The Conditions of the New

Daniel W. Smith Purdue University

I. Introduction

What are the conditions of the *new* that one finds laid out in Gilles Deleuze's philosophy?[1] Deleuze frequently said that the question of the conditions for the production of *novelty*, as Whitehead called it, or *creativity*, as Bergson called it, was one of the fundamental questions of contemporary thought.[2] It entails a profound shift in philosophy away from the eternal to the new, that is, from the universal to the singular. For Deleuze, the conditions of the new can be found only in a principle of *difference* – or more strongly, in a *metaphysics* of difference.[3] The reason: if identity (A is A) were the primary principle, that is, if identities were already pre-given, then there would in principle be no production of the new (no new differences).

Yet the question of the new is a surprisingly complex problem. On the one hand, the 'new' seems to be one of the most obvious phenomena in the world: every dawn brings forth a new day, and every day brings with it a wealth of the new: new experiences, new events, new encounters. If the new means 'what did not exist earlier' then everything is new. On the other hand, one can say, with almost equal assurance, with the writer of Ecclesiastes (1: 9–10), that there is nothing new under the sun: the dawn of today was just like the dawn of yesterday, and simply brings with it more of the same. The new seems to come in well-worn and predictable patterns. Talk of the new, in other words, immediately threatens to be pulled back into talk of the old. As the French saying puts it, 'Plus ça change, plus c'est la meme chose' ('The more things change, the more they stay the same'). These complexities are due to the fact that the problem of the new is easily confused with a host of related but nonetheless distinguishable problems, including questions of transformation and change, causality and determinism, and the possibility of emergence (emergent qualities).

1. Transformation and change

One could, for instance, pose the question of the new in terms of the question of transformation or change. When artists create a painting or a piece of sculpture, they are simply rearranging matter that already exists in the world in a new way. Such a view of novelty would be merely *combinatorial*. Melodies are made out of notes, paintings are made out of pigments, and sculptures are hewn out of stone. This would be a simplified caricature of the hylomorphic schema. Creation is the imposition of a new form (*morphe*) on a given material or matter (*hyle*), even if matter contains a certain potentiality for the form. Here, novelty is found on the side of the form, and matter is the passive receiver or receptacle of this newness. In this case, novelty would be little more than the rearrangement of matter in the universe into ever new forms. The question of whether such novelty would eventually be exhausted would rest on metaphysical speculation about the finitude or infinity of matter (and time) in the universe, which is ultimately pure – and hence empty – speculation.

2. Causality and Determination

The question of novelty is also linked to the question of causality. If everything has a cause, and if effects pre-exist in their causes, then *only old things can come out of change*. If there is nothing in the effect that was not already in the cause (or, to put it in logical terms, if there is nothing in the consequent that was not in the antecedent), then causal processes can give rise to objects that are new in number, but not new in *kind* – there can be *quantitative* or numerical novelty, as in mass produced objects, but not *qualitative* novelty. Yet, as Mario Bunge has argued in his classic book *Causality*, this view, though consistent (and popular), is extreme, since it rests on a simplified and linear view of causality. Effects can be (and usually are) determined by multiple causes (heat can be produced by friction, combustion, nuclear chain reactions, microwaves, and so on), and causes can have multiple effects (penicillin may cure my infection but kill someone allergic to it).[4] Causality, in other words, must be distinguished from the more general question of *determination*, since determination can be not only causal, but also statistical or probabilistic (determination of a result by the joint action of independent entities), structural or wholistic (determination of parts by the whole), teleological (determination by ends or goals), dialectical (determination by internal strife or synthesis of opposites), as well as dynamic

or causal. Deleuze's proposal will be to see all such forms of determination as derivable from a metaphysical principle of difference: 'Difference is the state in which one can speak of determination *as such*' (Deleuze 1994: 28).

3. Emergence

The question of the new must also be distinguished from the question of emergence, even though the two issues are closely related. Emergence is a phenomenon of widespread interest in contemporary science and philosophy. It is an issue that initially arose in a physicalist ontology, which holds that all existents are physical entities, and hence that all sciences, in principle, should be reducible to physics. The problem is that physicalism (at least in its radically reductionist versions) cannot take into account phenomena such as organisms, artifacts, and societies, which have supra-physical (or emergent) properties that their (physical) components lack, such as the emergence of new species and new individuals, the emergence of new institutions, and so on .[5] If radical novelty can be distinguished from emergence, however, it is because emergence implies the production of new quality at ever higher 'levels' of complexity in a system, whereas the concept of the new in Deleuze – as well as Whitehead and Bergson – implies conditions in which *novelty becomes a fundamental concept at the most basic ontological level*.

II. Three Types of Conditions: The Logically Possible, Possible Experience, Real Experience

The problem of the new must thus be distinguished from the problems of change, causality, or emergence, and should instead be repositioned as a fundamental ontological concept (Being = Difference = the New). The properly Deleuzian question would therefore be: what are the ontological *conditions* under which something new can appear in the world? But this raises a second set of issues: what exactly does it mean to speak of the *conditions* of the new? From this viewpoint, one could perhaps distinguish between three types of conditions with which philosophers have tended to concern themselves: (1) the conditions that demarcate what is logically possible; (2) the conditions that determine the limits of possible *experience* (Kant); and (3) the conditions of real experience. For Deleuze, the problem of the new is coextensive with the attempt to determine the conditions of *real* experience (since the real *is* the new). What then is the difference between these three types of conditions?

1. The Logically Possible

First, one could say that thought, *on its own*, is only capable of thinking the possible, and that it does so in the name of certain principles which one can call *logical principles*. Logical principles are principles that determine what is possible and what is not possible. Classical logic identified three such principles: (1) the principle of identity (which says that 'A is A', or 'A thing is what it is'), (2) the principle of non-contradiction, which says that 'A is not non-A' ('A thing is not what it is not'), and (3) the principle of the excluded middle, which says that between A or not-A, there is no middle term). Taken together, these three principles determine what is impossible, that is to say, what is *unthinkable*: something that would not be what it is (which would contradict the principle of identity); something that would be what it is not (which would contradict the principle of non-contradiction); and something that would be both what it is and what it is not (which would contradict the principle of the excluded middle). By means of these three principles, thought is able to think the world of what is possible (or what traditional philosophy called the world of 'essences'). But this is why logic does not take us very far: it leaves us within the domain of the possible.

2. Possible Experience

Kant went a step further than this when he tried to demarcate, not simply the domain of the possible, but the domain of possible *experience*. This domain of possible experience is no longer the object of formal logic, but what Kant called *transcendental* logic. The transcendental conditions for demarcating possible experience are found in the *categories*. If logical principles demarcate the domain of the possible, categories demarcate the domain of possible experience. Causality is a category for Kant since we cannot conceive of an object of our possible experience that has not been caused by something else. This transcendental logic allowed Kant to distinguish between what was immanent within and transcendent to this domain of experience. Empirical concepts are immanent to experience (and hence testable by hypothesis and experiment), whereas the object of *transcendent* concepts (or what Kant called, following Plato, *Ideas*) go beyond any possible experience. The three great transcendent Ideas that Kant identified in the 'Transcendental Dialectic' were God, the World, and the Soul. Such Ideas are *thinkable* (they are not logically inconsistent, given the principles of formal logic), but they are not *knowable*, since there could never

be an object in experience that would correspond to them – they lie outside the domain of possible experience.

3. Real Experience

But the post-Kantian philosophers, starting with Salomon Maimon, attempted to push the Kantian project one step further: from the conditions of *possible* experience to the conditions of *real* experience. Maimon aimed two fundamental criticisms against Kant. First, Kant assumes that there are a priori 'facts' of reason (the 'fact' of knowledge in the *Critique of Pure Reason*, the 'fact' of morality in the *Critique of Practical Reason*), and then seeks the 'condition of possibility' of these facts in the transcendental. Maimon argues that Kant cannot simply assume these supposed 'facts' but has to show how they were *engendered* immanently from reason alone as the necessary modes of its manifestation. A method of *genesis* has to replace the simple method of *conditioning*. Second, to accomplish this task, the genetic method would require the positing of a principle of difference. Whereas identity is the condition of possibility of thought in general, he claimed, *it is difference that constitutes the genetic condition of real thought*.[6] These two exigencies laid down by Maimon – the search for *the genetic elements of real experience* (and not merely the conditions of possible experience), and the positing of a *principle of difference* as the fulfilment of this condition – reappear like a leitmotif in almost every one of Deleuze's books up through 1969, even if Maimon's name is not always explicitly mentioned. Indeed, one might ay that these are the two primary components of Deleuze's *transcendental empiricism*. 'Without this [Maimonian] reversal,' Deleuze writes, 'the Copernican Revolution amounts to nothing' (Deleuze 1994: 162).

III. The Conditions of Real Experience: Five Requirements

Thus, in speaking about conditions, we can trace out a trajectory from what constitutes the *logically possible* (determined by logical principles), what constitutes *possible experience* (determined by the categories), and our current problem: what constitutes the genetic and differential conditions of *real experience*?[7] Insofar as Deleuze's project constitutes a search for conditions (or a search for sufficient reason), Deleuze's philosophy can be said to be a transcendental philosophy. Obviously the question of knowing how to determine the transcendental field is very complex. Throughout his work, Deleuze explores the various requirements that must be met in determining the conditions of real experience. Five of

them seem particularly relevant to our concerns (though they by no means exhaust the ways of approaching the problem).

First, as we have already seen, for a condition to be a condition of real experience, and not merely possible experience, it must form 'an intrinsic genesis, not an extrinsic conditioning' (Deleuze 1994: 154). The genetic method means that the conditions of real experience must be able to account for novelty or the new – which means that the *future* must become the fundamental dimension of time, not the past.

Second, the condition cannot be in the image of the conditioned, that is, the structures of the transcendental field cannot simply be traced off the empirical. This was one of the fundamental critiques that the post-Kantians addressed to Kant. Kant had simply conceived of the transcendental in the image of the empirical. But as Deleuze writes, 'the task of a philosophy that does not wish to fall into the traps of consciousness and the cogito is to purge the transcendental field of all resemblance' (Deleuze 1990: 123). What this means, in part, is this: in traditional philosophy, the relationship between the possible and the real is one of resemblance. We think of the possible as a field of possible options, only one of which can be 'realised' in the real, with all the other possibilities being thwarted and not passing into existence. Two principles govern this relation: the real *resembles* the possible, and the real is a *limitation* of the possible. This is why Deleuze will substitute for the possible-real opposition what he calls virtual-actual complementarity: the virtual is constituted through and through by difference (and not identity); and when it is actualised, it therefore differs from itself, such that every process of actualisation is, by its very nature, the production of the new, that is, the production of a new difference. This is why Deleuze can say that the transcendental must be conceived of as a field in which 'the different is related to the different *through* difference itself' (Deleuze 1994: 299, translation modified).

Third, to be a condition of real experience, the condition can be no broader than what it conditions – otherwise it would not be a condition of *real* experience, capable of accounting for the *genesis* of the real. This is why there can be no categories (at least in the Aristotelian or Kantian sense) in Deleuze's philosophy, since (as he puts), the categories cast a net so wide that they let all the fish (that is, the real) swim through it. But his requirement – that conditions not be broader than the conditioned – means that the conditions must be determined *along with* what they condition, and thus must change as the conditioned changes. In other words, the conditions themselves must be plastic and mobile, 'no less capable of dissolving and destroying individuals than of constituting them temporarily'[8] (Deleuze 1994: 38).

Fourth, in order to remain faithful to these exigencies, Deleuze continues, 'we must have something unconditioned' that would be capable of 'determining both the condition and the conditioned' (Deleuze 1990b: 123, 122) and which alone would be capable of ensuring a *real* genesis[9] (Deleuze 1990b: 19). It is the nature of this unconditioned element that lies at the basis of Deleuze's dispute with the general movement of the post-Kantian tradition. Is this unconditioned the 'totality' (Kant, Hegel), which necessarily appeals to a principle of identity (the subject), or is it 'differential' (which is Deleuze's position, modifying a position hinted at by Leibniz)?

This is why Deleuze aligns himself with the work of Spinoza and Leibniz, the arch-rationalists, despite his own self-description as an empiricist. Indeed, Deleuze's appeal to the interrelated concepts of the foundation [*fondation*], the ground [*fond*, *fondement*], and the ungrounded [*sans-fond*] reflect his complex relation to the traditions of pre- and post-Kantianism. Both Spinoza and Leibniz, in their shared anti-Cartesian reaction, complained that Descartes had not gone far enough in his attempt to secure a foundation for knowledge. Erecting a foundation is a futile enterprise if the ground itself is not firm and secure. Before laying the foundation, in other words, one must prepare the ground; that is, one must inquire into the *sufficient reason* of the foundation.[10] Indeed, Deleuze describes *Difference and Repetition* in its entirety as an inquiry into sufficient reason, but with this additional caveat: in following the path of sufficient reason, Deleuze argues, one always reaches a 'bend' or 'twist' in sufficient reason, which 'relates what it grounds to that which is truly groundless', the unconditioned (Deleuze 1994: 154). It is like a catastrophe or an earthquake that fundamentally alters the ground, and destroys the foundations that are set in it. All three of these aspects – foundation, ground, and the ungrounded – are essential to Deleuze's project. 'Sufficient reason or the ground,' he writes, 'is strangely bent: on the one hand, it leans towards what it grounds, towards the forms of representation; on the other hand, it turns and plunges into a groundlessess beyond the ground which resists all forms and cannot be represented'(Deleuze 1994: 274–5). For instance, in Deleuze's theory of repetition (temporal synthesis), the present plays the role of the foundation, the pure past is the ground, but the future the ungrounded or unconditioned, that is, the condition of the new.

Fifth, and finally, the nature of the genesis that is at play here must therefore be understood as what Deleuze calls a *static* genesis (that is, a genesis that takes place between the virtual and its actualization), and not a *dynamic* genesis (that is, a historical or developmental genesis

that takes place between actual terms, moving from one actual term to another).

These five themes recur in almost all of Deleuze's early writings as elaborations of the two post-Kantian demands that Deleuze appropriates from Salomon Maimon (the search for *the genetic elements of real experience* and the positing of a *principle of difference* as the fulfilment of this demand).

IV. The Model of Calculus

However, it is one thing to lay out a general project like this; it is another thing to find a 'method', so to speak, capable of providing a way of *thinking* these conditions of the real. If logical principles determine the conditions of the possible, and the categories determine the conditions of possible experience, where can one go to search for the conditions of real experience (that is, the conditions for novelty itself)? Deleuze in fact appeals to several non-philosophical models in his work. One of them is artistic creation, and in a sense Deleuze's transcendental empiricism can be read in large part as a reworking of Kant's transcendental aesthetic. Another model is molecular biology, which defines individual terms of a genetic structure that constitutes the real conditions of its external and visible properties and thus constitutes a profound break with the traditional approach of 'natural history'. But the model I would like to focus on here is the mathematical model of the differential calculus. Many of the concepts that Deleuze develops in *Difference and Repetition* to define the conditions of the real are derived from the calculus – the differential relation, singularities, multiplicities or manifolds, the virtual, the problematic, and so on.

There are a number of reasons why Deleuze would turn to the model of the calculus. Philosophy, of course, has always had a complex relationship with mathematics. But the particular *branch* of mathematics privileged by philosophers often says much about the nature of their philosophy. Since the late nineteenth and early twentieth centuries, for instance, philosophers have tended to focus on axiomatic set theory, since they were preoccupied with the question of the foundations of mathematics, with its twin programmes of formalisation and discretisation. Plato, by contrast, famously appealed to Euclidean geometry as a model for Ideas because it defined forms (or essences) that were static, unchanging, and self-identical. Deleuze could be said to appeal to calculus for the exact opposite reason: it is calculus that provides him with a mathematical model of a principle of difference. Calculus is the primary mathematical tool we have

at our disposal to explore the nature of reality, the nature of the real – the *conditions of the real*. When physicists want to examine the nature of a physical system, or an engineer wants to analyse the pressure on a weight-bearing load, they model the system using the symbolism of the calculus. What spawned the 'scientific revolution' of the last three centuries was what Ian Stewart called 'the differential equation paradigm': 'the way to understand Nature is through differential equations' (Stewart 1989: 32–3). As Bertrand Russell put it in *An Outline of Philosophy*, 'scientific laws [or laws of nature] can *only* be expressed in differential equations'[11] (cited in Bunge 1979: 74–5, emphasis added). In this sense, one might say that the calculus is existentialism in mathematics, 'a kind of union of mathematics and the existent'.[12]

This is why Leibniz remains such an important figure for Deleuze. In the history of philosophy, he suggests, there were two great attempts to elucidate the conditions of the real, albeit in two different directions: Hegel (the infinitely large) and Leibniz (the infinitely small).[13] Deleuze's strategy, with regard to the history of philosophy, seems to have been to take up Maimon's critiques of Kant and to resolve them, not in the manner of the post-Kantians, such as Fichte and Hegel, but rather by following Maimon's own suggestions and returning to the pre-Kantian thought of Hume, Spinoza, and Leibniz. Of these three, it is Leibniz – who invented the calculus, along with Newton – that plays a decisive role, at least with regard to the question of the real that concerns us here. Leibniz already had an implicit response to the two post-Kantian demands formulated by Maimon. 'All the elements to create a genesis as demanded by the post-Kantians,' Deleuze noted in one of his seminars, 'all the elements are there virtually in Leibniz.'[14]

Calculus takes us into a complex and heavily-mined territory, with its own complex history.[15] Moreover, calculus is not the only mathematical domain to which Deleuze appeals: group theory, topology, and non-Euclidean geometry, among others, also make frequent appearances throughout Deleuze's texts. It is not that Deleuze is setting out to develop a philosophy of mathematics, nor even to construct a metaphysics of calculus. Deleuze appeals to calculus primarily to develop a *philosophical* concept of difference, to propose a concept of difference-in-itself for pure thought. 'We tried to constitute a philosophical concept from the mathematical function of differentiation,' Deleuze wrote in the preface to *Difference and Repetition*. 'We are well aware, unfortunately, that we have spoken about science in a manner which was not scientific' (Deleuze 1994: xvi, xxi). In what follows, then, I would simply like to explicate, in a schematic manner, a number of the concepts that Deleuze extracts

from calculus for his philosophical purposes. This analysis would constitute a segment of a broader consideration of Deleuze's philosophy of difference.[16]

V. The Differential Relation, Singularities, Multiplicities

Let me turn first to the nature of the differential relation, and the way in which this type of relation differs from logical relations, or real or imaginary relations in mathematics. In 1701, Leibniz wrote a short, three-page text entitled 'Justification of the Infinitesimal Calculus by That of Ordinary Algebra', in which he tries to illustrate the nature of the differential relation using an example from ordinary algebra. His example is as follows (Figure 1). Leibniz draws two right triangles – CAE and CXY – that meet at their apex, at point C. Since the two triangles CAE and CXY are similar, it follows that the ratio e/c (in the top triangle) is equal to $y/(x - c)$ (in the bottom triangle). Now, Leibniz asks us, what happens if we move the straight line EY increasingly to the right, so that it approaches point A, always preserving the same angle at the variable point C. The length of the straight lines c and e will diminish steadily, yet the ratio of e to c will remain constant. What happens when the straight line EY passes through A itself? It is obvious that the points C and E will fall directly on A, and that the straight lines c and e will vanish, they will become equal to zero. And yet, Leibniz says, even though c and e are equal

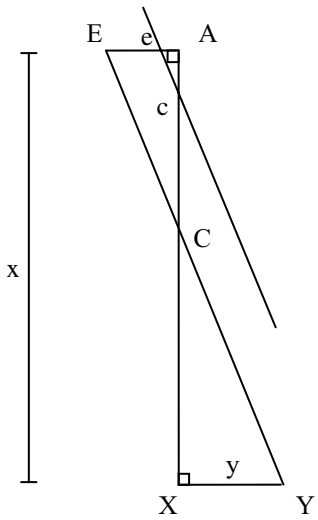

Figure 1[17]

to zero, they still maintain an algebraic relation to each other, equal to *y*/*x*. In other words, speaking intuitively, when the line EY passes through A, it is not the case that the triangle CEA has vanished; rather it continues to subsist 'virtually,' since the relation *c*/*e* continues to exist even when the terms have vanished. Rather than saying the triangle CEA has disappeared, Leibniz says, we should say that it has become unassignable and yet perfectly determined. In this case, $e = 0$ and $c = 0$ but the relation e/c is not equal to zero, since it is a perfectly determinable relation equal to y/x. Unassignable, yet perfectly determined. This is why the differential relation is such a great mathematical discovery, even in a simple algebraic example such as this one: the miracle is that the differential relation dx/dy is not equal to zero, but rather has a perfectly expressible finite quantity, which is the differential derived from the relation of x to y.

Deleuze derives an important consequence from this analysis of the differential relation. The differential relation can be said to be a pure relation, insofar as it is a relation that persists even when its terms disappear: it thus provides him with an example of what he calls the concept of 'difference-in-itself'. Difference is a relation, and normally – that is to say, empirically – it is a relation between two things with a prior identity ('x is different from y'). With the notion of the differential relation, Deleuze takes the notion of difference to a properly *transcendental* level. The differential relation is not only external to its terms (Bertrand Russell's empiricist dictum), but it also determines its terms. Difference here becomes *constitutive* of identity, that is, it becomes productive and genetic, thus fulfilling Maimon's demand: a genetic philosophy finding its ground in a principle of difference.

In a certain sense, one could say that this principle of difference is the starting point of Deleuze's philosophy, from which he will deduce a number of related concepts that constitute the conditions of real experience.[18] When a differential relation reciprocally determines two (or more) virtual elements, it produces what is called a *singularity*, a singular point. This is the first concept Deleuze deduces from the differential relation. In logic, the notion of the 'singular' has long been understood in relation to the 'universal'. In mathematics, however, the term is used in a different manner: a singular point (or singularity) is distinguished from ordinary or regular points, particularly when speaking about points on a determinate figure. A square, for instance, has four singular points, its four extreme corners, and an infinite number of ordinary points that compose each side of the square. Similarly, a cube is determined by eight singular points. Simple curves, like the arc of a circle, are determined by singularities that are no longer extrema, but maximum or minimum points (this

led to what Leibniz called the calculus of maxima and minima). The singularities of complex curves are far more complex. They constitute those points in the neighbourhood of which the differential relation changes sign, and the curve bifurcates, and either increases or decreases.

Such an assemblage of ordinary and singular points constitutes what Deleuze calls a *multiplicity* – a third concept. One could say of any *determination* in general – that is, of any individual – that it is a combination of the singular and the ordinary, of the remarkable and the regular. The singularities are precisely those points where something 'happens' within the multiplicity (an event), or in relation to another multiplicity, causing it to change nature and produce something new. For instance, to take the example of a physical system, the water in my kettle is a multiplicity, and a singularity in the system is one that occurs when the water boils (or freezes), thereby changing the nature of the physical multiplicity (changing its phase space). Similarly, the point where someone breaks down in tears, or boils over in anger, is a singular point in someone's psychic multiplicity, surrounded by a swarm of ordinary points. Every determinate *thing* is a combination of the singular and the ordinary, a multiplicity that is constantly changing, in perpetual flux.

One can see here that, at the very least, Deleuze is breaking with a long tradition which defined things in terms of an essence or a substance – that is, in terms of an identity. Deleuze replaces the traditional concept of substance with the concept of multiplicity, and replaces the concept of essence with the concept of the event.[19] The nature of a thing cannot be determined simply by the Socratic question 'What is . . .?' (the question of essence, which in Deleuze's view set philosophy on the wrong track from the start), but only through such questions such as 'How?' 'Where?' 'When?' 'How many?' 'From what viewpoint?' and so on – precisely the questions Plato rejected as inadequate responses to the question of essence.[20] For Deleuze, the question 'What is singular and what is ordinary?' is one of the fundamental questions posed in Deleuze's ontology, since, in a general sense, one could say that 'everything is ordinary!' as much as one can say that 'everything is singular!' In a psychic multiplicity, a new-found friend might suddenly boil over in anger at me, and I would ask myself what I could possibly have done to provoke such a singularity; but then someone might lean over to me and say, 'Don't worry, he does this all the time, it's nothing singular, it has nothing to do with you, it's the most *ordinary* thing in the world, we're all used to it.' Assessing what is singular and what is ordinary in any given multiplicity is a complex task. It is why Nietzsche could characterise the philosopher as kind of physician, who assesses phenomena as if they were symptoms

that reflected a deeper interrelation of forces within the multiplicity at hand, whether that multiplicity was a person, or a culture, or a metaphysical system – or a perception.

VI. The Example of Perception: Leibniz's Theory of Unconscious Perceptions

Here I would like to open a parenthesis in order to provide an example of how Deleuze makes use of these concepts in a concrete domain, namely, the domain of perception. Leibniz has noted, famously, that we often perceive things of which we are not consciously aware, such as a faucet dripping at night. Leibniz therefore suggested that our conscious perceptions are not derived from the objects around us as such, but rather from the minute and unconscious perceptions of which they are composed, and which our conscious perception integrates. We can apprehend the noise of the ocean or the murmur of a group of people, for instance, but not necessarily the sound of each wave or the voice of each person that composes them. A conscious perception is produced when at least two of these minute and virtual perceptions – two waves, or two voices – enter into a differential relation that determines a singularity, which 'excels' over the others, and becomes conscious. Every one of our conscious perceptions constitutes a constantly shifting threshold. The multiplicity of minute or virtual perceptions are like the obscure dust of the world, its background noise, or what Maimon liked to call the 'differentials of consciousness'. At the limit, Leibniz would say, we perceive the entire universe, but obscurely. The differential relation is the mechanism that extracts from these minute perceptions our zone of finite clarity on the world. 'Far from having perception presuppose an object capable of affecting us, and conditions under which we would be affectable, it is the reciprocal determination of differentials (dy/dx) that entails *both* the complete determination of the object as perception, and the determinability of space-time as a condition' (Deleuze 1993: 89, translation modified). This is what Deleuze means when he says that conditions of real experience must be determined at the same time as what they are conditioning. Space and time here are not the pre-given conditions of perception, but are themselves constituted in a plurality of space and times *along with* perception.

We can also see how the how the Cartesian notion of 'clear and distinct' ideas finds an entirely new set of coordinates in Deleuze's work. My conscious perception of the noise of the sea, for example, may be *clear*, but it is by nature *confused*, because the minute perceptions of which it is composed are not themselves clear, but remain obscure. Conversely,

the minute, unconscious perceptions are themselves distinct but obscure (not clear): *distinct*, insofar as all the drops of water remain distinct as the genetic elements of perception, with their differential relations, the variations of these relations, and the singular points that they determine; but obscure, insofar as they are not yet 'distinguished' or actualised in a conscious perception, and can only be apprehended by thought, or at best, in fleeting states close to those of drowsiness, or vertigo, or dizzy spells. Leibniz in this way determines the conditions of real experience by starting with the obscure and the virtual: a clear perception emerges from the obscure by a genetic process (the differential mechanism). These obscure and minute perceptions do not indicate the presence of an infinite understanding in us (as Kant himself has suggested with regard to Maimon), but rather the presence of an unconscious in thought – a differential unconscious, which is quite different from the oppositional unconscious developed in Freud.

VII. The Problematic and the Virtual

With this example in mind, drawn from the field of perception, we can return, in our deduction of concepts, to two final notions: the problematic and the virtual. These concepts correspond to the question: 'What is the status of the multiplicity constituted by these minute and unconscious perceptions?' Deleuze will say that they are objects of Ideas in a modified Kantian sense, because even though they are not given directly in phenomenal experience, they can nonetheless be *thought* as its conditions. They are, as it were, the noumenon closest to the phenomenon. To move from conditions to the conditioned is to move from *a problem to its solution* or, what amounts to the same thing, from the *virtual to the actual*. It remains for us to examine the parallel structure of these two remaining concepts.

We sometimes think of philosophy as a search for solutions to perennial problems, and the terms 'true' and 'false' are used to qualify these solutions. But in fact the effort of the greatest philosophers was directed at the nature of the problems themselves, and the attempt to determine what a true problem was as opposed to a false one. In the 'Transcendental Dialectic' of the first Critique, for instance, Kant tells that the concept of the World (or the universe, the totality of what is) is an illusion, because it is generated from a false problem, derived from the category of causality. The problem of causality stems from the fact that an event A causes event B, B causes C, C causes D, and so on, and that this causal network stretches indefinitely in all directions. If we could

grasp the totality of these series, we would have the World. But in fact, we *cannot* grasp this infinite totality. The true object of the Idea of the world is precisely this *problem*, this causal nexus. When, rather than grasping it as a problem, we instead think of it as an object (the World), and start posing questions about this object ('Is it bounded or endless?' 'Is it eternal or did it have a beginning?'), we are in the domain of a transcendental illusion, prey to a false problem. This is why Kant said that Ideas such as the Soul, the World, and God are objectively *problematic* structures. The object of the Idea is a problem, it is the objective existence of a problem that is separated from its solutions, and it is, as Kant said, 'a problem incapable of solution' (Kant 1999: A327/B384).

Deleuze has something similar (though not identical) in mind when he says that the conditions of real experience have an *objectively* problematic structure. What does it mean to speak of a problem that has an objective existence (and is not simply a subjective obstacle to be overcome on the path to knowledge)? Here again, calculus can help us. It is not by chance that it was calculus itself that (soon after its invention) seemed to lend credence to the classical view of determinism, that is, a clockwork universe without any novelty, in which the future was completely determined by the past. Differential equations allowed mathematicians to predict, for instance, the exact dates of the return of Halley's Comet (Lalande), or the next solar eclipse, or the fact that there was another planet perturbing the orbit of the planet Neptune, which led to the discovery of Pluto (Le Verrier). The success in solving such astronomical problems led to extravagant claims like those of Laplace: eventually *every* future event will be explainable by the use of differential equations.

Today, this belief in determinism, as supported by calculus, has been undermined. The reason is simple: setting up differential equations is one thing, solving them is quite another. Until the development of computers, the equations that *could* be solved tended to be *linear* equations, with *convergent* series, equations that 'describe simple, idealized situations where causes are proportional to effects, and forces are proportional to responses' (Strogatz 2003: 181). Thus, early on in the history of calculus, as Ian Stewart has written, 'a process of self-selection set in, whereby equations that could not be solved were automatically of less interest than those that could' (Stewart 1989: 73–4). The equations that could *not* be solved tended to be non-linear equations, which described fields whose infinite series *diverge* – and most differential equations have turned out to be non-linear equations.

In the late 1800s, Henri Poincaré worked out a way to study such equations. Even though an exact solution was not attainable, Poincaré

discovered that he could recognise the general patterns the solutions would have to take for the equations he was working with – such centres, foci, saddle points, and nodes or knots. Today, through the use of computers, much more complicated solution patterns have been discovered, such as the well-known Lorenz attractor. Put simply, the solution to the equation will be found in one of the points in the attractor, but one cannot say in advance which point it will be since the series defined by the equation diverge. This is why we cannot predict the weather more accurately – not because we do not have all the variables, but because the weather system itself is *objectively problematic*. At every moment in its actuality, it is objectively unassignable which trajectory of the attractor the weather system will follow, since its problematic structure is constituted positively by an infinite set of *divgerent series*, which is nonetheless entirely determined by the attractor itself.

This brings us, finally, to the concept of the virtual, which is one of Deleuze's most well-known concepts. The concept has little to do with the notion of 'virtual reality'; rather, it concerns the *modal* status of such problematic structures. On this score we might be tempted to say that they are the locus of *possibilities* waiting to be realised. But in fact Deleuze is strongly critical of the concept of possibility in this context, since it is unable to think the new or to make us understand anything of the mechanism of differenciation. The reason is this: we tend to think of the possible as somehow 'pre-existing' the real, like the infinite set of possible worlds that exist in God's understanding before the act of creation (Leibniz). The process of realisation, Deleuze suggests, is subject to two rules: a rule of resemblance and a rule of limitation. One the one hand, the real is supposed to *resemble* the possible that it realises, which means that everything is already given in the identity of the concept, and simply has existence or reality added to it when it is 'realised'.[21] On the other hand, since not every possible is realised, the process of realisation involves a *limitation* or exclusion by which some possibilities are thwarted, while others 'pass' into the real. With the concept of possibility, in short, *everything is already given*; everything has already been conceived, if only in the mind of God (the theological presuppositions of the concept of possibility are not difficult to discern).[22] Instead of grasping existence in its novelty, Deleuze writes, 'the whole of existence is here related to a pre-formed element, from which everything is supposed to emerge by a simple "realisation" ' (Deleuze 1990a: 20).

This is why Deleuze proposes that in describing the modal status of problematic multiplicities we should replace the concept of the possible with the concept of the virtual, and substitute the virtual-actual relation

for the possible-real relation. This is much more than a matter of words or semantics. The virtual, as Deleuze formulates it, is not subject to a process of realisation, but rather a process of actualisation, and the rules of actualisation are not resemblance and limitation, but rather *difference* (the differential relation) or *divergence* (divergent series) – in other words, creation and novelty. 'Problematic' and 'virtuality' are strictly correlative concepts in Deleuze's work: a problem has an objectively determined structure (a virtuality), that exists apart from its solutions (which are actual).[23] At every moment, my existence (like that of a weather system) is objectively *problematic*, which means that it has the structure of a problem, constituted by divergent series, and the exact trajectory that 'I' will follow is not predictable in advance. This is why Deleuze would say that every actuality is always surrounded by a halo of virtualities, which are not mere logical possibilities, but physical realities (even if they remain virtual), precisely because they are what constitute the problematic structure of my existence. In a moment from now, I will have actualised certain of those virtualities: I will have spoken in a certain manner, or gestured in a certain manner. In doing so, I will not have realised a possibility (in which the real resembles an already-conceptualised possibility), but will have actualised a virtuality – that is, I will have produced a difference. In other words, when the virtual is actualised, it *differentiates* itself, it produces the new (the actual does not resemble the virtual in the way that the real resembles the possible). Moreover, when I actualise a virtuality, or resolve a problem, that does not mean that the problematic structure has disappeared. The next moment, so to speak, still has a problematic structure, but one that is now modified by the actualisation that has just taken place. This is what Deleuze mans when he says that conditions and the conditioned are determined at one and the same time, and that conditions can never be larger than what they condition – thus fulfilling the Maimonian demands for the conditions of real experience. It is precisely for this reason that we can say, even speaking of ourselves, that every event is *new*, even though the new is never produced *ex nihilo* and always seems to fit into a pattern (this pattern is precisely what we call, in psychic systems, our 'character').

VIII. Conclusion

With this we break off the deduction, somewhat arbitrarily, since our aim was not to explicate all of Deleuze's concepts, but to follow a rather specific trajectory through Deleuze's thinking about the problem of new.

First, there is the demarcation of the problem of the conditions of *real experience*, as opposed to what is logically possible or the conditions of possible experience. Second, derived from the work of Salomon Maimon, there is the twofold demarcation of what it means to talk about conditions of real experience (or the new): one must seek the *genetic* elements of real experience, and one must posit a principle of *difference* as the fulfilment of this demand. Finally, Deleuze finds in the model of calculus various concepts of difference (the differential relation, singularities, multiplicities, and so on) that serve to define a transcendental field that is both virtual and problematic, and which serves to define the conditions of real experience. For Deleuze, Being itself always presents itself under a problematic form, which means that it is constituted, in its actuality, by constantly *diverging* series, that is, by the production of the new. The resuscitation of a positive conception of divergent series, following the advent of non-Euclidian geometries and the new algebras, itself represents a kind of Copernican revolution in contemporary mathematics.[24] Deleuze's philosophy of difference – in part derived from these mathematical advances – represents a Copernican revolution of its own in philosophy, insofar as it makes the problem of the new (difference) not simply a question to be addressed in a remote region of metaphysics, but rather the primary determination of Being itself.

Notes

1. This paper is a modified version of a talk given at the annual meeting of the British Society for Phenomenology, 'The Problem of the New', St. Hilda's College, Oxford University, 8–10 April 2005.
2. See, for instance, the following: 'The aim is not to rediscover the eternal or the universal, but to find the conditions under which something new is produced (*creativeness*)' (Deleuze 1987: vii); Bergson 'transformed philosophy by posing the question of the "new" instead of that of eternity (how are the production and appearance of something new possible)' (Deleuze 1986: 3); 'The new – in other words, difference – calls forth forces in thought that are not the forces of recognition, today or tomorrow, but the powers of a completely other model, from an unrecognized and unrecognizable *terra incognita*' (Deleuze 1994: 136). Nonetheless, it is true that the *new* is merely an operative concept in Deleuze's philosophy; which he himself thematises under the rubric of *difference*.
3. On these issues, Deleuze did not hesitate to identify himself as a metaphysician, in the traditional sense. 'I feel myself to be a pure metaphysician. Bergson says that modern science hasn't found its metaphysics, the metaphysics it would need. It is this metaphysics that interests me.' From an interview with Deleuze cited in Villani 1999: 130.
4. See Bunge 1979, especially pp. 17–19 on 'The Spectrum of Categories of Determination'.
5. See the discussion in Bunge 2001, especially on 49 and 222.
6. These claims need to be qualified, since they simply summarise the two themes that Deleuze retains from Maimon. But as Martial Gueroult has shown in his magisterial work *L'Evolution et la structure de la Doctrine de la Science chez Fichte*, Maimon himself in fact hesitated between two ways of solving the problem of genesis: 'Maimon oscillates between two solutions: first, to turn difference into a pure principle like identity . . . In a certain fashion this is the path Schelling will choose in the philosophy of Nature . . . This conception everywhere has the same consequences . . .: the suppression of the immanence in the knowing subject of the constitutive elements of knowledge; the finite subject Ego [*Moi*] is posterior to the realities of which it has knowledge . . . But another solution presents itself: identity being absolutely pure, and diversity always being a given (*a priori* and *a posteriori*), identity can be posited as the property of the thinking subject, and difference as an absence of identity resulting from the

limitation of the subject' (Gueroult 1930: I, 126). The latter will be the path followed by Fichte (the positing of the 'I = I' as a thetic principle of identity); the former position (which we summarise here) will be the path retrieved and pursued by Deleuze.

7. In a Deleuzian context, it might be preferable to speak about the conditions of the *real*, rather than *real experience*, since the latter seems to imply a link to a (transcendental) subjectivity. But one can retain the phrase, if one instead links it to the notion of pure experience in the Jamesian sense – that is, an experience without a subject or an object.
8. 'The search for a ground forms the essential step of a "critique" which should inspire in us new ways of thinking . . . .[But] as long as the ground remains larger than the grounded, this critique serves only to justify traditional ways of thinking' (Deleuze 1994: 54).
9. In order to assure a real genesis, the genesis requires an element of its own, 'distinct from the form of the conditioned', something unconditioned, an 'ideational material or "stratum" ' (Deleuze 1990b: 19).
10. Leibniz and Spinoza will both claim, for example, that Descartes' *clear and distinct* ideas only find their sufficient reason in *adequate* ideas. On the relation of the foundation to the ground, Deleuze writes: 'The foundation concerns the soil: it shows how something is established upon this soil, how it occupies and possesses it; whereas the ground . . . measures the possessor and the soil against one another according to a title of ownership' (Deleuze 1994: 79).
11. Deleuze cites a similar statement by Hermann Weyl, who noted that 'a law of nature is necessarily a differential equation' (Deleuze 1993: 47).
12. See Deleuze, seminar of 22 April 1980, online at www.webdeleuze.com: 'It is because it [calculus] is a well-founded fiction in relation to mathematical truth that it is consequently *a basic and real means of exploration of the reality of existence*.' See also the seminar of 29 April 1980: 'Everyone agrees on the irreducibility of differential signs to any mathematical reality, that is to say, to geometrical, arithmetical, and algebraic reality. The difference arises when some people think, as a consequence, that differential calculus is only a convention – a rather suspect one – and others, on the contrary, think that its artificial character in relation to mathematical reality allows it to be adequate to certain aspects of physical reality.'
13. See Deleuze 1994: 42–50, where he analyses and compares the projects of Hegel and Leibniz on this score: 'differential calculus no less than the dialectic is a matter of "power" and of the power of the limit' (43).
14. Deleuze, seminar of 20 May 1980, online at www.webdeleuze.com.
15. For a discussion of this history, with regard to Deleuze's use of calculus, see Smith 2003.
16. Strictly speaking, the list of concepts that follows, as Deleuze points out, is not a list of categories, nor could it be (without changing the concept of a category): they are 'complexes of space and time . . . irreducible to the universality of the concept and to the particularity of the now here' (Deleuze 1994: 285).
17. This figure is taken from Leibniz 1966: 545.
18. By contrast, in *The Fold* (Deleuze 1993), Deleuze begins his deduction of concepts with the differential concept of *inflection*.
19. Miguel de Beistegui, in his magisterial *Truth and Genesis: Philosophy and Differential Ontology* (2004), has analysed in detail the shift from substance to multiplicity brought about by Deleuze's differential ontology.
20. Alfred North Whitehead makes a similar point in *Adventures of Ideas*: 'We can never get away from the questions: – How much, – In what proportions? – and In what pattern of arrangement with other things? . . . .Arsenic deals out either

health or death, according to its proportions amid a pattern of circumstances' (Whitehead 1967: 153).

21. Furthermore, the means by which the possible is realised in existence remains unclear: existence always occurs 'as a brute eruption, a pure act or leap that always occurs behind our backs' (Deleuze 1994: 211).
22. See Deleuze 1990b: 105: 'the error of all determinations of the transcendental as consciousness is to conceive of the transcendental in the image and resemblance of what it is supposed to found.' If the real is supposed to resemble the possible, is it not because we have retrospectively or retroactively 'projected' a fictitious image of the real back into the possible? In fact, it is not the real that resembles the possible; it is the possible that resembles the real. See Deleuze 1990a, chapter 5, for further discussion.
23. For this reason, Deleuze's work has been seen to anticipate certain developments in complexity theory and chaos theory. Manuel Delanda in particular has emphasised this link in Delanda 2002. For a general presentation of the mathematics of chaos theory, see Stewart 1989.
24. On this topic, see Kline 1972: 1096–7: 'After the dawn of rigorous mathematics with Cauchy, most mathematicians followed his dictates and rejected divergent series as unsound'; but with the advent of non-Euclidean geometry and the new algebras, 'mathematicians slowly began to appreciate that . . . Cauchy's definition of convergence could no longer be regarded as a higher necessity informed by some superhuman power.'

The Work of Art that Stands Alone

Claire Colebrook Edinburgh University

In 'From Work to Text' – Roland Barthes' classic manifesto that spelled the end of any closed structuralism and opened the text to as many forces, connections and actualisations as possible – Barthes suggests that the closed work is the very death of literature. The *work* can be 'held in the hand'; this material separateness, Barthes argues, allows literature to be reduced to a thing or object. The relations that constitute a text can be determined in advance because a text is placed within and limited by a proper context. A work has its rightful owner (the author), its rightful heirs (the critics) and, more importantly, its very own sense, held within itself. The sense may be brought to light, unearthed and revealed, but criticism does no more than disclose the already said. The critic is reverentially passive, effacing himself as much as possible so that the work might speak on its own. But the work is no longer active, for its work *as work* is already completed, fully actual, and its maintenance in the present is only possible if it is treated as a corpse, no longer bearing the ability to alter itself or become other than what it so uniquely is. Barthes' 'text' by contrast is open to the future, and is so because it remains fully *active*, an activity enabled only by the joyful fact that it cannot be held in the hand, is not a thing but a potentiality for relations:

> [T]he work can be held in the hand, the text is held in language, only exists in the movement of a discourse (or rather, it is Text for the very reason that it knows itself as text); the Text is not the decomposition of the work, it is the work that is the imaginary tail of the Text; or again, *the Text is experienced only in an activity of production*. (Barthes 1977: 157)

If the text is active, not a thing but a growing, mutating and forceful vector, then the reader is similarly liberated from the due reverence one pays to a body lying in state. No longer a pious critic, the reader is now 'writerly': actively and irreverently opening the text to as many

connections as possible. The text no longer *has* a context or border, and is no longer a thing to be revered or studied. For Barthes, to see texts as works is to take the open potentiality of life and allow one achieved actualisation – the canonised work, the sacred edition – to limit and deaden the future. The work no longer lives; its creation has been fully realised – so much so that the reader must preclude the growth or excrescence of any further relations. The work in itself and standing alone can, therefore, be an object of longing, as though it might be owned and consumed: 'the work is a fragment of substance' (Barthes 1977: 156). One might grasp the sense of the work and add it to one's store of knowledge. In doing so one would become like so many other dutiful consumers. Nothing further would have been produced, the same sense would be passed around, circulating without alteration of itself, allowing the body of consumers also to remain unchanged – passively ingesting.

The text, by contrast, is not an object of desire, but the occasion for *jouissance*. No longer consuming subject and valued object, the text inaugurates a relation of joyful and productive loss. In not striving to maintain himself or the sanctity of the work, and in risking the destruction of the already achieved, the textual player may lose the object revered by the community of readers, may fail to save the sense of the work, but may create new, proliferating and unheard of relations: 'The text is not a co-existence of meanings but a passage, an overcrossing; thus it answers not to an interpretation, even a liberal one, but to an explosion, a dissemination' (Barthes 1977: 159). If the text has a *life* then it is not that of a once living organism (Barthes 1977: 161), now embalmed, but a virus that mutates, spreads, and proliferates in a rhizomatic fashion – not the production or actualisation *of* some end determined in advance: 'The reader of the Text may be compared to someone at a loose end (someone slackened off from any imaginary) . . .' (Barthes 1977: 159).

In this essay and its celebration of active textual relations over the completed body of work Barthes' might seem to define what continental philosophy has meant for departments of art and literature since the 1980s and the advent of theory. His argument offers a series of self-undermining binaries that then yields the literary ethics of post-structuralism. For the difference or border between a work and a text, the difference between a dead literary relic and an open textual potential, can itself be understood as a bordered category or as a textual dynamic: 'What constitutes the Text is . . . its subversive force in respect of the old classifications' (Barthes 1977: 157). From the point of view of the work there simply *are* some literary objects that withstand the flux of time, remaining in themselves and harbouring a universal meaning through which we recognise who we are.

But from the point of view of the text, the difference between those objects of timeless value and the merely ephemeral is itself textual: created, contingent and open to renewal. We can imagine taking the work that has been lovingly placed within its context, attributed to the eternal vision of its author and tirelessly restored by a history of deferential criticism and reading it now as text. Isn't this what happens when we show no respect for the canon, according as much value to Shakespeare as Tarantino, or reading Shakespeare's corpus – the definitive divine work – as though it emerged from a web of anecdotes, rumours, circulating myths and accidental accretions? To read a work as a text would mean not yet knowing whether Shakespeare were worth preserving, not yet knowing what its force might be, not yet sure whether it is nothing more than a network of allusions ripe for re-quotation, parody and pastiche.

If we were to accept Barthes' celebration of the text as an indication of what continental philosophy might offer literary criticism, then we would align his work with Derrida's now notorious '*il n y a pas d'hors texte*' and Deleuze and Guattari's rhizome. We could set the achievement of continental philosophy against the residual maintenance of American New Criticism's self-enclosed poem or well-wrought urn (Brooks 1947) *and* Marxism's and feminism's location of the text within its ideological milieu or context (Eagleton 1976). For New Criticism the work separates itself from the daily life of functional and practical language. If everyday language emerges from drives to efficiency, recognition and *not* perceiving and naming the world anew at every moment, then literary language breaks with this functional maintenance of life. In so doing the literary work has a life of its own; it revives the *act* of language. New Criticism's well-wrought work is not oriented to reference. By referring to itself, and by displaying its own creation of relations independent of any external end, the work is an end in itself. If this ideal remains today it does so in certain accusations that post-structuralism, despite manifest appearances, has remained a dead formalism (Lentricchia 1980). For all its talk of textuality the absence of any end outside the text reduced the text to a mere letter. If the new critics celebrated the work's capacity to enliven language by detaching it from reference, recognition and any already determined image of life, the criticism of Paul de Man went one step further. The very notion of a life that falls into language and then forgets itself as the very origin of language is itself only effected through language (De Man 1971). The work, seemingly alive, proliferating and open, is really open to nothing. De Man has, therefore, been criticised for not being so distant from the New Criticism he targeted (Nealon 1992). Even though the French-inflected criticism from Barthes to Derrida

attacked the notion of the work as a self-contained object, it only broadened the work textually; it could not negotiate the real forces of the non-textual, the forces of politics, life and bodies. It was this sense of post-structuralism's closure and formalism, for all its talk of openness and radicalism that motivated New Historicism:

> This ambition to specify the intriguing enigmas of particular times and places distinguishes our analyses from the contemporary pantextualism of the deconstructionists, who have their own version of the proposition that a culture is a text. Stressing the slippages, aporias and communicative failures at the heart of signifying systems, linguistic or otherwise, their cultural textualism has no historicist ancestry. For them, written language is the paradigmatic form in which the problems of making meaning become manifest, and a culture may be said to be 'textual' because its meaningful signs are inherently ambiguous, paradoxical and undecidable. Deconstructionist literary analyses thus continually turn up textuality itself as the source and structure of all enigmas. Although maintaining that there is nothing outside of the text, no place of simple and transparent meaning where the slipperiness of the sign can be escaped, deconstructionists nonetheless tend to draw their examples from the literary canon. While we frequently explore other kinds of texts, they urge that literary language uniquely exposes to scrutiny a textuality that operates everywhere and throughout history. Hence, in addition to skipping the levels of analysis that interest us most – the culturally and historically specific – deconstructionism also seems to reerect the hierarchical privileges of the literary. (Gallagher and Greenblatt 2000: 14)

Critics of post-structuralism argued that like New Criticism, the celebration of the text had led to the death of literature; the literary work had been isolated from those non-literary and non-textual forces which gave it potency and meaning. In order for the work to come to life it needs to be opened to what is not itself, removed from formalism's understanding of it as form – bounded and repeatable – and exposed to its material fragility. It is not enough to see the text as nothing more than a tissue of relations; as long as the text has maintained its *own* relations we remain within the dead letter of the old work. The way out of this dead-end of formalism would seem to be some form of historicism or ideology critique. It was in a complex response to the perceived aestheticism of post-structuralism *and* the limits of any simple reference to an outside that post-structuralist Marxisms and feminisms abandoned the idea that the text is either a mirror or distortion of some pure political reality (Ryan 1982; Weedon 1987). The text may not be able to grasp history as some simple outside or referent, but the text's relations do connect with relations of material production; there is indeed something outside

the text, even if that something is itself textually mediated or given in the form of relation (Jameson 1981). Certainly, on New Historicism's own self-definition, history cannot be appealed to as some pure present and stable ground; nor is history some stable context which allows us to place and contain the work in its proper past. New Historicism, in its many and diverse forms, attacks the isolationism and formalism of both New Criticism and post-structuralism, and does so by using a language of re-animation, restoration, enlivening and reactivation (Greenblatt and Gallagher 2000: 30). Criticising Barthes' idea of text, Jerome McGann argues that the post-1960s emphasis on textuality has done nothing to overcome the lifeless formalism of the New Criticism. Just as the new critics took the text as a self-present thing and refused to question its emergence, so the celebration of text creates some disembodied ideal that can circulate without any attention paid to its originating and productive energy. What we should really do is differentiate, in a manner diametrically opposed to Barthes, the text from the poem (McGann 1981). We can only have poems, those repeatable, re-readable and circulating ideal forms in anthologies and contemporary editions, because there are texts – material objects that emerge from language as social action. To consider the material object 'held in the hand' enables, rather than precludes, the activation of the text.

For McGann, as long as we see Byron's *Don Juan* as the finished, edited and anthologised object that can be circulated without difference we lose the text's animating force. (McGann wants to use the word 'text' to refer to the material, empirical object – the bound, printed edition – in opposition to the poem or work which is the ideal or immaterial object that is repeatable and iterable only because of an original materiality.) *Don Juan's meaning,* McGann argues, is inextricably intertwined with its original force as a social act, and as an utterance with a certain force: 'the circumstances of publication *always* bear upon literary meaning' (McGann 2002: 77). If we want to understand a word we need to look at what it does, and the same applies to a work of art. Byron's *Don Juan* emerged in a context where poetry had become a social act that denied the efficacy of social action; while Romantic poets were creating a language of poetic inwardness and contemplation, Byron was creating poetry that showed the force of language. Byron's work was so scandalous that it was printed in elite expensive editions to prevent irresponsible circulation, a fact that then compounded the work's pirated and proliferating popularity. A consideration of the text's materiality – its original matter of publication, its marks, deletions, binding and actual circulation – precludes the post-structuralist dilution of the text into a

general and indifferent network. So while we may acknowledge a politics or context that is always already *textual* it matters very much just what counts as a text's *own* textuality, the specific relations that animate and revive its own force. What post-structuralism's celebration of text had lost is just this decisive materiality of textuality, the fact that texts occur in networks of resonance, action and circulation.

We can conclude, then, by arguing that post-structuralism's attack on the work that stands alone – the work that would be shielded from the forces and encounters that might give it further life – was itself trumped by a later New Historicism. Far from giving the text life, force and relations, post-structuralism had (supposedly) merely given formalism a new rationale. Whereas New Criticism's object had stood alone in its organic integrity, allowing language to renew itself without being enslaved to reference or communication, poststructuralist textualism allowed the textual network in general to preclude the text from being connected to its specific, forceful, animating and determinate field. And if Stephen Greenblatt was less concerned than McGann to read the poem on its own terms (according to its specific material and socially active connections) he nevertheless criticised post-structuralism for not deciding which texts made for salient connections. Indeed, he justified his seemingly 'arbitrary' connections with the claim that he was illuminating the text's resonant, if not actual context. Thus it would be justifiable to connect the scene of Hamlet's ghost with much later anecdotes about spectres and visitations; the point was not what Shakespeare read or would have known. Anecdotes yield those fragments of textualised reality – the way that reality is actually lived and narrated – that open up seemingly frozen and singular canonic works to a life that they have only apparently lost: 'the most gossamer touch of the real, its only virtue in the present context is its very marginality, its stretching to the limit the possibility of a meaningful link, its distance from the kind of historical document more conventionally adduced to illuminate a work of art' (Greenblatt 1997: 25).

But is the legacy of post-structuralism best represented by this notion of a proliferating textual difference? And is the idea of re-animation, reactivation or re-vivification the best way to carry the text of the past into the future? Are Deleuze and Guattari's concepts of rhizomes and deterritorialisation fairly translated into a textual free for all? And is Derrida's *différance* nothing more than an acknowledgment that life is only given through relations and contexts, and that any appeal to a context is itself contestable and context bound? I would argue to the contrary. First, at the heart of post-structuralism in both its Derridean and Deleuzian forms there was a commitment to the work of art that stands alone. Second,

this idea of the separated text, the text that is not caught up in relations, is opposed to a normative image of life that dominates both traditional literary criticism and the literary appropriation of textualism. When New Criticism had argued for the *life* of the free-standing work it had done so because of a critique of language as technology. The language that is originally active and creative and used to master life becomes, in the sciences, a dead weight on life. Only by tearing language away from function and efficiency will life be restored to itself, no longer perverted by a system that operates without animating intent. Similarly, Barthes also criticised the living death of mythic or frozen language, a language that began as act or production but that had come to appear natural: natural not in the sense of growth, but natural in the sense of incontrovertible, not open to question.

New Historicism's critiques of post-structuralism as a formalism are perhaps the most explicit in their appeals to the properly living text. We should not forget that texts begin as social *acts* and have no meaning beyond what they set out to do, the forces they aim to transfigure (McGann 1988). It is against this appeal to life, relations, activation and the text as purposive action that I would set the radically post-structuralist critique of life: both Derrida's deconstruction of the sense that can always return to itself, and of the subject that can master and feel/hear itself speak, and Deleuze and Guattari's attack on the 'lived' as the ultimate of criticism (Deleuze and Guattari 1994: 171). Neither Derrida, nor Deleuze and Guattari were concerned with privileging the text over life. What was at issue were two competing conceptions of life. Unlike Barthes, who employs a language of always remaining-in-act, thereby maintaining the notion of one productive life, Derrida used the concept of text to describe a life and experience that could never be present to itself, could never be located within consciousness or a subject (Derrida 1976). Similarly, but in different ways, Deleuze and Guattari rejected a life that would be immanent *to* some subject or power, and instead saw life as a plane that was effected through relations but was never some ultimate body productive of relations (Deleuze and Guattari 1997: 197). Both the idea of the formalist work *and* the historicist text are dominated by a normative image of life. The work, traditionally, is an organism that forms relations from itself, remains open to its own world and invites us to see the world anew from the work's own monadic point of view – to re-live the world as it was lived by the heightened sensibility of its author. But the Barthesian 'text' too in its own way is no less alive, not because its border is an open and living membrane but because it has no border, no inside or

outside, no *objective* being; it is nothing more than its potential connections and activations. It is this image of open and proliferating life that, I would argue, ends up domesticating what is most radical in art. If art is considered not as a living organism open to the world, nor as a burgeoning and fully permeable network, then what remains is to think of the work as a dead letter or, more radically, as a corpse: lodged within life, devoid of relations, and seemingly lacking in potentiality.

It is perhaps salient to recall two criticisms of the modernist aesthetic of returning the dead weight of tradition and formalised language to its animating spirit. As early as *Introduction to Edmund Husserl's Origin of Geometry* Derrida seems to set up a celebratory opposition between Husserl and Joyce. Husserl's ideal is that of a language that might always be returned to its origin. Despite history and dissemination all signs and traces might find once again their animating intent. In this case the ideal would be that of univocity; despite cultural, linguistic, psychological and cultural dispersion transcendental consciousness can recognise itself as that which gave birth to the multiplicity of voices. By contrast, Joyce's text is a celebration of equivocity, a language that cannot be reduced to a founding sense (Derrida 1989: 111). Even so, Derrida argues that the modernist celebration of the proliferation of voices does not break with the metaphysics of presence, a metaphysics that is dominated by a life that gives birth to itself and recognises itself only insofar as it differs from itself. What would be truly radical, he suggests, is not the idea of a life that issued in an infinite array of voices and that could be recognised in all its myriad of difference, but that which would not give itself to reading, recuperation or production. Much later, in *A Thousand Plateaus,* Deleuze and Guattari will deliver a similar warning regarding the modernist book that would reterritorialise the multiplicity of life through the notion of the great authored work (Deleuze and Guattari 1987: 6). What would be truly rhizomatic, then, is not a network of textual proliferation, but a difference that could not be recuperated or commanded as the difference *of* either textuality or life. If there is a tendency to read Derrida as a textualist, such that we would only know life as it is given through textual relations, then there is a similarly strong tendency to read Deleuze as a vitalist, so that one intensifying rhizomatic life connects every text with every other text and with every other differentiating potential of life. In contrast with the linguistic reading of post-structuralism, we might note that deconstruction is not a critique of a theory of language so much as an exposure of the image of life that underpins our claims about language. If we privilege speech it is because we privilege self-affective life, a life that can feel itself, express itself, and

understand what is other than itself as the emanation of one expansive and productive theological and expressive being. What is wrongly perceived as Derrida's 'textualism' is not a claim that we only know life through relations but that relationality cannot be incorporated, cannot be reduced to knowledge, language or consciousness. For Derrida, there 'are' relations that do not come to presence, actualisation or sense. This might sound, at first, to be a sign of the great divide between the life and joy of Deleuzian philosophy and the death and spectrality of Derrida's insistence on that which withholds itself and that cannot be *lived*. But we could, as John Protevi has done, read Derrida as having undertaken a critique of Western metaphysics' hylomorphism – the ideal of the imposition of form on an otherwise undifferentiated life – and then see Deleuze as going further to give a voice to life (Protevi 2001). On this understanding, whereas Derrida would remain focussed on the system or relations through which the world is lived (with 'life' always being deferred from itself, never lived in itself) Deleuze and Guattari would go beyond the text or work to the forces from which the work is actualised.

The task of reading, on such an understanding of Deleuze, would be to refer the work back to its animating life. One way of pursuing thought after Deleuze would be to take up the materialist project of genesis: not accepting the systems through which life is lived, but accounting for the emergence of systems. Art, like social systems, would be an emergent phenomenon: not predictable from a set of given conditions, but a potential that may or may not come to actuality. The task of thought would be to account for art, neither as it is in itself, nor according to its own relations, but as an expression of a broader physical universe which harbours the potential for art (and this potential of material systems would be the virtuality of art.) Nevertheless this, I would argue, is precisely what does *not* follow. Just as Derrida criticises the notion of a life that would then express itself through an external body or text, and instead regards the text as disrupting the supposed self-presence of life, so Deleuze (and Deleuze and Guattari) see art as the extension of a singularity or potentiality of life *beyond* its defining territory. Art is not just a de-territorialisation of life in the sense of extending a tendency; it is the opening up of a new plane, or a 'higher deterritorialisation' (Deleuze and Guattari 1997: 197).

It may be that there are practical, life-sustaining tendencies of the human sensory-motor apparatus, such as the intellectual capacity for concepts and the habitual capacity to code affects: life would not maintain itself if each perception were responded to in its singularity, and so concepts allow us to create a sense which grasps a set of possibilities all at once

(at infinite speed). Similarly, the habits of the body allow us to form a relatively stable coding of affects: I feel hungry, I eat; I feel tired, I sleep; I feel fear, I retreat; I feel boredom, I act. Human life in its everyday form is just this connectedness or network of singularities, where certain potentials of the body – the potential for the eye to respond to light – are coordinated with other singularities, such as the ear's response to sound, the body's response to its environment and so on. Art, however, is the decomposition or separation of this complex; it is the power for the affective to stand alone, to be liberated from the maintenance of this (human, relatively stable) point of view: this is why life's greatest achievements are *not vital*, in the sense of being continuous with the striving of self-maintenance, but radically disjunctive (destroying the bodies and forces from which they emerge (Deleuze and Guattari 1997: 209)). How else could we read Deleuze and Guattari's claim in *What is Philosophy?* that architecture is the exemplary art because art is a monument, with the aim of art being the achievement of an affect that stands alone? 'Art begins not with the flesh but with the house. That is why architecture is the first of the arts' (Deleuze and Guattari 1997: 186). How, also, would we read the claim in *Kafka* that it is only when the text is at its most cramped, restricted and devoid of relations that it is capable of achieving its minority and revolutionary status? We do not see the art of art as long as we re-territorialise the work by drawing it back to its conditions of emergence; instead, art gives the most to life, and lives most fully, only when it is detached from life. Far from flowing from *physis* or being an expression *of life* – a life that *is* only insofar as it brings its potentiality to full and proper actualisation – art is best considered as radical *techne*: devoid of any natural or already given life, living on in an inhuman, disruptive and certainly not immediately communicative or sympathetic manner.

