termed the neo-Kantian reading of desire I have proposed because it means that we cannot define desire in a transitive fashion: any attempt to define desire as the desire for something immediately puts us back into the realm of lack. Productive desire cannot be the desire for something, it must produce something. This brings me to the fourth point I want to make about desire. If desire is productive and what it produces is real then desire must be actual and not virtual. Deleuze and Guattari are quite explicit on this point. Referring to the formation of symptoms, such as hallucinations, Deleuze and Guattari write: '*The actual factor is desiring-production*' (Deleuze and Guattari 1983: 129; emphasis in original).[9] To which they add the following important clarification:

> The term 'actual' is not used because it designates what is most recent [which is its usual meaning in both French and German], and because it would be opposed to 'former' or 'infantile' [which is how it is used in Freud's texts]; it is used in terms of its difference with respect to 'virtual'. (Deleuze and Guattari 1983: 129)

I doubt there is a more important or consequential statement in the whole of Deleuze and Guattari's writings. Its importance becomes clear in the next sentence:

> *And it is the Oedipus complex that is virtual, either inasmuch as it must be actualized in a neurotic formation as a derived effect of the actual factor, or inasmuch as it is dismembered and dissolved in a psychotic formation as the direct effect of this same factor*. (Deleuze and Guattari 1983: 129; emphasis in original)

This is a major reversal of how we are taught to think about the relationship between the actual and the virtual. On this rendering of it, that which stems from the unconscious and therefore has no tangible form is treated as the actual, while that which flows from outside the unconscious, whether from the conscious or the perception system, and therefore has some possibility of having a tangible form, is treated as the virtual. To actualise the virtual, then, does not mean that something that was previously only notional or imaginary is thereby made concrete and real; rather, it means that something that was sensual is made present to the mind in an active sense. The actual is that which concerns the mind right now. Freud's biggest mistake, Deleuze and Guattari claim, which demonstrates his failure to understand this point, was to think that the unconscious is constructed in the image of Oedipus, which would mean that the unconscious is merely a shadow theatre for the conscious and not a productive system in its own right.

My point is that there is nothing at all within Deleuze and Guattari's theory of desire that can tell us either how we should live or how we should treat others. And this is perhaps as it must be. As Dworkin says: 'The *fact* of desire – even enlightened desire, even a universal desire supposedly embedded in human nature – cannot justify a moral duty' (Dworkin 2011: 193). And yet, this is precisely what Foucault attempts to do with Deleuze and Guattari's work. He takes statements that have to do with the functioning of desire as the productive unconscious and turns these into moral and ethical statements. This is, in effect, a category mistake because it treats Deleuze and Guattari's theory of how the psyche operates as the basis for a radical politics; moreover, it prioritises aspects of the functioning of the psyche that are described by Deleuze and Guattari as pathological (as Deleuze and Guattari repeatedly say, the schizo is not a model – Deleuze and Guattari do not romanticize the schizo, it is their readers who do that). Foucault transforms Deleuze and Guattari's quite practical thoughts on political transformation into a series of more or less empty slogans – free political action from paranoia, develop action by proliferation, juxtaposition and disjunction, prefer the positive and multiple, don't be sad, don't be enamoured of power and so on. These slogans combine to form an image of Deleuze and Guattari's thought that obscures what is original and interesting in it, namely the concept of productive desire. But even more problematically, in my view, it creates an image of Deleuze's thought that is all too easily dismissed by scholars whose philosophical formation leads them to expect straightforward answers to straightforward questions (albeit highly complex straightforward questions such as the one I cited above from Linda Polman's book).

This is not to say that we should abandon any thought of deriving either an ethical or moral discourse from Deleuze and Guattari's work. There is ample reason to think that the opposite is the case. But it is to suggest – insist even – that we cannot build such a discourse from Deleuze and Guattari's analyses of how desire operates. And indeed, no workable ethical or moral discourse could be constructed in this way because, as Kant shows, determining the right way to live and the right thing to do cannot be a matter of what the individual wants or thinks. My desires, sovereign though they may be to me, do not confer or justify the right to do as I please, no matter the cost to others. And while it is true that Deleuze and Guattari's rhetoric is flamboyantly in favour of throwing off the manifold shackles that keep our individual desire in check, nowhere do they suggest that the liberation of our desire should take priority, no matter the cost to others. So while we may think of them as anarchists or liberationists, take your pick, we also have to assume that they accept the necessity that something other than desire must form the basis of our ethical or moral discourse. In other words, we cannot take the easy way out of this problem of trying to determine how Deleuze and Guattari would decide what the right thing to is and simply say that Deleuze and Guattari reject all forms of ethical or moral discourse. That cannot be true. What can be and probably is true is that they reject all existing forms of ethical or moral discourse in favour of one still to be constructed. Our job then in Deleuze Studies is to begin the process of constructing that discourse.

Notes

1. This is the basic of hypothesis of Hardt and Negri's concept of the multitude. See Hardt and Negri 2000.
2. See Badiou 2000 and Hallward 2006.
3. It was for this reason that I titled my first book on Deleuze *Deleuzism* – it was intended as an exploration of the problematic of how to 'follow' an author who instructs his readers to go their own way and create their own questions. I make this point because in a recent article, Douglas Spencer (2011) has used the term 'Deleuzism' as a kind of catch-all pejorative for what he sees as banal uses of Deleuze's work. See Buchanan 2000.
4. See Sandel 2010.
5. Dworkin 2011: 17.
6. For example, it would be very interesting to hear Deleuze's thoughts on the concept of freedom, or, even more pointedly, his thoughts on justice. Deleuze has no hesitation in saying, for example, that the Israeli occupation of Palestine is an injustice, but nowhere does he explain what in his view ought to be done to rectify the situation (Deleuze 1998: 30). But to accuse Israel of acting unjustly he must have some notion – however inchoate – of justice in mind, and that is precisely my point: we need to force Deleuze's work to disclose answers to these kinds of implicit questions.

What is Pharmacoanalysis?

Gregg Lambert Syracuse University

Abstract

In *A Thousand Plateaus*, Deleuze and Guattari call for what they term a 'pharmacoanalysis' as an ancillary, but nevertheless related, component of schizoanalysis. Employing Spinoza's theory of affections, they argue that if desire is only the conscious idea of the effect of an external body on our own, then especially around the question of drugs psychoanalysis fails to provide an adequate idea of the real effective bodies that act on our bodies and our minds. Instead, it conceals these real and effective bodies behind a symbolic form that organises our ideas according to a consistent pattern of signification. In the case of certain drugs, moreover, desire bypasses a symbolic order and directly invests the perception and the perceived. A pharmacological investigation reveals real social and political consequences in that molecules, like individuals, are organised into living societies, and the drug can enter into one society in order to effect a change in composition, either by adding new relations or causing existing relations to decompose. This insight is then applied to the threefold illusion of consciousness, producing a more accurate analysis of the problem of addiction and a critique of the moral prohibition that usually determines the representation of illicit drugs, and at the same time, the 'Oedipalisation' of certain other drugs prescribed by the legal dealer, or clinical physician.

Keywords: Deleuze, Guattari, Spinoza, Drugs, Psychoanalysis, Schizoanalysis

Polyp and Medusa are names for two body forms of animals (coelenterates) of the phylum Cnidaria – one, the polyp or hydroid, is stationary; the other, the medusa, is free-swimming. Both consist of a cylindrical body with a mouth

Deleuze Studies Volume 5: 2011 supplement: 21–35

Drugs are dangerous, to be sure, and certainly some drugs are more dangerous than others. And yet, what is the danger specific to drugs? According to Deleuze and Guattari, 'this is where a pharmacoanalysis would come in, which must both be compared and contrasted to psychoanalysis' (Deleuze and Guattari 1987: 283). In taking a drug, my body encounters another real, effective body. Therefore, it is not a matter of consciousness being 'altered' by a secondary attribute; rather, it is a relation between two bodies that undergoes an essential transformation that takes place below the level of consciousness. In the encounter between my body and the body of the drug, according to Deleuze and Guattari, the two relations form a more 'pregnant whole' ('Body without Organs'). Of course, this is not without its own dangers. Sometimes the relations combine in such a way as to cause my body to decompose, destroying 'its own relation' and the parts to be combined with this new, more powerful body; that is, the new body severs the former relations that belong to the former body, the so-called 'body proper', and its parts. However, all relations are external, which is why it is an illusion specific to consciousness to identify certain relations as internal or proper, and others (like those introduced by the body of the drug) as contingent and arbitrary.

Despite altering the relations that already compose our bodies in order to effect new intensities, some drugs can sometimes cause these former relations to decompose. For example, the muscular spasms and uncontrollable vomiting brought on by mescaline or peyote is an example whereby the body is grasped by a new relation that causes it to empty itself, eschewing all the heaviness of the matter that constituted the health and nourishment of the former body's own relation, transforming it into a pure vessel for another body that burrows into it like a dangerous animal. Likewise, the anaemic and anorexic body of the heroin addict shows the relation of a body that has re-composed its parts in relation to a new whole that needs only a little water between hits in order to sustain itself, like a cactus or desert flower. In both cases, one could say that each drug approaches, by relative and differential speeds, a point of absolute deterritorialisation, although one never reaches this point by means of drugs alone.

This is, in fact, impossible and constitutes the limit of positive movement or line of flight. According to Deleuze and Guattari, the best one can do is to skirt a line of abolition and to attempt to free the experience from secondary determinations such as delirium, hallucinations, bad feelings, toxicity and addictions of various kind and intensity. This is not aided by our lack of knowledge concerning the specific causality of each drug, and the wild variations one often encounters in the same kind. Grass is unruly; there are too many varieties to perceive the specific causality of its mood. In this way, it could be compared to wine. (Alcohol, in general, produces a heaviness whereby the body succumbs to the spirit of gravity and usually ends up wallowing in the mire.) Cocaine produces incredible speeds, but usually at the cost of an exaggerated slowness associated with the post-high state, which also comes far too quickly. Acid produces the imperceptible, but also too much perception (that is, the problem of hallucination). Ecstasy produces the insensible, but also too many good feelings, which are like stained glass: they distort the reality of desire. If all these examples are derived from so-called 'illicit' drugs, evoking a moral order of representation, it is only to highlight the problem of attribution more clearly. As in the descriptions above, each drug is defined only by its secondary attributes. We have not reached what Deleuze and Guattari call the 'pregnant whole'.

In a well-known passage on drugs that appears in *A Thousand Plateaus*, which is crucial for our discussion, Deleuze and Guattari define drugs in relation to movement and duration (the 'imperceptible'), that is, in terms of a perceptive causality that Deleuze will address in the context of cinema later on. They write:

> What allows us to describe an overall Drug assemblage in spite of the differences between drugs is a line of perceptive causality that makes it so that (1) the imperceptible is perceived; (2) perception is molecular; (3) desire directly invests the perception and the perceived. (Deleuze and Guattari 1987: 282)

The first two propositions can be examined together since Deleuze and Guattari assert several times that 'the imperceptible itself becomes necessarily perceived at the same time perception becomes necessarily molecular'. Here one might remark a formal or structural relationship between this axiom and the Kantian thesis of apperception: that the condition of possible experience is at the same time the condition of the possible objects of experience. The phrase 'at the same time' functions as the hinge and causes the two parts of the proposition to become implied

in one another, as two phases of the same event. We also find this phrase in the formulation by Deleuze and Guattari concerning drugs, which echoes the third proposition described above: 'It is our belief that the issue of drugs can be understood only at the level where desire directly invests perception, and perception becomes molecular *at the same time* as the imperceptible is perceived' (Deleuze and Guattari 1987: 283; my emphasis). I will return to comment on the first part, but wish to turn my attention now to the second part of this thesis and ask why is it that the perception of the imperceptible (movement, duration) *necessarily* implies it becoming molecular?

In the experience of drugs, whether we are speaking of this or that particular drug, there is a duration that consciousness passes through, one that is purely transitive, made up of relative speeds. Perception is folded by a series of presents (or now-points) that appear to fade in and out, or more accurately, to bleed into consciousness. Perception is made from a series of stains, splotches or smears like an expressionist canvas. Moreover, consciousness itself becomes a pure passage, or rather the awareness of the passage between states that it judges in terms of a greater or lesser degree of potency. In this movement, consciousness is entirely defined by a process of differentiation, before and after, or from one moment to the next; at once dividing and being divided, both differentiating and differentiated. However, it does not differentiate between two moments of the same duration, as between two entirely different durations, or two 'wholes' (employing a Bergsonian distinction) that suddenly become 'perceptible' by a consciousness that passes in between them. But here, again, is where the illusion of consciousness sets in, since in experiencing a duration that involves the difference between two states, consciousness often affirms an attribute of the body, or some part thereof (such as sight, or hearing, or even the capacity of touch or affection), a greater or lesser force of existing than before. These are necessarily confused ideas, according to Deleuze's own Spinozist reading of this state, and are bound to an inadequate idea of drugs' specific causality. Here, Deleuze remains fairly scholastic in defining the finitude that limits and conditions consciousness – and makes illusion an internal principle of its constitution – since consciousness is entirely caused by the effect of external bodies on our own, by ideas of affections, of which consciousness itself has only inadequate ideas. Consciousness, however, has no form of its own – meaning that there is no idea of consciousness itself – because it is purely passive reflection, contemplation and contraction of the external bodies that act upon it.

Deleuze is thoroughly Spinozist in subtracting from consciousness any formal power of its own, which means any power of self-affection or spontaneity of action. Consciousness is entirely caused by the action of external bodies, itself being only the ideas of these actions and these bodies, even though all its ideas are inadequate. Here, illusion is constitutive of consciousness and its relation to external causes, since the adequate ideas of external bodies and causes are by their very nature unconscious. And yet, Deleuze says, 'it is this positive kernel of the inadequate idea in consciousness that can serve as a regulative principle for a knowledge of the unconscious' (Deleuze 1988: 60). The simple empiricist thesis that Deleuze asserts regarding this positive kernel is the following: even inadequate ideas are capable of expressing real encounters, albeit in a distorted and mutilated form; however, inasmuch as all inadequate ideas contain a positive kernel of a true and effective cause, they also contain traces of the real external bodies and can be used to create more adequate ideas. In contrast to a psychoanalytic determination of the Unconscious, which is dependent upon another plane of organisation that is inferred or concealed from the perception-consciousness system, to create a true knowledge (*connaissance*) of the unconscious would be nothing less than to create more adequate ideas of the external bodies that are the true cause of consciousness and, thus, to have clearer and more distinctive ideas of the affects 'as determinations of *conatus* by the ideas' (79).

We can now clarify how perception becomes molecular. This happens to the degree that consciousness appears as the effect of the multiple bodies acting upon it, as is sometimes perceived in an experience when one can grasp that the appearance of an external body (a certain note in a song, or a colour that appears against a wall in the Piazza di San Lorenzo in Rome) is the cause of consciousness. Consciousness becomes the pure idea of affection and this idea is necessarily expressed as a multiplicity of effects that are caused by other bodies acting upon it. Thus, consciousness can no longer be defined as the psychological (or moral) expression of the subject, but rather as the expression of 'the idea's property of doubling and redoubling itself to infinity' (Deleuze 1988: 59). Does this imply, however, that the ideas of consciousness that belong to a duration of drugs are, for that reason, more adequate to these external bodies? No. First, for the reason given above, because the drug is itself an external body and therefore also inadequately rendered in consciousness; second, the fact that perception becomes molecular only implies that consciousness no longer functions as the cause of perception, or provides it with its principle. Rather, consciousness itself

is dispersed into haecceities, moments, events, as if filled with the music of all the external bodies and other ideas that crowd in and press against it. Perception becomes molecular since consciousness is no longer at its centre, but can be located on the surface or fringes of these external bodies themselves; these external bodies become a field in which consciousness could no longer occupy a perspective that is outside and at a distance from the perceived. Rather, consciousness would be immanent (meaning 'near to') every perception, as if constituting the shiny and opaque or scintillating surface of things themselves.

The third proposition, that 'desire directly invests the perception and the perceived', brings us to a confrontation with a psychoanalytic concept of desire. In order to understand this confrontation, we must become Spinozists rather than Lacanians. According to the psychoanalytic concept, desire is never apprehended 'in itself', but is always inferred or concluded from another plane of organisation, and from the plane of *language* in particular, by which the Real enters into the Symbolic. On the other hand, we might understand the claim that with drugs 'desire directly invests perception and the perceived' to mean that, in this state, desire can be apprehended 'in itself' and no longer needs to be *translated* onto another plane of symbolic organisation. But does this imply that the Freudian concept of the unconscious disappears entirely as a result? Does this mean that there is no unconscious where the imperceptible appears as the object of desire itself, and no longer in its figurative or symbolic representatives? In order to reply to these questions, it would be necessary for a Spinozist concept of desire to be substituted for the psychoanalytic one. Desire is the whole of causality, which remains 'in itself' even in undergoing modification, in its modes. 'Spinoza defines desire as *conatus* having become conscious, the *cause* of this consciousness being the affection' (Deleuze 1988: 60). In other words, as Deleuze writes, 'consciousness is completely immersed in the unconsciousness … we are only conscious of the ideas that express the effect of external bodies on our own, ideas of affection' (60).

It is from this Spinozist perspective, moreover, that we might return to comment on a certain resemblance to the Kantian correspondence between the conditions of possible experience and the possible objects of experience. If consciousness is determined by the effect of external bodies on our own, by the ideas of affection (whether these be perfect or imperfect), then the unconscious is merely the quantity of external bodies that we have not yet encountered. Hence, we will need to arrive at a real definition of desire, one that at the same time shows the 'cause' by which consciousness is hollowed out, as it were, in the appetitive

process. Now, appetite is nothing but the effort by which each thing strives to persevere in its being, each body in extension, each mind or each idea in thought (*conatus*). But because this effort prompts us to act differently according to the objects encountered, we should say that it is, at every moment, determined by the affections that come from the objects. *These determinative affections are necessarily the cause of the consciousness of the conatus* (Deleuze 1988: 21). If desire is only the conscious idea of the effect of an external body on our own, then psychoanalysis fails to provide an adequate idea of the real effective bodies that act on our bodies and our minds. Instead, it conceals these real and effective bodies behind a symbolic form that organises our ideas according to a consistent pattern of signification; hence the famous phrase 'the unconscious is like a language'. Furthermore, it also fails to provide the ideas by which we have a consciousness of the direct experience of other bodies and modes of existence, even though these ideas are only indirect figurations of real, lived experiences. According to a Spinozist definition, desire is merely the conscious idea of affection; the idea of an external body present in our own. Affections are images that appear in the mind and corporeal traces that cross the body's threshold of sensibility first of all. They are images associated with feelings defining the presence of our relation to an external body. As Deleuze writes, 'the *affectio* refers to a state of the affecting body, which involves the nature of the external body, and the affect, which involves an increase or decrease of the power of acting, for the body and the mind alike.' As I will return to demonstrate in the conclusion, the idea of escape, in most addictions, functions as the conscious idea that links the body of the drug to a determinate feeling in the subject and gives us a knowledge of the causal relationship between these bodies.

Concerning this notion of affect, we find that neither joy nor sadness should define the quality of the affect associated with a drug; rather, it should be understood quantitatively, as increasing or decreasing the body's own relations. This is because even the most exuberant affective state can really be a form of suffering or sadness, as often in the case of sexual pleasure, which sometimes masks a narcissistic wound or a wish to go unconscious. Consequently, it would not be too difficult to apply this observation to our idea of drugs, given that the usual representations are bound up in a remarkable degree with the illusions of consciousness as Deleuze defines them. In other words, drugs approach, by a relative and differential speed, a point of absolute deterritorialisation. The point is the following: one never reaches this point by means of drugs alone. It is, in fact, impossible. The best one can do is skirt a line of abolition and

in this sense drugs represent a tarrying with the negative, to attempt to free the trip from secondary distinctions such as delirium, hallucination, bad feelings, and toxic and poisonous substances. But we might ask why there is also so much sadness and destruction surrounding this desire. As Deleuze and Guattari write in the same context of the passage above,

> the causal line, or line of flight, of drugs is constantly being segmented under the most rigid of forms, that of dependency, the hit and the dose, the dealer . . . Instead of holes in the world allowing the world lines themselves to run off, the lines of flight coil and start to swirl in black holes; to each addict a hole, group or individual, like a snail. (Deleuze and Guattari 1987: 285)

As in the case of discriminating between so-called 'joyful affects' and 'sad passions', here we must acknowledge that a Spinozist definition of 'the body and what it can do' more often than not eventually leads to disappointment, which can be phrased as follows: since Being is positive, affirmative in essence, it is always tragic to see this Being become defined by the negative, to see it in a form that is distorted and mutilated. This echoes Spinoza's formulation that if the striving for power is essentially a positive and affirmative trait of every mode, why is it that in the consciousness of the human being this desire becomes deformed by an image of tyranny and domination, and is essentially separated from the body's power to affect and be affected? In other words, why do humans so often desire their own repression and slavery? This could be defined as Spinoza's complaint, one that is shared by Deleuze and Guattari in the formulations of unconscious desire, of power, and, in this context, of drugs as well. One begins with a positive declaration of Being only to end by amassing so much evidence against it. We are fated to begin with the inadequate ideas, that is, with consciousness itself, in order to discover in them the kernel of adequate ideas that will determine its true causes.

> So once we have attained adequate ideas, we connect effects to their true causes, and consciousness, having become a reflection of adequate ideas, is capable of overcoming its illusions, forming clear and distinct ideas of affections and affects it experiences. (Deleuze 1988: 60)

As one can see from this passage, Deleuze can be called the last of the rationalists, but one whose idea of reason can only be attained through consciousness, the seat of illusion. This is a strange kind of rationalism, since the more he lays claim to a principle of reason, the more he is driven to find this principle in the field of empiricism, to discover in the ideas of reason the traces of the encounters of real experiences.

Nevertheless, from the above observation, it would be fair to say that consciousness itself appears to comprise the entire region of the problematic of drugs, since consciousness is the site of 'illusion', the place where secondary determinations are represented for the subject, or the experience is being represented under the most rigid of forms. What are these forms and how might they appear in a consciousness of drugs?

As Deleuze argues in *Spinoza: Practical Philosophy*, consciousness is the seat of a three-fold illusion. This threefold illusion, as I will show, can be applied to the representation of drugs as well.