One way, then, of moving away from a post-structuralist notion of the text as a radically open and proliferating network of play would be to consider the relation between life and *techne* in Deleuze's books on cinema, where the technical apparatus reaches the point of art when it destroys the body's connections and syntheses, when it disrupts the productive flow of life. The human sensory-motor apparatus folds its perceptive field around its organising, active and pragmatically oriented body. Time is lived as the time *of* this subject. The notion of a *history* of time in these books challenges the normative assumption of a life that goes through time to recognise and actualise itself. Instead, Deleuze argues that time is measured out according to the body's perceptions, and further that the mode of that measuring develops in tandem with the emergence of the model of the body as machine or apparatus.

Historically, from Ancient philosophy onwards, movements are originally understood as the achievement of, or transition towards, recognised forms, so that change is subordinated to the proper forms that ought to be realised. Time is the measure of transition from potential to realisation. A key shift occurs with Cartesian philosophy and science, when movement is no longer the actualisation of 'poses' and when space is not the space of this or that proper form. Rather, a notion of 'any-space-whatever' is released, and we begin to think movement and space in distinction from actual forms. Time or change is still, however, mapped from the point of view of a subject who views the world in terms of the changes *of things*, things that are perceived from the point of view of the viewing human subject.

It is cinema – the encounter of the human body with a machine that beats to another rhythm – that disrupts the subordination of time and difference to the body of praxis and the world that is folded around 'man's' own interested viewpoint. Time is no longer the retention of my past and the anticipation of my future but can be composed from irrational cuts that then allow the image to be viewed *for itself*. This would allow us to think of 'time in its pure state'. Time is no longer the time taken to achieve a certain movement, nor the time imagined as the unfolding of a motivated causal series. The time-image is achieved when the power to perceive is liberated from the embodied human viewpoint, located in the inhuman eye of the camera, and then allowed to create syntheses and connections not folded around this or that living organism: not oriented to a specific speed, motility or duration. This cinematic insight can, and should, allow us to perceive something about the singularity of art. A technology that might begin as a supplement – such as the camera that extends or deterritorialises the power of vision beyond the eye so that we can see more and have a broader view of history or narrative – can then take on a force of its own. The camera would not, then, be the *extension* of this or that 'imaging' or 'perceiving' body, but would realise the image as such, in its singularity. One can think of singularity here as a potential for relations – something there to seen – that is not yet organised according to a network of relations. Whereas we normally imagine time as the sequence of the eye's perceptions, or the time taken to actualise something expected, the image in itself, cut off from conventional relations, is the presentation of a potential for relations – the potential for the production of series. This is not time as it is lived, but time in its pure state; each life or lived experience is one way, among others, that a series of perceptions might be organised. Any image as pure image – detached from a grounding motivated body – is the time image.

Everyday time is given from the human viewpoint, as the retention of the past into the present, and the anticipation of the future from the present; and the life of this time or the specificity of this duration is determined by the limits of the organism – how much we can remember, how much difference we can include in the present, and how much we can anticipate or imagine. But the transcendental possibility of this personal time is the image as such; one perceives the present in terms of its virtuality, the pasts that it draws along and that may or may not be actualised, and the futures towards which it may or may not lead. It is in this sense that Deleuze may not be a theorist of being or an ontologist; for what there *is* – what any particular world acknowledges as existing – is the consequence of the relations one effects among images, and the distinctions one makes between the before and after, the original and the parasitic. Against, then, a time grounded on a single image – man as perceiver who categorises and synthesises his world – Deleuze offers a metaphysics of image over being. There are only things or beings as a result of relations among images, such as the eye that organises a world of matter around its own body, or the camera that constructs a plane of composition tying image to image. One never perceives the thing itself in its full, punctual and complete presence. Life *is* imaging, with an infinite multiplicity of potential relations producing or unfolding into relatively stable points of perceiver and perceived. The eye is a potential to see but only if it connects with light, but light is also a potential for colour, for warmth, for photosynthesis, for laser technology, all depending on what relations it encounters. This might lead us to think that Deleuze is a philosopher of the 'text' in Barthes' sense – that a work of art is nothing more than all the readings and actualisations it allows. But this is not the case, for Deleuze is insistent that the task of thinking is the liberation of the artwork from its actuality: counter-actualisation, and this leads to quite a distinct mode of formalism. Is it possible to think the work of art, not as it is for us, not as it has been lived through time, but in itself: not as effected relations but as relationality per se? Can we think the power to become or differ not as it is – as a being – but as pure potentiality?

This is the power of the image as such: a singularity that we always encounter in some relation or connection, but that is not exhausted by its relations. The cinematic time-image takes those images that are normally bound up with causal, personal and affective series, and separates them from their usual or habitual connections. We see affect itself, prior to its connection with action, and it is *this* possibility, when extended, that allows us to think imaging as such. An early example of the affection-image occurs in Alfred Hitchcock's *Suspicion*. Joan Fontaine, becoming

increasingly aware and anxious regarding her husband's (Cary Grant) gambling debts, hears that her husband is taking his business partner on a drive to the coastline they plan to develop. We shift directly from the scene where they are playing with scrabble letters that spell the word 'murder' to an image of Grant's business friend falling to his death. Fontaine then falls into a swoon and faints. So far, this use of images is not too remarkable, and we see a possible future as imagined by a present character. The next scene shows Fontaine waking up, realising that Grant and his friend have departed. She drives to the coast. We see her face and then cut directly to the cliffs and the swirling waves, a scene that *may or may not* be the scene of the crime. What we are seeing, whether it is or is not the image of threat, death and menace, is yet to be determined. The cut from Fontaine's face – her world, and her fear – marks the next image as an image *of fear*, but in its virtual aspect only. (This is not an image that makes us afraid, presenting an object that would cause a visceral response, but an image of fear – not the object but a mode of relating to the object, or affect as such.) The film concludes with no crime taking place, with no actual fulfilment of Fontaine's suspicion, but we are nevertheless given images of suspicion – Fontaine reading books where 'perfect crimes' are described. It is just this absence of narrative actualisation, or the film that anticipates an act that does not occur, that leads us to a new way of thinking relations. As a meta-text we can think of the film as moving away from an object to which one relates – the crime and its effects – to relations that do not have an object. After all, what is suspicion if not the power to perceive in the actual presented world, not just what is hidden, but what has not yet happened, a secret that is not yet decided? The world *as imaged* harbours connections not yet made, potentials not yet realised. Even in this simple form, Hitchcock gives an image not of the possible – what characters may or may not do in the realm of action – but the virtual, the worlds that are perceived but that are never actualised, nor intended, nor determined. The entire film produces an image of *what will happen*, but never gives us a crime that would answer the suspicion.

We can now see how art works to allow affect or percept to stand alone. A film dominated by narrative would tie suspicion to the suspicion *of* this or that specific crime or outcome, but as film becomes increasingly non-narrative or liberated from the desire for unfolding connections and a logic of consequences and fulfilment, it allows the image in its actual-virtual aspect to tear life from its 'own' unfolding, in order to create diverse or incompossible worlds: the full reality of what does not or cannot happen. But this is not unique to film, and Deleuze had

already in his book on Proust argued that 'time in its pure state' can be achieved when we liberate signs from their worldly relations and think of the sign as such. Once again we need to make a note regarding Deleuze's ontology and the work of art. Far from conceiving the world of beings as exhaustive of reality, Deleuze looks at the ways in which worlds, or what can be said to be, are produced through relations. The virtual, or the potential for relations, is real; the actual – what exists in this or that world – is one of the ways in which the virtual is unfolded. When Deleuze reads Proust he looks at how this specific work of art produced a world; the novel is not the representation of a distinct reality, nor is it (as in Barthes) a capacity for textuality or play liberated from being. Instead, each work produces a world or mode of relations, or creates its own outside. We do not assume that the text is a picture of the world, or a break from the world, but a way of seeing how a world unfolds from a system of relations. Only if we do not decide in advance that the artwork has a relation 'to' reality can we see the ways in which artworks open up worlds or relations. Proust achieves this through a style of writing that adopts the *problem of the sign*, so that in his novel we can see the way in which reading is placed as a figure within the text, ultimately allowing for a novel that presents an image of reading as such. We move from signs of the world – the sign of this or that being beyond signs – to a work that presents the relation of sign as such, as a potential or singularity (a point from which relations or an actual existent might be effected).

Thus, we move from a 'reading' of the world where one image naturally or automatically follows another: smoke is a sign of fire; 'would you like fries with your order' is a sign of a dutiful employee. Such signs are part of a regular technology and connectedness that renders life efficient. We can, however, move away from convention and automatic connections to *sensuous* signs, seeing the colours, vibrations, sounds and tremors of one's world not as they are bound up in action but as they are for themselves. We are no longer within a life rendered conventional, human and efficient. Even so, we are still at this level of sensuous signs perceiving a world of our own. This power to perceive signs, this singular potential which in the human being has developed and connected with a world of conventions and regularities, can extend itself even further, and this occurs in the signs of love. We perceive the beloved not as assimilable to our own duration; nor are we able to flesh out or actualise just what the glance or gesture of the beloved *means*: neither what she intends, nor the worlds and durations that unfold from her point of view. In the signs of love, the beloved's world is *not* given, and it is this

style of sign that takes the singularity of imaging – the power to see, to be affected, to connect with potentials not one's own – and allows for the perception of imaging or singularity in general. If the work of art can take the signs of love – such as jealousy, the melancholy of unrequited love, the yearning for an impossible affair – and situate those signs in a frame or work disengaged from practical life, then we become capable of thinking singularity or image as such. If we define singularity as a potential from which certain styles or relations are actualised, then we recognise both that we only know singularities as they are already bound up in composites and assemblages, and also that the singularity is not exhausted by the relations that issue from it. The power of vision or imaging is, in everyday life, bound up in a technology of making one's way in a world, a world that can also be spoken, heard and felt. But can we isolate these singularities? This is what happens, according to the Deleuze of *Proust and Signs,* in the signs of the work of art. To give the signs of love a form, to allow them to stand alone and be perceived in their power to open the actual to a virtuality beyond what is merely possible or expected, this is the power of the work of art.

Great art is minor, therefore, because it does not open itself directly to its context. The artist who does nothing to de-form desire, who offers his dream in terms of the object he simply misses – as Freud noted – provides nothing more than a personal wish, and as Deleuze remarked in *The Logic of Sense,* just gives us the 'neurotic novel', where we repeat the symptom as our own. What we need to do is take the power of the symptom, the tendency of desire to direct itself towards an impossible object, and then extend that distance to the point where we open up worlds that are not of this world. Kafka can only transform his world, not by representing the bleakness of his surrounding reality, not by the Castle or trial standing as allegories of a bureaucratic state, but by showing bureaucracy *as a desire*. It is the *absence* of represented context that allows us today to use words like 'Kafkaesque' when referring to everything from immigration departments and university management systems to the way one might have been dealt with by a general practitioner or lover: the bureaucratic machine is not Czechoslovakia in the 1930s but a style of questioning, a placement of bodies in relations of deference, a duration (or waiting), a mode of architecture without open spaces. The castle *is* bureaucracy, and not a metaphor; we are given an image of bureaucracy itself, and the way in which it opens up a certain world. It is this capacity to take a singularity from a context and expose its tendency *as such* that enables Kafka to stutter in the already given connections of major language.

To understand how this notion of the intrinsic separation of art might work, we can consider an example from William Blake whose work connects word with visual image, although in a non-illustrative way. Blake, perhaps more than any other Romantic poet, has been the subject of great historical restoration, with early critics such as David Erdman defining Blake's political method and representation of actual history against the inward Wordsworthian mode of Romanticism (Erdman 1954). More recently, McGann has argued that we can only understand a poet on their own terms, and this means looking at the specific conditions of production of their text. In the case of Blake's *Jerusalem* we should not just restore the work's integrity and allow it to circulate as a complete object; we should see specific and material moments of deletion or marking out as *positive,* as sending a message, or as an act with an intended force (McGann 2002: 80). What such historicising manoeuvres such as McGann's try to avoid, and laudably so, is the alarming commodification of Blake, whereby his chaotic, enigmatic, proliferating and unassimilable work is reduced and rendered as not only unremarkably Romantic but, even more alarming, dutifully religious or quirkily proverbial (Goode 2006). But if using a fragment of *Milton* as a Church of England hymn and anthem for the proms misses a force that would originally have attached to Blake's work in its context, there is also a powerful *re*-territorialisation achieved by the return of his work to context. To think of Blake as meaningful solely insofar as his text acts in its own time precludes thinking about the relations the artwork can produce when detached from any set of relations determined in advance. What happens if we look at Blake's work, not in terms of the world from which it emerged, but in terms of its apparently unreadable lack of world, or what I would like to demonstrate as its stunning unreality and decontextualisation?

This does not mean that we see the work as existing outside of time, but we do need to move away from asking how an historical period might explain a work and instead see what a work makes of its time. In the case of William Blake the actual figure of revolution should be referred back, not to the French and American revolutions, and not only to the political problem of how individuals act in ways that diminish their powers for action. Revolution in Blake is given a singular articulation as the problem of power or potential as such. How does a power, force, engagement or difference cease to be active and contrary, and come to negate itself? Blake does give this a political figure, with the murderer of a tyrant becoming a tyrant in his stead (Erdman and Bloom 1988: 490). He also gives it a cultural historical figure: the poets that animate the world becoming priests when active naming and forming results in a

system to be obeyed (Erdman and Bloom 1988: 38). Finally, he also gives the event of reaction or the folding back of power a figure of sexual difference: the other body who allows for the very striving of my desire can come to appear as an obstacle, gap or impediment to desire, leading to a rhetoric of accusation, despair, jealousy or (in Blake's words) 'experience'. There is even, throughout Blake's works, an epistemological image of the very problem of the image: mind is an image that takes itself as the centre of all imaging; the brain becomes the head that has somehow to find an outside world: 'His nervous brain shot branches / Round the branches of his heart. / On high into two little orbs / And fixed in two little caves / Hiding carefully from the wind' (Bloom and Erdman 1988: 76). But the key theoretical point only emerges when Blake takes this concept of a power that turns back on itself, this tendency for the flow of images to organise itself around a single resonant and redundant image, and gives this event of infolded difference a material form. The technology of Blake's work, or his method of illuminated printing, takes the conventional, clichéd, and manually deft art of the brushstroke, and allows the line and its matter to be presented as insubordinate or resistant to the hand and eye. By painting with acid-resistant material onto the engraving plate, Blake takes the fluidity of the brushstroke and attaches it to the solid and rigid lines of engraving; shades, toning and gradations have to be achieved through a laborious and resistant method, in which the material support comes to stand alone. Because colour is added to the plate after printing there is a detachment of colour from line, and because shadows and tones are achieved through engraving the presentation of light has to be built up from lines. In viewing a Blake original the eye can 'feel' the hand's struggle with line, paper and colour. This material decomposition, where colour, line and light are presented as coming-into-relation is coupled with Blake's use of figures: so that what he represents – muscular bodies in dynamic poses – has to be wrested from a highly resistant medium (a method of engraving that allows the tracing of line and the corrosion of the plate to remain visible). Blake's art is a dynamic form of de-actualisation, where the bodies of fixed poses – bodies drawn in the image of statuary or anatomical diagrams – enter into movement. Their engraved style does not allow the line to flow effortlessly; the curves clearly have to be achieved, worked for, brought out from matter's potential and resistance. Blake's formal method places the outline or form of the body into a struggle or encounter with the material from which it emerges. Blake combines a dynamism of poses with a marked out musculature; his technique of engraving a rigid outline and then adding colour precludes the simple

melding of colour and contour. It as though he chooses the method least compatible to bringing out the fluidity and movement of the human form; this allows the form or outline to be given *as form*, to no longer fall back into being a *vehicle* for representation. Blake's work displays the very struggle of artistic materials, as though the matter – line, colour, surface – comes all the more to the fore insofar as it does not pass easily into the creation of an image.

On the one hand then, at the level of representation, the plates are dominated by moving, leaping, interacting and transforming bodies, while on the other hand the matter of their expression resists the figuration and tends to move for itself. At the textual level, it is typical to approach Blake in two ways, either to abstract those communicable aspects of his work for general circulation; or, to authorise his lexicon by forming a dictionary of terms, drawing on possible contemporaneous references and the slim biographical evidence. But we could also see his syntax, diction and poetic composition as expressing the struggle between on the one hand an active, naming, outward moving text that refers, and can circulate and live on, against, on the other hand, a text that allows a dead letter to preclude the insemination of sense, allowing for a true dissemination – not the proliferation of meanings, but words that do not come to fruition, that fail to connect and that disenable the easy communication of content. The following quotation from *Milton*, for example, at once adopts the position of prophecy, speaking about time and space and the formation of a world; at the same time it uses proper names that cannot be traced back to some mythic source, have no clear reference within Blake's 'system' and present themselves more as sonorous matter than as signifiers with a determined relation:

> To measure Time and Space to mortal Men, every morning.
> Bowlahoola and Allamanda are placed on each side
> Of that Pulsation and that Globule, terrible their power.
> But Rintrah and Palamabron govern over Day and Night
> In Allamanda and Entuthon Benython where Souls wail:
>
> (Bloom and Erdman, 1988: 127)

To conclude, then, I would argue that if Deleuze offers anything to literary theory, or the theory of the work of art, it is *not* a philosophy of life that would allow us to account for the work's emergence. Rather, it is the body of the work with its enigmatic separateness and monumental quality that allows us to rethink life. Life is not that which differs from itself in order to express itself. Beyond vitalism, the work of art evidences the power for the image to separate life from itself, to create an image of

a life that neither serves nor remains identical to itself. The work of art is not a text, neither a material object with its already given proper network, nor an ideal web that is nothing more than its connections. It is rather, that which stands alone, tearing sensations from their composed forms to release new potentials.

Utopian Political Philosophy: Deleuze and Rawls

Paul Patton University of New South Wales

One of the remarkable and appealing features of Deleuze's way of doing philosophy is its commitment to movement in thought. This is apparent in his interest in the openness of concepts and their a-systematic relations with other concepts. In *What is Philosophy?* Deleuze and Guattari define philosophical concepts as open-ended multiplicities, a definition that is earlier elaborated in *A Thousand Plateaus*, which displays the concept's susceptibility to variation as components are modified in the passage from one plateau to the next, forming a 'rhizome-book' as an assemblage of open concepts that has no argumentative or narrative conclusion. Therefore, it ends with a set of definitions and rules for the construction of concepts that are clearly intended to suggest that the 'system' of concepts laid out in the book could be continued in any number of directions. In his Letter-Preface to Jean-Clet Martin, Deleuze writes: 'I believe in philosophy as a system . . . For me the system must not only be in perpetual heterogeneity, it must also be a *heterogenesis*, which as far as I can tell, has never been tried' (Deleuze 2006: 361).

Deleuze's commitment to movement in thought is also evident in his own intellectual biography, particularly his method of creating concepts from one project to the next. Thus, in his extended *Abécédaire* interview with Claire Parnet, he denies that he is an intellectual or a 'cultivated' thinker in the sense of one who possesses a stock or reserve of knowledge.[1] With obvious allusion to Descartes' suggestion in the *Discourse on Method* that the philosopher embarking on a project should first lay in provisions, like a mariner setting out on a long voyage, he insists that:

> I have no reserves. I have no provisions, no provisional knowledge. And everything that I learn, I learn for a particular task, and once its done, I immediately forget it, so that if ten years later . . . I have to get involved with . . . the same subject, I would have to start again from zero. (Ibid)

Apart from the denial – no doubt exaggerated – that he has accumulated any intellectual reserves, this remark implies that he is not someone who seeks to elaborate a systematic body of thought or 'a philosophy'. It is because of the manner in which his practice of philosophy is problematic or problem-driven that there is always movement in his thinking from one project to the next.

This feature of Deleuze's way of 'doing philosophy' is nowhere more apparent than in his engagement with political philosophy, where new orientations and new concepts continued to emerge right up until his very last texts; for example, the importance of jurisprudence and law (in *Negotiations*), the philosophical functions of shame and a sense of the intolerable (in *What is Philosophy?*), societies of control as opposed to discipline or capture (in *Foucault* and 'A Postscript on Societies of Control'), becoming-revolutionary, becoming-democratic (in *What is Philosophy?* and in *Essays Critical and Clinical*).[2] Some of the new concepts that appear in Deleuze's later political philosophy imply an increasing awareness of normative political issues that were less prominent in earlier writings with Guattari. My aim in what follows is to draw attention to this shift in orientation and to suggest ways in which it might be further developed through engagement with Rawlsian liberal political philosophy.

Unlike much English language political philosophy, *Anti-Oedipus* and *A Thousand Plateaus* do not set out to provide normative standards for the justification or critique of political institutions and processes. Instead, they outline a political ontology that enables us to conceptualise and describe transformative or creative forces and movements. This ontology has a normative dimension in the sense that it presents a world of interconnected machinic assemblages, the innermost tendency of which is towards the 'deterritorialisation' of existing assemblages and their 'reterritorialisation' in new forms. The normativity embedded in this ontology accords systematic priority to 'minoritarian becomings' over 'majoritarian being', to 'lines of flight' over 'forms of capture', to 'planes of consistency' over 'planes of organisation', and so on. These concepts, and the underlying open system of their construction, allowed Deleuze and Guattari to undertake certain kinds of critical engagement with Marxist political thought. Their political philosophy incorporates both a recognisably Marxist critique of capitalist society and, at the same time, a post-Marxist critique of revolutionary vanguard politics and the philosophy of history that sustained these movements. It proposes a non-teleological conception of history, as well as a more nuanced appreciation of the deterritorialising *and* reterritorialising aspects of capitalism.

It offers ways of understanding the conditions and processes of social change that depart from Marxist orthodoxy (for example, by suggesting that it is not class conflict but movements of deterritorialisation and lines of flight within a given social field that provide the impetus and direction for change), as well as an alternative to traditional conceptions of revolution as the capture of State power by a privileged class (for example, Deleuze and Parnet outline a concept of becoming-revolutionary where this encompasses the myriad forms of minoritarian-becoming open to individuals and groups (Deleuze and Parnet 1987: 147)).

While these conceptual innovations and modifications took place within a broadly Marxist perspective that envisaged the emergence of new and better forms of social and political life, Deleuze and Guattari do not directly address the normative principles that inform their critical perspective on the present, much less the question how these might be articulated with those principles that are supposed to govern political life in late capitalist societies. Their machinic social ontology remains formal in relation to actual societies and forms of political organisation. The principled differences between liberal democratic, totalitarian and fascist States are mentioned only in passing in the course of their analysis of capitalism and present day politics as a process of axiomatisation of the social and economic field, in response to which they insist on the importance of struggle over particular axioms such as those involving welfare, unemployment benefits and forms of regional and national autonomy (Deleuze and Guattari 1987: 461–73). However, they offer no normative theory in support of the redistribution of wealth or the establishment of differential rights for cultural or national minorities. In this sense, their political philosophy does not engage with the political values and normative concepts which are supposed to inform the basic institutions of modern liberal democracies: the equal moral worth of individuals, freedom of conscience, the rule of law, fairness in the distribution of material goods produced by social cooperation, and so on.

Deleuze's writings and comments in interviews from the 1980s mark a significant shift in his thinking about such normative issues. He responds to the renewed interest in human rights during this period by insisting on the importance of jurisprudence as the means to create new rights.[3] His 1979 'Open Letter to Negri's Judges' already adopted the speaking position of one 'committed to democracy' (Deleuze 2006: 169). This theme becomes more pronounced in *What is Philosophy?*, where the primary example of becoming-revolutionary is not drawn from Lenin, but instead from Kant. Deleuze refers to the latter's distinction between the bloody events that took place in Paris in 1789 and the

people's enthusiasm for the idea of a constitutional state in order to suggest that the concept of a revolution in favour of the equal rights of men and citizens expresses 'absolute deterritorialisation even to the point where this calls for a new earth, a new people' (Deleuze and Guattari 1994: 101). The sense in which his political philosophy still advocates becoming-revolutionary as the path towards a new earth and 'a people to come' is modulated by the call for resistance to existing forms of democracy in the name of a 'becoming-democratic that is not to be confused with present constitutional states' (Deleuze and Guattari 1994: 113; translation modified). Far from dismissing the democratic ideal, the highly critical remarks about actually existing democracies found in *What is Philosophy?* imply that other actualisations of the concept or 'pure event' of democracy are still possible.[4]

In the remainder of this article I propose to explore further this normative turn in Deleuze's political thought by comparing his utopian conception of the aim of philosophy with the utopianism of Rawls's political liberalism. The purpose of this comparison is not to deny the differences that separate these two approaches to political philosophy but rather to use these differences to more sharply bring into focus some of the unexamined dimensions of each. Deleuze's analysis of societies of control has attracted considerably more attention than his embrace of some of the political values that inform the institutions and practices of liberal democracy. In part, this article might be read as an extended commentary on the one sentence in *What is Philosophy?* that invokes the concept of a 'becoming-democratic'. The comparison with Rawls enables us to identify some of the normative principles implicit in the critical stance toward existing liberal capitalist democracies adopted in *What is Philosophy?* In addition, the overtly historical dimension of political liberalism's version of the theory of justice suggests ways in which these principles might be understood in a manner consistent with Deleuze's broader commitment to norms that are immanent to particular forms of social and political life. In return, Deleuze's insistence upon political philosophy's role in the creation of new forms of life suggests that Rawls's principles of justice must also be supposed to remain open to the future and to the ever-present possibility of a democracy to come.

I. Extravagant versus Realistic Utopianism

At first glance, Deleuzian and Rawlsian political philosophy appear to be engaged in profoundly different enterprises: one is a primarily critical while the other is predominantly reconstructive; one is primarily

concerned with the dynamics of social and political assemblages, while the other is concerned to elaborate a normative conception of society as a fair system of cooperation. The aim of Rawls's political liberalism is to set out in systematic form principles of justice that may plausibly be supposed to find acceptance among reasonable members of modern democratic society. A 'well-ordered' society in his sense of the term is one that is effectively governed in accordance with principles of justice that everyone understands and accepts and knows that everyone understands and accepts. These principles should spell out the terms on which society can operate as a fair system of cooperation. They should determine the structure of the basic political, economic and social institutions. Most importantly for the comparison with Deleuze, ideas that form the basis of the conception of justice must be drawn from the public political culture of Western liberal democracy, including its institutions and the historical traditions of their interpretation. In this sense, Rawls insists that the theory of justice is political rather than metaphysical.

In *Justice as Fairness: A Restatement*, Rawls identifies four purposes served by this kind of reconstructive political philosophy: (1) It can help to resolve deeply disputed questions by searching for common philosophical and moral ground between the protagonists. The aim is to achieve social cooperation on bases of mutual respect even though irresolvable differences remain. For example, with regard to the conflict within the Western liberal tradition between the values of liberty and equality, political liberalism searches for underlying bases of agreement or higher order principles in the hope that these might narrow the differences between libertarian and egalitarian concepts of freedom and equality; (2) It can serve the task of orientation that seeks to identify reasonable and rational ends, both individual and collective, and to show 'how those ends can cohere within a well-articulated conception of a just and reasonable society'; (3) It can address the task of reconciliation by seeking to show the limits of what can be achieved within a democratic society characterised by the existence of 'profound and irreconcilable differences in citizen's reasonable comprehensive religious and philosophical conceptions of the world'; (in this manner, political liberalism argues against communitarians that a political society is not a community in the sense that this implies shared comprehensive moral views, but also against libertarians that it is not simply an association that one can leave at any time); and finally (4) political liberalism serves the 'realistically utopian' task of 'probing the limits of practicable political possibility' (for example, it asks what a just and democratic society would be like, given the 'circumstances of justice' that obtain in the actual historical

world in which we live, but also what it would be like 'under reasonably favourable but still possible historical conditions' (Rawls 2001: 3–4)). Rawls recognises that there is a question about how we determine the limits of the practicable and indeed of our social world. He notes that these are not simply given by the actual since we can and do change existing social and political institutions, however, he does not pursue this question (Rawls 2001: 5). By contrast, the ambition to challenge the limits of our present social world is at the forefront of Deleuze's conception of philosophy.

What is Philosophy? outlines a political conception of philosophy as the creation of concepts in which the aim is overtly utopian: '*We lack resistance to the present*. The creation of concepts in itself calls for a future form, for a new earth and people that do not yet exist' (Deleuze and Guattari 1994: 108). The suggestion that philosophy provides a way of responding to what is intolerable in the present implies that this resistance may assist the emergence of new forms of individual and collective life that, in specific ways, are *better than* existing forms. Nevertheless, since the contours of the intolerable are historically determined and subject to change, there is no presumption of any end of the current state of things or attainment of a perfectly just society; nor does Deleuzian political philosophy appear to be concerned to set out the normative principles in terms of which new social arrangements might be qualified as better or more just than those that precede. Rather, it is focused on the forces and processes that produce or inhibit changes to the character of individual and social life. Of the four functions that Rawls identifies, Deleuze and Guattari do not address those of resolution, orientation or reconciliation; however, they do address the utopian function, but not by setting out principles against which we might evaluate the justice or fairness of social institutions. They do not offer principles of society as a fair system of cooperation in the light of which we might point out the ways in which present liberal democracies fail to live up to this ideal. In other words, their philosophy is utopian by virtue of what it does rather than by virtue of laying out a blueprint for a just society.[5]

The conception of the political vocation of philosophy outlined in *What is Philosophy?* suggests far more radical ambitions than those acknowledged in Rawls's realistic utopianism: philosophy 'summons', calls forth, or otherwise helps to bring about 'new earths and new peoples'. Success in this kind of political philosophy is not measured by the test of reflective equilibrium or by the requirements of maintaining a well-ordered society but by the capacity of its concepts to engage productively with real movements of social change. In this respect, Deleuze's

conception of the political task of philosophy is close to that of Foucault, who describes the aim of his genealogical criticism as the identification of limits to present ways of thinking, acting and speaking in order to find points of difference or exit from the past: 'in what is given to us as universal, necessary, obligatory, what place is occupied by whatever is singular, contingent and the product of arbitrary constraints?' (Foucault 1997: 315). Rather than attempt to provide normative justification for such departures from established ways of thinking, acting and speaking, Foucault prefers to link the limits described in genealogical terms to specific social transformations underway in the present in which he wrote, such as those in relation to prisons and sexual morality.

Deleuze expresses a similar view when he links the creation of philosophical concepts to the kinds of 'becoming-revolutionary' available to individuals and groups in a given social milieu. He follows Nietzsche in supposing that becoming or the pure event is an 'unhistorical element' that is necessary in order for new forms of life to emerge. He distinguishes between the way in which revolutions turn out historically and the 'becoming-revolutionary' that is expressed in a given concept but that remains irreducible to its historical manifestations. Here, too, he aligns his conception of philosophy with Foucault's conception of the task of the genealogist; in both cases, the point is to identify particular ways in which we are undergoing transformation or becoming-other. Nietzsche's 'untimely' and Foucault's concept of the 'actual' both attempt to identify what Deleuze calls 'the virtual' or the 'becoming' that is expressed in a concept. In each case, a distinction is drawn between present reality, which can be understood as a product of history, and 'what we are in the process of becoming – that is to say, the Other, our becoming-other', which can only be understood in relation to the virtual, the untimely or, in Foucault's case, the actual (Deleuze and Guattari 1994: 112). Particular processes of becoming-revolutionary imply forms of individual and collective self-transformation in response to what is intolerable or shameful in the present. They do not always lead to better or more just social arrangements, but they are the only means to achieve such local improvements in the conditions of a given people.

II. Utopianism and Becoming-democratic

Two features of the relationship of philosophy to the social milieu in which it takes place are relevant to the utopianism of Deleuze's political philosophy. First, the manner in which philosophy is inherently critical of its milieu; second, the manner in which its critical aspect draws upon

processes and tendencies that are immanent to this milieu and that embody a potential for change. It is because it creates concepts that express pure events or 'becomings' that philosophy is inherently critical of its milieu. However, such criticism is effective only to the extent that it connects with deterritorialising forces already at work within that milieu:

> Philosophy takes the relative deterritorialisation of capital to the absolute; it makes it pass over the plane of immanence as movement of the infinite and suppresses it as internal limit, *turns it back against itself so as to summon forth a new earth, a new people*. (Deleuze and Guattari 1994: 99)

Together the deterritorialising impulse proper to philosophy and the synthetic relationship between philosophy and its milieu explain Deleuze's appeal to 'becoming-democratic' as a concept capable of resistance to the present. Let us consider each of these features in turn.

What is Philosophy? presents the emergence of philosophy as the result of an entirely synthetic and contingent encounter between the Greek milieu and the plane of immanence of thought. This encounter gave rise to a specific kind of thought defined in terms of its affinity with absolute as opposed to relative deterritorialisation. Relative deterritorialisation concerns the historical relationship of things to the territories into which they are organised: the manner in which these territories break down and are transformed or reconstituted into new forms. Absolute deterritorialisation concerns the a-historical relationship of things and states of affairs to the virtual realm of becoming or pure events that is imperfectly or partially expressed in what happens. Philosophical concepts express such pure events or becomings, where these are understood as the conditions of change and the emergence of the new:

> Actually, *utopia is what links* philosophy with its own epoch, with European capitalism, but also already with the Greek city. In each case it is with utopia that philosophy becomes political and takes the criticism of its own time to its highest point. Utopia does not split off from infinite movement: etymologically it stands for absolute deterritorialization but always at the critical point at which it is connected with the present relative milieu. (Deleuze and Guattari 1994: 99)

The sense in which this conception of philosophy is utopian must therefore be understood in terms of the connection between the absolute deterritorialisation pursued in philosophy and the relative deterritorialisations at work in its social milieu: 'There is always a way in which absolute deterritorialisation takes over from a relative deterritorialisation in a

given field' (Deleuze and Guattari 1994: 88). It follows that the utopian vocation of philosophy can only be achieved in function of the kinds of relative deterritorialisation at work in a given society. Philosophical concepts are critical of our present, even revolutionary, to the extent that they 'connect up with what is real here and now in the struggle against capitalism' (Deleuze and Guattari 1994: 100). Deleuze's utopianism is therefore immanent in the sense that it does not simply posit an ideal future but rather connects with processes of relative deterritorialisation that are present in but stifled by the present milieu, extending these and taking them to extremes. To the extent that these processes or 'lines of flight' encompass resistant political forces and the ideals or opinions which motivate them, it follows that this immanent utopianism will draw upon elements of present political normativity to suggest ways in which the injustice or intolerability of existing institutional forms of social life might be removed.

In the light of this account of Deleuze's immanent utopianism, it is easy to see how the concept of 'becoming-democratic' serves the task of philosophy. The complex concept of democracy ties together a number of the values at the heart of liberal political thought. Determinate conceptions of democratic political society will serve to counteractualise particular forms of resistance to the present in contemporary public culture. The appeal to 'becoming democratic' as a vector of resistance to the present relies upon a number of historical claims about the relationship between democracy and modern society: (1) That democracy is the preferred political form of the nation states which sustained the emergence of capitalist economies and now function as the administrative nodes of its global system. Democracy is the modern version of the Greek society of brothers or friends (Deleuze and Guattari 1994: 98); (2) That democracy implied certain forms of relative deterritorialisation of society. Consider the ways in which the idea of fundamental equality of all citizens undermines the hierarchies of pre-capitalist society; (3) That these forms of deterritorialisation were reterritorialised on the modern constitutional state and its extension into the international sphere in the form of principles of human rights; (4) But that, since there is no universal democratic state, there are only particular democratic states with their own forms of democratic governance and their own institutional implementations of the equal rights of man and citizen; (5) Finally, that processes of democratisation remain an important vector of deterritorialisation in modern capitalist society.

'Becoming-democratic' thus expresses the potential extension of existing forms of relative deterritorialisation to the limits of what is possible

under present conditions (I will say more about Deleuze's understanding of these limits below). In other words, it points to ways of criticising the workings of actually existing democracies in the name of the egalitarian principles that are supposed to inform their institutions and political practices. This is not to say that Deleuze would endorse all forms of becoming-democratic. Like all forms of deterritorialisation, it is not without its dangers, and the comments on Heidegger and the experience of fascism in *What is Philosophy?* remind us that it is not enough to put one's faith in the people: it depends on what people and how they are constituted as a political community (Deleuze and Guattari 1994: 108–9). Deleuze offers no detailed account of just what he understands by 'becoming-democratic' and it is not difficult to imagine forms of populism that go against the grain of his political sensibility. At the same time, it is not difficult to find elements in his work with which this concept might be filled out. Here are three such elements:

(1) One of the sources of conflict that has been present ever since the introduction of modern democratic government has been the coexistence of formally equal rights alongside enormous disparities of material condition. The history of modern democracies has been in part a history of struggle to reduce material inequality and to ensure that the basic rights of citizens have at least approximately equal value for all. Deleuze alludes to this ongoing problem when he contrasts the universality of the market as a sphere of exchange of commodities and capital with the manner in which it generates poverty as well as enormous wealth and distributes these unequally. The benefits of market economies are not universally shared and inequalities of condition are handed down from generation to generation in direct contravention of the principle that all are born equal. Deleuze is critical of the way in which modern democratic states fail to live up to their egalitarian promise: 'There is no democratic state that is not compromised to the very core by its part in generating human misery' (Deleuze 1995: 173).[6]

However, the suggestion that democratic states are morally and politically compromised by their role in the perpetuation of this form of injustice implicitly raises the normative question what principles of distribution should apply in a just democratic society? Should we push for radically egalitarian principles that would treat any undeserved inequality of condition as unjust, or should we be satisfied with Rawls's difference principle according to which social and economic inequalities are allowed only when they are attached to positions open to all and when they are 'to the greatest benefit of the least advantaged members of society' (Rawls 2005: 6)? Should the principles of distributive justice

apply globally or only within the borders of particular democratic states? I am not suggesting that Deleuze provides us with the means to answer these normative questions, but only that they are inevitably raised by his criticisms of the existing state of affairs. Achieving a more just distribution of material social goods is one vector of 'becoming-democratic'.

(2) Another constant source of conflict in democratic nation states ever since their inception has been the struggle to broaden the base of those who count as citizens and thus enjoy full access to the entire range of basic legal and political rights. Democracy has always relied upon the principle of majority rule, but the prior question 'majority of whom' has always been settled in advance and usually not by democratic means. This exposes a fault in one of the key components of the concept of democracy, namely the concept of majority. This can mean either the quantitative majority of those counted or the qualitative majority of those among the population at large who are considered fit to be counted. Deleuze and Guattari rely upon the latter, qualitative sense of majority in *A Thousand Plateaus* when they point to the existence of a majoritarian 'fact' in contemporary European derived societies, namely the priority of 'the average adult-white-heterosexual-European-male-speaking a standard language' (Deleuze and Guattari 1987: 105). The adult, white *et cetera* male is majoritarian not because he is numerically in the majority but because he forms the standard against which the rights and duties of all citizens are measured. Deleuze and Guattari point out that the existence of such a standard presupposes the exercise of power over women, children, non-whites and other excluded groups: 'Majority assumes a state of power and domination, not the other way around' (Deleuze and Guattari 1987: 105).

Minoritarian becomings are defined as the variety of ways in which individuals and groups fail to conform to this standard. These have given rise to a succession of measures to extend the scope of the standard and thereby broaden the subject of democracy: first, in purely quantitative terms by extending the vote to women and other minorities; second, in qualititative terms by changing the nature of political institutions and procedures to enable these newly enfranchised members to participate on equal terms. The idea that who are the representatives in a given polity matters as much as the ideas represented has become widely known as 'the politics of presence'.[7] That it remains a difficult struggle is shown by the fact that efforts to achieve political representation of women in proportion to their numbers in the population is ongoing in most European derived countries, despite their having been

enfranchised for the better part of a century. Efforts to change the nature of public institutions in ways that both acknowledge and accommodate many kinds of difference are ongoing in democratic societies, for example in relation to sexual preference, physical and mental abilities, cultural and religious backgrounds. Deleuze and Guattari affirm the importance of the politics of presence and of efforts to enlarge the character of the majority, even as they insist that the power of minorities 'is not measured by their capacity to enter into and make themselves felt within the majority system' (Deleuze and Guattari 1987: 471). By their nature, processes of minoritarian-becoming will always exceed or escape from the confines of any given majority. They carry the potential to transform the affects, beliefs and political sensibilities of a population in ways that amount to the advent of a new people. In turn, to the extent that a people is constituted as a political community, the transformations it undergoes will affect its conceptions of what is fair and just and therefore the nature of the rights and duties attributed to the new majority.[8] Minoritarian becomings therefore provide another vector of 'becoming-democratic'.

(3) A third struggle concerns the principle of legitimacy that governs decisions in a democratic polity. In his interview with Negri, 'Control and Becoming', Deleuze comments on the importance of jurisprudence as a source of law and new rights with reference to the question of rights in relation to new forms of biotechnology. He goes on to add that we mustn't leave decisions on such matters to judges or experts. What is required is not more committees of supposedly well qualified wise men to determine rights but rather 'user groups' (Deleuze 1995: 169–70). The implicit principle in this recommendation is the democratic idea that decisions ought to be taken in consultation with those most affected by them. This is one of the founding principles of modern democratic governance. Deleuze is not the only theorist to recommend its extension and application to new contexts. Thus, Ian Shapiro argues that whether or not someone is entitled to a say in a particular decision depends upon whether or not their interests are likely to be affected by the outcome and upon the nature of those interests: the more fundamental the interest the greater their entitlement to a voice in the decision-making process (Shapiro 2003: 52). Liberal-socialist egalitarians such as Rodney Peffer rely on the same principle to argue that democracy should be implemented in the workplace (Peffer 1990: 419–20). Deleuze's proposed application of the principle in the realm of jurisprudence suggests that the opening-up of decision-making procedures throughout society will constitute a further vector of 'becoming-democratic'.

III. Immanent Criticism and Considered Opinion

Deleuze's appeal to the concept of 'becoming-democratic' as the means to resist the injustices of capitalism suggests that the differences between Rawls's political philosophy and his own are neither as profound nor as irreconcilable as they might first appear. Closer examination reveals other ways in which the distance between them is narrower than we might have imagined. First, while it is true that a central concern of Rawls's political liberalism is to provide a systematic rationale for the basic political structure of liberal democratic society, his conception of justice is not so cautious, nor so remote from critical engagement with those forces hostile to change, as some commentators suggest. For example, in his *Reply to Habermas*, he lists three points on which his theory implies criticism of the current institutional structure of American democracy:

> the present system woefully fails in public financing for political elections, leading to a grave imbalance in fair political liberties; it allows a widely disparate distribution of income and wealth that seriously undermines fair opportunities in education and in chances of rewarding employment, all of which undermine economic and social equality; and absent also are provisions for important constitutional essentials such as health care for many who are uninsured. (Rawls 2005: 407)

More generally, his theory of justice implies the need for basic social institutions incompatible with existing forms of welfare state capitalism, much less neo-liberal versions of this regime. The problem with even the most generous welfare states is that they do not provide for equal value of basic political liberties or for real equality of opportunity among all citizens. They allow a relatively small class of citizens to retain control of means of production and, as a result, to exercise disproportionate control over economic and political life. For these reasons, Rawls prefers a form of 'property-owning' democracy which would ensure widespread ownership of means of production: productive assets as well as human capital (Rawls 1971: 274). Such a society would aim to endow all citizens with the means to be fully participating members of society as a shared system of cooperation, with the relevant skills, knowledge and understanding of institutions necessary for real equality of opportunity from one generation to the next (Rawls 2001: 139). In these and other ways, Rawls's theory of justice is genuinely utopian. In Deleuze's terms, it provides bases for effective resistance to present forms of liberal capitalist democracy.

Second, the utopianism of both approaches is based upon normative concepts immanent to the political culture of the society in question. Deleuzian philosophy is political insofar as it produces concepts which

draw upon and connect with processes of relative deterritorialisation already underway in the social field. We saw above how the concept of a 'becoming-democratic' implicitly draws upon elements of our existing concept of democracy as well as historical struggles to implement or expand democratic principles of government. In parallel fashion, Rawls elaborates his theory of justice on the basis of concepts and convictions already present in the public political culture of liberal democracies. Democratic political order requires principles of public reason to set limits to the conduct of public debate and provide the normative framework within which disagreements can be settled, or at least kept within reasonable bounds so as not to threaten stability. Rawls's answer to the question 'where do these principles come from?' is to say that their ultimate foundation lies in the settled convictions and considered opinions of the people concerned. The principles of public reason and the political conception of justice on which they are based must be consistent with the settled convictions of the political culture, such as the toleration of religious diversity or the abhorrence of slavery. The ultimate test of an acceptable political conception of justice is the achievement of 'reflective equilibrium' between the proposed principles of justice and the firmly held convictions embedded in the institutions and traditions of the political culture: 'The most reasonable political conception for us is the one that best fits all our considered convictions on reflection and organises them into a coherent view. At any given time we cannot do better than that' (Rawls 2001: 31).

The overlapping consensus which underpins political liberalism's principles of justice is not reached by means of empirical survey or negotiation between the actual convictions of a particular people, but it is nonetheless supposed to be attainable by reasonable persons on the basis of the political convictions that are embedded in liberal democratic institutions, including constitutions, laws and their traditions of interpretation. The fact that it appeals to nothing outside the convictions and discourses that belong to a particular political assemblage justifies the claim that Rawls, like Deleuze, offers an immanent political utopianism. The manner in which Deleuzian concepts are supposed to express pure events that function as vectors of absolute as opposed to relative deterritorialisation undermines the possibility of any simple contrast between a 'materialist' philosophy of becoming and an 'idealist' theory of justice.

Third, both Rawls and Deleuze define the task of political philosophy in relation to a certain kind of opinion that must be distinguished from the day-to-day opinions of citizens. The role of reflective equilibrium in Rawls's approach quite explicitly ties the theory of justice to the

considered opinions of people on fundamental principles of right, fairness and justice. Political liberalism therefore implies a distinction between two kinds or levels of opinion: considered opinions about right ways of acting, insofar as these are expressed in the institutions, the constitutional settlements, legal decisions and traditions of interpretation of the society in question, and everyday opinions on matters of current concern or public policy. Deleuze also draws a distinction between everyday opinions on matters of current concern and the opinions embedded in the national characteristics of a people, their conceptions of right and their practical philosophy as this is expressed in political and legal institutions. In the context of the account of 'geophilosophy', he asks at one point whether philosophy in its present critical form is closely aligned with 'the modern democratic state and human rights' (Deleuze and Guattari 1994: 102). In reply, he points out that there is no universal democratic state but only particular democratic states, the contours of which are determined in part by the philosophical 'opinions' or 'nationalitarian' opinions about what is right, fair and just (Deleuze and Guattari 1994: 102–4). The opinions expressed in the political and legal institutions of a given people, their conceptions of right, justice and equality as opposed to the everyday opinions of people, will determine the national characteristics of their thought. They will also condition the institutional and constitutional structure of particular national forms of democracy. Deleuze suggests that, to the extent that modern philosophy is reterritorialised on the idea of the democratic state, it will always be modulated by 'nationalitarian' concerns:

> In each case philosophy finds a way of reterritorialising itself in the modern world in conformity with the spirit of a people and its conception of right. The history of philosophy therefore is marked by national characteristics, or rather by *nationalitarianisms, which are like philosophical opinions*. (Deleuze and Guattari 1994: 104; emphasis added)

The limits that flow from the manner in which democratic ideals are expressed in accordance with the philosophical opinions of particular peoples amount to one kind of constraint on the institutional and legal actualisation of democratic ideals in a given society. Deleuze points to a second kind of constraint on democratization in the present that follows from the requirements of global capitalism. He argues that there is no universal democratic state because 'the market is the only thing that is universal in capitalism' (Deleuze and Guattari 1994: 106). The account of the relation between contemporary nation states and capitalism in *What is Philosophy?* remains the same as it was in *A Thousand Plateaus*: national

state government and economic systems are 'models of realisation' of the immanent axiomatic of capitalism. To the extent that modern democratic states function as models of realisation of the immanent axiomatic of global capitalism, they will be constrained by their subordination to the requirements of this system. This implies that relations of interdependence compromise even the most democratic nodes of this global economic system insofar as they are direct or indirect beneficiaries of the actions of dictatorial states. It also implies that the extension of the fundamental equality and security of citizens in the form of human rights amounts to adding axioms that coexist in the global axiomatic of capital alongside other axioms, 'notably those concerning the security of property' (Deleuze and Guattari 1994: 107). These property rules, Deleuze suggests, do not so much contradict the basic rights of individuals as suspend their operation in certain contexts. Thus, when basic political rights co-exist alongside private property in large-scale means of production, and in the absence of publicly financed elections, they do not have the same value for all citizens. When private property in means of production exists alongside the absence of mechanisms to provide minimal healthcare, housing or education, the basic welfare rights of the poor are effectively suspended. Hence the force of the rhetorical question:

> What social democracy has not given the order to fire when the poor come out of their territory or ghetto? Rights can save neither men nor a philosophy that is reterritorialized on the democratic State. Human rights will not make us bless capitalism. (Deleuze and Guattari 1994: 107)

Such extreme situations of poverty and oppression are not the only manifestation of the subordination of democratic life to the requirements of capital. Deleuze also points to 'the meanness and vulgarity of existence that haunts democracies' as this is expressed in the 'values, ideals and opinions of our time' (Deleuze and Guattari 1994: 107–8). This is an important part of the reason why 'our democracies' do not provide optimum conditions for resistance to the present or the constitution of new earths and new peoples. The consensus of opinions in these societies all too often reflects 'the cynical perceptions and affections of the capitalist' (Deleuze and Guattari 1994: 108, 146).

As we saw above, however, the day-to-day opinions of citizens must be distinguished from the considered opinions of a given people on fundamental principles of right. Rawls and Deleuze are in agreement that political philosophy should engage with the opinions of the latter kind present in a given social milieu. The difference between a relatively cautious and realistic and a more extravagant and critical utopianism

re-appears in the difference between their respective relations to philosophical opinion. Rawls's political liberalism seeks to reconstruct the considered opinions of a historically specific form of society in order to render them systematic and coherent. In this way, it produces a concept of a fair and just society, subject to the qualification that this concept might change as the considered opinions of the society change. By contrast, Deleuze's 'utopian' conception of the political vocation of philosophy implies a more critical relation to existing forms of opinion. It implies a critical engagement with considered opinions, aimed at their transformation rather than their systematic reconstruction. That is why, in the brief exergue to *Negotiations*, Deleuze presents philosophy as engaged in a 'guerilla campaign' against public opinion and other powers that be such as religions and laws (Deleuze 1995). His criticisms of the inequalities produced by capitalism should be understood in this light. They challenge existing opinions about what is acceptable with the aim of extending and developing equality of condition within contemporary societies. Such criticism must engage with forms of becoming-revolutionary that are immanent and active in present social and political life if they are to assist in opening up paths to new forms of individual and collective life.

The first two elements of the concept of becoming-democratic identified above directly confront the two kinds of limitation on the actualisation of democracy in the modern world: the struggle against unjust inequality of condition challenges fundamental elements of the capitalist axiomatic, while the struggle against the arbitrary nature of the qualitative majority challenges the weight of nationalitarian political and philosophical opinion. The different kinds of minoritarian-becoming that give rise to movements to reconfigure the subject of democracy, such as the struggle for equal representation of women or for equal rights for homosexual partners, encounter varying degrees and kinds or resistance depending upon the details of nationalitarian opinion in each case. The third element points to an additional line of flight in contemporary democratic societies that has the potential to connect up with the first two and carry the transformative process forward, even to the point of breaking down the limits imposed by the separation of a private sphere of property relations and a public sphere of deliberation over and regulation of the common good. As the 'contour, the configuration, the constellation of an event to come' (Deleuze and Guattari 1994: 32–3), the concept of becoming-democratic points toward the deterritorialisation of existing democracies and their reconfiguration in new social and political forms. The specification of these new political territories and peoples

requires that we spell out the normative principles governing the basic institutional structure of society. The further development of Deleuzian political philosophy along the paths opened up by the concept of 'becoming-democratic' therefore implies a need for further engagement with the kind of normative political theory undertaken by Rawls and other egalitarian liberals.

Notes

1. *L'Abécédaire de Gilles Deleuze avec Claire Parnet* is unpublished in literary form but available on video cassette (1996) and CD Rom (2003) from Vidéo Editions Montparnasse. These remarks are from the section entitled *C comme culture*. I am grateful to Charles J. Stivale for his help in transcribing and translating them.
2. On jurisprudence, see Deleuze 1995: 153, 169–70, and his remarks in *L'Abécédaire*, *G comme Gauche*. On the philosophical function of shame, see Deleuze and Guattari 1994: 108 and Deleuze 1995: 172. On societies of control, see 'Postscript on Societies of Control', Deleuze 1995: 177–82. On becoming-revolutionary, see Deleuze 1995: 171; Deleuze 1997: 4 and Deleuze and Parnet 1987: 147. On becoming-democratic, see Deleuze and Guattari 1994: 113.
3. See the comments on Deleuze's remarks about jurisprudence in *L'Abecedaire* in Smith 2003, 314–15. I discuss Deleuze's remarks and his criticisms of the enthusiasm for human rights in Patton 2005a, 58–60 and 2005b, 404–6.
4. Philippe Mengue's provocative argument (Mengue 2003) that Deleuze is fundamentally hostile to democracy provided an important stimulus to thinking about this question.
5. Eugene Holland draws a useful distinction between utopianisms that elaborate an ideal blueprint and utopianism as process, in order to suggest that Deleuze's utopianism is of the latter kind (Holland 2006: 218).
6. See also his comments about the 'absolute injustice' of the current unequal global distribution of wealth in *L'Abecedaire*, in the section *G comme Gauche*.
7. Anne Phillips sums up the core idea as follows: 'when the politics of ideas is taken in isolation from the politics of presence, it does not deal adequately with the experience of those social groups who by virtue of their race or gender have felt themselves excluded from the democratic process. Political exclusion is increasingly – I believe rightly – viewed in terms that can only be met by political presence' (Phillips 2006: 173).
8. For this reason, Deleuze and Guattari affirm the importance of the feedback from minoritarian becomings to the character of the majority: 'molecular escapes and movements would be nothing if they did not return to the molar organizations to reshuffle their segments, their binary distributions of sexes, classes and parties' (Deleuze and Guattari 1987: 216–17). I comment further on the relations between majority and minority in Deleuze and Guattari's political philosophy in Patton 2005a: 60–2 and Patton 2005b: 406–8.

The Figure of the Arab in *Three Billion Perverts*

Gary Genosko Lakehead University

I. Introduction

Why write about a journal issue? Even if the notoriety of the journal in question, the *Three Billion Perverts* issue of *Recherches*, had not survived the decades since its publication, returning to the scene of the crime, as it were, may still prove valuable for historical and philosophical and political purposes within Deleuze and Guattari scholarship. Critical, though, is the focus on the journal itself within the project of understanding the lifework of Félix Guattari. If there were a constant in Guattari's brand of activist-intellectualism, it was his involvement in the collective production of journals by trans-disciplinary editorial assemblages. He went down this road from his teenage years when he engaged in a collective auto-unfolding of a peripatetic youth group dedicated to far left politics in one of the splinter groups within the youth hostel association in France. The journals we have come to associate with him – *Recherches* and *Chimères* – are predated by the broadsheets and reviews of the far left groupuscules for which he worked, and the little experiments such as *Change international* in which he participated, not to mention all the newspapers, mainstream and otherwise, for which he wrote. The journal is a favoured micro-institutional matter produced by editorial assemblages seeking to realise collectively their projects and create new worlds of reference. The journal issue under discussion in this paper may be appreciated in these general terms, but it also underlines the challenges of collective production and quasi-anonymous authorship, especially when a volatile subject such as sexuality is at issue. *Three Billion Perverts* demonstrates something about which Guattari constantly reminded his readers: that it is not possible to exclude, as one skates along the plane of immanence, the worst excesses of multiplicity. Since this journal, to the extent that it survives, is the kind of enduring

micro-institutional matter that is available for revisiting (unlike all the other meetings and so forth lost to time), it provides an opportunity to study how one figure, that of the Arab, appeared to catalyse the collective self-production of the micro-institution called CERFI – Centre d'Etudes, de Recherches et de Formation Institutionnelles (Centre for Study and Research into Institutional Functioning).

II. Background

In March of 1973, CERFI published in its house journal *Recherches* a special issue (#12) devoted to homosexuality in France, 'Trois milliards de pervers: Grande Encyclopédie des Homosexualités' (see Figure 1). Guattari was listed as director of the publication and held legally responsible for it. Those familiar with Guattari's writings will know that his 'Liminaire' ["Introduction"] to the special issue has been reprinted here

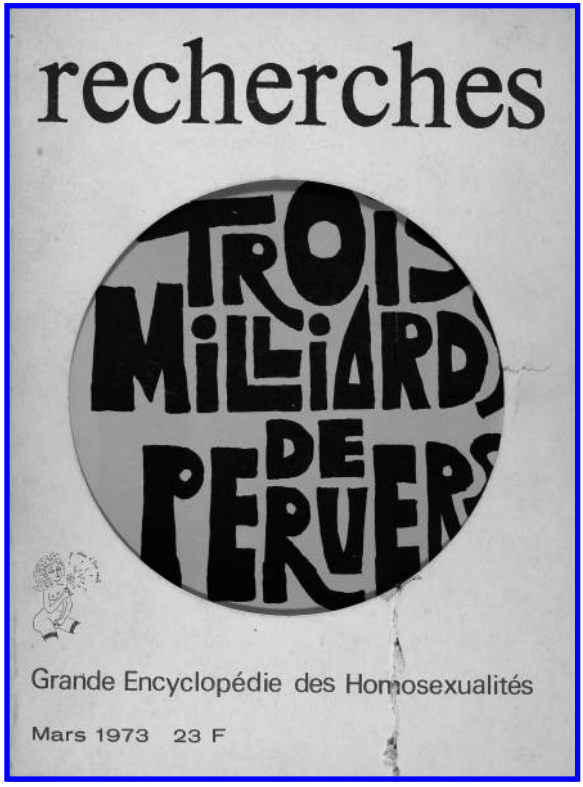

Figure 1 Cover of the *Three Billion Perverts* issue.

and there and translated into English, with additions, in *The Guattari Reader* (Guattari 1996). The events that followed the issue's publication are well-known and are summarised in a footnote: 'The March issue . . . had been seized, and Félix Guattari, as the director of publications, was fined 600 francs for affronting public decency. Number 12 . . . was judged to constitute a 'detailed display of depravities and sexual deviations', and the 'libidinous exhibition of a perverted minority'. All copies of the issue were ordered destroyed (Guattari 1996: 192).

Readers of Guattari are aware of these circumstances, but very few have actually seen a copy of the issue in question. In 2002, however, a copy that had been 'graphically adapted', in the words of the designer Olivier Surel, surfaced on the Internet on the site of the French journal *Critical Secret*, under the direction of Aliette Guibert and courtesy of Florence Pétry of Editions Recherches. Access to the issue is password protected. To this day, then, the issue is censored since, it is explained, 'the seductive boldness of 32 liberatory pages under the generic title Pedo-Philia was the object, without issuing a moral judgement, of a resolute self-censorship' (Guibert and Pétry 2002). Anyone who applies for a password in order to view the issue will notice the absence of the original section on paedophilia. On the whole, what is ordered destroyed is not necessarily enforced and paper copies of the issue are still to be found in private libraries of Deleuze and Guattari scholars. All further references to *Recherches* 12 will be to the original printed copy generously loaned to me by Paul Patton.

III. Overview of *Three Billion Perverts*

Generally, *Three Billion Perverts* mixed politics with pleasure, amateur with professional academic debate, journalistic modes of address with diary writing; the photos (often no more than snapshots) and drawings of a delightful lasciviousness (ribald and ridiculous), are playful and at times silly, but obviously in debt to Tintin (and at some points Dennis the Menace!). Aficionados of the French avant-garde can duly note the influence of Situationist aesthetics in these counter-deployments of comic strips (Wollen 1989: 27).

The list of original contributors runs to at least 35 persons. Many of the best-known contributors have since died: Guattari, Deleuze, Foucault, Sartre, Châtelet, Genet, Hocquenghem. The issue retains an aura of mystery, though the story of its creation has been recounted in part by Anne Querrien, and Guattari never failed to mention it when looking back on the highlights of *Recherches*. In 1972, several members

of the Front homosexuel d'Action Révolutionnaire (FHAR) crossed over into CERFI and, eschewing funding or the quaint term 'commissions' from the French state, produced the issue in question and thus, 'With them CERFI became what we wanted, and feared, from the outset: a gathering place for resistances and interconnecting singularities' (Querrien 2002). Querrien adds that the issue took six months to put together, with the aid of Guy Hocquenghem.

What exactly caught the attention of the court? In an interview with George Stambolian, Guattari explained that at the time 'among the things that most shocked the judges was one of the most original parts of this work – a discussion of masturbation. I think that a work devoted to homosexuality in a more or less traditional manner would have had no difficulty. What shocked perhaps was the expression of sexuality going in all directions. And then there were the illustrations – they were what set it off' (Guattari 1996: 204). The wide-ranging section on masturbation ('Masturbations' 1 and 2 occupies pages 64–94) meditates on a range of pertinent questions across the sexes – to lubricate or not and, if so, with what substance, and from which source? What is the relationship between masturbation and lack? And between lack and guilt? Solo or assisted? Intellectual or physical? Manual or non-manual? Genital or non-genital? 'Gilles' and 'Guy' (first names only) explore these and other themes in a speculative mode, while their discussion is punctuated by interjections from two frisky interlocutors, and then turned away from its overt phallicism by 'Anna'. The line drawings inserted into the dialogue stage all kinds of psycho-sexual scenes: the question of size (a carrot on a ruler); a penile film projector; prisoners masturbating, and so on. There is no hint of the scaffolding of objective social science: no holds barred, if you will. The only critical comment on any of the illustrations beyond that of Guattari is in the 'New Introduction' to Hocquenghem's *Homosexual Desire* in which Michael Moon tarries with a cartoon, 'La Pouissance ou Jouissance' ['Power or Pleasure']. Although he does not comment on other contents that he has listed dutifully, this cartoon by Copi held his attention. Perhaps Guattari was correct regarding the gripping nature of the illustrations that they set many machines in motion, some more fascistic than others. The cartoon by Copi is a parody of pop psychobabble – 'what's on a man's mind' – but with little line drawings showing that other men are on a man's mind. And what's on a woman's mind is sex with other women, as well. What strikes Moon is the absence of 'liberated gay men' in the cartoon, and that the humorous insight into fantasies that unlock otherwise blocked male desire also enable lesbian desire (Moon 1993: 12–15).

IV. The Figure of the Arab

Other sections of the publication are equally candid yet visually diffuse the discussion through art historical referencing (as in the section on lesbian culture) and by means of graphic novel formats (in the case of paedophilia). However, running through the sections of the journal may be found contributions regarding the volatile sexual dimension of French colonialism in North Africa. Indeed, if there is a 'problem' the issue tackled across its different sections, or subject (group) positions, it is that of the Arabs – the use of scare quotes around this term will be reserved for later in the discussion – who populated certain articles and were the (displaced) subjects of several submissions which sought to grapple with the racist and fascist desiring machines unleashed in the publication. My approach to the journal is based on a strategy of reading that critically follows the movements of race across the journal's sectional-sexual specificities. In this way the figure of the Arab serves the unrestrained expression of desire, providing the basis for a myriad of statements and observations, from the overtly racist to meta-editorial wrangling about which articles are in and which are out. This figure tells us about the transversal dimension of the journal and the group desire that it unleashed and conducted toward diverse referential anchors: autobiography (Arabophilia in French gay culture), sociohistorical specificity (the legacies of French colonialism in North Africa, understood at a specific historical juncture), and a certain kind of political critique of the journal itself (writing about Arabs yet without them).