The first illusion of consciousness involves representations that usually take effects for causes. For example, we usually define the drug by its secondary attributes – hallucination, bad feelings, delirium or even addiction. In fact, these are the effects of the relation in which the body of the drug only constitutes a partial factor. One wonders, of course, if bad feelings were already latent in the body's other relations (to other bodies and ideas), only to become perceptible via the relation to the body of the drug. This observation would be one aspect of what Deleuze and Guattari call 'pharmacoanalysis', in which the bad feelings perceptible through the drug would offer an occasion for analytical reconstruction, perhaps to a more effective degree than that achieved by a psychoanalytic method. However, by taking the drug as the 'whole' of the cause, the real or effective causality is cut off from an immanent social, and even political, determination. One might ask, what is the social causality of the specific mood of crack, what feeling or mood does it make perceptible, and what are the body's other relations (to family, to economic activity or capital, to pleasure and pain) that become perceptible in the crack addict's anorexic body, evincing a kind of sudden discharge of elation followed by a period of inactivity, often gazing at a wall six inches in front of one's face? Likewise, in the case of hallucinations associated with certain drugs such as acid or peyote, in usual representations it appears as if the drug is accorded a certain unconscious relation to perception-consciousness, as if it were simply a video tape that was inserted into the subject. On one side, this has created the myths concerning another or collective unconsciousness that has surrounded peyote; on the other, there are clichéd representations of the 'bad acid trip' in which the walls suddenly begin to bleed or a lover's face becomes unrecognisable, perhaps even transforming into the face of an animal such as that of a voracious bird whose beak appears particularly menacing when viewed from close up. Again, the specific causality of the hallucination is simply referred to the drug instead of

being identified with the relation to the body itself, or to the site of its unconscious production. Finally, because drugs represent an impersonal force, a becoming impersonal or anomalous, we often speak of '*a* drug addict', or '*an* alcoholic'. The habit is seen to dissolve all individual predicates, and the subject is simply identified by certain repetitive traits. In the representation of morality, other moral traits can be added as well. The alcoholic, for example, who is seen to entertain an improper relation to boundaries, is immediately suspected of acting on his or her sexual desires and must therefore be constantly surveyed. The drug addict is suspected of a-social inclinations, and is likely to become the subject of investigations for acts of robbery and embezzlement. At this point, the system of judgement, operated by moral consciousness, can make easy connections to other prejudices such as racial and class-bound determinations. Simply replacing the dose and the illicit dealer with the medical professional and the legalised prescription does not resolve the social forms of dependency – even though it causes some forms to become sanctioned and legitimate – nor create a more adequate picture of the manner in which both forms belong to a modern bio-political order that seeks to directly intervene in the brain in order to consolidate its collective assemblage of desire.[1]

The second illusion of consciousness that pertains to the representation of drugs is coupled with the first: 'consciousness construes the effect of a body on our body as the final cause of its own action' (Deleuze 1988: 20). Thus, consciousness gives itself the principle by which to rule over the body; it functions as the first cause. This illusion is particularly visible in the case of addiction, when the subject is heard to proclaim, 'I choose … to drink, or to do drugs, and I can stop anytime I wish.' Of course, this is a complete illusion, but not for the reasons usually associated with the critique of this statement. Typically, the first principle or cause is simply transferred to the body of the drug, as in the reply, 'You cannot simply choose to stop, because you're addicted.' But this returns us to the first illusion of consciousness: taking an effect for a cause. In a certain sense, popular moral sentiment is correct in assigning the first principle to the addiction, but the addiction here designates the body that is produced (by the passive synthesis of repetition and habit) in the encounter between my body and the body of the drug. As a result, the parts that compose each body have fabricated a new body, a new 'whole', and thus it is no longer accurate for the addict to say, 'This is my body,' since the body on drugs can no longer be designated as an object of consciousness. Concerning the real cause of addiction, therefore, it would be fair to say that we know very little about it,

because either we have been defining addiction too mechanically as the primary body's relation between pleasure and pain, or chemically as the particular effects of the chemical components of the drug in relation to the brain of the addict. In both cases, consciousness continues to spoil the equations on the body itself initially defined in a state of homeostasis or equilibrium (which really only pertains to the effect of the body on consciousness itself). In each case, we continue to work with a deficient notion of cause, which is why the real causality of addiction continues to remain imperceptible to analysis.

The third illusion of consciousness is what Deleuze, following Spinoza, defines as the 'theological illusion'. How would this illusion appear in the representation of drugs? I would propose renaming this third illusion the 'moral illusion' in order to make it more pertinent for our discussion. Deleuze defines the theological illusion as what happens when consciousness can no longer find itself as the first cause, or the organiser of ends, and evokes a God who rules over such a case and 'who operates by means of final causes and free decrees in order to prepare for man a world that is commensurate with his glory and his punishments' (Deleuze 1988: 20). Consequently, when consciousness can no longer find itself as the first cause in the relation to appetite (or desire), it invents or fabulates a moral God who prohibits any such a relation to begin with and who promises suffering for the man who disobeys his decree. As you can see, we are back in the garden concerning the decision to eat, or not to eat, the infamous fruit. This is also why Spinoza is extremely pertinent to any discussion of drugs, since the poisonous fruit was nothing less than a drug that symbolised the unconscious cause of *conatus*, that is, the relation between the real affective body and the idea that represents it in consciousness (the idea of desire).

Once again, concerning the notion of *conatus* being defined in this passage, neither joy nor sadness should be understood as defining the quality of the affect associated with a drug, but rather should be understood quantitatively – that is, either increasing or decreasing the body's relations. For example, according to the third illusion of consciousness, the moral God simply represents an imperfect idea of Adam's desire, so it would appear that Adam should not eat the fruit because God forbade him, when in fact it was simply because it was poisonous and would cause the parts of Adam's body to decompose and by destroyed. In the theological fable, any such knowledge of the relation between Adam's body and the body of the fruit is prohibited a priori, which means that it was not open to experimentation. Adam could have, for example, just tried it out, taken a little bite in order to

see what kind of effects were produced. Not a chance! This is because any experimentation was prohibited by the invention of a moral God who ruled it out on an individual level and who promised punishment for anyone who disobeyed. The irony that is present in Spinoza's reading of the theological fable is that Adam, in fact, should not have eaten the fruit from the tree; the fruit *was* poisonous and did cause the parts of Adam's body to enter into a new relation, that of mortality. However, because the idea that represents this knowledge is prohibited, Adam is never given the opportunity of coming to this knowledge by any means except by leaping over the prohibition and swallowing the fruit whole. But this did not bring him any knowledge, only sadness.

Here, we can readily see the pertinence of this discussion for determining the nature of the transcendental moral prohibition that surrounds drugs in today's society, and it is always funny to hear neurotics and other 'normative subjects' claim to have mastered the temptation to use drugs: '*I never touch the stuff!*' However, what they are referring to is a relation to an external body that they have never encountered and have no idea of as a relation to their own *conatus*. They might as well be saying, 'I have never become a horse or a flower; I have never seen the world from a caterpillar's point of view, or burrowed into the earth with the blindness of a mole.' In fact, what they are boasting is that they have no knowledge of such 'becomings' and desire to know nothing about it. This becomes the colourful stripe of their subjectivity, and a strange kind of pride, since only a moral consciousness promotes a desire to limit the number of relations, to keep the body pinned by its normal routines and habits (including its sexual and digestive habits), to restrict (not only for oneself, but particularly for others) the body and what it can do. This moral judgement does not advise us to experiment, to try a little in order to judge the effects for ourselves, to construct through a simple empirical method an idea of the relation between desire (or appetite) and the body that it determines, which in effect would accord each of us the power to determine our own relation between our body and the body of this or that particular drug. Rather, it rules out any such knowledge by simple prohibition. In response to this system of judgement, this judgement of God, I would simply recite the famous line by John Lennon: '*I'd love to turn you on (off).*'

In conclusion, let us return once again to the old Spinozist refrain: how is desire, which is essentially positive, an increase in the power of affecting and of being affected, transformed into sadness and misery? How is it that humans appear to desire their own slavery? Or, according to the terms of the drug, how is it that what begins as a positive

movement of deterritorialisation, or line of flight, seems to end up as a line of abolition, dependency and death? In response, I would say that this is impossible according to a rigorous understanding of Spinoza's concept of desire. Therefore, in such cases, the idea that determined the desire for drugs was never positive to begin with, and was only a line of abolition from the very start. To illustrate this point, I will briefly take up the confused idea of 'escape' as an object of pharmacoanalytic investigation.

First, if the idea of escape appears as the causal relation, which evokes the image of the drug as its necessary effect (as in the case of addiction), then the expression of the idea that determines the relation to drugs is already defined negatively, and thus already thrown off track. The drug merely intensifies this idea, both in image and in feeling, in the body and mind alike. The subject in the end only finds a relation to conscious desire completely determined by the idea of escape, both as a mental image and an intensive state. Escape, then, is a confused idea that already prefigures the causal relation to the affecting body of the drug, and it is usually very telling which particular drug is chosen to realise the desire to escape – usually the most addictive, which only seems to contradict the primary motive, but in fact is its fullest expression, representing a mode or modification of the idea of desire itself. What is addiction, after all, but the most contracted and repetitive crystallisation of the idea of escape? In addiction, one thinks of nothing but escaping; one feels nothing but the need to escape, accompanied by an incredible passivity in relation to this feeling; the more one feels this need, the more tightly the presence of the external body is contracted in consciousness, like in insomnia, or in certain experiences of pain when the wish to be released by a duration of intense pain (as in food poisoning) is accompanied by an intensification of the pain itself.

Second, if escape already functions as the idea, then it is ironic that addiction can be understood as the most intense expression of this idea, which completely dominates the relation between my body and the presence of an external body in me. A good doctor, or pharmacoanalyst, would probably advise that if you want to escape, then stay away from drugs, because you will only intensify this idea and soon be thinking of nothing else, nothing but escaping morning, noon and night. Usually, the external body that is being addressed in the desire to escape is designated by 'the world', which in reality only designates the multiple relations encompassed by the body's relation to other bodies and ideas. In addiction, these multiple relations are replaced by the singular relation to the body of the drug; and in general, there is a quantitative lessening

of the number of relations in consciousness, while at the same time, an intensification of the presence of the external body of the drug. Desire, which in general designates the capacity of the body's affections, its ability to act and be acted upon by external bodies, is reduced to one affection – the idea of addiction itself. The world disappears, as well the relations to other bodies and conscious ideas (to family, to work, to pleasure, to memory, etc.) and eventually there is only the presence of one body that defines the idea of desire. In the strictest sense, this quantitative reduction of the number of relations can be defined as a destruction of the virtual relations between the actual parts that compose the body. Escape, therefore, is only the intensification of an idea of desire that is also found to be peculiar to certain drugs, and functions as the cause that links the body of the drug to a determinate feeling in the subject and gives us an inadequate knowledge of the causal relationship between these bodies. In order to correct this relationship, in the end, what will be required is not simply a better or more refined drug, but a more adequate idea of desire, one that is no longer predicated on escape as a line of abolition.

It is clear from this discussion that the classical distinction between ethics (empirical inquiry or wisdom) and morality (transcendental judgement, unconscious prohibition) can be situated in the discourse that continues to surround drugs today. Therefore, if I began by admitting that certain drugs are dangerous, I conclude by locating the true source of this danger in the ideas that express the relation to a more 'pregnant whole' (or 'Body without Organs'), and which can also be determined in such a manner that it enters in to destroy the former body and its own nourishments. In contrast to a transcendental prohibition, the ethical principle of *conatus* could be formulated by the following ethical proposition that would serve as a principle of pharmacoanalysis: the drug that agrees with my nature determines me to form a superior whole that includes us, the drug and myself. The drug that does not agree with me jeopardises my cohesion, and tends to divide me into subsets, which, in the extreme case, enter into relations that are incompatible with my constitutive relation (in other words, *death* [Deleuze 1988: 21]).

Note

1. As Eugene B. Young has commented in response to reading this article, 'Are benzodiazepines like Xanax and Valium also not addictive, and does their legitimated usage by medical establishments mean that the user does not still form a confused idea of the drug, since a medical professional replaces the "dealer"? Would this not also provide an opportunity to critique the "idea" of the drug on

a social and political level, where confused and inadequate ideas are essentially marketed in proper bio-political fashion?' (Eugene B. Young, e-mail, 22 October 2010).

Flow, Code and Stock: A Note on Deleuze's Political Philosophy

Daniel W. Smith Purdue University

Abstract

In *Anti-Oedipus*, Deleuze and Guattari claim that a general theory of society must be a generalised theory of flows. This is hardly a straightforward claim, and this paper attempts to examine the grounds for it. Why should socio-political theory be based on a theory of flows rather than, say, a theory of the social contract, or a theory of the State, or the questions of legitimation or revolution, or numerous other possible candidates? The concept of flow (and the related notions of code and stock), I argue, is derived from contemporary economic theory, and most notably John Maynard Keynes. Deleuze and Guattari remained Marxists, not only because they held that contemporary political philosophy must inevitably be centred on the analysis of capitalism, but also because they held, following Marx himself, that the Marxist analysis of capital must constantly be transformed and adapted to new conditions. Thus, while certain aspects of Marx's analysis disappear from *Capitalism and Schizophrenia*, they are supplemented by the addition of new concepts adequate to the contemporary state of capitalism. The paper concludes, then, with an analysis of the role played by the concepts of flow, code and stock in Deleuze and Guattari's political philosophy.

Keywords: flow, code, stock, Keynes, Marx, capitalism

I. Introduction

In *Anti-Oedipus*, Deleuze and Guattari write that 'the general theory of society is a generalized theory of flows' (Deleuze and Guattari 1977: 262).[1] The basic thesis of the book is that it is the business of every society to code these flows (139), and the 'terrifying nightmare' (140) of any society would be a flow that eludes its codes, that is, a *decoded* or *uncoded* flow. While this language has become familiar to readers of Deleuze and Guattari, it is hardly a straightforward claim. Why does the concept of flow (or *flux*) lie at the basis of Deleuze's socio-political philosophy? To my knowledge, no other thinker has made the claim that the notion of a *flow* should be the fundamental concept of political philosophy. In making it, Deleuze is clearly distancing himself from other approaches to social theory, which instead would be based, for instance, on a theory of the social contract (Hobbes) or the spirit of the laws (Plato, Montesquieu), or a theory of the State (Plato), or the problem of legitimation (Durkheim, Habermas), and so on. The question I would like to address would thus serve as a necessary prolegomena to any consideration of Deleuze's political philosophy: why did Deleuze insist that it was necessary to base his entire socio-political philosophy on a theory of flows?[2]

In an interview, Deleuze and Guattari explain that the concept of the flow was 'a notion that we [initially] needed as an unqualified and undetermined notion [*notion quelconque*]' (Guattari 1995: 98), that is, as a purely *nominal* concept.[3] Indeed, intuitively, one can conceive of extraordinarily varied types of flow, and the ways they need to be controlled or coded.[4] Most obviously, there is the flow of *water*, and the building of dams and dikes to control and channel the water (in the Western USA today, the question of the rights to a limited water supply is becoming increasingly acute). There are *economic* flows such as money and capital, along with the control of markets. There are *material* flows of raw matter and utilities such as oil and electricity, along with the control of the grid, to keep the electricity flowing. There is the flow of *commodities*, along with their marketing and transport. There is the flow of *traffic*, along with the regulation of the highways and circulation (avoiding traffic jams), the mastery and control of speed.[5] There are *social* flows such as flows of populations, the flow of immigrants and foreigners over borders, along with the ability to control and monitor those borders (issuing passports, customs, and so on). There are flows of *sewage* and *refuse*, and the question of what to do with them. There are *somatic* flows such as urine, blood, sperm, sweat, faeces, milk, menstrual

blood, and so on, with their various codings. (This is the example with which *Anti-Oedipus* opens: a breast emits a flow of milk, which is cut into by a baby's mouth, which becomes a flow of faeces, cut off by the anus, and so on. Such is the lived experience of the infant, which has no sense of its organic body, but only of intensities such as hunger, or the need to defecate, and the flows and cutting of flows that satiate those needs.) One can even think of flows of *thought*, and the attempt to code and control the flow of thought via marketing, advertising, the media, and so on (such as the flow of scientific knowledge, as well as a flow of stupidity and opinion).

Now, while all these examples indeed give us a sense of the problem Deleuze has isolated and placed at the centre of his political philosophy – the problem of flows and their coding and control – it does not tell us where Deleuze got the concept from, nor why it lies at the basis of his social philosophy, nor how it functions philosophically in his work. For that, we need to turn to the domain of economics and Deleuze's analysis of capitalism, because it is here that Deleuze derives his concept of flow, and then extends it to domains outside of economics.

Robert Heilbroner once wrote a popular survey of the great economic thinkers called *The Worldly Philosophers* (Heilbroner 1999), and it is an apt title, since the great economists – the three greatest are Adam Smith, Karl Marx and John Maynard Keynes – deal philosophically with the most practical of matters: money, and everything that goes with it. While Deleuze only occasionally refers to Adam Smith, it is Deleuze's use of Marx and Keynes that I would like to focus on here.

In a 1990 interview, Deleuze remarked: 'I believe that Félix Guattari and myself have remained Marxists. This is because we do not believe in a political philosophy that would not be centered on the analysis of capitalism and its developments' (Deleuze 1995: 171).[6] It is nonetheless true that, as Lyotard noted in a review he wrote of *Anti-Oedipus* immediately after its publication, *Capitalism and Schizophrenia* contains a critique of Marx that is implicit rather than explicit, since a surprisingly large number of classical Marxist concepts (alienation, ideology, the class struggle, work-value theory, the dialectic of contradiction) drop out of Deleuze and Guattari's analyses completely: they are neither analysed nor criticised, but simply ignored (Lyotard 1972). Yet what Deleuze and Guattari retain of Marx's analyses is the definition of capitalism that lies at the heart of *Das Kapital*. It is in this sense that *Capitalism and Schizophrenia* can be said to present a Marxist theory of capitalism, but one that has been transformed and adapted to new conditions.

The definition that Marx gives of capitalism in the first book of *Capital* is organised around the encounter of two elements of abstraction, or what Deleuze will call two decoded flows: the flow of *subjective labour* and the flow of *objective capital*. On the one hand, the flow of labour must no longer be determined or codified as slavery or serfdom, but must become naked and free *labour*, in the form of the worker having to sell his labour capacity; and on the other hand, wealth must no longer be determined as landed wealth or the money dealing of merchants, but must become pure, homogeneous and independent *capital*, which is capable of buying this labour. Capitalism appears only when these two purely quantitative flows of unqualified capital and unqualified labour encounter each other and conjugate.

I will leave to the side the complicated historical analyses of *how* the conjugation of these two decoded flows of labour and capital took place, and *why* they first took place in Europe rather than elsewhere – this is, in part, the aim of Althusser and Balibar's analyses in *Reading Capital* (Althusser and Balibar 2009). But I would like to make two brief observations about how Deleuze interprets and uses this Marxist definition of capitalism.

First, for Deleuze, the *philosophical* importance of the conjunction of labour and capital lies in their common movement away from *representation* to what Deleuze calls at several places '*the activity of production in general*' (Deleuze and Guattari 1977: 270, 302). What does this mean? Marx said that Luther's merit was to have determined the essence of religion, not on the side of the object (Does God exist or not?), but on the side of the subject: faith as the source of religion (270). (This line of thought was continued in Kierkegaard's notion of interiority, though of course Deleuze does not follow Kierkegaard on this point.) According to Marx, Adam Smith and Ricardo did something similar in political economy: they located the essence of wealth, not in its object (land or money), but rather in an abstract subjective essence, which is my *labour capacity*, or my capacity to produce. What faith is to religion, labour is to political economy: humans produce gods in the same way they produce Prell shampoo or Ford automobiles.

The same is true of Freud: 'His greatness lies in having determined the essence or nature of desire, no longer in relation to objects, aims, or even sources, but as an abstract subjective essence – libido or sexuality' (Deleuze and Guattari 1977: 270). This is why Deleuze can say that the discovery of labour, by Smith and Ricardo, and the discovery of libido, by Freud, were really one and the same thing; that political economy and libidinal economy are *one and the same economy*. 'The discovery

of *an activity of production in general and without distinction*, as it appears in capitalism, is the identical discovery of both political economy and psychoanalysis, beyond the determinate systems of representation' (270; emphasis in original; cf. 302). Put differently, 'desire is part of the infrastructure' (104; cf. 63): our impulses and affects, and even our unconscious drives, what seems to be the most individual and personal part of ourselves (libidinal economy), are themselves immediately part of what Marx called the economic infrastructure, that is, the material base of every social formation (political economy). In other words, it is impossible to posit a mental or psychic reality to desire that is different from the material reality of social production (31; cf. 27: 'There is no particular form of existence that can be labeled "psychic reality"'); nor can one claim, as Freud does, that the libido has to be 'sublimated' (or desexualised or resolved) in order to invest the social field (352); nor can one say that the relations between social production and desire are relations of 'projection' and 'introjection' (28). This is one of the essential theses of *Anti-Oedipus*: libidinal economy and political economy are one and the same thing; they have an identical nature.

But Deleuze and Guattari immediately add a complementary thesis: although there is no *difference in nature* between the two economies, it is true that there is nonetheless a *distinction in régime* between them (Deleuze and Guattari 1977: 31). Technical machines, for instance, obviously work only if they are not out of order, which is what allowed Marx to posit a strict distinction, within political economy, between the means of production and the product ('Let us remember once again one of Marx's caveats: we cannot tell from the mere taste of wheat who grew it; the product gives us no hint as to the system and the relations of production' [Deleuze and Guattari 1977: 24]). In libidinal economy, by contrast, the product is always implanting itself back into its production, such that 'desiring machines' function only on the condition that they are constantly breaking down (31–2, 37, 151, 230) – whence the phenomena of manic-depressions or bipolarity, psychoses and, at the limit, schizophrenia. Much of the argument of *Anti-Oedipus* revolves around an assessment of the relations between the two economies given their identical nature but differing regimes. The first two chapters develop an entire theory of the nature of the *syntheses* of the unconscious: desiring-machines *produce* by means of immanent syntheses (local and non-specific and connections, inclusive disjunctions, nomadic and polyvocal conjunctions), whereas social machines *represent* the former by means of transcendent syntheses (global and specific connections, exclusive disjunctions, segregative and

biunivocal conjunctions). In both cases, '*the same syntheses are at issue*' (116; emphasis in original) – they have the same nature – but they are put to different uses. Desiring production and social production 'are therefore the same machines, but not at all the same *régime* ... or the same uses of syntheses' (288). Social production *represents*, at a molar level, what is *produced*, by desiring-production, at a molecular level. As a result, desiring-production comes to be crushed by the requirements of representation, and comes to desire its own repression.

In the third chapter of *Anti-Oedipus*, Deleuze and Guattari in turn develop a tripartite typology of social formations ('primitives', States, capitalism). 'In each case', they ask, 'what is the relationship between social production and desiring-production, once it is said that they have identical natures and differing *régimes*?' (Deleuze and Guattari 1977: 262). 'It could be', they will ultimately conclude, 'that where the *régimes* are the closest, the identity in nature is on the contrary at its minimum [primitive and despotic formations]; and where the identity in nature appears to be at its maximum, the *régimes* differ to the highest degree [capitalism]' (336). Social formations can therefore oscillate between two poles, depending on whether desiring-machines have a chance of causing their immanent connections to pass into the regime of the social machines (the active schizophrenic line of flight), or by contrast the social machines overcode desire through the transcendent syntheses of representation (the reactionary paranoiac investment). Yet as Deleuze and Guattari insist,

> we cannot allow the difference in *régime* to make us forget the identity in nature... There are no desiring-machines that exist outside the social machines that they form on a large scale; and no social machines without the desiring-machines that inhabit them on a small scale. (Deleuze and Guattari 1977: 340)

This idea that libidinal economy and political economy have differing regimes but nonetheless identical natures is one of the underlying threads that link together the entire socio-political analysis of *Anti-Oedipus*.[7]

Michel Foucault, in *The Order of Things*, had shown that a similar movement from representation to production had in fact occurred in numerous domains, to which Deleuze will often have recourse. In *biology*, for instance, we no longer define living beings by the external features or properties of an adult organism, but rather through genetics and embryology, that is, through the *process* by which the organism is *produced*. This is the historical switch from what was once called 'natural history' (Aristotle) to the modern sciences of molecular biology

(or genetics) and embryology. We will see in a moment that Deleuze's notion of social *coding* is in part derived from the idea of the genetic code. Likewise, in *geology*, Mount Everest would not be seen as an 'object', but rather as the result of an ongoing set of geological processes: the tectonic plate of India slamming into Asia, the folding of the earth's crust to produce the Himalayan mountain range, as well as the forces of glaciation and erosion that are simultaneously wearing down the mountains, and so on. In *A Thousand Plateaus*, Deleuze will develop a concept of 'stratification' derived from geology (the book contains a chapter called, precisely, 'The Geology of Morals'). This, then, is the first philosophical point Deleuze derives from Marx (and, later, Foucault): the movement from representation to production.

The second observation derives from the first: Marx held that, given this discovery of the activity of production in general, a *retrospective* reading of universal history was possible from the viewpoint of capitalism, that is, from the viewpoint of the two decoded flows of labour and capital (Deleuze and Guattari 1977: 140). Previous economies anticipated capitalism, but as something they warded off and avoided – for the obvious reason that they were based on codes (which operate at the level of representation), whereas capitalism is based on decoded flows (which operate at the level of production). Capitalism was therefore the nightmare previous social formations were trying to avoid.

But how does one go about doing this retrospective reading of universal history? Deleuze's answer is: through the concept of flow. Yet Marx himself did not have an explicit concept of flow: he defines neither labour nor capital in terms of flow. To understand Deleuze's concept of flow, we have to turn to the twentieth-century British economist, John Maynard Keynes. Deleuze says three things about Keynes's great book, *The General Theory of Employment, Interest, and Money*, which was published in 1936.[8] First, it presented the first modern theory of flows. 'Stocks and flows are the two fundamental concepts of modern political economy, as formulated by Keynes', Deleuze comments; 'The first great theory of flows can be found in Keynes' *The General Theory of Employment, Interest, and Money*' (Deleuze 2001: 14 December 1971). Second, it injected the problem of desire into the theory of money. 'One of Keynes's contributions was the reintroduction of desire into the problem of money', Deleuze and Guattari write; 'It is this that must be subjected to the requirements of Marxist analysis', notably with regard to finance and banking practices (Deleuze and Guattari 1977: 23). It is now a truism to say that psychology and economics are interrelated, and

that stock markets are mirrors of the human psyche: 'they can become depressed; they can even suffer complete breakdowns' (Ferguson 2008: 121). Third, Keynes proposed a new model of regulation and stimulus for the economy. In Deleuzian terms, Keynesianism was one of the laboratories for the production of axioms, during the New Deal and afterwards.[9]

Keynes wrote *The General Theory* in the midst of the Great Depression, for which he was attempting to provide both a diagnostic and a cure. The theory of flows, and the injection of desire into economics, was part of Keynes's new diagnostic of the state of capitalism, which for Deleuze is an essential supplement to Marx's analyses. The push for regulation and government intervention, by contrast, was part of his cure; and today, the term 'Keynesianism' has become largely synonymous with intervention in the economy. In 1971, Nixon uttered his famous phrase, 'We're all Keynesians now', and the 2009 stimulus package of the Obama administration was thoroughly Keynesian. But what interests Deleuze in Keynes's work is less interventionism per se, but rather the new analysis he gave of capitalism through the concepts of flows and stocks. In the wake of Keynes, flow and stock have now become two basic concepts in the analysis of dynamic systems in general.[10] So it is from an analysis of Keynes that we will be able to grasp the philosophical import of Deleuze's concept of flow.

As always, Deleuze extracts from Keynesian economics a number of concepts that he will use for his own philosophical purposes, all of which can be summarised in the concept of the *break-flow* (*coupure-flux*), or *schizz*.

1. *Flow*. First, from an economic point of view, a *flow* is the transmission (or exchange) of money – or more generally, of economic value – that moves from one pole to another, that is, there is an incoming and outgoing flow. The term 'pole' here simply refers to the individuals or groups (firms, companies, corporations, etc.) that function as the *interceptors* of these incoming and outgoing flows (for instance, in one's bank account). 'We are defining flows in political economy', Deleuze noted in a 1971 seminar (Deleuze 2001: 16 November 1971); 'its importance for contemporary economists confirms what I have been saying'.
2. *Code*. Second, the correlative of the concept of a flow is that of a *code* – which is, precisely, a form of inscription or recording – which in the capitalist formation assumes the form

of an accounting system: a transaction entered into the bank account of an individual or firm, the *recording* or *inscription* of this transmission of a flow (a change in assets or liabilities). A pay cheque is an incoming flow; a cheque I write to pay a bill is an outgoing flow. Flow and code are reciprocally determined: it is impossible to grasp a flow other than by and through the operation that codes it. Hard cash gives a somewhat false picture of what money is: only 11 per cent of the monetary mass in the USA exists as cash. Strictly speaking, money is simply an inscription, which is why the development of the two-ledger accounting system was essential in the development of capitalism. When I purchase a book online with my credit card, a flow takes place, a transmission of economic value from my account to, say, the account of amazon.com.

A code is not something that is 'applied' to a flow, as Kantian concepts are applied to intuitions; there is never a flow first and then a code that imposes itself upon it or is applied to it. What flows on the socius cannot appear as a flow except in correlation to a code: it is impossible to seize a flow other than by and through the operation that codes it. A flow is not recognisable as an economic flow, or a social flow, or a somatic flow, for instance, except by and through the code which encodes it.

This is why Deleuze will say that a non-coded flow is an unnameable power: the nightmare of every society is the terror of a non-coded or decoded flow. My salary, the cost of my plane ticket here, are coded flows, since I know their exact value. But the problem with the sub-prime mortgage derivatives that helped cause the 2009 recession was due to the fact, not that they had lost value, but that no one knew their value, or even knew how to assess their value; they had become a decoded, and indeed uncodable flow. But normally, the concept of flow (production) is strictly coexistent with the concept of code (inscription).

3. *Stock*. The third concept, after flow and code, is the concept of stock. If the flow is what moves from one pole to another, from one account to another, stock is what is related to one of these poles as its material or juridical possession: my bank account, or the value of my investments as of today – this is *my* portion of the flow, my *share* of the flow, 'so it's mine'.

We have here three elementary notions derived from economics – flow, code (or accounting system) and stock – which are all interrelated and

reciprocally determined: a monetary flow is in continuous variation; we only know the flow through its inscription or coding; and stock is the portion of the flow that is mine at a particular moment. Readers of *Anti-Oedipus* will recognise that these three notions correspond to the three syntheses: flow is the connective synthesis of *production*; code is the disjunctive synthesis of *recording* or inscription; and stock is the conjunctive synthesis of *consumption*. The remainder of this paper will briefly discuss each of these terms in order to examine the complex interrelations Deleuze establishes between them.

II. The Concept of Flow

Let me return first to the concept of flow. Deleuze derives the concept of flow from Keynes, and links it with Marx's conception of production. We have seen that Marx held that a retrospective reading of universal history was possible from the viewpoint of capitalism. Deleuze picks up on this idea, but interprets history as a progressive decoding of flows. One can easily think of two examples of such a reading that Deleuze does not mention. Historically, for instance, one thinks of the fact that in the Middle Ages, *usury*, the lending of money at interest, was considered to be a sin – whence the figure of Jewish moneylenders such as Shylock. Since they were not subject to this Christian restriction, the Jews became the lenders and bankers – a line of flight in an otherwise overcoded economy. Similarly, it was not until 15 August 1971, a few months before *Anti-Oedipus* was published, that the US dollar was removed from the gold standard and instead allowed to float freely on the exchange market – a further decoding of money that broke the centuries-old link between money and precious metal.

The history of money is one of the primary topics of Deleuze's retrospective reading of history. Primitive economies functioned in terms of a code of barter, that is, in terms of a direct relation of exchange between objects. But the introduction of money as a 'general equivalent' was enough to destroy these codes – this is what happened during colonialism (cargo cults etc.). What money showed was that the objects being bartered in primitive economies were themselves simply qualified pieces of labour to which there corresponded a given quantum of value; they were simply qualified flows, forms of stock. In other words, primitive codes were *already* operating in conjunction with these flows, but they warded off these flows: primitive societies kept merchants and blacksmiths in subordinate positions, they cordoned off exchange and

commerce, precisely because the 'abstract or fictional quantity' of money was enough to break the primitive codes.

Deleuze holds to the thesis – following Edouard Will – that money was invented by the State as a means, less of encouraging commerce, than of *controlling* commerce through *taxation*. The introduction of money meant that the State was able to insert itself into every transaction and siphon off a portion for itself in the form of a tax. This was the first step of decoding: the introduction of money as a pure flow, a pure abstraction (even if it initially remained tied to precious metals).

And something else happens. Primitive societies operated with blocks of mobile and finite debts; but 'money – the circulation of money – *is the means for rendering the debt infinite*' (Deleuze and Guattari 1977: 197; emphasis in original). In other words, money initiates the duty of an interminable service to the State: I will *always* be indebted to the State, I will always owe the State income tax, sales tax, and so on; it is a debt I will never finish paying off. Christian theology, at least in its Pauline form, simply 'spiritualises' this notion of an infinite debt to the State. Because I have sinned, I owe God an infinite debt that I cannot pay off myself; the price I have to pay is my death and eternal damnation; but God, in his mercy, decides to pay off the infinite debt to himself by dying in our place; he redeems us, just as the Romans redeemed slaves by paying for them. In this sense, one could say that Christian theology is a spiritualised form of economics.

But money – or monetary inscription – is not in itself enough to form capitalism. It does not yet have a 'body' of its own. Initially, it was simply inserted into the interstices of the pre-existing social bodies (Mother Earth, the Despot). Capitalism appears only when money ceases to be merely an abstraction that 'formally unites ... objects that are produced and even inscribed independently of it' (Deleuze and Guattari 1977: 226–7), and itself becomes a filiative capital, that is, when money begets money. Capitalism, in other words, marks *a new threshold of decoding or deterritorialisation*.

What does this mean? In the capitalist formation, the two decoded flows of labour and capital are expressed by two forms of money, namely, payment and financing. The first has its roots in a simple circulation in which money is used as a means of payment: you get your pay cheque, and you pay your bills with it. Finance-money, however, is completely different. It constitutes what Deleuze calls call the capitalist form of infinite debt, a vast 'dematerialisation' or 'demonitarisation' of money (although the structures of finance have their own territoriality). Rather than transferring a pre-existing currency as a means of payment,

finance capital is a flow that the banks create *ex nihilo* as a debt owing to themselves: it hollows out a negative money at one extreme (as a debt entered as a liability of the banks) while projecting a positive money at the other extreme (as a credit granted to the productive economy by the banks). It is this second form of money that constitutes the true 'economic force' of capitalism, 'the immense deterritorialized flow that constitutes the full body of capital' (Deleuze and Guattari 1977: 237).

> Today we can depict an enormous, so-called stateless, monetary mass that circulates through foreign exchange and across borders, eluding control by the States, forming a multinational ecumenical organization, constituting a de facto supranational power untouched by governmental decisions. (Deleuze and Guattari 1987: 453)[11]

This is the full body of capital into which the desire of each one of us is plugged.

Strictly speaking, Deleuze says, there is no common measure between the two flows of money: money as a form of payment has an exchange value; but money as a structure of finance is a pure movement of creation and destruction. Hence the importance of banks. Banks participate in both these flows, they are situated at the pivotal point between financing and payment: they function as exchangers or oscillators that convert the flows of financing – which is a mutant flow in constant variation – into segments of payment. Even though there is no common measure between these two flows, it is the banks that guarantee their 'fictive homogeneity', which Deleuze calls a 'profound dissimulation' (Deleuze and Guattari 1977: 229). In our time, States have become immanent to the capitalist system; and one of the primary functions of the State, as a regulator, is to ensure the convertibility between these two forms of money by guaranteeing credit, a uniform interest rate, the unity of capital markets, and so forth.

This is why Deleuze insists that Marx's analysis of capital has to be supplemented by Keynes's analysis.

> It is unfortunate that Marxist economists too often dwell on considerations concerning the mode of production, and on the theory of money as the general equivalent as found in the first section of *Capital*, without attaching enough importance to banking practice, to financial operations, and to the specific circulation of credit money. (Deleuze and Guattari 1977: 230)

(One can hardly imagine a more prescient comment, given the economic crisis of 2009, which revolved around the circulation of mortgage

derivatives within the financial operations of banks.) But it would be absurd to postulate a world super-government making the final decisions regarding this monetary mass, for there is no power that regulates the flow of capital itself, and neither the banks nor the State are even capable of predicting the growth in the money supply.

Now to say that libidinal economy and political economy are one and the same is tantamount to saying that

> the desire of the most disadvantaged creature will invest with all its strength, irrespective of any economic understanding or lack of it, the capitalist social field as a whole. Flows, who doesn't desire flows [capital], and relationships between flows, and breaks in flows? (Deleuze and Guattari 1977: 229)

This is why Deleuze can say that 'in a sense, it is the bank that controls the whole system and the investment of Desire' (Deleuze and Guattari 1977: 230):

> It is not by means of a metaphor that a banking or stock market transaction, a claim, a coupon, a credit, is able to arouse people who are not necessarily bankers... There are socioeconomic 'complexes' that are also veritable complexes of the unconscious, and that communicate a voluptuous wave from the top to the bottom of their hierarchy... For it is a matter of flows, stock, of breaks in and fluctuations of flows; desire is present wherever something flows and runs, carrying along with it interested subjects – but also drunken or slumbering subjects – toward lethal destinations. Hence the goal of schizoanalysis: to analyze the specific nature of the libidinal investments in the economic and political spheres, and thereby to show how, in the subject that desires, desire can be made to desire its own repression. (Deleuze and Guattari 1977: 105)

What then does Deleuze mean when he says that desire 'is a matter of flows and stock' (Deleuze and Guattari 1977: 105), or that 'every object presupposed the continuity of a flow' (6)? Consider the fact that I first delivered this paper at a conference in Italy. The money I used to purchase my plane ticket came from my pay cheque, which is derived from my university's endowment, a flow that is in turn linked to students' tuitions, investments in various corporations (and perhaps sweat shops), and so on. I subtracted from this flow to pay for my ticket, the price of which was fluctuating until I bought it, when it became my stock ('it's mine'). The flight was itself a material flow, as was the meal I ate on the plane (chicken salad, rice, chocolate cake), which was assembled at the airline's hub city from flows arriving from elsewhere: the red wine flowed from Napa Valley, the coffee from Starbucks. These

flows are assembled in my meal; I break into these flows when I eat; it produces in me a wave of satisfaction (*Voluptas*) – the portion or share of these flows that fall to me. These concrete examples are simply meant to illustrate Deleuze's fundamental claim: that desire is always a question of flows, with their fluctuations and breaks.

III. The Concept of Code

We have seen that flow and code are reciprocally determined: it is impossible to grasp a flow other than by and through the operation that codes it. Coding operates through a process of inscription or recording, in other words, by means of signs, whether these signs are numbers on a bank statement, or marks inscribed directly on the body. These signs are non-signifying, that is, it does not matter what they 'mean' or 'symbolise' per se; what matters is how they function in the determination of a flow.

We tend to use the word 'code' in phrases like the 'Morse code' or the 'civil code', where everything is given in advance: you apply a pre-given code, you use your decoding ring, and so on. But what Deleuze has in mind in proposing a concept of 'code' is primarily the biological notion of the *genetic code*: the concept of a code is 'a common characteristic of human cultures and of living species', of social reproduction as much as biological reproduction (Deleuze and Guattari 1977: 289; see also 248: 'the general traits characterizing a code have been rediscovered today in what is called a genetic code'). There are at least three parallels between the biological and social coding.

1. *Inscription* (or *Information*). In both cases, the code is what allows for the transmission and reproduction of 'information', which is why Deleuze terms it a synthesis of inscription or recording, much like an accounting system (although this information is never pre-given, but *produced* with each transmission). 'Molecular biology teaches us that it is only the DNA that is reproduced, and not the proteins. Proteins are both products and units of production; they are what constitute the unconscious as a cycle or as the auto-production of the unconscious' (Deleuze and Guattari 1977: 290).
2. *Molecular and Molar*. Second, we find in genetics the same distinction between *production* (what goes on at the molecular level) and what we see *represented* in the product (the molar organism). The code operates at a molecular level. For Deleuze, this was one of Lacan's shortcomings: he discovered the code

in what he called 'signifying chains' (functioning via metaphor and metonymy) in the domain of the Symbolic. But language, the symbolic, is a molar organisation, like the organism. The inverse side of the symbolic is what Deleuze at several points calls 'the real inorganization of desire'. As Jacques Monod says, the genetic code is not a structure, but a domain 'where nothing but the play of blind combinations can be discerned' (Deleuze and Guattari 1977: 328). The molecular domain – the domain of passive syntheses – is a domain of 'chance or *real inorganization*' (289, as well as 39, 309, 328), a domain where everything is possible, and nothing is given in advance. Every coding, in other words, entails a constant decoding of what came before it: 'The genetic code points to a genic decoding' (328). This, then, is the primary sense of Deleuze's distinction between molecular and the molar: social formations 'effect a unification, a totalization of the molecular forces through a statistical accumulation obeying the laws of large numbers. Thus unity can be the biological unity or a species or the structural unity of a socius: an organism, social or living, is composed as a whole, as a global or complete object' (342). But desire necessarily functions at a molecular level.

3. *Surplus Value of Code*. Finally, the genetic code implies not only the dimension of *filiation* (*x* begets *y*), but that of *alliance*. Deleuze often cites in this case the relation of the wasp and the orchid: the wasp is an essential element in the reproductive apparatus of the orchid because it transports its pollen. There is here a 'capture of code, a *surplus value of code*, a veritable becoming, a becoming-wasp of the orchid and a becoming-orchid of the wasp' (Deleuze and Guattari 1987: 10; my emphasis). Rémy Chauvin speaks here of 'the *aparallel evolution* of two beings that have absolutely nothing to do with each other' (10, citing Chauvin 1969: 205; emphasis in original). Such transfers are in fact the basis for what we call 'genetic engineering', and they have results analogous to those of 'the abominable couplings dear to antiquity and the Middle Ages' (Jacob 1973: 291–2, 311, cited in Deleuze and Guattari 1987: 10–11). This is also why Deleuze can claim that evolutionary schemas have abandoned the *arborescent* models of descent (the schema of a tree and its branches) in favour of *rhizomatic* models, which operate in the heterogeneous and jump from one already differentiated line to another. Such is the distinction between filiation and alliance: genealogical trees (filiation) are scrambled by 'transversal' communications between

> different lines (alliance). Whence the threat of viruses: 'We evolve and die more from our polymorphous and rhizomatic flus than from hereditary diseases, or diseases that have their own line of descent' (Deleuze and Guattari 1987: 11).

Deleuze and Guattari utilise the same notion in discussion social reproduction, stressing the notion of alliance (marriage) over filiation: socially speaking, *debt* is the unit of alliance. But here too, they stress the need for a retrospective rereading of history. In so-called primitive societies, social reproduction passed through human reproduction (*x* begat *y*), whereas in capitalism social reproduction passes through capital (money begets money) and human reproduction and relations consequently become *privatised*. Relationships become primarily private matters. Moreover, if capitalism entails a movement from codes to what Deleuze calls an 'axiomatic', it is primarily because codes deal with objects (already qualified flows) whereas capitalism operates in terms of the abstract quantities of capital and labour, which can only be subject to an axiomatic treatment. Finally, the term 'decoding' can mean two things: either to decipher the secret of a code, or to undo a code. When Deleuze and Guattari use the term, they are referring to the latter. Yet for Deleuze and Guattari, an uncoded flow is a limit concept or an Idea, that is to say, a *problematic*: it is not an ideal to be attained, but a problem that constantly demands resolution. The notion of 'chaos' that one finds in ancient creation myths, as well as the retrieval of that notion in *What is Philosophy?*, are both harbingers of the apocalyptic state of purely decoded flows.

IV. The Concept of Stock

A brief word, finally, on the concept of stock. Once again, we must note that stocks and flows are one and the same thing, but that they relate to fundamentally different units: stock is the attribution of value at a given point in time, whereas flow is what changes the value of stock over time (an inflow adds to stock, an outflow subtracts from the stock). Stock is any entity that accumulates or depletes in value over time, whereas a flow is the rate of a change in a stock. Stocks have a certain value at each moment in time, whereas a flow (incoming and outgoing) is what changes the values of a stock over time (appreciation and depreciation). In mathematical terms, the stock is the integral of the flow, while the derivative is the flow of changes in the stock. This is one of the fundamental principles of accounting: 'only the study of flows

allows one to realize the role of the incoming and outgoing movements involved in stock variations' (Deleuze 2001: 14 December 1971).

The stock–flow relation is what lies at the basis of what today is called 'system dynamics theory'. Although I have drawn from the example of economics, the two notions can be applied to any dynamic system. The population of an animal species could be considered a stock; the inflow would be births, the outflow would be deaths; and these flows would vary the value of the stock (that is, the population) over time. The guests in a hotel could be considered a stock; the inflow would be guests arriving, the outflow would be guests departing; the stock would measure the guests at any given moment, whereas the flow variable would measure the guests over a period of time, say, a year. The water in a bathtub could be considered a stock; if a gallon of water drains out of the tub every minute, while at the same time a gallon of water is added from the faucet, the stock will remain the same, even though there is a constant flow. In short, a stock is the term for any entity that accumulates or depletes over time; while a flow is the rate of change in a stock; flows accumulate in stock. Identifying the flows and stocks in a given system is not always easy: a 'deficit', for instance, is a flow (spending in excess of revenue), whereas a 'debt' is an accumulated stock. Moreover, by their nature, one of the characteristics of stocks is that they interrupt or 'decouple' flows.