This article presents a reading of *Three Billion Perverts* through the problem of the status of the figure of the Arab in French homosexual desire at a specific moment in a transversal social ecology. What is it to write, as one contributor put it in identitarian terms, 'on Arabs, but without Arabs'? This is the lesson of Deleuze's 'Letter to a Harsh Critic' inasmuch as it concerned issue number 12, especially Michel Cressole's contribution to 'Us and the Arabs', soundly criticised as 'completely Oedipal – more Oedipal than my daughter' – by Deleuze in his comment on the text 'Sex-Pol en Acte' (Deleuze 1995). The status of the figure of the Arab is made a subject of critical reflection and lively debate within the journal's pages, without cancelling out the masturbatory fantasies and field reports of several contributors, who cruised immigrant neighbourhoods in urban France, or enjoyed sex junkets to Morocco or Algeria. This field of desire is heterogeneous and complex, and as soon as we wade into it, apparently progressive political statements arise beyond the superficially correct sentiments that would be appropriate to

the period (that is, the late 1960s and early 1970s in French–North African relations). In this spirit it will be necessary to revisit some of the early and largely forgotten work of French sociologists and philosophers on North Africa. The references may seem a bit dusty, but this is intentional. Who is an 'Arab' anyway? What about the Arab/Berber distinction? What would Frantz Fanon have said? After all, Fanon diagnosed the racist character of French culture and exposed psychoanalytic apologists for colonisation. Problematically, he also fell back on over simplistic Freudian symbolic equations – 'the Negrophobic man is a repressed homosexual' (1967: 155–6). Still, Fanon connected the trauma of white Negrophobes with the inversion of a fear of a passive practice of fellatio into an active fellating of Black men already reduced to penises and nothing more in a racist economy of desire.

I want to revisit *Recherches* 12 without imposing upon it an order and organisation inadequate to the period in which it was produced. I will, however, reveal its hitherto undervalued status as a key moment in French gay historiography and as a neglected episode in Deleuze and Guattari's collaboration. I also take seriously Guattari's observation that the collective production of the journal was a key to understanding its effects. This will become obvious in my discussion of his remarks before the court about the limits of intentionality and authorship.

Politics also joins with play, for it needs to be acknowledged that the issue is staged as a game, a bit of Snakes and Ladders, suitably queered, and viciously parodied – what else can one say about a little hand-drawn penis the head of which is wrapped in a turban and bears a sultanate moustache ('Sexe Arabe')? What about the high-rise HLM (habitation à loyer modéré – council estates) penis? *Three Billion Perverts*, Guattari explained, gave voice to homosexual desire without the mediations, the vast apparatuses of representation and interpretative scaffolding, of social science, psycho-sexology and the media – Kinsey for France. To this extent, then, directness and freedom appear as affronts before the court, as pornographic in their vividness, and perhaps even as academically lewd.

V. On the Stand

It is worth revisiting in some detail Guattari's defence before the 17th Magistrate's Court. In 1973, the social and political predicament was very much a matter of the opportunities and consequences of 'giving voice' to an oppressed minority. Guattari rejected or, rather, reformulated this issue in a two-fold manner: first, he rejected the 'formal and Jesuitical' version of 'giving voice' to one's 'research subjects' under the guise of a

problematic pseudo-objectivity, and the many alibis of social scientific methodology; second, he wanted to use the special issue to 'create the conditions for a total, indeed a paroxysmic, exercise [of that scientific enunciation]' (Guattari 1996: 186). This rejection of method and scientific pretension is continued along Guattarian lines through the deconstruction of the figure of the 'native informant' (Spivak 1999: 6). These conditions would entail a decentred scientificity in three senses: against the logic of the survey à la Kinsey; beyond psychoanalytic prejudices (sameness fixation); and outside the isolated conditions of a classical union-based militancy that did not yet connect with the burgeoning social liberation movements. Indeed, for Guattari, the problem of militancy is its (in)ability to connect with other progressive movements and currents. This was the institutional task that CERFI attempted to ameliorate by engaging the expressive desires of FHAR and MLF (Mouvement de libération des femmes) during this period. By the same token, this did not mean that Guattari was hyper-valorising the figure of the gay activist: 'Incidentally, for the deaf: the gay, no more than the schizo, is not *of himself* a revolutionary – the revolutionary of modern times!' (Guattari 1996: 186).

Rather, Guattari considered the potential of what the gay activist could become; this becoming would constitute a critique of sexuality as such, to the extent that homosexuality 'concerned all normal sexual life'. In this expanded field of becoming, 'homosexuality would be, thus, not only an element in the life of each and everyone, but involved in any number of social phenomena, such as hierarchy, bureaucracy' (Guattari 1996: 187). This would not be an ethnographics of a minority, but a non-uniform becoming in which opportunities would be pursued and tendencies would be mined across the social field. In the process, for Guattari, homosexuality becomes trans-sexuality: 'From this perspective, the struggle for the liberty of homosexuality becomes an integral part of the struggle for social liberation' (Guattari 1996: 187). Recall here the three principles of minoritarian becoming: i. Dig: burrow, carve, crack open and find what is foreign within the familiar, and then carry it off; ii. it's not pornographic representation that is at stake, for as Guattari put it, *Recherches* wasn't competing with the sex shops precisely because everything minoritarian is political ('impropriety is political'); iii. create an assemblage of enunciation (collective, implying cooperation). Guattari explained: 'We dispensed here with the notions of an author and a work. When the examining judge asked me, for example, who had written this or that article, supposing I would even answer, I was not able to do so . . . Even the layout was done collectively' (Guattari 1996: 191). The refusal of individuation (resisting the demands of the legal system) operated through the indiscernibility of

becoming that ran between those involved in the issue's production. This becoming was an objective feature that made it impossible for Guattari to link single names with tasks and products. Of course, since he was listed on the masthead as Director, he was readily identifiable.

These are rather abstract considerations, to be sure. What Guattari found himself facing was a day in court. His lifelong passion for the work of Kafka was about to be put to the test in a becoming Joseph K. The 'ridiculous side' of the charge began with his return from a conference in Montréal, Canada, in April 1973. Upon return to his flat he was met by several patients sitting on the stairs awaiting their consultations, and found his door padlocked shut. His flat on the rue de Condé had been trashed by police executing one of dozens of warrants for the seizure of *Recherches* 12. All the while, Guattari wrote, *Recherches* had been available for weeks in bookstores around Paris: 'When I protested these proceedings to the examining judge, I must say that he remained largely perplexed. I thought then that there had been a mistake and that the case would be adjourned *sine die*' (Guattari 1996: 190). No such indefinite adjournment would be offered. Anyway, it may be remembered from Kafka's *The Trial* (1968: 160–1) that certain drawbacks, the prevention of actual acquittal, most certainly, are entailed by preventing the trial to progress towards the accused's sentencing. Limbo of a sort was described in these very terms by Deleuze, but with reference to the passage from disciplinary to control societies: an *endless postponement* to which Guattari's case did not accede. Guattari stood next to Kafka in this shift, but failed to convince the 'perplexed' judge who was stuck in the disciplinary society. Hence, the fine of 600FF.

The other side of this Kafka machine is, perhaps, just as serious. The issue was 'indefensible', Guattari believed, if the representational illogic of the court were to be granted. Of course, defence counsel would not grant this. First, Guattari was held responsible for a collective assemblage of enunciation as a matter of convenience:

> What does the fact of holding someone responsible for something signify?
> – I am responsible, I represent *Recherches*
> – You represent the law
> – Members of Parliament represent the people
> – The President of the Republic: France
> – Universities: knowledge
> – Gays: perversion
> – *Recherches* wishes to have done with this sort of representation, with all the bad theatre to which officials and institutions resort. (Guattari 1996: 188–9)

The court and counsel conveniently decided upon a signifying semiology (a bad theatre of representation) that specified in advance a regime of signs from which there would be no deviation. On the levels of content and form the issue was both rich and uncategorisable. Guattari did not distinguish between contents, citing a range of specific examples that included the sexual misery of youth, masturbation, among two explicit mentions of race and ethnic themes: 'the way in which different immigrant groups from North Africa live their homosexuality' and 'the racist fantasies which are sometimes invoked in relations of sexual dependency' (Guattari 1996: 190–1). The form of the publication did not answer to any 'pre-established category' (that is, it was not tied to a specific discipline or national professional society; nor was it undertaken in the name of a legitimated method). That it let some gays and straights communicate directly their experience 'without precautions and without supporting documentation' made it dangerous. The shock issued from the absence of interpretive 'screens' and the ambience of a deterritorialising semiosis. Guattari, too, took some abuse from disgruntled contributors.

Recherches 12 was a tool used to overcome the stultifying signifying semiology Guattari attributed to the court. This was not an isolated incident. Collective autoproduction centred on publishing was a constant in Guattari's life from his teenage years forward. *Recherches* contributed to the creation of institutional matter (CERFI) and is not itself a mere product engendered by an institution; rather, the institution is in part a product of a journal's collective elaboration and refinement over time, including everything that befalls a project of this kind, even the plight of its director. Collective autoproduction in the formation of institutional matter gives pride of place to the journal-artifact – as a surviving document and therefore resource – even though it is only one feature of the institutional matter engendered by editorial and other activities (including all the meetings, communications, fantasies, scribblings on scrunched pages, etc.). In other words, there are many a-signifying features (and some partially-formed semiotic as well) upon which projects of this sort depend; such a semiotic always has some use for signifying semiologies, even if only as a foil and to underline the passage from one (individuated subject held responsible) to another (collective editorial and authorial assemblage of enunciation). Remember that autoproduction of institutional matter is not exhausted by the finished product and remains partially unmediated by (certainly not reducible to) the sort of representational logic that demands clarity of comprehension and hierarchies of power so as to assign responsibility.

VI. Game On, Reader

Recherches 12 began with a game (see Figure 2). There are six players: Arabe, Petit Garçon, Femme, Enseignant, Travesti, and Pédé. The board is numbered 1 through 30 from Start to Finish along an involuted, segemented penis. The Rules of the Game dictate movement forward and backwards. Land on segment 1 – 'Les Arabes et Nous', which corresponds to the first article – and you are directed to 'Sip a mint tea until you have rolled a 6', which is another article 'Les Arabes et les Blancs'. Or, if you find yourself on segment 16, then 'Get the Arab to fuck you and keep his cock in your ass until either one of you rolls a 5' which is 'L'autre côté des ténébres' (1973: 4–5). And so on and so forth, with a range of substitutions, trips to the hospital, indications of sadism or masochism, and even the fate of having to read most of the issue, etc.

This is a 'screen', of sorts, not of interpretation, but of deferment (of important questions) in a fully parodic mode. For as much as interpersonal intellectual politics shaped the issue – Cressole could be counted among other oedipal 'guilt cops' from Gay Lib, as Deleuze (1995: 4) suggested – and a certain reflexivity was achieved with regard to the overtly racist

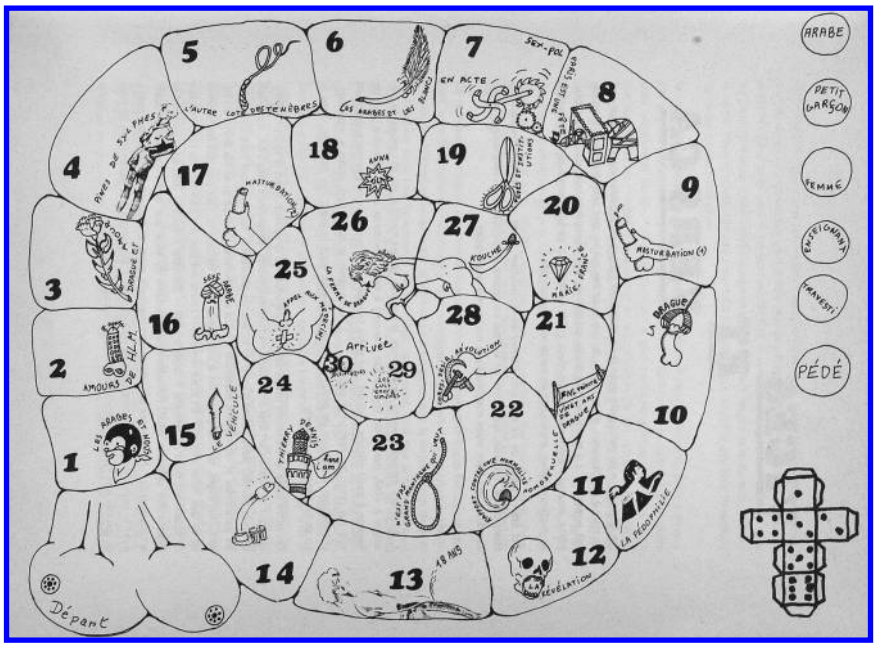

Figure 2 Penile snakes and ladders with player tokens.

content on display, the game-form was up-front: *Jeu de l'oie* or Snakes and Ladders, with instructions ('Jeu de l'oie: Mode de l'emploi'), no less.

> The game is played by six persons
> corresponding to the six detachable pieces
> beside the board and 2 copies of this issue.
> On each roll of the dice, consult the Rules of the
> Game for the number upon which you
> have landed. Between turns, read the
> article in the second copy corresponding
> to your position on the board. (1973: 4)

This editorial contrivance suggests a device that keeps one moving along the segments, according to the roll of the dice. This gaming doesn't permit an easy reduction to a static identity of the player/reader because in the next game you can try your luck as the Arabe or the Travesti, or someone else altogether. A static overcoding of identity would freeze these player tokens into subject positions with inventoried attributes and stable descriptors. Patience. After all, the game complements the idea that there are many ways to make a book work. Game on.

VII. Arab and Berber

Let's begin with one of several collective 'political' statements in support of indigenous North Africans: 'Vivent Nos Amants de Berbérie' (1973: np). 'Long Live Our Berber Lovers' is a detachable pictorial (colour) tableau of young North African men assembled for a group photo; it may be used, the collective suggests, as an alternate cover for the journal. The supporting text is a manifesto and declaration of love that begins with the recognition that 'Berbers' are not reducible to 'Arabs'. In fact, the authors continue, Berbers have been oppressed for centuries, and their struggle continues today: 'Arabs destroy their language and culture.' This problem is 'taboo', but we do not know for whom (for members of the collective, presumably). A few historical facts are mentioned: 'The first great rebellion of North Africans against colonial oppression was the war of Rif. The first experience of freedom we want to acknowledge here was the République berbère des Rifains, founded in 1921 by Mohamed Abdelkrim Alkhaltabi.' The text continues:

> We, the homosexuals who have found a voice in this issue of *Recherches* are in solidarity with their struggle. Because we have sexual relations with them. Because their liberation will also our liberation. Long live our friends from

> Rif, Atlas, the Aurès, and the Kabylie! Long live Berbérie! Long live our Berber lovers! (Text on recto of aforementioned detachable poster)

The facts are correct: the Riffian (Berber) Republican State was declared by Moroccan tribal leader Abd el-Krim in 1921 in a war against the Spanish (surrendering to French and Spanish troops in 1926/27). That el-Krim, a heroic precursor of anti-colonialist struggles, instituted Sharia Law (mixing it with tribal traditions at odds with certain Islamic prescriptions) is not mentioned for the obvious reason that homosexuality is condemned in the Koran and is, on strict interpretations, punishable as either adultery or sodomy. This makes the declaration of love, even despite itself, an intense provocation. The fact that this declaration is not signed, as opposed to the statement in support of a French schoolteacher fired for being gay ('Sale Race! Sale Péde', 1973: np – text on recto of 'Ça branle'), creates ambiguity beyond the obvious fact that the only 'voice given' to the unidentified loved ones by the lovers is pictorial.

The declaration is, however, grounded in a fundamental focal point of French–North African relations: that is, the role of language. For in the Maghreb there are two major language groups: Arabic and Berber. Language proved to be a key point of division, since both the Arabs and Berbers in question were largely Sunni Muslims (and it was Albert Camus (1966: 124) who preferred in his political writings of the late 1950s to link the future of Algeria with the French rather than any 'empire of Islam' and Arab nationalist-imperialism), but with different tribal traditions thrown into the mix, not discounting numerous dialects, local traditions, and hybridities. There are thought to be many other relevant distinctions that, despite their deconstructability, inform us about perceived social and political realities: urban (Arab) versus rural (Berber); veiled (urban Arab women) versus unveiled (rural Berber women) (Hart 1972: 26ff). As Fanon (1965: 36, n. 1) subtly explained, this latter observation was used by the colonising French to emphasise the positive aspects of Berber identity against the 'opacity' of veiled Arab women in the cities, despite the fact that Berber women in urban settings may be veiled as well.

The politics of language under the colonial regime can be an expression of a typical 'divide and rule' (Quandt 1972: 286) strategy, in which co-optable aspects of cultural identity were emphasised, while resistant aspects were criticised, criminalised, or re-categorised as 'foreign'. For example, the colonial curriculum rendered Arabic a 'foreign' language and even the post-colonial psycho-existentialist problematic favoured French as the language of the elite – of the writer, thinker, and modern citizen (and private school teachers and students). Jacques Derrida once exclaimed, in

reflecting on his linguistic choices as a French Algerian lycéen, that Arabic was an option permitted but interdicted: 'Arabic, an optional foreign language in Algeria!' (Marabou and Derrida 2004: 81). In Algeria, the post-colonial linguistic policy of Arabisation stumbled on the colonialist legacy since Arabic (classical versus spoken dialects) had to be 'recovered' and elevated to the official language – after 1962 (Naylor 2000: 63–4; Said 1993: 267). But if a certain Arabic became the official language, where did this leave Kabyle and other Berber tongues? Whither French? On the side of multilingualism, Fanon wrote stirringly of the radio station *The Voice of Fighting Algeria* in the anti-colonialist struggle and the significance of the use of Arabic, Kabyle and French which 'had the advantage of developing and of strengthening the unity of the people' in the cities and in the countryside (Fanon 1965: 84). The term Kabyle is thought to be misused when it describes a linguistic territory from which political consequences (such as separatism) are drawn by those far removed from the territory – in this sense it is a political projection (Favret 1972: 321).

Does one exacerbate the colonialist legacy by signalling the Arab/Berber distinction and by underlining in a declaration of love the oppression of Berbers by Arabs? Pierre Bourdieu (1962: xiii) once observed, after remarking on a series of obvious differences, that 'it would be dangerous to exaggerate the opposition between Arabs and Berbers. Between these two ways of life there are frequent transitions and deeply rooted affinities.' Obviously, these observations differ from place to place, from Algeria to Morocco, across different periods (Rabinow 1975). These considerations might compel one to read 'Long Live Our Berber Lovers' as a fundamentally incoherent document that does not make clear, beyond its dichotomising, how it is breaking a 'taboo': the official post-revolution Arabisation (linguistic) and then Islamicisation (religious erasure of civil society) of Algeria and Berber resistances with longstanding colonial shadows. Yet in a way this declaration is actually prescient since it would not be until the late 1980s that the spectre of an accelerated Islamism would help to articulate the predicament of linguistic minorities, especially the Kabyle political elite (or any elite for that matter) who were francophones and profited from colonial favouritism (or capitalised on the failures of decolonisation) (Naylor 2000:180–1). The real 'taboo' at issue here still seems hidden: Algeria's independence.

VIII. Minoritarian Becomings

Although it was not Guattari who was being interrogated in the previous section, it is helpful to refer to his basic orientation with regard to

both sexuality and racism. In an interview published two years after the *Three Billion Perverts* affair, Guattari explained that 'all disruptive semiotisation involves a disruptive sexualisation. Thus it is not necessary, in my view, to pose the question of homosexual writers, but rather to search for what is homosexual, at any rate, in a great writer, even if in other respects, s/he is heterosexual' (Guattari 1975: 15). The excavation of the minoritarian becoming, the becoming homosexual of the heterosexual writer, has its parallel in Guattari's tactics of anti-racism. Circa 1983 he wrote: 'All nations require immigrants and the relations to alterity posed though their coming. I am claiming that a nation's vitality corresponds to its capacity to engage itself in all the components of a becoming immigrant' (Guattari 1986: 40). Hence this becoming immigrant of all is a refusal of racism in a rather bleak neo-liberal period in which the opportunities for subjectification were being limited and/or tightly scripted through failures of the socialist government and the reemergence of dangerous archaisms and fictions that quickly filled the void ('France is France' of the Poujadists all the way to Le Pen).

Becoming immigrant was for Guattari a tactic for refusing uniformity and the anguish that results from it. Becoming minoritarian, whether gay and/or immigrant (becoming *beur*), may be soundly criticised as sterile if it actually reduces particularity and fails to deliver on the passages into the cracks, or inhibits the release of components the assemblage of which would build new solidarities and opportunities (at least for a practical modification of racism). Now, a gay becoming Berber would not entail a Gallic embrace or liberal-minded statement of sympathy and solidarity, but would burrow into the majoritarian dichotomy Arab/Berber in order to find the site of detachable components in a transformative process that would need to acknowledge hybridity, exchange, alterity and at the same time deflation, slowing down, sticking. The valorisation of Berbers must reckon with a partial becoming Arab and Gallic (not a becoming majoritarian) that would reveal paradoxical elements – does the absence of a transnational Berberism entail a rapprochement with Islamism? – that attach to all lines of escape/inscape. Becoming is practically speaking paradoxical.

IX. Racist Desire

The controversial 'transcription of a discussion' between P. 22, G. 32, and M, 24, 'Les Arabes et Nous', is quite ordinary in its prejudice towards so-called Arabs, a bloc that is barely differentiated and only vaguely identified. The conversation is peppered throughout with

negative stereotypes – stealing, lazy, lying, greedy – tempered at times with self-recognition that such things are not particular to this targeted group. This is no politics of fucking: it is either politics or fucking. At one point M reflects: 'When I was a militant, we would explain that it was a matter of descending into the working class in order to have political relations with young workers. Basically, our requirement was to establish with them a relation of seduction, and cruise them for the organisation. I just couldn't accept that. Whereas with the Arabs, whether at the hotel or elsewhere, it's true that our relations were not hidden behind political cruising' (1973: 19). This is the moment at which Deleuze (assuming he was the author of the unsigned 'Sex-Pol en Acte') dug into the text. He wrote: 'This remark is understood to be that of a lapsed former militant who has substituted homosexual activity for political action, making the former the litmus test' (1973: 29). What interested Deleuze was not so much the many scattered examples of racist or fascist desire expressed by the interlocutors, but the magical appearance ('diffuse and mobile') of racism (informed by a basic sexism) in those Arabs who did not speak. Things have gone from bad to worse: 'la bête Arabe' (to whom G is happy to deliver himself) may himself be racist towards 'us' (G and others), it is claimed, because 'for them, the homosexual relation is same as their relation to women in which there is great contempt, and a taste for domination' (1973: 17). For Deleuze, this was just one displacement among many in which Oedipal traps were set by the interlocutors themselves. Such traps included the distinction between Europeans (parents) and Arabs (husbands), with disdain for the former functioning, snapped Deleuze, as an incest prohibition, while the animalisation motif served as a focal point of racist desire. Deleuze even ventured a symptomatic reading of the telephone call that interrupts the proceedings at one point as 'the sign of Oedipus and Cain'. Oedipus, Oedipus, Oedipus. Deleuze's Oedipus, as Slavoj Žižek (2004: 83) has argued from a fortified Lacanian position, sometimes functions as an order-word: For example, gay conjugality is Oedipal because it crystallises a micro-fascist trap for desire set by coupledom and perhaps even by the right to marry. By repeatedly trumping the discussion with Oedipus, Deleuze says too little and too much, because Oedipus is supposed to contain within it a knockdown argument – evidence that serious thought has failed – yet the trump card seems infected by the very failure it identifies, that is, it is a trap for critical thought. This may be to give too much credit to Žižek because, after all, he is not specifically reading Deleuze's contributions to *Three Billion Perverts*. But the commentary on 'Les Arabes et Nous' is volatile, incensed, flashing with emotion as the

case is made: if you lubricate a homosexual desiring machine with Oedipus you get heterosexuality.

X. Activist-Intellectualism Redux

'Sex-Pol en Acte' is not the only response to 'Les Arabes et Nous'. The 'beautiful cocks' lubricated by saliva rather than Vaseline – the latter is so Saint Germain; so Roland Barthes! – extolled by G, despite the serial sameness of Arab men complained about by L, are not really the issue in 'Le Sexe "Arabe" '. As disagreeable as 'Les Arabes et Nous' may be, the author of 'Le Sexe "Arabe" ' (1973: 32–7) observes, it is acceptable if it provokes discussion – but among a small group and like-minded audience. What returns immediately is a set of provisos: to always refer to 'Arabs' in scare quotes and to invoke in this qualification the Arab/Berber distinction: the men at issue are Berbers, more or less Arabised and Islamicised, but in the political context that 'le vrai nom du Maghreb, c'est la Berbérie'. The socio-sexual context is also significant. The author underlines the same distinction that Deleuze saw as Oedipal: it is easier to cruise 'Arab' men than Europeans, both in Europe and in North Africa. Why? Because, as knowledgeable members of FHAR will attest, that is, for those members who only sleep with 'Arabs' (the so-called 'Arabophiles'), Europeans live their homosexuality 'pathologically', while 'Arabs' live theirs 'sans problèmes' and 'sans culpabilité'. There is a constant recourse to *sans*: without Arabs, who are then marked diacritically as a qualified referent 'Arabs', and are without problems and without guilt. Imposing a negative, qualified existence is the very violence of colonialist representation.

The article under discussion is staged as vaguely sociological and proto-ethnographic (asking for the responses of 'Arab' students in Paris to 'Arabes et Nous', but receiving nothing but promises and signs of danger that Zionists will seize upon the racist desires expressed there and use them to fan the flames of anti-Arab French racism). This 'study' (this is where scare quotes come in handy) took place in the Parisian university milieu, among Maghrebian students whose sexuality was fundamentally bisexual owing to the character of homosexuality in Islamic countries ('un fait culturel collectif', so it is put). By the time these students graduate, they will have apparently broken with their bisexuality, and thus separated off their homosexuality, for the sake of a normalised desire for a European opposite-sex partner.

These so-called findings are not worth disputing. Their truth or falsehood is not at issue. Rather, readers may ask themselves how this

academic call and response is being played out as it fills the pages of the issue. The effect, as M explains at length in a brief exchange (with G) embedded in a series of texts under the heading 'Les Arabes et les "Blancs" ' (1973: 206–9) is alienation. M is a 'real' white straight male, non-university-based writer ('white-hetero-bourgeois'), among 'imaginary Arabs'. The editorial committee, in rejecting his contribution as 'too literary', showed its true face: 'A section was done on cruising without cruisers, another on Arabs but without Arabs, and only the thinkers of homosexuality can speak about homosexuality.' But the 'blanc' positions himself among the 'blanks' at the heart of a journal in which the editors publish themselves, and it is necessary to 'sublimate', M complains, before Guattari using the politically correct 'salad' of jargon (Bataille-Genet-Guattari). Sour grapes or excavation of a syndrome? No doubt there is a crowd of subjects expulsed from the issue. Yet even the personal problem of having one's text refused is reconfigured as an opportunity to contribute another article to the issue in which one raises objections about lingering concerns. The privilege is that expression may be achieved by abandoning the company of the silenced. The white bourgeois non-academic writer molarises the collective process by insisting on being represented as someone who was excluded, in this way accounting as an individual for all elisions, and joining the collective process but with qualifications.

XI. Conclusion

Three Billion Preverts was a masterpiece of political impasse, implosive sexuality (Oedipal, phallocratic, myth of primitivism . . .), and legal transgression. Perhaps it should be stated, along with the author of the delirious and interminable contribution 'Les Culs Énergumènes', that in the end when all is said about 'Les Arabes et Nous', we are truly stuck between 'the ivory cock and the ivory tower' (1973: 230). And everybody is a dupe. But it doesn't end here.

Three Billion Perverts appeared only a year after Hocquenghem's important book *Homosexual Desire* (1993 [1972]). The one is a foundational text of queer studies *avant la lettre*; the other, a 'lost' period piece. But that is a matter of circumstance. The queering of Deleuze and Guattari studies can find its own 'original' points of reference in this issue, if it so desires, and there is no shortage of lingering notoriety attached to the recovery operation. My reading does not attempt to present an overview of the issue's contents. There is more work to be done on that point. Rather, I wanted to work through some of the problems associated with

the figure of the Arab as it circulated through the text because it was on this point that desire and revolution seemed to part ways. Yet great effort was taken to put them back together again, like the King's men and Humpty Dumpty. And we know how that story turned out. There is little doubt for the author of 'Les Culs' that any reader of 'Les Arabes et Nous' would classify it as a 'pathological episode' between 'phalluses without penises and penises without phalluses' (1973: 229) – Us (with editorial privileges intact) and the 'Arabs' (who are without a number of real and imagined attributes). My selection of the figure of the Arab is not random; it is the transversal contraption at work in the issue that exposed the soft tissues to long overdue critical scrutiny. With all of its problems, such a figure is a broken-down machine of missing parts and replacement representations that within its limits has the virtue of probing the worst attitudes, blunders, and repressed values circulating in one French intellectual circle at the time. Admittedly, it is not possible to reconstruct – towards which ideal – verisimilitude based on interviews or archives? – the scenes of the journal's production and reception; too many of the protagonists are deceased. However, the strategy I have adopted here attempts to reach a density of socio-sexual-political description that provides a context for the debates which retain some features of the period and the tenor of the specific undertaking within all of the workings of CERFI. There are many other markers of historical context stirring in the background, of course, and these include the oil crisis, Yom Kippur War, Vietnam, and the Charter of the Agrarian Revolution in Algeria (see Ruedy 1992: 222ff). While in principle every issue of *Recherches* has a lesson to communicate about the formation of institutional matter, *Three Billion Perverts* occupies a special place for it the most notorious issue in Guattari's memory. And by focusing on it, this paper signals that specific episodes, political and personal junctures, despite their somewhat 'old-fashioned' appearance (they were already so in 1973!), may serve as valuable nodes for organising research in Guattari Studies.

Reviews

Simon O'Sullivan (2006) *Art Encounters Deleuze and Guattari: Thought Beyond Representation*, London: Palgrave.

With the rise of installation and performance art the theoretical model of representation has become strained. Consequently, the methodology of art history has struggled to develop a new vocabulary and conceptual framework to respond to and articulate the shifts that have in large part taken place since the 1960s. There are of course some exceptions to this such as the writers of *October* magazine and many of the works published by Zone Books. Primarily, the difficulty lies in how we respond to a new style of art that confounds the categorical distinction between a subject and object. Works of art that resist their own status as 'objects' and demand the viewer's participation for their completion quite simply turn their backs on a mimetic relationship to the world. It is this very situation that Simon O'Sullivan charts in *Art Encounters Deleuze and Guattari: Thought Beyond Representation*.

Commencing with a distinction between representation and the encounter, O'Sullivan brings to our attention how with the former our belief systems and the knowledge we may have accumulated about the world remain intact. From here he argues that if we follow the Deleuzian sense of what it means to think, then with representation we do not actually think at all because we fall prey to habit. In contrast, the encounter in the way O'Sullivan intends it, cracks open our habitual ways of being and acting in the world to expose and affirm the new. It is here where he suggests art history has a lot to learn from the Deleuzian conceptual apparatus, advocating that 'we need to repeat the energy and style of his writing without merely representing his thought'. (3) Living up to this task, he constructs a philosophy of affective aesthetics: one that is no longer concerned with problems of beauty and aesthetic judgement, but rather the issue of

how we can identify the excess to which art gives rise. In this regard, he notes that the effect of an affective art practice is not always aesthetic. It is here where he begins to create a pagan philosophy of art focusing on its asignifying character. Pinpointing the difficulty of thinking beyond a representational framework, he introduces other paradigms that have been used in the past by artists and art historians, the most common of which is poststructuralism. Whilst poststructuralism may interrogate the dualisms underpinning representation, such as subject/object or signifier/signified, he claims that it 'often merely entails the reversing of the binary, or the putting under erasure (the deferral) of the privileged term'. (15) Using a wonderfully clear explanation of Deleuze and Guattari's concept of the rhizome, he suggests an alternative to the poststructuralist model, which is to think through art's connections by attending to its rhythms and the blocks of sensation that constitute its creativity.

O'Sullivan defines art as a series of productive encounters that are best understood as a 'meeting, or collision, between two fields of force, transitory but ultimately transformative' that force us to break with habit. (21) In typical Deleuzian fashion he invites the reader to think of art as a machine, shifting our attentions away from the meaning of the work onto what it can *do*. Looking to minor art, those practices that are not completely outside the world nor entirely part of it, he follows its creative dimension. In what may seem an odd case study in the context of a book on art, he looks to the work of the Red Army Faction (RAF). Studying the creative power of guerrilla tactics, he contests the reactive nature of negative critique and advances a notion of the artistic war machine, one that underscores the political dimension of contemporary art at the level of subjectivity (how subjectivity is produced). What he finds especially interesting about Baader and Meinhof is how dissent and the affirmation of the new are implicated in one another. He subsequently uses this observation to consider the broader ontological problem of subjectivity arguing that the connection between art and living a creative life has a political undercurrent, insofar as it encourages us to produce our own subjectivity instead of taking it as an a priori given.

Pursuing the question of creativity further O'Sullivan looks to the earthworks of Robert Smithson. Following Brian Massumi's lead he notes that the process of becoming-natural indicative of Smithson operates along a 'seeping edge', as Massumi calls it, between the virtual and actual. The immanent realm of virtual differences and the creative selection of all these that constitute the actual, avoid the trap of transcendence. Here he contends 'art practice can be positioned at that "seeping edge" between the existing state of affairs and a world "yet-to-come" '

(105). In what is a sensitive and poetic discussion of Smithson's work and his writings, he points to art's becoming; an object in the process of durational blending as it combines with the duration of a variety of bodies: art work, viewer, and environment. What is missing here though is some discussion of the more majoritarian aspects of Smithson's practice, for instance when he poured 1,000 tons of asphalt over a ledge for his *Asphalt Rundown* (performed in Rome, 1969). This kind of work is particularly offensive for environmentalists and one that I find to be especially patriarchal, having more to do with dominating the landscape than with a minoritarian affirmation of it. Furthermore, whilst the descriptions of Smithson's work are certainly literary the specifics of some of the pieces discussed are sparse. Issues of scale are important considerations in *Spiral Jetty*, producing their own blocks of sensation. For instance, the fact that the work is a 1,500 foot long path of limestone rocks and earth are details that would have enhanced O'Sullivan's use of the concept of duration. Also, the heated debate around whether or not to 'preserve' the *Spiral Jetty* once it reappeared from being submerged under water would have helped him expand upon some of the points raised in the previous chapter on how to apply the concept of the 'minor' to contemporary art, making that discussion less abstract and more pragmatic.

Similarly, in his discussion of Gerhard Richter O'Sullivan generally refers to his *Abstracts* but a reader unfamiliar with the artist's work would benefit from some more detailed discussion of particular works in the series; this would also rescue what at times are rather vague connections to the Deleuzian concept of the event. In a similar vein, more could be made of how Richter works with groups of paintings and in dialogue with other artists to enhance the discussion of difference and repetition. That said, O'Sullivan makes some important revisions to Deleuze and Guattari's disparaging view of conceptual art as put forward in *What is Philosophy?* He cogently argues the philosophical dimension of conceptual art is its strength. For instance, it is not just informative in the way it creates sensations instead of concepts, whereby the viewer's opinion decides whether or not a sensation materialises, rather he suggests conceptual art has more in common with Deleuze and Guattari's discussion of philosophy than it does with art.

This book is an important contribution to the field of art history and the growing scholarship around Deleuze and Guattari. O'Sullivan introduces the reader to a variety of difficult concepts, using these to interrogate the limits of representation. He identifies the moments when art not only stammers, but also when it makes us stammer along with it, and it is here where the revolutionary dimension of art is exposed. Art, he

claims, inspires us to move beyond the familiar and into strange and unknown territories, or as Deleuze (following Foucault) might say: into the realm of unthought.

Adrian Parr

Gilles Deleuze (2006) *Two Regimes of Madness*, ed. David Lapoujade, trans. Ames Hodges and Mike Taormina, New York: Semiotext(e).

Félix Guattari (2006) *The Anti-Oedipus Papers*, ed. Stéphane Nadaud, trans. Kélina Gotman, New York: Semiotext(e).

Since the publication of the first of two volumes of Deleuze's occasional texts *L'Île Déserte et autres textes* (Paris: Minuit, 2002, translated by Mike Taormina as *Desert Islands and Other Texts, 1953–1974*, New York: Semiotext(e), 2004), Deleuze scholars have been treated to a veritable treasure trove of heretofore largely inaccessible texts, and the latest addition, the publication in 2003 of the second volume, *Deux Régimes de fous* (occasional texts from 1975 to 1995), has now been complemented with its translation. At the same time, a new volume has been added to the Deleuze-Guattari archive: published in 2004 in France as *Les Écrits pour L'Anti-Oedipe* and attributed solely to Guattari, *The Anti-Oedipus Papers* offers a fascinating inside view of the process of collaboration between Deleuze and Guattari in developing the work that would become *Capitalism and Schizophrenia*.

Two Regimes of Madness shows the extraordinary range of written and spoken projects in which Deleuze was engaged from the early 1970s onwards, as one can determine from an overview of both *Two Regimes* and the publication of *Negotiations* (New York: Columbia University Press, 1993; *Pourparlers*, Paris: Minuit, 1990):

- sixteen solo and four collaborative articles (occasional essays, political interventions and homages; more on these below);
- nine prefaces to foreign editions of his own works, and more importantly, five prefaces or postscripts to works by other writers: Henri Gobard's *L'Aliénation linguistique* (Paris: Flammarion, 1976); Jacques Donzelot's *La Police des familles* (Paris: Minuit, 1977); Toni Negri's *L'Anomalie sauvage: puissance et pouvoir chez Spinoza* (Paris: PUF, 1982); Jean-Clet Martin's *Variations – La Philosophie de Gilles Deleuze* (Paris: Payot and Rivages, 1993); and Eric Alliez's *Les Temps capitaux* (Paris: Editions du Cerf, 1991);
- six affirmative book and film reviews: Daniel Schmidt's film *L'Ombre des anges* (1976); Alain Roger's *Le Misogyne* (Paris: Denoël, 1976);

Pierre Fédida's *L'Absence* (Paris: Gallimard, 1978); Toni Negri's *Marx Beyond Marx* (New York: Autonomedia, 1989); Jacques Rivette's film *La Bande des quatre* (1988); and Georgio Passerone's *La Linea astratta – Pragmatica dello stile* (Milan: Edizione Angelo Guerini, 1991);

- six open letters to friends (Foucault, Uno, Dionys Mascolo, Jean-Clet Martin, Serge Daney, Réda Bensmaïa) and one open letter to the Italian judges of Toni Negri;
- thirty interviews (two as transcriptions of talks; 17 in *Two Regimes*, 13 in *Negotiations*) mostly about Deleuze's recently published books, but also at least five political or critical interventions on contemporary topics: the so-called 'New Philosophers' (1977; *Two Regimes* 139–47), the Middle East crisis (1982; 'The Indians of Palestine', *Two Regimes* 194–200), the impact of the arms race on Europe (1983; 'Pacifism Today', *Two Regimes* 222–32), an interpretation of May '68 as event (1984; 'May '68 Did Not Take Place', *Two Regimes* 233–6), control societies (1990; *Negotiations* 169–76), and the first Gulf War (1991; 'The Gulf War: A Despicable War', *Two Regimes* 375–6).

In light of this typology, it should be obvious that one of Deleuze's main concerns in the majority of the occasional pieces is his active engagement with friendship. Besides the letter, reviews, prefaces and postscripts, the most evident form of friendship is the homage, to Maurice de Gandillac, François Châtelet, Alain Cuny, and Guattari. Among these, the ones dedicated to Gandillac and Châtelet are the most interesting, both written in the mid-1980s at the height of Deleuze's solo productivity. The Gandillac homage, 'Zones of Immanence' (*Two Regimes* 261–4), is remarkable, most notably for how it concurs with the practice of folds of friendship while also referring back (and forward) to an important reflection by Gandillac on this very theme. Deleuze's focus shifts from his reflections on Leibniz to his former teacher, to the way in which Gandillac emphasised 'this play of immanence and transcendence, the proliferations of the Earth into the celestial hierarchies' (*Two Regimes* 262). After citing a number of key works and concepts that he attributes to Gandillac's research, Deleuze addresses the general import of Gandillac's work, the 'ability to recognize the world of hierarchies at the same time he conveys a sense of the zones of immanence within these hierarchies, which destabilises them more effectively than a frontal attack' (*Two Regimes* 263). Furthermore, Deleuze links life and thought to Gandillac who practised and reinvented 'an art of living and thinking' as well as 'his concrete sense of friendship' (*Two Regimes* 263). The reference that Deleuze

provides here is to a fairly obscure text by Gandillac, his essay, 'Approches de l'amitié' ('Approaches of Friendship'; in *L'Existence*, ed. A. de Waehlens [Paris: Gallimard, 1945, 63–7]) that develops myriad distinctions in philosophy between love and friendship and creates implicit resonances with Deleuze's subsequent reflections on friendship, particularly in *Dialogues* and *L'Abécédaire de Gilles Deleuze*.

In Châtelet's case, Deleuze chose to pursue two tributes to his life-long friend and colleague at the University of Vincennes. First, in a brief text published in 1985 in *Libération*, then a thin book, *Périclès et Verdi* (Paris: Minuit, 1988), are found indices of one particular life that transformed into the traits of *a* life. In the *Libération* article included in *Two Regimes*, 'He Was A Group Star' (265–8), Deleuze first takes Châtelet's final words to him – 'my illness is too tough to manage' – as a sign of his friend's talent in organising and managing collaborative projects. But then, Deleuze notes the mysterious breaks in Châtelet's intellectual trajectory, the nature of which only appeared years later – a break with his early devotion to formal logic in order to work in the domain of the philosophy of history; his adhesion to the Communist Party, then his break with it, as did so many other thinkers and writers; his movement beyond philosophy of history to political philosophy, 'a critique of logos and of historical or political rationality' (*Two Regimes* 266). There was still another break, one suggesting 'something mysterious about François', the publication of a rather unnoticed novel in 1975, *Les Années de démolition* (Paris: Editions Hallier, 1975), that Deleuze compares to Fitzgerald's writing and also connected 'with Blanchot's themes on thought and fatigue, . . . a commentary on the relationships between life and self-destruction' (*Two Regimes* 266). Yet these breaks only reveal one aspect of Châtelet's contributions because Deleuze returns to the phrase with which he opened this essay (and ended his relations with Châtelet), describing him as 'an excellent producer in the cinematic sense of the word, . . . a great negotiator in combination with his keen political sense' (*Two Regimes* 267). These traits resulted in Châtelet directing many collaborative projects and in leading (and holding together) the Philosophy Department at Vincennes (Paris VIII), to which Deleuze adds the significant praise of Châtelet as 'a great pedagogue' (*Two Regimes* 267). Finally, this work of an individual life led beyond the man into a lasting contribution as 'producer-creator', 'to lead the critique of political reason, . . . [that] was inseparable from the collective work for a vast political vocabulary, a vocabulary of political institutions' – 'an illustrious professor . . . a creator who creates with production and management' (*Two Regimes* 268).

While I could pursue this review following a number of different lines of exploration, I will suggest simply that the two volumes, *The Desert Island and Other Texts* and *Two Regimes of Madness*, guarantee the reader surprises. I do not mean that one will necessarily find anything completely new on a conceptual level (that depends, of course, on each reader); but the chapters certainly reveal different and useful perspectives on possibly familiar material. In *Two Regimes of Madness* especially, one finds a number of well recognised and important shorter texts by Deleuze: his 1977 notes for Foucault on *The History of Sexuality 1*, entitled 'Desire and Pleasure' (*Two Regimes* 122–34); his fiercely dismissive statement from 1977 about the New Philosophers and the crisis in French publishing (*Two Regimes* 139–47); the 1986 round table discussion on cinema, 'The Brain Is the Screen' (*Two Regimes* 272–81); the transcription of the 1987 FEMIS lecture, 'What Is the Creative Act?' (*Two Regimes* 312–24), also available on the DVD of *L'Abécédaire de Gilles Deleuze*; and yet another translation of his final text 'Immanence: A Life' (*Two Regimes* 384–9).

There are also several unexpected gems: the transcript of the 1975 Proust round table with Roland Barthes and Gérard Genette (*Two Regimes* 29–60); two texts in support of Toni Negri, the 1979 'Open Letter to Negri's Judges' published in *La Repubblica*, and his brief essay on Negri's *Marx Before Marx* published later that year in *Le Matin de Paris* under the forthright title 'This Book Is Literal Proof of Innocence' (*Two Regimes* 169–74); the delightful 1983 interview with Hervé Guibert published in *Le Monde*, 'Portrait of the Philosopher as Moviegoer' (*Two Regimes* 213–21); two preparatory texts for *Foucault*, 'Michel Foucault's Main Concepts' from 1984 (*Two Regimes* 241–60), and the 1986 interview with Paul Rabinow and Keith Gandal, 'Foucault and Prison' (*Two Regimes* 272–81); and Deleuze's brief correspondence with Dionys Mascolo on their different perspectives on friendship (*Two Regimes* 327–32).

In this latter exchange between April and October 1988 – on the occasion of the 1987 publication of Mascolo's *Autour d'un effort de mémoire* (Paris: Maurice Nadeau, 1987) – Deleuze expresses quite explicitly his thoughts on friendship as he praises Mascolo's works. In particular, Deleuze places an emphasis on friendship as a possibility for thought, and he states that the authors he admires find different ways 'to introduce concrete categories and situations as the condition of pure thought', notably Kierkegaard with the fiancée and engagement; Klossowski with the couple ('and maybe Sartre in a different way'); Proust with jealous love 'because it constitutes thought and is connected to signs'; and for

Mascolo and Blanchot, 'it is friendship, [implying] a complete reevaluation of "philosophy" since you are the only ones to take the word *philos* literally' (*Two Regimes* 329–30). Deleuze is quick to point out the complexity of the word *philos*, and he insists on the importance of Mascolo's contribution about this word in the history of philosophy, of which Mascolo is 'the modern representative. [His role] is at the heart of philosophy, in the concrete presupposition (where personal history and singular thinking combine)' (*Two Regimes* 330).

To this, after expressing some embarrassment, Mascolo engages Deleuze on the terms of his argument, challenging Deleuze about 'where [would] this friendship come from' if it were to 'put the "distress" in thought' and create 'distrust of friends'. For Mascolo 'cannot imagine what *distrust* . . . is possible of a friend once he or she has been accepted in friendship. I have called this *communism of thought* in the past', which he associates with the writing of Hölderlin (translated by Blanchot). In a postscript, Mascolo wonders about whether 'friendship was precisely the possibility of sharing thought, from and in a common distrust with regards to thought' and whether 'thought that distrusted itself was the search for this sharing between friends' (*Two Regimes* 331–2). In the final, and very brief, response of this exchange, Deleuze re-states his question – 'How can a friend, without losing his or her singularity, be inscribed as a condition of thought?' – and then states his admiration for Mascolo's reply, 'a question of what we call and experience as *philosophy*' (*Two Regimes* 332, emphasis in original). And it should be obvious that each letter ends with the warmest expressions of friendship and 'camaraderie of thought'.

Despite the effusive praise I bring to my review of this volume, one major cloud overshadows this edition of *Two Regimes of Madness*, the deliberate editorial decision to omit without a single explanatory note a text appearing in *Deux régimes de fous*, 'Grandeur de Yasser Arafat'. Truly, it is difficult to comprehend how Semiotext(e) would choose to damage the integrity and integrality of this volume by an omission of this magnitude. Readers are left to refer to the only extant translation of this text, by Timothy Murphy in the journal *Discourse* (20.3 (1998), 30–3).

Whereas both of the aforementioned volumes, thanks to the careful work of David Lapoujade, are models of organisation, the recent publication of the working notes from the *Anti-Oedipus* collaboration, *The Anti-Oedipus Papers*, presents an entirely different editorial strategy. Fortunately, the book's editor, Stéphane Nadaud, provides an excellent introduction, humorously but quite appropriately entitled 'Love Story between an Orchid and a Wasp', reflecting on how the two-who-would-be-a-crowd leave traces of each other in the drafts, notes and journal

entries that constitute the volume. He asks the pertinent question about this collaboration: 'Is this what the collective aspect of enunciation amounts to, identifying something of Deleuze in Guattari and something of Guattari in Deleuze? Is it that simple?' (12) The common assumption about this collaboration had been that 'Guattari needed Deleuze in order to write. All the more so as Guattari made no bone [sic] about the fact that he certainly did' (12). The collaboration, according to Nadaud, is best understood under the aegis of the concept of assemblage which also helps understand the collection he himself assembles, for he admits that it is 'partial since only Guattari's archives have been "mobilized" ', (14) and not those of Deleuze. Each of the writers generated texts that he sent to the other between their meetings, so the volume consists of letters by Guattari, notes on his reading, theoretical writing, and even his personal journal entries, all transmitted to Deleuze, with Fanny Deleuze serving quite crucially as frequent intermediary and also as editor, judging from many personal notes from Guattari to her. That these were closely read by Deleuze is evident from his annotations, with Guattari's own comments as well.

Nadaud's introduction does the inestimable service of juxtaposing subsequent testimony about the collaboration, found mostly in interviews and Deleuze's letters (for example to Uno, in *Two Regimes*, 237–40), with evidence from the *Anti-Oedipus Papers*. Of particular interest is that after the two writers jammed and riffed, as it were, between one another, it fell to Deleuze to finalise the text and manuscript of *Anti-Oedipus*, at the risk of losing his identity in the process, according to Guattari, who understood by the end how much the process cost Deleuze. However, in preparing his own 'final' versions to deliver to Deleuze, Guattari consulted many specialists, for example, for Chapter 3 of *Anti-Oedipus*, or availed the text of his own expertise in psychoanalysis, especially the perspectives on Lacan. In any case, this dual intersection of relatively merged identities explains the image of the wasp and the orchid, as Nadaud says, duality in order 'to conceive production as an assemblage of differences' (20). In other words, they connected to each other rhizomatically, with their 'thought and writing . . . flying off in every direction – even if in different ways (in a disordered, flowing way for Guattari; and a conceptualised, organised way for Deleuze; in multiple practices for Guattari; and with the solitude of an academic researcher for Deleuze)' (21).

While Nadaud states that '*Anti-Oedipus* was written in successive stages, each concept and each point being developed by Deleuze and Guattari in turn' (16), he clearly rejects the successive process the authors

followed as an organisational principle for the volume. Rather than observe chronological order, he groups the texts under six somewhat arbitrary headings: (1) Texts for *Anti-Oedipus*, (2) Psychoanalysis and Schizo-Analysis, (3) Militant Incidences, (4) Pragmatic Linguistics, (5) Planes of Consistency, and (6) Corrections Made to *Anti-Oedipus* (the latter appearing as a 'pause' following section 1 in the French original). He calls this 'a trajectory through the heart of the "Guattari Papers" ', and yet I am unclear what informed this decision since the chronological order would seem necessary if Deleuze and Guattari did indeed follow a process of writing successively on concepts and points. Although Nadaud provides no explanation, his decision may well have been dictated by the fact that Deleuze and Guattari had no need to date their notes systematically, and did so only on occasion, given the process of immediate exchange and response.

Thus, the overall thematic trajectory at least provides a plausible grouping, even if some of the material included in one section might well appear in others. The opening section, Texts for *Anti-Oedipus*, seems the most arbitrary since any of these chapters in the section could have been included either under sections II or III. However, perhaps its organising principle is that of chapter 1 of *Anti-Oedipus*, i.e. notes (at least in chapters 1–5) to lay out different fundamental terms for the subsequent, more focused development: the three connections, desire, the body without organs, production and anti-production, territorialisation, the socius, and subjectivity. Chapters 6 and 7, primarily on the topic of infinitives and time, appear to have been written primarily by Deleuze, especially as the Aiôn-Chronos pair (from *Logic of Sense*) is linked to desiring machines. The brief chapter 8 looks very much like vintage Guattari complete with an organisational table, an outline of territorialisation developed in *Anti-Oedipus*, chapter 3. Then, while the titles for chapters 9 and 10 are indicated as written by Deleuze (respectively, 'Psychoanalysis and Polyvocality' and 'On How the Audiovisual Realm Is Called upon to Surpass the Oedipus'), each appear to be notes primarily by Guattari, judging from the developing intersection of semiotics (explicitly derived from Jakobson and Greimas, the latter's recent *Du sens* (Paris: Seuil, 1970)) with Freudian and Lacanian terminology.

In some ways, these final chapters link directly to the following section, ostensibly on Psychoanalysis and Schizo-Analysis. But, as I suggested above, chapters of section I concern the section II topics as well, or vice versa, e.g. 'Full Body without Organs and Infinitivation' (II.1), having already been introduced in the first section. However, the chapters in section II very clearly address concerns between Guattari and Deleuze

about translating psychoanalytical terms into schizoanalytic concepts, especially as regards Oedipus in terms of machinic desire, and the object 'a' in terms of the body without organs. Similarly, despite section III's somewhat oblique title, Militant Incidences, the chapters therein link back to section I.8 in grouping together notes on primitive, Asiatic, and capitalist States in relation to machinic and semiotic desire (III.1–4) and on semiotics of class struggle (III.6–7). A rather detailed middle chapter, 'Militant Incidences' (III.5), brings together Guattari's thoughts on political *groupuscules*, desire and flows, then on the object 'a', subjectivity and signifying production (especially in Lacan: '*The unconscious is not "structured like a language". It's annoying, but it's true!*' (186, Guattari's emphasis)). In the midst of this chapter, we find an Interlude, 'a pleasant example of code surplus value: perversion among orchids', with Guattari drawing extensively from Rémy Chauvin's *Entretien sur la sexualité* (Paris: Plon, 1965), on how 'wasps fuck flowers, . . . for nothing, just for fun!', the wasp getting caught 'in the "call of the code", the open of the code of the vegetable machine' (179–80).

We can see in section III especially how Guattari's reflections link to eventual developments in the collaboration with Deleuze and in his own individual works, notably on refrains and semiotics. The latter topic is the full focus of section IV, Pragmatic Linguistics, and specifically the work of Louis Hjelmslev, especially in contrast to Saussure. Chapter 1 remarkably reveals the derivation of schizoanalytic perspectives on stratification from contemporary linguistics (or a segment thereof), concluding with 'the construction of our own semiotic machine': 'Three level: 1- *Desiring machines* . . . 2- *Disjunctive recording machines* . . . 3- *Conjunctive machines* . . . The *jouissance* of waste. The production of trash entering code transcursivity . . . The transduction of a *power sign flow*. Deterritorialisation that travels, migration, a plane is deployed: reference plane for powers [*puissances*] and forces = plane of consistency. A new filiation.' (219–20). Guattari links the linguistic concerns to the political through 'the idea that there are not a zillion different revolutions but only *one*. It's: – Either the Urstaat with the imperialism of the signifier. – Or polyvocality and filiation on the same plane of consistency as *all* machinism, in the same historical deterritorialisation. . . . Either a politics of desire and so revolution is everywhere simultaneously. Or a politics of historical illusion claiming that one thing comes after another, etc.' (221–2). Then, in sections IV.2, 3 and 4, the notes draw out these many concepts, on 'power signs' [*signes de puissance*], chapter 3 ending, with reference to the '"universal expansion" of the sign', 'It's so schizo, man!' (*C'est ti pas schizo ça!*). The final

chapter, 'Of Both Types of Break' (title by Deleuze), attempts to outline 'a multipolar ethics', 'from the real of production to the incorporeal of representation' (254). Guattari provides, first, a review of machinic semiotics (254–8), and then readings of *Difference and Repetition* and *Expressionism in Philosophy: Spinoza* in order 'to distinguish between two politics of the sign. One for encasted signs, paved in the signifier's body without organs and one for power signs, the agents of real production' (258) via Spinoza and Leibniz. The chapter leads to a definition of three kinds of subjectivity – Lacanian, 'enunciated through signifying chains', 'collective enunciation', and 'the use of figure-signs and consciousness machines' (271–2) – and 'the planes of consistency continuum' (273–9). As Nadaud indicates in the section's last footnote, the final pages 'are the nearly fully formed premises of what is to be developed by Deleuze and Guattari in *A Thousand Plateaus*, especially the November 20, 1923 plateaus in the chapter on "Postulates of Linguistics" ' (*A Thousand Plateaus* 86–8).

Aside from the 'Corrections' appendix (411–13) and the schizoanalysis glossary (413–21), written by Guattari for the *Molecular Revolution – Psychiatry and Politics* (London: Penguin, 1984), then published in *Les Années d'hiver 1980–1985* (Paris: Bernard Barrauet, 1986), these *Papers* could very well stand without the lengthy, sometimes informative and fascinating, but more often tedious and self-indulgent section V, 'Planes of Consistency'. Three of the chapters have already been published: chapters 2 and 3, Guattari's journals from 1971 in *Nouvelle Revue Française* (563 (October 2002), 564 (January 2003)); and chapter 5, 'Plane of Consistency' published in modified form in *La Révolution moléculaire* (Fontenay-sous-Bois: Recherches, 1977).

Chapter 1 on planes of consistency (dated 1971) provides notes ostensibly on the main section topic, but which was then followed by a rather randomly organised series of short notes, concluding with a reflection on analytic transfer in contrast to schizoanalysis: 'Become schizo in 20 lessons! Sign up now for the great journey that has no passport and no Ithaca' (298), in the margin of which Deleuze writes 'le voyage' (the trip, journey). Chapters 2 and 3, Guattari's journals from 1971, include an extremely broad range of reflections on his childhood, dreams ('Another dream about Lacan! This is insane!' 305), auto-analyses based on the dream imagery, Guattari's status and work at the La Borde clinic, pre-publication jitters and reactions about *Anti-Oedipus* (including a convocation in Lacan's office and a dinner invitation, both for him to 'explain' schizoanalysis to Lacan), and meta-critique about the journal in response to Fanny and Gilles Deleuze's reactions to its entries (they read it and

Fanny types it while in progress). In mid-November 1971, Guattari expresses his extreme anxieties about completing both books – *Anti-Oedipus* and his *Psychanalyse et transversalité*: 'I feel like scrunching myself up into a little ball, becoming tiny, putting an end to this whole politics of presence and prestige . . . to such an extent that I almost blame Gilles for having dragged me into this mess' (351). These sentiments announce additional misgivings revealed in chapters 4 and 6 (notes and journal entries from February–March, then September–October 1972), the first when *Anti-Oedipus* is released, the second in light of reactions to it, and to Deleuze and Guattari's commitment to produce a second volume and to work together: 'Writing to Gilles is good when it enters into the finality of the common project. But for me, what matters, really, is not that. The energy source is in the whatever, the mess. The ideas come after' (401); 'I don't really recognise myself in A.O. I need to stop running behind the image of Gilles and the polishedness, the perfection that he brought to the most unlikely book. Dare to be an asshole. It's so hard, being strapped to Gilles! Be stupid in my own way' (404). Besides the range of seemingly random notes in both of these chapters, another important development following *Anti-Oedipus*'s publication is that Guattari starts to develop the collaborative work that will result in *Kafka. Towards a Minor Literature*, ending the book on a final reflection on Kafka's dreams: 'It's obviously in the melting pot of this omission [in the dreamy consciousness] that we find the basic machinic lines of the Kafkaesque machine' (407).

So this volume of notes contains a plethora of material, much very raw and, for that reason, extremely provocative as well as indicative in terms of the collaborative work in which Guattari and Deleuze engaged for a full decade at first, and then in a final burst for *What Is Philosophy?* published in French in 1991, a year before Guattari's death. While I could carp about the volume's failings in term of the scholarly apparatus – especially no index and also indications within certain notes that Nadaud did have access to many more dates for the entries than he provides – let me conclude where I began, about the treasure trove of material furnished in these two volumes. Clearly, the purpose of exploring the details of Guattari's notes is not to assign authorship to specific concepts, but rather to better understand their development thanks to the copious examples that are furnished, but then are prudently edited. Similarly, in the volumes of Deleuze's occasional works, many of the interviews and essays provide elaborations on concepts developed with more economy and, therefore, with fewer examples in published and edited books than Deleuze allowed in his spoken and occasional pieces. In both cases,

we have at our disposal possibilities for better comprehending what Guattari and Deleuze mean by a 'new alliance' to achieve 'a sign machine and not a machine's sign' (279), works that defy pre-formed significations in hopes of staking out new territories, new experimentations, in short, new possibilities for thought.

Tokyo, the Proud

Félix Guattari

Introduction

Félix Guattari visited Japan on a number of occasions during the 1980s. These visits consisted of invited lectures and a series of conversations and collaborations with Japanese intellectuals, artists, and architects. His collaborative writings with Deleuze, particularly the *Kafka* and *Rhizome* books, began to appear in Japanese translation in the late 1970s. By the mid-eighties, however, *Anti-Oedipus* was available for Japanese readers.[1]

The year 1985 saw the publication of Guattari's conversations and co-authored papers with Japanese dancer Min Tanaka collected under the title of *Velocity of Light, Fire of Zen: Assemblage 1985*. This was followed in 1986 with the translation of Guattari's jointly authored volume with Antonio Negri, *Les nouveaux espaces de liberté*. In the same year, the colourful volume *Tokyo Theatre: Guattari in Tokyo* appeared. This volume includes the present translation. It also contains multiple contributions by leading Japanese intellectuals, especially 'neo-academicist' types like Akira Asada who were inspired by Deleuze and Guattari's philosophy in the first two volumes of *Capitalism and Schizophrenia*.[2]

A distinction needs to be made between the translations of French publications and the original Japanese editions of writings by, about and with 'Ferikkusu Gatari'. Guattari's main translator, Masaaki Sugimura from Ryuukoku University in Kyoto, is less-well known within the global Deleuzian scene in comparison to Kuniichi Uno from the University of Tokyo who was lead translator of Deleuze and Guattari's *Mille Plateaux*.[3] Some of the Japanese Guattari books are cobbled together collections of short papers, interviews, translations of older materials, similar to the Semiotext(e) style of presentation of fragments, out of chronological order, thematically linked, but decontextualized.