V. Conclusion

Deleuze's socio-political theory is constructed on the basis of three interrelated concepts, which are derived from contemporary economic theory, and particularly Keynes: *flow*, which is the production of value; *code*, which is the inscription or recording of flows; and *stock*, which is the portion of the flow that belongs to me at a given moment in time, which I can spend and consume. To be sure, these are not the only concepts at work in *Anti-Oedipus*. Deleuze in turn links these three concepts with the three passive syntheses derived from Kant (connection, disjunction, conjunction) and the three types of production to which they correspond (the production of production, the production of inscription, the production of consumption). The three are summarised by Deleuze in the concept of the *schizz* or the *break-flow* (or more literally, the *flow-cut*, '*coupure-flux*'), which is the operation involved in every coding of flows.[12] The sole aim of these reflections has been to give a content to the unexpected claim that lies at the basis of the entire *Capitalism and Schizophrenia* project, namely, that in the contemporary situation an

adequate socio-political theory must take the form – not of a theory of the state, or a theory of rights, or a theory of legitimation – but rather of a theory of *flows*.

Notes

1. This article was originally presented as a paper at *ConnectDeleuze*, the Second International Deleuze Studies conference at the University of Cologne on 10–13 August 2009, organised by Leyla Haferkamp and Hanjo Berressem. It was derived from lectures given at the *Collegium Phaenomenologicum*, 13–31 July 2009, in Città di Castello, Italy, organised by Peg Birmingham, to whom I owe a debt of gratitude.
2. I can give no notion by references or citations of what this paper owes to previous studies of *Anti-Oedipus*, notably Holland 1999, Thoburn 2003 and Buchanan 2008, as well as the articles included in the *Deleuze and Marx* special issue of *Deleuze Studies* (Jain 2009). On the relation between Marx and Keynes, see also Negri 1983.
3. See Deleuze 2001: 14 December 1971: 'It is not yet important for us to have a real definition of flows, but it is important, as a starting point, to have a nominal definition and this nominal definition must provide us with an initial system of concepts.'
4. See Deleuze and Guattari 1987: 468: 'The four principal flows that torment the representatives of the world economy, or of the axiomatic, are the flow of matter-energy, the flow of population, the flow of food, and the urban flow.'
5. Paul Virilio has shown that the problem for the police is not one of confinement (Foucault), but concerns the flux of the 'highways', speed or acceleration, the mastery and control of speed, circuits and grids set up in open space. See Deleuze 1988: 42.
6. Jacques Derrida made a similar claim in Derrida 1993: 101: 'Marxism remains at once indispensable and structurally insufficient *but* provided that one transforms and adapts it to new conditions.' See also the analyses in Badiou 1991 and Guattari and Negri 1991.
7. See Deleuze and Guattari 1977: 116: 'From the beginning of this study we have maintained both that social production and desiring-production are one and the same, and that they have differing *régimes*, with the result that a social form of production exercises an essential repression of desiring-production, and also that desiring-production – a "real" desire – is potentially capable of demolishing the social form.'
8. Keynes 1964. Deleuze seems to have relied in part on a study of Keynes by Daniel Antier entitled *L'Étude des flux et des stocks* (Antier 1957). See his comments in Deleuze 2001: 14 December 1971.
9. See Deleuze and Guattari 1987: 462: 'Keynesian economics and the New Deal were axiom laboratories.' With regard to regulation, Deleuze writes that 'the question is not that of freedom and constraint, nor of centralization or decentralization, but of the manner in which one masters the flows' (Deleuze and Guattari 1987: 462).
10. Dynamic systems theory was formalised by Jay W. Forrester in his *Principles of Systems* (Forrester 1968), who referred to stocks as 'levels' and to flows as 'rates'.
11. Bernard Schmitt, in his *Monnaie, salaires et profits* (1966), advanced a profound theory of money that Deleuze draws heavily from, describing the full body of

capital as 'a flow possessing the power of mutation' that does not enter into income and is not assigned to purchases, a pure availability, nonpossession and nonwealth (Deleuze and Guattari 1987: 234–6). See the appeals to Schmitt in Deleuze and Guattari 1977: 237, and Deleuze 1995: 152.

12. See Deleuze and Guattari 1977: 141–2: 'The social machine is literally a machine, independently of any metaphor, in that it presents an immobile motor and undertakes diverse kinds of cuts: selection [*prélèvement*] from the flows, detachments from the chain, distribution of parts. Coding the flows implies all these operations. This is the highest task of the social machine, in that the selections [*prélèvements*] of production correspond to detachments from the chain, resulting in a residual share for each member, in a global system of desire and destiny that organizes the productions of production, the productions of recording, and the productions of consumption.'

Time Out of Joint: Hamlet and the Pure Form of Time

Henry Somers-Hall Manchester Metropolitan University

Abstract

The aim of this paper is to explore why Deleuze takes up Hamlet's claim that 'time is out of joint'. In the first part of this paper, I explore this claim by looking at how Deleuze relates it to Plato's *Timaeus* and its conception of the relationship between movement and time. Once we have seen how time functions when it is 'in joint', I explore what it would mean for time to no longer be understood in terms of an underlying rational structure. The claim can be understood as about a relationship between time and action. In the second part of this paper, I want to relate this new understanding of time to *Hamlet* itself, in order to see how temporality operates within the play. I will conclude by relating these two different conceptions of time out of joint to one another through Nietzsche's eternal return.

Keywords: Kant, Plato, Hamlet, eternal return, synthesis of time, tragedy

I. Movement and Time in the *Timaeus*

In *Difference and Repetition*, Deleuze introduces the notion of time out of joint in connection with two figures, Kant and Hamlet.[1] In the first part of this paper, I want to elucidate exactly what Deleuze means by time being out of joint. His characterisation of it is as follows:

> The joint, *cardo*, is what ensures the subordination of time to those properly cardinal points through which pass the periodic movements which it measures (time, number of the movement, for the soul as much as for the world). By contrast, time out of joint means demented time or time outside the curve

> which gave it a god, liberated from its overly simple circular figure, freed from the events which made up its content, its relation to movement overturned; in short, time presenting itself as an empty and pure form. (Deleuze 2004: 111)

In order to develop an understanding of what Deleuze means by time out of joint, I want to begin by examining what 'jointed' time might look like. The key to this is the notion of the joint itself, which Deleuze presents in more detail in his 1978 lecture, 'Synthesis and Time':

> Cardinal comes from cardo; cardo is precisely the hinge, the hinge around which the sphere of celestial bodies turns, and which makes them pass time and again through the so-called cardinal points, and we note their return: ah, there's the star again, it's time to move my sheep! (Deleuze 1978b)

Deleuze is here referring to Plato's conception of time, presented in the *Timaeus*.[2] The *Timaeus* gives us a mythical account of the creation of the world by a demiurge, who seeks to create the universe by imposing form on chaotic matter. The demiurge

> took over all that was visible – not at rest but in discordant and disorderly motion – and brought it from a state of disorder to a state of order, because he believed that order was in every way better than disorder. (Plato 1997b: 30a)

As the creator himself is perfect, he desires to create the universe as far as possible as an image of himself. As he wants to create the most perfect world possible, the world has several key attributes. First, as it cannot be less intelligent than the creatures within it, it is an animal, and thus possesses a soul. Second, as unity is an attribute for perfection, the world is composed of just one animal. Third, as the sphere is the most perfect form, the universe is formed as perfectly spherical. Finally, the creator himself is eternal, but given the nature of the world as already in motion, he can only create the world as a likeness to eternity:

> Now it was the Living Thing's nature to be eternal, but it isn't possible to bestow eternity fully upon anything that is begotten. And so he began to think of making a moving image of eternity: at the same time as he brought order to the universe, he would make an eternal image, moving according to number, of eternity remaining in unity. This number, of course, is what we now call 'time'. (Plato 1997b: 37d–e)

The universe is here seen, therefore, as a sphere in motion. Now, at this point, we can already note the first important point in this myth. Time is here seen as a structure of the realm of appearance. While the world itself is a copy of the creator, time has no place in relation to the eternity

of the creator himself. So how does time come about? Before the universe is organised according to time, it is still in motion, although this motion is 'disorderly'. Thus, motion is not dependant on time, as motion is prior to the imposition of time. Time is not that which allows movement to take place, but that which allows movement to become rational. In fact, Timaeus believes that time is grounded in the elements which are most perfect in the universe. That is, the celestial bodies. The celestial bodies thus occupy something like a mediating position, as on the one hand, they are similar to the eternal, whereas on the other, they are the ground for time. The planets move in an orderly manner, which is what allows time to be related to measure (the star that represents the time to move the sheep in Deleuze's example):

> In this way and for these reasons night-and-day, the period of a single circling, the wisest one, came to be. A month has passed when the Moon has completed its own cycle and overtaken the Sun; a year when the Sun has completed its own cycle. As for the periods of the other bodies, all but a scattered few have failed to take any note of them. Nobody has given them names or investigated their numerical measurements relative to each other. And so people are all but ignorant of the fact that time really is the wanderings of these bodies, bewilderingly numerous as they are and astonishingly variegated. (Plato 1997b: 39c–d)

On the Platonic model, therefore, we cannot have something like an understanding of the pure form of time, as time is the way in which something else (in this case, the number, or measure of motion) presents itself. Time is simply an imperfect way in which the eternal patterns of the world present themselves. It is always an ancillary time premised on a logically prior movement. The possibility of understanding time as out of joint therefore requires that we move away from the Platonic model of time, as Platonic time is always impure. While the mythological nature of Plato's account in the *Timaeus* may lead us to treat it lightly, underlying Plato's account is a more substantial philosophical position. In this regard, we can see the *Timaeus* as, with some reservations,[3] providing an account of how an essentially rational structure becomes exemplified in the world as a whole.[4] In this sense, just as *The Republic* explores the nature of moral justice through its externalisation in the city-state (Plato 1997a: 368–9), the *Timaeus* relates goodness to the whole of an eminently rational universe. The *Timaeus* therefore provides a mythological account of the relationship between the world of appearance and the forms. This relationship essentially makes man, as rational agent, at home in the world. These relations between psychology

and cosmology are also played out in Hamlet's characterisation of his own condition in terms of the universe as a whole, as we shall see in the second half of this paper. We can see that the subordination of time to an eternal, intelligible, and also, representational, model of time is central not just to Plato's conception, but also to a more general trend in pre-Kantian philosophy. Leibniz, for instance, argues that the notions of space and time are simply ways in which we, as finite intellects, perceive what are essentially a series of intelligible relations between things:

> As for my own opinion, I have said more than once that I hold space to be something purely relative, as time is – that I hold it to be an order of coexistences, as time is an order of successions. For space denotes, in terms of possibility, an order of things that exist at the same time, considered as existing together, without entering into their particular manners of existing. And when many things are seen together, one consciously perceives this order of things among themselves. (Leibniz 2000: 15)

Space and time are simply 'well founded phenomena' by which we inadequately perceive the true 'conceptual' order of things. As such, time is really a mode in which the essential structure of succession appears to us. In this case too, therefore, time is secondary to a rational, conceptual and representational way of ordering things. Time is predicated on a prior rational structure. Number is expressed in the celestial movement of the heavens. To be 'in joint' is therefore to be hinged, tied to cardinal numbers and tied to a prior rational order. For Deleuze, it is Kant who first provides an understanding of time which is not reducible to Leibniz's 'order of successions,' and I therefore now want to turn to Kant's attempt to provide an alternative conception of time.

II. Kant on the Difference between Concepts and Intuitions

The key innovation in the Kantian system in this regard is the division between intuition and the understanding. Kant argues that in order for us to be able to think, an object must be given to thought. In the case of both Leibniz and Plato, what is given to thought is a confused image of the true nature of things; that is, a copy that differs in degree from it. For Plato, what is presented is an image of eternity in time, but time is simply a manifestation of the rational movement of the celestial bodies. Similarly, for Leibniz, space and time are simply confused perceptions of a properly conceptual reality. Kant's claim in the *Critique of Pure Reason* is essentially that rather than regarding perception as merely a confused form of conceptual thought (what Kant calls in relation to

Leibniz 'intellectualised appearances' [Kant 1929: A271/B327]), there is a difference in kind between perception and concepts. In his article, *Concerning the Ultimate Foundation for the Differentiation of Regions in Space* (1768), Kant presents this difference explicitly as the grounds for a refutation of Leibniz. If we take Leibniz's position as being that space and time are simply confused presentations of conceptual relations, then we would expect all of the properties of spatial and temporal entities to be ultimately explicable in conceptual terms. If we consider a hypothetical universe containing simply one glove, however, then even if we were to completely specify the conceptual relations between the parts of a glove, we would not be able tell whether the glove was left or right handed, as the mirror image of the glove would have exactly the same relations between the parts that composed it:

> However, since there is no difference in the relations of the parts to each other, whether right hand or left, the hand would be completely indeterminate with respect to such a quality, that is, it would fit on either side of the human body. But this is impossible. (Kant 1968: 42–3)

Given that the glove must be left or right handed, it therefore possesses a determination (its 'handedness') that is not reducible to conceptual relations. If this is the case, then spatial entities cannot be seen merely as expressions of a non-spatial rational nature (we might think of this claim that space is also out of joint as a parallel thesis to the one we are considering), but also contain something in excess of the rational. In this case, therefore, Kant writes that 'there are no inner differences here that any understanding could merely think; and yet the differences are inner as far as the senses teach' (Kant 1997: sec. 13). The argument from incongruent counterparts shows that space cannot be seen as a mode of presentation of conceptual relations in the way that Leibniz proposed, and Kant makes similar arguments in the *Critique of Pure Reason* for the difference between time and succession. Kant's distinction of concepts and intuition therefore has the consequence that time cannot be seen as the moving image of eternity, as it is no longer the expression of an underlying representational structure, whether the 'number of movement' or the true 'order of things'. Once we recognise a difference in kind between concepts and intuitions (or between time and measure), then our understanding of time is no longer 'joined' to, and dependent upon, an understanding of rational movement, and thus we open up the possibility of a genuine understanding of the 'empty and pure form of time' itself.

III. Time out of Joint and Deleuze

Does this mean that Deleuze's 'time out of joint' is an essentially Kantian form of temporality? In fact, Kant's understanding of time is limited by his commitments to an essentially epistemic and subject-centred project. That is, Kant is concerned with the conditions under which a subject can attain a priori knowledge of a world of objects. On this basis, he claims that whereas 'hitherto it has been assumed that all our knowledge must conform to objects, ... we must ... make trial whether we may have more success in the tasks of metaphysics, if we suppose objects must conform to our knowledge' (Kant 1929: Bxvi). In working out the implications of this assumption, Kant takes time and space to be faculties of the subject. That is, they are ways in which that which is to be thought by the subject is given to the subject. As space and time are faculties through which the subject apprehends objects, then those formal properties of the object that derive from its spatio-temporal nature can be known a priori. Given that we are interested in knowledge, which involves concepts, and Kant has posited a radical split between concepts and intuitions, the major project of the *Critique of Pure Reason* is to show how the faculty of the understanding can be related to the faculty of intuition. In Deleuze's words, 'does he not once again come up with the idea of harmony, simply transposed to the level of faculties of the subject which differ in nature?' (Deleuze 2003: 19). Kant himself recognises that this is the central problem of the *Critique*, and it is the role of the transcendental deduction to show that it is impossible that 'appearances might very well be so constituted that the understanding should not find them to be in accordance with the conditions of its unity' (Kant 1929: A90/B123).

This is not the place to give a full description of Kant's account of how intuition and the understanding are related, but Kant's essential claim is that the understanding relates to intuition through the notion of synthesis. Kant defines synthesis as 'the act of putting different representations together, and of grasping what is manifold in them in one act of knowledge' (Kant 1929: A77/B109). Now, conscious empirical synthesis takes the form of making judgements. When I count, or bring together the moments of a judgement ('the apple is red'), it is I who actively relates these representations to one another. In a sense, the spontaneity of my ego is what holds together the passive determinations, 'apple' and 'redness'. On their own, these determinations are unities, and thus are in themselves indifferent to one another. In fact, this is clear from Kant's definition, as judging *is* this conjunction of what is

manifold in a single act (*S* is *P*). Kant's understanding of the relation of the understanding to intuition is analogous to his understanding of judgement, and it is the understanding that actively relates different spatio-temporal representations to one another to allow us to represent to ourselves a well ordered world. Such an approach has a number of consequences. As Deleuze notes in *Empiricism and Subjectivity*, it presupposes 'a methodologically reduced plane that provides an essential certainty – a certainty of essence – we ask: how can there be a given, how can something be given to a subject, and how can the subject give something to itself?' (Deleuze 1991: 87). Deleuze's claim is that Kant has essentially taken a psychological account of how we synthesise judgements and reiterated it at a transcendental level. 'The same function that gives unity to the different representations in a judgement also gives unity to the mere synthesis of different representations in an intuition, which, expressed generally, is called the pure concept of the understanding' (Kant 1929: A79/B104). By using this model, Kant ties the notion of synthesis to the notion of consciousness, and hence debars any form of synthesis that is not ultimately governed by judgement. This leads to a further sharp dichotomy between passivity and spontaneity. If the activity of synthesis is tied to the subject, then there is no possibility of a form of synthesis which does not involve a subject – intuition becomes a passive material to be taken up and organised by the conceptual understanding. Furthermore, once again, we do not arrive at a truly pure form of time, as time is now a faculty of a subject:

> It is impossible to maintain the Kantian distribution, which amounts to a supreme effort to save the world of representation: here, synthesis is understood as active and as giving rise to a new form of identity in the I, while passivity is understood as simple receptivity without synthesis. (Deleuze 2004: 109)

Deleuze's notion of time will therefore take up this idea that it is fundamentally different in kind from the structure of representation, but as Deleuze does not '[trace] the so-called transcendental structures from the empirical acts of a psychological consciousness' (Deleuze 2004: 171), he opens the possibility of seeing time as capable of exhibiting organisation in its own right (what Deleuze calls 'passive synthesis').

At this point we can return to the empty and pure form of time itself. We can now give a schematic account of it by noting the revolutionary result of the Kantian theory of intuition. That is, that rather than time being a mode of succession, succession is a mode in which time appears

to us. In fact, succession is simply a way in which *we* organise time for Kant. Deleuze puts this point forward as follows:

> Time cannot be defined by succession because succession is only a mode of time, coexistence is itself another mode of time. You can see that he arranged things to make the simple distribution: space-coexistence, and time-succession. Time, he tells us, has three modes: duration or permanence, coexistence and succession. But time cannot be defined by any of the three because you cannot define a thing through its modes. (Deleuze 1978b)

The talk about modes is important here, and refers us to Spinoza's conception of substance. Spinoza held that all attributes, such as thought and extension, are equally expressions of the same substance. Here, Deleuze is suggesting that succession and coexistence are simply different 'attributes' of time. The pure and empty form of time therefore has the same relationship to succession and coexistence as substance for Spinoza has to the attributes.[5] The characterisation of 'substance' as time is therefore made possible by two innovations. The first is the recognition by Kant that time is not an expression of an underlying rational structure, whether the number of movement or the concept of the Leibnizian monad. Without this insight, time is simply a mode of expression of an underlying rational structure. The second is the understanding that time itself is capable of synthesis. This frees time from its role in Kant's system as merely a form of receptivity, and allows it to take the role of a pre-individual ground (or 'unground') of both the modes of temporality we find and of the subject itself. The reason why Deleuze introduces this notion is that we need to explain the interaction of the two very different forms of time themselves. Deleuze posits a difference in kind between the successive nature of habit and the coextensive nature of memory, two fundamental structures responsible for the constitution of the subject.[6] The question of how memory is able to relate to habit arises, a question much like Kant's question of how two different faculties can relate to one another. Deleuze's answer to this question in terms of time is ultimately Spinozist.[7] Habit and memory can relate to each other because they are simply different modalities or expressions of the form of time itself. As such we can think (somewhat figuratively) of memory and habit as simply being different ways of presenting the same underlying form of time itself. By taking this approach, the problem of the priority of succession over coexistence, or vice versa, is put out of play. They are both expressions of the same ontologically prior temporal form, which in itself is neither successive nor coexistent. The empty and pure form of time is therefore that which

bifurcates itself into the past of memory and the present of habit. Placing time out of joint and opening up the possibility of a pure form of time itself is, therefore, essential to Deleuze's constitution of an ontology of becoming. I want to return to this point in the final section, when we see how time out of joint is related to the eternal return.

IV. Aristotle's *Poetics*

The emphasis of the first half of this paper has been on what one might call the metaphysical aspect of time out of joint. In this second half of the paper, I want to return to the question of drama itself, and see how the move to a different conception of drama affects our notions of temporality.[8] My argument will be that implicit in classical drama is a metaphysics of time that is overturned in *Hamlet*, and so the second half of this paper will retrace the evolution of the metaphysics of time, but within the domain of the dramatic. In this domain, it will no longer be a question of overturning the priority of movement, but instead of overturning the privileging of the act. If we are to look at the notion of a time out of joint in drama, a good place to begin will be with Aristotle's definition of tragedy in the *Poetics*, at least in order to provide a contrast to what we find in *Hamlet*. Aristotle presents a somewhat similar position to Plato's in the *Physics*, arguing that time requires change, as without change, we would not be able to determine that time had passed. Time here is simply the measure of motion, and so we once again have the subordination of time to a rational structure. Aristotle claims that tragedy is

> the imitation of an action that is serious and also, as having magnitude, complete in itself; in language with pleasurable accessories, each kind brought in separately in the parts of the work; in a dramatic, not in a narrative form; with incidents arousing pity and fear, wherewith to accomplish its catharsis of such emotions. (Aristotle 1995: 1449b25–9)

For our purposes, what is important to note is that in Greek tragedy, what is central is action ('they do not act in order to portray the characters; they include the characters for the sake of the action' [Aristotle 1995: 1450a20–1]). As Michael Davis points out, 'the *Poetics* is about two things: *poiêsis* understood as poetry, or imitation of action, and *poiêsis* understood as action, which is also imitation of action' (Davis 1999: 9).

We find the same emphasis on action in Hegel's conception of tragedy. If we look at a play such as *Antigone*, we can see that the drama

arises from the actions of its characters, and traces their consequences. The conflict at the centre of the drama emerges through King Creon's prohibition on the burial within the city of Antigone's brother, the traitor Polyneices, and Antigone's transgression of this prohibition. Here the conflict occurs between the laws 'of the gods, that are unwritten and unfailing' (Sophocles 2003: 501), the right to bury the dead, and the laws of the state, exemplified by Creon's prohibition. Each character chooses to act solely according to one determining principle, and does not recognise the rights of the other. The one-sidedness of their opposed actions means that a resolution can only be achieved by the tragic death of Antigone, and Creon's loss of his wife and son. We can note that what is presented in this case is a legal conception of the individual. To begin with, action is fundamentally tied to the concept of law in Greek tragedy. The tragedy cannot occur simply through a misfortune on the part of the characters, since this is 'not fear-inspiring or piteous, but simply odious to us' (Aristotle 1995: 1452b36). Likewise, it cannot involve evil characters suffering misfortune, as 'pity is occasioned by undeserved misfortune' (1453a4). In this sense, the plot of tragedy involves 'a man not pre-eminently virtuous and just, whose misfortune is, however, brought about not by vice and depravity but by some fault' (1453a6–10). In order to explore Deleuze's reaction to this form of drama, I want to bring in here Rosenberg's analysis of drama, as it is central to Deleuze's application of the metaphysics of the empty and pure form of time to drama itself.[9] In what Rosenberg calls 'old drama', the basis of tragedy is some kind of fault on the part of the agent, some kind of transgression for which the agent is responsible:

> [T]he concepts of morality or social law, applying exclusively to human beings and ignoring possible analogies with other living creatures, tend to define the individual not as an entity enduring in time but by what he has done in particular instances. A given sequence of acts provokes a judgement, and this judgement is an inseparable part of the recognition of the individual. (Rosenberg 1994: 136)

When we look at the legal conception of the person, it is not the case that the unity of the individual can be given in terms of his or her acts themselves. Rather, when someone comes before a judge, what the judge relates to is not a unity governed by personality, but rather a series of acts which are unified by the last act's relationship to the law. As Rosenberg notes, the actual acts of a murderer are in large part no different from the acts of anyone else, and are only made criminal by

the fact that they precede the murder itself: 'entering an automobile, stepping on the gas, obeying the traffic lights'. (Rosenberg 1994: 138) When we look at a criminal act, it is the law that provides a framework for the analysis of action, and which imposes a structure of artifice that unifies the conduct of the perpetrator. This is not merely the case in the sense that it is the transgression of the law which defines the act as criminal, but also that the law provides a way of synthesising certain other acts which, without reference to the crime, would be indifferent in relation to the law. We can see that there is a certain artificiality to such a mode of analysis in the following way. First, there is the fact that in determining the guilt or innocence of the perpetrator of a crime, the judge explicitly sets to one side the personality of the individual in order to base the judgement purely on the identity of the actions. Second, we can note that if it is suddenly discovered that the alleged perpetrator did not commit the crime, then the entire identity of series of actions before the law disintegrates. The actions of 'stepping on the gas' and 'obeying the traffic lights' now take on an entirely innocent aspect. In this sense, law is what draws together a series of acts that in themselves are indifferent to one another, in a similar way to that in which the Kantian notion of judgement draws together the moments of intuition which are themselves purely passive in relation to one another.

Now, obviously in the case of the law, the problem is of determining whether the structures of the law apply to the actions or not (whether the person is guilty or innocent). In the case of 'old drama', we do not have the difficulty of determining whether acts properly accord with the structure of the law. Rather, characters in 'old drama' are constituted to be in accordance with their fate from the outset:

> The dramatist's definition of the character was not an arbitrary superimposition that exchanged the emotional, intellectual, and mechanical characteristics of a biological and social organism for some one deed that concerned the court; it constituted instead the entire reality of a character, avoiding the ruinous abstraction of the law by determining in advance that his emotions, his thoughts and his gestures should correspond with and earn in every respect the fate prepared for him. (Rosenberg 1994: 139)

In 'old drama', therefore, character is seen simply as a manifestation of the underlying unity provided by actions' relation to the law. On the basis of this relation of character to action, Rosenberg presents his criticism of 'old drama'. Once character has been subordinated to the structure of the law through action, the possibility of an exploration

of the change or development of character is ruled out. Thus, while Creon's relations to those around him – Haemon, for instance – may change during the course of the play, this is simply as a result of the expression of the same moral identity. This is explicit, for instance, in Hegel's reading of tragedy, where 'the truly inviolable law is the unity of the action' (Hegel 1975: 1166). Hegel's understanding of tragedy sees it emerging through each character's adoption of a partial aspect of ethical life (*Sittlichkeit*) as his guiding principle. Thus Antigone is justified in appealing to the rights of the family in seeking to bury Polyneices, just as Creon is justified in upholding the laws of the state. They are both also culpable in that their action fails to take into account the complete structure of ethical life. The resolution of tragedy is the restoration of balance to the ethical, but as 'the *individuals* have more or less put their whole will and being into the undertaking they are pursuing' (1166; emphasis in original), the resolution of the tragedy can only occur with the dissolution of these partial views, and with them, the characters who embody them. Thus, by focusing on action, we rule out an account of character, or at least of a change of character. We can, however, further note that this model of drama mirrors that of a metaphysics of time I presented in the first half of this paper. Rather than seeing the character as an entity that develops in time, we have a drama which is subordinated to the movement of the action. Similarly, the singularly human nature of action as relation to ethical structure reflects that what is being played out is something primarily atemporal. The duration of the play is simply the mode of expression of the underlying rational structure of the law of action. In the case of the metaphysical notion of time in joint, this structure was given by an initial movement, or conceptual determination. Here, the phenomenal manifestations of characters in classical drama are merely manifestations of an underlying law, or an underlying judgement: the fate of the character. Hence, 'psychology can establish the plausibility of Macbeth's or Lear's behaviour, but for the sufficiency of his motivation, we must not refer to a possible Macbeth or Lear "in real life" but to the laws of the Shakespearean universe' (Rosenberg 1994: 140).

V. Hamlet and Time out of Joint

The focus of Deleuze's philosophical interest in *Hamlet* is in Hamlet's hesitation. Provided we do not simply explain Hamlet's hesitation as a contingent psychological phenomenon,[10] we can approach *Hamlet* as offering an alternative to the Greek conception of drama. In the opening

scene, Marcellus sets up the opposition to the Platonic scheme by noting that war has severed the connection between action and the celestial bodies in the Kingdom of Denmark:

> Why such impress of shipwrights, whose sore task
> Does not divide the Sunday from the week.
> What might be toward, that this sweaty haste
> Doth make the night joint-labourer with the day?
> (Shakespeare 2003: I, i, 75–8)

As Spencer notes (Spencer 1943: 11), the view of the celestial spheres as a rational realm mirroring the rational faculty of man was widespread at the time that Shakespeare was writing, and views such as that of the humanist, G.-B. Gelli, that 'man is made of two natures, one corporeal and terrestrial, the other divine and celestial; in the one he resembles beasts, in the other those immaterial substances which turn the heavens', were the standard fare of renaissance cosmology. Hamlet relates his own inability to act to a more general malaise with the universe:

> And indeed it goes so heavily with my
> disposition that this goodly frame, the earth, seems to me a sterile
> promontory; this most excellent canopy the air, look you, this brave
> o'erhanging firmament, this majestical roof fretted with golden
> fire – why, it appeareth no other thing to me but a foul and pestilent
> congregation of vapours. (Shakespeare 2003: II, ii, 281–6)

In this sense, Hamlet's concerns are not simply psychological, but are also related to a feeling of incongruence with the kind of rational cosmology put forward by the *Timaeus*. *Hamlet* sees Hamlet himself not as an identity in the legal sense, or in the dramatic senses which we find in Aristotle. He is not defined by action as, for instance Sophocles' own model of the vengeful son, Orestes, is, who claims that 'talk is expensive', and is instead concerned with 'practical details': 'where we should hide, where we can leap out and push that enemy laughter right back down their throats!' (Sophocles 2001: 1720–5). We do not need to turn to Greek tragedy for the figure of an identity, however, as Hamlet's character is paralleled within the play itself by Laertes and his need for revenge. As Rosenberg points out, the drama prior to Hamlet's return from England concerns his inability to act:

> I do not know
> Why yet I live to say 'This thing's to do;'
> Sith I have cause and will and strength and means
> To do't. (Shakespeare 2003: IV, iv, 43–6)

Now, as these lines makes clear, Hamlet is very much aware of what he should do, but he is simply not able to do it. To this extent, we have an odd dramatic structure since, if characters are understood in terms of the relations of acts to the judgement of the law as they would be in classical drama, then Hamlet's various speeches, and use of speech in the first half of the play, are simply irrelevant to the structure of his role. As Deleuze writes, 'Hamlet is the first hero who truly needed time in order to act, whereas earlier heroes were subject to time as the consequence of an original movement (Aeschylus) or aberrant action (Sophocles)' (Deleuze 1998: 28). Rather than the movement of the action determining the time of the drama, Hamlet experiences time itself as being the ground of action. In this sense, he operates within a time out of joint where his relation to the world, and to himself,[11] is governed by a fundamental passivity. His actions unfold in a time which is not his own. In this sense, Hamlet's experience is much like that which Bergson describes in his influential analysis of waiting for sugar-water to mix:

> For here the time I have to wait is not that mathematical time which would apply equally well to the entire history of the material world, even if that history were spread out instantaneously in space. It coincides with my impatience, that is to say, with a certain portion of my own duration, which I cannot protract or contract as I like. It is no longer something *thought*, it is something *lived*. (Bergson 2002: 176; emphasis in original)

Rosenberg's interpretation is precisely this, that Hamlet's character cannot be understood as purely derived from the structure of the action he is to undertake, unlike in the case of an identity, and hence he exists outside of the role that the play assigns him. The task of taking on the role of avenging his father is simply too big for him. The sea voyage is therefore necessary to the structure of *Hamlet*, as it represents the break in the structure of the play whereby Hamlet becomes equal to the task allotted to him. What does this involve? Deleuze talks about the first half of Hamlet in terms of the '*a priori* past'. In this sense, Hamlet exists in the past of the event of the murder of his father (he is yet to become equal to the action of revenge). Hamlet, in the first half of the play, exists in a state of relation to a past that is disconnected from the present. In this sense, there is a failure to relate the past to action, which is mirrored

by the failure to identify himself with the actual structure of the law. As Deleuze puts it, in his discussion of Hamlet and Oedipus, 'they are in the past and live themselves as such so long as they experience the act as too big for them' (Deleuze 2004: 112). The second time, the action, is the moment of the present, where the self becomes capable of acting. In this sense, for Deleuze, Hamlet mirrors the central problem of Kant's transcendental philosophy: how can two orders, which are different in kind, be brought into alignment with one another? For Kant, this problem is posed in terms of the incongruence of intuition and the understanding. For Rosenberg and Deleuze, the problem is posed in terms of the incongruence of personality as 'an organic coherence intuitively based on the real world of sensation' (Rosenberg 1994: 135), and legal identity as the basis for action. Hamlet recognises that his relation to the world, and even to himself, is mediated through a time divorced from the movement or actions of agents, and thus experiences himself as subordinate to time:

> The spontaneity of which I am conscious in the 'I think' cannot be understood as the attribute of a substantial and spontaneous being, but only as the affection of a passive self which experiences its own thought... being exercised in it and upon it but not by it. (Deleuze 2004: 108)

The question is not how this time of duration can be overcome, but of how it can be related to the time of action. We can therefore see 'old drama' as dramatising an ontology of movement, whereas Hamlet dramatises an ontology of time as out of joint or freed from movement. It provides an image for enabling us to think the gathering together of time.[12] Hamlet's question is how he is able to reconcile his personality with the identity of action. For Deleuze, it is only against the future that these two moments can be related. It is only the future that allows the self of the past to be brought into a 'secret coherence' with the present, as action precisely is this relation of past and present towards a future. There are thus three moments to Hamlet; the first, that of passivity, where he is incapable of acting. The second is the caesura, the voyage to England, which Deleuze represents as the present, and the final moment, the future, the horizon against which the action takes place. Together they provide what Deleuze calls a 'symbol' or 'image' (Deleuze 2004: 112) of the totality of time. They show that the two modes of time, the past and the present, can be brought into relation with one another, but only through a third moment of time, the future. In this sense, 'it matters little whether or not the event [of the past] occurs or the act [of the present] has been performed or not: past, present and future

are not distributed according to this empirical criterion' (Deleuze 2004: 112). That is, Deleuze's claim is that we are not concerned with the actual (empirical) relationship of past, present and future in the play (he notes that in another image of time provided by Oedipus, the act empirically precedes the event of the past), but with the formal relations that present the metaphysical structure of temporality. On Deleuze's reading, it is necessary that Hamlet die in the empirical future, not because his character is incapable of changing, but instead for the following reasons. First, because the future is the horizon of action, and the point at which Hamlet's acts escape him as a subject of action; and second, because if Hamlet is to be viewed as a hero who truly relates to time out of joint, this time must ultimately be separated from the subject for the pure and empty form to itself take primacy. If *Hamlet* is to truly provide an image of the totality of time, then the third moment, the unity of the past and the present, must be the equivalent of the Spinozist 'substance as time' that we encountered in the first half of this paper. Just as what unified the times of succession and coexistence was that which was expressed in both and thus was itself neither successive nor coexistent, the future, as the unity of the past and the present, escapes both aspects of Hamlet's character. In order for an image of the totality of time to be constituted, the moment of 'secret coherence' must be one where Hamlet is neither subject to the event, nor capable of acting. This moment is the moment of his death.

> In this manner, the I which is fractured according to the order of time and the Self which is divided according to the temporal series correspond and find common descendant in the man without name, without family, without qualities, without self or I, the 'plebeian' guardian of a secret, the already-Overman whose scattered members gravitate around the sublime image. (Deleuze 2004: 112)

One might in fact question whether Deleuze is correct that Hamlet's death really marks the instigation of time definitively out of joint, or rather the reinstatement of jointed time as the rule of his line comes to an end, however.

VI. Conclusion: The Eternal Return

As well as a novel conception of philosophy, we also have a new conception of theatre. Both of these novelties present a new way to coordinate the moments of time. The metaphysics of time out of joint relates succession and coexistence through a prior empty and pure form of time, whereas the theatre of time out of joint relates the past and

present to one another against the horizon of the future. The final question is, therefore, how are these two forms related to one another? The answer, I think, is found in Nietzsche's claim that *Hamlet* is an essentially metaphysical tragedy, that 'it is not reflection, it is true knowledge, insight into the terrible truth, which outweighs every motive for action, both in the case of Hamlet and in that of Dionysiac man' (Nietzsche 1997: 40). Deleuze follows Nietzsche in claiming that at the heart of *Hamlet* is a metaphysical truth, even if this is no longer the truth of Nietzsche's *Birth of Tragedy*, but rather that of the eternal return. The recognition that there are two forms of the eternal return allows us to relate the two terms of Nietzsche's characterisation, Hamlet, and Hamlet's 'terrible truth'. While we can give the eternal return a dramatic reading as a tripartite structure in terms of the act, as incorporating the past into the present in order to relate to the future, 'such an exposition remains purely introductory' (Deleuze 2004: 113). It presents us only with an 'image' of time, such as we found in *Hamlet*. In addition, Deleuze presents a second interpretation of the eternal return, this time in terms of an 'esoteric truth' that 'concerns – and can concern – only the third time or the series' (Deleuze 2004: 113). It is in *Thus Spoke Zarathustra* that these two moments are related to one another. We can begin by noting parallels between *Hamlet* and *Zarathustra*. Both involve their central characters moving from a state where they are not equal to their action to the act itself. The bulk of *Zarathustra* is governed by Zarathustra's inability to think the eternal return ('O Zarathustra, your fruits are ripe, but you are not ripe for your fruits' [Nietzsche 2006: 117]). *On Redemption* is central in this respect, in that it explores two different relationships to the past. As Zarathustra says, 'this alone is *revenge* itself: the will's unwillingness towards time and time's "it was"' (111). This conception of time, with its 'dreadful chance', is the past of mathematical succession – the line of time that is the expression of a rational movement. In this framework, temporality itself is seen as the ground for resentment, man is not the ground for his own actions (he cannot will backwards), and so he is in this sense alienated from what he is by the structure of temporality. The spirit of revenge is therefore engendered by the passing of time, and its incommensurability with the will. Nietzsche offers two solutions to this problem. The first is the annihilation of the will (the Schopenhauerian solution); the second is the redemption of time. The eternal return is that which offers us the possibility of a more appropriate relation to temporality.[13]

Deleuze claims that the second part of *Zarathustra* is concerned with the transformation of Zarathustra, as he finally becomes adequate to the

thought of the eternal return. In the last part of *Zarathustra*, Zarathustra finally throws off his 'pity for the higher men' (Nietzsche 2006: 266). In his pity for the higher men, Zarathustra was still conceiving of the eternal return as the return of time determined by that which exists within it. Such a form of time is the time of revenge and the 'fragments and limbs of human beings' (110). The final stage, Deleuze claims, is unwritten, and would have dealt with the death of Zarathustra. Deleuze describes this final time as 'time by excess' (Deleuze 2004: 113), where the subject is once again dissolved, and time prior to its actualisation in a field of beings presents itself. In essence, we can read the eternal return in this formulation as the unity of past, present and future. It is also, however, the metaphysical structure of time itself: 'the eternal return is neither qualitative nor extensive, but intensive, purely intensive. In other words, it is said of difference' (303). As Deleuze notes, 'we rely upon the overly simple circle which has as its content the passing present and as its shape the past of reminiscence' (114) when we see the eternal return in terms of Hamlet or Zarathustra. In fact, the eternal return, or the empty and pure form of time, is that which makes the relation of past and present possible, rather than this relation itself. It is also that which allows us to think an ontology where time is not subordinated to the movement of things, but rather where things emerge from the unfolding of time itself. For Deleuze, Zarathustra's progress therefore amounts to the dramatisation of the process of coming to think an ontology of becoming. It is only once he has given up the last trace of an ontology of being (his pity for the higher men) that he becomes capable of thinking of the redemption of time itself, rather than a redemption of things through a change in our relation to time: 'Only the extreme, the excessive, returns; that which passes into something else and becomes identical... Eternal return or returning expresses the common being of all these metamorphoses, ... , of all the realised degrees of power' (51). The eternal return is therefore both a test to redeem our own relationship to time, which Deleuze formulates in a way which parallels Kant's imperative ('what ever you will, will it in such a way that you also will its eternal return' [Deleuze 1986: 68]), but also time itself, redeemed from movement.

Notes

1. 'The Northern Prince says "time is out of joint". Can it be that the Northern philosopher says the same thing: that he should be Hamletian because he is Oedipal?' (Deleuze 2004: 111).

2. Deleuze makes this connection between jointed time and the *Timaeus* explicit in his lecture on Kant (Deleuze1978a: 21 March 1978). In the section on time out of joint, he claims, 'In the *Timaeus* there were some very beautiful pages on the arc of the Demiurge which makes circles, this bending activity. However, this time as an image of eternity, the cyclical figure of time subordinated to movement and whose secret will be the periodic return of planets to the same position relative to each other, is indeed a time which is the image of eternity.'
3. As Francis Cornford notes, the forms have no generative power, and so cannot replace the role of the demiurge in *creating* a moving image of eternity (Cornford 1937: 28).
4. 'It is to be taken, not literally, but as a poetical figure. The whole subsequent account of the world is cast in a mould which this figure dictates. What is really an analysis of the elements of rational order in the visible universe and of those other elements on which order is imposed, is presented in mythical form as the story of a creation in time' (Cornford 1937: 27).
5. In *Difference and Repetition*, Deleuze argues that despite developing a univocal conception of being, the fundamental limitation of Spinoza's philosophy is that substance is understood in terms of being, rather than becoming: 'Substance must be said *of* the modes and only *of* the modes. Such a condition can be satisfied only at the price of a more general categorical reversal according to which being is said of becoming, identity of what is different, the one of the multiple, etc.' (Deleuze 2004: 50). Deleuze's own metaphysics can therefore be seen as an attempt to invert Spinozism, with becoming taking the place of substance.
6. The constitution of the time in terms of memory and habit is the topic of the first two of the three syntheses of time. Cf. Deleuze 2004: 90–107, Ansell Pearson 1999: 99–101.
7. My interpretation of time here differs from that of James Williams in his recent study of Deleuze's philosophy of time in that I take the relation between the two forms of drama to be defined by the priority of movement or time. Since Plato, on Deleuze's reading, sees time as essentially confused movement, there is no possibility of the formulation of an empty and pure form of time, as time only exists as a secondary effect of the rational movement of the celestial bodies. Without this rational movement, on this conception, there would equally be no time. We can therefore only conceive of an *empty* form of time once we see time as primary, or at least as independent of movement (by, for instance, Kant's recognition of the difference in kind between the faculties of intuition and the understanding). It is in this sense that Hamlet is seen as Kantian by Deleuze. The future is the *pure* form of time because, as Deleuze writes, 'the future, which subordinates the other two to itself and strips them of their autonomy, is the royal repetition' (Deleuze 2004: 117). In terms of the three syntheses of time, the future is that which is expressed in both the past and the present, each of these functioning as attributes to time, which is analogous to Spinoza's conception of substance. The claim that both the past and the present are attributes of the future, as the pure form of time, is what allows Deleuze to overcome the difficulty he encounters at the conclusion of the second synthesis, that it appears as if the pure (virtual) past is subordinate to the (actual) present. Relating both to the future prevents the prioritisation of either temporal synthesis. Williams instead interprets the empty and pure form of time in terms of a subtractive procedure where number is removed from time: 'For Hamlet, once his father's ghost has spoken, the numbering and legitimacy of kings is out of joint and his time becomes empty (there is no next numbered ruler) and pure (there is no legitimate ruler)' (Williams 2011: 88–9). Such a subtractive approach runs

the risk of occluding the fact that the presence of number in the world is an expression of a deeper rational structure (such that it is not a question of simply removing numbers from the world, but of overturning their transcendental ground). As Williams notes, with the empty and pure form of time, temporality 'changes from a cardinal time numbering revolutions of the circle, to an ordinal time setting events in order' (Williams 2011: 89). Once we see the empty and pure form of time as a change in that which is repeated (from the rational to time itself), these two moments can be recognised as different aspects of the same process.

8. In doing so, I follow Deleuze's claim in *Difference and Repetition* that 'the theatre of repetition is opposed to the theatre of representation, just as movement is opposed to the concept and to representation which refers it back to the concept' (Deleuze 2004: 11–12). Deleuze's claim here is that we can distinguish a theatre grounded in genuine repetition from a theatre grounded in movement as the instantiation in the world of a concept. The latter account of theatre clearly mirrors the account in the *Timaeus* of (rational) movement as the instantiation in the world of the atemporal rational structure of the forms.
9. Cf. Faulkner 2006: 109–14 for further discussion of Deleuze's use of Rosenberg, although Faulkner does not address the question of the pure form of time directly.
10. Cf. Bradley's Hegelian reading of Hamlet, where 'the direct cause' of his failure to act is read as 'a state of mind quite abnormal and induced by special circumstances,– a state of profound melancholy' (Bradley 1920: 108).
11. Deleuze cites Kant's paralogisms as providing a model for Hamlet's hesitation, where Kant argues that even the self is given under the form of time.
12. On the processual nature of this gathering, see Williams 2011: 91.
13. My account here focuses on the metaphysical doctrine of the eternal return. For detailed analysis of the ethical doctrine, see Hardt 1993: 26–55; and Ansell Pearson 1997, 1999. Lorraine 2003 suggests a connection between Deleuze and Derrida's ethical uses of the formula, 'time is out of joint'.