Turning to the early years of 1980–81, Tetsuo Kogawa (who served during this period as an international editorial associate of the US-based critical theory journal *Telos*, and would later publish on the free radio movement and media in Japan, eventually landing at Tokyo Keizai University) and the aforementioned Sugimara, collaborated on a book of dialogues with Guattari titled *From Politics to Signs*, which was undertaken in the fall of 1980 and the spring of 1981; this work was less informal than those largely unedited dialogues published in Portuguese with Suely Rolnick on the occasion of Guattari's visit to Brazil in the early 1980s.[4]

Guattari's early 1980s visits to Japan were largely ignored by 'orthodox' scholars and mainstream media, neither of which had any interest in Guattari's efforts to bring together activism and theory. But this changed over the course of the decade as the 'bubble economy' created a seemingly insatiable hunger for prestige goods, including ideas.

Japan's bubble economy arguably extended from the mid-eighties to the early nineties. It was driven by a large number of integrated economic factors, but primarily formed around: real estate speculation, overpriced stocks – especially bank stocks - a soaring Nikkei, and a wild credit spiral. Guattari's work was well received during the asset bubble because it spoke directly to the problem of how to characterize, in both specific and general terms, capitalism's powers of deterritorialisation. It was as a decoder of capital's mutations that Guattari gained widespread intellectual celebrity in Japan.

Throughout his career, beginning in the early 1980s, Guattari developed historically-based typologies of capitalism that mapped re-orderings of its constituent features (state, market, production) towards a nascent theory of globalization and the rise of a networked world economy, called Integrated World Capitalism. In an age in which information is a factor of production and labour becomes immaterial, the playful life-cycle of capitalism proposed by Guattari, and recalled by Asada, was attached to economic and historical blocs: elderly or early mercantile capitalism (Italy and France are supported by the transcendental signifier Catholicism); adult or industrial capitalism (England and the US and the self-policing, oedipalised, individual); infantile, post-industrial capitalism (Japan and neither transcendental nor inner-oriented persons, but those of a purely relative, child-like wonder and passion, perfectly adapted to a placeless electronic space).

In 'Tokyo, the Proud', Guattari provides specific negative examples of 'capitalistic infantilism' in popular culture. There is a strong 'machinic eros' in Japanese culture that is deeply repetitive and productive of

Figure 1. Tetsuo Kogawa with Félix Guattari, Tokyo, May 1981.

a subjectivity invested in getting high on machines. The problem, for Guattari, is whether a machinic buzz connects with a productive social outlet, like business, sending it in new directions, or vegetates stupidly in addiction to video games, or even implodes into suicide.[5] All three are evident in Japan. For Guattari, 'Japan is the prototypical model of new capitalist subjectivities'[6] that has produced within the high-tech miracle ambiguous results, careening wildly from the extraordinarily creative to the hyper-alienated.

Guattari returned to Japan in November 1989 and participated in a rather conservative event in Nagoya, sponsored by The Japan Institute of Architects, that included city planners, architecture critics, urban designers, and philosophers.[7] Guattari's dialogue with Japanese New Wave architects (a label used reticently by him) found a foothold in the establishment with this event, and the results were impressive: Guattari's conversation with Shin Takamatsu was published; others, such as Hiromi Fujii sought to account for Guattari's ideas in the construction of a psychiatric clinic. This influential event in Nagoya was still, according to Kogawa, strange because of the sight of Guattari among the suits from 'big corporations and city offices' - a symptom of bubble economy-style 'impossible planning'. However, Kogawa was careful to note that it wasn't Guattari who was co-opted, but rather, a kind of 'counter-cooptation' took place as well.

Finally, at least as far as Guattari's profile is concerned, there is the myth of a final uncompleted work, a film. According to his son Stephen, Félix was scheduled to shoot the film in the fall of 1992 in Japan with photographer Keiichi Tahara (for whom he had written, in 1988, an essay on faciality in his photographs then on tour in France). The film was tentatively titled *Les Anges Noirs*.[8] Sadly, Félix Guattari passed away in August 1992.

Readers of Guattari may sense in this little text on Tokyo some of the elegance of the original in the assembling of sentence fragments in paragraph form, stacked like floors of high-rises, rising proudly, just like the skyscrapers at which Guattari wondered.

Tokyo, the Proud
Félix Guattari

Luminous cubes[9] on top of the skyscrapers. To blaze a trail across the sky? To interpellate the gods? Certainly, out of pride, like the medieval towers of Bologna.

That inimitable attentiveness of your Japanese interlocutor who suddenly makes you feel worthy of consideration and induces you into the mimetic temptation – irresistible, though hopeless – of understanding the other from a viewpoint imbued with a new sensitivity.

An imperceptible transgression is then followed by rejection and abandonment on the shores of a final void. Pride, gentleness and violence mingle in the fleeting exchange of glances [*fleur de regard*].

Paradoxically, female and maternal values are omnipresent yet so rigorously circumscribed and inhibited; this makes their repression ostentatious.

Three-tiered concrete highways span the mosaic city, legs wide apart like the heroes of the Kabuki theatre, crushing all in their path. Each day thousands of additional inhabitants and hundreds of conquering companies are parachuted in; the absurd lamination of the urban patrimony.

I don't know how many 'mountaineers' risk their lives climbing the most inaccessible peaks of the Himalayas each year, I only recall that more than half of them are Japanese.

What is it that drives the Japanese? Is it the attraction of wealth and luxury, the consequences of the marked lack of iron affecting their memories?[10] Or, perhaps it is primarily the desire to be "in the thick of things" [*être dans le coup*], what I call machinic eros!

Becoming child of Japan; becoming Japanese of our future childhoods.

Certainly do not confuse these becomings with capitalistic infantilism and its vibrating zones of collective hysteria, such as the syndrome of puerile cute culture ('kawaii'), the reading-drug of Manga comics, or the intrusiveness of loukoum music; the latter is, to my taste, the worst kind of pollution.[11]

All the trends of the West have arrived on the shores of these islands without resistance. But never has the wave of Judeo-Christian guilt that feeds our 'spirit of capitalism' managed to swamp them. Might Japanese capitalism be a mutation resulting from the monstrous crossing of animist powers inherited from feudalism during the 'Baku-han' and the machinic powers of modernity to which it appears everything here must revert?

Externalized interiorities and rebel exteriorities with univocal signifying reductions populate the surfaces and engender new depths of the sort where inside and outside no longer maintain the mutually exclusive relationship of opposition to which Westerners are accustomed. The signalizing [*signalétiques*] matters characteristic of the texture of subjectivity are found to be inextricably related to the energetico-spatio-temporal components of the urban fabric.

Despite the cancerous tumours that threaten to suffocate it at any moment, Tokyo in many ways reveals its ancient existential territories and ancestral affinities between microcosm and macrocosm. This is apparent at the level of its primary configurations, whose admirable oneiric explorations have been presented to us by Kobo Abé's novel *The Ruined Map*,[12] as well as in the molecular behaviour of its crowds that appear to treat public spaces as so many private domains.

Is it enough to say that the ancient surfaces of Yin and Yang, raw and cooked, analogical iconicity and 'digital' discursivity, still manage to merge opposites? Or, further, that today the Japanese brain reconciles its right and left hemispheres according to specific modalities, or any other such unsound and harmful nonsense in which a number of anthropologists seem to delight?

Different approaches that are less archaizing and less simplistic could perhaps lead us to a better understanding of the present form of this Japanese pride, a Manichean affirmation that everywhere shows through the reigning phallocratism in a will to thoroughly exploit, sometimes to the point of absurdity, and in the tyrannical power of shame associated with any infringement of the exterior signs of the dominant conformity.

And what about this cult of the norm, this 'canonism' that is cultivated like a fine art, and harbours a fundamental heterodoxy of secret

dissidences? Is it merely the façade and medium in aid of imperceptible singularisations – at the very least from Western viewpoints?

The deterritorialised mandalas in intimate gestures of similitude; the unmentionable pleasures in the respect for etiquette, punctuality, and submission to rituals which dissipate vague yearnings, and circumscribe the wandering of fuzzy intentionalities .... Small differences from which proliferate – far removed from egoic harmonies – large-scale collective undertakings [*projectualités*].

But trap, just as well the molecular capitalistic machineries which, in order to temporarily divert Japanese elites from the territorialized hedonism of the historical bourgeoisie, threaten to sink them yet again, in a deathly will to power.

At the invitation of the 'Aid and Mutual Action Committee' of Sanya,[13] I travelled to the place where the Yakuzas assassinated Mitsuo Sato,[14] and paid homage to this progressive filmmaker who investigated the Japan of the disenfranchised, precarious and rebellious.

Kobo Abé remarked on the fact that Sanya is perhaps less representative of an absolute misery than an irrevocable refusal of the existing order. He declared that he would like to 'be worthy of Sanya'.

Vertigo of another Japanese way: Tokyo relinquishes its status as the Eastern capital of Western capitalism in order to become the Northern capital of the emancipation of the Third World.

7. Guattari's contribution to the seminar on urban design in the 21st century was 'Restoration of the Urban Landscape', in *Proposal from Nagoya* (Nagoya, 1989): 85–95. I am grateful for the reflections on this event by participant Tetsuo Kogawa (Letter from Kogawa-Genosko, January 23, 2003).
8. Mentioned briefly by Stephen 'Deadalus' Guattari in the 'Pré-Texte' to 'Ritournelles', *La Nouvelles Revue Française* 548 (jan 1999): 338–39.
9. The obvious, but misleading, reference is to Shin Takamatsu's Kirin Plaza (1987) in Osaka. The luminous cubes are the four patterned rectangular lanterns that reach toward the sky from the four corners of the structure. This building is not in Tokyo; so, any of the dazzling neon towers of Shinjuku or Shibuya will suffice.

   One is struck by the image of Guattari wandering around the nocturnal city fixated on the bright spectacle above his head. The same sense is found in his *Ritournelles*, this time with respect to the dense, hypermodern commercial district in Tokyo, Shinjuku: "The buildings of Shinjuku traversed from top to bottom by parallel neon bars." (*La Nouvelle Revue Française* 549 Avril 1999: 337)
10. Guattari exploits here the medical link between iron deficiency and impaired memory [*manque marquée du fer dans les mémoires* – marked lack of iron affecting their memories] in a double entendre.
11. Guattari appears to be complaining about a kind of electronic music, a species of techno known as *loukoum* in France and elsewhere. It is named after the sweet 'Turkish Delight'.
12. Kobo Abé, *The Ruined Map*, trans. E. Dale Saunders, New York: Vintage, 1997. Guattari was an avid reader of Abé novels and found the dream cartography of the aforementioned detective novel particularly evocative of a marginal Tokyo.
13. Sanya is a district in Tokyo in which foreign and day labourers live. Many are homeless and live in makeshift shelters made of found materials. Elsewhere Guattari simply made the point that zones of disparity coexist in the great cities, no more in terms of centre and periphery relations, citing the concentrated wealth of Shinjuku and misery of Sanya as an example. See 'Space and Corporeity: Drawing/Cities/Nomads', in *Semiotext(e) Architecture* (1992): 118–21; 122–25.
14. Sato Mitsuo was a Japanese documentary film director known for his social activism. He was murdered during the making of his 1985 film 'YAMA', the colloquial name for Sanya. The film follows the struggles of the district's day labourers to organize.

Deleuze Goes to Xanadu

David Musselwhite University of Essex

> After all, what most urgently needs thought in this century,
> if not the event and the phantasm?
> – Michel Foucault, 'Theatrum Philosophicum'[1]

Foucault's adjuration, which is to be found in the essay in which he notoriously announced that the century (the last) will be 'Deleuzian', would seem to have fallen on deaf ears to the extent that the notion of the phantasm and the place it occupies in Deleuze's thinking has received astonishingly little attention. One scours the indices of the enormous body of work dedicated to the exposition of Deleuze's thought in vain to find any mention of the phantasm or of the text that lies behind his use of the concept, namely Laplanche and Pontalis's 1964 paper, 'Fantasme originaire, fantasmes des origines, origine du fantasme'. By way, in part, of remedying this situation I propose to examine what a 'Deleuzian' or a 'phantasmatic' reading might make of Coleridge's *Kubla Khan*.

To account for this choice it might be helpful to describe first the principal characteristics of a 'phantasmatic' structure, not least the critical distinction that has to be made between the 'phantasm' and 'fantasy'. 'Fantasy' is a conscious reverie or daydream – it is something that a subject can have or indulge in at will – it belongs to the waking consciousness. The 'phantasm', on the other hand, is a 'deeper' unconscious or pre-conscious experience or event, in the course of which the subject may find itself not so much a witness of the scene as a participant in it:

> [T]he phantasm is not the object of desire, it is a scene. In the phantasm, in effect, the subject does not target the object or what stands for it; rather he figures there himself, caught up in the sequence of images. (Laplanche and Pontalis 1964: 1868)

The phantasm, then, is something that happens to, and, in a sense, places the subject. These experiences come upon the subject in moments of abstraction or semi-consciousness, in the moments between sleeping and waking, and, as in a dream or trance, capture it unawares. *Kubla Khan*, with its notorious preface recording it had been composed in precisely this kind of hypnagogic state, between sleeping and waking, which is most propitious for a phantasmatic happening, offers itself as a prime candidate for a phantasmatic reading. In the poem, moreover, as in the phantasmatic scenario, there is every evidence of that confusion of subject positions: the 'I' that claims to be the subject of the final vision of the 'damsel with the dulcimer,' for example, gives way to the 'him' and the 'he' 'caught up in the sequence of images.'

The second major characteristic of the phantasmatic structure and the one that constitutes its primary function, is that it operates at the interface between biology and culture, between body and mind. Following Freud, Laplanche and Pontalis list a number of typical phantasms that befall the young child – phantasms of the primal scene, of seduction and of castration – and each of these plays its part in its socialisation:

> What does the primal scene mean for us? The link between the biological fact of conception (and of birth) and the symbolic act of filiation, between the naked act of coitus and the existence of the triad of mother-infant-father. (Laplanche and Pontalis 1964: 1854)

The phantasm marks the transition from animal need to human desire, from the biological to the cultural:

> Phantasms are produced by an unconscious combination of things experienced (*choses vécues*) and things heard (*choses entendues*). (Laplanche and Pontalis 1964: 1854)

In the phantasm what has 'formerly been interpreted as pure noise (*pur bruit*)' (Deleuze 1969: 233) now finds itself located in the context of the *bruit* ('noise', again but now understood in the sense of the 'noise' of tradition, repute, acclaim – the *dit* (sayings or tales) or *rumeur* (gossip, wisdom)) of the social group to which the child belongs. (Laplanche and Pontalis 1964: 1854) What the phantasms configure for the child, moreover, are questions of *origins* (whence 'Fantasmes *originaires*...): the primal scene, the origin of life; seduction, the origin of sexuality; castration, the origin of the difference of sexes. In this sense phantasms are constitutive of the child's awareness of its vital state, its sexuality and its gender – in a word: its humanity.

At the time of writing *Kubla Khan* (i.e., the late 1790s), Coleridge, like many of his contemporaries, was fascinated by the body/mind interface, that is with 'what he called the "corporeality of thought."' (Richardson 1990: 40)[2] In a letter of September 22nd 1800 to William Godwin he raises the 'great Question – whether there be reason to hold, that an action bearing all the *semblance* of pre-designing Consciousness may yet be simply organic . . . ' (Coleridge 1956: 625–6).[3] Coleridge's interest in what today we would call 'cognitive' science, that is the organic or physiological nature of thinking, was almost obsessive. Part and parcel of such an interest in the relation between the mind and the body inevitably led to experimentation with mind-changing and mind-enhancing drugs and stimulants, the most notorious outcome of which was, of course, *Kubla Khan* itself. (Richardson 1990: 51, 53)

Turning to the poem itself, it is one of the commonplaces of practically all readings of *Kubla Khan* that it

> presents at once a 'mental topography' or map of the human psyche and a representation (however fragmented or over-determined) of the human body . . . a psychologised landscape that also suggests a dispersed, erotically charged body. (Richardson 1990: 57, 60)

The poem itself seems to stand as an interface between 'the human psyche' and the 'human body'. On the whole, however, criticism has tended to dwell on the sexual-orgasmic nature of the imagery: the 'pleasure dome' is notoriously celebrated as a multivalent and androgynous symbol of both breast and phallus; the fountains and the caves are taken to represent respectively male and female – ejaculation and womb – attributes; the 'gardens bright with sinuous rills . . . . Enfolding sunny spots of greenery' recall the *topoi* of late-medieval romance where gardens figure the body of the beloved; and while the 'sacred river . . . Five miles meandering with a mazy motion' may symbolise spiritual turmoil it just as readily evokes the possibility of intestinal and visceral convolutions.

On the other hand, and almost at the opposite extreme, there is that body of scholarship, represented most notably by John Livingstone Lowes, that concerns itself with the search for the sources of the poem in Coleridge's extensive reading. Despite attempts to correct, emend and supplement it, Lowes work still seems to me to be pretty authoritative. There, it will be recalled, – prompted by Coleridge's own acknowledgement, in the prefatory note, of 'Purchas's Pilgrimage' – he traces the sources of much of the material of the poem to earlier travelogues: in addition to *Purchas His Pilgrimage*, he looks

at *Purchas His Pilgrims*, William Bartram's *Travels Through North and South Carolina, Georgia, East and West Florida*, James Bruce's *Travels to Discover the Sources of the Nile*, Athanasias Kircher's *Oedipus Aegiptiacus* (on the source of the Nile and including also an account of an earlier discoverer of the source of the Nile, Father Peter Paez), Thomas Maurice's *History of Hindostan*, Major James Rennell's *Memoir of a Map of Hindoostan*, F. Bernier's *Voyage to Surat*, as well as many other classical and Arabic sources.

I will limit myself to two observations concerning this material: the first is that many of the passages Lowes quotes seem almost to be variations of one another – 'an image of an image of an image' as he remarks at one point (Lowes 1978: 334); similarly, at times Bartram, Bruce, Kircher, Paez collapse into one another so that all question of which is the original and which is the copy becomes hopelessly entangled (Lowes 1978: 340). Second, practically all the accounts cited refer to origins, either of the Nile and other great rivers, or of Paradise itself. The various descriptive details quickly blur into the archetypal primal scene, Eden: blossoms, fountains, springs, greenery.

Like the phantasm, then, *Kubla Khan* becomes the meeting point, or interface, of, on the one hand, an imagery strongly focussed on the human body, whether erotic or purely physiological, and, on the other, a dazzling kaleidoscope of exotic scenarios whose common theme is that of geographical and cultural origins.

The third major constituent of the phantasm is the experience of loss. What the phantasmatic event effects in the shift it facilitates from need to desire is a loss of 'the real' and its replacement by a 'virtual' object more precious and more unattainable than any 'real'. What is lost is the real, biological, functional organ of need. Its replacement is the ideal or virtual object of desire – the phallus more powerful than any real phallus, the breast more perfect and more ideal than any real breast. This shift mediates the leap from the domain of the purely organic to the realm of the social and the human. The virtual 'Good Object', however, which might be a composite of the ideal breast and the ideal phallus, or of the ideal father and the ideal mother, is always a Lost Object and it is always and forever this lost Good Object that furnishes the fulcrum and 'quasi-cause' of the pendular swing and cumulative resonance of desire.

Kubla Khan is in many respects a meditation on loss: 'deprivation,' writes Elizabeth Schneider, 'haunts the language' (Schneider 1966: 287). Initially it is about the loss of those 'two to three hundred lines' composed while the poet was 'in a profound sleep.' It is also about the loss of Paradise. The Miltonic inspiration of an Eden of pre-lapsarian

innocence, added to that furnished by travelogues, is everywhere in evidence.[4] But pre-eminently it is about the loss of that 'stately pleasure dome' that bestrides and dominates the poem, the quintessential symbol of the lost Good Object, an amalgam of the virtual phallus and the virtual breast, an overdetermined composite of the ideal father and the ideal mother.

The fourth characteristic of the phantasm is its temporality: the phantasmatic event is never a simple, punctual, 'one-off' event. The phantasm always involves at least two moments. In the case of the 'originary phantasm', because of the prematurity of human birth, the phantasm occurs always 'too early', when we are not ready for it, either physiologically or emotionally. It is only later, 'too late', at a post-pubertal moment when we are sexually and mentally equipped to deal with it, that the earlier event is retrospectively (Freud's key notion for this delayed temporality is *Nachträglichkeit*, translated by Laplanche as 'afterwardsness' (Laplanche 1992: 217ff)[5]) comprehended and properly 'lived through'. What occurs at this moment of 'the traversal of the phantasm' (Lacan 1977: 273) is something like a pendular movement of resonance between the two events, a resonance that can gain sufficient moment that it begins to take in other phantasmatic memories so that the 'whole' can climax in something like a moment of ecstatic delight and transport.

It is this diphasic temporality of the phantasm, its 'afterwardsness', that accounts for the troublesomely diphasic, even 'broken', structure of *Kubla Khan*. Elizabeth Schneider regards '[t]he division of *Kubla Khan* into its two parts' as 'fatal to the unity of the poem':

> The whole reads like a fragment with a post-script added at some later time when it has become obvious to the poet that he cannot finish the piece. The post-script is skilfully linked with the rest by the recurrence of the dome and caves of ice; but these and other devices do not conceal, and I imagine were not meant to conceal, the actually disparate parts. (Schneider 1966: 249, 247–8)[6]

This is to fail totally to understand the extent to which the last eighteen lines of the poem are a phantasmatic *réprise* ('afterwards' recapitulation) of the events depicted in the first part of the poem: 'A damsel with a dulcimer' is like a 'lite' version of 'In Xanadu did Kubla Khan': we have to forget 'meanings' here – syllabically and phonetically this is a dental and labial surface reconfiguration of the nasals, harsh gutturals and glottal depths of the opening line. The '*Abyss*inian *maid*' is a condensed re-articulation of the earlier associated figures of the

'deep romantic *chasm*' and the '*woman* wailing'; and the rather heavy 'dome' is now reconfigured as the much lighter, but in many ways just as innuendo rich, 'dulcimer' on which the damsel plays.[7]

It is true that the 'damsel' and her 'dulcimer' are 'lost objects' that need to be 'revived', but surely the sense of the concluding lines is not of a failure to capture the song of the damsel – 'Could . . . . 'twould' – but that it has already been captured in an incantatory dance of ecstasy.[8] These last few lines are a resonating digest of the whole poem: we have seen how 'Kubla Khan' and 'Xanadu' have been reconstituted as the 'damsel with a dulcimer', and the 'deep romantic chasm' and the 'woman wailing' translated into the 'Abyssinian maid'. There is a return, too, of the 'sunny dome!' and 'caves of ice!', echoes of the many travelogues, in the ecstatic, trance-like, rhythms. The poet, himself, has become one with – even possessed by – the despotic figure – 'His flashing eyes, his floating hair' – who has opened the poem with his inaugural decree, the only response to which might be 'Beware! Beware!' Finally, in a typically phantasmatic gesture,[9] the poem returns upon its own origin, the opium moment that provoked it:

> Weave a circle round him thrice,
> And close your eyes with holy dread
> For he on honey-dew hath fed,
> And drunk the milk of paradise.

The poem/phantasm, in other words, recounts its own genesis and culminates in the transport of the subject it presupposes.

This emergence of a subject that can in some sense lay claim to the poem that has produced him returns us to the distinction between the phantasm and fantasy and allows us to introduce a fifth characteristic of the structure of the phantasm – its stratification into a number of levels. Fantasy is closer to the day-dream or waking reverie, whereas the phantasm proper is a 'deeper' more unconscious scenario, but Laplanche and Pontalis counsel against making too strong a distinction between the two to the extent that day-dream and the unconscious scenario might have common elements – the unconscious scenario might have been once a conscious reverie now repressed. Nevertheless the structure of the two will differ:

> At the pole of the day-dream (*rêverie diurne*), the scenario is essentially in the first person, the place of the subject marked and invariable. The organization is stabilised by the secondary revision, ballasted by the 'self' (*moi*): the subject, one says, lives its reverie. The pole of the originary phantasm, on the contrary, is characterised by an absence of subjectivation which goes along

> with the presence of the subject *in* the scene: the child, for example, one of the personages amongst all the others . . . (Laplanche and Pontalis 1964: 1860–61).

The phantasmatic nature of *Kubla Khan* – its status as an originary phantasm rather than a simple fantasy – is evidenced, as we have seen, by the relatively 'unstabilised' and 'unballasted' organization of its subject and gender allocations. In addition, the points of view of both the opening passage – the decreeing of the stately pleasure dome – and the second section of the poem – the description of the deep romantic chasm – are difficult to locate, disturbed as they are by what one senses are incompatible shifters ('there were . . . here were') and puzzling identifications ('But oh! . . . ' seems to be the cry of the woman wailing). In many ways, the drama seems to be taking place at a wholly pre-personal level, far below and anterior to human consciousness, so that, for example, Sandra M. Gilbert and Susan Gubar can write:

> Kubla's kingdom is rocked by the quasi-sexual violence of an almost overwhelming primal scene, for from the 'deep romantic chasm' the panting earth forces out a phallic 'mighty fountain' which flows 'in tumult' through 'the caverns measureless to man.' (Gilbert and Gubar 1989: 98)

Another commentator, Beverley Fields, can detect evidence of the primal scene on a different, more classic and more nearly domestic, level when she traces the Oedipal pattern of the relationships of the poet, Kubla Khan, and the 'woman wailing' in the opening two stanzas. (Fields 1967: 98) In fact, once the 'deep' structure of Gilbert and Gubar's 'overwhelming' aeonic and quasi-geological 'primal scene' is conceded, and Fields' more restrained 'Oedipal' interpretation accepted, it is not too great a leap to move to another level and locate the specific trauma that lies behind the poem, namely the death of Coleridge's father which was recorded in the letter of October 1797 – practically contemporaneous with the date of composition of the poem – to Thomas Poole:

> In a minute my mother heard a noise in his throat – and spoke to him – but he did not answer – and she spoke repeatedly in vain. Her *shriek* awaked me – & I said, 'Papa is dead.'(Coleridge 1957: 355)[10]

Here, surely, we have the poem *in nuce*: 'Kubla *Kh*an' is phonetically little more than a guttural, glottal, 'noise in [the] throat,' a death rattle; the mother is indeed a 'woman wailing'; and there remains the small child who has dreamed/witnessed the whole thing. We could hardly

have a clearer illustration of the stratifications of the phantasmatic structure: from the 'deep,' 'geological' level of the 'mighty fountain' and the 'measureless caverns,' through the more generic 'Oedipal' scene of Kubla Khan and the woman wailing, to the precise and contingent event of 'daddy, mummy and me' of the letter to Poole – the arrival at the 'revisionary' level of the classic familial romance (Gilbert and Gubar 1989: 161).

At this point we have pretty much taken the original Laplanche and Pontalis model of the phantasm as far as it can go, remaining, for the most part, within the bounds of the classic phantasmatic scenarios of the primal scene and Oedipus. Perhaps the most striking contribution that Deleuze makes to this model of the phantasm (it will not surprise readers of the *Anti-Oedipus* to learn) is to move beyond the *dramatis personae* of a classical theatre to address instead the tumultuous pre-personal and fragmented world of Melanie Klein's schizo-paranoid, depressive and Oedipal 'positions'.[11] Here, says Deleuze, 'Tout commence par l'abîme' – everything begins in the abyss. In the schizo-paranoid position the unconscious is the site of a frenzied *melée* of 'internal partial objects, introjected and projected, alimentary and excremental, poisonous and persecutory, explosive and toxic' (Deleuze 1969: 218). Where Deleuze differs slightly from Melanie Klein is in suggesting that even at this level the excremental fragments are in part countered and checked by a fluid, urethral, liquid principle:

> What we have here opposing each other are two depths . . . . Two mixtures, the one of hard and solid fragments . . . ; the other liquid, fluid and perfect . . . which fuses and solders (*fondre et souder*) . . . (Deleuze 1969: 220)

Now, it seems to me that if we accept that what we have in the poem is, as many have claimed, something like a sustained metaphorical depiction of the human body, then at its very centre is a 'gastric' or 'visceral' panorama strikingly reminiscent of Melanie Klein's schizo-paranoid position:

> And from this chasm, with ceaseless turmoil seething,
> As if this earth in fast thick pants were breathing,
> A mighty fountain momently was forced:
> Amid whose swift half-intermitted burst
> Huge fragments vaulted like rebounding hail
> Or chaffy grain beneath the thresher's flail:
> Amid these dancing rocks at once and ever
> It flung up momently the sacred river.

> Five miles meandering with a mazy motion
> Through wood and dale the sacred river ran,
> Then reached the caverns measureless to man,
> And sunk in tumult to a lifeless ocean:

Here are the 'two depths', 'the two mixtures': the suspension of 'hard and solid', 'alimentary' and 'excremental', 'oral' and 'anal' ('chaffy grain'; 'rebounding hail'; 'huge fragments') partial objects, on the one hand, and 'liquid,' 'fluid' and 'urethral' (the fountain; the river), on the other. There is a strong sense of an aggressive schizo-paranoid, internecine strife in the violence of the verbs: 'seething', 'forced', 'rebounding'. In this conjunction of 'hard' and 'fluid' mixtures Deleuze suggests that we have the embryonic forms of the *id* and the *ego* (Deleuze 1969: 221). What we also have here is a rudimentary sketch of the tension between the *corps morcelé* (the fragmented body in pieces) and the body without organs (BwO) that is to figure so prominently in the later works Deleuze composed with Guattari.

What follows upon the schizo-paranoid position is the 'depressive position' centred no longer on the partial, fragmented, objects of the aggressive phase but on a complete 'Good Object on high':

> The good object is on high, it holds itself aloft . . . The good object has taken upon itself both the schizoid poles, that of the partial objects from which it has extracted the energy, and that of the body without organs from which it has abstracted the form – that is completeness and integrity. (Deleuze 1969: 221)

As supreme eminence, the Good Object combines the ideal attributes of both parental figures – both ideal breast and ideal phallus – and becomes a prototype of the super-ego: 'The superego begins . . . with the good object that remains on high' (Deleuze 1969: 225). As such it is the bearer of the voice of tradition:

> But, precisely what assures . . . the first stage of the formation of language, is the good object of the depressive position on high. For it is this that, from all the noises of the depths, extracts a voice . . . Freud insisted on the acoustic origin of the superego. For the child, the first approach to language might properly consist of seizing upon this as the model of everything that posits itself as pre-existing, as referring to the whole domain of what is already there, the familial voice that carries tradition. (Deleuze 1969: 225)

The Good Object, then, is a transitional figure that draws on the energies of the partial objects of the schizoid-paranoid depths and anticipates the emergence of 'the combined idol of both parents'

(Deleuze 1969: 233) prefatory to the formation of the Oedipal moment. The equivalent shift in the poem is from the schizo-paranoid noises – the 'ceaseless turmoil' and the 'thick pants' – of the aggressive phase, to that 'miracle of rare device', the 'sunny pleasure dome', and the emergence of the tradition-bearing 'ancestral voices' associated with the Good Object on high:[12]

> And 'mid this tumult Kubla heard from far
> Ancestral voices prophesying war!
>
> The shadow of the dome of pleasure
> Floated midway on the waves
> Where was heard the mingled measure
> From the fountains and the caves.
>
> It was a miracle of rare device,
> A sunny pleasure dome with caves of ice!

The dome as a composite symbol of both ideal breast and ideal phallus and so of a combined parental ideal is a classic instance of the 'Good Object'. Its intermediary role is manifest in its bestriding both heights – 'a sunny pleasure dome' – and depths – 'caves of ice' while its shadow floats 'midway on the waves' resonating with the energies from the earlier schizo-paranoid position – 'from the fountains and the caves'. With the emergence of the Good Object there is the emergence, too, of the 'ancestral voices prophesying war': instead of the naked *bruit* of the depths we have now, with all its potentially martial associations, the *bruit* of generations, of pride and creed and renown.

At the same time as this graduation from the schizo-paranoid position to the depressive position another process is taking place which is not so much 'vertical' as 'lateral': this is the exchange of the partial objects of the depths for the constitution of the partial zones of an erogenous body-surface. This mapping of an erogenous body surface that doubles the biological, purely organic, body is a crucial stage in the formation of a body image and a sense of self.[13]

According to Deleuze the responsibility for mapping and surveying this erogenous surface lies principally with the Good Object from its vantage point on high. Here, in the poem, that responsibility is assumed by the Khan who now exclusively takes upon himself the paternal (and therefore phallic) pole of the hitherto composite (both phallus and breast, paternal and maternal poles) Good Object. The Khan's inaugural gesture is precisely to decree (which now replaces the noises of the depths

and the voices of the heights[14]) a mapping of an erogenous surface of pleasure:

> So twice five miles of fertile ground
> With walls and towers were girdled round:
> And there were gardens bright with sinuous rills,
> Where blossomed many an incense-bearing tree;
> And here were forests ancient as the hills,
> Enfolding sunny spots of greenery.

Here, in this *paysage moralisé* that reminds one of *The Romaunt of the Rose*, is an almost one-to-one redeployment and surface efflorescence – 'sinuous rills'/ 'mighty fountain'; 'blossomed'/'chaffy grain'; 'sunny spots of greenery'/'caverns measureless to man') – of the ferocious and anarchic energies located in the schizo-paranoid depths.

Following this triumph of the Good Object as omnipotent phallus, and the constitution of the erogenous surface that doubles the organic body, we confront the Oedipal moment. With the Oedipal scenario, which is the phantasmatic moment *par excellence* – embracing, as it does, all the originary phantasms of the primal scene, seduction and castration – there is a 'leap' from an aetiology determined purely by the body – its depths, its heights, its surfaces – to an aetiology determined by the clusters of events – Oedipal among them – passed on from generation to generation and that takes place, as it were, upon a second screen:

> One could say that the whole action is projected upon a double screen, one constituted by the sexual and physical surface, the other a surface that is already metaphysical or 'cerebral' . . . The phantasm is the process of constitution of the incorporeal . . . It is with Oedipus that the event detaches itself from the causes that come from the depths [i.e. its physiological determinants] and spreads itself out [*s'étale*] on the surface . . . Perfect crime, eternal truth, royal splendour of the event, each one of which communicates with all the others in one and the same phantasm. (Deleuze 1969: 242; 256; 247)

The Oedipal scenario is the 'nuclear' phantasm not simply because it is constitutive of one's vital state, gender and sexuality – that is of one's humanity – but because, to the extent that it addresses questions of crime and punishment, love and guilt, innocence and loss, it resonates, too, like a Leibnizian monad, with every other originary event/phantasm – including those culled from Milton, Bartram, Bruce, Maurice, Rendell and the rest.

It is with the confrontation of just such an Oedipal moment that the poem opens – with the all powerful Kubla Khan and the 'woman wailing

for her demon lover': we have already traced the biographical source of this trauma. The hubristic *élan* of the opening, however, quickly folds and the poem seems to implode in on itself. The surface proves itself to be all too fragile.[15] The poem, in many ways, records the initial failure to come to terms with the Oedipal event and the consequential collapse into a kind of schizophrenic delirium. The trajectory of the poem, at least of the first 28 lines, is the reverse of the passage from depths to heights to surface to Oedipus traced so far in the relationship between the poem and the phantasm. The 'deep romantic chasm' is the rent, what Deleuze would call the *'fêlure'*, the 'fissure' or 'crack', that marks the fracture of the surface of the text.[16]

> The first evidence of schizophrenia is that the surface is cracked (*crevée*) . . . The primary aspect of the schizophrenic body is that it is a kind of colander (*corps-passoire*): Freud stressed that tendency of the schizophrenic to conceive of the surface and the skin as if pierced by an infinity of small holes. (Deleuze 1969: 107)

No-one skirted the abyss of schizophrenia more closely than did Coleridge and there was always the chance that the despotic majesty of Kubla Khan might crumble into the rubble of Ozymandias.[17] There is always the danger, too, that the traversal of the phantasmatic structure might go into reverse and consciousness suffer a catastrophic *chute* back into manic-depressive delirium and schizo-paranoid fragmentation.

It is this failure to cross the Oedipal threshold and the consequential collapse of the surface that accounts for much of the 'difficulty' of the poem. It exists in a pre-Oedipal or pre-linguistic state: this accounts for the ambiguities of its gender allocations and its vacillating subject positions, as well as the great difficulty of reading any kind of global 'symbolic' meaning into it.[18] It is not surprising, then, that critics like Elizabeth Schneider and cognitive theorists like Reuven Tsur frustrated by the lack of meaning to be found at the global level have focused their reading on the formal prosodic structure of the work, on its phonological and metrical structure. Deleuze, too, cautions us against too quickly dismissing as 'sense-less' a use of language that lies below the threshold of 'meaning' understood at a lexical, global, level:

> If a child arrives into a pre-existing language that he cannot yet understand, perhaps inversely he fixes upon what we no longer recognize in the language we already possess: the phonematic relations, the differential relations of phonemes. (Deleuze (1969): 268)

Concentration on the 'phonemic relations' of the poem quickly alerts one to what might be called its 'anagrammatic' features: David Perkins has noted that 'Xanadu' is a quasi-anagram of 'anodyne'[19] and with a little patience and ingenuity it is possible to find – as in the last line:

And drunk the milk of paradise
K u p l a K a n / S/Z a n d i

– the phonemes and syllables of 'Kubla Khan' and 'Xanadu' scattered about the poem like a corps morcélé or, to recall something I said earlier, the rubble of Ozymandias. We have already noted that 'damsel with a dulcimer' might be regarded as phonematic-lite 'translation' of 'Kubla Khan' and 'Xanadu.' It is this anagrammatic play that gives the poem its characteristically granular texture.[20]

We have spoken earlier of Coleridge's interest in the body/mind interface and we quoted at the time from his letter of September 22nd. 1800 to Horne Tooke where Coleridge broaches the question

> whether there be reason to hold, that an action bearing all the *semblance* of pre-designing Consciousness may yet be simply organic . . . '

If we now reinsert that question into the broader context of the letter –

> I wish you to write a book on the power of words, and the processes by which human feelings form affinities with them – in short, I wish you to *philosophize* Horne Tooke's System, and to solve the great Questions – whether there be reason to hold, that an action bearing all the *semblance* of pre-designing Consciousness may yet be simply organic, & whether a *series* of such actions are possible – and close on the wheels of this question would follow 'Is Logic the essence of thinking?' in other words – Is *thinking* impossible without arbitrary signs? & . . . how far is 'arbitrary' a misnomer? Are not words &c. part & germination of the Plant? And what is the Law of their growth? – In something of this order I would endeavour to destroy the old antithesis of *Words & Things*, elevating, as it were, words into Things, & living Things too. All the nonsense of vibrations etc. you would of course dismiss.
>
> If what I have written here appear nonsense to you, or commonplace thoughts in a harlequinade of outré expressions, suspend your judgment till we see each other. (Coleridge 1956: 625–6)

– what we find is that what particularly interests Coleridge is the way in which language itself emerges from the body. Words are not merely arbitrary signs to Coleridge but organic things – 'part and germination of the Plant.' What is more, Coleridge is evidently looking for an account of the emergence of language – 'what is the law of [its] growth?' – far more sophisticated than that provided by Hartleyan associationism. This more

narrow focus on the emergence of language links the project of *Kubla Khan* even more closely to that explored by Deleuze in *Logique du sens*, the central concern of which is 'what makes language possible?'

> To make language possible means this: to ensure that sounds are no longer confused with the sonorous qualities of things, with the noise (*bruitage*) of bodies, with their actions and passions . . . Language is rendered possible by that which separates (*distingue*) it. That which separates sounds and bodies makes sounds the elements of a language . . . What renders possible is the surface, what happens at the surface: the event . . . (Deleuze 1969: 212; 217)

Up to a point and in rather general terms this process has already been traced in the movement from the noise of the schizo-paranoid depths to the voice of the manic-depressive heights and on to the establishment of a surface that lends itself to the resonance and double screen of the event and to the performative effect of the decree, which not only proclaims the autonomy of language in relation to the body but also the power of language to react back on the body. Deleuze speculates, moreover, that one might correlate the phonetic/phonemic strata of language with the schizo-paranoid depths and erogenic zones, morphemes with the manic-depressive heights, and semantemes with the Oedipal moment:

> But to what extent can one link phonemes with the erogenic zones, morphemes with the phallic stage, and semantemes with the evolution of Oedipus and the complex of castration? (Deleuze 1969: 268–9)

Again, Deleuze seems to be echoing Coleridge's own interests. Coleridge, for example, was fascinated by the way in which children acquire language:

> Like many of his contemporaries, Coleridge regards the question of the origin of language as inextricably bound up with the process of language acquisition by infants . . . Coleridge [explores] the theory that certain classes of phonemes are more primitive than others: the labials, uttered by infants, are seen as most primitive of all. (McKusick 1986: 16)

Certainly an awareness of this interest goes some way to legitimizing the attention here to the phonetic components of the poem and, indeed, to the link between phonetic elements and the primitive roots of language itself.[21]

We have already looked at the phonetic *débris* of the anagrammatised 'Kubla Khan' and 'Xanadu' that bestrews the text. This, in a sense, constitutes the rubble, the hardcore, of the fabric of the poem. Slightly higher are those unstable phonemic clusters that easily regress, as it were, from their role as signifiers to assume again a quasi-physical function, to

the condition of lacerating and penetrating partial objects akin to the aggressive fragments of the schizo-paranoid depths –

> Huge fragments vaulted like rebounding hail
> Or chaffy grain beneath the thresher's flail

'Rebounding hail' is doubly penetrative: it is not just the 'hail' of a 'hail-storm' – which is its normal significative meaning; a 'hail' is also a direct address, a design on and grasping of the body. A 'hail' is language at its most physical: it has a concrete, interpellative effect as immediate as an arrest. Indeed, what does the poem conclude with except 'rebounding (in the sense both of repetitions and of repeated binding – 'weave a circle round him thrice') hails' – 'Beware! Beware!'? Indeed, to the extent that the poem as a whole, with its rhythms and repetitions, its internal rhymes, its alliterations and assonances, its gutturals, dentals, fricatives, palatals – its dazzling verbal enactment – almost physically assaults us, *Kubla Khan* itself might sometimes seem little more than a hail-storm.

Or, again 'chaffy grain': 'chaffy' is again textural – granular grain – but it is also 'bantering' – again to chaff someone is to tease and molest, with the chaffing including the sense also of chafing, cutting, lacerating, marking. 'Chaffing,' like 'hailing,' is language in its rawest most visceral state, impacting immediately on the body. It is at this lowest, almost visceral, intestinal level – barely above raw phonetic splutterings and stammerings – that language begins and from which it has to emerge. Again we can recall 'Tout commence dans l'abîme' – let us translate: everything begins in the abyss, is 'Abyssinian maid/made.' I do not think we need to apologise for these grotesque puns: this is where language begins. 'Abyssinian maid/made' is just the sort of pun one might expect from someone who referred to himself as a 'mottophilist' or 'mottomanist' or, indeed, as 'papyrologiophagus'[22] and is prepared to gloss 'illuminize' as 'allum in eyes' (Coleridge 1956: 293, 532, 564).[23]

Let us take next 'A damsel with a dulcimer'. I have already suggested that it is a phonetic reconfiguration of the opening line of the poem. I have also indicated that it is pointless to attempt to give it some kind of referential meaning.[24] What we have here are not words but simply 'phonematic relations, the differential relations of phonemes' that barely attain the status of distinctive morphemes.

I do not know how far one might be able to trace this emergence of language. We have already followed this process in broad outline – from the schizo-paranoid noises of the depths, to the depressive position governed by the Good Object on high and the ancestral voices

associated with the super-ego, and from there to the constitution of the erogenic/sexual surface and the Oedipal event of the law – Kubla Khan's decree.

Kubla Khan sits astride the poem like Humpty Dumpty: it is his decree alone that can arrest the arbitrary play of language and make it mean whatever he decides it should mean. In fact on the two out of three occasions that Kubla Khan or some other Khan, is mentioned by name in Coleridge's notebooks it is in association with language. In 1802, the following entry was made: 'Kublaikhan ordered letters to be invented for his people' (Suther 1965: 190), while an entry in 1799 records 'The Tartar Chan' as '[setting] on foot a Translation of the Great French Encyclopaedie into the Tartar language' (Suther 1965: 191). This dual role of inventor and translator makes the Great Khan, in effect, both the author and the reader of his own (untranslatable) poem.

Paradoxically, at this point the account of the emergence of language from the depths of the body has culminated in an order originating rather in a despotic decree. The contradiction implicit in this scheme owes to an ambivalence in Coleridge's own thinking about language he never resolved. On the one hand, there was the theory of language deriving from Horne Tooke and the whole empirical tradition stretching back to Locke. According to this theory, language was a matter of giving arbitrary names to the sensations of things, with the mind being no more than a passive *tabula rasa* recording these discrete events. More elaborate mental operations were simply the results of the association of ideas. Tooke took this empirical theory to its radical and materialist extreme: all language was based on a very small number of basic names of things and any analysis of even complex linguistic structures ultimately depended on tracing the etymology of the terms used back to their primitive roots. So that any mention of 'spirit' or a 'spiritual' dimension inevitably led back to 'spirit' being construed as just 'air'; whereas 'I think' itself, for example, was merely a corrupt and abbreviated form of 'me thingeth' or 'I am thinged' (Aarsleff 1983: 63). It was this theory of language that lay behind Coleridge's interest in the corporeality of thought and so perhaps behind the opium experiment that was the source of *Kubla Khan*. On the other hand, Coleridge was always reluctant to accept the absolute materialism of Horne Tooke's theory and from the beginning held onto a much more orthodox theory of natural language, where words and things have an irreducible affinity and correspondence, that ultimately goes back to Adam's naming of things in Eden and is therefore sanctioned by Holy Scripture and so by God (McKusick 1986: 10, 19, 21).

What enabled Coleridge to reconcile in part what were, in the end, two incompatible philosophies of language – the one empirical, materialistic and politically radical, the other idealist, theological and politically conservative – was his introduction in 1798–9, during a sojourn in Göttingen, to the German metaphysical and philological traditions, particularly to the works of Herder, Kant and Johann David Michaelis.[25] From Herder, Coleridge would have gleaned the notion that language is a historical product that bears within it the whole inner life of a nation. Just as distant from the empirical tradition's interest in the sensationalist source of thought and language was the notion of the innate categories of experience to be derived from Kant. Frustratingly, however, the dilemma presented by the incompatibility of the empirical and 'natural' language schools of thought is only refined, but not resolved, in the difference between the historical and transcendental alternatives offered respectively by Herder and Kant. It is the work of the third thinker, Johann David Michaelis, whose *A Dissertation on the Influence of Opinions on Language and Language on Opinions* had already been published in English in 1769, who really seems to offer a solution to the problem. The title of Michaelis' work refers to his principal thesis: not just that opinions affect languages but that languages affect opinions:

> By 'opinion' Michaelis means the entire range of mental activities both conceptual and affective . . . (McKusick 1986: 59)

Michaelis looks forward to Herder's view that all mental activity reflects one's national character, but it is expressed in a more temperate and more nuanced manner:

> Languages are the accumulation of the wisdom and genius of nations, to which everyone has contributed something . . . So that language is a kind of archives (*sic*), where the discoveries of men are safe from any accidents, archives which are proof against fires, and which cannot be destroyed but with the total ruin of the people. (Quoted in McKusick 1986: 59)

So while the notion of language as 'the accumulation of the wisdom and genius of nations' acknowledges the historical dimension of language, the notion that language 'is a kind of archives' or 'respository of collective knowledge' (McKusick 1986: 59) provides the means of conceptualizing the 'innate' constituent role of language without recourse to the trans-historical categories of Kant. McKusick claims this conception of language as an 'archive' is 'closer to Coleridge's own position' than the later more mystical works of Hamann, Herder or Humboldt and as close to a worked out theory of language as

Coleridge ever came. The notion of the archive allows Coleridge to escape completely from the empiricist tradition's obsession with discrete elements. But it also leads to the realization that 'words are learnt by us in clusters' (Coleridge quoted in McKusick 1986: 68) rather than 'determinately' (as Locke would have it: a 'determinate' sound linked arbitrarily to a 'determinate' thought):

> Paradoxically, then, the loss of determinate signification produces a gain in immediacy; the listener regresses, as it were, to an early stage of childhood when words affected him not as discrete entities, but in clusters. (McKusick 1986: 68)

McKusick concludes his discussion of the shortcomings of Locke's view of language compared to that implicit in the notion of clusters as follows:

> Locke's treatment of words as discrete units is sterile and ultimately misguided, since the most important communications are least susceptible of such analysis. The deepest truths and the most violent passions burst forth from the dark recesses of the mind like the mighty fountain of 'Kubla Khan' . . . (McKusick 1986: 69)

I would not have expressed it that way: we have seen what comes out of the 'dark recesses': not archival clusters but the noise of phonetic/phonemic fragments, the ancestral voices of generational strife, despotic decrees. On the other hand, what opens at the surface is the second screen of the phantasmatic event, opened to the multiple vicissitudes of the Oedipal scenario, the Oedipal cluster – for that is what Oedipus is: an archival cluster – a historically determined and culturally inherited transgenerational phantasm that resonates with all the other transgenerational clusters and phantasms.[26] Lowes' 'clusters', as he also (and probably not coincidentally) terms them (Lowes 1978: 333), all the originary events and archives, from Purchas, Bartram, Bruce, Kircher, Paez, Maurice, Rennell and the rest, all versions one way or another of the primal scene, can now be seen to resonate with the Oedipal scenario of the poem. It can also be seen how they complement and engage with, and, in a sense, are expressed by, or are embodied in, the indispensable organic linguistic substratum (noise [*bruit*], voice [*voix*], utterance [*parole*]) that has emerged from the body. Without this metaphysical dimension, the organic labour and turmoil of the poem would hang in a void. It is this unparalleled convergence of pre-existent cultural clusters (a multiple *entendu*) with the raw potential for speech and thought that has been prepared in the strata of the organic

body (the *vécu* in all its brute immediacy) that makes *Kubla Khan* the quintessentially phantasmatic structure that it is and perhaps accounts for its peculiar fascination.

This moment of convergence is not easy to describe and it is not made any easier by the fact that Deleuze himself on occasions is inclined to describe it in a misleading way:

> That which emerges in the phantasm is the movement in which the self opens itself at the surface and frees the acosmic, impersonal and pre-individual singularities that it enclosed. Literally [*A la lettre*], the self looses them off like spore, and explodes [*éclate*] in this disburdening [*délestage*]. (Deleuze 1969: 249)

The 'acosmic, impersonal and pre-individual singularities', which is Deleuze's term for what we have described as 'clusters', are not to be found trapped inside a self like spore or seeds within a pod:

> Far from the singularities being individual or personal, they preside over the genesis of individuals and persons . . . (Deleuze 1969: 125)

Events are pre-individual and trans-individual: even the dream of the stately pleasure dome, as Borges reminds us, pre-existed not only Coleridge but Kubla Khan himself.[27] Clusters are like virtual nebulae of events migrating about the universe waiting to happen and we have to distinguish between 'the event, which is by nature ideal, and its spatio-temporal effectuation in a state of things.' (Deleuze 1969: 68) How this spatio-temporal effectuation takes place is not easy to explain though Coleridge does his best when, almost apologetically, he invokes the 'Leibnizian' notions of 'precipitation' and 'coagulation' (Richardson 1990: 44).[28] Deleuze speaks of singularities 'becoming actual' (*s'actualisant*) (Deleuze 1969: 125). The individual or the person emerges in a moment of 'actualization' which is also a moment of 'expression', not unlike a character or a role being actualized or expressed by an actor. These clusters of events, moreover, are not collections of discrete events but of multiplicities of events each one resonating with all the others. The individual self, like the Leibnizian monad, can only embody and express a selection of the roles available to it even though in each individual monad there must be a trace of the universe as a whole.[29] There is a beautiful summary of the Leibnizian 'world' in Deleuze's late work on Leibniz, *Le pli*:

> The world exists only in its representations such as they are included in each monad. It is a lapping of waves, a murmuring of sounds, a mist, a dance of dust. It is a state of death or catalepsy, of sleep or slumbering, of a loss

> of senses, of vertigo. It is as if the depths of each monad were made up of an infinite number of small folds (inflexions) which ceaselessly folded and unfolded themselves in all directions, so that the spontaneity of the monad is like that of a sleeper who turns and turns on his couch. The microperceptions of representations of the world are like these tiny folds in all directions, folds within folds, folds upon folds, fold after fold, a painting by Hantaï, or one of Clérambault's toxic hallucinations. (Deleuze 1988: 115)

Not only does a passage such as this remind us of the deep continuities between Deleuze's earlier (pre-Guattari) and later work, it also reveals the insistence of the phantasmatic model in his thinking. This passage also seems to me to be a beautiful description of *Kubla Khan* – the state of 'sleep or slumbering' obviously, but even more the 'folds in all directions, folds within folds, folds upon folds, fold after fold' (all those multiple internal foldings and repetitions of the poem) and the Orientalist associations in the reference to 'a painting by Hantaï'. Perhaps even more importantly, for those who find such groupings useful, what this account suggests is that *Kubla Khan*, far from being a 'romantic' poem should be regarded as a late but magnificent example of the 'baroque.'

And as in a baroque masque, there is no discrete role: one role is always another role, so that in playing a role the actor 'is always in the situation of playing a role that plays other roles' (Deleuze 1969: 176). Xanadu, in the end, is a Garden of Forking Paths:

> In all fictional works, each time a man is confronted with several alternatives, he chooses one and eliminates all the others: in the fiction of Ts'ui Pên, he chooses – simultaneously – all of them. *He creates*, in this way, diverse futures, diverse times which themselves also proliferate and fork. (Borges 1970: 151)

This is what the poem finally achieves and what grants it its futurity, so to speak. One senses, in the opening section, the tremendous weight of the archive and the patriarchal decree – the institution of the Oedipal order. But that fails and that failure leads to the collapse of the surface and to a process of psychic regression and schizophrenic delirium. In the final section the attempt to impose a despotic order is subject to an 'afterwardsness' (*reprise*) in the vision of the damsel with a dulcimer and her song which recapitulates many of the motifs of the body of the poem – the sunny dome, the caves of ice and even the figure of the despot himself. There is a change from the 'psychic regression' of the first part to a 'speculative investment' (Deleuze 1969: 278) – whence the conjectural 'Could I . . . 'twould'. The damsel, sings, too, of Mount Abora: there has been much debate about the source of this and Lowes traces it to a

welter of sources – Abola, Astaboras, Amara (Lowes 1978: 340–2) – and in many ways its coalescence of many sources itself recapitulates one of the prime devices of the poem. 'Abora', however, if it is to remind us of anything, it must surely be of the *abor*-iginal pre-occupations of the *fantasme originaire*. The final section 'resonates' the whole poem. The resonance and repetition of the phantasm is never meekly passive: it is 'selective' and 'countereffectual'. It is selective in that it extrapolates from the original event what is affirmative within it, the multiple choices that it offers: it refuses to succumb to its deterministic weight or to an arbitrary decree: the Oedipal imposition. It is countereffectual in that the repetition 'plays' the original scenario in its differences – it plays the scene like an actor or dancer:

> Countereffectuating each event the actor/dancer extracts the pure event that resonates with all the others. (Deleuze 1969: 209)

By so playing the scenario, as we sense the damsel with the dulcimer playing the vision of Xanadu, and as we sense the poet himself taking up that dance and play himself, what we see happening at the end is a loss of self – of the 'I' – and its dissolution into the transport of the 'pure event', into the trans-historic dream that is 'the dream of Kubla Khan'.[30] It is this dream that awaits us. Borges concludes his account of 'The dream of Coleridge':

> Such facts allow us to conjecture that the series of dreams and works of art [i.e. palaces and poems] has not reached its end. To the first dreamer there was proffered in the night the dream of a palace and he built it; to the second, who knew nothing of the dream of the previous dreamer, the poem about the palace. If the pattern holds true, some reader of *Kubla Khan* will dream, in a night from which we are separated by centuries, a statue or a piece of music. This man will not know that two others have already dreamed; perhaps the series of dreams has no end; perhaps the key to the whole is in the last dream. (Borges 1960: 29)

What we see in this final section are a number of reversals that perhaps need to be stressed. There is, first, the reversal of what might be termed the 'normative' axis of the Laplanche and Pontalis phantasm that culminates in one's being socially placed in terms of vital state, gender and sexuality – the Oedipal decree. The normative project is transcended to the extent that in the *jouissance* ('deep delight') of the revisionary song the polarities of the opening section – 'That sunny dome! Those caves of ice!' – are simultaneously affirmed in what seem like ecstatic snatches. When the speaker/poet (or whoever it is) becomes caught up in the phantasmatic scenario the references to 'His flashing eyes, his

floating hair!' are at least potentially androgynous – as if capturing traits of both the despot and the woman wailing. The very fact that the 'I' has become a 'he' suggests the dissolution of the self into the phantasmatic maelstrom. It is this liberation from the self, this emergence of a *moi dissous*, that distinguishes the 'Deleuzian' phantasm from that of Laplanche and Pontalis and here countereffectuates the Oedipal hold of the opening. The second reversal, already implicit in much of what has already been said, is of that model employed by Deleuze of a self that explodes spore from within itself: it is not the self that loosens off the spore of singularities, it is rather the self that becomes dissolved in the singularities that converge upon it, transported by the singularities of the pure event.

It is only here, in the song of the damsel, that language lifts off from the body and assumes its own autonomy. It is here that Deleuze would locate the emergence of the Word[31] – after the noises of the schizo-paranoid depths, the voices of the manic-depressive heights, and the decree of the Oedipal moment.[32] Deleuze's notion of the Word is extremely complex, but clearly tied to his notion of 'univocity'.[33] By 'univocity' Deleuze means all the voices that echo and resonate in the phantasm ultimately 'say' the 'same' thing – just as ultimately every monad reflects or expresses the 'same' universe. It is finally with this univocity of every utterance that language becomes self-sustaining and self legitimating and so attains its autonomy and freedom from the body. In this sense the song of the damsel with the dulcimer is something like the 'refrain' or *'ritournelle'* described in *Mille Plateaux*: a rhythmic set of self-sustaining internal references autonomous with respect to all external dependence (Deleuze and Guattari 1980: 382ff). It is only when we can speak this univocal Word (or perhaps, we are spoken by it), that something like an unequivocal sense is possible. This univocal Word is, of course, impossible and is only glimpsed in the kind of Pentecostal transport with which the poem concludes. *Logique du sens*, itself, ends with the following:

> And what else can a work of art do, except always take the path that goes from the sounds to the voice (*des bruits à la voix*), from the voice to the decree/utterance (*de la voix à la parole*), from the utterance to the word/Word (*de la parole au verbe*), build that *Musik für ein Haus,* in order to always find there the independence of sounds [from the body] and locate [*fixer*] that blaze [*fulguration*][34] of the univocal, an event too quickly covered over by everyday banality or, on the contrary, the sufferings of madness. (Deleuze 1969: 290)

Musick für ein Haus – Kubla Khan: the song of a pleasure dome, indeed, a fulgurating blaze of the univocal, an event too frequently dismissed as to all intents and purposes meaningless or as being little more than a symptom of Coleridge's notoriously fragile mental state.

Notes

1. All translations are my own unless otherwise specified.
2. See also Miall: 205: 'In letters and notebook entries, particularly in the earlier part of his life (up to about 1810) Coleridge frequently referred to the influence of the body on thinking.'
3. The date of this letter shows that Coleridge was pondering these questions at about the same time as the composition of *Kubla Khan* which has been variously dated between 1797 and 1799.
4. 'Milton's topography is clearly implied in the laying-out of Kubla's more indefinite garden' (Schneider 1966: 264).
5. The French equivalent is *aprés coup*; see Laplanche and Pontalis 1964: 1849.
6. See also Fruman: 337 '*Kubla Khan*, as most readers have seen it, is a kind of phantasmagoria without any significant relation between its parts. "Nobody in his waking senses could have fabricated those amazing eighteen lines," says Lowes of the closing of the poem, and the majority of readers have more or less accepted this opinion.'
7. In fact there has been some debate about the dulcimer: see Fruman: 544 n. 39: 'Did Coleridge really visualize an Abyssinian maid playing a *dulcimer*? Alethea Hayter is surely right in stating that "most of us . . . have a mental picture of the damsel flitting about with something in the nature of a lyre or a lute . . . " But in fact a dulcimer is

   > A flat box up to three feet wide, standing on a table or on its own legs, most definitely not portable, and played with two hammers . . . (Hayter 1968: 220)

   In fact I don't think it matters what a dulcimer actually is: as in the retranslation of 'Kubla Khan' and 'Xanadu' into 'damsel with a dulcimer' what we have here is a playing with words as sounds or, indeed, things in themselves rather than as signifiers of something else.
8. Reuven Tsur writes: 'As for the emotional mood, the last stanza seems to reach the peak of an emotional experience, best described as ecstacy' (Tsur 1987: 72).
9. '. . . the origin of the phantasm is integrated into the very structure of the originary phantasm' (Laplanche and Pontalis 1964: 1853).
10. Of this account Douglas Angus remarks: 'It would be hard to find a more classic bit of evidence for a strongly developed Oedipal complex than this' (Angus 1960: 657).
11. For an understanding of the 'depressive' and 'schizo-paranoid' 'positions' see the essays 'The psychogenesis of Manic-Depressive States' and 'Notes on Some Schizoid Mechanisms' in Klein 1986.

12. 'The passage from noise to the voice, we constantly relive in dreams: observers have frequently noted how the sounds (*bruits*) that come upon the dreamer while he sleeps organise themselves into voices ready to wake him. We are schizophrenics when we are asleep, but manic-depressives when about to wake' (Deleuze 1969: 226).
13. I think it is here, with the constitution of this erogenous body double, that Deleuze should have located the *'corps sans organes'* ('body without organs') rather than at the urethral stage we have described earlier.
14. 'From the schizoid position of the depths to the depressive position of the heights we pass from noises to the voice. But with the sexual position of the surface we pass from the voice to the decree/utterance (*parole*)' (Deleuze 1969: 271).
15. 'Nothing is more fragile than the surface' (Deleuze 1969: 101).
16. The *'fêlure'*, in other words, is in many ways the obverse of the *'corps sans organes'* (body without organs): the BwO is the production of a non-organic, erogenous, surface that resonates with the events of history and culture, whereas the *'fêlure'* is the catastrophic fracturing and collapse of that same surface.
17. *The Rime of the Ancient Mariner*, for example, seems to me to be virtually a text-book example of R. F. Laing's (1967: 106ff) account of the 'schizophrenic journey'.
18. 'the symbolic interpretations offered in the past .... do not solve any of the problems that the poem really presents' (Schneider: 262). In his *New Foundations for Psychoanalysis* Laplanche seems to be describing something very like the predicament of the poem: confronted by the primal scene – 'the parents are joined in an eternal act of coitus [recall Gilbert and Gubar's recognition of an 'elemental primal scene'] .... the baby is denied the ability to take part and therefore to symbolize' (Laplanche (1989): 127).
19. David Perkins suggests that 'Xanadu' is a quasi-anagram of 'anodyne.' (Perkins: 100)
20. I originally intended at this point to read *Kubla Khan* as a Saussurian *'anagramme'* or *'hypogramme'* but constraints of space forbid. See Starobinski (1971): 19, 23, 33.
21. I think it is probably worth suggesting at this point that *Kubla Khan* has much of the nursery rhyme about it just as *The Ancient Mariner* is close at times to doggerel.
22. This last, of course, with its 'meaning' something like 'someone who eats manuscripts/words', is at the heart of our problematic: how to distinguish speaking from eating, words from bodily sounds.
23. Coleridge intended to write an essay on punning. Coleridge 'regards puns and conundrums as exemplary of the coalescence of a word with the thing that it signifies' and, therefore, quintessentially poetic in nature (McKusick 1986: 32, 42). Puns are therefore untranslateable, just as *Kubla Khan* is virtually untranslateable, and/or uninterpretable.
24. See fn. 7.
25. For all this see McKusick 1986, especially his third chapter 'The Legacy of Göttingen: Coleridge's Response to German Philology'.
26. Although I owe this term to the notion of the 'transgenerational phantom' developed by Nicolas Abraham and Maria Torok (1994), this is by no means the same concept. Abraham and Torok's notion of the 'transgenerational phantom' seems to me to be an inadequate theorisation of what I call here the 'transgenerational phantasm.'
27. He quotes from the Arab historian of the fourteenth century, Rashid ed-Din: 'To the east of Shang-tu, Kublai Khan erected a palace, according to a design that he had seen in a dream and that he guarded in his memory' (Borges 1970: 28). See

also Lowes 1978: 326: 'In ancient tradition the stately pleasure dome of Kubla Khan itself came into being, like the poem, as the embodiment of a remembered vision in a dream.'