Deleuze and Guattari and the Future of Politics: Science Fiction, Protocols and the People to Come

Ronald Bogue University of Georgia

Abstract

When is the future? Is it to come or is it already here? This question serves as the frame for three further questions: why is utopia a bad concept and in what way is fabulation its superior counterpart? If the object of fabulation is the creation of a people to come, how do we get from the present to the future? And what is a people to come? The answers are (1) that the future is both now and to come, now as the becoming-revolutionary of our present and to come as the goal of our becoming; (2) utopia is a bad concept because it posits a pre-formed blueprint of the future, whereas a genuinely creative future has no predetermined shape and fabulation is the means whereby a creative future may be generated; (3) the movement from the revolutionary present toward a people to come proceeds via the protocol, which provides reference points for an experiment which exceeds our capacities to foresee; (4) a people to come is a collectivity that reconfigures group relations in a polity superior to the present, but it is not a utopian collectivity without differences, conflicts and political issues. Science fiction formulates protocols of the politics of a people to come, and Octavia Butler's science fiction is especially valuable in disclosing the relationship between fabulation and the invention of a people to come.

Keywords: fabulation, utopia, politics, science fiction, protocols, Octavia Butler

Deleuze Studies Volume 5: 2011 supplement: 77–97

My purpose is first, to reflect on the concept of fabulation as the invention of a people to come, and then to consider the manifestation of the concept in science fiction, or as it is sometimes called, speculative fiction – a term I prefer to the former. Rather than speak abstractly about the genre as a whole, I will concentrate on a limited corpus: the fiction of Octavia Butler, the first and still, I believe, the foremost African-American female exponent of speculative fiction. My inquiry will be guided by four questions, the first of which will serve as the general context in which questions two, three and four are situated. The first question is: when is the future? The second: why is utopia a bad concept and in what way is fabulation its superior counterpart? Question number three: if the object of fabulation is the creation of a people to come, how do we get from here and now to there and then, from the present to the future? And question four: what is a people to come? Octavia Butler's fiction will be especially helpful in thinking about a people to come as a literary element, that is, as a component of the possible, the plane of composition, the realm in which the event takes finite, material form in order to create the infinite in its own special way.

From the point of view of common sense, the question 'When is the future?' must seem absurd – the future is the future, and it is what will happen, in contradistinction to what has already happened and what is happening now. But as we all know too well, common sense is no guide to the thought of Deleuze. If we look at *Difference and Repetition* (1994), we may distinguish three futures, one for each of the three passive syntheses of time. In the first synthesis, that of the present, the future is something like the forward edge of a moving present. A common but mistaken concept of time is that of a line of infinite points, each point representing a present 'now'. Such a conception leads to Zeno's paradoxes, to which Bergson responds by positing time as composed of indivisible movements. The present in this regard contains many points along a line, and in that sense we can say that the present is a contraction of past, present and future within a single movement. Husserl makes essentially the same point when speaking of the retention of the past and protension of the future in a moving present. The present contracts chunks of time, as it were, and in theory the present contraction could be infinite – and indeed, the Stoics said that the present of the gods included all time. But other creatures have limited capacities for contraction, and hence they reach a point of fatigue. The rhythm of any entity's contractions of the present marks the pattern of that entity's powers and fatigue. Cells, organs and organism all have different

capacities for contracting the present, such that bacteria, the heart, insects and whales inhabit different presents. But for all of them, there is a future of the present, the leading edge or avant-garde of each temporal contraction on its way toward the limit of fatigue.

In the second synthesis of the past, the past coexists with the present as a virtual double and continues to exist in itself as a retention of all virtual presents within an ever-expanding field of the past. Since the present always passes, it must pass into something which will continue to be doubled by the virtual past, which in turn will perpetually retain itself. In this regard, the past pre-exists the present as its necessary condition, and thus, there is a future of the past. (My explanation here is truncated and inadequate, admittedly, but sufficient for the present purposes.)

The third passive synthesis is that of the future. The third synthesis is a pure form of time which 'unfounds' time and splits the subject, or 'I'. But as James Williams has so eloquently shown, the third synthesis is not simply time out of joint, '*hors de ses gondes*', but also a cut, an assembly (*un ensemble*), an ordering and a seriation. The third synthesis as a novel action requires a cut, a caesura in time, which produces a before and an after. The cut must assemble the before and after within itself, but also tear them apart. Once torn apart, an ordering of before, cut and after emerges. The cut produces an asymmetrical division in which the before and after are incommensurable. As asymmetrical elements, the before and after are thus distinguished not simply as an order, but as a series (see Williams 2011: 79–112).

We may say, then, that there is a future of the present as contraction, a future of the past as retention and precondition, and a future of the future as cut, assembly, ordering and seriation. But why raise these issues? When Deleuze speaks of a people to come, he often cites Paul Klee's remark that 'the people are missing', '*c'est le peuple qui manque*'. The implication seems clear: in the present there is no people, and the people to come, *le peuple à venir*, is only possible in some future that has not yet arrived. In *What Is Philosophy?*, Deleuze and Guattari say that philosophy creates a plane of immanence and that 'deterritorialisation of such a plane does not preclude reterritorialisation but posits it as the creation of a future new earth [*une nouvelle terre à venir*]' (Deleuze and Guattari 1994: 88). Philosophy works '*to summon forth a new earth, a new people*' (99; emphasis in original). Philosophy's problem is that '*We lack resistance to the present*... Art and philosophy converge at this point: the constitution of an earth and a people that are lacking as the correlate of creation' (108; emphasis in original). And yet, Deleuze and Guattari also say that philosophical thought is a matter of

> acting counter to the past, and therefore on the present, for the benefit, let us hope, of a future – but the future is not a historical future, not even a utopian history, it is the infinite Now, the *nun* that Plato already distinguished from every present: the Intensive or Untimely, not an instant but a becoming. (Deleuze and Guattari 1994: 112)

For Foucault, they observe,

> what matters is the difference between the present and the actual. The actual is not what we are but, rather, what we become, what we are in the process of becoming – that is to say, the Other, our becoming-other . . . It is not that the actual is the utopian prefiguration of a future that is still part of our history. Rather, it is the now of our becoming. (Deleuze and Guattari 1994: 112)

It would seem, therefore, that the new earth and new people are also present, that the future is now – but, of course, that now is an infinite Now, the Nietzschean Untimely, the time of our 'becoming', the time of Aion. 'When is the future?', then, is a serious question when considering *un peuple à venir*. Is such a people 'to come', or is it 'at hand', that is, in the process of becoming in an Untimely Now? I will speak further about this issue when addressing my fourth question: what is a people to come?

Now to my second question: why is utopia a bad concept and in what way is fabulation its superior counterpart? Deleuze makes explicit the relationship between utopia and fabulation in a 1990 interview with Toni Negri. There he says 'Utopia isn't the right concept: it's more a question of "fabulation" in which a people and art both share. We ought to take up Bergson's notion of fabulation and give it a political meaning' (Deleuze 1995: 174). Why is utopia not 'the right concept', or as Deleuze and Guattari put it in *What Is Philosophy?*, 'not a good concept' (Deleuze and Guattari 1994: 110)? In the fourth chapter of *What Is Philosophy?*, when the subject of a new earth and a new people is addressed, for a while Deleuze and Guattari use the word 'utopia' without apology. They remark that

> *utopia is what links* philosophy with its own epoch, with European capitalism, but also already with the Greek city. In each case it is with utopia that philosophy becomes political and takes the criticism of its own time to its highest point. Utopia does not split off from infinite movement: etymologically it stands for absolute deterritorialisation but always at the critical point at which it is connected with the present relative milieu, and especially with the forces stifled by this milieu. (Deleuze and Guattari 1994: 99–100; emphasis in original)

Yet reservations soon emerge, as they state, 'The word utopia therefore designates *that conjunction of philosophy, or the concept, with the present milieu* – political philosophy (however, in view of the mutilated meaning public opinion has given to it, perhaps *utopia* is not the best word)' (Deleuze and Guattari 1994: 100; emphasis in original). The initial problem, then, is one of public opinion and degraded usage. But beneath such superficial misconstruction lurks a deeper potential for misunderstanding: 'Utopia is not a good concept because even when opposed to History it is still subject to it and lodged within it as an ideal or motivation' (110). As an ideal, utopia functions as a kind of Platonic Idea, something above this world, static and perfect. If utopia is a motivation, then it is something external to action, something aimed for as a goal. We might add that utopias frequently are spatial rather than temporal – places, rather than times.[1] The architecture of utopias is often complete and contained, and processes take place within their spatial confines as components of a self-regulated system. In all these regards, utopias are the antithesis of becoming, process and movement toward a future that is genuinely new and thus inherently unpredictable, defiant of any mapping. Motivation cannot be external to the process of becoming, and becoming cannot be goal-directed.

Fabulation is a superior concept because its essence is to activate the 'powers of the false', to falsify orthodox truths in the process of generating emergent truths. To fabulate, in Pierre Perrault's words, is to 'legend *in flagrante delicto*' (cited in Deleuze 1989: 150; translation modified), and in doing so, to summon forth a 'people to come'. As Deleuze says in *Negotiations*, what we have to do is catch someone else 'legending',

> 'caught in the act of legending'. Then a minority discourse, with one or many speakers, takes shape. We here come upon what Bergson calls 'fabulation' . . . To catch someone in the act of legending [*Prendre les gens en flagrant délit de légender*] is to catch the movement of constitution of a people. A people isn't something already there. A people, in a way, is what's missing, as Paul Klee used to say. (Deleuze 1995: 125–6)

Fabulation does not presume an ideal, nor does it have an external goal as its motivation. It is its own end, an irreducibly temporal process of becoming-other that is open-ended, and if it is a process of summoning forth a future people, it is one that cannot move beyond itself without involving the participation of a collectivity in its action. Fabulation commences with resistance, since 'to create is to resist' (Deleuze and

Guattari 1994: 110), but if it is resistance to the present in the hope of a better future, that future cannot be predicted, nor can its superiority to the present be assured.Yet one might ask, do we simply start blindly becoming, with no coordinates, no point of inception? This brings me to my third question: if the object of fabulation is the creation of a people to come, how do we get from here and now to there and then, from the present to the future? Let us remember first, that if the becoming of fabulation involves resistance, such resistance is always contingent and specific. One resists the intolerable where one finds it, when one can no longer tolerate it – hence, the point of inception is no problem. But what about the coordinates of becoming? Here, I would like to suggest that protocols of experimentation can provide a certain scaffolding for resistance. Deleuze and Guattari state that 'To think is to experiment', although they add that 'experimentation is always that which is in the process of coming about – the new, remarkable, and interesting that replace the appearance of truth and are more demanding than it is' (Deleuze and Guattari 1994: 111). Yet experimentation is not a haphazard activity. In *Kafka: Toward a Minor Literature*, Deleuze and Guattari find in Kafka's letters to Felice

> a prodigious operation by which [Kafka] translates this horror [of impending matrimony] into a *topography of obstacles* (where to go? how to arrive? Prague, Vienna, Berlin?). The Surveyor. And also the other operation by which he enumerates a numbered *list of conditions* that the subject of the statement thinks can dissipate horror when, in fact, it is this very horror in the subject of the enunciation that inspires them (a Life Plan, or a Life Program, à la Kleist). (Deleuze and Guattari 1986: 31–2; emphasis in original)

The reference to Kleist is intriguing, if in need of further clarification. In several letters to his half-sister, Ulrike, Kleist does indeed speak of the need for a *Lebensplan*, a life plan, but he seems to mean something quite mundane. He tells his sister that he cannot achieve anything if he does not have a plan for his life. He then complains in subsequent letters that he cannot create a satisfactory plan, that one plan soon gives way to another, and once adopted, each plan proves inoperable. But Deleuze and Guattari give this innocuous concept of a life plan a more interesting sense. They see the life plan as a programme for experimentation, which suggests that Kafka's 'topography of obstacles' and 'list of conditions' are also elements of an experimental protocol. In *Dialogues*, Deleuze contrasts French literature with minor literature, in which there is no longer

> the infinite account of interpretations which are always slightly disgusting, but finite processes of experimentation [*des procès finis d'expérimentation*], protocols of experience [*protocoles d'expérience*]. Kleist and Kafka spent their time making programs for life [*programmes de vie*]. Programmes are not manifestos – still less are they phantasms, *but means of providing reference points for an experiment which exceeds our capacities to foresee.* (Deleuze and Parnet: 2002: 47–8; emphasis in original)[2]

What, then, are the coordinates of resistance? They are the 'reference points for an experiment that exceeds our capacities to foresee', and it is by way of such reference points, such protocols, that we may move from the present toward the future. It is worth noting that in *Anti-Oedipus*, something of this experimental spirit is invoked indirectly in Deleuze and Guattari's remarks about utopias. The elaborate plans, structures and proposed institutions of utopian thinkers are not maps of achieved perfection. Rather, they say,

> the great socialist utopias of the nineteenth century function . . . not as ideal model but as group fantasies – that is, as agents of the real productivity of desire, making it possible to disinvest the current social field, to 'deinstitutionalise' it, to further the revolutionary institution of desire itself. (Deleuze and Guattari 1983: 30–1)

As they remark at another point in their text, 'if we must still speak of utopia in this sense, à la Fourier, it is most assuredly not as an ideal model, but as revolutionary action and passion' (Deleuze and Guattari 1983: 63).[3]

And now my fourth question: what is a people to come? In the concluding paragraph of *What Is Philosophy?*, Deleuze and Guattari offer an image of philosophy, science and the arts as brains submerged in chaos. And in this submersion, they say, 'it seems that there is extracted from chaos the shadow of the "people to come" in the form that art, but also philosophy and science, summon forth: mass-people, world-people, brain-people, chaos-people' (Deleuze and Guattari 1994: 218). In *Essays Critical and Clinical*, Deleuze says that the people to come is

> a minor people, eternally minor, taken up in a becoming-revolutionary. Perhaps it exists only in the atoms of the writer, a bastard people, inferior, dominated, always in becoming, always incomplete. *Bastard* no longer designates a familial state, but the process of drift of the races. I am a beast, I am a Negro of an inferior race for all eternity. (Deleuze 1997: 4)

The ultimate aim of literature, says Deleuze, 'is to set free . . . the creation of a health, [the] invention of a people, that is, a possibility of life' (Deleuze 1997: 4). We might note that the 'people to come' is in

many ways a version of the 'subject-group' of *Anti-Oedipus*, 'a group whose libidinal investments are themselves revolutionary' (Deleuze and Guattari 1983: 348).

The people to come, then, seems to be simply resistance that initiates group becoming toward an unknowable future. In this regard, any actually fully formed 'people' would seem to be a utopian collectivity, and the process of resistance a movement toward an impossible goal. Perhaps no one has more vociferously and thoroughly made the case for such a reading of the concept of the people to come than Philippe Mengue, and his critique is worth examining in detail, since it reveals many of the ways in which Deleuze's thought is often misconstrued.

Mengue finds a decidedly anti-democratic strain in Deleuze, which he attributes to a latent leftist radicalism and an aristocratic scorn for the masses. Micropolitics, he asserts, 'risks sinking into a pragmatic vitalism of subversion, which encloses micropolitics in an avant-gardism that is nothing more than the last burst of an exhausted modernism' (Mengue 2003: 203). In this view, micropolitics proves to be a rejection of the realm of true politics, which is one of *doxa*, negotiation and compromise. The 'radical dissidence' of Deleuzian micropolitics, claims Mengue, 'leads to the impasse of the retreat of the political, and, finally, to the abstract and indeterminate retreat into the vain and utopian waiting for a Revolution and a "people to come"' (204). What Deleuze seeks is a 'metapolitics' above the messiness of genuine politics, a collectivity that is a '*totality* which is in principle' incapable of 'any possible realization', a human community that is 'radically new (whatever the form one attributes to it), in which humans would be "other" (desire for an "other" human) because they would lead an "other life", in an "other society" (one of total and faultless peace, justice, liberty and equality)' (192; emphasis in original). This is what Deleuze seeks when he calls for a 'new earth' and a 'new people'.

Deleuzian micropolitics, nomadism, the untimely Event, resistance to the intolerable, the people to come – all, in Mengue's reading, are symptoms of an unconscious idealism and a scorn for the unavoidable imperfections of genuine politics. What Deleuze refuses to recognise is 'the undeniable fact that the juridico-political order is *forever situated in the impossibility of fully satisfying human desire as such*' (Mengue 2003: 193; emphasis in original). Given the inherent constraints of the political, Mengue judges democracy to be the best system for conducting politics. The political is by nature a domain of opinion, and the best one can hope for in any political system is 'a little *solidarity* and *consensus* concerning what needs to be done, here-now' (52; emphasis

in original). Deleuze's contempt for *doxa* and discussion constitutes contempt for democracy, since in the democratic public space, opinions are put forward, discussed, critiqued, reformulated, amalgamated in compromised formulations, and once temporarily formed, left open to an endless process of future discussion. This *is* the thought of the *polis*, in which 'opinions become *views* to discuss, their authors become *friends* or citizens' (53; emphasis in original). Such friendship is not formed to seek 'knowledge or truth, but for something that is also beautiful, and which requires wisdom – friendship that links and creates harmony in disharmony itself, "discordant harmony" ["*l'accord discordant*"], not among the faculties of the mind, but among humans and their opinions' (54). A true understanding of politics and democracy shows that 'political *doxa* can be "right." Granted, not "true" or even "remarkable" (even if it might prove to be so eventually), but acceptable, allowable – at a given moment for a given assembly or community' (56).

Ironically, democracy is the most fully Deleuzian of politics, claims Mengue. 'Democratic politics alone is without foundation, because it is the only possible logic in the fact of the plurality and rivalry of opinions and political actions' (Mengue 2003: 47). Deleuze's antipathy toward democracy betrays a hidden longing for the foundation of a stable, ideal political order. Mengue concurs with Deleuze that thought is a confrontation with chaos, but chaos, for Mengue, is a gap, lack, the void. 'Philosophical thought, in its ultimate dimension, never ceases to think about chaos, to think about its *gap* (*béance*)' (198; emphasis in original). What characterises democracy is that it explicitly takes into account what Mengue calls '*the hole* [*trou*] *of the political*' (199; emphasis in original). What is fundamental in democracy is

> the clear and explicit consciousness – and which is said, and never ceases to be said in all tones, from lamentation to exaltation – of its absence of foundation. Democracy is the only political form in which power is 'sworn to remain in search of its foundation.' It goes forth from an absence, a lacuna in *knowledge*. (Mengue 2003: 199; emphasis in original)

Deleuze retreats from this absence and instead posits a counter-absence, the missing people (*le peuple qui manque* – literally, the people who 'lack', who 'are lacking'). The people to come, then, is for Mengue nothing more than an attempt to fill this lack and thereby put an end to genuine politics, which must permanently deal with its own constitutive lack.

Mengue is correct that Deleuze speaks disparagingly of democracy, especially late in his life. He also consistently declares war on all

forms of *doxa*, and he frequently admits that he despairs when others ask him to 'discuss' philosophical issues. But it is not at all certain that Deleuze's critique of democracy signals a total rejection of the concept itself; rather, his critique is directed against democracy as it is practiced in the West. The polemical and perhaps exaggerated tone of his remarks – most often proffered in interviews, a venue that seeks a wider audience than that of professional philosophers alone – is meant to counter the complacency and self-satisfaction implicit in standard political discourse in contemporary democracies. Likewise, his critique of *doxa* is a critique of the commonplace, that which goes without saying, the thoughtless, mindless slogans of received wisdom. What Mengue labels 'opinion' is much broader than that, and there is no indication that Deleuze rejects the exchange and mutual examination of serious views about politics and the political. He despairs of 'discussion' because discussion all too often is a matter of egotistical combat, an effort to defeat the opponent in a battle of fixed commitments and positions. In that sense, discussion is the opposite of exchange and cooperative interaction, a mere contestation of competing ideologies, fixed forms of *doxa*. Throughout his work, Deleuze shows a willingness to examine others' ideas, and he welcomes exchange that might lead to the emergence of something new. Deleuze embraces interaction with others in the form of 'interference' and 'intercession',[4] which could easily been seen as types of discussion (in Mengue's broad sense of the term). Such interference and intercession aim at 'resonance' among forces and the emergence of new truths via the 'powers of the false' (Deleuze 1995: 125–6). Deleuze nowhere suggests that processes of interference, intercession, resonance and exchange cannot take place in the domain of the political. And despite the apparent utopian aura of the term 'people to come', such a people, I believe, is ultimately not one that has reached the perfection of an ideal society – whether that of total liberty, equality, benevolence, harmony or justice.

There is certainly something of an anarchic strain to Deleuze's concepts of nomadism, the war machine and becoming. But he insistently reminds us that deterritorialisation and reterritorialisation always occur ceaselessly and simultaneously. Further, he recognises the dangers of unbridled deterritorialisation. Absolute deterritorialisation is the leading edge of innovation and creativity, but it must be engaged with caution, not with mindless and total abandon. Mengue's characterisation of chaos as lack, gap or absence is not Deleuze's. For Deleuze, chaos is plenitude, but a fullness that perpetually issues forth in temporary and provisional forms of organisation. Chaos's absolute deterritorialisation

is inseparable from processes of reterritorialisation, and such reterritorialisations themselves oscillate between movements toward relative deterritorialisation and returns to homeostatic forms. As Simondon argues, the ubiquitous process of nature is that of individuation, an actualisation of metastability in locally stable entities, those entities themselves simultaneously sustaining elements of metastability that make them vital, living and changing entities. Chaos and its differentiation are immanent and inextricable, and the becoming of the world is always a liminal phenomenon, at the interface of absolute chaos and the restricted chaos of half-stable, half-metastable processes of individuation. Thought, for Deleuze, is like the cosmos, 'at the edge of chaos', as Jeffrey Bell (2006) aptly puts it. When Deleuze and Guattari say that thought must confront chaos, it is not in order to vanquish chaos, but to delineate a plane of consistency that makes chaos productive and usable, a force of creativity. The invention of a people to come entails an engagement with a chaotic plane of consistency, and when viewed exclusively in terms of its movement toward the new, it seems anarchic. But just as thought aims at creating concepts, so the invention of a people to come is directed toward something that is not absolutely chaotic and anarchic, toward some form of collectivity that is simultaneously metastable and temporarily stable, always engaged in processes of negotiation, dissolution and reformation.

It must also be granted that Deleuze and Guattari's call for the creation of a 'new earth' and a 'new people' has a millennial aura about it, but such newness need not be ideal, simply better than what we have at present. Ian Buchanan makes a useful distinction between utopia as a process and utopia as 'a place, a mythical island in an unknown sea' (Buchanan 2000: 164),[5] a distinction that Eugene Holland has framed as an opposition between 'utopia as a fixed "product"' and 'what may be called "utopianism as a process"' (Holland 2006: 217), both arguing that Deleuze and Guattari advocate the latter rather than the former. By maintaining the designation 'utopian' in characterising this process, Buchanan and Holland establish a degree of continuity between Marxist and leftist traditions of thought, a continuity that is suggested in *What Is Philosophy?* when Deleuze and Guattari say that philosophy's effort '*to summon forth a new earth, a new people*' is 'closer to what Adorno calls "negative dialectics" and to what the Frankfurt School called "utopian"' (Deleuze and Guattari 1994: 99; emphasis in original), and when Deleuze and Guattari affirm Ernst Bloch's distinction between 'authoritarian utopias, or utopias of transcendence, and immanent, revolutionary, libertarian utopias' (100).