28. In fact Coleridge is speaking much later in his career when he has reverted to a more orthodox notion of a spiritual 'Nous' or 'Reason' as almost a divine essence and the way in which it produces both sense and its objects 'by the precipitation, or, if I may dare to adopt the bold language of Leibniz, by the coagulation of spirit' (Richardson 2001: 44).
29. See Leibniz 'Principles of Nature and Grace' §13 (Leibniz 1998: 264).
30. For this 'countereffectuation' of the event see Deleuze 1969: 176–7.
31. Not least of the difficulties of *Logique du sens* is that Deleuze use the word *verbe* for this moment of language that crowns the progression from the noises (*bruit*) of the schizo-paranoid depths, the voices (*voix*) of the manic-depressive heights, and the decree/utterance (*parole*) of the Oedipal position. The English translation dutifully translates this word as 'verb' which just doesn't make any sense to an English reader. It helps, I think, to recall that, in French, *verbe* with a capital letter – *Verbe* – means the 'Word' as in 'The Word of God' i.e. Gospel.
32. 'The noise (*bruit*) of the depths was an infra-sense (*infra-sens*), an under-sense (*sous-sens*), *Untersinn*; the voice of the heights was a pre-sense (*pré-sens*) . . . . The organization of the physical surface [i.e. the moment of the Oedipal *decree*] is still not sense: it is, or rather, will be a co-sense (*co-sens*) . . . [i.e., it is still imbricated in sexuality and the body] (Deleuze 1969: 272).
33. 'The Word (*Verbe*) is the univocity of language, in the form of a non-determined infinitive, without person, without present, without distinction of mood (*voix* – here in the sense of 'mood' i.e. indicative or subjunctive 'moods'/*voix*). Such is poetry itself' (Deleuze 1969: 216).
34. Elsewhere Deleuze (1969: 280) uses 'Radiancy', a term taken from Lewis Carroll.

Citizen Kant: Flatness and Depth in the Image of Thought

Stephen Crocker Memorial University of Newfoundland

I. The Image of Thought

In the final pages of his *Cinema* books, Deleuze explains that his aim is not to understand films, but to extract from them concepts that the cinema has itself given rise to 'which are themselves related to other concepts corresponding to other practices' (Deleuze 1989: 272).[1] Cinema does not resemble concepts, it creates them. The *Cinema* books are not a guide to reading films. Instead, we are invited to see how concepts such as 'image', 'plane' or 'relations of thought' correspond to and interfere in creative ways with other practices outside the cinema. So, a cinematic concept such as 'image of thought' can help us think in new ways about developments in widely differing fields, such as the history of painting and philosophy.

'Image of thought' has an interesting history in Deleuze's thought. In his early work he dismisses this phrase and calls for 'imageless thought,' meaning thought that doesn't understand itself to be the expression of some higher, transcendent order. In later works, he embraces this phrase. In *What is Philosophy* he describes it as 'the image thought gives itself of what it means to think, to make use of thought, to find one's bearings in thought' (Deleuze and Guattari 1994: 37). Image of thought is, however, an ambiguous notion. Does it mean an external representation of the thinking mechanism, or an image that thought gives to itself of itself? Both of these senses, which we might call the aesthetic and the philosophical, come together in interesting and instructive ways in Deleuze's reading of the deep focus shot.

Deleuze regards the emergence of deep focus, most notably in the films of Orson Welles, but in Jean Renoir, William Wyler and others as well, as the culmination of a long evolution of the cinematic shot,

or plane (in French 'plan' indicates both shot and plane). For Deleuze, cinema evolves from the single plane of the earliest films, to the serial presentation of flat planes in montage, beginning in the late teens, to finally the multi-plane, deep focus image introduced by Welles and others in the early 1940s. These last, he suggests, with their complex internal structures represent the first 'time–images' in the cinema.

The significance of deep focus does not lie in its correspondence to the 'extra-cinematic' world, as André Bazin, among others had supposed. For Deleuze, it represents instead a kind of Copernican turn in film. Welles achieves in film something analogous to what Kant had achieved in philosophy. Instead of asking whether philosophy can produce an accurate image of the world, Kant asks how we can produce any image of the world at all. Critical philosophy concerns itself with the conditions of reason: what must reason be in order to produce an image of reality? In a similar way, Welles' cinema of relations 'arouses the thinker in us' and reveals a new vocation for film: not to provide evidence that the world exists, but to produce an image of our powers of thought. After Welles, 'The cinema must film not the world, but our belief in the world.' (Deleuze 1989: 172) The deep focus shot achieves this change through a new organization of the cinematic shot, or plane.

Welles overcomes early cinema's dialectic of one or many planes when he reproduces the principle of montage – cutting up action into different planes – inside the shot. The result consisted neither of a single plane, nor a series of single planes unfolded in succession. Instead, complex planar relations inside the shot took on a more active role in the creation of whatever transpired on screen. Thus, 'Relations of thought in the image have replaced the contiguity of relations of images.' (Deleuze 1989: 174)

This evolution in the cinematic shot resonates with similar developments in painting and philosophy. Deleuze suggests that 'Welles recreates for our age a revolution in thought that first took place in the baroque.' (Deleuze 1989: 143) This insight points to a number of striking and important parallels between the history of the plane in cinema and the development of what we might call planar aesthetics in Renaissance and baroque painting. Caravaggio, Rembrandt and other baroque artists develop a new recessional style of composition driven by the very same desire to overcome the opposition of 'one or many planes' and make the canvas convey something about the role of relation and abstraction in experience as such.

And as my title 'Citizen Kant' suggests, the evolution of the cinematic image can help us think in new ways about the philosophical image of thought, specifically as Kant develops it in the doctrine of

Transcendental Ideas. The Transcendental Idea is not an image of something outside thought, it is a wholly internal and necessary moment of thinking in which finite reason produces an image of its own totality in order to systematize the otherwise isolated concepts of the understanding. Kant calls these images Ideas, and in a striking passage he compares them to images composed in depth and centred on a vanishing point.

In overcoming the opposition of one or many planes, deep focus presents us with a new image of thought which, without the support of a central organizing principle, nonetheless holds things together in open unties, or multiplicities. For this reason, the history of the plane raises important questions about the popular 'postmodern' diagnosis of the flatness and depthlessness of contemporary life. It has become a common assumption in cultural theory that the decline of a central representation, such as man, the subject or the signified, leaves us with only fragments of sense and a distracted perception that experiences the world 'partes extra partes'. This thesis, which found its most intense formulation in the work of Fredric Jameson, Jean Baudrillard and Jean Francois Lyotard, identified a flattening of sense brought on by some combination of the advance of late capitalism, the collapse of meta-narratives, and the society of the spectacle. The most far-reaching insight of Deleuze's cinema theory may be that the image of the many, as it appears in montage, planimetric composition or, more recently in postmodern fragmentation, is only an initial and weak displacement of 'the One'. What Deleuze sees in the evolution of cinema is a Nietzschean story of how the collapse of the theological image of universality makes the world deep, complex and multiple.[2]

II. Cinema: From One to Many Planes

Readers familiar with the ideas of André Bazin and Jean Mitry may recognize in the *Cinema* books a reworking of their already well-established theories on the impression of reality in long sequence and deep focus shots. For Bazin and Mitry, the deep focus shot represented a leap beyond the analytic fragmentation of action that characterized earlier forms of montage, because it allowed for a more realistic presentation of events as they occurred. Mitry described this as a change from 'actualization' to 'presentification'. In the classical montage which precedes Welles 'we participate in a represented past, rather than a present actuality . . . what we are viewing is the consequence of an action.' (Mitry 1997: 187) In the deep focus shot, on the other hand,

we witness the development of action and the open time in which this takes place.

This argument rests on a belief in film's direct photographic/indexical relation to reality, which Bazin understood to be a part of a movement toward a more perfect analogical presentation of the world in a 'total cinema'. Deleuze's relation to Bazin is complex. He builds on Bazin's evolution of film language, but directs it toward a very different end. It is well known that when he reads philosophical texts such as those of Kant, Spinoza or Bergson, Deleuze does not simply offer commentary or exegesis.[3] It is less often recognized that he uses a similar strategy in his *Cinema* books. Many of Deleuze's stunning readings of cinematic images are, in fact, reworkings of well-known debates in cinema theory from which he extracts new 'monstrous' concepts whose grasp extends far beyond film and aesthetics.

His reading of the deep focus shot is an excellent example of just such a monstrous creation. Bazin had already established that deep focus marked an important turning point in cinema. A 'realist', Bazin situated the evolution of film in a longer history of representation stretching back to the Renaissance discovery of perspective. Painting, photography and the various moments of film history are all defined by a movement toward a more perfect correspondence between the image and the reality it represents. The automatic, machinic nature of the photograph was a critical leap forward in this movement, and the deep focus shot its next significant stage. Where photography gave us unequivocal evidence of the world in a mould made from the object's reflected light, the deep focus shot brought us still closer because it presented the 'moulding' of the thing in time, or 'an imprint of the duration of the object' (Bazin 1995: 14). On this view, the history of film displays a definite logical and dialectical progression.

A single undifferentiated plane of activity characterizes the earliest cinema of the so-called 'actualities', the film simply a transcription of whatever occurred in front of the camera. Very little attempt was made to organize the plane into complex relations. The shot comprised a single sequence of action not analytically decomposed in any way. Thus, in the Lumière brothers' film of workers at the factory gate, or the train arriving at the station in Lyon, we are given a single static shot. There is no use of close-up, for instance, to break in on any of the conversations taking place, or to single out the shuffle of feet as we might see in any contemporary film. There may well be cuts between these shots, but when they occur they serve only to link 'whole spaces' and not to break action into closer views.

For Deleuze, the compositional art of the cinema takes an evolutionary leap forward when filmmakers begin to employ analytical editing to break scenes into component pieces and rearrange them into logical sequences. This involved a whole different form of presentation. For it was now possible to decide what in a particular shot should be emphasized in terms of the space (what elements or details matter) and time (for how long we should look). After seeing a sequence of these selected shots, we draw inferences about what we have witnessed. In Dreyer's *Joan of Arc* (1928), for example, we see a shot of the judge, a shot of Joan, a grave being dug, and then the council of judges. We are left to infer that the council will judge against Joan who will then be buried in the grave we saw earlier. The film provides this information through a serial presentation of single, shallow focus shots, or planes. The whole of the idea conveyed is something we assemble after the fact. This is the basic structure of the classic Hollywood cinema of the 1930s. The well-known Hollywood two-shot, or shot-counter-shot, displays a series of simple, flat images. Often we are presented with an establishing shot, followed by a series of close shots that break down the action into component pieces.

Early cinema, then, oscillates between two basic structures. It presents either a single undifferentiated plane, or a series of single planes given in succession. To these different forms there correspond two different types of synthesis, which, in turn, present two different kinds of 'wholes'. In the early actualities, the whole is given in advance of its presentation. The camera simply records an already existing situation. In analytical montage, the whole is given as a sum that we piece together after the presentation of a sequence. In each case a whole, or an idea, is presented. In neither of these cases, though, is the whole immanent to the image being presented on screen. It is either given before, as a full reality to be captured, or afterwards, when a sequence has completed itself and an idea may be inferred from it. And in both cases the single plane – the cinema of the One – remains the basic compositional element of a whole that is conceived of as either as an archē or a telos.

Hence the significance of *Citizen Kane* (1941). Welles overcomes classical cinema's dualism of one or many planes when he creates a shot composed of a set of striated planes all presented at once. What is remarkable about the shot is its new method of compositing and presenting a whole. The use of shadow and light, the presence of the visible ceiling and floors give us a whole space in which complex actions transpire. The viewer is invited to roam across the multiple planes and to make inferences about the details as the scene unfolds. In this way,

Welles presents a whole that does not proceed or follow the parts it organizes, but emerges instead along with the presentation of the planes it unites. In the Wellesian shot, the whole is contemporary with the elements it presents.

The best example of this new type of shot is the now famous deep focus one in which Kane bursts into his girlfriend's bedroom to discover her unconscious from an overdose of pills. In an extreme deep focus shot, we see Kane, a tiny figure in the background entering the room. In the middle ground Susan lies catatonic in her bed, and filling almost a third of the frame in the foreground is a drinking glass and a pill bottle, the evidence of her suicide attempt.

If it were shot with shallow focus and analytical editing the scene would have been broken into a series of separate shots from which we would subsequently have to infer a meaning. David Bordwell describes how it might have looked:

> A 1930s decoupage director would have cut from Kane outside Susan's room, banging on the door, to Susan gasping in bed, and then to the glass and bottle. This string of shots would allow us to infer that she has taken an overdose of medicine. But Welles jams all the elements into a single frame. (Bordwell 1997: 62–63)

The opposition of a montage of separate spaces, analytically decomposed into a series of images is here overcome in a dialectical leap forward which incorporates both the style of a single plane, and the decomposition of the plane into a series of many foreshortened ones. Deleuze explains that 'It is the method of 'between two-images'. . . which does away with the cinema of the One.'(Deleuze 1989: 180) What we get is a new kind of image based on relations inside the shot. The history of the shot progresses from one (the early actualities) to many (montage) to, finally, a multiplicity (deep-focus shot) that passes beyond the opposition of one or many planes. Equally, it changes from a whole that proceeds to one that follows, and then from a whole that follows to one that is contemporaneous with the things it unites.

We are no longer dealing with one single present, or a sequence of presents. It is true that *Citizen Kane* makes use of classical forms of montage which show us short, flat shots detailing the habitual movements of Kane's life – Kane reading the newspaper, at dinner, in a meeting. But deep focus opens up these presents, and suspends them from the chronological progression so that they can be explored as 'sheets' or 'regions' of past where we can roam around and look for the missing element – Rosebud – which the film seeks in the different slices of Kane's past.

Welles is not the only, or even the first filmmaker to use depth. Before him, Jean Renoir had made us of it in *Rules of the Game* (1939), where he coupled it with mirrors and reflecting surfaces to open out space and to produce frames within frames. However, by using wide angles and in-camera double exposures Welles and Gregg Toland significantly increased depth in new ways to expose ceiling and floors, and achieve gigantic dimensions which can be connected to reduced sizes in the background. William Wyler, also working in conjunction with Gregg Toland used similar techniques in *The Best Years of Our Lives* (1946). In a pivotal bar scene, Uncle Butch teaches Homer Parish, the war amputee, to play piano with his prosthetic hooks, while his soldier pal Al Stephenson looks on. Meanwhile at the extreme other end of the bar, Fred Derry, their struggling alcoholic war buddy watches this scene from a phone booth where he makes the call that ends his illicit affair with Al's daughter Peggy. The complex relation of nearness and distance that make up their new post-war lives and the non-synchronous layers of time – the eternal present of the bar, Homer's concern about his future as an amputee, and Al's ties to his drinking past – are all condensed in a single scene. In this way, the complex intricacies and the movement among these relations and tenses can be watched as they fold and unfold in diagonals and bands and strips of light and shadow.

Since Deleuze's reading of cinema sometimes drifts toward an 'auteur' theory of the artist as genius, it is important to keep in mind that the deep focus shot is complex and multiple in its origins. It is, after all, equally the creation of Greg Toland's innovative cinematography. Toland's technical alteration of the camera, use of lens coatings, development of optical printing and in-camera composite images all made possible the new kind of shot.[4] We should note as well the work of set designers and lighting technicians who created the play of shadows and expansive floor to ceiling space, and then there is the brute technical fact of progress in lighting that made it possible to narrow the aperture and increase the depth of the recorded image.

It is of course possible to construct other, different histories of the cinema that do not see the simple images of the early cinema as a prelude to the later complex forms. We might pay more attention to the role of the viewer, for example, or the social context of the film's reception. Tom Gunning, for instance, gives us a very different sense of the significance of early cinema, which relates it to the sensation machines of the fairgrounds and other entertainment spectacles (Gunning 1990). Bazin's interests in the evolution of sequencing, shot selection and the internal composition, or plastics of the image, are more useful for

Deleuze's purposes because they allow him to better understand the relation of time and movement in the cinema, and how it resonates with similar problems in aesthetics and philosophy. In fact, we might wonder if Deleuze's cinema theory is, at some deeper level, a reworking, or 'buggery' of the Bazinian theme of realism. Manuel De Landa, for example, has stressed the element of dynamic realism in Deleuze (De Landa 2002). The referent of realism in the *Cinema* books is not the faithful reproduction of the object in an external reality, but the structure of time and movement, or the 'kinesiology' from which cinema derives its name. The deep focus shot gives us the first time image, which Deleuze describes as 'a direct presentation of time' (Deleuze 1989: 214).[5]

III. Painting: The Beauty of the Plane Yields to the Beauty of Recession

Cinema is not the first art to use depth of field to break free of the unity of the plane. Deleuze says that 'The question of depth of field already took up in a way a transformation of painting in the seventeenth century.', and he speculates '[i]t is possible that Welles' cinema has been able to recreate, for the use of our modern world, a transformation of thought that originally took place in that distant century' (Deleuze 1989: 143). When Deleuze compares Welles' deep focus image to the baroque, he refers us to Heinrich Wölfflin's work on the history of plane and recession in early modern painting. Wölfflin is best known for developing the distinction between tactile and visual forms of seeing. In *The Principles of Art History* Wölfflin advances another, less noted thesis that the history of modern art is defined by a change from an initial emphasis on the plane, in Renaissance perspective, to an increasing emphasis on the relation, or 'recession' between planes, in the baroque (Wölfflin 1950). What is revolutionary in the baroque is the new image of synthesis and whole, which it extracts from the technique of perspective. This represents a change not only from one style to another. It is the basis for all subsequent abstraction in art.

Linear or mathematical perspective is often identified as a turning point in Western culture when we gained a new mastery over the earth and expressed a desire to detach ourselves from our conditions of existence. Erwin Panofsky liked to remind us that perspective means 'looking through', as in looking through a window out onto something that is clearly distinct from us (Panofsky 1991). Hannah Arendt drew a direct line from Alberti's essay *On Painting*, which taught us to see the world through a frame, and the launching of Sputnik 500 years later

(Arendt 1961). Heidegger suggested as much with his notion of the age of the world picture, or the world as a picture (Heidegger 1977). What is less often pointed out, though, is that perspective also made it possible to multiply the number of aesthetic planes in a work and have them adhere together into complex wholes. Perspective makes the synthesis of multiple interacting planes a basic defining problem of aesthetics. What does it matter if the work foregrounds the elements that are placed in association, or the activity of association itself? Here lies the basis for all questions of abstraction, of figure-ground relations and of depth, whether taken in a straightforward cognitive sense, or as a metaphor for the multilayered complex nature of modern living.

The technique of perspective, as it emerged in the 15th century, allowed an artist to multiply the number of planes in a work and unify them with mathematical rules of recession. This created a radically new kind of image, different than the medieval type which was focused on a central, foreground compositional plane, which Erwin Panofsky called 'an unconditionally two-dimensional surface' (Panofsky 1991: 51).

The movement from the medieval, single flat plane to the multidimensional perspectival work mirrors the change we followed in film from the early actualities to montage. Wölfflin's thesis, however, allows us to be precise about what this change involves because he distinguishes between two basic elements of perspective, which he calls plane and recession. He shows that one could produce very different kinds of images depending on whether the accent was placed on one or the other of these elements.

Initially, in the early Renaissance, perspective is used to create compositional planes that appear distinct and autonomous from one another. The painting is arranged into strata and sequences of discrete events. Each space of action exists first on its own, and only subsequently in relation to the others. This early form of 'planimetric' composition, as Wölfflin called it, multiplied the number of planes but it did not place in question the unity and self-containedness of the plane. In its initial uses, perspective gives us many single planes but does little with the relations of recession that unite these.

We can take as exemplary of an initial 'planimetric' use of perspective, a well-known work: Hieronymus Bosch's *Garden of Earthly Delights* (1504). Here, the landscape consists of a series of episodes of carnal transgression. Each of these planes is a separate present moment which can stand on its own and in fact does when, as commonly happens now, the painting is reproduced in detail. These tableaux are nevertheless distinct events, and the overall unity of the work is cumulative. We

might think of Bosch as a sort of Renaissance equivalent of analytic montage.

The same 'planimetric' structure can be seen in the early Italian Renaissance style of Uccello or Crivelli. In Uccello's *The Battle of San Romano* (1454–57) it is still possible to determine a foreground plane in which the action is centered. It is true that the background recedes away in depth but the painting is divided into strips, or bands of light with intervals of land separating them, so that depth and recession work to maintain the divisions between these planes. In Crivelli's *The Annunciation* (1486) the pronounced geometrical division of columns, walls, windows and doors produces this same analytical division of space.

In Renaissance paintings, depth and recession multiply the number of planes, but they are not yet used to challenge the status of the singular plane that remains what it was in the medieval world – the basic cell of composition. However, in the evolution from Renaissance to baroque style the value of plane and recession changes. Wölfflin says 'The beauty of the plane yields to the beauty of recession' (Wölfflin 1950: 76). Recession, or the relation between planes, begins to play a positive role in composition. The 'nerve' of the painting now lies in the relation of foreground and background. Consequently, the plane as central focus of the painting is 'depreciated'. The painting is no longer able to unite in the plane.

With Rubens, for example, the interest lies less in the composition of the planes, and more in the movement of light across them, which he uses to bring the viewer into the work. This 'into the picture' movement can be achieved in various ways. In *The Elevation of the Cross* (1610) Rubens uses the properties of colour to lead the eye across the planes and to avoid presenting any of them in isolation. Rembrandt, on the other hand, uses light to achieve a similar into the picture movement. In *The Blinding of Sampson* (1636), the plane is reduced to a secondary status, and light and colour, which unite the planes, is the principle subject. Much the same can be said about the role of light and chiaroscuro in Caravaggio, for instance, *The Calling of St. Matthew* (1599). What unites all these baroque examples is that the unity of the plane is replaced by an interest in the coexistence and relation among the planes; or, to be more precise, the relation takes precedence over the *relata*. Baroque recession is, like the 'irrational interval' of modern cinema, not simply an inert connective tissue, but a principle of differentiation that plays a positive role in the idea of the image.

Wölfflin explains that, in the baroque use of perspective:

> [T]he recessional movement dominates and nothing settles into strips. Roads leading inward, foreshortened avenues happened earlier, but they never dominated the picture. Now it is on just such motives that the accent lays. The recession of forms is the chief thing, not their co-relation from left to right. Concrete objects can even be totally absent, and then the new art really comes into its own, then it is the general depth of the space that the spectator is called upon to apprehend in one breadth as a unified whole. (Wölfflin 1950: 97)

All pictures have recession, but the recession has a different effect, depending on whether we are compelled to organize the space into different planes, which we subsequently synthesize, or to experience it as a recessional movement. In the case of Renaissance planimetric composition, our attention is directed to the separate planar components of the work. The relations that link these together merely convey the eye from one distinct plane to another. We could say that the relations are subordinate to the planes, or that they work in the service of the plane. The baroque image, on the other hand, realizes a latent possibility of Renaissance perspective: that the multiplication of planes allows the relation to gain some autonomy from the content of the plane. Recession, or as Deleuze likes to say, 'the interstice' now knows a new unlimited freedom.

In *The Fold*, his book on the baroque, Deleuze explains, in a way reminiscent of Wölfflin, why Uccello's folds are not 'baroque'.

> Uccello's folds are not really baroque because they are held in solid, polygonal, inflexible even if ambiguous geometrical structures. Should we wish to maintain the working relation of the baroque and the fold, we shall therefore have to show that the fold remains limited in the other cases, and that in the baroque it knows an unlimited freedom whose conditions can be determined. Folds seem to be rid of their supports of cloth, granite, or cloud in order to enter into an infinite convergence. (Deleuze 1993: 34)

Uccello's Renaissance style still does not break free of the planar geometrical style and as long as this is the case the fold remains only a difference between two things, and not yet a principle of differentiation out of which any plane, figuration or content emerges. Like the deep focus shot at the centre of the *Cinema* books, the baroque image does not permit the eye to form either a sequence of distinct planes, or a unity of a single plane. The opposition of one (the medieval flat panel) and many (the Renaissance multi-plane planimetric panel) is overcome in a new art of relations. The receding depth opens a vista between the main figures in the picture and the viewer is now compelled to move between the planes, to

link up fore- and back- ground and to grasp the meaning of the work in the movement between the planes. As Deleuze says of Welles, 'each image is plucked from the void and falls back into it' (Deleuze 1989: 179). Fold, relation and abstraction become the content of the image. This is 'the contribution of the baroque to art in general' (Deleuze 1993: 34).

We can further clarify the relation of foreground, background and interval in the planimetric and recessional use of depth by drawing a comparison with Merleau-Ponty's distinction of 'primordial' and 'objectified' depth. Merleau-Ponty opposed a phenomenological theory of depth to the 'associationist' image of perception as a 'mobile zone of distinctness' (Merleau-Ponty 1969: 219). In this latter, commonsensical image of perception, we seem to focus attention on only one image at a time, and thus to view any one at the expense of all others. After having taken in a number of such views of the exterior world, so the theory goes, we synthesize them and make inferences based on them, as in empiricism. This simple theory of depth sees it as essentially a matter of empirical distance among distinct entities. Depth is based on the recognition of a distance between things. We first view one thing, and then another. Once we establish the difference in the size of objects in the fore- and background, we then calculate the depth or distance between them. This understanding of depth, which Merleau-Ponty traces to Descartes' *Dioptrics* corresponds roughly to the kind of organizational form that Wölfflin calls planimetric composition. Here the self-contained plane remains the basic compositional unit, and relations serve to link several of these into an aggregate unity.

The trouble with the simple, Cartesian theory of depth is that it derives the relation of depth from the things it relates. But, as Merleau-Ponty reminds us, we can only isolate a foreground figure because another background one has already provided a context that allows us to consider the two as participating in a whole in which relations can be formed. Figures seen in relative size in the fore- and background of a work can only be judged and compared because I have already regarded them as elements of a totality. Merleau-Ponty's thesis is that the projection of this whole is the condition of any empirical relations we might construct among the parts. There is not first a given difference in size and then a recognition of depth. We do not perceive planes with a given set of properties that we then relate. It is only because they have first been synthesized in this way that the elements can be distinguished and empirical and quantitative relations constructed among them.

This is why depth is 'the most existential of all the dimensions' (Merleau-Ponty 1995: 264). In depth, elements that are mutually

exclusive and belong to different planes nevertheless take as 'profiles' of one and the same phenomenon. Depth is the dimension in which 'things or elements envelop each other'. It is 'the contraction into one perceptual act of a whole possible process' (Merleau-Ponty 1995: 264). Crucial here is this ambivalence in the use of depth: it can signal either an associationist connection among discreet parts, experienced 'partes extra partes', or an open whole or 'folding' in which an array of sensations are co-implicated. It is in this latter possibility that both Wölfflin and Deleuze find the basis of all subsequent abstraction in art.[6] In both cinema and painting the break with the plane represents a Copernican turn in which thought and image move away from the problem of representation toward an analysis of the conditions of any presentation at all.

IV. Empiricism and the Image of Thought

Hume's empiricism gives us the first image of the immanence of thought. And as in painting and film, it initially appears in the partial and incomplete form of 'the many'. Hume shows that human nature participates in the creation of what it experiences, and in doing so he overturns the Platonic image of thought as a 'reminiscence' of already existing connections and correspondences in the external world. There is no external 'transcendent' One that thought represents or remembers. It is human nature that allows us to infer relations, to create beliefs and posit rules, and so to produce sequences of experience.

In his book on Hume, Deleuze corrects the mistaken image of empiricism as the derivation of knowledge from experience (Deleuze 1991). What matters in empiricism is that it is an activity internal to the mind. For Hume, the movement of the mind organizing a diversity of sense impressions creates experience. When I say 'because', 'always', 'necessarily', or 'as a result', I am not pointing to any real or pre-existing connections in the world. I am actively organizing the elements of experience into a form that, until now, they had not known. Empiricism describes the mind's movement through a sequence of impressions. It is the cognitive equivalent of analytical editing and planimetric composition. The empiricist mind abandons the central representation of God or nature, to range over strips, bands, and lines of impressions.

Hume's new image of thought as a creative motion internal to thought raises the same difficult questions concerning the organization of diversity and 'the One' encountered in aesthetics. It displaces the unity of

God with a new image of the mind as a play of impressions from which connections are inferred.

Schelling summarized the problem with Hume's efforts to break with theology when he said that Hume supposes that there is first a time when we do not judge experience according to laws of association and causality, as though we first experience impressions in the raw, and then infer relations from them (Schelling 1994: 97). The problem here is the same one that Merleau-Ponty identified with associationism. Before we subject our impressions to principles of association, we have to first contract them into a sequence. We have to provide a manifold or whole – even if it is entirely projective or fictitious – with which we can hold together a set of impressions in order to derive order from them.

Kant provides a new image of this kind of whole in which diversity can appear. Kant does for empiricism what deep focus does for montage. He does not deny that thought is made of a diversity of sensations. Nor does he want to return to a theological vision of unity. When Kant asks about the conditions under which a manifold of immanent sensations can be thought, he is not dismissing empiricism but, rather, deepening and extending the principle of immanence introduced by Hume. Until Kant, the image of thought is divided between the One of God and the many of Hume's 'simple' empiricism. In the same way that Welles moves montage inside the shot, Kant moves the empiricist array of impressions inside a new image of the whole of reason.

In his reading of Kant, Deleuze shows that the new image of the whole that Kant introduces is not a theological relic. It is not an image outside thought, but the image that thought presents to itself *of* itself. The whole which finite intuition requires is immanent to thought. It does not precede thinking as it might in rational theology, and it is not simply a sum of parts that follows the experience of events, as in Hume's 'simple' empiricism. Paraphrasing what Deleuze says in the *Cinema* books about Bergson's concept of the whole, we could say that Kant's new image of the whole is not a closed set of concepts, but that by virtue of which each set of concepts remains open.

Kant's name for the new image of thought is 'Transcendental Idea'. The idea in the Kantian system is a name for the whole that is implicit in each of our conceptual judgments. It is by virtue of the presence of the whole that we can regard any given phenomena as a part of a system that insures its truth-value. It is the idea, for example, that allows reason to create syllogisms where one idea (Man) implies, or is implicated in, another (Mortality).The Idea allows the concepts produced by the understanding to co-implicate, or to be together as common elements of

the same phenomenon. Without this kind of projected whole thinking would only amount to the application of isolated concepts – this is an x and that is a y.

In a striking passage in the first critique, Kant himself describes the Idea - the mind's own image of the whole of reason – in a way that reminds us of a deep focus image. He calls the idea a *focus imaginarius*, and he likens it to the imaginary space which we must imagine to lie behind a mirror in order that, upon looking into it, we are able to see not only the objects which lie before us (the sink, our hands washing themselves), but those at a distance behind our backs:

> I accordingly maintain that Transcendental Ideas never allow of any constitutive employment. When regarded in that mistaken manner, and therefore as supplying concepts of certain objects, they are but pseudo-rational, merely dialectical concepts. On the other hand, they have an excellent, and indeed indispensably necessary, regulative employment, namely that of directing the understanding towards a certain goal upon which the routes marked out by all its rules converge, as upon their point of intersection. This point is indeed a mere idea, a *focus imaginarius*, from which, since it lies quite outside experience, the concepts of the understanding do not in reality proceed; none the less it serves to give to these concepts the greatest [possible] extension. Hence arises the illusion that the lines have their source in a real object lying outside the field of empirically possible knowledge – just as objects reflected in a mirror are seen as behind it. Nevertheless this illusion (which need not, however, be allowed to deceive us) is indispensably necessary if we are to direct the understanding beyond every given experience (as part of the sum of possible experience) and thereby to secure its greatest possible extension, just as in the case of the mirror-vision, the illusion involved is indispensably necessary if, besides the objects which lie before our eyes, we are also able to see those which lie at a distance behind our back. (Kant 1965: 553)

The mirror illusion allows us to synthesize different elements and planes of experience into a whole. It functions, in relation to the concepts, in the same way that a vanishing point does with respect to the different planes of a work of art. It transforms the flat, two-dimensional relation of concept and object into a three-dimensional plane with depth.

Earlier we saw that in the baroque, 'the beauty of the plane is replaced by the beauty of recession'. When this occurs 'it is the general depth of the space that the spectator is called upon to apprehend in one breadth as unified whole' (Wölfflin 1950: 97). Can we say that Kant introduces a recessional type in philosophy, since he directs our attention away from

the specific impressions and concepts to the kind of whole necessary to unite them and experience them together, at once?

V. Flatness and Depth in an Extra-Aesthetic Sense

There is an affinity between Orson Welles, Caravaggio and Kant not only because their images and concepts resemble each other, but because they provide a similar solution to the failure of earlier efforts to break free of the figure of 'the One'. For this reason, the consequences of their revolution in thought extend well beyond aesthetics and philosophy and concern a wider transformation in experience where mediation and intervals take on a whole new productive capacity. In the present intellectual climate, they provide an important alternative to the themes of flatness and fragmentation which have dominated cultural theory in the last few decades.

Unity, flatness and depth are all at the centre of the now well-worn 'postmodern' thesis that the contemporary world is a depthless one of fragmented subjectivities and distracted perceptions. In the 1980s and 1990s it was popular to describe the cultural development of the post-war world as a progressive flattening of things. In the absence of any full and whole experience, the world comes to us in the form of isolated, flat signs. Flatness is the central thesis of what were, arguably, three of the most influential works of cultural theory in the past quarter century: Jean Baudrillard's *Simulations*, Jean François Lyotards's *The Postmodern Condition*, and Fredric Jameson's *Postmodernism, or, the Cultural Logic of Late Capitalism*. Lyotard describes the decline of Enlightenment 'Grand Narratives' as a flattening of knowledge: 'The speculative hierarchy of learning gives way to an immanent and, as it were, "flat" network of areas of inquiry' (Lyotard 1984: 39). Fredric Jameson and Jean Baudrillard identify depthlessness as a central element of the hyperreal culture of late capitalism. As daily life is speeded up and plugged into ever wider global circuits of information and exchange, it becomes more difficult to recognize any pattern in the randomness of events. So many events vie for attention at any one time that no one of them can command it in its entirety, or in depth. Jameson famously captures this position with his thesis that late capitalism produces a schizophrenic consciousness.

Fragmentation, it seems to me, falls prey to the illusion of the new which Deleuze describes at the beginning of *Cinema 1*:

> [T]hings and people are always forced to conceal themselves, have to conceal themselves when they begin. What else could they do? They come into being

> within a set that no longer includes them and, in order not to be rejected, have to retain the characteristics, which they retain in common with the set. (Deleuze 1986: 2–3)

In a similar way, the image of a world of isolated flat sensations does not really challenge the older metaphysical 'image of thought' because it still retains the principle of unity as its basic organizational cell. If this is true then a post-metaphysical world is neither one fixed whole, nor a chaos of dispersed fragments. Caravaggio, Kane and Kant help us understand how, in the absence of any central unity, things can nonetheless hold together in the depth, wholeness and multiplicity of this world that is not 'One'.

Notes

1. I would like to thank Ian Buchanan and the anonymous readers who provided very helpful comments on an earlier version of this paper.
2. While it is beyond the scope of this essay, it would be interesting to consider further the evolution of Deleuze's ideas on the autonomy of art and the creation of concepts from the *Cinema* books to *What is Philosophy*? Cf. Badiou 2005.
3. He has compared his readings to acts of buggery, or Immaculate Conception, and characterises his method as 'approaching an author from behind and giving him a child that would indeed be his but would nonetheless be monstrous.'(Deleuze 1995: 6) He does not simply follow another thinker, but occupies their ideas and transforms them into some new kind of assemblage.
4. On Gregg Toland's role in the development of cinema see Hilton Als' essay "The Cameraman" in *The New Yorker*, June 19, 2006, pp. 45–61.
5. I have explored the relation of time and movement in the *Cinema* books more fully in Crocker 2001.
6. Even when depth ceases to be central to visual art, as Clement Greenberg (1993) has said of 20th century painting, and when painting consists of 'blocs of sensation' as Deleuze has suggested, these aesthetic developments still find their origin in the baroque's break with figuration and content (Deleuze 2005).

Wounds and Scars: Deleuze on the Time and Ethics of the Event

Jack Reynolds La Trobe University

> The wounds of the Spirit heal, and leave no scars behind
> – G. W. Hegel *Phenomenology of Spirit*

Deleuze's oeuvre is best understood as a philosophy of the wound synonymous with a philosophy of the event.[1] The philosophy of his immediate predecessors in the phenomenological tradition can thus be envisaged as constituting a philosophy of the scar, with phenomenological and embodied intentionality (including the significance given to habit, coping, etc.) resulting in a concomitant refusal to privilege the event as wound. Various consequences hang on this difference, but primarily it results in a very different ethico-political orientation in Deleuze's work in comparison to the tacit ethics of phronesis that can be ascribed to much of the post-Husserlian phenomenological tradition. Although this wound/scar typology may appear to be a metaphorical conceit, the motif of the wound recurs frequently and perhaps even symptomatically in many of Deleuze's texts, particularly where he is attempting to delineate some of the most important differences (transcendental, temporal, and ethical) between himself and his phenomenological predecessors.

Although a discussion of wounds and scars would normally register as spatial, these terms are explicitly temporal in Deleuze, who consistently refers to the aspect of time his work privileges as caesura, break, cut and wound – something akin to what Elizabeth Grosz' recent book calls the 'nick of time' (Grosz 2004). The priority he accords this nick of time, this temporal wound, does not follow from a commonsense understanding of temporal anteriority, such as the observation that scarification follows from, and is a direct causal consequence of, a prior

wound. Rather, Deleuze advocates a distinctively new understanding of both time and the relation between cause and effect in *Logic of Sense*. There the event is explicitly understood as an effect rather than a cause. Without yet explicating this somewhat counter-intuitive position that Deleuze develops through an engagement with Stoicism, suffice it to say he intends to problematise exclusively unidirectional, empiricist understandings of causality. Deleuze points to reversals that interrupt the order of brute physical causality, while insisting upon the subsistence of a more 'ghostly' or subterranean causality obtaining on the level of the virtual/transcendental, the 'quasi-cause,' which also haunts and at least partly produces the actual. Quasi-causality does not function on the basis of strict causal necessitation and determination. When Deleuze treats the event as synonymous with the wound, the wound is both temporal and transcendental, rather than an empirical event that happens. For him, the event never actually happens or is present; it is always that which has already happened, or is going to happen. As such, his manner of thinking the relation between wound and scar is not one of empirical antecedent or spatial succession, and, unlike the Hegelian epigram with which this essay began, there is no healing or overcoming of this transcendental temporal wound, i.e., the future that is perennially to come, the pure past that never was.

Likewise, few twentieth-century phenomenologists would endorse Hegel's comment, albeit for reasons antithetical to Deleuze. For the phenomenological tradition it is more accurate to say that all healing leaves scars. This includes the scars of historical time, which preclude the teleological understandings of history of both Hegel and Marx, for whom, in different ways, the scars of the dialectic can ultimately be overcome or sublated. We should also note that the attempted phenomenological reduction is itself necessarily incomplete, at least for those post-Husserlian phenomenologists who, paradoxically enough, provide phenomenological evidence for our inability to access consciousness purely and without remainder. For Heidegger, Merleau-Ponty, and Sartre, among others, this 'return to the things themselves' is always partially successful and partially aborted (e.g. scarified). Inner and outer are always co-implicated and contaminated, and some residue of our socio-historical situation—e.g. being-in-the-world or what Heidegger calls 'mood'—is always presupposed.

In some respects, of course, Heidegger's account of the priority that Dasein must cede to the future, the 'not yet', presages aspects of the poststructuralist account of time, including Deleuze's, but the importance existentialism attributes to embodied comportment (and the

significance of coping and the ready-to-hand for Heidegger; equilibria for Merleau-Ponty) is also, arguably, accompanied by a priority ascribed to that which makes the world meaningful as a temporal binding or gathering. In the canonical rejections of phenomenology proffered in Deleuze's *Difference and Repetition*, *Logic of Sense*, and *What is Philosophy?* (with Félix Guattari), but also in Derrida's *Speech and Phenomena*, and, more recently, *On Touching: Jean-Luc Nancy*, the most telling and repeatedly expressed objections to phenomenology are fundamentally about time. More specifically, the objections deal with the way in which time predominantly gathers, scarifies, or conjoins rather than disjoins, thanks to a tacit reliance upon an untenable conception of the instant or 'now' moment, as well as by the way in which 'lived' time almost inevitably forms a neat and unified continuum. In *Difference and Repetition*, Deleuze makes this explicit in his critique of a temporality betrothed to good and common sense (the ur-doxa), which he argues continues to afflict phenomenology.[2]

I. Aion: The Event as Wound of Time

The theme of the wound is arguably one of the key aspects of Deleuze's *Logic of Sense*, but in order to understand its centrality it is first necessary to discuss a series of interrelated distinctions that undergird this text. Deleuze's strategy is to begin with something that seems to resemble a typical opposition, but which is soon shown to be an interrelated one, in that the terms involved cannot be considered complete without each other and that some kind of process of becoming obtains between them. The important concepts for our purposes are Aion and Chronos, surface and depth, wound and scar, event and state of affairs, and, imported from elsewhere (particularly from *Bergsonism* and *Difference and Repetition*), the virtual and the actual. Although they are certainly not synonyms (the Aion/Chronos distinction pertains to time, whereas surface/depth refers primarily to space, and both are involved in the paradoxical constitution of sense), these terms nonetheless have an isomorphism of function that maps on to the overarching distinction between the virtual and the actual which preoccupied Deleuze throughout his career. Schematically, the virtual refers to that which is creative, productive and transformative (a transcendental field of difference), whereas the actual refers to that which is created, produced, and of the realm of identities, sameness, and all that currently *is*. These distinctions also have an order of priority

embedded within them, in that Deleuze consistently associates Aion, surface, and wound (all of which are of the order of the virtual) with the event, or at least with the 'truth of the event.' Aion, surface, and wound, are also directly tied to the possibility of a new ethics, even if it is not an ethics that Deleuze himself thoroughly explicates.

In *Logic of Sense* there is a privilege given to surfaces over depths, as well as to that which breaks open the surface (but is nonetheless not opposed to it), namely the 'crack' or wound, which Deleuze insists does not reveal something deeper (Deleuze 2004: 11). This is intimately bound up with the temporal priority he gives to the time of the event, which does not occur in regular linear time, and to the pivotal distinction he draws between Aion and Chronos.[3] In the overtly Stoicist understanding of *Logic of Sense*, Aion is described as the time that constantly decomposes into elongated pasts and futures, whereas Chronos is said to be composed of a series of interlocking presents. Chronos measures temporal actualisation and the realisation of an event—its 'incarnation into the depths of acting bodies and its incorporation in a state of affairs' (Deleuze 2004: 73). Deleuze suggests that this latter time, which involves incorporation, mixtures, and depth, all figures of mediation, is the time of the scar, the realm of the actual, including bodies and states of affairs (Deleuze 2004: 10). It is, however, the incorporeal surface, rather than the corporeal depth, that Deleuze associates with the privileged time of Aion, which subdivides endlessly into the past and future, and the event that likewise never actually occurs in present time. The time is never present that allows for an event to be realised, or to definitively exist (Deleuze 2004: 64).

On this understanding, the event is 'always and at the same time something which has just happened and something which is about to happen; never something which is happening' (Deleuze 2004: 73), never an actuality. It subsists rather than exists. Whereas Deleuze suggests that Chronos 'is cyclical, measures the movement of bodies and depends on that matter which limits and fills it out', Aion is a 'pure straight line at the surface, incorporeal, unlimited, an empty form of time, independent of all matter' (Deleuze 2004: 73). The time of Aion is therefore independent of both matter and the present, which for Deleuze means that it is independent of habit, and thus of embodied forgetting, coping, and the maintenance of equilibria that is typical of bodies and states of affairs.[4] It is also independent of Reason, although that need not suggest that it is independent of the concept, or the virtual Idea. This is a curious and paradoxical thought, which suggests there is some kind of rupture between the transcendental and the empirical that refuses mediation,

even while asymmetrical reciprocal determination continues to obtain between the orders of the virtual and the actual.[5] That gap or wound is a certain aspect of time, and in positing this temporal independence that is at the heart of what he describes as his 'secret dualism' (Deleuze 2004: 4), there is a sense in which Deleuze's work appears to be pre-modern, or pre-Kantian, despite the fact that there are also various ways in which his work can be understood as a radicalisation of the Kantian conception of time and the transcendental.[6] The wound that refuses mediation and recuperation (scarification) involves the non-presentist and more paradoxical manifestations of time.

There is also an asymmetrical reciprocal determination that takes place between these key oppositions in the *Logic of Sense*, modelled on the virtual/actual distinction. Deleuze insists that the actual ramifies back upon the virtual, albeit in a manner to which he gives less attention than the reverse determination from the virtual to the actual.[7] Deleuze insists upon the necessity of relations between the actual and the virtual, and, at times, a similar logic seems to pertain to the distinctions between Aion and Chronos, surface and depth, and event and state of affairs. Nonetheless, and despite the odd disclaimer, these distinctions also involve a hierarchy, an order of subordination, whereby the transcendental or virtual term of the pair is prioritised in both a philosophical and an ethical sense. For example, in relation to the surface/depth relation, Deleuze observes that in depth it is through 'infinite identity that contraries communicate' (Deleuze 2004: 200). Written just a year previously, the entirety of *Difference and Repetition* is devoted to undermining the primacy of such a philosophy. In *Logic of Sense* itself, we are told that the realm of the surface, and the counter-actualisation associated with it, has, by contrast, already attained to 'infinite distance' (Deleuze 2004: 200). Similarly, Deleuze's descriptions of the 'monocentered' return of Chronos evince his attitude towards this aspect of time (Deleuze 2004: 201). He also links Chronos directly to both nouns and equivocity (Deleuze 2004: 211). The latter is not genuine ontology, for him, because it does not reach the order of verbs and univocity (in the terms of *Logic of Sense)* or the eternal return of difference rather than sameness (in the terms of *Difference and Repetition*). If Chronos and depths are disparaged, Aion and the surface are, on the contrary, praised as 'the transcendental field itself, and the locus of sense and expression' (Deleuze 2004: 142). Finally, the time of Chronos is closely (if not inextricably) associated with an ethics of *ressentiment*, whereas Aion and the surface are fundamental to any affirmative ethics that accepts Deleuze's basic, Stoic-inspired, premise:

'either ethics makes no sense at all, or this is what it means and has nothing else to say: not to be unworthy of what happens to us.' (Deleuze 2004: 169)

Before we get to the problem of ethics, however, it is necessary to comprehend Deleuze's repeated suggestion that events are only effects (Deleuze 2004: 10, 29, 241). How then, can an event be said to be an effect? According to Deleuze, the reversals in Lewis Carroll's *Alice* books give us some kind of indication. There, characters are punished before having done anything wrong, or they cry before pricking themselves (Deleuze 2004: 5). Now, there may be empirical explanations for such behaviour, but these are not of the order of the event. To focus upon them would leave what he calls the expressive aspect of the event untouched, which does not obey the logic of anticipation, rational reconstruction, and prediction. Empirical explanations fail to see that what has occurred is never wounding because of any particular actuality, whatever it may be, but that we are wounded because of the prospect of worse 'to come' or because of the relation that any given actuality bears to the complex of temporal syntheses that is our past, noting that this memorial past synthesises from passing moments a form that never existed before that operation (Roffe 2002). As such, it is the future and the past that wound us; that is the time of the event. According to Deleuze—prior to the later influence of Guattari—psychoanalytic explanations were capable of understanding this and thus promised to provide the science of the event (Deleuze 2004: 242–3). And it is easy to see why he might have been impressed with psychoanalysis. Despite Freud's scientific pretensions, psychoanalysis need not require an actually occurring, actually wounding, primal scene to which the child and adult subsequently adjust. This is partly why Karl Popper famously calls it unfalsifiable, and, without buying into a Popperian objectivism, we will consider here the philosophical efficacy of the particular techniques of transcendental argumentation that Deleuze employs. While Deleuze calls into question the normalising tendency he finds at the heart of psychoanalysis – hence his positive discussion of the 'perverse' structure towards the end of *Logic of Sense* (Deleuze 2004: 280–1, 341) – for him psychoanalysis nonetheless managed to grasp the event as an effect, and one that does not simply follow from any single cause, or from a concatenation of actual causes constituting any given state of affairs.

This is because, for Deleuze, the event is subject to a double causality (a double structure), one aspect of which involves a mixture of bodies and states of affairs (e.g. empirical causes), the other aspect being the

configuration of different incorporeal events that are of the order of the quasi-cause (Deleuze 2004: 108). Psychoanalysis, too, has a double structure or a secret dualism at play in it, in the manner in which the symbolic order of language is disjunct from the realm of bodies. Deleuze endorses aspects of this account in the latter stages of *Logic of Sense*, and his key point is that the event also results from the quasi-causal interaction of other events in the realm of the virtual, which is associated with *both* past and future contra Alain Badiou's interpretation which associates the virtual rather exclusively with the past (Badiou 1999: 52; Badiou 2007: 38). The virtual relation between different incorporeal events is not a relation of causal necessity; on the contrary, it is a relation of expression (Deleuze 2004: 194). Event-effects are said to assume amongst themselves a relation of expression that is quasi-causal: as such, the event haunts and subsists without inhabiting bodies or places. Exactly how this relation differs from ordinary causation is not spelled out in any detail by Deleuze who suggests that this quasi-causal relation with the virtual/transcendental is unknowable. We can know that it occurs, but we cannot trace particular chains of quasi-causation.

While Deleuze acknowledges that the event does have immediate corporeal causes (Deleuze 2004: 10), and states of affairs do precipitate the event, they are not sufficient causes of the event itself. Explicating the event at the level of corporeal cause(s) and historical conditions always leaves something important untouched. For example, there may be a momentous historical event (let's say May '68) brought about by certain preconditions (economic, social, etc.) that can be fairly rigorously delineated, but that actual state of affairs is not commensurate with the Event of May '68. As an effect, the event is always that which has just happened or is about to happen, but never of the order of that which currently is happening. He hence associates the event with reversals between the orders of past and future, but not the present.[8] The event is thus virtual, perhaps even extra-worldly. It can never come about, but produces and conditions that which does come about. According to Peter Hallward's provocative interpretation, this means that Deleuze's work is not sufficiently concerned with the world and history (Hallward 2006). While such an interpretation arguably ignores the double causality at work in the architectonic substructure of Deleuze's philosophy, Hallward is right in one important respect: the emphasis Deleuze gives to Aion over Chronos means he also prioritises the effect as quasi-cause (the virtual) over the cause (actual) itself. There is indeed a sidelining of ordinary causality (Chronos, bodies, states of affairs, mixtures, depths,

etc.), as Hallward complains. To put it another way, the emphasis upon creativity and difference undergirding Deleuze's work tacitly devalues 'average, everydayness' (and thus scarification and mediation).[9]

II. Counter-actualisation: An Ethic of the Wound

Does this conception of the transcendental devalue ordinary causation of both a scientific and embodied bearing, thus resulting in an immanently unjustified hierarchy and a tacit ethics? To put it another way, what does this transcendental philosophy of time mean for the wound? Wounds are incorporeal for Deleuze and hence not part of ordinary causation: instead, they are regularly treated as synonymous with the event. For example, he speaks of 'the Event itself, the result, the wound as eternal truth' (Deleuze 2004: 51) and asks 'why is every event a kind of plague, wound, war or death?' (Deleuze 2004: 172), and 'is it the case that every event is of this type— forest, battle and wound—all the more profound since it occurs at the surface?' (Deleuze 2004: 12). These comments are bound up with his discussion of Joe Bousquet, to whom he attributes the Stoic maxim: 'my wound existed before me, I was born to embody it' (Deleuze 2004: 174). As is clear from this maxim, the wound cannot be understood as something that accidentally and contingently befalls us. That would be to treat it as an empirical event, rather than of the order of the virtual, the event-effect. But what might a virtual wound be? What is surreptitiously being imported into the equation by the naming of the virtual event-effect as 'wound' and opposing that to the scarified realm of bodies and their recuperation? My questions for Deleuze, then, are threefold: first, is this event-wound priority tenable? Second, can an ethics be deduced from this transcendental priority? And third, what ensues (consequentially) when a transcendental and ethical priority is given to the non-embodied, to the virtual wound that is avowedly 'independent of all matter'? Does it mean that his political work runs the risk of degenerating into an eternally patient moral perfectionism, which eschews both rational calculation as well as the basic causality of bodies in favour of stylised prophesies and transcendental dreams of the disruptions of the past and future?

The full picture of Deleuze's ethics is rather more difficult to grasp than is usually assumed. Frequently, we are told that his work synthesises the respective ethics embedded in the Nietzschean and Spinozian philosophies, ethics that eschew transcendent judgment as well as rule-based law.[10] While this is at least partly true, such a characterisation does not adequately account for the fact this immanent

ethics cannot be understood as immanent to the actual physico-biological world, but is more aptly said to be contrary to it, or at least contrary to the dominant aspect of it. Indeed, it is only on seeing the manner in which counter-actualisation (as well as associated ideas like deterritorialisation) is bound up with the time of Aion and the virtual, that we can begin to grasp what an ethics of the event-effect might be.

While Deleuze does not offer any moral prescriptions, there is a clear normative force at work in the distinction between Aion and Chronos. Hence his rhetorical question, 'is there not in the Aion a labyrinth very different from that of Chronos – a labyrinth more terrible still, which commands another eternal return and another ethic (an ethics of Effects)?' (Deleuze 2004: 72). Despite the fact that this appears to be an open question, his invocation of '*another* eternal return' here is important. We know that there is both an ontological and normative force given to the time of the eternal return of *difference* in *Difference and Repetition*. The eternal return of the *same*, however, is described as being of only the most simplistic and introductory value (Deleuze 1994: 91). Without considering the warrant for this as an interpretation of Nietzsche, something very similar is going on in *Logic of Sense*.[11] Here Deleuze not only calls for 'another eternal return', but explicitly associates the wisdom of the actual cause with the eternal return of the same, a moral and eternal wisdom that he denigrates (Deleuze 2004: 72). There are innumerable other comments from Deleuze that suggest that it is an ethics of effects that he is ultimately interested in and the more committed to. He comments, for example, that 'Paul Valery had a profound idea: what is most deep is the skin. This is a Stoic discovery, which presupposes a great deal of wisdom and entails an entire ethic' (Deleuze 2004: 12). We will come back to this purported entailment, but while Deleuze proffers no prescriptive or rule-based account of ethics, and while this invocation of another ethic (an ethic of Aion) does not suggest that we can simply dispense with an ethics of Chronos and the depths (rules, rationality, causal considerations), it seems incontrovertible that there is (in *Logic of Sense* specifically, and arguably in Deleuze's work more generally), a definite priority given to the ethics of Aion (an ethics of non-presentist time), which is synonymous with an ethics of the wound. This ethics is a product of Deleuze's appropriation of the Stoic ethic of willing the event, and the inflexion that his concept of counter-actualisation gives to it.

Deleuze suggests that Stoic ethics oscillates between two poles: on the one hand, between advocating the greatest possible participation in a divine vision that gathers in depth all of the physical causes; on the other

hand, it is also concerned with willing the event (surface), whatever it may be, and without any interpretation or intent to integrate it within the unity of all physical causes (Deleuze 2004: 163–4). Deleuze suggests that the first Stoic pole is problematic because of the physicalism it presupposes. For him, events differ in nature from the corporeal causes from which they are the result; they have other laws (not deductive-nomological ones) and other incorporeal forms of relation, i.e. quasi-causal and expressive (Deleuze 2004: 164). Although it is arguable that he simply replaces the Stoic impetus towards a gathering in depth of all physical causes with an affirmation of the univocity that obtains between virtual event-effects, it must be noted that on his account, 'the unity of events or effects amongst themselves is very different from the unity of corporeal causes amongst themselves' (Deleuze 2004: 75). It is, however, the second pole of the Stoic ethic with which he is primarily concerned and which he wishes to rework for his own purposes. Accomplishing this second aspect – willing the surface event without interpretation – depends pivotally upon one's relation to time, because it is not a matter of simply willing all that befalls us. That particular interpretation of *amor fati* is insufficient and amounts to a form of indifferent resignation Deleuze finds ethically problematic (Deleuze 2004: 170). As John Sellars puts it, it is a human Stoicism that tacitly remains resentful, rather than a cosmic Stoicism that involves both affirmation and a more paradoxical relation to time (Sellars 2006: 164). Indeed, according to Deleuze, the genuine Stoic sage must simultaneously wait for the event as something eternally yet to come and always already passed (Deleuze 2004: 166). While Deleuze argues that the sage wills the actualisation of the event-effect and the giving-body to the incorporeal effect (Deleuze 2004: 166), even then the sage ought not to will exactly what occurs, whatever it may be, but something within that which occurs (Deleuze 2004: 170).

Bousquet offers as an example of what this might involve. As Sellars comments, 'the task for Bousquet was to transform the event of the wound from a tragic external assault that afflicted him into a vital and necessary event in his life that made it possible for him to discover himself as a writer, to become who he already was' (Sellars 2006: 161). We can conclude from this that despising any particular wounding-event is a form of *ressentiment*, as, to a lesser extent, is the traditional Stoic ethic of expecting suffering and misfortune but soldiering on. Both make a transcendental mistake when they treat the wound empirically. On the other hand, embracing the event and the transformations it induces— not its brute actuality— is *amor fati*. This is the rather stark alternative Deleuze seems to leave us with, and he goes on to encourage us to

become the offspring of one's events, not of one's actions. One must become the offspring of the virtual intensities that subsist in oneself, which is another way of saying that one must express the wound and make it the quasi-cause of one's life. Now this cannot mean to become the offspring of one's emotions or passions, or even to intensify one's emotions and passions. After all, emotions are, for Deleuze, bound to a subject, and considered to be of the order of a state of affairs rather than of the order of the event (Deleuze 2004: 7). It is difficult to pinpoint positively what his ethics might involve, but it seems to require the recognition that we are all traversed by some kind of fault-line (a virtual, impersonal intensity) that is supra-individual and not confined to the realms of bodies and states of affairs. Whether this faultline or wound can be distinctive for each of us or ultimately partakes in one transcendental wound is not clear, but it is the concept of counter-actualisation that he uses to more fully describe what is involved in the appropriate manner of giving body to an incorporeal event-effect.

In describing his ethic of counter-actualisation, Deleuze suggests that each time the event is inscribed in the flesh, 'we must double this painful actualisation by a counter-actualisation which limits, moves and transfigures it' (Deleuze 2004: 182). Inscribing the event in the flesh (in the realm of bodies and habits) is hence necessary for the sage and for ethics, but it is not the key aspect of his ethic (Deleuze 2004: 192). Rather, it is the potentialities of that actuality that are expressed, not merely the literal re-inscription of the same (Williams 1997: 232–46). Not pathological repetition, then, but repetition with a difference. Counter-actualisation must 'limit, move, transfigure' and mime that which effectively occurs. While the event is brought about by the living present, by bodies, states of affairs and reason, its eternal truth is irreducible to them (Deleuze 2004: 182). The event may be the result of the actions and passion of bodies, but his ethics affirms its irreducibility to these origins, done by linking it to a transcendental quasi-cause (wound, Aion, virtual, etc.) rather than to the empirical cause (Deleuze 2004: 109). This is an ethics of the mime and of acting. Sensations and intensities can be extended beyond the singular through the expressive and dramatic practices of counter-actualisation. For Deleuze, it is 'the free man, who grasps the event, and does not allow it to be actualised as such without enacting, the actor, its counter-actualisation' (Deleuze 2004: 173). This counter-actualisation involves a delicate operation, in that we need to limit ourselves to the counter-actualisation of an event (and thus embrace our wounding virtual-effect) without allowing the full

actualisation of this wound that characterises the victim and the patient (Deleuze 2004: 179).

For Deleuze and Bousquet alike, the wound exists before us, before any particular subject or individuality, and yet we are born to embody it, thus 'becoming the quasi-cause of what is produced within us' (Deleuze 2004: 169). Again, it is difficult to understand precisely what this means, but we know what it does not mean. We should not be indifferently resigned to whatever happens to us, as in the commonly received understanding of Stoicism, and it is also important to note Deleuze's second and inverse warning: 'counter-actualisation is nothing, it belongs to a buffoon when it operates alone and pretends to have the value of *what could have happened*. But to be the mime of *what effectively occurs*... is to give the truth of the event the only chance of not being confused with its inevitable actualisation' (Deleuze 2004: 182). There are then, two main ways of misunderstanding and mistakenly living his ethics of counter-actualisation: assenting to whatever actually happens indifferently and with resignation, or flippantly miming other possibilities that bear no effective relation to what happens. No prescription can tell us how to accomplish this, but we can see that counter-actualisation endeavours to achieve that most paradoxical of things: to express and even illicitly embody the virtual, to feel that time-which-is-not. If the present (Chronos) measures the temporal realisation of an event, and the way in which the wound is covered over and incorporated into a state of affairs (Deleuze 2004: 73), counter-actualisation depends upon maintaining a relation to time that opens itself to the immemorial past (that past that defies conscious memorial reconstruction) and the future that is to come, a time that retreats and advances, divides endlessly into a proximate past and an imminent future. This is the time of Aion, the wound.