(Buchanan and Holland's notion of utopianism as process, in fact, seems roughly equivalent to Bloch's 'immanent, revolutionary, libertarian' utopianism.) What Buchanan and Holland emphasise is the initial phase of the emergence of new possibilities for life through resistance to the present and 'the *diagnosis* of becomings in every passing present' (Deleuze and Guattari 1994: 113; emphasis in original), a phase that is undoubtedly central to Deleuze and Guattari's thought, but one that can easily be misconstrued as simply anarchistic and a nostalgic remnant of Deleuze and Guattari's immature May 1968 radicalism (which is Mengue's reading of this phase).

In a trenchant and extended critique of Mengue, Paul Patton proposes an argument in line with my own, remarking that Deleuze and Guattari's 'political philosophy is not so utopian that it is completely disconnected from the normative and conceptual horizons of the present' (Patton 2010: 162), for which reason Patton, in another essay, adopts Rawls's distinction between an 'extravagant utopianism' and a 'realistic utopianism', arguing that Rawls's advocacy of a realistic utopianism is one shared by Deleuze and Guattari (186).[6] Patton systematically demonstrates that Deleuze's negative assessments of democracy are not expressions of a fundamental antipathy to the broad concept of democracy as 'a form of society characterized by the absence of class or caste privilege and by the implementation of the egalitarian principle of the equal worth of individuals such that no person's life, beliefs, or values are inherently worth more than those of anyone else', nor necessarily to a narrow sense of democracy as 'a form of government in which the governed exercise control over governmental bodies and their policies, typically through regular and fair elections' (164). Patton demonstrates that it is on the basis of such a broad conception of democracy that Deleuze formulates his critique of contemporary democracies, which claim to be democratic in both senses of the word, but which in fact are neither. Patton concedes that 'the Deleuzian theory of micropolitics is only a partial account of the process of political decision making', but such incompleteness does not indicate antipathy, 'and there is no reason to suppose that Deleuzian theory proposes an alternative rather than a supplement to democratic political theory' (167). In a parallel fashion, Patton rebuts Mengue's claim that Deleuze's critical remarks about 'human rights' express a blanket hostility to the normative principles of fairness and justice purportedly endorsed in the concept, but claims instead that Deleuze is critiquing the function of the term 'human rights' in contemporary discourse as well as the ways in which this concept purportedly is implemented.

What is crucial in Patton's analysis is that Deleuze's critiques are not to be taken as endorsements of lawlessness and anarchy. Deleuze focuses on the failures of contemporary governmental and judicial institutions and on philosophy's task of critiquing those institutions and initiating a process of 'thinking otherwise'. Deleuze does not address broad questions of the means whereby justice and equality might be actualised, and it is for this reason that Patton proposes that we extend Deleuze's analysis and consider the general institutional conditions under which the fundamental principles of justice and equality might be articulated. Put bluntly, Deleuzian political philosophy should be seen as an endorsement of democracy and a justice which may be actualised through a proper use of law.[7] Patton's effort to extend and complete Deleuzian political analysis, in my judgement, is an attempt to answer the oft-posed question: what do we do if the revolution succeeds? What do we do if a becoming results in something approaching an actual 'people', a viable collectivity? A key to approaching these questions is to recall that Deleuze characterises the invention of a people to come not simply as a becoming-minor of resistance, but also as the invention of alternative modes of existence, new possibilities of life (Deleuze 1997: 4).

Clearly, if we want to theorise further about a different collectivity, we must rethink the notion of such a people as merely an accursed race defined by resistance. Were this characterisation of the people to come the sole means of describing this collectivity, the concept might well be construed as one that is defined from without. An accursed race, as constituted by the sanctioned, dominant race, and the centrality of resistance invite a conception of the people to come as solely a people *against* something. All of this smacks of Hegelian negation and even of Nietzschean *ressentiment* and the negative Will to Power. We must also reject any idealistic conception of the people to come, in which universal harmony prevails and the rule of consensus puts an end to any genuine politics. In *Anti-Oedipus*, when Deleuze and Guattari discuss 'subject groups', they cite with approval Jean-Pierre Faye's assertion that in genuinely revolutionary groups, 'What counts, what is effective in our opinion, is not such and such a group, but rather the dispersion or the Diaspora produced by their splinterings *éclats*', a position they see as asserting 'the necessarily polyvocal character of subject-groups and their writing' (Deleuze and Guattari 1983: 349). 'Subject-groups' possess heterogeneous desires, since collectivities are multiplicities, not aggregates that form an amorphous mass (like the fascist mobs that so fascinated and frightened Canetti in *Crowds and*

Power [1984]).[8] If indeed collectivities are heterogeneous multiplicities, then they must incorporate genuine differences, that is, differences that make a difference, and hence differences that signal conflict and the need for resolution or some form of mutual accommodation of differing interests and desires. The people to come, in short, will be a people perpetually generating differences, potential asymmetries of power, and sites of resistance for those who find themselves faced with the intolerable. The means whereby differences are negotiated, we hope, will be better than those currently in effect. No matter what social order emerges in a process of becoming, there will be a politics of the future, and that politics will not be defined from the outside, but from within the people to come *as that people continues its becoming*.

This is where I find Octavia Butler's fiction helpful. Science fiction is above all other genres primarily a literature of the future. Dystopian fiction is always set in a near future, and speculative fictions of various sorts, utopian or not, are generally set in a future time. This holds true for Butler's works as well. She endorses the common view that science fiction 'uses science, extrapolates from science as we know it to science as it might be[,] to technology as it might be' (Butler 2010: 84). But her speculations take a specific form that is especially germane to our concerns. She recalls in one interview that

> when I was in my teens, a group of us used to talk about our hopes and dreams, and someone would always ask, 'If you could do anything you wanted to do, no holds barred, what would you do?' I'd answer that I wanted to live forever and breed people – which didn't go over all that well with my friends. (Butler 2010: 18)

In fact, all of Butler's fiction is directed toward the invention of a people to come. When asked in another interview if she tries to create new types of communities in her writings, she replies, 'I'd say more that I don't try to create communities; I always automatically create community' (Butler 2010: 111). And those communities often literally involve new people – hybrids, genetic alterations, parasite-induced mutations, and so on.

The five-novel Patternmaster Series spans several centuries, from the late-eighteenth century to some distant, undesignated future.[9] The first novel tells of Doro, a four thousand year-old Nubian mutant who has gained the power of immortality, but only at the cost of inhabiting a succession of human bodies and discarding their empty, dead shells when he enters a new body. He has undertaken a eugenics project to breed other mutant beings with exceptional powers, and in the course of

his wanderings he has encountered Anyanwu, a central-African woman who has lived for four hundred years, healing others and maintaining a rejuvenated form without possessing other bodies. She comes under the sway of Doro and becomes part of his breeding programme. In the second novel, which takes place in the twentieth century, successful mutant humans are finally created, and they develop 'the pattern', a psychic force field that greatly enhances the powers of all its participant members. Doro tries to maintain control of the pattern, but in a struggle with his daughter he is defeated and killed. In successive generations, the pattern masters sponsor journeys to other planets, and following one such expedition a returning astronaut brings an alien virus that genetically alters its human hosts and induces mutant offspring whose appearance combines human, feline and porcine characteristics in an otherwise monstrous form. These mutant becomings-animal are labelled 'Clayarks', and their characteristics seem those of pack animals with intuitive intelligence and territorial aggressivity. In the concluding novel (actually the first one written) set in the distant future, the established order consists of a feudal aristocracy of pattern masters, the servant class of humans who are totally dominated by the mind control of the pattern masters, and the feral Clayarks who roam the wilds outside patternist settlements. This, then, is the ultimate configuration of the series' 'people to come'.

Butler's two Parable novels, *Parable of the Sower* (1993b) and *Parable of the Talents* (1998), are at once her most dystopian and most utopian fictions. Set in the near future of a collapsed American society, the novels envision a world of ecological degradation, technological breakdown and widespread poverty and drug addiction. Gated communities have become walled fortresses surrounded by masses of homeless derelicts, most of whom are desperate, many violent, and some addicted to substances like 'pyro', a designer drug that went out of control and created humans who gain intense sexual pleasure from setting fires and especially from incinerating other humans. The teenaged heroine, Lauren, must flee when her walled enclave is overrun, and throughout the first novel she walks the interstate highway I-5 (now only used by pedestrians) from Los Angeles to northern California. Along the way, she gathers other survivors and brings them together through her self-generated personal religion, Earthseed, in which she teaches two basic lessons: first, that 'God is change', and that being shaped by and shaping God are the sole means of becoming-other in a productive fashion in this new world; and second, that our species' destiny is to inhabit other planets. Eventually, she and her incipient community, which she

consistently calls 'her people', settle in a secluded part of northern California, and there they form the community of Acorn, something like a communal collective. In the second novel, fundamentalist Christian paramilitary forces raid Acorn, kill most of its inhabitants, and enslave the surviving women via 'slave collars' that induce powerful, debilitating electrical impulses at the first sign of resistance to their captors. Lauren stages a successful revolt, and the inhabitants of Acorn flee and disperse. She learns that spreading the movement of Acorn cannot proceed via the proliferation of isolated communal settlements, but must focus on the ideas of her religion, since the spread of ideas is much more difficult to control than the physical spread of concrete bodies, and since the specifics of Acorn's socio-economic organisation are subordinate to the ultimate goals of the religion. Eventually she succeeds in forming a broad network of community groups of various kinds, many of them integrated into urban environments and partially enmeshed in capitalist market institutions. The movement gains economic power, helps fuel widespread economic recovery and the restoration of a modicum of socio-political cohesion on the continent of North America, and achieves a certain institutional prominence and autonomy. At this stage, the 'people to come' are no longer practitioners of a counter-capitalist communal socio-political culture, but exponents of the religion of Earthseed, and with economic success they are able to begin the pursuit of their ultimate goal: to leave earth and colonise other planets. Lauren's initial inspiration in formulating this component of the Earthseed project was the belief that humans can only form a viable community by uniting in a collective cause that leads to struggle against an alien and challenging environment. Hence, the community of the people to come issues in a creative line of flight, but that line of flight is to other worlds, since humans cannot coexist peacefully on this world alone – a conclusion which, for those of us condemned to remain on earth, signals a decidedly non-utopian future.

Butler's masterpiece, the *Xenogenesis Trilogy*,[10] provides the fullest and most intriguing account of various becomings, the invention of a new people, and the establishment of alternative modes of existence and possibilities of life. After a global nuclear holocaust, a small number of humans have survived in suspended animation, thanks to the intervention of an alien species called the Oankali, who have saved the humans and gradually detoxified the earth for recolonisation. The Oankali, who call themselves genetic 'traders', search for interesting life forms, and when they find them, engage them in the collective procreation of hybrid organisms. The Oankali have three sexes: male,

female and ooloi, the ooloi being a definite 'it', not some male–female combination. The Oankali have saved the humans in order to mate with male and female humans in pentads of a human male and female couple, an Oankali male and female couple, and one Oankali ooloi. Each ooloi, by combining the genetic materials of the human and Oankali couples, and then manipulating those materials through use of its vast, cosmic stock of genetic materials gathered by generations of ooloi on countless planets and preserved in the ooloi's special organ called its Yashi, fashions human-born and Oankali-born 'constructs' who then go on to produce further iterations of a new, hybrid people. The first novel recounts the initial resuscitation of humans and the formation of pentads for settlement on earth. The second and third novels trace the development of Oankali family units and construct children on earth.

Many readers have seen the Oankali as utopian beings. They value life and embrace difference. They naturally heal, their relationships are nurturing, they cannot cause pain without feeling that pain themselves, their connections to the environment are all-embracing and ecologically sound, and they govern the collectivity through consensus. Yet others have argued that the Oankali are insidious beings, one critic labelling them symbols of neoliberal capitalist globalisation. They embrace difference, but in Oankali constructs the organelle that inhabits every cell of the Oankali (the word 'Oankali' is also the name of that organelle) is present in every construct cell as well. The Oankali only *seem* to surrender their identity. Whatever hybrids they fashion continue to have a fundamental Oankali identity. They are like global capital, capable of embracing everything and assimilating it within the capitalist machine. Disturbing as well is the human–ooloi relationship. The ooloi injects its 'ooloi substance' when in contact with humans, and that substance, while deeply pleasurable and healing, also is intensely addictive, and it makes the human male and female incapable of physically touching one another. The entirety of Oankali culture is based on neurochemical bonding, and their consensus only occurs because of those bonds. Unlike the familial bonds of humans, the Oankali bonds preclude conflict among males. No male, female or ooloi need fear that a partner will be taken, since the ooloi has chemically marked the couple as its own. Hence, the political order of the Oankali, humans and constructs is one of consensus and non-violence, but made possible only through addiction and the deep control of ooloi intermediaries.

In all of Butler's novels, she invents a people to come. In each case, new modes of existence and possibilities of life are delineated. But in all of them, politics continues. The new possibilities are not

necessarily better, just different. The socio-political structures include versions of primitive collectivism, family-centred social networks, feudal class relations, master–slave institutions and international ecumenical movements. If we add to the mix the world of Butler's last novel, *Fledging (2005)*, we would have examples of tribal cultures, matrilineal and patrilineal settlements, and mixtures of polyandry and polygamy with various forms of homo- and heterosexual alliances. Each novel is a form of experimentation, an investigation of the possible outcomes of becoming-other and thereby creating a people to come. As experimentation, each novel introduces a protocol, a '*means of providing reference points for an experiment which exceeds our capacities to foresee*'. This I regard as an important positive function of science fiction, one way in which art renders concrete the realm of the possible. In this way, fiction promotes the thought of a people to come as something that actually might take any number of definite forms, and perhaps may assist us in *our* attempts to imagine, invent and enact alternative modes of existence, new possibilities of life.

Notes

1. In *Spaces of Hope*, David Harvey makes a useful distinction between 'the utopianism of social process' and 'utopias as spatial form'. If there is a utopian strain in Deleuze (and, with sufficient qualification, one could say that indeed there is), it would be such a 'utopianism of social process'. See especially Harvey 2010: 164–81.
2. In the second essay of *Essays Critical and Clinical*, 'Louis Wolfson; or the Procedure [*procédé*]', Deleuze assigns a negative connotation to the word 'protocol', opposing it to the term 'procedure'. Deleuze's essay is devoted to two books by the schizophrenic Louis Wolfson, *Le Schizo et les langues* and *Ma mère musicienne est morte*. Deleuze is fascinated by the mental gymnastics Wolfson performs in transforming words via various foreign languages in order to defend himself from malignant influences in his environment. Deleuze argues, however, that Wolfson, unlike Raymond Roussel and Antonin Artaud, is not an artist in his linguistic experimentation. 'Wolfson's book, however, is not a literary work, and does not claim to be a poem. What turns Roussel's procedure into a work of art is the fact that the interval between the original sentence and its conversion is filled with marvelously proliferating stories, which make the starting point recede until it is entirely hidden … But there is nothing similar in Wolfson: between the word to be converted and words of the conversion, and in the conversions themselves, there is nothing but a void, an interval that is lived as pathogenic or pathological … The transformations never reach the grandiose level of an event, but remain mired in their accidental circumstances and empirical actualizations. The procedure thus remains a protocol. The linguistic procedure operates in a void, and never links up with a vital process capable of producing a vision' (Deleuze 1997: 10–11). It is worth noting that in the original version of 'Louis Wolfson; or the Procedure', which Deleuze published as a preface to Wolfson's *Le Schizo et les langues* (1970) and titled

'Schizologie', no such distinction between 'protocol' and 'procedure' exists. In the opening paragraph of the original preface, Deleuze says that 'One of the great originalities of this book is that it sets forth a protocol of experimentation or activity' (this sentence is retained in the 1993 version of the essay). But Deleuze clearly is simply offering a synonym for 'procedure' when he speaks of Wolfson as a practitioner of 'a protocol of experimentation or activity'. Only in 1993 does Deleuze make use of that opening sentence later in the essay to contrast protocols and procedures (and the sentence contrasting the two is the only sentence in the 1993 essay that addresses that distinction). Clearly, 'protocol' was a positive term for Deleuze in 1970, and it remained so in the 1977 text of *Dialogues*, where 'protocol' is treated as a synonym of 'process' ['*procès*, a cognate of *procédé*']. (We might note that the words *procès*, *processus* and *procédé* appear frequently in Deleuze's works, and often in related if not interchangeable ways.)

3. At two points in *Anti-Oedipus*, Deleuze and Guattari come close to embracing the term 'utopian' themselves. In the first, they cite with approval an extended passage from Pierre Klossowski, praising him as the philosopher who has most fully described the schizoid dimension of desire, 'but still within the category of an active utopia' (Deleuze and Guattari 1983: 367–8). At another point, they pose the rhetorical question, 'In what sense does the schizoid investment constitute . . . a real investment of the sociohistorical field, and not a simple utopia?' (Deleuze and Guattari 1983: 367). In my judgement, however, these passages still indicate an underlying resistance to adopting the term 'utopian' to describe their own position.
4. In *Negotiations*, where Deleuze elaborates on the concept of 'intercessors' (translated as 'mediators' by Joughin), Deleuze introduces the concept by saying, 'The important thing has never been to accompany the movement of one's neighbor, but to make one's own movement. If no one begins, no one budges. Interferences are also not exchange: everything takes place through gift or capture' (Deleuze 1995: 125, translation modified). For some reason, Joughin renders '*Les interférences*' as 'interplay', which obscures an important element in Deleuze's concept of intercession. Intercession and mediation can easily be thought of as relatively peaceful, cooperative activities, whereas interference suggests, if not violent opposition and conflict, at least a meeting of different forces that is less than irenic. The addition of 'interference' to 'intercession' counters the tendency to read intercession as a utopian process. Likewise, Joughin's decision to translate '*capture*' as 'taking' tends to reduce an agonistic process to a gentler form of interaction. Finally, Joughin's choice of 'giving and taking' as equivalents of 'gift and capture' obscures Deleuze's implicit reference to traditional cultures (termed 'primitive' in *Anti-Oedipus*), in which entities pass from one individual according to the logic of the gift, as delineated by Marcel Mauss, or through capture in war, as well as Deleuze's allusion to the Nietzschean master's affirmative will to power in *The Genealogy of Morals*, a will that proceeds via the donation of value.
5. One of the more insightful aspects of Buchanan's *Deleuzism* is the correlation he draws between the utopian strain in Deleuze and Guattari and the concept of utopia developed by Fredric Jameson (see Buchanan 2000: 164–9). Buchanan also provides incisive commentary on the utopian dimension of *Anti-Oedipus* in *Deleuze and Guattari's Anti-Oedipus: A Reader's Guide* (2008; see especially pp. 124–32.)
6. Both Holland and Patton cite Deleuze and Guattari's statement in *What Is Philosophy?* that 'The word utopia therefore designates *that conjunction of philosophy, or the concept, with the present milieu*' (Deleuze and Guattari 1994: 100), but neither includes the parenthetic remark that completes the

sentence: '*however, in view of the mutilated meaning public opinion has given to it, perhaps utopia is not the best use of the word*', and neither makes use of Deleuze's remark in *Negotiations* suggesting that utopia be replaced by the concept of 'fabulation'. I do not see this as an oversight or a mistake, however. Deleuze and Guattari make frequent reference to fabulation in Chapter Seven of *What Is Philosophy?*, which concerns the arts, whereas the comments on utopia occur in the Fourth Chapter, 'Geophilosophy', which is focused on philosophy. In *What Is Philosophy?*, Deleuze and Guattari emphasise the qualitative differences between philosophy and the arts, which suggests, I believe, that even though 'utopia is not the best word' in philosophy or the arts, the concept of fabulation should replace that of utopia only in the arts, and that some other, never specified term might be used instead of 'utopia' in philosophy. Since Deleuze and Guattari never provide such a term, it seems reasonable to propose such terms as 'utopia as process' or 'realistic utopia' as means of delineating the bad use of 'utopia' from those more in keeping with Deleuze and Guattari's non-idealistic, processual conception of utopian change.

7. Laurent de Sutter makes a related argument in his *Deleuze: La Pratique du droit* (2009). De Sutter differentiates between a critical and a clinical conception of law in Deleuze, the former generating Deleuze's frequent critiques of law, the latter, only vaguely sketched late in Deleuze's career, suggesting the possibility of a positive conception of law. De Sutter argues that Hume's conception of institutions as vehicles for the establishment and expansion of social relations, which Deleuze discusses in his early *Expression and Subjectivity: An Essay on Hume's Theory of Human Nature*, is implicit in Deleuze's endorsement of jurisprudence, which de Sutter glosses as a positive mode of expanding the sphere of law in ways that promote genuine equality and fairness. See especially pp. 63–106.
8. Hardt and Negri distinguish among a 'people', which 'has traditionally been a unitary conception'; the 'masses', which, while being 'composed of all types and sorts', within which 'all differences are submerged and drowned'; and the 'multitude', which 'is composed of innumerable internal differences' (Hardt and Negri 2004: xiv). My reading of Deleuze's 'people to come' is in accord with Hardt and Negri's 'multitude'.
9. The volume *Seed to Harvest* (1993a) contains four of the five Patternist novels. The fifth, *Survivor* (1978), is the one work Butler has expressed displeasure with, for which reason she chose to omit it from *Seed to Harvest*. (In my view, Butler's evaluation of the novel is unnecessarily harsh, and in fact, the novel is equally as interesting and engaging as the other works in the series.)
10. The three novels of the trilogy – *Dawn* (1987), *Adulthood Rites* (1988) and *Imago* (1989) – have been reprinted in a single volume, titled *Lilith's Brood* (1989).

Flashforward: The Future is Now

Patricia Pisters University of Amsterdam

Abstract

In *The Future of the Image* (2007) Jacques Rancière states that the end of images is behind us. He argues for an aesthetics of the image that acknowledges the continuing power of images as educating documentations of traces of history, as directly affecting interruptions, and as open-to-combining signs of the visible and the sayable ad infinitum. But does Rancière's claim also concern the future of cinema? His cinematic references, in a Deleuzian sense, are mostly to modern time-images. Is the future of film indeed a form of the time-image, or has the 'heart' of cinema moved beyond this image-type? This paper proposes to look at a third category of cinematographic images, based in the third synthesis of time as developed by Deleuze in *Difference and Repetition*. This filmic image, that could be called the neuro-image, is connected to the impure regime of images typical for the database logic of the digital age. By comparing Alain Resnais's *Hiroshima Mon Amour* (1959) to the television series*FlashForward* (2009), I will analyse the temporal operations of the image of the time-image to these images of a new regime of images, the image of and from the future.[1]

Keywords: time-image, neuro-image, brain is screen, database logic, flashback, flashforward, future of the image

I. The Death of the Image is Behind Us

Starting with the observation that 'a certain idea of fate and a certain idea of the image are tied up in the apocalyptic discourse of today's cultural climate', Jacques Rancière investigates the possibilities of 'imageness' or the future of the image that can be an alternative to

Deleuze Studies Volume 5: 2011 supplement: 98–115

www.eupjournals.com/dls

the often heard complaint in contemporary culture that there is nothing but images, and that therefore images are devoid of content or meaning (Rancière 2007: 1). This discourse is particularly strong in discussions on the fate of cinema in the digital age, where it is commonly argued that the cinematographic image has died either because image culture has become saturated with interactive images, as Peter Greenaway argues on countless occasions (see for instance, Greenaway 2007 and 2010), or because the digital has undermined the ontological photographic power of the image but that film has a virtual afterlife as art (Rodowick 2007). Looking for the artistic power of the image, Rancière offers in his own way an alternative to these claims of the 'death of the image'. According to him, the end of the image is long behind us. It was announced in the modernist artistic discourses that took place between Symbolism and Constructivism between the 1880s and 1920s. Rancière argues that the modernist search for a pure image is now replaced by a kind of impure image regime typical for contemporary media culture.

Rancière's position is free from any technological determinism when he argues that there is no mediatic or mediumistic catastrophe that announces the end of the image. The qualities of an image do not depend on the fact that they are seen on a canvas, a cinema screen, a television set or computer window. For Rancière there is a certain imageness (that can even be evoked by words) that continues to influence our perception and understanding. Rancière defines the cinematic images in particular as a manifestation of 'operations that couple and uncouple the visible and its signification or speech and its effects, which create and frustrate expectations' (Rancière 2007: 5). Images on the one hand refer to reality, not necessarily as a faithful copy, but as to what it suffices to stand for. And then there is also the interplay of operations between the visible and invisible, sayable and unsayable, an alteration of resemblance and dissemblance which is the way by which art constructs images that have affective and interrupting power. Rancière argues that (filmic) images in our museums and galleries today can be classified in three major (dialectically interrelated) categories according to the dominant type of operations: the naked image, the ostensive image and the metaphorical image.

Naked images are those images that do not constitute art, but which testify to reality and trace history; they are images that primarily witness and testify. Ostensive images are images that also refer to reality but in a much more obtuse way, in the name of art, with dissemblances that perform an operation on reality. The final category of images, the metaphorical ones, follow a logic that makes it 'impossible to delimit

a specific sphere of presence isolating artistic operations and products from forms of circulation of social and commercial imagery and from operations interpreting this imagery' (Rancière 2007: 24). These are images that employ various strategies (play, irony, metamorphosis, remixing) to critically or wittily interrupt and join the media flow. Taken together, these image-types constitute the operational power of the image in contemporary culture, while the last category especially seems to indicate the dominant impureness of the new image regime. It is the last category that is relevant for discussing the future of the image as a third type of image in a Deleuzian sense. But this is in fact a flashforward of what will come later in this paper.

First, I should like to address a problem that seems to be hidden in the categorisation of the images in respect to the future of the cinematographic image. While Rancière refers to the new image regime of contemporary culture, his filmic examples almost always refer to modern cinema of the sixties, or, to put it in Deleuzian terms, to time-images. And when Rancière speaks of more contemporary cinema, such as the films of Pedro Costa, these films also follow the irrational and crystalline logic of the time-image (Rancière 2011: 137–53). But one can wonder if the 'heart' of cinema today still resides in modern time-images. Of course, time-images exist in contemporary cinema. But is the impurity that Rancière describes as typical for the new image regime really a form of the time-image? A comparison of two 'apocalyptic images', one from the sixties and one from contemporary media culture, might help to investigate this question further.

II. Flashback: The Time-Image Grounded in the Past

First, a flashback to Alain Resnais's *Hiroshima Mon Amour*: not only a classic modern time-image in a Deleuzian sense, but also a film that investigates the (limits of the) power of the image. The famous phrases 'I have seen everything in Hiroshima' and 'You have seen nothing in Hiroshima' indicate the struggle between the visible and its significations that Rancière announces. Considered according to his categories of naked, ostensive and metaphorical images, we can see that on one level the film is a naked image that traces the catastrophic event of the atomic bomb attack on Hiroshima in 1945. In the first instance, Resnais was asked to make a documentary about this apocalyptic event. And some of the images, such as the images in the Hiroshima Memorial Museum, are 'naked' in that witnessing sense. However, *Hiroshima Mon Amour* is not a purely, nakedly documenting image. As Resnais tells in an interview

on the DVD edition of the film (Resnais 2004), he quickly found out he was not capable of making a documentary on this traumatic moment in history. Not finding any solution to transform the disaster into images that would add something to the existing Japanese documentaries and news reels, he asked Marguerite Duras to write a script. During their long conversations, the filmmaker and writer were wondering about the strange fact that while they were talking about Hiroshima, life took its usual course while new bombs were flown over the world. This is how they got the idea to focus on a small-scale personal event, a love story of a Japanese man and a French woman, with the catastrophe constantly in the background.

And so we see how Resnais and Duras render the naked image obtuse, witnessing, but also transforming the image by colliding words (Hiroshima – Amour), bodies (the famous opening sequence of the ash-embracing bodies), seeing and not-seeing ('You have seen nothing in Hiroshima'), countries (Nevers in France, Hiroshima in Japan) and times (the past and the present that start to collapse into each other). I will return to these temporal dimensions of Resnais's film, but at this point it is important to see how this temporal confusion as one of the 'dissemblance' techniques is typical for the artistic ostensive image. As far as Rancière's last image category is concerned, the metaphoric image, it is more difficult to see where Resnais's film intervenes ambiguously in the flow of media images. Even though the images of agonising/loving bodies in 'ashembrace' at the beginning of the film are in themselves images that allow metaphoric (or allegorical) readings, they are not part of the playfully critical artistic and commercial images Rancière ranks under this category (the term metaphoric is perhaps not the most well-chosen in that sense). Therefore, it is fair to say *Hiroshima Mon Amour* moves between naked and ostensive images, but cannot be categorised under Rancière's last category of metaphoric images so typical for today's audio-visual culture. So is the time-image then the most explicit and typical expression of this typical imageness of contemporary culture?[2]

Hiroshima Mon Amour is a time-image in the Deleuzian sense. As is well known, in all his work Alain Resnais is preoccupied with time. Practically all his films present a battle with the ravages of time, with echoes of the past that keep on resonating in the present. *Hiroshima Mon Amour* audio-visually translates the Bergsonian thesis that the past coexists with the present. The love story the French woman has with the Japanese man in 1950s Hiroshima makes her relive her first love affair with a German soldier during the Second World War. The Japanese

man becomes the German lover from the past. She becomes Nevers in France. *Hiroshima Mon Amour* is a crystal of time, which gives us the key to the time-image in general (Deleuze 1989: 69). As Deleuze argues, 'what the crystal reveals is the hidden ground of time, that is, its differentiation into two flows, that of presents which passes and of pasts which are preserved' (98). *Hiroshima Mon Amour* translates the untranslatability of the apocalypse and the unimaginabilities of the traumas of the (collective and individual) past into ostensive images that are fundamentally Bergsonian in their conception of non-chronological time, the pre-existence of a past in general, the coexistence of all sheets of the past and the existence of its most contracted degree: the present. Now, in order to understand the temporal dimensions of the time-image in respect to the future, it is useful to make a connection between the cinema books and Deleuze's philosophy of time as developed in *Difference and Repetition*.

III. Temporal Dimensions in the Passive Syntheses of Time

In chapter 2 of *Difference and Repetition*, Deleuze develops the idea of the passive syntheses of time. As in the cinema books, here too, Bergson is the main reference point, although the starting point of his reflections is Hume's thesis that 'repetition changes nothing in the object repeated, but does change something in the mind which contemplates it' (Deleuze 1994: 70). Repetition has no 'in itself', but it does change something in the mind of the observer of repetitions: on the basis of what we perceive repeatedly in the living present, we recall, anticipate or adapt our expectations in a synthesis of time, which Deleuze calls in Bergsonian terms 'duration'. This synthesis is a passive synthesis, since 'it is not carried out by the mind, but occurs in the mind' (71). The active (conscious) synthesis of understanding and recollection are based upon this passive synthesis that occurs on an unconscious level. Deleuze distinguishes different types of passive syntheses of time that have to be seen in relation to one another and in combination with active (conscious) syntheses. The conception of the syntheses of time is incredibly sophisticated and complicated, which James Williams recently has demonstrated brilliantly (Williams 2011). Here I will only be able to refer to the basic elements of Deleuze's conception of time because it offers the possibility of conceiving the 'future-image'.

The first synthesis Deleuze distinguishes is that of habit, the true foundation of time, occupied by the living present. But this passing present is grounded by a second synthesis of memory: 'Habit is the

originary synthesis of time, which constitutes the life of the passing present. Memory is the fundamental synthesis of time which constitutes the being of the past (that which causes the present to pass)' (Deleuze 1994: 80). Moving to the cinema books, it is possible to argue that the first synthesis of time, habitual contraction, finds its aesthetic expression as movement-images, the sensory-motor manifestations of the cinematographic brain-screen. The second synthesis of time can be related to the dominant form of time in the time-image, where the past becomes more important and shows itself more directly as the ground of time, as the time within which time operates. Time-images are based in the 'pure past' of the second synthesis of time. Now, while arguing that the movement-image is mainly based in the first synthesis of time, and the time-image is predominantly grounded in the second synthesis, this does not mean that the movement-image cannot open up to the second synthesis, even if this does not happen very often. And in the time-image there can be moments that are based in the first synthesis of time. So it is more a matter of a sort of 'temporal keynote' that is different in the movement-image and the time-image. Moreover, each synthesis has its own composition of past, present and future.

So the present that is based in the first synthesis of time is a contracted synthesis, a particular stretch in the present, as with the lovers embracing in *Hiroshima Mon Amour*: 'It's crazy how soft your skin is,' the woman tells the man in the first scene after the long opening sequence when we finally see the lovers in a hotel room that is presented as a little stretch in the present of the film. In difference with that, the present as a dimension of the past (grounded in the second synthesis of time) is the most contracted degree of all of the past, which is the more dominant temporal dimension in *Hiroshima Mon Amour*: the Japanese man becomes the German lover of the past, he becomes Hiroshima, the woman becomes Nevers in France. The present as a dimension of the past is its crystallising point.

But the past also has its own temporal manifestations: as a dimension of the present (in the first synthesis) the past is always related to the present as a clear reference point from which it differs. One can think of the flashback in the most famous impossible love story of the movement-image, *Casablanca*, which constitutes the shared memory of Rick and Ilsa: the recollection of their love affair in Paris which explains the drama of the situation in the present of Casablanca. But in the second synthesis of time, the past is sheets of all of the past that start to float and move, such as the collective and individual pasts in *Hiroshima Mon Amour* that mix up. Or the mosaic of memory snippets in other Resnais films,

such as *Muriel, or the Time of Return* (1963), where memories of the Algerian War of Independence and personal memories of the characters connect in fragmentary and ambiguous ways.

And then there is of course the problem of the future. If we look from the dimensions of the first and second syntheses, the future is expected either from a point in the present, or from the past. Usually, in the first synthesis of time the future as a dimension of the present is an anticipation that departs from the present, an anticipation that in movement-images motivates goal-oriented behaviour, such as the pursuit of happiness in melodrama or the various goals of an action hero. It could also be argued that the future in the movement-image starts after the film ends, such as the 'happily ever after' moment of the wrapping up of classical Hollywood narratives. The future is that which comes after the present of the film has ended. An end that in the movement-image we usually anticipate through genre conventions that give us what we expect.

IV. The Future as Dimension of the Past

In the time-image, the future becomes a dimension of the past. Here it becomes less an anticipation of an action, but the expectancy of a repetition of an event whose outcome is based on the past. Each layer of a coexisting past implies its own possible future. Deleuze mentions Resnais's *Je t'aime, Je t'aime* (1968) as one of the few films that show how we inhabit time. As the poster of the film announces: 'The past is present and future in Alain Resnais's new time machine.' In other words, the present and future are dimensions of the second synthesis of time. *Je t'aime, Je t'aime* is the strange science fiction of a man who has tried to commit suicide after the death of his girlfriend. He survives, collapses into a catatonic depression, and at his release from mental hospital, he is recruited as a guinea pig for a scientific experiment. He is brought to a remote research centre where scientists tell him that their only subject of research is time. They have built a machine, which looks like a giant brain. The idea is that the scientists send him back in time exactly one year (to 5 September 1966 at 4.00 p.m.) for the duration of one minute. Before he enters the brain-machine the man is heavily sedated with drugs that, as is explained to him, make him 'completely passive though still capable of receiving memories'. As if the scientists had read *Difference and Repetition*, they seem to have created a machine for literally travelling into the second passive synthesis of time.

The inside of this machine is soft and lobe-like. The man lies down, sinking into the velvet folds of the brain-machine, and waits for the memories to come to him. The scene to which he returns is at the seaside during a holiday with his girlfriend in the south of France. He is snorkelling and gets out of the water. His girlfriend, who is sunbathing on the rocks near the water, asks him, 'Was it good?' This scene is repeated several times, but always with slight differences and subtle variations, both in the order of the shots within the sequence, its variable beginnings and ends, and the slightly different camera angles and shot lengths. It is as if his brain is looking through a kaleidoscope to see all the possible combinations of the mosaic snippets of memory, possibly looking for a new outcome, a new future perhaps. Another important scene repeated with variations is in a hotel room in Glasgow where the man and his girlfriend are on holiday. This is the moment where she will die because of a leaking gas heater. Was it an accident or not? The memory is not clear and changes slightly each time. The first time, we see the memory of this hotel room scene and the flame of the heater burns. His memory is transformed by his feelings of guilt, and at the last return, we see the flame is extinguished. His future changes accordingly: when this 'memory' arrives, he will die. So the future in this film is a dimension of the past.

In *Hiroshima Mon Amour* there are also futures related to the past. At several instances, it is said that the traumas of war and other disasters will be repeated in the future, which is based on the idea that we have seen nothing, that we will forget, and everything will start all over: '2,000 dead bodies, 80,000 wounded, within nine seconds. The numbers are official. It will happen again,' the woman says in voice-over over images of a reconstructed Hiroshima. Also in the love story, the future is raised as a function of memory and forgetting, as the man says, 'In a few years when I have forgotten you, I will remember you as the symbol of love's forgetfulness. I will think of you as the horror of forgetting.' The woman, too, when she recalls her first love, trembles at the fact that the intensity of such shattering love can be forgotten, and a new love can be encountered again.

It is important to note that in *Hiroshima Mon Amour* everything happens a second time: the unimaginable disaster was repeated in history already in Nagasaki. The impossible love of the Second World War is repeated a second time with another passionate love affair in Japan. Even film history returns as the film recalls, both thematically and stylistically, other impossible love affairs of the cinema: Michael Curtiz's *Casablanca* was already mentioned, but Hitchcock's *Vertigo* can also be recognised.

Not only do Hitchcock and Resnais share the theme of a love affair haunted by the past, but some of the scenes in *Hiroshima Mon Amour* are composed in a strikingly similar way to *Vertigo*. On all levels, we can see in *Hiroshima Mon Amour* a variation of the idea of the future that is based in the past: I will forget you, we will forget (love, war). And it (love, war) will happen again. Repetition and difference, the future as grounded in the past, this is the temporality of *Hiroshima Mon Amour.*

V. The Future as Eternal Return

In *Difference and Repetition* Deleuze also distinguishes another idea of the future, the future as such as the third synthesis of time: 'The third repetition, this time by excess, [is] the repetition of the future as eternal return' (Deleuze 1994: 90). In this third synthesis, the foundation of habit in the present and the ground of the past are 'superseded by a groundlessness, a universal ungrounding which turns upon itself and causes only the yet-to-come to return' (91). In this third synthesis the present and the past are dimensions of the future. The third synthesis cuts, assembles and (re-)orders from the past and the present, to select the eternal return of difference. The third synthesis is the time of (endless) serial variations and remixes of pasts and presents. My basic argument is that contemporary cinema can be understood as a 'neuro-image', cinema predominantly based in the third synthesis of time, and hence has a particular relation to the future. Only the third synthesis can include the first and second syntheses of time. This, as I hope to show, can explain some of the neuro-image's impurity and manifestations in different modes of filmmaking. But let me first return to Deleuze's discussion of the third synthesis of time.

For the development of the third synthesis of time in *Difference and Repetition*, Deleuze does not refer to Bergson any more. Now Nietzsche has become the main reference point. In *The Time-Image* Bergson also seems to disappear at a certain moment in favour of Nietzsche's appearance, though in the cinema book Nietzsche is not *explicitly* connected to the question of time (not to the third synthesis of time, in any case). In the chapter on Orson Welles and the powers of the false (chapter 6 of *The Time-Image*), Nietzsche is an important reference to understanding the manipulating powers of the false. However, they are discussed as a consequence of the direct appearance of time, which is until that moment in *The Time-Image* mainly elaborated in terms of the pure past (all of the past) of the second synthesis of time. At the

end of the discussion of Welles's cinema, the powers of the false are connected to the creative powers of the artist, the production of the new (though not explicitly to the eternal return and the future). The series of time (characteristic of the third synthesis) are also mentioned in *The Time-Image*, especially in the chapter on bodies, brains and thoughts (chapter 8). Here the bodies in the cinema of Antonioni and of Godard's films relate to time as series. In the conclusion of the book Deleuze explains this special chronosign of time as 'a burst of series' (Deleuze 1989: 275). But after all the insistence on the Bergsonian temporal dimensions of the movement-image, the time-image and Deleuze's extended commentaries on Bergson, this form of time remains rather underdeveloped on a theoretical level in *The Time-Image*. Referring to *Difference and Repetition*, we can now understand that the powers of the false and the series of time that can be sensed in some time-images perhaps might belong to the third synthesis of time. We have seen that Alain Resnais's films, *Hiroshima Mon Amour* in particular, are firmly rooted in the second synthesis of time, even when they speak of the future. Is it perhaps possible to find glimpses of the third synthesis of time in Resnais's films, where the images speak *from* the future? As Deleuze suggests at the end of 'The Brain is the Screen', cinema is only at the beginnings of its exploration of audio-visual relations, which are relations of time (Deleuze 2000: 372). This suggests the possibilities for new dimensions of time in the image and perhaps clearer openings to the third synthesis of time.

In *My American Uncle* (1980) Resnais mixes fiction with scientific findings about the brain. Here the genre is less 'science fiction', where scientists invent strange experiments to reveal truths about the nature of time and memory as in *Je t'aime, Je t'aime*, but more a 'docufiction' where French neurobiologist Henri Laborit discusses (in voice-over and in direct address from behind his desk) findings about the workings of the human brain that by and large match with contemporary cognitive neurosciences. Laborit discusses the brain from an evolutionary perspective from which it is possible to distinguish three brains (a primitive, reptile one, which is the brain for survival; a second affective and memory brain; and a third brain, the outer layer or neocortex that allows associations, imagination and conscious thoughts). Throughout the film, Laborit explains how these three layers together in constant exchange with one another, and constantly influenced by others and our environment, can explain human behaviour. These scientific intermezzos are seamlessly connected to the stories of three different characters, who tell and enact their story and whose lives will meet at certain

moments. These fictional stories translate the scientific discourse of the neurobiologist quite literally, sometimes too literally for a contemporary audience. Nevertheless, *My American Uncle* also gives a moving insight into what ultimately motivates the filmmaker, the philosopher and the scientist: to understand more profoundly why we do what we do, and to find ways to improve not only individual destinies but also the fate of humanity.

The last images of *My American Uncle* present a particular political coda to the expositions and dramatisations that went before. This last scene follows directly after we have heard Laborit in voice-over declaring in a future conditional tense that as long as we do not understand how our brain works, and understand that until now it has always been used to dominate the other, there is little chance that anything will change. What follows are images of a travelling camera through a ruined city landscape, and because the words that just preceded these images still resonate in the following sequence, we comprehend that this war-ruined landscape might be understood as an image from the future: the eternal return of the series of war and disaster. The images are in fact from riots in the Bronx in the 1970s, when Resnais filmed them. But the images also immediately remind us of a desolate bombarded Sarajevo and Grozny (still future urban warzones at the time of filming) and Boulogne (the city that heavily suffered during the Second World War, and the setting of *Muriel*). So the past, the present and the future are now a dimension of the future. Then at the end of the final sequence of *My American Uncle*, the camera suddenly detects a ray of hope and holds at the only colourful image in the deserted streets: on one of the sombre walls a forest is painted, a wall painting by American artist Alan Sonfist; a sort of city screen as a hopeful sign of a possible future, a rebeginning. While the camera zooms in, the forest turns into pure green, fragments and colours that have to look for new connections. As such, these last images of the film, as a sign of death and rebeginnings, belong perhaps to the third synthesis of time, the future, the image related to the inevitability of death and repetitions of death, but also the possibility of the creation of the new.

VI. Database Logic of the Neuro-Image

So Resnais's cinema, although mainly based in the second synthesis of time (with its particular future), also seems to be open to the third synthesis of time that speaks from the future as such. And, not coincidentally, as I will try to show in a moment, his films also express

a 'digital logic' *avant la lettre*, which shows some of cinema's internal struggle with informatics. The necessity of cinema's internal positioning towards the digital is an important remark made by Deleuze in *The Time-Image* to assure its rebirth and developments in the future (Deleuze 1989: 266). It may seem like a far stretch to think of Resnais as a Web 2.0 filmmaker. But for one, it can be argued that there is a kind of very contemporary 'database logic' in Resnais's work. Database logic is described by Lev Manovich in *The Language of New Media* as a typical characteristic of digital culture (Manovich 2001: 212–81). Contemporary culture is driven by databases, from which time and again, new selections are made, new narratives can be constructed, in endless series. As Manovich explains, this does not mean that the database is only of our time: the encyclopaedia and even Dutch still lifes of the seventeenth century follow a kind of database logic. It is just that with the seemingly endless storage and retrieval possibilities of digital technology, the database seems to become a dominant cultural form. And it allows very explicitly for endless series of new combinations, orderings and remixes of its basic source materials, which on a temporal scale matches the characteristics of the third synthesis of time, the future as eternal return.

The database logic in Resnais is often developed from within the second synthesis of time: in *Hiroshima Mon Amour*, *Last Year in Marienbad*, *Muriel* and *Je t'aime, J t'aime*, for instance, the past presents itself in different variations. But there are also some moments where the future as the third synthesis of time presents itself in a glimpse as the ungrounded ground from which it is spoken, such as the last images of *My American Uncle* discussed above. Or, at some moments in *The War is Over*, where the main character imagines in a sort of 'database flashforward' the unknown girl that has helped him to escape from the police at the Spanish border (he only heard her voice on the phone): a montage of flashforwards with female faces gives various possible options of what the girl would look like. These kinds of database-options of various futures return at other moments in the film as well. *My American Uncle* is also database-like, when at the beginning of the film several objects are shown without any clear meaning or connection between them. Later in the film, some of these objects will be suggested in relation to different stories and characters, and obtain (symbolic) meaning, only to return in a mosaic of many different objects and persons at the end of the film. Here Resnais's film-screen really becomes a typical web page that offers multiple entrances that each hide other possible future stories.