How can an ethics be based on time, and on the aspect of an event that never actually occurs but is understood as something within that which occurs, and which is also said to be both always already passed and yet to come? In one respect Deleuze is simply following in the footsteps of Nietzsche. What Nietzsche diagnoses as *ressentiment* (disgust for life that trades in negativity) is a revenge against the fact that time passes. The major form of this *ressentiment* results from artificially delimiting time and insisting upon the priority of the present. From the perspective of some particular present, we might rail against suffering and injustices, whether they be anticipated or endured. The problem with this attitude, however, is that it treats the wound-event as somehow wholly outside of us. This is the reverse of what Deleuzian counter-actualisation aims to

achieve. It wants the wound to give birth to us, but not to be the same as us. Deleuze insists that there is no other ill-will than *ressentiment* of the event, and, given that we also know that for him the truth of the event is Aion (Deleuze 2004: 166, 182), we can conclude that there is no other ill-will than *ressentiment* of Aion. For counter-actualisation to be successful, although it cannot simply return to the virtual, it must both show the manner in which the virtual and the time of Aion breathe life into that which occurs, as well as simultaneously allow this to happen. This is the tension between the 'is' and the 'ought', the descriptive and the normative that Deleuze's philosophy negotiates and sometimes conflates. What does that mean for the role of the present, for Chronos, for bodies, states of affairs (including empirical wounds and suffering), and even for Reason, which Deleuze also suggests is a being of the present? (Deleuze 2004: 74). They are all insufficient for an ethics, and his point is not merely that some kind of dialectical relation with an ethics of Aion needs to be recognised, in order to balance or moderate the monopoly that an ethics of Chronos has hitherto enjoyed. Rather, his point is once again both transcendental and normative: the time of Aion and the virtual are the condition for the event, and from them he also derives what is arguably the governing normative principle of his work: counter-actualisation.

The important question then becomes the following: can a transcendental condition also entail a normative principle, even one as opaque as this ethic of counter-actualisation? For Deleuze, the transcendental needs to provide the conditions for real experience. If we grant for a moment that his philosophy accomplishes this in its descriptions of the molecular, difference-in-itself, the virtual, the Aionic aspect of time, etc., in what sense does an ethics of counter-actualisation follow from this? It is not clear that it does. Nor is it clear why Aion and the truth of the event need to be understood as 'independent of all matter'. One would have thought that the transcendental condition, the realm of the virtual, is never wholly independent of matter; indeed, by Deleuze's own lights (as evinced by the concept of reciprocal determination in *Difference and Repetition*), it is not.[12] Does this independence of matter, this 'secret dualism' of *Logic of Sense*, wherein Aion and the event are privileged, simply reproduce itself at a moral level, with a moral hierarchy? It seems to me that it does. If so, this is philosophically problematic in itself, but there are also reasons to question this ethic in its own right. Because it parallels the movement of the quasi-cause and is associated with the virtual, an ethics of counter-actualisation necessarily resists the imposition of any form of criteria.

As such, using this ethics to discriminate between different modes of existence is exceedingly difficult. While this problem is partly overcome in other of Deleuze's texts, especially those on Spinoza and Nietzsche, this ethic also (illegitimately, in my view) consigns coping, equilibria, and the body of depths, to a secondary status. This is problematic because it is aristocratic (Mengue 2003), which is also, perhaps, another way of saying, 'extra-worldly' (Hallward 2006). This is a strange and counter-intuitive consequence for a philosophy of immanence, and it seems to me that it arises from competing tendencies in Deleuze's work that are never satisfactorily resolved: that is, his post-Kantian philosophy of time and the transcendental (which intercedes intermittently in his ethics), and his pre-Kantian ethics of immanence (which is also ontological), which should theoretically do away with the hierarchies that his transcendental philosophy of time tacitly depends upon.

III. Reflections on the Broader Deleuzian Oeuvre

Although these aspects of Deleuze's work—the transcendental priority given to Aion, the virtual, and a resultant ethics—are foregrounded in a distinctive way in *Logic of Sense*, similar positions prevail in the very different idioms of *Difference and Repetition*, *What is Philosophy?* and *Bergsonism*.

In *Logic of Sense*, the incorporeal wound is the wound of time, but not of all time understood as some kind of whole; rather, it is the wound of a particular disjunctive aspect of time – Aion rather than Chronos. More particularly, Aion is composed of a simultaneous movement in two directions, opening upon both the future and the past. In the terms of *Difference and Repetition*, Aion hence encompasses two different temporal syntheses, memorial and futural, and in *Difference and Repetition* it is only the latter of the two which Deleuze explicitly understands as caesura (Deleuze 1994: 89, 92). It is the futural synthesis of time (the caesura) that fractures the 'I' and which Deleuze suggests 'must be determined in the image of a unique and tremendous event' (Deleuze 1994: 89). This futural time, exemplified for him by the idea of the eternal return of difference, simultaneously conditions and undermines both habitual and memorial time, and cannot itself be reduced to its corporeal conditions (Deleuze 1994: 90–1). While it is a wound that refuses mediation, Deleuze nonetheless implies that we can still, somehow, live this time, if only we could become good throwers of the dice, embracing both chance and necessity in the manner that

Nietzsche's philosophy of the eternal return of difference is said to teach us.

In order to understand the priority Deleuze gives to the future synthesis of time in *Difference and Repetition*, it is worth reflecting on what Deleuze has to say about Péguy and Kierkegaard. Both of them are described by Deleuze as great philosophers of repetition, yet he suggests that they were not ready to pay the necessary price and embrace this radical futural wound. For him, 'they entrusted this supreme repetition, repetition as a category of the future, to faith . . . However, faith invites us to rediscover once and for all God and the self in a common resurrection . . . they realise Kantianism by entrusting to faith the task of overcoming the speculative death of God and healing the wound in the self' (Deleuze 1994: 95). In other words, his objection to their philosophies of repetition is that they heal this temporal wound, cover it over, in a very different manner to their predecessor Hegel but with the same result nonetheless. With Nietzsche's death of god and the wars of the twentieth century, however, things have changed on the philosophical scene. Indeed, I have contended that with post-Husserlian phenomenology the healing is never complete and perfect but always scarificatory.[13] As such, phenomenology can plausibly be characterised as tacitly presupposing an ethic of scars (coping),[14] a phronesis that mediates, or a wisdom that searches for the middle (Gallagher 1993: 298–305), and therefore it constitutes a philosophy of common-sense.[15] But the important question is whether common-sense is automatically worthy of condemnation and warranting replacement with becoming a 'little alcoholic, a little crazy . . . just enough to extend the crack' (Deleuze 2004: 179), worthy, that is, of Deleuze's conviction that 'health alone does not suffice' (Deleuze 2004: 182). Clearly I remain unconvinced by Deleuze's answers in this regard, at least insofar as there is an ethical privilege granted to the crack (wound), madness, and the virtual event-effect. But based on the above we might risk the following epochal formulation: time, *Geist*, and history heal all wounds for Hegel; God heals the temporal wound for Peguy and Kierkegaard; for the post-Husserlian phenomenologists time imperfectly scars; and with post-phenomenology (in particular Deleuze and Derrida) it is the wound of time itself that is revalued in a transcendental move that tacitly diminishes the scar.

Against a certain postmodern reception of Deleuze as a philosopher of the body, there is a sense in which this transcendental move also diminishes the actions and passions of bodies. Although all actualisations necessarily involve creativity and transformation for

Deleuze, it is nonetheless the case that the force for this change comes from the virtual, Aion, the time which is not. In this respect, Deleuze's transcendental philosophy of time, and his associated ethics, subtly disparage the imperfect corporeal scarification and mediation that is always already at work.[16] To see how this is so, it is worth briefly considering Deleuze's detailed treatment of the virtual/actual distinction in *Bergsonism*. Deleuze directly confronts the question of whether Bergson's position amounts to a dualism or a monism, and in describing Bergson's methodological strategy of division he also makes an observation that seems to bear crucially upon his own modus operandi. Deleuze states that:

> [T]here is some resemblance between intuition as a method of division and transcendental analysis. If the composite represents the fact, it must be divided into tendencies or into pure presences that only exist in principle ... We go beyond experience to the conditions of experience. (Deleuze 1988: 23)

Deleuze adds:

> By dividing the composite according to two tendencies, with only one showing the way a thing varies qualitatively in time, Bergson effectively gives himself the means of "choosing" the right side in each case; that of the essence. (Deleuze 1988: 32)

According to Deleuze, this does not depend on arbitrary inspiration, but it is unclear how this might be so without a vicious circularity, e.g. picking the qualitative over the quantitative as Badiou (1999: 24–5) suggests. More to the point, however, might we also conclude that this is the manner in which Deleuze's own work proceeds, given that Deleuze himself suggests the comparison between Bergson's method and his own transcendental analyses? Indeed, we have seen that the various oppositions that concern Deleuze ultimately involve a hierarchy of sorts, in which one term (i.e. those associated with the virtual, including Aion, surface, the event, etc.) is the transcendental condition of the other (i.e. those associated with the actual, including Chronos, depths, states of affairs), and the former also has an ethical impetus associated with it. There is an axiomatic preference for the virtual over the actual (in both a transcendental and ethical sense) and for counter-actualisation over actualisation. These discriminations only make sense insofar as a 'secret dualism' persists in his evaluative scheme, even if it may ultimately be a part of an ontological monism as the doctrine of univocity suggests.

Indeed, despite Deleuze following Bergson in certain respects and intermittently offering an account of actualisation as being necessarily creative and transformative (e.g. evolution), it is also worth considering his account of the prototype of counter-actualisation as it appears in *Bergsonism*. In this intriguing text, Deleuze spends some time detailing four aspects of actualisation: what he calls, 'translation and rotation, which form the properly psychic moments; dynamic movement, the attitude of the body that is necessary to the stable equilibrium of the two preceding determinations; and finally mechanical movement, the motor scheme that represents the final stage of actualisation . . . the adaptation of the past to the present' (Deleuze 1988: 70). Despite the attention given to these psychic and sensory processes of actualisation, the metaphor of 'mechanism' here again betrays Deleuze's view of habit as being too closely aligned to mere 'bare repetition' and of the order of the merely empirical. These processes of actualisation are understood as akin to brute nature, and need to be supplemented by another process, an inorganic or orgiastic one. Indeed, Deleuze adds a fifth element which radically differs in kind from these first four, and which he describes in almost precisely the same terms as what in *Logic of Sense* he calls counter-actualisation: 'a kind of displacement by which the past is embodied only in terms of a present that is different from that which it has been' (Deleuze 1988: 71). As we have seen, this counter-actualisation that partakes of the virtual, although it is embodied, owes its value to that in it which is not embodied. As such, the virtual retains an ethical priority over mere mechanism, and the 'great souls', artists and mystics, manage to embody this virtuality in its purest form (Deleuze 1988: 112). However, this religious and mystical aspect to the last few pages of *Bergsonism* is not entirely a reflection of Bergson's philosophy: it also reflects Deleuze's own enduring, if sometimes undisclosed, commitment to a secret dualism.[17]

Some of these tendencies are also apparent in *What is Philosophy?*, where Deleuze and Guattari recapitulate many of these ideas regarding the virtual and the actual, and the motif of the wound and the scar also return. For example, Deleuze and Guattari suggest it is the conceptual personae who counter-effectuates events, who wills war against past and future wars, who wills 'the wound against all scars' (Deleuze and Guattari 1994: 160). Moreover, in redescribing the virtual and actual distinction, they also suggest:

> [F]rom everything that a subject may live, from its own body, from other bodies and objects distinct from it, and from the state of affairs or

> physico-mathematical field that determines them, the event releases a vapour that does not resemble them and that takes the battlefield, the battle, and the wound as components or variations of a pure event. (Deleuze and Guattari 1994: 159)[18]

As such, Deleuze and Guattari reaffirm that the event is actualised or effectuated when inserted into a state of affairs, but counter-actualised or counter-effectuated when abstracted from states of affairs so as to isolate its concept. Hence there is still a sense in which one needs to disembody oneself from states of affairs and extract oneself from a lived situation (both of which are treated as ordered and monotonous) in order to embody the incorporeal event and to experience the counter-forces that might have been, and, in a certain paradoxical sense, nonetheless still are. While the point is arguably not to take oneself 'out of this world,' as in the title of Hallward's recent book, but rather to live the event 'in the world' (noting that 'world' must be understood in an expanded and non-empirical sense) in a way other than the way in which it first presents itself, the spirit of the injunction is nonetheless to be true to the aspect of the wound (event) that does not and cannot appear in the world.

Now it might be protested that Deleuze's indebtedness to empiricism and his sustained discussions of habit complicate this claim that he marginalises the actual, bodies, scars, etc., and in a certain sense they do. For him, habit is fundamental to the constitution of subjectivity. This is clear as early as *Empiricism and Subjectivity*, and also in *Difference and Repetition*. His analyses are highly acute in this regard, but it is important to recognise that habit is nonetheless the lesser (ontologically) of the three syntheses of time he describes in chapter two of *Difference and Repetition*. While in both an empirical and logical sense there cannot, for Deleuze, be a subject without habit, it is the motif of binding that dominates his descriptions of this synthesis of time. We must note that in the context of his discussion of the three syntheses of time, Deleuze says of the habitual synthesis that 'a scar is the sign not of a past wound but of "the present fact of having been wounded": we can say that it is the contemplation of the wound, that it contracts all the instants which separate us from it into a living present' (Deleuze 1994: 77). This suggests that the condition of habitual time is the wound (futural time, difference-in-itself). However, this transcendental privilege also becomes an ethical one when Deleuze insists on the importance of the time of apprenticeship and the way it never leaves us and is never fully mastered (Deleuze 1994: 25). His overarching ethic is hence not

one of phronesis, of practical wisdom within a given embodied and cultural context. If an ethics of phronesis can be seen tacitly at work in most phenomenology, with its communitarian inclinations, this is clearly not the case for Deleuze. On the contrary, it is an ethic of jolting this world (of 'time out of joint'), and of disturbing the equanimity of the experiences of wisdom and mastery.

In regard to the ongoing question of Deleuze's 'secret dualism' and the relationship that obtains between the transcendental (virtual) and the actual, it is worth noting that even in *Difference and Repetition* there is said to be a 'vast difference' between 'material and spiritual' repetition (Deleuze 1994: 84), between the actual and the virtual. Even though the transcendental (virtual) is not fixed but fluid, and in an asymmetrical relation of reciprocal determination with the actual, it nonetheless retains a priority (via the quasi-cause, via counter-actualisation) over the body and states of affairs. It is an epiphenomenal and temporal wound that not only has a philosophical order of priority, but also an ethical one. As such, his work constitutes an ethics of the virtual, or an ethics of the event-effect. Grasping this depends upon seeing the significance of his philosophy of time and its anti-presentism, along with the wound that time opens up both individually and virtually. His ethical principles derive from a hierarchical transcendental philosophy that gives to the body the lesser role: even when Deleuze talks of 'sensations' they come from the virtual and the surface more than from the realm of bodies and depths. If one thinks this characterisation is too swift given his Spinozian declarations that we do not yet know what a body can do, it must be noted, again, that such transformations can and must come from outside the body, from something akin to the virtual (Deleuze 1990: 226). Despite the profound excavations that his work exerts upon the Cartesian mind, the philosophy of the subject, and the philosophy of representation, Deleuze's philosophy nonetheless reinvents a strange amalgam of the modern and the pre-modern, reinventing a form of dualism that is uniquely his own. No doubt that is a major accomplishment understood in terms of the creation of concepts, but it is also one that deserves to have these and other critical questions put to it.

Notes

1. This essay has benefited from the assistance of Jon Roffe, the *Deleuze Studies* referees and editorial team, and the Australian Research Council.
2. Cf. Reynolds and Roffe 2006.
3. These terms are also used in *A Thousand Plateaus* (Deleuze and Guattari 1987: 262).
4. Cf. Hallward 2006.
5. This is not to dispute his famously opaque concept of transcendental empiricism, found largely in *Difference and Repetition*, which purports to allow one to discern the conditions for actual rather than merely possible experience. There is clearly a relation between the orders of the virtual and the actual, as well as something about each that necessarily resists the other. My main concern in this paper, however, is with the manner in which a dualist evaluative scheme makes possible his ethics. On this interpretation, transcendental empiricism is really an attempt to foreground the significance of the virtual and the transcendental (and their expressive 'quasi-causality') so that we don't have an all-encompassing realm of brute empiricism/physicalism, which Deleuze refers to as involving merely 'bare repetition'.
6. Cf. Williams 2006.
7. In *Out of this World*, Peter Hallward suggests that they ultimately conflate into a monistic univocity, precisely because what I label the transcendental component of the distinction, that which does not refer to *l'actualite*, is in fact ultimately all that there is. Deleuze, however, consistently speaks of a 'secret dualism' in *Logic of Sense*, with, as we have seen, the body and states of affairs the lesser but arguably not entirely effaced term of the dualism. I return to this question below, but it revolves around the extent to which Deleuze is read as a Bergsonian, since for Bergson, at least on Deleuze's account, we might understand the actual as but a tendency of the virtual. Hallward and Alain Badiou interpret Deleuze and Bergson's positions as very closely related, but it needs to be noted that Deleuze's understanding of the virtual is not exactly synonymous with Bergson's – Bergson's conception focuses upon the past and memory, but Deleuze adds a complicated account of the futural synthesis of time to the equation, especially in *Difference and Repetition*.
8. He complicates this account towards the end of *Logic of Sense* in the series titled 'Aion', where he details the different modalities of the present and instant that are characteristic of Aion and Chronos. Adequately addressing this material,

which is in tension with some of the other formulations in his book, is beyond us here.

9. This term is taken from Heidegger's *Being and Time* and highlights the privilege it initially accords to the 'ready-to-hand', to the pragmatic and 'equipmental' relation to place and objects.
10. Cf. Smith 2007. Smith's admirably clear and precise essay encapsulates a certain thrust of Deleuze's ethics, but it has relatively little to say about the extra-worldly ethic of *Logic of Sense*. In the course of a discussion of Primo Levi's life and work, Ian Buchanan's *Deleuzism* (2000: 77–87) offers an interesting analysis of the link between counter-actualisation and concept creation, something I have not been able to explore here.
11. In fact, Nietzsche propounds competing and perhaps mutually exclusive interpretations of the eternal return, suggesting in *The Gay Science* that there would be 'nothing new in it', seemingly resisting Deleuze's conviction that we ought to understanding it as being concerned with the eternal return of difference rather than sameness (Nietzsche 2001: 341).
12. Cf. Williams 2005: 89–105.
13. Consider the central role that time plays in Merleau-Ponty's (1994: 345–6) famous account of ambiguity in *Phenomenology of Perception*, and the manner in which it breaches what has been considered to be inner and outer. The philosophy of ambiguity is a philosophy of the scar. Cf. Reynolds 2006.
14. While there is no single ethical and political position that we can attribute to phenomenological philosophers and to post-structuralist philosophers, certain tendencies can nonetheless be associated with each of them. Phenomenologists tend to be more communitarian in outlook, emphasising the role of ethos in the constitution of individual moral agents – consider the work of 'neo-phenomenologists' like Hubert Dreyfus, Charles Taylor, and Paul Ricoeur, along with the early explicit critiques of liberalism advanced by Merleau-Ponty and de Beauvoir. They are essentially communitarian in their focus upon the difficulties inherent in liberalism's atomistic conception of the subject; they will not accept the supposition of a rational disengaged agent, even as a regulative ideal. If the ethical model par excellence for most phenomenologists is something like phronesis (and a kind of virtue ethics), this is not the case for poststructuralists for reasons related to their philosophies of time, their denunciation of habit, skills, gathering, and their consistently radical politics of the new and the different.
15. Gallagher's paper makes it apparent that phenomenological phronesis is generally rejected by poststructuralist thinkers (as in Derrida and Deleuze, where it is understood to be common sense), or inadequately thematised, as Gallagher suggests is the case with Lyotard. It seems to me that Gallagher is right that there is a tacit denial of the importance of phronesis (or Gadamerian *Verstehen*), habits, ethos over time, and that these are replaced by a priority given to inventing new moves, new games, particularly in the case of Lyotard and Deleuze. While they know that the creating of new games is never ex nihilo, they assert there is a temporal priority given to a particular futural synthesis of time that for them is exemplified by motifs like the dice-throw, the child, etc.
16. Of course, many objections might be raised against this interpretation, and the resources for which can be found in some of the many reflections in the Deleuzian secondary literature on the related issue of difference/identity. See, for example: Williams 2003; Williams 2006; May 1999; and Smith 2003. Smith's eloquent defence of Deleuze against Badiou, however, does not invalidate my position here. Firstly, my interpretation of Deleuze is certainly *not* that he is a vitalist (as Badiou suggests in *The Clamour of Being*); on the contrary, Deleuze's

ethics is one of the inorganic. Second, to the extent that the nomad/royal science distinction Smith is concerned with maps onto the distinctions discussed here, both Deleuze and Smith prioritise differentiation (problems, virtual) over differenciation (dynamisms, actual solutions) and hence nothing necessarily contravenes my account. While the impetus behind such a prioritisation is arguably the hope of somehow reinvigorating the actual, it is again the case that the ethical imperative for this derives from the fundamental hierarchical differentiation of the virtual and the actual.

17. Deleuze (1988: 105) also accepts the preferability of a 'finalism' in which the living being is somehow non-analogically compared to the whole of the universe. But perhaps the clearest example of this mysticism in Deleuze's work, however, occurs in his essay 'Michel Tournier and the World Without Others', an appendix to *Logic of Sense*, but written much earlier. I analyse this intriguing essay in Reynolds 2008.
18. Some similar observations regarding the wound also feature in *Pure Immanence*: 'The wound is incarnated or actualised in a state of things or in lived experience: but it is itself a pure virtuality on the plane of immanence' (Deleuze 2001: 31). Establishing precisely what the relationship is between the virtual and the plane of immanence is, however, beyond me here.

Review Essay

Gilles Deleuze and his Readers
A Touch of Voluntarism and an Excess of Out-Worldliness

Constantin V. Boundas

May, Todd (2005), *Gilles Deleuze: An Introduction*, Cambridge: Cambridge University Press, 184 pages.

Hallward, Peter (2006), *Deleuze and the Philosophy of Creation: Out of this World*, London: Verso, 199 pages.

A book review, if you will, can be a powerful tease for readers who anticipate extracting nuggets of insight from its parent source. It can also be—and often is—a way for the reviewer to bask in the glow of a good writer or, by the same token, to flaunt his own cleverness and sense of superiority at the expense of a struggling essayist. I never had conclusive evidence to hold myself immune to either of these temptations. This time, however, I am in a position—temptations notwithstanding—to render my services to interested readers, with the satisfaction that comes from knowing that the pains of composing a review have been fully redeemed by the pleasure of having read two books that made me think long and hard.

May's and Hallward's books are very different from each other, in scope, ambition, and targeted readership: May chose to write an introduction to Deleuze—an introduction that could be read and appreciated even by those who know nothing, or very little, about Deleuze—and he did it with honesty, fidelity to the material he has been working with, and with the exquisite transparency and subtlety of his

style. The result is one of the best introductions to the rhizome-Deleuze we have had that can be read profitably by beginners and Deleuze-aficionados alike.

Hallward, on the other hand, chose to write a book on Deleuze that, in his words, 'aims to go right to the heart of Deleuze's philosophy.' His is not an easy reading: his book asks for readers who have an intimate knowledge of Deleuze. It subjects Deleuze's texts to a hermeneutic scrutiny the plausibility of which demands constant justification, and repeated appeals to textual evidence whose interpretive relevance must also be constantly demonstrated and legitimized. But the result is a remarkable reading of Deleuze, whose structure, close-knit argumentation, and powerful advocacy for its conclusions are seductive and *almost* convincing. I say 'almost convincing,' because, although I am indeed impressed by Hallward's successful identification of Deleuze's main concerns, his attention to detail, and his challenging deductions, I hasten to add one qualification: the enjoyment that reading his book gave me was often diminished by the suspicion that was growing in me as my reading progressed that Hallward's encounter with Deleuze was deeply problematic. I will argue later that the flaw lies in the author's decision to obstruct the (sometimes) overdetermined and (some other times) underdetermined deterritorializing lines of Deleuze, and to reterritorialize them upon a line of flight of his own making that has the 'outside of this world' as its telos.

I begin with Todd May's *Gilles Deleuze: An Introduction*. It takes courage to write a book like this one—courage and thorough familiarity with the material. With this volume, Todd May proves that he has both. To publish a book on Gilles Deleuze, whose chosen stuttering style and theses have proven to be a tough nut for the strongest of teeth, and to write it—without cutting corners or sacrificing important building blocks—in a way that allows even those with little knowledge of Deleuze to understand and savor its contents—is a rare feat. May is not a newcomer to the domain of recent French philosophy and to Deleuzian scholarship.[1] The present volume shows a maturity of philosophical beliefs and a wonderful choice of a mode of expression and communication that opts for the intelligibility and transparency of what is written. The author wants his interpretation of Gilles Deleuze to be such 'that, [it] remains mindful of and oriented toward the one question that is never far from [Deleuze's] texts: how might one live?' (p. 3). He pursues the transformations of the Socratic question, 'How should one live?' from its early preoccupation with a deontology of living, supported by the immersion of human life inside an order as

vast as the entire cosmos, to the 'How should one act?' of the moderns, and the 'How might one live?' question of today. The transition from 'should' to 'might' prepares May's readers for his discussion of Deleuze's immanence and experimentation, and his relentless opposition to the transcendence-laden imperatives of the 'should.' 'How might one live?' claims May, ushers in an ethics and a politics of creativity—of chance and necessity—without the higher authority of an externally imposed obligation to conform.

Our times, May argues, show a marked tendency to denounce ontology altogether because ontological responses to the question, 'What is there?' have been known to generate frames proposing and imposing transcendent limits to creative, new and interesting ways to live. Indeed, Foucault's and Derrida's denunciations of ontology, for those reasons, are among the most recent examples. Deleuze, on the other hand—and here, I believe, May is absolutely right—does not denounce ontology. '(His) works are steeped in ontology' (p. 15); they construct an alternative ontology—an ontology of immanence—that allows experimentation, creativity and discovery. Evidently, two traditional assumptions will have to be abandoned before such an ontology gets off the ground: a) that ontology involves discovery rather than creation (p. 16); and b) that identity has a logical priority over difference (p. 17). The resulting ontology will come to rest on Being, conceived as difference in itself, and on time, structured according to the demands of the (Bergsonian) *durée*. Deleuze avoids the risk of mistaking difference in itself for another foundation in a litany of grounds responsible for the framing act of traditional ontologies—May suggests—by having difference 'palpated' rather than grasped, conceived or represented: '(I)f it is difference rather than the identity we seek, and the interesting and remarkable rather than the true, then it is palpation rather than comprehension we require' (p. 20). The determined nature of the present along with the determining nature of the past (present) are eschewed through the conception of a pure past—a past that has never been present, teeming as it is with differences in a virtual stage. As for the requisite experimentation and creativity—the dice throw of chance and necessity—they are made possible through the eternal repetition of differences. Perceptively, May points out that the construction of Deleuze's ontology requires three intercessors: Spinoza, whose 'immanence is difference made flesh'; Bergson, whose temporality of duration allows 'immanence to be born'; and Nietzsche, whose spirit 'of the active and creative affirmation of difference . . . pervades the entire project' (p. 26).

With the help of Spinoza's substance, Deleuze denounces transcendence; begins to articulate his own theory of the virtual; and is able to argue that the virtual/substance exists only in its attributes and modes, albeit it retains an ontological priority over them. 'The role of transcendence', writes May, as he explains the reasons behind Deleuze's opposition to transcendence, 'is to allow the universe to be explained in such a way as to privilege one substance at the expense of another, to preserve the superiority of certain characteristics and to denigrate others' (p. 31). A successful challenge to transcendence results in an ontology of immanence that banishes (May maintains) all hierarchy and division (p. 34). The success of this challenge depends on two interlinked theses—both enthusiastically embraced by Deleuze: the univocity of being (being is said of its attributes and modes in one and the same sense) and expressionism—neither creationism nor emanationism ('substance is not like a thing that gives birth to other things. It is more like a process of expression' {p. 37}.) Substance expresses itself as it modulates itself. The combination of these theses permits Deleuze to inflect his question about how one might live, giving it a more general scope: 'what might it be to be alive?' The answer follows from what has already been said: life is everywhere because foldings, unfoldings and refoldings occur everywhere. Life does not have to be organic.

The modulation of the one univocal substance is not possible as long as time is supposed to be the linear succession of now-points and (as is the case with the 'objective' view of time) as long as an ontological privilege continues to be assigned to the present: 'the linear conception cannot capture the process of expression' (p. 44) that requires the substance to remain within its expression; nor can the immanence of substance be retained, if (as with phenomenological and existentialist theories of time) temporality is made immanent to consciousness. Only the Bergsonian *durée* can account for the modulation of the one substance, because only it offers the three requisites for an ontology of difference: a) There is no present that does not actualize the (virtual) past; b) It is the entire (virtual) past that is actualized at any one moment; and c) The (virtual) past that is actualized is real (the past insists) (p. 52). This is a difficult moment in May's book, but, with his usual lucidity, he comes to the rescue of the reader. In Deleuze's ontology, the virtual and the actual are two mutually exclusive, yet jointly sufficient, characterizations of the real. The actual/real consists of bodies, states of affairs, bodily mixtures and individuals. The virtual/real consists of incorporeal events and singularities on a plane of consistency, belonging to the pure past—the past that has never been present. Without being

or resembling the actual, the virtual nonetheless has the capacity to bring about actualizations without ever coinciding or being identified with them. And May concludes: '(T)he Bergsonian revolution is clear: We do not move from the present to the past, from perception to recollection, but from the past to the present, from recollection to perception . . . Duration does not only give rise to the present; it is also of the present . . . . [But then], if [duration]/difference is immanent to the present, then each moment is suffused by a realm of difference that lies coiled within it, offering the possibility of disrupting any given identity' (p. 55).

Now, if Spinoza is the Christ of philosophers, as Deleuze maintains, and Bergson, the Father, then Nietzsche—writes May—is the Holy Ghost. The construction of Deleuze's ontology owes a lot to Nietzsche's eternal return and to the allegory of the child-god playing at dice throwing, provided that the eternal return is correctly understood as the return of unactualized difference, and the dice throw, as the double affirmation of chance and necessity. This is how May expresses these points: '[T]he future is not empty. It is full to overflowing . . . What returns are not the identities that are actualized in the present. What returns is the virtuality that lies behind and within these identities' (p. 61).

In order to be constructed and sustained, an ontology of difference needs also an alternative to the dogmatic image of thought behind the traditional frames: familiar representation must give way to the jolt of fundamental encounters; recognition (with its *concordia facultatum*, good and common sense) must yield to *concordia discordata;* the modeling of thought after solutions must cede its place to the formulation of interesting problems. ('Problems are inexhaustible, while solutions are a particular form of exhaustion' {p. 85}.) As for learning, it should willingly be a long apprenticeship to the art of 'palpation'—palpation of a difference that cannot be represented, albeit it never ceases to give itself.

On the other hand, an ontology of difference requires a language that is neither a transparent medium for the representation of thought nor a 'prison house' or an 'opaque blade' in the heart of being. May, therefore, gives us an accurate account of the theory of language that Deleuze offers as the desired alternative. Denotation (reference), manifestation (of the speaker's moods), and signification (the implications maintained between an utterance and other utterances) attempt to fix the meaning of a proposition, but they do not allow the stuttering of language—the *sine qua non* of creation and discovery. Only sense can do that. 'Sense,' May says, 'is expressed in propositions, it inheres in them. But it is

not reducible to the qualities of the proposition that expresses it . . . It is an event that happens in the proposition but is not the proposition itself . . . The other side of sense faces the world; it is an attribute of things or of states of affairs. The event subsists in language, but happens to things' (pp. 101; 102). Deleuze, following a long but maverick tradition, prefers to think of sense as something that is best expressed in the infinitive form of verbs.

Deleuze believes that philosophy (the art of creating concepts) and science (the domain of functions) are different activities; he has no need to blend and mix the genres—as is fashionable in some circles. But of course an ontology that would choose to ignore the needs of the scientific field and a science that would rule out the possibilities of certain ontological constructs—not through experimentation and creation, but rather a priori—do not bode well. May, therefore, takes the time to remind his readers of advances in the scientific arena (still contested, but in the process of becoming entrenched) that engage fluid identities, the primacy of the different, and the stochastic. Science too can think difference. Biologists' preoccupation with biological and ecological systems rather than with individuals, Simondon's discussions of intensity giving rise to extensity, Prigogine's bifurcations, Monod's perception of humans as the product of chance and necessity, are proofs of this.

In his fourth chapter, 'The Politics of Difference', May turns his attention to what Deleuze has to say about our living with others. Deleuze's task, he writes, 'is not merely to think the world differently, but to live it differently . . . And one lives among others' (p. 116). Experimentation and creation with new and interesting ways of living (even when not presided over by transcendent 'shoulds') do occur in the context of being with others—indeed they require being with others in order to be actualized. The discussion of issues generated in the course of living with others belongs to politics and ethics.

In this context, May reviews the shortcomings of our liberal political theory, which is grounded on the primacy of the individual, on lack, needs and their satisfaction, and on molar institutions (the government, the State, classes). Underlying all, one finds a theory of representation, made to invigilate over whether or not our needs and interests are adequately represented, and whether or not the legitimation of their satisfaction is brought to rest on the equitable representation of the governed. And with that, identity obliterates difference. What Deleuze and Guattari bring to the table is a new political ontology. Rather than beginning with individuals and representation, they start with

'machines' and 'machinic thinking.' Machines—being neither organisms nor mechanisms—are defined by the connections they establish with other machines. Changing the connections changes the machine. To the extent that there is always more to their parts, machines are defined by their virtual capacity for being actualized in different ways in different contexts. Machinic connections are productive and their *modus vivendi* is fluid identity. They are not defined in terms of lack and interests—at least not initially. It is this anti-representational strategy, May argues, that permits Deleuze to develop an intriguing theory of desire (productive and affirmative of the real), a preference for the minor (not the small, but the process wherein quantic flows predominate), and for the indispensability of lines of flight {'lines of transformation—not a leap into another realm, but a production within the realm of that from which [the line] takes flight' (p. 128).} The result is an advocacy for micropolitics (the hunt for 'transversal' connections that cut across traditional political identities). In this context, May gives us several fine pages as he discusses Deleuze and Guattari's nuanced attitudes towards the State, capitalism, subject groups and subjected groups, nomads and sedentaries. And he concludes with the following lines: 'Politics is an experiment, not a deduction . . . There is no general prescription . . . Everything is played in uncertain games . . . Each line has its own dangers' (p. 153).

How might one live, then? The concluding chapter of May's book extrapolates an answer to this question from an imaginative analysis of four exemplary cases: jazz, the Palestinian intifada, the lessons learned in urban renewal, and the passionate uncertainties of love and eros. 'The folding, unfolding, and refolding of . . . life cannot be predicted,' he concludes. '[They] cannot be managed by fiat. One can only help foster a diversity of elements and watch what happens from there' (p. 165). An ontology of problems, a transversal thinking, and a stuttering language are indispensable to sustain such living.

I strongly recommend this superb introduction to beginners and sophisticated readers of Deleuze alike. But I feel I should also forewarn them about three possible weaknesses in May's endeavor: I contend that 1) he may have underestimated the extent to which difference in itself guides the construction of Deleuze's ontology; that 2) in his eagerness to pursue Deleuze's question, 'how might one live?' he might not have decisively averted the 'existentialist' and 'decisionist' risks that loom large behind a certain way of reading Deleuze; and that 3) he seems to have missed a golden opportunity to strengthen Deleuze's hand by neglecting the importance Spinoza carries for Deleuze's ethics

and politics, and by failing to notice the crucial role of the dialectics of 'transgression' and 'aristocratic distance' that permeate Deleuze's political thinking.

1) May pays serious attention to Deleuze's statements about philosophy being governed by the quest for the new, the interesting and the remarkable: these are fit directives when it comes to the logic of problems rather than the deontology of solutions. The solution has the truth that it merits given the problem and the question whose response it is. 'Philosophy is not inspired by truth, but it is not inspired by fiction either. Instead, philosophy creates a way of seeing the world in which we live that disturbs the verities we are presented with' (p. 22). Although a conciliatory tone is struck in this statement, which refuses to choose between truth and fiction, it has sometimes been taken as a denunciation of ontology.[2] But, in the present book, May heeds Deleuze's claim that philosophy is ontology. Of course, he makes it clear that Deleuze's ontology is not based on identity and representation; rather, it is after the differentiated virtual that differen*c*iates itself in its actualizations—and difference is not a fiction (p. 21). But, on the other hand, May—being eager to hold onto Deleuze's experimental and creative flows in philosophy—resolves the underlying tension in statements like this: 'difference is no more a creation than it is a discovery' (p. 22). He does so without noticing how unhelpful or disingenuous such statements can be, and without taking the necessary precautions to prevent them from being mere expressions of defeat in the face of Deleuzian paradoxes.

I am not suggesting that to maintain a balance between creation and discovery, in reading Deleuze, is disingenuous. I am in full agreement with May when he attributes the function of 'palpating' difference—rather than comprehending, seizing, or grasping it—to the concepts that populate Deleuze's ontology. My difficulty with May's reading is that I do not find his way of establishing the balance between creation and discovery convincing enough. What May seems to miss is that Deleuze's ontology relies on his allegiance to a strict parallelism between being and thinking. *To gar auton esti noein te kai einai* is as much Deleuze's conviction as it was Heidegger's: the same 'thing' is given to be and to be thought—except that, in Deleuze's case, the 'same thing' is difference itself. With Deleuze, the parallelism of being and thinking requires the alignment of the thinking and acting 'subject' with the difference that gives itself over. This is the point of Deleuze's transcendental empiricism (the quest for the conditions of the actual); this is also the sense of the chain of the gerundives that structure his transcendental empiricism (*sentiendum, memorandum*, *cogitandum*); and this is how 'becoming

imperceptible' succeeds in displacing molar and molecular subjects. And let us not forget the passages in *Difference and Repetition* where the *cogitandum* seems to go beyond mere palpation.[3] Experimenting and creative 'subjects' are necessary conditions for new ways of seeing, conceiving, acting and, in a word, living, but it is difference that gives itself and directs creation and orientation. The virtual, after all, is real. And it is neither you nor I, but the eternal return that functions in Deleuze's ontology as the principle of selection. Without this alignment of being and thought, Deleuze's philosophy would be no different from Jean-François Lyotard's musings about the sublime or Jacques Derrida's homage to the messianic *à venir*.

It is worth listening to Deleuze again: 'This power of decision at the heart of problems', he writes in *Difference and Repetition*, 'this creation or throw which makes us descendant from the gods, is nevertheless not our own. The gods themselves are subject to the *Anankē* or sky-chance . . . The imperatives are those of being, while every question is ontological and distributes "that which is" among problems' (p. 199). There is no room for 'decisionism' here; the one who plays at rolling the dice is not the mighty 'I' but the pre-personal and pre-individual 'larval selves' that have become-imperceptible. It is the 'spiritual automaton'—not of Leibniz, still capable of formally deducing his ideas from each another—but the spiritual automaton of Artaud and Blanchot that 'testifies to the impossibility of thinking that is thought' (Deleuze 1989b: 166). The spiritual automaton, once the link between man and the world is broken, testifies to 'an unthinkable in thought, which would be both its source and barrier . . . and to the presence . . . of another thinker in the thinker, who shatters every monologue of a thinking self' (1989b: 168).

2) If the alignment of the being of the AND to the thought of the fissured I, (as suggested by the evocation of the spiritual automaton), is properly heeded, the existentialist and decisionist temptations that at times loom large behind May's words will be prevented from reaching full maturity. The balance between chance and necessity—between being given over to throwing the dice without any prior knowledge of the number combinations that will come up (chance) and the landing of the dice with its specific number combinations (necessity)—cannot be Deleuze's last word on the question of 'how one might live.' One needs something more, because the fear of throwing the dice and giving oneself over to the play, without pretending to know what combination of numbers the dice throw will bring about, is not always a symptom of a cowardly or a reactive disposition; it may also be an indication that someone has taken being and living with others

seriously. The insouciance of the child-God playing at dice throwing cannot be seriously advocated if the returned combination were to bring corpses, apartheids and genocides. The throw of the dice itself may not be protected by verities or certainties—not even by probabilities—but must be embedded in a few guiding principles of intelligibility. The dice thrower, after all, was not born yesterday; there are ways of re-reading the Aristotelian *phronesis* that do not have to import the oppression of transcendence. After all, Deleuze, no less than Nietzsche, opts for an ethics (and a politics) of the good and the bad as soon as the morality of good and evil is laid to rest. The alignment of being and thought goes a long way toward checking whatever residual decisionist initiatives may be found in the dice metaphor. In the becoming imperceptible of the spiritual automaton, we reach a point where it is no longer important to say 'I'. In other words, we reach the point where it is not important to distinguish between creating and discovering. When in the process of actualization the virtual unfolds what is enfolded in it, and in the process of re-virtualization the actual is once again folded in the virtual, then but only then who creates and who discovers are moot questions; or, if we insist in raising the question, life—overflowing life—is responsible for creation and discovery.

In other words, Deleuze needs Spinoza again, as much as he needs a subtle reading of Nietzsche's eternal return. May evokes Spinoza only for the construction of the ontology of the virtual, while totally giving Deleuze's politics over to Nietzsche's magisterial presence—and this is an oversight. He is correct in making a prominent place for Deleuze's and Spinoza's statements that 'we do not yet know what a body is capable of'—we do not yet know what a body politic is capable of. But, then, it is curious to see him overlook what is crucial: that for both Spinoza and Deleuze, a body's power increases in its association with other bodies *that are compatible with it;* and that a body's power decreases in its association with bodies *that are incompatible with it*. It is an entire phenomenology of the becoming-active of human beings in Spinoza's *Ethics* that inspires Deleuze's ethics of joy. Because it is instrumental in eliminating decisionist overtones, this phenomenology should not be overlooked in any discussion of Deleuze's politics. Through the formation of the adequate ideas that the affect motivates, it offers a political ontology and a theory of sociability informed by a few principles of intelligibility and a constitutive rule for dice throwing, without which the toss will be blind and irresponsible.

3) In the last analysis, the one weakness of May's excellent introduction to Deleuze, in my opinion, is in its failure to strike the right

balance between the man of action and the 'seer'—or rather to be faithful to the way that the two resonate together in Deleuze. In my asking for a delicate balance, I follow the analyses of François Zourabichvili and Jérémie Valentin[4] whose works I recommend to the readers of May's book. Both have argued that Deleuze's reflections on the political are best understood after we come to appreciate the simultaneous presence of two attitudes in his work—*subversion* and *perversion*—as well as of the role that difference plays between the two, in preventing these tendencies from ever freezing in an iconic immobility, in contaminating the one with the other, and in joining them together in the space of an inclusive disjunction.

May's book handles beautifully the subversive tendencies in Deleuze's work, namely, the minor, nomadic and transformative forces (of life, politics, thought, artistic creation) capable of escaping the sedentarism and stratification of majorities. But there is another side to Deleuze's (and Guattari's) posture vis à vis the political—a posture that Valentin and Zourabichvili qualify as 'perverse'—a side that May tends to overlook. 'Politics,' for Deleuze, Valentin writes, 'is a posture, a matter of perception, the result of a conversion that allows the development of a mechanics of resistance to the present' (Valentin 2004, 106). This posture is 'the permanent quest for an inner balance (for a liberation of) . . . always an in-between (*entre-deux*)' (138): in-between philosophy and non-philosophy; in-between political philosophy and politics; in-between the aristocracy of thought and the becoming-democratic; in-between the chief and the tribe; in-between the near and the far; in-between a past that has never taken place and a future that will never come to be present; in-between subversion and perversion. Zourabichvili says the same thing, but he prefers, with Deleuze, to see the structure of this perversion in the light of Freud's characterization of disavowal: 'It might seem that a disavowal,' writes Deleuze, 'is, generally speaking, much more superficial than a negation or even a partial destruction. But this is not so, for it represents an entirely different operation. Disavowal should perhaps be understood as the point of departure of an operation that consists neither in negating nor even destroying, but rather in radically contesting the validity of that which is: it suspends belief in and neutralizes the given in such a way that a new horizon opens up beyond the given in place of it' (1989a: 31). In being structurally akin to disavowal, Deleuze's perversion is always untimely. Untimeliness better equips the political philosopher in her task to resist the present, but also renders Deleuze's political philosophy incommensurable with traditional political thought. This

incommensurability is particularly evident in Deleuze's attempt to draw a delicate distinction between *'ne faire rien'* (to do nothing) and *'faire le rien'* (make the nothing) and to render the second imperative the center of his political posture—problematizing the field of the possibles, without ever articulating a plan in view of a *telos*.

Provided that this aristocratic posture is not confused with hatred for all forms of democracy, those who presently speak of the aristocratic dimension in Deleuze's thought are right (see Mengue 2003). It may come as a surprise to Todd May to hear that his reading of Deleuze is too 'liberal.' But to say, as May does, that the univocity of Deleuzian Being is meant to eliminate all hierarchies (p. 34) is to overlook this aristocratic posture. Yet, Deleuze in *Nietzsche and Philosophy* (1983: 60) clearly approves the 'superiority of active to reactive forces' and the 'unalterable and innate order of rank' in hierarchy. From Pierre Clastre's writings on primitive societies Deleuze retains the attribution to the chief of an aristocratic distance from the tribe (see Deleuze and Guattari 1987: 357–61)—the space, in other words, necessary for the chief to exercise his *voyance* and to ponder the means available for summoning the 'new people and the new earth'—the 'missing people' who give Deleuze's political posture 'a purposefulness without purpose.' It will be a pity, of course—as I maintained elsewhere (Boundas 2005)—to read in these summons the messianic aspirations of a Derridean *à venir*: It is the missing people that constitute the space of the political because and to the precise extent that they are always already missing. And this is not to say that I hold May responsible for the reinsertion of the teleological in the space of politics. I only wish that he had made Deleuze's opposition to telos-inspired politics even more clear through an unambiguous critique of all decisionist temptations.

Time now to turn my attention to Hallward's *Deleuze and the Philosophy of Creation*. Hallward begins his book with the assertion that Deleuze's Being is creation, and devotes the rest of his time to the exploration of the implications of this dictum for ontology, epistemology, and for the ethics and politics of our being with others. He ends the book reproaching Deleuze for turning his back on Marx's Thesis Eleven, abandoning the political imperatives for the transformation of our world, and opting rather for an exo-cosmic ineffectual contemplation. Between the opening assertion and the concluding reproach, Hallward displays an impressive knowledge of Deleuze's work, and an enviable interpretive insight (sometimes, brilliance). He composes some beautiful pages, as he goes on to discuss the progressive de-materialisation of medium and message in Deleuze's

assent from art to philosophy (Chapters 5 and 6). But he also displays a curious blindness that occasionally causes him to misrepresent key Deleuzian concepts and arguments; to place them in contexts where their meaning (or better, their function) hardens and makes them lose their original subtlety; and prompts him to draw questionable conclusions from premises that are often beyond reproach.

But I am jumping ahead of myself; it is time to go back to the beginning. Hallward correctly designates the Deleuzian Being as creation, and then rightfully asks that this designation be taken in the precise sense in which Being is both creating force(s) and created entities—both creating act(s) and resulting creatures (p. 27). Like Spinoza, Deleuze's ontology revolves around *natura naturans* and *natura naturata*. And like Bergson—in fact, without the ambiguity that characterizes Bergson on the subject of intensity—his philosophy is articulated around the notions of intensity and extension, or, even more to the point, around the notions of the virtual and the actual. Being is creating/creative, *natura naturans,* intensive and virtual; but Being is also what is created (the creature), *natura naturata,* extended and actual.

The Deleuzian virtual has generated an endless number of discussions and controversies, and it is to Hallward's credit that he takes the time necessary to satisfy himself that his readers understand what Deleuze means by the juxtaposition/complementarity of the virtual and the actual (see pp. 27–54). In Deleuze's ontology, the virtual and the actual are mutually exclusive, yet jointly sufficient, characterizations of the real. Actual/real are states of affairs, that is, bodies and their mixtures or individuals existing in the present. Virtual/real are incorporeal events and singularities in a plane of consistency, belonging to a past that Deleuze qualifies as 'pure,' suggesting thereby that this past has never been present. Virtual is something which, without being or resembling an actual x, has nonetheless the capacity to bring about x, without (in being actualized) ever coming to coincide or to identify itself with, or to be depleted and exhausted by, the x (p. 4). The kind of process that we find in Deleuze's ontology is not, therefore, properly captured in the scheme, actual/real → actual/real; the correct account of it would rather be this : virtual/real ↔ actual/real ↔ virtual/real (Deleuze 1994: 208–21). In other words, becoming, instead of being a linear process from one actual to another, should rather be conceived as the movement of a virtual tendency through an actual state of affairs towards its re-virtualisation or as a movement from an actual states of affairs through a dynamic field of virtual/real tendencies, to the actualization of this

field in a new state of affairs. This schema safeguards the relationship of reversibility between the virtual and the actual.[5]

All that is well-known to those who are reasonably familiar with the work of Deleuze, and Hallward's careful elucidation of these notions and their distinction, for the most part, serves the reader well. As he begins his narrative with assertions that repeat standard Deleuzian positions, the reader has nothing to complain about: 'Being' Hallward says, 'is the inexhaustible proliferation of creatings or events of creation . . . Creation is one but it proceeds as two, through [the] distinction of creatings and creatures . . . (T)he creating is implied or "implicated" within its creator; the creation is an explication or unfolding of the creating' (p. 27). But soon trouble pays a visit and difficulties begin to multiply. Their starting point is almost inconspicuous. 'Creation,' writes Hallward, 'is precisely the immanent combination of both creature and creating: the creating is more "internal" to the creature than any actual inside . . . Nevertheless . . . (i)t is only the creating that differs or produces, and it is only the creating *as such* that can claim to be properly new' (p. 28). From such unproblematic beginnings, Hallward develops the rest of his book as a critique of an alleged ontological difference with which he, like a present-day Aristotle, saddles Deleuze, his Plato. According to Hallward, unlike Plato, who refrained from lending his ideas an immediate creative force, Deleuze, endows the virtual with this force. 'A Platonic essence . . . is merely one that allows actuality to resemble it via imitation, approximation or generalization, rather than one that [like Deleuze's virtual] directly produces the actual in its unique . . . thisness' (p. 123). Hallward, in the sequence, characterizes this creative nature of Deleuze's virtual the way that Aristotle characterized the ontological primacy of the Platonic Forms: '*hoi de echorisan* (those over there, [our former friends] did separate [the really real from the illusory copy]).'[6] Now, raising the Aristotelian objection to Plato's ontological difference against Deleuze carries with it serious implications that affect key positions in Deleuze's ontology: for starters, the univocity for the sake of which Deleuze strove long and hard, and the uncompromising immanence of his philosophy, (with no concessions to transcendence), will have to be surrendered; and if so, Hallward would be well on his way to the conclusion that Deleuze's philosophy promotes an ineffectual contemplation of what is 'out of this world'.

Although creatings and creatures jointly constitute Deleuze's real, or what is created—the actual, extended and individuated entities, as they get sedimented (*naturatae*)—argues Hallward, tend to annul the differentiated élan *naturans* that they actualize. They are uncreative,

indifferent creatures, veritable impediments to the creative forces. 'Being is creation but . . . creation itself generates internal obstacles to its own continuation' (p. 79). Faced with creatures, one has to choose between accepting them as the termini of creative acts, depleted from the intensity required for creation and, therefore, as creation's potential enemies; or treating them as so many states of affairs—veritable occasions for the extraction of the virtual creating force. But, since creating is infinite (*es gibt Sein*), the depletion of Being within the cosmos is impossible. Ergo, *the virtual*—the Being 'out of this world of beings'—is, according to Hallward, the sole creative agent—the real more real than the real. 'The main mistake to avoid here is again the assumption that the virtual and the actual enjoy equal power of determination, that creating and creature reinforce one another in some sort of mutual co-implication. No: the creating literally does what the word says, it creates the creature, which itself creates nothing at all' (p. 79).

Now it seems to me that Hallward's reading of Deleuze's ontology underestimates the degree of solidarity that subsists in Deleuze's coordination of the two facets of the real—creating élan and creaturely result, the virtual and the actual. In his eagerness to reach his conclusion concerning the 'out-worldliness' (not the other-worldliness) of Deleuze's ontology, Hallward begins with the identification of the actual with the world (of creatures) and of the virtual, with the creating force, which is 'out of this world.' In his effort to support his reference to the 'out-worldly,' he goes occasionally too far and makes statements that are in direct contradiction to Deleuze's own. For instance, '[t]he virtual alone is real . . . A virtual creating is the reality that lives in any actual creature'—a claim made by Hallward on p. 35 of his book (without the qualification that this is what he himself wishes to conclude, and not what Deleuze maintains)—directly contradicts Deleuze's stubborn determination to think both virtual and actual as real. And the same goes for the following statements: '[T]he actual is never anything more than an illusory and ephemeral world' (p. 38); 'There are only creatings, but some of these creatings give rise to the unavoidable illusion of creatural independence' (p. 55); 'The expressive or "explicative" determination that links the implicated *naturans* (the virtual creating) and the explicated *naturata* (the actual creature) is strictly unilateral and irreversible' (p. 57). One could easily find at least a dozen similar statements in Hallward's book.

Compare now what Deleuze actually says on these issues: 'Every object is double without it being the case that the two halves resemble one another, one being a virtual image and the other an actual image.'; but 'we must carefully distinguish the object in so far as it

is complete and the object in so far as it is whole. What is complete is only the ideal part of the object, which . . . never constitutes an integral whole as such. What the complete determination lacks is the whole set of relations belonging to actual existence' (Deleuze, 1994: 209). Concerning the nature of the (transcendental) illusion of what Hallward calls 'creatural independence,' Deleuze maintains that '[t]here is an illusion tied to intensive quantities. This illusion, however, is not intensity itself, but rather the movement by which difference in intensity is cancelled . . . Only transcendental enquiry can discover that intensity remains implicated in itself and continues to envelop difference at the very moment when it is reflected in the extensity and the quality that it creates, which implicate it only secondarily, just enough to "explicate it"' (1994: 240). Finally, in order to prevent any potential misunderstanding regarding the irreducibility of the relation between virtuality and actuality, Deleuze refers to the movement from the one to the other as perfectly reversible: 'In fact, there is no virtual which does not become actual in relation to the actual, the latter becoming virtual through the same relation: it is a place and its obverse which are totally reversible' (Deleuze, 1989b: 69). From these passages—and they are not the only ones in Deleuze's texts—there emerges a message that differs substantially from the claims that Hallward has made: The virtual and the actual are both real. The explication of the virtual in the actual that gives rise to the alleged autonomy of the actual is responsible for a *transcendental illusion*—not just an illusion, as Hallward has it. The series over which virtual becoming and actual history preside are totally reversible.

Faced with this evidence—and given that his acquaintance with Deleuze's writings is second to none—Hallward will not be in a position to withhold reality from what is actual forever, and will be forced to fine-tune his reasons for the ontological comparative (more real than the real) that he attributes to Deleuze: *'Even if the virtual is incarnated in the actual,'* [emphasis mine], he now maintains, 'the resulting incarnation is not "equally" virtual and actual . . . The creatural qua creatural is unredeemable . . . There is nothing properly creative to be salvaged from the actual or creatural *per se,* other than the energy released by its own dissipation' (p. 78; p. 80). And it will be upon this premise that Hallward will build his reading of Deleuze as a 'redemptive philosopher.' The creator is trapped within the creature, in a state of diminishing intensity, and only the dissolution of the creature will set him free. Difference is trapped within identity, and only the dissolution of identity will restore it to its original calling—the call of difference in itself. In this context,

it is once more Hallward's thorough familiarity with Deleuze's texts that is behind some of his claims, which in being perfectly Deleuzian are also strangely at odds with what he himself maintains elsewhere in his book. Here is one such statement: 'After all, the production of actual creatures is a fundamental aspect of what creation is. The creatural is itself an aspect of creation, rather than its falsification or debasement, or a lower reality that must be transcended. Intensive difference isn't simply cancelled in the system of extension, it also "creates the system by explicating itself"' (p. 56). But if this is the case, the reader has the right to ask: what are the grounds for the 'degrees of reality'[7] that Hallward attributes to Deleuze?

I do not think that it is necessary to trumpet my surprise at Hallward's calling 'redemptive' a philosopher who invited us *'[d'] en finir avec le jugement (de Dieu)'*. I find it more profitable, going back to the quotation that I introduced earlier (pages 78 and 80 from Hallward's book), to suggest that the quotes around 'equally' in his sentence, '(t)he resulting incarnation is not "equally" virtual and actual,' cannot help him with the point he intends to make: for, how can there be any question of equality, here? The virtual is the domain of problems; the actual, the domain of solutions; the problem differs in nature from every solution to which it is susceptible, although, to be fair, it is immanent to all solutions, since the closer we come to the determination of the problem, the more we approximate the problem's solution (Deleuze, 1994: 163–5). Similarly, the notions of 'richer in reality'/'poorer in reality' have no place here. Attempting to establish equivalence between problems and solutions is a non-starter. Writing, as Deleuze does, that problems have the solutions they deserve (in terms of the ways in which they are formulated) introduces a very different perspective of the relation between problems and solutions than the one that Hallward intends with his ontological comparative. And when Hallward goes on to write, '(a)ll the . . . [c]reatural concern can only become the vehicle for insight if properly oriented, precisely *away* from the creatural and *towards* the creating' (p. 57), his 'all the same'—which attempts to resolve the tension in his book between withholding reality from the actual *and* asserting that the actual is not some kind of debased or lower reality—cannot bear the weight that Hallward expects it to carry. For, the 'away' and the 'towards' of the last quotation are, given the nature of the question, odologically misleading. The fact that the virtual and the actual differ in nature does not justify either the 'degrees of reality' ontology that Hallward attempts to read into Deleuze's work or, as we are going to see shortly, the epistemological meliorism that

he seems to hold as a fallback position. Anne Sauvagnargues perfectly captures the spirit of Deleuze's position with respect to the actual-virtual relation in the following: 'The virtual is neither a reserve of Being prior to the actual nor a potency destined to realize itself dialectically in the actual; rather, it is a reality in solidarity with the actual, in a position of reciprocal presupposition—that is, in a position of reversibility—with respect to the actual' (Sauvagnargues, 2003: 27). I find it strange that Hallward, who is fully aware of the debt that Deleuze owes Spinoza's difference in nature between *natura naturans* and *natura naturata,* fails to see that a Spinoza-inspired expressionism presides over the kind of co-imbrication of virtual and actual that Deleuze wants and that Hallward distorts. The constant message of *Expressionism in Philosophy: Spinoza* (1990b) is that the expressed does not exist outside its expression; that God's expression is both his manifestation and his self-constitution. Nature as infinite indeterminate potency-in-act is *natura naturans;* as the exhaustively determinate actuality of this potency it is *natura naturata.* It seems to me that, in this text, there is a decisive repudiation of any kind of 'degrees of reality' ontology.

Hallward, of course, may, at this point choose to remind me that *natura naturata* should not be identified with the modal world. 'Contrary to what you might expect,' he writes, 'the attribute of extension, when considered as an individuating attribute of substance, involves an indivisible and purely intensive or non-actual spatiality. Actual "extensity" fails the ontological test that Deleuze associates, after Nietzsche, with the eternal return, since in it difference, the condition of eternal return, is cancelled' (p. 39). In this, Hallward is right, and he has Deleuze on his side this time. *Natura naturata* should not to be identified with the durational world of the modes which is finite and divisible; it is the eternal 'make of the whole universe,' infinite, one, and indivisible. But I do not think that these lines lend any support to the degree of reality ontology (or the melioristic epistemology) that Hallward wants to attribute to Deleuze. Even if the modal world were a privation in view of the eternal 'make of the whole universe,' (and 'privation' is not at all Deleuze's characterization of it) the 'out of this world' objection would not be justified unless and until it could also be shown that all preoccupation with the virtual offers no assistance whatsoever in our dealings with the actual.

But I do not see how it can be seriously maintained that Deleuze sacrifices the actual world for the sake of the virtual creating act in a way that would support Hallward's challenge of out-worldliness. Such a challenge will sound plausible only as long as the role that

Deleuze-Spinoza attributes to causality and the 'quasi-cause' is sidestepped. And I am afraid that this is precisely what Hallward does. Speaking of Deleuze's view of causality and its role in the expressionism of his ontology, he maintains that all relations between virtual and actual are creative—not causal (p. 41). He then adds that 'a creating is an effect that becomes irreducible to its cause' and that 'logics of creation are incompatible with logics of predictable causation or determination' because 'a creating . . . assemble[s] a series of contingently autonomous effects' (p. 41). And he concludes: 'Rather than seek to understand the mechanism of their causation or production, Deleuze emphasizes instead the virtual sufficing of the events thus "caused." . . . [I]t may be that Deleuze only evokes causality at all as to drive it down into the chaotic and sterile obscurity of the depths' (p. 41).

It seems to me that the source of Hallward's dissatisfaction rests with his conviction that only efficient causality guarantees explanatory insight; logics of creation that may be modeled on some mathematical intuitions or on the behaviour of dissipative structures do not carry, for him, the same explanatory force. If this in fact is the point of contention, I am afraid that I do not have the space here to enter into a discussion on the exclusive disjunction implied in this way of introducing rival scientific paradigms. The only thing that I can do is refer Manuel Delanda's book, *Intensive Science and Virtual Philosophy* (2002) and the immensely helpful bibliographical endnotes that it contains to those who would want more on the interaction of causality and 'creation.' On the Stoic heritage behind Deleuze's views on causes and the quasi-cause, Delanda says: '[T]he Stoics . . . were the first to split the causal link: on one hand, processes of individuation are defined as sequences of causes (every effect will be the cause of yet another effect) while singularities become pure incorporeal effects of those series of causes; *on the other hand, these pure effects are viewed as having a quasi-causal capacity to endow causal processes with coherent form* [emphasis mine]. By splitting causality this way, Deleuze manages to separate the determinism (or destiny) which links causes to causes, from strict necessity' (Delanda, 2002: 207, n. 62).

However, if Deleuze cannot be held responsible for an ontology based on the ontological comparative of the more and the less real, Hallwark thinks a different stratagem may bring about the conclusion he wishes to establish: in the absence of an ontological difference between the virtual and the actual, it could still be shown that Deleuze is harbouring an epistemological and an ethico-political one. The formation of adequate ideas, and the highest degree of knowledge to which the creature can

aspire, requires, Hallward maintains, removal of the barriers and the elimination of the limits that the creature raises between itself and the creating act. They demand the dissolution of the creature in repeated counter-actualizing processes, the purpose of which is the liberation of Being in its creating dynamism, and the advent of pure thought. Parmenides' '*to gar auton estin te kai einai*' is true only if we understand Being as creating, and thinking as pure thought. Deleuze's transcendental empiricism is the reliable pathway to the Parmenidean identity.

A few quotations from Hallward will best demonstrate how he develops and sustains this epistemological stratagem. To the extent that Deleuze follows Spinoza in his definition of adequate ideas, he must hold the view that 'an adequate idea is one that expresses its cause [;] the more [therefore] ... an individual understands itself and other individuals as individuations of God the more its thinking proceeds through adequate ideas' (p. 31). Given that in Deleuze's philosophy the individuation of what is actual is the result of the creative differenciation of the virtual, then to acquire an adequate idea of the actual is to grasp it as the result of the virtual—a result that retains in itself a trace of the creative force of its creator. It is true, Hallward admits, that 'we must actively construct the means of acquiring' adequate ideas, and that, to this effect, experimentation in actuality 'with what a body can do and a mind can think' (p. 90), is indispensable. Nevertheless, the highest possible degree of knowing—the one expressed in the Parmenidean dictum, 'the same thing is given to be and to be thought'—can be achieved when the experimentation with body and mind successfully ushers in the contemplation of what is virtual. 'To think is to allow thought to work through us ... Thinking is never willed or deliberate ... The [spiritual] automaton is a mode in which "thought thinks itself" on the sole basis of its own laws ... Incapable of action, [the automaton] is "cut off from the outside world"' (p. 137; p.138). 'To grasp the virtual involves the suspension or dissolution of the actual as such' (p. 42). 'To know reality is thus to see through actuality' (p. 50). 'When we truly think, it is God who thinks through us' (p. 12).

Hallward concludes that there is a mystic in Deleuze (p. 86); that his philosophy is a theophany (p. 4)—with the virtual creative élan occupying the place of God; that his prized contemplation takes as its object, not another world, but definitely that which is out of the world (pp. 3, 6, 57); and that his transcendental empiricism designates the flight to this outside as the condition for the reality of the actual world. But this is like saying that Spinoza's third kind of knowledge, to which Deleuze's

'contemplation' owes a lot, is the flight of a mystic to the out-worldly; and I do not think that this proposition can be seriously maintained.

As for the ethico-political argument in favour of Hallward's conclusion, I will summarize it as follows. If, as Deleuze maintains, the only ethics worth its salt today is the ethics that beckons us to become worthy of the event, and if 'becoming worthy of the event'—rather than standing for the resignation to whatever befalls us—invites an active counter-actualisation of the state of affairs, then the ethical telos of the creature is precisely in the extraction of the virtual event from the state of affairs that incarnates it (Deleuze 1990a: 142–53). Once again, Hallward chooses to locate in the extraction of the (out of this world) event from the (worldly) states of affairs the 'redemptive' nature of Deleuze's philosophy. 'Deleuze's philosophy is redemptive, not pessimistic' he writes (p. 56). His strategies of extracting the virtual event, subtracting it from the states of affairs that implicate it, are strategies of redemption. 'The goal is less an actual construction than a virtual extraction' (p. 91): Deleuze's vitalism is 'subtractive.' 'The goal is to escape confinement within the creatural without yielding to the temptation of an abrupt transcendence of the creatural. The goal is to build or find that force within ourselves, within the world, that opens a route out of both self and world' (p. 58). And Hallward names correctly the Deleuzian process by means of which the 'force within ourselves' can be uncovered. It is the process of counter-actualisation (or counter-effectuation).

On the subject of counter-actualisation, this is what Hallward has to say. 'If its actualization or effectuation confines a creating within a creature, its counter-effectuation restores it to its fully creative potential or virtuality' (p. 143); and again: 'Every actual creature will have as its particular task the development of its own counter-actualisation or self-transcendence, the process whereby it may become an adequate vehicle for the creating which sustains and transforms it' (p. 6); notice that '[t]he actual is not creative but its dissolution can be' (p. 82) and that '[t]he process of counter-actualisation is itself . . . creative . . . ' (p. 125). 'Counter-actualisation accesses "a virtuality that has become consistent," i.e. that has attained a purely creative . . . intensity. It is this extractive isolation that is properly transformative' (p. 44).

Hallward's characterization of counter-actualisation is pivotal for his assessment of Deleuze's ethics and politics, and equally central to his extrapolation of the melioristic epistemology[8] that I described earlier as well as the 'degrees of reality' ontology that I criticized. Hallward is undoubtedly right in assigning the centrality he does to the process of

counter-actualisation for Deleuze's ethical position. He is equally right in stressing that this process is creative and in reminding his readers that counter-actualisation and 'becoming worthy of the event' go together hand in glove. But the accuracy of his reading must once again be questioned as soon as he places the process of counter-actualisation at the service of a flight towards an 'outside of this world' that has nothing helpful to say about the actual. If Deleuze had in mind the kind of flight that Hallward attributes to him, he would not have described the relation between well-formulated (virtual) problems and their (actual) solutions the way he did. He would not have welcomed in Hume and his ethics a kindred spirit and position (see Deleuze 1991: 25–9) nor would have approved Spinoza's recommendations for an ethics of joyful affects (See Deleuze 1998 & Boundas 2003).

Finally, from the point of view of its resourcefulness for politics, Hallward finds Deleuze's philosophy unhelpful in the extreme: 'Those of us who still seek to change our world and to empower its inhabitants,' he writes, 'will need to look for our inspiration elsewhere' (p. 164). Once again, I choose to interject a few quotations from his book that will make his reasons behind this harsh judgement clear. '(T)here is no place in Deleuze's philosophy for any notion of change, time or history, that is mediated by actuality. In the end, Deleuze offers few resources for thinking the consequences of what happens within the actually existing world as such' (p. 162). Or again, 'there can be little room in Deleuze's philosophy for relations of conflict or solidarity, i.e., relations that are generally between—rather than external to—individuals, classes or peoples (p. 162). And one more—this time, inimitable—jab: '(S)ince a free mode or monad is simply one that has eliminated its resistance to the sovereign will that works through it, so then it follows that the more absolute the sovereign power, the more 'free' are those subjected to it (p. 139). It is interesting to notice that Hallward reaches this bizarre conclusion from the correct premise that 'freedom of the will' is not one of Deleuze's concerns. In the context of the extraction of the virtual creating process, it is the freedom from the will of the actual creature that must be subtracted, Hallward says, precisely because it is an obstacle to the counter-actualisation processes (pp. 138–9). But there is more: 'Deleuze rejects all forms of moral evaluation or strategic judgement', writes Hallward (p. 163). 'Preoccupation with the world as such, let alone a concern with the orderly representation of the things of the world, serves only to inhibit any . . . affirmation [i.e. our immediate participation in reality]' (p. 6). 'Life lives and creation creates on a virtual plane that leads forever out of our actual world' (p. 164).

Summing up, Hallward's complaints that, according to him, justify the rejection of whatever Deleuze has to say on the political, leaves me with the following list: Deleuze knows of no mediation between becoming and history; actual history is at best an occasion for the contemplation of becoming. Actual relations of solidarity and conflict (presumably, the very fabric of the political, according to Hallward) are counter-actualised for the sake of the inclusive disjunctions of the virtual. To look for actual relations in Deleuze's work is a waste of time, because, despite a well-entrenched assessment of this work, Deleuze is not a relational thinker. Consequently, judgements of prudence and strategic counselings have no place in Deleuze, because what really matters to him is a quick exit from this world (without even the benefit of a utopian thinking geared towards another world).

Now, earlier in my attempt to strengthen Todd May's dossier on Deleuze's political, I alluded to the *concordia discordata* between subversion and perversity that Zourabichvili and Valentin insightfully located in Deleuze and Guattari's work. I would very much like to know what Hallward thinks of it. If I may be so bold as to make a guess, I suspect that he would dismiss the subversive tendencies as ineffectual or as momentary concessions to the *soixante-huitards* and he would attribute what Zourabichvili and Valentin called 'Deleuze's perversity' to the posture of someone who looks for a quick exit from this world of conflict and solidarity. After all, Deleuze is not a 'relational thinker'.

But I see no reason at all to concede the point that Deleuze is not a 'relational thinker.' Hallward, in support of his point, refers his readers to Deleuze's essays, 'Michel Tournier and the World without the Others' (1990a: 301–20) and 'Immanence: A Life' (2001). The elimination of the other (as an expression of a possible world) from Robinson's island, Speranza, seals, in the mind of Hallward, Deleuze's acosmic position, and the impossibility of any meaningful discussion of interpersonal relations. But with this unfair generalization, Hallward misses the fact that the other which Deleuze exiles from Speranza is the other of the phenomenologist and the vacuity that characterizes our hackneyed talk of intersubjectivity. I have argued elsewhere that the message of Speranza is the mutual implication of *altrucide* and *suicide* (deconstruction of the other/deconstruction of the Subject-Self) for the sake of the *autrement qu'autre*—that is, for the sake of a new way of being (and thinking about the) other (See Boundas 1993: 32–43). At this point, one feels tempted to ask Hallward, in the style of Nietzsche: have we really thought what compassion (solidarity, conflict) would be between those who express

this *autrement qu'autre*? Even if the *autrement qu'autre* were to be found at the edges of this world, its relevance to our actual-all-too-actual (?) preoccupations would not be *eo ipso* null and void. But it is not a question of the edges of the world; the Deleuzian virtual *autrement* is within the identity of the actual and the possible, as their *'ratio essendi'* and *'ratio cognoscendi'*. And I would say the same about the message emerging from Deleuze's 'Immanence: A Life.' 'The unloved character Riderhood', the moment he lingers between life and death, releases a spark of impersonal and singular life—'a Homo tantum with whom everyone empathizes.' When next, Riderhood 'grows warm' again, the intensity of the affect that the spark of 'a life' generates tends to be lost in extension. But unlike Hallward, I see, with Deleuze, the potentiality of the spark (despite its propensity for being extinguished in the world of the extended magnitudes) as the best guarantor of solidarity among (actual) individuals—much more promising in fact than the reflecting mirrors of the phenomenologist or the romance of recognition with competing desires.

In view of Hallward's challenge, I do not think that we should overlook the fact that resonance is also a relation, and that ever since his *Difference and Repetition,* Deleuze has raised it, along with transversality, speed and slowness, to a veritable substitute for the 'synchronisation of perceptions'—the expression of choice for phenomenologists attempting to rethink relations of conflict and solidarity inside the political (Deleuze 1987: 31; Deleuze 1994: 140–3; Deleuze 1987: 258–61).

With respect to the question of whether or not Deleuze is a 'relational philosopher' and what it means to be one, I would like to recommend a recently published book, by Paul Bains, *The Primacy of Semiosis: An Ontology of Relations* (2006), for its erudite demonstration that an ontology of relations subtends Deleuze's semiotic theory in particular and his theory of multiplicities, sense and becoming in general. In the quotation that follows, Bains captures successfully the place that the ontology of (external) relations has in Deleuze's philosophy: '[T]he univocal ontology of relations... seems to have extraordinary resonances with Deleuze's logic of sense, in particular the concept of an "outside" of thought that is not the outside of an external world but rather the externality of relations that allow thought to have a relation with something that does not depend on it. Relations are external to their terms, and the issue is not primarily a relation of thought to the external world but rather the relation of thought to something other than itself' (Bains 2006: 134).

Far from supporting a flight from the world, Deleuze's well-known formal—not material—distinction between history and becoming (Deleuze & Guattari 1994: 96) clearly envisages counter-actualisation as a line of deterritorialisation that must be constructed and followed for the sake of a reterritorialisation with new weapons, new insights, and renewed efforts. Hallward is right in one thing: it is another way of seeing Combray that the Proustian madeleine evokes (119–20). It is another way of evoking alterity that the intensive reduction of Tournier's Speranza suggests—but this other way is not the annihilation of the other *sans phrase*.

In conclusion, I repeat: Hallward's advice to readers to look elsewhere if we want to heed Marx's entreaty and change the world rests on an encounter with Deleuze that seems to me problematic. Even if epistemologically and ethico-politically the Deleuzian philosophy were an *askesis* enjoined for the sake of the contemplation of the virtual, Hallward would not have proven the inefficacy of this posture unless he had also shown that there is nothing in the contemplation of the virtual that could serve our efforts to reshape the actual. But this demonstration is absent from Hallward's book. His distinction between worldly and out-worldly presupposes a clear understanding on his part (and a will to share it with the reader) of what is worldly. And, only if this (unthematised) presupposition were to be granted, his conclusion about the inefficacy of the Deleuzian out-worldliness would follow. But on the subject of this presupposition Hallward remains silent.

Two books; two thought-provoking readings of Deleuze, in many respects diverging from each other, yet capable of being brought together, with the intensity of a *concordia discordata*, around a central issue that runs through both: the issue of freedom. Hallward is right: Deleuze is not interested in the *liber arbitriium* (which is not to say that the only freedom that he proposes is the *freedom from* the human). But, on the other hand—and May is right in saying that Deleuze is interested in the implementation of his ethics—Deleuze has views on good and bad ways of living and does not hesitate, as we saw, to recommend counter-actualisation and alignment with the event as the means to the realization of an ethics worth its name and the conduct of a life worth living. May and Hallward—each takes hold of one aspect of the problem. May: the causality of freedom, without which necessity reigns supreme and invalidates well-entrenched ethical intuitions. But May mistakes this causality of freedom for freedom of choice and action, *tout court*. Hallward, on the other hand, takes on the other half of the problem: the indispensability of the virtual for the construction of

Deleuze's ethics. But, instead of discovering the causality of freedom in the movement towards the virtual, Hallward condemns the futility of its exo-cosmic trajectory. As they stand, their books are incompatible with each other. But were May to give a more central place to the virtual, the quasi-causal, the necessity that marks the domain of the actual, and a better calibrated reading of the imperative to counter-actualise, the twin problematic of the two causalities—so central to Deleuze—would surface, free from the baggage of voluntarism and decisionism. Were Hallward to acknowledge the irreducible presence of causality (of freedom and of necessity) in the Deleuzian works, the out-worldliness he attributes to Deleuze could no longer be sustained. In its place, a more sophisticated play of necessity and freedom would come to rest—a play within the real, being at last conceived as a veritable Möbius strip of the actual and the virtual.

Notes

1. See May (1993); May (1994a); May (1995) and May (1997).
2. May himself, in an earlier essay of his, argued that Deleuze cannot be the thinker of difference (or the thinker who privileges difference over unity or identity), and in his attempt to support this claim May did refer to this type of Deleuzian statements. See May (1994b).
3. See, for example Deleuze, *Difference and Repetition* (1994: 193): 'Take, for example, the linguistic multiplicity, regarded as a virtual system of reciprocal connections between "phonemes" which is incarnated in the actual terms and relations of diverse languages: such a multiplicity renders possible speech as a faculty as well as the transcendent object of that speech, that "metalanguage" that cannot be spoken in the empirical usage of a given language, but must be spoken and can be spoken only in the poetic usage of speech coextensive with virtuality. Take the social multiplicity: it determines sociability which cannot be lived within actual societies in which the multiplicity is incarnated, but must be and can be lived only in the element of social upheaval (in other words, freedom, which is always hidden among the remains of an old order and the first fruits of a new.'
4. See Zourabichvili (1998) See also Valentin, (2004) & (2006).
5. Hallward seems to dispute the reversibility relation between the actual and the virtual. He writes: 'The expressive or "explicative" determination that links the

implicated *naturans* (the virtual creating) and the explicated *naturata* (the actual creature) is strictly unilateral and irreversible' (p. 57).

Deleuze and the Limits of Mathematical Time[1]

Dorothea Olkowski University of Colorado, Colorado Springs

Abstract

In *Creative Evolution,* Bergson argues that life, the so-called *inner becoming of things,* does not develop linearly, in accordance with a geometrical, formal model. For Bergson as for classical science, matter occupies a plane of immanence defined by natural laws. But he maintains that affection is not part of that plane of immanence and that it needs new kind of scientific description. For Deleuze, affection does belong to the plane of immanence whose parts are *exterior* to one another, according to classical natural laws. Out of this may be cut the closed, mechanical world with its immobile sections that Bergson attributes to cinematographic knowledge. Thus, in place of a science of creative evolution, Deleuze has substituted external relations, blocs of becoming and ultimately, a theory of extinction.

Keywords: Deleuze, Bergson, mathematical, natural laws, plane of immanence, creative evolution, extinction.

I. The Loss of Innocence

For philosophers and film theorists of today, there can be no innocent account of the philosophy of Henri Bergson, and especially, no innocent account of Bergson and film. The latter is due in large part to the two books on cinema written by Gilles Deleuze, books which both acknowledge Bergson's rich and inventive notion of the image, but which simultaneously seek to circumvent Bergson's own so-called 'overhasty critique' of cinema, a critique that apparently arises when he characterizes the medium as a model for the forces of rationality that immobilize and fragment time (Deleuze 1986: xiv). As Amy Herzog has written, 'cinema, for Bergson, or rather the cinematic apparatus, corresponds directly to the function of the intellect.... The camera

isolates fragments of reality, erasing the nuances of transformation occurring between frames' (Herzog 2000). However, according to Deleuze, when Bergson puts forward his three theses on movement and accuses cinema of producing false movement, movement distinct from the space covered by that movement (which Deleuze refers to as the 'cinematographic illusion'), Bergson is mistaken and must be corrected. If the error of cinema is that it reconstitutes movement from immobile instants or positions, this frees it from the privileged instants or poses of antiquity, the Forms or Ideas that refer to intelligibility. At least the error of cinema can be identified with modern science, no longer privileged instants but something Deleuze calls 'any-instants-whatever,' which, for Deleuze, are immanent and material, derived from the continuous and mechanical succession of moments of classical science, according to which time is an independent variable:

> Cinema is the system which reproduces movement as a function of any-instant-whatever, that is, as a function of equidistant instants, selected so as to create an impression of continuity. (Deleuze 1986: 4)

Thus, according to Deleuze, Bergson demonstrates that cinema belongs to the modern scientific conception of movement. This conception may be traced from the invention of modern astronomy by Kepler who sought to determine the relation between the trajectories of orbits and the time a planet takes to circumscribe them, to classical physics, which sought the link between space covered by a falling body and the time of this fall, to modern geometry which worked out the equation for determining the position of a point on a moving straight line at any moment in its course, and finally, by differential and integral calculus, examining sections of space brought infinitely close together (Deleuze 1986: 4).[2] Newton proposed the idea of absolute space, invisible empty space at rest relative to any motion in the universe so that motion could be measured relative to this absolute space. He also proposed an absolute, mathematical time flowing without relation to anything external. Newton proposed absolute space and time even though ultimately he could not adequately defend these concepts because he needed them in order to make sense of motion and gravity (Wheeler 1990: 2–3). The theory of Special Relativity does away with the Newtonian postulate of absolute reference of space and time, eliminating any privileged point of view and introducing the concepts of time dilation and space contraction. That is, the idea that time passes more slowly for people and objects in motion and distances shrink for people and objects in motion, and also, that events that

are simultaneous from a moving point of view are not simultaneous from a stationary point of view (DeWitt 2004: 209). Thus time and space exist in relation to one another; they are what Deleuze will call a 'bloc of becoming'. Nevertheless, the speed of light remains an invariant governing motion, and relativity theory maintains a fundamental role for observation and measurement: 'Time is relative in Einstein's special theory of relativity, but this relativity is expressed by equations which are always valid. Time is not, therefore, chaotically relative, but . . . relative in an ordered way' (Durie 1999: xvii).[3] In spite of the profound changes in physics' conception of space and time, Bergson still maintains that the scientific conception of time 'surreptitiously bring[s] in the idea of space' by successively setting states side by side, whereas the time he calls duration, is 'succession *without [the] mutual externality*' of temporal states' (Durie 1999: vii). So it seems that much depends on how one understands Bergson's complaint against science and cinema, and Deleuze is very cagey here. He quotes Bergson stating that: 'Modern science must be defined pre-eminently by its aspiration to take time as an independent variable' (Bergson 1988a: 336, cited in Deleuze 1986: 4). Yet, we might ask, does Deleuze ignore what is more important for Bergson, namely the question of the attitude of science, including the theory of relativity, toward change and evolution? Moreover, Deleuze's argument might well rest on his assertion – an assertion that seems to have been anticipated by Bergson – that the theory of relativity alters Bergson's fundamental critique of cinematographic knowledge. For although Bergson most certainly accepted the special theory of relativity, did he not do so precisely with the hope of freeing it from the restraints imposed by classical physics, restraints that eliminate duration for the sake of impersonal time? (Durie 1999: v–vi)[4]

Herzog (2000) has argued that Bergson's and Deleuze's positions can be reconciled if we do not take film to be a model for perception or an image of reality but rather, if we study it as simply an image in its own right, with its own duration.[5] As agreeable as this solution may be, it leaves open some interesting if not urgent questions, as Herzog also points out. How, we might ask, are our philosophical concepts influenced and formed by, not so much by our technological developments, as by the dominant scientific structures and concepts arising from the so-called 'invention of modern science'? Isabelle Stengers and Ilya Prigogine have argued that there exists 'a strong interaction of the issues proper to culture as a whole and the internal conceptual problems of science in particular' (Prigogine and Stengers 2000: 19).[6] The reorientation from the modern classical to

the contemporary view is, for them, equally reflected in the conflict between the natural sciences and the social sciences and humanities, including philosophy. Like Bergson, Stengers and Prigogine state that if the development of science has been understood to shift away from concrete experience toward mechanical idealization, this is a consequence of the limitations of modern classical science, its inability to give a coherent account of the relationship between humans and nature. Many important results were repressed or set aside insofar as they failed to conform to the modern classical model. In order to free itself from traditional modes of comprehending nature, science isolated and purified its practices in the effort to achieve greater and greater autonomy, leading it to conceptualize its knowledge as universal and to isolate itself from any social context (Prigogine and Stengers 2000: 19–22).

If this is what occurred, it is not surprising that modern classical science was soon faced with a rival knowledge, one that refuted experimental and mathematical knowledge of nature. Immanuel Kant's transcendental philosophy clearly identified phenomenal reality with science, and science with Newtonian science. Thereby, any opposition to classical science was an opposition to science in its entirety. According to Kant, phenomena, as the objects of experience, are the product of the mind's synthetic activity. So, the scientist is, in effect, the source of the universal laws discovered in nature, but the philosopher, reveals the *limits* of scientific knowledge, insofar as it can never know things in themselves. Beyond those limits, *philosophy* engages with ethics and aesthetics, the noumenal realm which belongs to philosophy alone. What Kant refuses, for the scientist, is any notion of activity, of choice or selectivity with respect to the theoretical and experimental situation: 'Kant is after the *unique* language that science deciphers in nature, the unique set of a priori principles on which physics is based and that are thus to be identified with the categories of human understanding' (Prigogine and Stengers 2000: 88).

Unlike Kant, who at least proposed a détente with Newton, G. W. F. Hegel's philosophy systematically denied the principles of Newtonian science, insisting that simple mechanical behavior is qualitatively distinct from that of complex living beings who can become self-conscious. Although 'Hegel's system provides a consistent philosophic response to the crucial problems of time and complexity,' it ultimately failed insofar as no science could support it (Prigogine and Stengers 2000: 90).[7] A similar verdict is delivered, initially, with respect to Henri Bergson. Bergson, it is argued, wished to create a metaphysics based on intuition,

'a concentrated attention, an increasingly difficult attempt to penetrate deeper into the singularity of things,' and attributed to science in general limitations that were applicable only to the science of his time (Prigogine and Stengers 2000: 91).[8]

In 1922, Bergson attempted to introduce and defend (against Einstein) the possibility of simultaneous 'lived' times, but since, for Einstein, intelligibility remained tied to immutability, Bergson's thesis was widely understood to have failed (Prigogine and Stengers 2000: 293–4). And yet, if philosophy is to be something more than the mere handmaid of science. For Stengers and Prigogine, the status of philosophy in relation to science is tied to the respective discipline's understandings of time which can span the spiritual and physical aspects of nature, including human nature. If the mechanistic view and laws of motion put in place by Isaac Newton formulated a world that is closed, atomistic, predictable and time-reversible, Stengers and Prigogyne reformulate this world as open, complex, probabalistic and temporally irreversible:

> In the classical view, the basic processes of nature were considered to be deterministic and reversible .... Today we see everywhere, the role of irreversible processes, of fluctuations. (Prigogine and Stengers 2000, xxvii)

For this reason they give an account of the conceptual transformation of science from classical science to the present, particularly as it applies to the macroscopic scale, the scale of atoms, molecules and biomolecules with special attention to the problem of time, a problem that arose out of the realization that new dynamic states of matter may emerge from thermal chaos when a system interacts with its surroundings. These new structures were given the name *dissipative structures* to indicate that dissipation can in fact play a constructive role in the formation of new states (Prigogine and Stengers 2000: 12).[9] Stengers and Prigogine thus take us from the static view of classical dynamics to what they take to be an *evolutionary* view arising with non-equilibrium thermodynamics. They conclude that the reversibility of classical dynamics is a characteristic of closed dynamic systems only, and that science must accept a pluralistic world in which reversible and irreversible processes coexist (Prigogine and Stengers 2000: 279–90). In place of general, all embracing schemes that could be expressed in terms of eternal laws, there is time. In place of symmetry, there are symmetry-breaking processes on all levels. And yet, there remains a kind of unity: time irreversibility *becomes* the source of order on all levels.

Bergson himself expresses a similar idea in his introduction to *Creative Evolution*. He says that a theory of knowledge and a theory of life seem to be inseparable, but that life cannot simply accept the concepts understanding provides for it: 'This is an old problem. How can the intellect, created by the processes of evolution, be applied to and understand that evolutionary movement which created it? (Bergson 1988a: xiii) Certainly, humans are not pure intellect, for there lingers all around us, around our conceptual and logical thought, 'a vague nebulosity, made of their very substance out of which has been formed the luminous nucleus that we call the intellect,' and beyond this, other forms of consciousness, which, although not freed of external constraints as the human intellect is, nevertheless do express something 'immanent and essential in the evolutionary movement' (Bergson 1988a: xii).[10] Thus, insofar as the cinematographic mechanism of thought arises in the evolutionary context, it may be that in order truly to understand it, we need to examine this evolutionary context more fully. That is, why does Bergson's critique of cinematographic knowledge appear in the final chapter of *Creative Evolution*? What is the relation between his critique of this concept of rationality and modern classical science and the theory of relativity? Can a bridge be constructed, as Stengers and Prigogine suggest, between the spiritual and physical aspects of life, an evolutionary bridge based on time irreversibilty as the source of order on all levels?

II. Evolution

Nearly three-quarters of a century before Stengers and Prigogine, Bergson begins his account of cinematographic knowledge with the assertion that *duration is irreversible*. Not only, he claims, is something new added to our personality, but something absolutely new that not even a divine being could predict. This must be contrasted with geometrical deductive reasoning, for which, impersonal and universal premises force impersonal and universal conclusions. For conscious life, the reasons of different persons that take place at different moments are not universal, they cannot be understood 'from outside' and abstractly; for conscious beings, to exist is to change, meaning, to create oneself and to go on creating oneself (Bergson 1988a: 6–7).[11] This is consistent with Bergson's general idea of the evolutionary process. Life, he argues, does not develop linearly in accordance with a geometrical, formal model. For life, change is not merely the displacement of parts which themselves do not change except to split into smaller and smaller parts, molecules,

atoms, corpuscles, all of which may return to their original position and remain time reversible. In principle, any state of such a group may be repeated as often as desired; the group has no history, nothing is created, for what it will be is already there in what it is, and what it is includes all the points of the universe with which it is related (Bergson 1988a: 6–7).[12]

Without doubt, evolution had first to overcome the resistance of inert matter, which changes only under the influence of external forces, where such change is no more than the displacement of parts (Bergson 1988a: 8).[13] The difficulty would be not to fall into the path of Hegel, for whose notion of change no mathematical or scientific justification could be found. There is no question but that Bergson recognizes this difficulty, but in order to make the transition from inert matter to life, phenomena had first to participate in the *habits* of inert matter, meaning, the behavior of inert matter, insofar as it is influenced causally by external forces. This behavior can be said to follow the laws that external forces prescribe, and as thermodynamics had already revealed, those laws, produce probabilities not certainties, that is, their patterns can be called habits. From the point of view of contemporary evolutionary biology, life arose as a phenomenon of energy flow; it is inseparable from energy flow, the process of material exchange in a cosmos *bathing* in the energy of the stars. Stars provide the energy for life and the basic operation of life is to trap, store and *convert starlight into energy*. So, for example, carbon, so essential to living matter, was formed out of the lighter elements baked by the nuclear fission of exploding stars following the initial 'singularity,' the explosion from an immensely hot, infinitely dense point 13.5 billion years ago, and in photosynthesis, photons are incorporated, building up bodies and food (Bergson 1988a: 99).[14] Thermodynamics developed as the science that studies these energy flows from which life emerges, as living matter internalizes, with ever increasing variation, the cyclicity of its cosmic surroundings. For evolutionary biology, the science of non-equilibrium thermodynamics supports the idea that energy flows through structures and organizes them to be more complex than their surroundings, that organized and structured patterns appear out of seemingly random collisions of atoms (Margulis and Sagan 1997: 28).[15] There is, therefore, all the more reason to accept Bergson's conclusion that the simplest forms of life were initially both physical and chemical *and* alive, and that life is simply one tendency among others, albeit a tendency that diverges over and over, sometimes preserved by nature and sometimes disappearing.

In evolution, adaptation is mechanism insofar as species must adapt to the accidents of the road, but it appears that *these accidents do not cause evolution*, and that evolution remains creative and inventive in spite of adaptation. Likewise, evolution is not finalism, the realization of a plan, for this would make it representable prior to its realization, and in any case, rather that reaching a final harmonious stage, evolution often scatters life, producing incompatible and antagonistic species (Bergson 1988a: 102–03).[16] Moreover, it is difficult to clearly separate animal and vegetable worlds. At best, we can say that vegetables create organic matter out of minerals they draw from the elements: earth, air and water. Animals cannot do this, so they must consume the vegetables which have accomplished this feat for them. Thus, Bergson's claims seem to be compatible with those of evolutionary biologist, Lynn Margulis, who states that the first living beings must have sought to accumulate energy from the sun so as to expend it in a discontinuous and explosive manner in movement (Bergson 1988a: 115–16; Margulis and Sagan 1997: 23).[17] Evolution did not proceed merely by association, but always by dissociation or divergence; species participate in an original identity from which they diverge, even while retaining something of their origins, the original tendency out of which they evolved. Although, animal and vegetable worlds each retain some of the characteristics of the other, animals are characterized by movement (Bergson 1988a: 108–9).[18] What makes mobility so important is its link to consciousness: 'the humblest organism is conscious in proportion to its power to move *freely*' (Bergson 1988a: 111).[19] So perhaps it should not shock us that recent research involving ravens, creatures that freely move through at least three dimensions, reveals a startling capacity for consciousness and abstract thought (Heinrich and Bugnyar 2007).[20] If this is so, we might conclude that it is not impossible to define animals by their sensibility and consciousness, and vegetables by their insensibility and lack of consciousness, as long as one accepts that these tendencies derive from a common origin, the first living creatures oscillating between animal and vegetable, participating in both (Bergson 1988a: 112).

Bergson contrasts this view of evolution as tendencies to an understanding of evolution as causal mechanism, a theory he rejects (Bergson 1988a: 102).[21] A mechanistic evolutionary theory, 'means to show us the gradual building up of the machine under the influence of external circumstances [forces] intervening either directly by action on the tissues or indirectly by the selection of better adapted ones' (Bergson 1988a: 88).[22] Bergson also opposes finalism, the idea that evolution occurs according to the projection of a preconceived plan.

Mechanism and finalism are both constructed in the same manner as cinematographic knowledge; they proceed through *the association and addition* of elements.[23] As the cinematograph unrolls, different immobile photographs of the same scene follow one another so that the film apparatus operates just like the geometrical deduction. *Extracting* or deducting from each individual figure, it produces an impersonal abstract and simple movement in general, a homogeneous movement of externally related entities. The movement particular to each figure, the so-called *inner becoming of things* is never developed, and we are left with the artificial, abstract, uniform, movement connecting the singular, individual attitudes, in place of real, evolutionary change. We are left with association and addition rather than dissociation and even dissipation. Unfortunately, Bergson argues, 'the mechanism of our ordinary knowledge is of a cinematographical kind;' perception, intellection and language, the fundamental *human* relations with the material world, proceed in accordance with the rules of this 'cinematograph inside us' (Bergson 1988a: 306; Deleuze 1994: 141). Not surprisingly then, the cinematographic mechanism, which is a *mechanical* mechanism, operates with precisely the same structure. It operates through the association and addition of homogeneous units (frames) and always under the influence of external circumstances, the mechanism of the projector in this case. Likewise, it imitates certain aspects of human behavior, notably those that require association and addition, such as perception, intellection, language, and especially, action. Our acts reflect the insertion of our will into reality whereby we perceive and know only that upon which we can act.

Given this state of affairs, what is missing from cinematographic movement, from change as described by cinema, and therefore also from the cinematographic *image*, is precisely *the movement particular to each figure, the inner becoming of things*, the evolutionary movement of dissociation and dissipation. But what is the inner becoming of things? 'Things,' are matter and matter has a tendency: it tends to constitute isolable systems that can be treated geometrically. This tendency appears to preclude any notion of inner becoming even though it is only a tendency and not an absolute. Yet recall the glass of water into which Bergson pours sugar: 'I must wait, willy nilly, wait until the sugar melts' (Bergson 1988a: 9).[24] Why not, Deleuze suggests impatiently, why not simply stir it with a spoon, why wait around for the sugar to melt on its own? One waits, according to Bergson, because even material objects may be observed to unfold as if they had a duration like our own. Such waiting does not take place in mathematical time, the time of

the succession of homogeneous instants whereby the past, present and future of material objects and isolated systems can be simultaneously spread out in space. One waits, because the isolation of matter is never complete and only waiting reveals that the system belongs to another, more extensive system: the sugar, the water, the glass, the temperature and humidity of the air, the table, the room, and on and on into the solar system transmitting, in this way, a duration immanent to the whole universe including the duration of the observer (Bergson 1988a: 10–11).[25] With respect to cinema, this raises the following question: Is the cinema itself only a tool of mechanism and/or finalism? Is it an isolated system, a geometrical abstraction, so that it is not, for this reason, a genuine creative practice, but a manifestation of perception, intellect, language and action in the context of the homogeneous and mechanical material world?

Deleuze attempts to answer these questions with reference to Bergson's conception of duration. He calls the answer to these questions, 'Bergson's third thesis,' which when reduced 'to a bare formula would be this: not only is the instant an immobile section of movement, but movement is a mobile section of duration, that is, of the Whole' (Deleuze 1986: 8). Matter moves but does not change, but duration is change; and this is, we are told, the very definition of duration. Moreover, movement expresses this change in duration or in the whole. Movement is a change of quality; the fox moves in the forest, the rabbits scatter, the whole has changed. When water is poured into sugar or sugar into water, the result is a qualitative change of the whole. Deleuze admits that 'what Bergson wants to say . . . is that my waiting, *whatever it be,* expresses a duration as a mental, spiritual reality' (Deleuze 1986: 9). Whatever it be, it is not the whole since the whole is open, the universe is open to evolution, which is to say, to duration. But again, contrary to Bergson, Deleuze goes on to define the whole as 'Relation,' which is not a property of objects but is 'external to its terms' (Deleuze 1986: 10).[26] Bergson concurs that there exists a duration immanent to the whole of the universe and that the universe itself endures, but what this means is not movement of a mobile section; what it means is 'invention, the creation of new forms, the continual elaboration of the absolutely new,' whereas the systems marked off by science can be said to endure only because they are bound up with the rest of the universe (Bergson 1988a: 11). Nevertheless, the time of waiting for the sugar to melt coincides with the impatience of the one who waits; it coincides with the duration of the one who waits: 'It is no longer something *thought*, it is something *lived*. *It is no longer a relation*, it is an absolute' (Bergson 1988a: 10). Deleuze seems to try to

resolve this incommensurability by arguing that the whole creates itself in another dimension without parts and that this is a spiritual or mental duration. And yes, this is entirely possible. But what is this duration? It cannot be blocs of space-time which would be divided into sets or closed systems, nor can it be the movement of translation between these systems (Deleuze 1986: 10–11). Nowhere in the movement-image can we find this other dimension. Why is this the case?

III. Time in Modern Classical Science

By comparison with evolution, the making of a cinematographic image is much simpler. It begins with instantaneous views, fixed attitudes, immobilities. The apparatus strings them together along the trajectory defined by the continuous and homogeneous space of modern classical science: 'The process then consists in extracting from all the movements peculiar to all the figures, an impersonal movement, abstract and simple, *movement in general*,' movement comparable to that of geometrical deduction, successive positions attributed to a moving object (Bergson 1988a: 305; 316). This corresponds, according to Bergson, to our perception, intellection, language and action. For life, or becoming, as Bergson sometimes refers to it, there are different evolutionary and extensive movements, but perception, intellection, language and action extract from these completely different sorts of movements 'a single representation of becoming *in general*' (Bergson 1988a: 304).[27] It is a single representation of becoming in general that is both easier to manage and, in terms of classical modern science, much more effective and useful than the so-called inner life of things, the evolutionary tendency whose structure is not a simple deduction from geometrical axioms. However, Bergson does not refer to cinematographic knowledge as the reproduction of a constant, universal illusion. Clearly, Greek philosophy distinguishes between contemplative and practical space – but modern science does not (Arendt 1998: 27–30).[28] What Greek and modern science share is the temptation to define the physical by the logical, to substitute signs for objects. Ancient science thinks it knows objects when it notes privileged moments, whereas modern science takes the object as any moment whatever. To study a falling body, Galileo considered it at any moment of time whatever, indefinitely breaking up time as he pleased since it had no natural articulations of its own (Bergson 1988a: 331–2). Modern science attained a precision the Greeks never imagined, not by isolating the galloping horse on the Parthenon at its essential and characteristic moment, but by isolating it

at any moment whatever, since no moment stands out and each is the same as any other (Bergson 1988a: 333).[29]

Modern science, it seems, aims at something different from Greek science. The instantaneous changes of modern science described by calculus are purely quantitative variations; modern science works with a view to measure. Its laws represent constant relations between variable magnitudes, constant relations between the quantitative variations of two or several elements (Bergson 1988a: 333).[30] But there are other factors as well. The Greeks already considered variable magnitudes in, for example, Archimedes' principle, but their cosmos was essentially static.[31] The modern scientific view concerned itself with laws that connect the space traversed by a falling body with the *time* occupied by the fall: 'The essence of Cartesian geometry . . . consists, therefore, in seeing the actual position of the moving points in the tracing of the curve at *any moment whatever*' (Bergson 1998: 335, emphasis added). This is done in order to know the positions of the planets at any given moment and to be able to calculate their positions at any other moment. Applied to each and every material point in the universe, it is a question of being able to determine the positions of these elements at any moment whatever if their original positions are given. This is a mathematical task beyond actual human capabilities, but not beyond that of an ideal, superhuman intellect (Bergson 1988a: 335–6). What matters for our purposes here is that 'this conviction [that we may determine the positions of the elements at any moment of time] is at the bottom of *the questions we put to ourselves on the subject of nature* and of the methods we employ to solve them' (Bergson 1988a: 336). The point is that modern science is distinguished by its 'aspiration to take time as an independent variable,' an any moment whatever (Bergson 1988a: 336). The problem for Bergson is that modern science, which is the science of matter, follows from the tendencies of the intellect and not those of instinct. It follows the tendencies of our ordinary knowledge and those tendencies are demonstrated in the cinematographical mechanism: 'It distinguishes as great a number of moments as we wish in the interval of time it considers. However small the intervals may be at which it stops, it authorizes us to divide them again if necessary . . . it is occupied indifferently with any moment whatever' (Bergson 1988a: 336).[32] What is a moment? It is a virtual stopping place, an immobility, such that real time, becoming, cannot be known by science for which time is simply a mobile "*T*" on a trajectory. What we retain of each mobile "*T*" is simply its positions on a trajectory, meaning that it is a point corresponding to other points. So that, 'when we say that a movement . . . has occupied a

time *t*, we mean by it that we have noted a number *t*, of correspondences of this kind. We have therefore counted simultaneities' (Bergson 1988a: 337–8).[33] What makes it *any* moment? In this trajectory, each *t* is exactly the same as every other *t*, no qualities differentiate one from another; they are differentiated only by location. In principle, the entire history, past, present and future of the universe can be laid out simultaneously using this technique. The 'illusion,' Bergson is careful to say, 'consists in supposing that we can think the unstable by means of the stable, the moving by means of the unmoving,' and it is *this* that constitutes the illusion at work in the production of film (Bergson 1988a: 273). Even so, 'the cinematographical method is the only practical method'. By this means, knowledge conforms to action: 'The mechanism of the faculty of knowing has been constructed on this plan' (Bergson 1988a: 306–7). Knowledge is pragmatic; it follows an interest. To use the intellect to think does not yield illusion, rather it simply yields pragmatic knowledge. *The illusion would be to imagine that an understanding of duration can be produced by static means.*

Does anything change when the theory of relativity enters the picture? Deleuze argues that the plane of immanence is a *section*, an *any moment whatever*, but it is a mobile section, a mobile any moment whatever: 'It is a bloc of space-time since the time of the movement which is at work within it is part of it every time' (Deleuze 1986: 59).[34] The Special Theory of Relativity introduces the idea that there is no way to distinguish between two frames of reference in uniform motion, thus that we must give up the idea that space and time are separate aspects of Nature and to replace them with the notion of *space-time* (Wheeler 1990: 8). In *Duration and Simultaneity,* Bergson asks: how do we pass from inner time to the time of things?

> Nothing prevents us from imagining… human consciousnesses… brought close enough to one another for any two consecutive consciousnesses, taken at random, to overlap the fringes of their fields of outer experience. Each of these two outer experiences participates in the duration of each of the two consciousnesses. (Bergson 1999: 32)

As a result, the two experiences will have some part in common; they unfold, so to speak, in a single duration, at least in part. In this manner, a single duration might be said to gather up all the events in the physical world to the point where, all durations intersecting with all durations, we may abandon the notion of a personal consciousness if it suits our purposes. This is how both Deleuze and the Special Theory of Relativity imagine simultaneity, a time common to all things. The

relativity theorist, the mathematician, who is concerned with measuring the world, still pictures succession, before and after, a snapshot view of reality, homogenous units which are now units of space-time.

But this version of time does not satisfy Bergson. For Bergson, there is no duration without consciousness and no before and after without memory. Bergson states: 'We may perhaps feel adverse to the use of the word "consciousness"; it is anthropomorphic' (Bergson 1999: 33). But without this personal element all we have is one moment next to another and there will be *nothing to connect them*. Duration is and only can be the continuation of what no longer exists into what does. This and only this is, according to Bergson, real time. It is not a bloc of space-time at all. Duration implies consciousness.[35] For this reason, Bergson maintained that conscious beings do not only follow the physicist in counting the number of units in a process and their relative positions and changes in position. There is more than one way for a consciousness to be conscious. *Conscious beings may also feel and live in these units or intervals*. The duration of melting sugar is, for the physicist, relative, reduced to indifferent, homogeneous units of time. But for a watching and waiting consciousness, it is absolute, they are in it. It is happening now and that consciousness is w-a-i-t-i-n-g. Nothing is given all at once. Infinitely dividing the time would alter it substantially, as would taking a spoon to the glass and stirring. A felt or lived interval emerges with its content. This future cannot be predicted from the present, no matter how much information is currently available.

Cinema, like modern science and the science of the relativity theorist, considers events in a time unrolled in space, retaining only what can be isolated without suffering too much deformation. Watching a film, one can easily ask where a particular moving body will be, what shape the film will take, what state its changes will pass through at a given moment, as each and every moment of the film exists simultaneously with every other (Bergson 1988a: 340–3). The solution, according to Deleuze, is to find a new model for cinema, 'a state of things which would constantly change, a flowing matter in which no point of anchorage nor centre of reference would be assignable' (Deleuze 1986: 57). But Deleuze, like the relativity theorist, continues to utilize the language of classical modern science in developing this model, precisely the geometrical language that Bergson refrains from applying to the idea of duration. At any 'point,' Deleuze says, centres could form and impose *fixed, instantaneous* views yielding *by deduction* consciousness, natural perception or cinematographic perception *from* this point. Or, on the contrary, one could imagine points with no centre or horizon, sections,

instantaneous views, that would *reverse* themselves in the direction of a-centred states, abandoning natural perception, consciousness and cinematographic perception. So, we have a unique situation: either deduce natural perception from fixed points designated as centres in mathematical space, or find a way to dissassemble those centres, to *reverse their trajectories* and to find the 'matrix,' the *mother* movement-image as it is *in-itself*. As such, we do not depart the model of modern science, we accept its order. We do not even follow Kant in declaring the limits of this science and declare ourselves to be in the realm of the in-itself where no science dares to go. Rather, now, the in-itself is matter. The image, the movement, and matter are all identical, thus there is nothing that the mathematical theorist cannot analyze. The problem, for Deleuze, is to undo Bergson's antidote to the power of modern science, including the theory of relativity, and to rid ourselves of ourselves, to demolish ourselves, not only our perception and action, but especially, our affective states. The image is the mechanism through which this is to be accomplished.

IV. In the Realm of the Image

Knowing nothing of illusion and reality, we exist in the presence of images, auditory images, sensible images, olfactory and gustatory images, as well as images for which there may be no name. Some of these come from outside and are clearly perceptions but some come from inside and *these* are affections, a special kind of sensitivity. Matter is the aggregate of these images and as material, each of these images receives movement from others and transmits movement back to them. By and large, this occurs in accordance with the laws of nature as articulated by classical dynamics, but with respect to our bodies and its affective sensibilities, something else occurs. Some of this matter is organized into a nervous system. External objects disturb afferent nerves which pass this disturbance on to centres of molecular movements. Alterations in external objects or images will alter these molecular movements and alter their effects. In other words, they produce perception and perceptions vary with the molecular movements of the centre, the cerebral mass, an instrument of analysis with respect to movement received, and an instrument of selection with respect to movement executed (Bergson 1988b: 17–30). In a simple organism, like an amoeba, every part of the protoplasmic mass receives stimulation and every part reacts against it. Perception, matter and movement are indeed one. In a more complex organism, functions are differentiated: sensory nerve fibres transmit

stimulation to a central region which passes it on to motor elements. Unlike the organism which is able to move, to escape danger, 'the sensitive element retains the *relative immobility* to which the division of labour condemns it' (Bergson 1988b: 55).

Unlike the amoeba, for complex beings, there is something in between the perceptions coming from outside and the actions to be undertaken in response to these perceptions. Sensory nerve fibres which are relatively immobile act as a 'zone of indetermination,' an interval, that is the very possibility of free mobility (Bergson 1988b: 30–1).[36] In this interval, the sensory nerve fibres, called affections, might contain an invitation to act, but they might also offer permission to wait, even to *do nothing at all*. Recent research supports Bergson's argument. It has been suggested by contemporary physiologists that perception can and must be distinguished from sensation, and that sensation is not limited to the five senses. Some sensation is aroused inside the body, so any 'afferent' pathway may be considered a potential site of sensation. Thus, affection or *sensitivity* may be defined as the capacity of an afferent neuron to detect physical or chemical change occurring at its endings and to transmit this information to our nervous centres. *Sensation*, may then be defined as the emergence of such sensitivity into consciousness. The transformation of sensitivity and sensation into perception occurs when there are multiple simultaneous sensory inputs as well as cognitive input from memory (Cabnac 1992: 4–5). In addition, it has been argued that the affective dimension of sensation is strongly correlated with pleasure. That is, 'as soon as a stimulus is discriminated, the affective dimension of the sensation aroused tells the subject, animal or human alike, that the stimulus should be sought, avoided, ignored' (Cabnac 1992: 8).[37] But sensation is pleasurable or paInful only in relation to the internal state of the subject such that warmth is a pleasure if one is cold, but not if one is already hot. Affection gives us the possibility of choice, not predictability. Affections are situated *between* excitations from without and movements about to be undertaken, between perception and action, and consciousness of affection is *feeling* or *sensation* (Bergson 1988b: 17). Thus, it is a different kind of consciousness, not that of perception, intellect or language, but one arising from the body's influence on itself.

Moreover and perhaps shockingly, it seems that nothing new can happen in the aggregate of images called the universe, *except* through the medium of affection, that is, feeling or sensation which takes place through the medium of the body (Bergson 1998b: 18).[38] What is Bergson's view of this in *Matter and Memory*? Pain is the effort of the

damaged element to flee, a motor tendency in a secondary nerve. The pain intervenes precisely at the moment when the organism repels the stimulation. With respect to perception, it is not a difference of degree but a difference of nature or kind. Perception reflects what interests us in the world and measures our possible action on things and their action on us. Affection, however, absorbs; and affective states are experienced where they occur, at a given point of the body. Affect is what we subtract from perception to get the pure idea of perception. In other words, there is no perception-image *per se*, no pure image of perception; rather every image of external bodies, every perception-image, is mixed with affection, or the real action of the body on itself. There is an awareness of affections in the form of feeling or sensation. What matters here is that the act 'in which the affective state issues is not one of those that might be rigorously deduced from antecedent phenomena, as a movement from a movement' (Bergson 1988b: 18). Hence something truly new is added to the universe. This implies that creative evolution, the evolution of the new, requires at least a zone of indetermination, a zone made available only through affection. As Bergson points out, any 'unconscious material point' has an infinitely greater and more complete perception than human beings because it gathers and transmits the influences from and to *all* the points of the material universe, whereas human perceptual consciousness reflects back to surfaces the light emanating from them only insofar as it is interesting. What is interesting is only what is chosen by centres of spontaneous activity, that is, by beings whose zone of indetermination differentiates them from amoeba and gives them a choice (Bergson 1988b: 37).[39] But any living matter, even a simple mass of protoplasm (such as the colourless material comprising the living part of a cell, including the cytoplasm, nucleus, and other organelles) is 'already irritable and contractile,' and because of this, it may still evolve from simply mechanical, physical and chemical reactions to something else, moving from pure automatism to voluntary acts (Bergson 1988b: 28).[40] In other words, what has to be explained is not how unconscious material points can be said to perceive, but rather, how perception evolves from affective images of potentially the entire material universe, to those that are interesting to the perceiving entity: that is, from the whole to the part and not the reverse. Science may localize vibrations of a particular amplitude and duration at a particular point *P* that sends vibrations of light to the retina (Bergson 1988b: 41–42).[41] This still begs the question of why this image was chosen to form part of one's perception, chosen from the many, many images whose light simply passes through. *The image of one's own body is*

at first simply one among many in the material world. Gradually, it distinguishes its own image as a centre of action from out of that multiplicity but only by distinguishing it as a zone of indetermination, an affective zone; otherwise it is simply responding to the material forces of the universe that impinge upon it (Bergson 1988b: 48–9; 53).

Indeed, Bergson argues that the living body is a kind of centre, but it is not, a mathematical point. The body is exposed to the action of external causes that threaten to disintegrate it. Some of these causes are reflected, producing perception, the measure of our possible action on things and their action on us, as such. Perception expresses *virtual action*, for there is always a distance between one body and another. When that distance decreases to zero, the body absorbs the action of external causes. This is affection, for it is then our own body that is sensed and the action upon ourselves is real action. The totality of perceived images subsists even if our own body is no longer present; but to annihilate the body is to destroy sensation which is simply a modification of the image called body (Bergson 1988b: 56; 57; 65). From this Deleuze concludes that movement-image and matter are identical: 'you may say that my body is matter or that it is an image' (Deleuze 1986: 59). Yet, in contrast to Bergson, Deleuze situates this on a mathematical plane of immanence: 'Let us call the *set* of what appears, "Image"' (Deleuze 1986: 58). Alain Badiou defines sets for us on the basis of formalized mathematical language: 'Given a property, expressed by a formula $\lambda(a)$ with a free variable, I term "set" all those terms (or constants, or proper names) which possess the property in question, which is to say those terms for which if l is a term, $\lambda(l)$ is true (demonstrable).' Thus for a set, 'The same, itself is both thinking and being' (Badiou 2005, 39, 38). Since sets are determined by their elements, set theory may be called a theory of multiples:

> Sets are fundamental objects that can be used to define all other concepts in mathematics, they are not defined in terms of more fundamental concepts. Rather, sets are introduced either informally, and are understood as something self-evident, or, as is now standard in modern mathematics, axiomatically, and their properties are postulated by the appropriate formal axioms.[42]

In and of itself, the determination that images are sets means only that images are not fundamental, that they can be understood in other terms, and those terms are set theoretics. What might make a difference are the kinds of relations Deleuze envisions as existing between sets.

For Bergson as for classical science, matter occupies a plane of immanence defined by natural laws that can be used to predict the

future position of any material point given its current position. But he maintains that there is something that is not part of that plane of immanence; that something is called affection, the sensation of one's own body from inside. For Deleuze, affection does belong to the plane of immanence; it is an immobile section between two mobilities on that plane. He argues that the *infinite set* of *all* images constitutes a plane of immanence. Out of this plane of immanence, whose parts, which follow certain rules that may be called natural laws, are *exterior* to one another. Out of this, may be cut the closed, mechanical world with its immobile sections that Bergson attributes to cinematographic knowledge.[43] But the plane of immanence, as a whole consists of the movements between all the parts of each system (set) and between one system (set) and another. It is still a section, still consisting of parts related to one another externally, still governed by rules derived from logic or geometry but it is now slightly redefined. This whole is not simply the immobile and instantaneous section characterized by homogeneous movements in space; it is rather, Deleuze claims, not just a bloc of space, but a block of space-time. The same immobile blocs of space have been mobilized by the addition of time so that the plane of immanence corresponds to the *succession* of movements in the universe (Deleuze 1986: 59). As Deleuze comments in his notes, 'this notion of the plane of immanence and the characteristics which we give it, seem to be a long way from Bergson' (Deleuze 1986: 226). But Deleuze is trying to make the plane of matter into an instantaneous section of becoming (not just an instantaneous section), where becoming is still understood as instantaneous succession. This, Deleuze asserts, is a view of cinema totally different from that which Bergson describes. Is it? Has the addition of time to the instantaneous section resulted in something totally different from the view of cinema that Bergson criticizes?

On the plane of immanence, each image is said to exist *in-itself*. The image *is* the in-itself, the noumenal realm Kant set aside for philosophy. But can we speak of the in-itself which is not *for* anyone and not addressed *to* anyone? Indeed, we can. We can do it, as Bergson himself predicted in *Duration and Simultaneity*, by getting rid of all the 'anyone's,' meaning *all living things*: eliminating the bodily affections and leaving only the images, the in-themselves. Is it not the case that for the image in-itself, bodies, their affections and actions are nothing but projections of movement in general? Thus, in place of bodies, their affections and actions, we may put into play perception-images, affection-images and action-images on the plane of immanence inhabited by blocs of space-time.[44] This is made possible through the realization in

the theory of relativity that matter and light are not really two different things. 'The theory of relativity . . . consists of . . . saying, "It is the light-figure that imposes its conditions on the rigid [geometrical] figure." In other words, the rigid-figure is not reality itself but only a mental construct; and for this construct it is the light-figure, the sole datum, which must supply the rules' (Bergson 1999: 88). Relativity theory substitutes light-lines (an elastic line that stretches as the speed attributed to the system increases) for time, essentially making a clock out of the propagation of light. Blocs of space-time are figures of light. As physics identifies things with measurement, the light-line is both the means of measuring time and time itself; light propagation is now the ultimate clock. So, Deleuze concludes, the movement-image is neither bodies nor rigid lines, it is only figures of light, blocs of space-time (Deleuze 1986: 66).[45] It remains the case, however, that 'the theory of relativity is a physical theory; it tends to ignore all psychological duration . . . and to retain of time nothing more than the light-line' (Bergson 1999: 93). The light-line lengthens or contracts with the speed of the system yielding precisely a multiplicity, a multiplicity of contemporaneous times, but meanwhile, '*real duration continues to haunt us*' (Bergson 1999: 93).

Where does this leave us? Does duration continue to haunt us? In the physical world of the plane of immanence defined by Deleuze, there exist blocs of luminous space-time, points with no centre or horizon, sections, instantaneous views, that reverse themselves in the direction of a-centred states, by abandoning natural perception, consciousness and cinematographic perception. To differentiate the universe that evolves from the universe that merely changes place, Bergson theorises the existence of luminous images, movements between images, and intervals which define zones of indetermination and choice. The set theoretical plane of immanence proposed by Deleuze still operates in accordance with the structures defined by modern science. Sets must be axiomatized; rules govern their behaviour; entities are externally related according to these rules. Blocs of space-time are the plane of immanence within which the light that is matter is organised then torn apart, reversing trajectories as classical science allows. From this physical point of view, perception is prejudiced, partial and subjective, a delimitation of the 'total, objective perception which is indistinguishable from the thing' (Deleuze 1986: 64). But perception also allows the perceiver to grasp both the virtual action of things on the perceiver and the virtual action of the perceiver on things, and one passes imperceptibly from perception to action. However, in order not to be reduced to an atom or a simple protoplasmic mass, something else is needed, something that Deleuze

describes as an *immobilised* receptive plate, effectively reducing affection to nothing, nothing more than an expression of receptivity (Deleuze 1986: 65–6). There is no implication here that sensitivity ever emerges into consciousness, that it is anything more than a physical or chemical receptor, not even a process or part of a process. Thus, it is a simple matter to subject perception, action and affection to reversal, to tear them apart. If affection is nothing but a site of immobility, the *immobilised receptive faculty*, an 'immobilized receptive plate' (Deleuze 1986: 66). Have we, in this way (via centres of indetermination), condemned our receptive facet to immobility, to what absorbs movement and expresses it but creates nothing? Is it the case that, incapable of real action, affection exhibits only tendencies, efforts that stir up the immobile element so that it may express the movement it receives as a quality in an otherwise immobile face. Expressed as a pure image, affect is a sign, a quality or 'qualisign;' it is 'affect expressed in "any-space-whatever"' (Rodowick 1997: 63).[46] If this is the case, then perhaps reversing and extinguishing the perception-image, the affection-image, and the action-image, ridding ourselves not only of ourselves but ridding ourselves of all living things, does lead, inexorably, to a stoical and formidable modernist heroism: 'This is what the end suggests – death, immobility, blackness. But... immobility, death, loss of personal movement and of vertical stature... are only a subjective finality' (Deleuze 1986: 58).[47] What matters is the return to the 'mother movement-image': 'An important tendency of the so-called experimental cinema consists in recreating this acentred plane of pure movement-images in order to establish itself there' (Deleuze 1986: 68). What matters is to keep moving, to witness the tearing apart, the *extinction,* not only of the affection-image, but of the perception and action images as well, the obliteration of action, perception and affection insofar as they organise not only subjects but life itself. Reverse them, extinguish them in order to make way for 'universal becoming,' the destruction of every living personal self, every point of view. What, after all, is a tendency?

> A perfect definition applies only to a *completed reality*; now, vital properties are never entirely realized, though always on the way to becoming so; they are not so much *states as tendencies*. And a tendency achieves all that it aims at only if it is not thwarted by another tendency. (Bergson 1988a: 13)

May we not posit that the return is exactly what Bergson cautions against in his critique of cinematographic knowledge and in *Duration and Simultaneity*? The immobilisation of affection, which is the immobilisation of pleasure and pain, and the immobilisation of

evolution which is the immobilisation of life, for which is substituted external relations, blocs of becoming and ultimately, extinction?

Notes

1. An earlier and shorter version of this essay will appear in Felicity Colman (ed.) *Philosophers on Film*. This essay examines only what has been called, the movement-image. The time-image will be the subject of a forthcoming essay.
2. Certainly these are part of Deleuze's general interest as well. In departing from the Greek notions of Form and Substance, and by embracing the concept of the

differentiable instant on a plane of immanence, developed by calculus, as well as the notion of time as an independent variable, Deleuze is simply formulating a metaphysics compatible with modern science.

3. Durie cites the physicist Andre Metz (Bergson 1999, 160–83).
4. Durie argues that for Bergson, 'the acknowledged superiority of Einstein's special theory of relativity is that it demonstrates the fallacy of Newton's hypothesis of an absolute time' (Durie 1999: vi).
5. This is Bergson's title for chapter four of *Creative Evolution*. He does not use the term cinematographic illusion.
6. The French title of this book, an earlier and slightly less developed version, reflects the 'new alliance' between science and culture
7. The theories Hegel relied on were soon shown to fail. However, Hegel's reliance on logic rather than mathematics was to have long-term ramifications, opening the way eventually to logical positivism.
8. Science and intuition are, for Bergson, two divergent directions of the activity of thought. Science exploits the world and dominates matter. Intuition is engage with nature as change and the new (Prigogine and Stengers 2000: 91–2). Bergson's frequent engagement with relativity theory seems to put into question the conclusion that he 'sums up the achievement of *classical* science' (Prigogine and Stengers 2000: 93). Possibly he does more than this.
9. Equilibrium thermodynamics studies the transformation of energy and the laws of thermodynamics recognize that although 'energy is conserved,' when energy is defined as the 'capacity to do work,' nevertheless, nature is fundamentally asymmetrical. That is, although the total quantity of energy remains the same, its distribution changes in a manner that is irreversible. So, for example, although human beings long ago figured out how to convert stored energy and work into heat, the problem has been to convert heat and stored energy into work. Otherwise expressed, how are we able to extract ordered motion from disordered motion? (Atkins 1984: 8–13).
10. Bergson notes that if these other forms of consciousness were joined with human intellect, this might yield a complete vision of life.
11. This is due to the structure of duration.
12. This corresponds to the static view of classical dynamics set forth by Stengers and Prigogine.
13. It seems to me that Bergson is proposing a new image for science but as he was a philosopher and not a physicist, he was and remains widely misunderstood.
14. Photons are a quantum of electromagnetic radiation (Margulis and Sagan 1997: 8; 24).
15. Margulis is a well-known evolutionary biologist, Sagan is a science writer. Life is only one example of thermodynamic systems, but as the authors admit, it is among the most interesting.
16. Evolution sometimes involves devolution, turning back (Bergson 1988: 104).
17. Bergson cites the chlorophyl-bearing Infusorian.
18. Bergson provides examples of plants that climb and eat bugs and animals, like parasites, that do not move.
19. Motor activity maintains consciousness but consciousness directs locomotion.
20. Ravens use logic to solve problems and manifest abilities surpassing those of the great apes.
21. Margulis and Sagan seem to evade mechanism as well as finalism altogether.
22. This corresponds to what Deleuze calls 'force' (Deleuze 1994, 141).
23. For this reason, *Creative Evolution* is a thorough critique of empiricism and empirical principles as well as of Kantianism and Kantian principles.

24. 'Common sense, which is occupied with detached objects, and also science, which considers isolated systems, are concerned only with the *ends of the intervals* and not with the intervals themselves' (Bergson 1988, 9, emphasis added).
25. When science does isolate matter completely, Bergson admits, it is only in order to study it.
26. The difference of viewpoints on this is quite remarkable.
27. For a fuller account of the relation between classical movement and Bergson's duration, see Olkowski 2007: 202–22.
28. The Greeks made a clear distinction between the necessity of the household sphere and the freedom of the polis. But beyond this, in Aristotle for example, *nous*, or the capacity for contemplation, is humanity's highest faculty and cannot even be expressed in speech. In introducing Zeno's paradoxes, Bergson says, that these arguments were formulated with a very different intention from his own (Bergson 1988: 308).
29. The Greeks were content with qualitative descriptions since such accounts see nothing but forms replacing forms.
30. This contrasts with the Greek satisfaction with merely producing concepts.
31. http://hyperphysics.phy-astr.gsu.edu/hbase/pbuoy.html 'A buoyant force on a submerged object is equal to the weight of the fluid displaced.'
32. At the time, however, natural perception seemed to demand no more or less than the 24 frames per second in the case of cinema, although there is not reason why there cannot be more. Numerous artists have experimented with this.
33. Thus, it appears that rather than indicating a duration, time marks a position on an axis.
34. A machine assemblage would, it seems, operate in accordance with certain rules. Those rules seem to be the rules of connection, disjunction and conjunction. See Chapter 2 of Olkowski 2007.
35. It is this possibility of different forms of consciousness, affective and sensible forms that I address in chapter one of Olkowski 2007.
36. Thus arises the 'law' that 'perception is the master of space in the exact measure in which action is the master of time' (Bergson 1988b, 31).
37. Pleasure and displeasure are thus linked to the well being of the organism. Pleasure, in fact, is well-being.
38. This is the case for one's own body and that of other beings.
39. In order to eliminate this view of choice, one must eliminate the zone of indetermination and reduce affection to immobility. This is the goal of Deleuze's Cinema books.
40. Evolution requires a zone of indetermination.
41. Bergson does not deny the scientific explanation; it is simply not what he is after.

Towards Another '–Image': Deleuze, Narrative Time and Popular Indian Cinema

David Martin-Jones University of St. Andrews

Abstract

Popular Indian cinema provides a test case for examining the limitations of Gilles Deleuze's categories of movement-image and time-image. Due to the context-specific aesthetic and cultural traditions that inform popular Indian cinema, although it appears at times to be both movement- and time-image, it actually creates a different type of image. Analysis of *Toofani Tarzan* (1936) and *Dilwale Dulhania Le Jayenge* (1995) demonstrates how, alternating between a movement of world typical of the time-image, and a sensory-motor movement of character typical of the movement-image, popular Indian cinema explores the potential fluxing of identities that emerge during moments of historical complexity.

Keywords: Deleuze; Movement-image; Time-image; Bollywood; Popular Indian Cinema; *Toofani Tarzan*; *Dilwale Dulhania Le Jayenge*.

Although it is theoretically possible to identify aspects of both movement- and time-image in popular Indian cinema, because of its culturally specific origins, popular Indian cinema actually creates a different type of image to those categorised by Deleuze. The narrative of popular Indian cinema is marked by the fluid interaction of two movements: a movement of world typical of the time-image and a movement of character (a sensory-motor movement) typical of the movement-image. These movements alternately mesh and separate, taking it in turns to dominate and drive the narrative, which proceeds circuitously through a series of spectacles or interruptions. The fluid interaction of these two movements enables popular Indian cinema to explore the flux of identities that emerge during moments of historical complexity.

This is not the first piece to approach popular Indian cinema from a Deleuzian perspective. Rajinder Dudrah and Amit Rai (2005) and Amit S. Rai (2006) have used Deleuze's ideas to interrogate popular Indian cinema. In both instances they followed the trajectory of scholars like Steven Shaviro (1993), Barbara Kennedy (2000), Patricia Pisters (2003) and Anna Powell (2005), whose Deleuzian inspired works have variously addressed the issue of audience interaction with the cinematic image. In contrast to this work, however, I take popular Indian cinema to be a 'limit case' so as to facilitate a constructive, historicised engagement with Deleuze's categories of movement- and time-image. Neither movement-image nor time-image, the popular Indian film exposes the Eurocentric reterritorialising that Deleuze's image categories impose on cinema, a reterritorialising intent that colludes with his problematic side-stepping of numerous popular genre cinemas. Examining this particular popular cinema throws into question both Deleuze's understanding of what 'cinema' actually is (suggesting that it is a far more fluid entity than his image categories suggest), and indeed, the conclusions he draws from his analysis of predominantly European and North American cinemas.

I. Deleuze's 'History' of Cinema

The movement-image creates an indirect image of time. It renders visible the virtual whole of time (Henri Bergson's concept of duration), but only in a spatialised form. This process is most apparent in the action-image, in which the sensory-motor continuity of the protagonist creates the impression of spatial and temporal continuity across the otherwise discontinuous spaces juxtaposed by the editing. By contrast, the time-image provides a direct image of the virtual movement of time. Accordingly in the time-image, the montage of discontinuous spaces appears to move around a protagonist whose sensory-motor continuity is insufficient to master this 'movement of world' (Deleuze 1989: 59).

Deleuze's categories of movement-image and time-image exist in a number of different forms. For scholars in Anglo-American film studies they often appear rather dated in their division between what are, broadly speaking, European art cinema (time-images) and classical Hollywood cinema (action-images, the dominant form of the movement-image). Admittedly there are numerous other types of films discussed in *Cinema 1* and *Cinema 2*. *Cinema 1* contains analysis of pre war European cinematic movements such as German Expressionism, French Impressionism and the Soviet Montage School, particularly the works

of *auteurs* like Fritz Lang, Abel Gance and Sergei Eisenstein. *Cinema 2* eventually departs from its European focus to include discussion of international *auteurs* such as Yasujiro Ozu, Glauber Rocha, Youssef Chahine and Yilmaz Gűney. Even so, a film studies scholar encountering Deleuze's work for the first time might be forgiven for considering it a product of a bygone age when *auteurs* were unquestioningly venerated; its potentially universalising approach to cinema being similar to that of film theory before the turn to national cinemas problematised the Hollywood/Europe binary, and the study of popular genres and Asian cinemas gained legitimate standing in the field. Yet this very broad view of Deleuze's work, although in some ways accurate, is inaccurate in other ways. Deleuze's emphasis on the organic and crystalline regimes of the movement- and the time-image offers a profitable way of examining cinema, despite the traditional and at times elitist manner in which Deleuze framed them.

Film studies scholars working with Deleuze's categories of movement- and time-image have usually interpreted their relationship following one of two schools of thought: D. N. Rodowick (1997: 175–80), Angelo Restivo (2000: 171) and Patricia Pisters (2003: 16) all agree that the movement-image and time-image depict different ways of thinking, marking a shift in the relationship to time, truth and the image. For these scholars, the 'history' that the two cinema books create charts a rupture, or epistemic shift, rather than a linear narrative of progression from movement- to time-image. By contrast, in his contribution to *The Brain is the Screen*, András Bálint Kovács argues that – despite Deleuze's claims to the contrary – Deleuze's two cinema texts provide a linear history of cinema.

> Even though he never says outright that film history is tantamount to the emergence of modern cinema, that this is the "aim" of film history, Deleuze's entire taxonomy anticipates the shift from classical to modern. (Kovács 2000: 156)

According to Kovács, the time-image is for Deleuze the zenith of cinema's development, the end point of its linear progression through classical to modern cinema, from organic to crystalline regimes. The time-image precedes the movement-image not only in Deleuze's thinking about cinema (such that the writing of *Cinema 1* presupposes the writing of *Cinema 2*) but also in the sense that the time-image marks cinema's development to its ultimate goal. Kovács quotes Deleuze to this effect, stating:

> The categories that Deleuze uses to define modern cinema – as I suggested, mental images or direct time-images – were already given at the beginning

> of cinema, virtually present in the image. As Deleuze writes, "The direct time-image is the phantom which has always haunted the cinema, but it took modern cinema to give a body to this phantom." (Kovács 2000:156)

This position does not necessarily contradict that of Restivo, Rodowick and Pisters. Rather like Lyotard's view that, 'a work can become modern only if it is first postmodern' (a position mentioned in passing by Restivo), the possibility of the time-image always existed along with the movement-image. It is possible, then, to follow Deleuze's stance, and see the emergence of the time-image in European cinema as a consequence of the conditions that arose in the immediate wake of the World War II, when the time-image came to illustrate a shift in the western image of thought. However, movement- and time-image – whilst marking a definite historical crisis in Deleuze's understanding of cinema – can be interpreted differently. As the case of popular Indian cinema demonstrates, these categories actually co-exist, and Deleuze's use of WWII as a demarcation line was more a product of the types of cinema he focused upon than a universally influential historical event.

Several writers have already noted the coexistence of movement- and time-image. Most obviously, in *Cinema 2*, Deleuze acknowledges the existence of the time-image in the films of Japanese director, Yasujiro Ozu, who he credits as 'the inventor of opsigns and sonsigns' (1989: 13). Yet Deleuze avoids any attempt to understand why this might have occurred in 1930s Japan, noting only that the post war European directors did not learn from Ozu. For Deleuze, then, Ozu is an unexplained, isolated precursor to the post war European shift in thought marked by the time-image. More usefully perhaps, in *The Skin of the Film*, Laura Marks notes Deleuze's Eurocentric position, pointing out that time-images should not be understood as a phenomenon specific to the post war European New Waves. The metropolitan any-space-whatevers and the wandering 'seer' (Deleuze 1989: 2) protagonists caught in a sensory-motor limbo that Deleuze believed characteristic of the post war European time-image, are nowadays to be found in any number of films made by diasporic, immigrant and otherwise displaced postcolonial populations (Marks 2000: 27). Finally, Pisters, as part of her argument for a new cinematic consciousness of reality, writes of contemporary movement-images 'contaminated' by aspects of the time-image, presenting 'schizophrenic movements of deterritorialization of the constraints or absurdities of life' (Pisters 2003: 104).

Following on from these precursors, in *Deleuze, Cinema and National Identity* (2006), I draw on *A Thousand Plateaus* (1980) – which Deleuze

co-wrote with Félix Guattari before *Cinema 1* and *Cinema 2* – to argue that the movement- and time-image are extreme manifestations of the same phenomenon. In *A Thousand Plateaus*, Deleuze and Guattari describe the interaction between a reterritorialising plane (the plane of organisation) and a deterritorialising plane (the plane of consistency). These two planes are locked in an interactive relationship, forever struggling to de- or reterritorialise (Deleuze and Guattari 1987: 270). To summarise my argument very briefly, when examining narrative time in cinema, the movement-image exists on the reterritorialising plane of organisation, whilst the time-image emerges on the deterritorialising plane of consistency. This interactive model explains why cinema history contains examples of movement- and time-images that cross the great divide between *Cinema 1* and *Cinema 2*, and why numerous films contain aspects of both image. Thus, I conclude that the possibility of both type of image always exists, and that it is a question of degree as to how de- or reterritorialised they are, how close to the limit conditions of the movement- or the time-image (Martin-Jones 2006:19–49).

Drawing on these various intersecting positions one can argue that even though it is usually the reterritorialised form of the movement-image that is dominant, cinema always contains within it the deterritorialising possibility of the time-image. Deleuze acknowledges as much in *Cinema 2* when he describes the time-image as 'the phantom which has always haunted the cinema', and the time-image as an image that is 'virtual, in opposition to the actuality of the movement-image' (Deleuze 1989: 41). Prior to this, in *Cinema 1*, Deleuze introduced the crisis of the action image in the post war era saying: 'But can a crisis of the action-image be presented as something new? Was this not the constant state of cinema?' (Deleuze 1986: 205). Time images, then, whilst evidence of the potential that has always existed for a destabilizing of the movement-image, are not necessarily evidence of a radical shift of episteme. Moreover, films with a deterritorialised narrative time scheme, even films evoking a Nietzschean powers of the false, are not necessarily evidence of the existence of the time-image, not necessarily a glimpse of the plane of consistency. Rather, Deleuze's categories of the movement- and the time-image are a product of his selection of certain films for discussion, and his ignorance (whether purposeful or not) of certain others, not least of which was popular Indian cinema.

Had Deleuze paid attention to the existence of popular Indian cinema – a major force in many parts of the world today, as it was for much of the twentieth century – then the distinction he draws between North American and European cinemas would have appeared very differently.

Indeed, as the popular Indian aesthetic that is most widespread today emerged in the 1930s, the distinction Deleuze draws appears very much that of a European cinephile whose experience of 'cinema' is confined to the circulation of classical Hollywood and (predominantly) European art films in the international arena. This distinction fails to take into account the numerous different national experiences of cinema, especially indigenous popular genre films that exist around the world.

Popular Indian cinema muddies any clear distinction between the movement- and the time-image. Defying easy categorisation, it goes beyond illustrating the perpetual coexistence of the possibility for de- and reterritorialisation offered by the two images. Rather, it demonstrates a different plane of organisation to that of the movement-image. Detailed consideration of the popular Indian film form and its reception acknowledges the different national, cultural, historical and aesthetic conditions that shape the de- and reterritorialisations that exist on its particular plane of organisation. I argue that Deleuze's Eurocentrism is the cause of the initial polarising of cinema into the movement- and time-image, and his use of this dual model as evidence of an epistemic shift becomes extremely difficult to extrapolate into a globally applicable conclusion once popular Indian cinema is considered.

II. Popular Indian Cinema

Popular Indian cinema, often problematically referred to as Bollywood cinema,[1] has been recognised as a legitimate topic of discussion within film studies since the 1980s. As there are now a huge number of books and articles on the subject I will very briefly summarise the major points surrounding the popular Indian aesthetic and its consumption. This background information is essential if we are to grasp the culturally specific reasons behind the emergence of this distinctive plane of organisation.

The most obvious influences on popular Indian cinema are two sacred texts of the Hindu faith, the *Ramayana* and the *Mahabharata*. The structures of these epic texts greatly influence the popular Indian film narrative. Rather than the clearly defined linear narrative of the classical Hollywood form (the action-image in its large form (SAS′)), the narrative of popular Indian cinema, like that of the epic texts, incorporates 'endless digressions, detours [and] plots within plots' (Gokulsing and Dissanayake 1998: 17). It is the interweaving of many storylines together

that popular Indian cinema derives from this epic narrative tradition, and it is primarily this that leads to the length of popular Indian films.

Due to this structure, in popular Indian film the narrative drive is secondary to the progression of a series of often seemingly disconnected episodes, like song and dance routines, fight scenes, comic sequences, moments of family melodrama, tearful confrontations between lovers, and so on. In her seminal article, 'Indian Cinema: Pleasures and Popularity', Rosie Thomas notes that the origins of this aesthetic in Sanskrit philosophy ensure that it is non-Aristotelian in its rejection of 'the unities of time and place and the dramatic development of narrative' (Thomas 1985:130). The Hollywood movement-image stresses the need to maintain a unity of time and place to the narrative, as is the guiding principle of continuity editing. The popular Indian film narrative, however, is not constrained by the need for the coherent narrative world demanded of realism. Instead, popular Indian film's distinctive aesthetic offers a narrative that is a ' "ridiculous" pretext for spectacle and emotion' (Thomas 1985: 123), thereby providing the viewer with the pleasure of experiencing a *masala*, a blending of flavours or moods.

Thomas argues that the pleasure to be had from viewing a popular Indian film is not derived from finding out what will happen at the end, but from seeing how the story gets to the end (Thomas 1985: 130). The epics from which popular Indian films gain their structure are part and parcel of an oral storytelling tradition, and historically functioned to keep a communal record of cultural history amongst a predominantly illiterate rural populace. Hearing the same story told over and over again, the pleasure is in hearing the familiar embellished, or otherwise rendered slightly differently each time. Similarly, in popular Indian cinema, the pleasure is gained from seeing how the same story is told slightly differently, rather than specifically from the way it ends – a fact which is generally already known (or is almost entirely predictable) to the viewer. This understanding of the popular Indian film narrative also explains why they are consumed differently from Hollywood films. Audiences in India are more likely to watch a popular Indian film several times over, singing along with the songs if they know them. This is unlike the consumption of films in most western cultures, where they are usually only seen once, in comparative silence, at least in the cinema.

Gokulsing and Dissanayake and others variously agree that, along with the *Ramayana* and the *Mahabharata* there are five other major influences that give popular Indian film its distinctive aesthetic

(Gokulsing and Dissanayake 1998: 18–22). Firstly, Sanskrit theatre: This is the classical Indian theatre from which popular Indian films inherited the episodic narrative, dance spectacles and various stylistic acting conventions. Indian folk theatre also contributes: peasant productions which continued the 'style and techniques of the classical theatre after its decline in the tenth century' (Gokulsing and Dissanayake 1998: 20). Then there is Parsi theatre, a commercially oriented theatre at once realist and fantastic, and popular throughout India in the nineteenth century (Prasad 1998: 30). Hollywood is also an influence, but its storylines are Indianised (Thomas 1985: 121; Mishra 2002: 18) – usually through an infusion of emotion – so as to be incorporated within the distinctive popular Indian film aesthetic. Finally, in recent years MTV has been thrown into the mix, especially its quicker editing style, pop video camera angles, faster paced camera movements, and increased focus on teenager protagonists (Gokulsing and Dissanayake 1998: 22). The combination of these aesthetic influences creates the circuitous, episodic narrative progression of the popular Indian film. Finally, the distinctive shape of the popular Indian film is also a product of the structure of the Indian film industry. As M. Madhava Prasad argues in detail in *Ideology of the Hindi Film*, due to the segmentation of the production process into a series of independently produced constitutive parts ('the story, the dance, the song, the comedy scene, the fight, etc.' (Prasad 1998: 43)), the structure of the Indian film industry does not facilitate a linear narrative. Rather, the story is simply one more part in the whole, a fact that is reflected in the fragmented production process.

III. *Masala*-image

Due to its episodic narrative structure, which functions by blending together a range of different flavours or moods, the popular Indian film aesthetic does not exactly correspond to Deleuze's categories of movement- or time-image. So how does it function?

In 2002, Lalitha Gopalan dubbed popular Indian action cinema a 'cinema of interruptions' (Gopalan 2002: 3) in some ways akin to the early silent 'cinema of attractions' observed by Tom Gunning in his seminal work of that name. Gopalan notes that from its inception as a silent form, popular Indian cinema 'developed in a whirl of anti-colonial struggles that included an impulse to forge an independent cultural form by both reinterpreting tradition and making technology developed in the West indigenous' (Gopalan 2002: 17). Gopalan goes on to argue

the case for the 'interrupted pleasures' offered by this aesthetic, noting how – far from simplistically interrupting the pleasure of watching a seamless narrative progress – these moments of interruption serve to both 'block and propel the narrative in crucial ways' (Gopalan 2002: 21). Reading Gopalan's introduction to *Cinema of Interruptions* it is apparent that she is writing specifically to convince an audience that considers the classical Hollywood narrative normative, the problem that arises from this being the presupposition that the classical Hollywood narrative is somehow *un*interrupted in comparison.

Yet this assumption is of particular relevance for this discussion of popular Indian cinema in relation to the movement- and the time-image. Due to its culturally specific narrative structure, the popular Indian film is not exactly a movement-image, as the classical Hollywood film is, nor is it exactly a time-image (even though the time-image seems readily apparent in the popular Indian aesthetic), or even just a blending of the two. Rather, the popular Indian aesthetic is a different type of image altogether. On the one hand, the series of spectacles or interruptions through which the popular Indian film haltingly or circuitously progresses suggests a 'movement or world' (Deleuze 1989: 59). The various spectacles seem to move around the characters, catching them up and causing the narrative – at once blocked and propelled – to progress circuitously. In this sense popular Indian films at times seem akin to time-images. On the other hand, popular Indian film narratives typically foreground the sensory-motor continuity of the protagonists. The most obvious examples are the physical moments common to nearly all popular Indian films, the dance routines, slapstick moments, fights, and other action scenes. In this sense they seem closer to the movement-image.

Indeed, in terms of their overall narrative structure, popular Indian films typically uphold the status quo, and are often described in terms that evoke the overarching SAS′ structure of the Hollywood action-image. As Tejaswini Ganti states:

> Hindi films present a moral universe, the disruption of which initiates the narrative action. The disruption can have taken place in a previous generation or be very subtle and communicated briefly, but restoring order or resolving the disruption is usually the goal of the narrative. (Ganti 2004: 138)

Yet this situation is not as simple as it may appear. In *Bollywood Cinema: Temples of Desire*, Vijay Mishra seemingly agrees with Ganti's position, describing the manner in which the apparently conservative

popular Indian cinema constructs 'texts that function as metatexts of tradition and dharmik values' (Mishra 2002: 5).[2] Yet this overarching structure, which tends towards the status quo, also facilitates the controlled exploration of a series of possible transgressions. Mishra continues:

> The relay through dharma-adharma-dharma allows for transgressive eruptions to take place from within so that the unspeakable, the anti-dharmik, may be articulated. Hence pleasures of transgression are entertained as the spectator identifies with any number of ideologically unstable elements with the foreknowledge that the order will be re-established. (Mishra 2002: 5)

Although this progression – 'dharma-adharma-dharma' – may appear akin to Hollywood's SAS′ structure, the obvious difference is the greater space, or rather, duration, that is opened up between beginning and end of the popular Indian film within which to explore potential ideological transgressions. Within its overarching narrative development the popular Indian film narrative proceeds in a circuitous route, its various spectacles, interruptions or 'eruptions' both blocking and propelling the narrative in a manner determined by the numerous interweaving plotlines.

Rather than developing from situation, through action to changed situation (SAS′), the popular Indian film narrative is perhaps more accurately understood as developing through SSS, or perhaps SS′S′, SS′S″, or even SAS′AS″AS‴. This is not because it is a movement-image interspersed with time-images, but because it is an altogether different kind of image emerging on a context specific plane of organisation. In this sense, Gopalan's slightly problematic choice of the term 'interruptions' (although it tacitly suggests that a supposedly *un*interrupted mainstream Hollywood film is the norm) is in fact extremely helpful. It is because the popular Indian film narrative progresses through various spectacular interruptions – themselves the product of its specific emergence in India – that it can be understood to exist on a different plane of organisation to that of the movement-image.

On this plane of organisation, sensory-motor continuity (typical of the movement-image) meets a general movement of world usually associated with the time-image. Character actions propel the narrative at times, but at others are not equal to the movement of world that periodically sweeps them along. Actions do not always become equal to situations, a factor which delays or interrupts any smooth movement from situation, through action, to changed situation. Moreover, characters never know

when a new situation is going to suddenly emerge and derail their forward momentum. Thus, as the narrative progresses through its spectacular interruptions these two movements either mesh, or one or the other comes to the fore. This fluid interchange of movements seems to imply a shift or flux of movement- and time-images, but in actual fact the image that emerges on popular Indian cinema's plane of organisation is both and neither of these.

Although popular Indian cinema's view of time is sometimes very apparently Bergsonian, the type of image that emerges on this plane of organisation is also patently the product of other, indigenous factors specific to India. These include the cyclical temporal worldview of Hinduism. The temporal progression of popular Indian cinema is circuitous. During moments of spectacle, past and present moments of the narrative can come into contact. When this occurs, it again suggests the influence of the Hindu epic texts such as the *Ramayana* and the *Mahabharata*, which emphasize reincarnation, or samsara (the journey of life through various incarnations) and the presence of karma, 'the accumulated effect of moral behaviour' (Billington 1997: 37–40). In addition to Deleuze's Bergsonian view of time, then, this cyclical temporal worldview provides another potential source for the movement of world characterising popular Indian cinema. The perpetual shifting between movement of character and movement of world suggests a cyclical view of the relationship between human actions and the greater shifting of the cosmos within which human actions are caught up. This is another reason why it is not sufficient to simply argue that time-images emerge in popular Indian cinema. Rather, its plane of organisation creates an image which is at times akin to what Deleuze categorised as a time-image, but which must also be considered the result of an altogether different temporal worldview. This explains why the potentially transgressive eruptions of the popular Indian film which Mishra identifies are both facilitated and contained within a larger movement of world. In this respect a second contextually specific influence also becomes apparent, that of Parsi theatre.

From Parsi theatre, popular Indian cinema derives its style of direct interplay between characters on screen and audience members. This aesthetic feature is at odds with the code of continuity editing central to the verisimilitude of narrative world, and associated voyeuristic pleasures, of Hollywood cinema. As Mishra notes, this interplay might involve direct address to the audience, or 'the twice told tale, where events appeared to have happened before the scene being enacted'

(Mishra 2002: 9). Drawing on this tradition, the spectacles of popular Indian cinema render its movement of world as though the film were a play told against a variety of sets or backdrops. The transgressive eruptions facilitated by the popular Indian film's greater movement of world appear as virtual possibilities, potential other, virtual worlds (as they also appear in the European time-image) but played out in a fantastical manner for the subversive pleasure of the audience.

This altogether different type of image might be termed the *masala*-image. The *masala*-image is different from both movement- and time-image; it entails a different plane of organisation on the plane of consistency. It comes from a different aesthetic, cultural, national and historical context than the movement- or the time-image. On this plane of organisation, spatial and temporal discontinuity exists and is celebrated within an overarching progression that circuitously proceeds through digression and multiplicity. Yet this occurs not because of any radical shift in 'our' thinking about narrative time (a Eurocentric conclusion), but because of the specific aesthetic tradition from which the popular Indian narrative stems. This plane of organisation calls into question the fixity of Deleuze's movement- and time-image categories and their capacity to reterritorialise cinema into these two dominant categories without consideration for the possibilities offered by other, culturally specific cinematic forms.

IV. A Real Song and Dance

To more fully understand the difference between the popular Indian film aesthetic, the movement- and the time-image, a detailed consideration of the place of the spectacle or interruption in the popular Indian film narrative is necessary. At the risk of simplifying matters somewhat – as this spectacle can take a number of forms – I will focus on the song and dance sequence, a staple of the majority of popular Indian films. As in a Hollywood musical, popular Indian films set numerous scenes in everyday situations (a house, a street, a restaurant). A character bursts into song and the whole world responds. It is also common for a song to transport characters to other locations, often to exotic places with no relationship to the diegetic world. This has increasingly been the case as popular Indian films target the huge international market of diasporic South Asians (Non Resident Indians, or NRIs), by shooting on location in parts of the world as diverse as Scotland, Switzerland and New Zealand (Wills 2003: 255).

Song, and laterally song and dance, have been integral components of popular Indian cinema since the first talkies. The first Indian talkie, *Alam Ara* (1931) contained seven songs (Gopalan 2002: 19). The popularity of the song was such that in the following year *Indrasabha* (1932) contained over seventy songs (Gokulsing and Dissanayake 1998: 14; Kabir 2001: 157). In 1933 alone, '75 Hindi films were produced, all with songs and dances' (Ganti 2004: 209). In their seminal, *Indian Film*, Erik Barnouw and S. Krishnaswamy point out that:

> In 1931 and 1932, at what seemed a dark moment in Indian film history, song and dance – in part derived from a tradition of folk music-drama – played an important role in winning for the sound film an instant and widening acceptance. (Barnouw and Krishnaswamy 1980: 73)

Today the majority of critics agree that after the early 1930s 'Music and fantasy came to be seen as vital elements of the filmic experience' (Gokulsing and Dissanayake 1998: 13). Nasreen Munni Kabir is even more definitive, stating:

> *Alam Ara*, India's first sound film . . . borrowed the basic structure from the plays of the Parsee Theatre, which featured a number of songs based on Hindustani light-classical music . . . . After the success of these early song-filled movies, music became an essential component, featuring in all popular cinema. (Kabir 2001:155)

The point of this evidence is to note that the *masala* aesthetic was conceived in India in the 1930s. Although the popular Indian, or 'Bollywood' cinema, as we know it today, is perhaps more accurately dated to the post-war independence period, and although it is here that images akin to those which Deleuze categorised as time-images do begin to appear, this is not a phenomenon that can be unproblematically assimilated within the schema of the epistemic shift envisaged by Deleuze. The evocation of folk and theatrical traditions as key influences on popular Indian cinema in both Barnouw and Krishnaswamy and in Kabir, illustrates the need to understand the popular Indian film aesthetic as distinct from both the movement- and the time-image because of its specific cultural origins. The non-Aristotelian narrative of popular Indian cinema offers its audience the pleasure of spectacles for their own sake. As Kabir puts it:

> The average Hindi film does not pretend to offer a unique storyline . . . [W]hile a new twist to a familiar Bollywood storyline helps a film to succeed, if the audience is looking for originality, they know it is principally to be found in

> the score. The song and dance sequences are the most important moments. (Kabir 2001: 15)

Yet, the question remains, if the narrative's interruptions are the whole point of the narrative, exactly what type of image is seen in the song and dance sequence? On the one hand, song and dance sequences (loosely) fall into the category of movement-image. As Rodowick's analysis of Buster Keaton's moving body in the dream sequence of *Sherlock Jr.* (1924) shows, in the organic regime of the movement-image the protagonist's body unifies the discontinuous spaces through which he passes, because his unbroken sensory-motor continuity enables him to act upon what he sees. Rodowick notes:

> When Keaton finds himself on a rock by the ocean, he dives, only to land headfirst in a snowbank. Keaton's movements from one shot to the next link incommensurable spaces through what modern mathematics calls a 'rational' division. The interval dividing any two spatial segments serves simultaneously as the end of the first and the beginning of the second. In Keaton's film, every division, no matter how unlikely and nonsensical, is mastered by this figure of rationality where the identification of movement with action assures the continuous unfolding of adjacent spaces. The consequence of this identification is the subordination of time to movement. (Rodowick 1997: 3)

In this way the action-image moves from situation through action to changed situation in a linear progression, the protagonist's command of space ensuring movement occurs in an entirely causal fashion. In the movement-image we see an indirect image of time, of time edited around the protagonist's ability to act upon what they see. Similarly, the continuous organic movement of the actors in the song and dance sequence unify the disparate and disconnected environments through which the sequence takes them. In terms of Deleuze's findings in *Cinema 1* concerning the representation of time in various pre-war European cinema movements, the popular Indian film – like the early French, German and Soviet movement-images – uses montage in the song and dance sequence to provide an indirect image of time (Deleuze 1986: 29–55).

However, we might also view such moments as time-images, as instances of fantasy, of sensory-motor suspension where the narrative pauses, or digresses, and the world moves around the protagonist, transporting them elsewhere even though they themselves do not move. When Deleuze discusses the musical in *Cinema 2* it is in precisely this fashion. Overcoming the seeming paradox of sensory-motor movements like singing and dancing occurring in the pause between perception and

action, in *Cinema 2*, Deleuze sees this physical movement taking place within a larger movement of world:

> [W]hat counts is the way in which the dancer's individual genius, his subjectivity, moves from a personal motivation to a supra-personal element, to a movement of world that the dance will outline. This is the moment of truth where the dancer is still going, but already a sleepwalker, who will be taken over by the movement which seems to summon him: this can be seen with Fred Astaire in the walk which imperceptibly becomes dance . . . as well as with [Gene] Kelly in the dance which seems to have its origin in the unevenness of the pavement. (Deleuze 1989: 61)

In the song and dance sequence, then, the movement of time itself catches up or overtakes the sensory-motor movements of the characters. Deleuze also discussed *Sherlock Jr* in *Cinema 2* to demonstrate the difference between the recollection-image (a virtual image of the past that becomes actual in the present, and therefore closer to the movement-image) and the dream-image (as in *Sherlock Jr*) which is closer to the time-image because it perpetually defers its actualisation into another virtual movement (Deleuze 1989: 57). In Rodowick's analysis of this scene the protagonist's sensory-motor actions are used to unify the elliptically edited spaces of the continuity system, hence, a movement-image. By contrast, in Deleuze's analysis, the movement of the world ensures that the sensory-motor actions of the protagonist are forever deferred. Keaton is always one step behind the movement of world, the trajectory SAS′ is impossible to complete, and therefore this dream-image is considered closer to the time-image. This undecidability is emblematic of the nature of the popular Indian film.

Yet the popular Indian film is not a musical. Leaving aside Mishra's argument that Bollywood cinema constitutes a sort of meta-genre (Mishra 2002: 32), popular Indian cinema should not be viewed as a genre in the same sense that the musical can be seen to exist within Hollywood cinema. Therefore, what happens in the popular Indian film song and dance number is not simply a moment of spectacle in an otherwise linear narrative, a time-image blended into the overarching structure of a movement-image. Rather, these categories must be reconsidered altogether to take account of the fluxing state of the image on popular Indian cinema's plane of organisation.

In popular Indian cinema the contrasting movements of character and world alternatively mesh or alternate in importance or dominance, as the film's narrative progresses. The discontinuous montage often found in the song and dance sequence is therefore symptomatic of the larger

episodic progression of the popular Indian narrative, which weaves its way through numerous times and spaces, relying on a certain amount of sensory-motor continuity provided by its characters, whilst these characters are themselves periodically caught up by the larger movement of the narrative world. The episodic arrival of the song and dance sequence provides the clearest evidence of this. Here the point of change from one type of movement to another illustrates that it is a matter of degree or speed of movement as to which one dominates at any time.

V. Popular Indian Cinema's Plane of Organisation

Toofani Tarzan (*Tempestuous Tarzan*) (1936), a jungle adventure made by Wadia Movietone, one of the studios to achieve success during the 1930s, mainly through the production of stunt films, is a perfect illustration of this point (Barnouw and Krishnaswamy 1980: 110). As Thomas has shown at length, such action films were extremely popular at the time (a fact sometimes forgotten in histories of popular Indian cinema) and were, 'at their core, sites of negotiation of a new Indian modernity' (Thomas 2005b: 50). Examining this example from the early days of talkie production in India gives an indication of the initial development of the plane of organisation on which the *masala*-image emerged.

For the most part, *Toofani Tarzan* – whose basic storyline is the Tarzan myth – proceeds through a series of episodes which often bear no immediate causal relationship to the one preceding or following it. These include: a daring hot air balloon ride through a thunderstorm, various performing animals fighting, doing tricks or generally looking menacing, elephant rides, elephant charges, slapstick comedy routines, stunt sequences (inevitably including Tarzan (John Cavas) swinging on a vine), Tarzan's daring kidnap of Leela (Gulshan) and their ensuing romance, action scenes (including Tarzan wrestling with an imprisoned King Kong), a tribal ambush or two, a set piece song around a campfire, Leela's love song, and so on. This cinema of interruptions is reminiscent of the early silent cinema of attractions, with its circus or cabaret-like appeal to the spectator's attention over the short time span of a sequence of novelty acts. As such it perfectly illustrates the movement of narrative world in an SSS (or SS′S″ etc) pattern typical of popular Indian cinema.

Admittedly something similar could be said of the original US Tarzan movies, or indeed, Laurel and Hardy or Buster Keaton films. The difference is that *Toofani Tarzan*'s interweaving storylines work to disrupt any sense of linear flow to the narrative's progression. The most

obvious example of this is the recurring and unannounced appearances of Tarzan's insane mother (Nazira). Another good example is Tarzan's deterritorialisation of Leela from the safari party to his jungle hideaway, and the ensuing, unrelated progression of the two narrative strands. Both examples illustrate how the causal narrative progression we might expect of the movement-image is constantly interrupted by the narrative's episodic progression. One specific point in the film that distils the intermeshing movements of character and world, and their use to explore identities, is Leela's love song.

Towards the end of *Toofani Tarzan*, Leela (Tarzan's Indianised Jane), sings a song whilst bathing in a jungle pool. This interruption occurs rather abruptly after most of the safari caravan have been captured by tribal natives. The switch of mood is palpable. We suddenly leave the tense sequence involving the captives to focus on the bucolic scene of Leela singing of falling in love in the forest. Here the movement of narrative world typical of the cinema of interruptions is evident. It operates on the micro scale as well. The song Leela sings reflects the movement of world that takes place around her. As Leela treads water and sings her song of love, she temporarily becomes the centre of both the jungle and the narrative. Her partial sensory-motor immobility stills the narrative, and we pause for a moment to revel in the spectacle of her song. Leela is shot from various angles around the pool, and is intercut with shots of a bird nesting in an overhead tree, an inquisitive chimp which climbs into a nearby tree to watch her (point of view shots of Leela are provided for both animals), elephants bathing and grazing nearby, the surrounding mountains, a shot of the coast, and finally the arrival of Moti (Tarzan's faithful dog) who returns Leela to the narrative by stealing her clothes and running into the jungle with them. These discontinuous spaces, intercut with Leela singing in the pool, pass before the spectator's gaze without the sensory-motor continuity of the organic regime of the movement-image. As an expression of the movement of world around the character they are more akin to the time-image. As the narrative picks up again with Leela's chasing of Moti, however, these two movements (movement of world and character movements) coincide once again and we seemingly return to the organic regime of the movement-image.

In this early example we can clearly see how, rather than movement- or time-image, the *masala*-image creates a distinctive plane of organisation belonging to both and neither of these categories. In its slippages into interruption the movement of world comes to the fore, and literally takes over from the character. With the return to narrative,

however, sensory-motor movement of character and movement of world momentarily coincide once again. What is important to note in this example from the 1930s is that this is the norm in the popular Indian cinema of interruptions, in which the narrative progresses circuitously through a series of spectacles, from S to S′ to S″ and so on.

This interchange of movements also facilitates a broader examination of identities. In the case of *Toofani Tarzan*, the interplay of movements (movement of characters and movement of world) facilitates an exploration of the interaction taking place in India at that time between tradition and modernity. In the only existing discussion of *Toofani Tarzan* in English, Thomas describes this scene as being illustrative of Leela's position in the film as a facilitator of a larger exploration of fluid, "'modern" identities'. Thomas states:

> Leela is an intriguing mix of 'modern' independence, coquettish helplessness and unconstrained sexuality. She encompasses two facets of decadent city femininity: the vanity and 'falseness' signalled by her obsessional attachment to her make-up bag, and the assertive toughness of a woman in slacks who stands up to men, wields a gun and defies her father to choose her own sexual partner. The movie transforms her into a free spirit in a miniskirt whose hedonistic sexuality becomes, through a series of moves and denials, acceptably identified with the innocence of the jungle. Thus, for example, an erotic bathing scene, in which she (purportedly) bathes nude while singing a sensual song about 'a burning rising in my body' is immediately followed by a comedy gag in which Moti the dog steals her clothes, and then her kidnap by the cannibals. (Thomas 2005a: 36)

For Thomas, Leela's assertive femininity opens the space for the playing out of a 'modern' sense of identity. Whilst she is at home in the city, she is also able to accommodate herself to life in the jungle. The interplay between her different possible identities – assertive city dweller, equally assertive jungle wife – interacts with the different movements evident in the film. On safari with her father and his entourage, in her pistol-toting, pith helmet, boots and trousers guise, she drives the narrative through her sensory-motor actions. Once kidnapped by Tarzan, however, she becomes subject to the movement of world enacted by the jungle, and is threatened repeatedly by tigers and crocodiles, each time to be saved and carried off by the commanding sensory-motor presence of Tarzan. Even so, the potential for identity exploration remains. This is evident in the scene in question, where the movement of world offers an opportunity to explore a 'modern', expressive female identity (semi-naked, and with 'a burning rising in my body') and then disavows this potential as Moti leads Leela into the clutches of the cannibals. Ultimately, then, the

montage, Moti the dog, and finally the cannibals, are the agents who shift events around her as she literally treads water in the centre of the image. In one context, her sensory-motor continuity is assured. In the other, the movement of world pauses her trajectory, enabling the film and its audience to gaze upon her lyrical exploration of her modern identity.

At the film's conclusion, Leela learns to overcome the movement of world in the jungle. This she achieves through the modern, mutually reinforcing relationship she develops with Tarzan, which Thomas describes as 'fundamentally – and quite radically – one of mutual interdependence' (Thomas 2005a: 37). This union sees them disappear into the jungle together at the film's close, Leela's running figure uniting the spaces of the montage as she flees her father, illustrating her regaining of sensory-motor control over the jungle's, and the film's, movement of world. Thus, in the context of the growth of the nationalist movement in 1930s India, the two movements at play in the *masala*-image facilitate an exploration of the versatility and potential of 'modern' female identity in India.

The flexibility of this structure and its ability to adapt to changed geopolitical circumstances can readily be seen in the smash hit *Dilwale Dulhania Le Jayenge* (1995). This film exemplifies the international aim of popular Indian cinema after the impact on India of a free market style 'economic liberalisation' (Kaur 2002: 205) and its appeal to the massive global market of Non Resident Indians (NRIs) worldwide. In *Dilwale Dulhania Le Jayenge* the difficulty of attributing movement- or time-image status to the popular Indian film is also apparent. In the main, the narrative is defined by the sensory-motor actions of its protagonists; the first half of the film, in particular, sees its carefree young protagonist, Raj Malhotra (Shah Rukh Khan) and love interest Simran Singh (Kajol) backpacking across the discontinuous spaces of tourist Europe. Typically of the movement-image, their physical presence in these spaces provides continuity across the montage, as it does in the second half which takes place in the Punjab.

In the song and dance sequences of the first half of the film, however, the movement of world takes precedence, the discontinuous montage clearly overtaking them, leaving them to sing and dance in the suspended sensory-motor interval. Here the lovers sing and dance as they move more rapidly through costume changes, visit various towns, travel on trains, appear on snow covered mountain tops, swim in indoor swimming pools, wander the streets at night, and so on. The difference between these two moments, however, are simply a matter of degree,

or speed of movement of world, and the subsequent interaction that is created with character movement.

Dilwale Dulhania Le Jayenge's theme song, Tujhe Dekha, is especially interesting in this respect. It takes place at the beginning of the second half of the film, and in it a Bergsonian model of time emerges as Raj and Simran revisit the European locations in a song of mutual memory, and re-realise their initially stilted courtship as though it had been a time of mutual love and uninterrupted happiness. The song begins in a vast field of yellow mustard flowers stretching out of the frame. As Raj and Simran sing, they are transported back in time through their memories of Europe (and through various scenes from earlier in the film) revisiting a church, train, hotel room, lush green countryside, lake, bridge, and snow covered mountains before returning to the Punjabi mustard field. Several of these virtual movements include costume changes, the overall impression being of the two lovers slipping between Deleuzian sheets of the past.

Reliving the recent past as though it were a time of unbridled love and happiness (whereas in reality it was a time of halting, if good natured courtship) the recent past is coloured by the realisation of their love in the present. The virtual past and the actual present oscillate, becoming indiscernible in the moment of the song, as we might expect of the time-image. However, as the narrative returns to the mustard field in the Punjab, the popular Indian film narrative – which always proceeds circuitously due to its constant interruptions – *here literally progresses circuitously*, as the narrative's past is revisited and advanced in the present. Once again the larger movement of world of the narrative of interruptions catches up the characters, but here it returns them to previous moments of the narrative, enabling them to become active once again. This momentary interruption to the narrative's progress actually enables the characters' movements to mesh with those of the narrative world once again, ensuring that the narrative's progression is something like, SAS′AS″AS‴. In this more sophisticated fashion (in addition to the general fluidity of movements of world and movements of character), narrative in the song and dance sequences advances because of the alternation between movement of world and sensory-motor movement of characters.

As in *Toofani Tarzan*, these two intersecting movements facilitate an exploration of changing identities, but this time in the context of the contemporary relationship between India and its NRI diaspora. Tujhe Dekha brings together the two movements of the film, and in doing so, also intertwines Europe and India, past and present,

and transnational (indeed, global) capital flows and traditional Indian values. In this respect, Purnima Mankekar's observations on the film are particularly pertinent. Mankekar notes that: 'In a context marked by liberalization and intensified transnational flows of migrants and of capital, *Dilwale Dulhania Le Jayenge*'s representations of the homeland signal the reconstitution of postcolonial Indian nationalism' (Mankekar 1999: 754). In such a context:

> [P]ostcoloniality does not designate a moment of unambiguous rupture with the colonial past but, instead, signifies the ubiquitous presence of the colonial past in the present. This understanding of postcoloniality rests on the premise that decolonisation does not occur along a linear trajectory (as in the teleological fantasies of anticolonial nationalists), but that it constitutes a series of discontinuous and uneven processes and is characterized by multiple temporalities. (Mankekar 1999: 735)

Thus, in the intertwining of the film's movements, *Dilwale Dulhania Le Jayenge* engages a postcolonial Indian present with a recent narrative past spent in the diaspora, echoing the 'discontinuous and uneven processes' and 'multiple temporalities' through which post-colonial identities are reformed in the present. The narrative's past, the possibility of potential liberation from traditional restraints, is revisited in the homeland, as though the European diaspora houses the possibility of romantic rejuvenation, alongside the promise of financial injection offered by the return of the NRIs to India. It goes without saying that traditional Hindu values were upheld while the characters travelled across Europe, the romance remaining chaste almost in spite of the threateningly "liberating" context. In this way, as Gayatri Gopinath notes, *Dilwale Dulhania Le Jayenge* reassures the 'transnational viewership both in India and the diaspora that globalisation and "traditional" Indian values go hand in hand' (Gopinath 2005:190). The Indian homeland is reinvigorated by the diaspora, as the movement of world (also here a postcolonial, economic movement of the world) reactivates the film's sensory-motor past, to examine the changing face of Indian and NRI identities.

VI. Conclusion

The plane of organisation that popular Indian cinema materialises on the plane of consistency is one where the movement of world (Deleuze's time-image) and the sensory-motor movement of characters in the world (Deleuze's movement-image) exist as part of a broader

cinema of spectacular interruptions. This is a plane of organisation that reterritorialises as a cinema of interruptions. Thus although both movement- and time-image can be identified if we look for them in popular Indian films, these images should be understood as part of something altogether different from Deleuze's reterritorialising categories, which were derived from a particularly Eurocentric knowledge of cinema limited to Hollywood and various classics of predominantly European *auteur* cinema.

Popular Indian cinema's plane of organisation is decidedly less linear in its reterritorialisation of the plane of consistency than the movement-image, especially in its Hollywood action-image form. Instead, it reterritorialises as a non-Aristotelian narrative of sequential episodes, a *masala*-image. For this reason it often appears closer to the time-image in places, even though it also bears a close affinity to the movement-image. It is characterised by a dual movement, a movement of world on the one hand, and a sensory-motor movement of characters on the other. These alternately mesh and unmesh as the narrative haltingly progresses through a series of spectacles, facilitating the exploration of different possible identities in various historical contexts.[3]

Notes

1. The term 'Bollywood' is problematic because it actually refers to Hindi cinema, produced by the film industry focused around Mumbai. Although this is now a recognised international term for popular Indian cinema, it tends to homogenise the numerous regional Indian cinemas under one banner heading. Moreover, it is debateable exactly when popular Indian cinema first became known as 'Bollywood' cinema, the term potentially causing confusion as to the time period under discussion.

2. Broadly speaking the term dharma refers to a universal law which the Hindus believe governs all existence (Kim 1973: 9) and prescribes the morally dutiful way of life (Billington, 1997: 32).
3. This study has, of necessity, focused on one aspect of Deleuze's work. There is still plenty of scope for future work in this area that would add further dimensions to my conclusions. As Dudrah and Rai have already indicated, the conditions of reception (for instance, whether in India or amongst diasporic NRI audiences) also provide scope for new ways of addressing popular Indian cinema using Deleuze. Following this trajectory, the *masala*-image described herein might be reconsidered in another light in terms of a *rasa*-image. This argument, however, will have to wait for another occasion.

Sensations spill a Deluge over the Figure

Lorna Collins Jesus College, Cambridge

Abstract

This paper utilises Deleuze's *Logic of Sensation* to critique the concept 'Figure' that he raises to formulate this theory in his monograph of Francis Bacon. Deleuze engages with Bacon's paintings to demonstrate how sensations from Figural artworks rupture through representation and disrupt binary logic. However, in his argument Deleuze seems to use the same kind of thinking that he intends the Figure to disrupt, since he prioritises and secludes art deemed Figural over and above abstraction. Such problematic categorisation is challenged here, by juxtaposing Figural and abstract paintings by Francis Bacon and Wassily Kandinsky. Both Figural and abstract works resound with *The Logic of Sensation*, which thereby spills over those boundaries posited by Deleuze's Figure.

Keywords: Deleuze, Figure, sensation, Francis Bacon, representation, Wassily Kandinsky, abstraction, rupture.

Introduction

What is at stake in the opposition between Figure and figuration at the centre of Deleuze's account of modern painting? How does his aesthetics of sensation disrupt this opposition?

By bringing forth the concept of Figure Deleuze ruptures the problem of figuration in order to theorise the violent, sensuous content of the aesthetic encounter with Bacon's paintings. He maps his conceptual trajectory on the surface of these paintings.

However, as will be shown in this paper, within his argument Deleuze draws a line around what art might be named Figural, alongside which abstract art is placed in a complex, seemingly contrary fashion – as though dissimilar and passing by figuration, rather than violently rupturing through it. Deleuze juxtaposes the painters Francis Bacon and Wassily Kandinsky to provide his argument for this, and forms the core thesis of his *Logic of Sensation* in response to the way Bacon's

figurative paintings expound the Figure by bursting through their shape as disruptive *sensations*.

But these sensations exceed the Figural restraints that Deleuze imposes by the way he categorises this genre and segregates other, abstract responses to that central need of breaking with figuration. By comparing two very different paintings by Kandinsky and Bacon it becomes clear that the opposition which seemed to be presented at the outset in fact dissolves, since they share the same effect and affect, in addition to that pivotal initial intent. These two artists use a different pictorial language to confront this, but their works resound with the same consequence of that confrontation.

The importance and intention of Figure in Deleuze's *Logic of Sensation* is, as Slaughter puts it, 'For Deleuze this is where the dichotomy between subject and object breaks down, where force and formation in the artist and the Figure are one … This is where the artist "seizes hold of life"' (Slaughter 2004: 251). Crucial in Deleuze's analysis of the aesthetic experience is the forceful link he creates between art and sensation, but his theory is troubled by the inherent dichotomy it tries to rupture, since in postulating Figure Deleuze constructs unnecessarily rigid boundaries around this concept. As such, this impedes the effort to explain how Figural art can securely 'break with representation', since it fails to account for the abstraction which similarly, even definitively, also breaks with representation.

There is, then, a plane or surface on which abstraction and Figure converge. This is the surface where representation is ruptured and sensation produced in response to the confrontation of this duality. The surface vibrates through colour, absorbing and propelling sensation, which ruptures through form. Here, at the surface of the disruptive, compelling, affective work of art, is where sensations spill over Deleuze's formulation of the Figure and *seize hold of life*. The point is that Deleuze's *Logic of Sensation* overflows his concept Figure and can be used to critique how he formulates this term.

I. Critique: How Deleuze builds the concept Figure in his *Logic of Sensation*

i) The intent to break through the paradigm of representation

In Deleuze's critique of representation the term Figure refers to an active element in painting, which in *What is Philosophy?* he defines as '*a bloc of sensations, that is to say, a compound of percepts and*

affects' (Deleuze and Guattari 1994: 164 italics in original). It is the point where sensation provides a means of rupturing the static clichés of representative imagery. This definition evolves out of his discussion of Francis Bacon. He describes sensation as having 'one face turned toward the subject (the nervous system, vital movement, "instinct", "temperament" – a whole vocabulary common to both Naturalism and Cézanne) and one face turned toward the object (the "fact", the place, the event). Or rather, it has no faces at all, it is both things indissolubly' (Deleuze 2005: 25).

Deleuze looks at how the static object of a painting can become more than an illustrative image and provide an affective sensation that extends beyond itself, surging outwards and towards the viewer like some kind of life force yet enacted in the *event* of the aesthetic encounter. He conceives of this event in particularly violent terms. He looks at Bacon's figures and senses that Bacon is trying to paint the very decomposition of flesh, as though the organs were somehow being swallowed by their bodies, in the attempt to evince a limit which erupts like some kind of pure, sensory form. From this Deleuze can plot his concept of 'Body without Organs' in terms of how the eruptive intensities one senses in Bacon break through the constraints of representation.

This intent and need to rupture representation is fundamental and, Deleuze argues, can be extended to define both modern art and philosophy, as the summation of what it means to 'overturn Platonism' (Deleuze 2004: 71). In *The Logic of Sensation*, this process extends from the disruption of figurative imagery, to the breaking up of that antagonistic, binary canon which constructs the discursive strategy of representation. Deleuze wants to reveal and rupture through, the 'world of representation . . . [as] a site of transcendental illusion' (Deleuze 1997: 265). For Deleuze, representative form is illusory since it marks the absence of a basic reality that is being re-presented. A figurative work of art represents something that is not present, which raises a binary or divisional gap between these two levels of reality and its illusory representation, between essence and appearance, or immanence and transcendence. Deleuze calls this mode of thought the 'binary logic of dichotomy' and in the *Logic of Sensation*, he presents the Figure as an aesthetic move to rupture it (Deleuze and Guattari 2004: 6). As a consequence of this rupture and 'breaking through representation', Deleuze means to close the gap, break through any representative semblance and directly confront the preceding essence of the real as presented. For this Deleuze proposes a new kind of reason or logic,

which involves the threshold of forces he applies his term Figure to describe and conceptualise.

This mode of thought, which functions to segregate and divide reality, can usefully be described as *diaphora*. This connotes a sense of the primal strife which prescribes and resonates in binomial conflict fuelling, forming and finally erupting in the Figural work of art, as well as the need to confront, resolve or find the way between the constrictive, constructed, and aged manacle this dualism presents.[1] *The Logic of Sensation* emphasises the connection between diaphora and the chaotic act of rupturing through representation, and brings forth a powerful analysis of why and how great works of art can affect us so profoundly. In constructing this concept, however, Deleuze succumbs to precisely the kind of thinking he intends the term Figure to critique, disrupt, or, as he concludes, 'surpass' (Deleuze 2005: 113). This occurs as he constructs tight boundaries around Figure, which compartmentalises and segregates abstraction into an assigned 'tactile/optical duality', and involves the same 'binary logic of dichotomy' that he is critiquing, and which both abstract and Figural art are trying to break from (Deleuze 2005: 73–77; Deleuze and Guattari 2004: 6). Thus Deleuze problematically positions the Figure to succeed, via sensation, whilst arguing (or insinuating) that the 'tactile/optical duality' of abstract form does not.

Thus the intent and need to rupture representation and break with the binary is itself laden with contradiction. Modern art has tried to pry apart the shackle by unravelling the diaphoric barricade set up by the layers of figuration, which seem to obscure what is real and true; the beginning of this can perhaps be seen in the evolution of abstraction, as the definitively non-representational. Hegel argued that this would mean abstract art is no longer real, or 'divorced from reality' (Hegel 1975) – but it remains plausible to argue that abstract art is anything but divorced from reality. As Kandinsky's work illustrates, the abstract can provide those sensations Deleuze defines as the modern work of art's method of disrupting the discursive barricade of representation, and by that means access basic reality.

Deleuze's effort to break with representation and challenge the boundaries of form has an idiosyncratic violence to it. His concept of Figure implies the aggressive motion of rupturing the *surface*, piercing through the boundaries of representation. This occurs when sensations burst from the painting as affective energy or vibration, as can be immediately encountered in Francis Bacon's work. Deleuze argues that Figural paintings fracture their boundaries, pierce through constraints

of shape or skin (and their vast implications or connotations), and burst free as a sense or force of the *incommensurable*, i.e. chaos. This *chaos* is immediate and real. It functions as the force of affective sensation at the limit of form, resonating from the confrontation of the conflict between essence and appearance, and its ensuing dichotomy. This is what 'seizes hold of life'.

Chaos is an incommensurable because it is something essential, neutral *and* unknown. It equates to (or is) that awesome, irrational discourse by which the discursive strategy or barricade of representation is raised in order to control, discipline and bar our access to such an undecipherable, incomprehensive layer of reality. Its outline seems to compose the continuing, antagonistic diaphora which the artwork disrupts by bursting through the barricading representative form. At this moment of rupturing, on the surface, the diaphora unfolds into its incommensurable essence, which is chaos. The movement and moment has a potent dynamism which resonates as vibrating sensation. Deleuze uses the verbs *arracher*, *rompre*, *casser*, *empêcher*, *libérer*, *extracter* to describe this movement. In other words, chaos is a pulsating, vigorous action that provides the aesthetic encounter between the artist, art-work and viewer (Deleuze 1981: 12).

ii) How Deleuze builds and categorises Figure

Deleuze constructs his Figure from the intense, disruptive dynamic of chaos itself, because it demonstrates the real potential for variation inherent in everything. He describes the physical action of these sensations hitting the nervous system before the brain, and uses this action to prioritise the Figural over the abstract. Both Figural and abstract art emit sensations, but he argues that the affect of the former is quicker, and so favoured as more direct and successful. This assumption is obviously problematic because it relies on Deleuze's (misguided) delimitation (and thus, ironically, linearization) of abstraction to a linear geometric style and lacks the psycho-physiological justification required to promote the affect of Figural art over abstract.

Yet Deleuze continues to build his term Figure, separated from abstraction, to describe how Figural art impinges upon our nervous system, as a primal or precedent, direct sensation. He uses the ideas of haptic function, painting forces, rhythm, colour and diagram to describe how the materiality of paint can provoke this. Deleuze summarises how all of these, in his own words, 'converge in colour, in the "colouring sensation", which is the summit of this logic' (Deleuze 2005: xi).

He is trying to explain why and how Francis Bacon's figures are so affective – simultaneously representative, being largely figurative, but scrambling and violently breaking through this form, as Figural. Deleuze conceptualises this by trying to grasp those sensations that erupt as a result of this. *Colour* is the agent here – applied with a rhythm conducted by the forces provoked in the artist, which emanate as sensation.

He uses this forceful sense of colour to build his Logic and his concept of Figure, and also, in a subtle way, to promote and distinguish these from abstraction. He says that '*By avoiding abstraction*, colourism avoids both figuration and narration, and moves infinitely closer to the pure state of pictorial "fact" which has nothing to narrate. The fact is the constitution or reconstitution of a haptic function of sight' (Deleuze 2005: 93, my emphasis). In this Deleuze fails to recognise what occurs when abstraction is engaged – rather than 'avoided' – to similarly (non-figuratively) the transgressive tenets of colour.[2]

He identifies the disruption with representation in the way colour is used for the *reconstitution* of a precedent, principle sensation, which Deleuze names the 'haptic function'. This term refers to a particular modulation of space and colour in painting, which causes the multi-sensuous dynamic evident from affective works of art, where lines and colours raise the visual sensate, burst their dimensions, so that one can, as Deleuze names it, 'touch with the eyes' (Deleuze 2005: 109). This idea refers to an encompassing rendezvous with a painting, when colours strangely become tactile values, as optical and tactile senses of space interact and commingle, stimulating that tacit, trembling trait – 'saisir sur le vif' (Deleuze 2005: 97).

Haptic refers to a type of vision distinct from the optical that alludes to or evokes the sense of touch. By engaging with the haptic as our most primary sense, Deleuze draws upon Aloïs Riegl (Deleuze 2005: 138, n. 2). Deleuze depicts how Bacon's f/Figures, by rupturing representation and their figuration so violently, provoke sensations that reconstitute this precedent, haptic sense. Being convoluted, agonizing, isolated, raw – in their crucifixal, masochistic, drug-induced ferocity – these f/Figures break through their contours, transcend what holds them down and exist as similarly brutal sensations which emerge from the colours' interplay with the canvas. They build (or 'reconstitute') the figure, in order to strangle this level of reality and create a Figure that extends beyond its visual shape and pushes boundaries to the limits of form. This is what prompts such palpable impressions in the viewer.

Meanwhile, Deleuze infers that abstraction neither deconstructs nor reconstitutes, but rather bypasses representation, without engaging or

forming a haptic sense. He argues that expressionism produces a purely manual sense of space, whilst abstract paintings consist of merely optical space, together posing a tactile-optical duality, which is what the Figure surpasses by its engagement with haptic sense (Deleuze 2005: 72–93).

But this is problematic with regards to Kandinsky's abstract paintings, which are particularly renowned for their multi-sensuous, synaesthetic scope and span, and for reaching far further than their flat, visual dimensions. Margaret Olin identifies what Deleuze terms and impresses here as 'haptic sense', from Kandinsky's early abstract art, and offers what seems a similar argument to that which Deleuze takes to describe the Figural paintings of Bacon. Olin also engages with Riegl on the haptic sense to emphasise how and why touch is the most primary sense that can, as a sensuous affect in a painting, break from the duality of tactile-optical senses of space, and the duality posed between the 'abstract' and the 'real' in art genres (Olin 1989: 165). Olin describes how, from the haptic sense invoked by his paintings, Kandinsky is 'grasping reality' (Olin 1989: 155). Such a description of Kandinsky's affective abstraction would surely compliment and augment Deleuze's *Logic of Sensation*; or, rather, Kandinsky's abstraction itself would, had Deleuze considered it sufficiently here (Olin 1989: 144–72).

Deleuze's description of the primary task of the painter as one of 'capturing forces' remains central, and is consistent with Paul Klee's much cited mantra that the purpose of art is 'Not to render the visible, but to render visible' (Deleuze 2005: 40). Deleuze's aesthetics of force is central in his construction of Figure, since it is the forceful vibration, from the application and rhythm of colour, which interconnects and is mechanised to induce sensation. This makes the aesthetic encounter an affective *event*. When Deleuze states that 'Painting's eternal object is this: to paint forces' (Deleuze and Guattari 1994: 182), he wants to engage with this power of surging affect, and the life-force that paintings seem to mobilize, in his own philosophical creations of concepts.

In *Logic of Sensation,* Deleuze tries to explain why in the case of Bacon a Figure the same shape as a figure, or the human body, can break out of that representative, figurative shape to become Figural fact rather than (mere) illustration. This seems awkward; as concepts are formed and figuration is ruptured, Deleuze seems to recreate the kind of chaotic violence or disorientating hysteria that he describes of the act of painting and sensing art. By saying that 'the pure presence of the Figure is indeed the reconstitution of a representation, the re-creation of a figuration', but only to break out of it, it is as though Deleuze means to conceptualize the disorientating twist and manoeuvring of limits,

and the effort to destructively challenge form and boundaries (Deleuze 2005: 68).

But the question still begs, when is figuration sufficiently broken down to make it something abstract? How can an image no longer be representative, and yet not something abstract? How can a devastated, reconstituted figure not remain representative? How can any term accurately describe what is occurring here?

The somewhat bewildering impression set between figuration, the Figure and abstraction fits (in its displacement) with the 'abyss', 'chaos' and 'catastrophe' that are central notions in the *Logic of Sensation*, and describe an essence that lies at the heart of all creative acts. Deleuze postulates that to paint is to 'plunge into' and release this incommensurable, unknown essence, or chaos (Deleuze 2005: 72–3). This composes Francis Bacon's trademark, the chaotic 'brutality of fact', which is what Deleuze is trying to conceptualise. He focuses particularly on the issue of chaos, both in terms of sensation and the act of painting itself, because it produces a rapid movement passing beyond representation: 'Art struggles with chaos . . . in order to render it sensory' and, in the quest for this, 'the painter must confront the chaos and hasten the destructions so as to produce a sensation that defies every opinion and cliché' (Deleuze and Guattari 1994: 204). It is this rupturing of *cliché*, another representative term that refers to the underlying diaphora, which brings the artist into contact with the pre-existing and the incommensurable. Such movement provides the vibration that resonates as sensation, so that the artwork becomes a 'plane of composition', which constitutes 'a chaosmos, a composed chaos – neither forseen nor preconceived' (Deleuze and Guattari 1994: 204).

How the painter renders this chaosmos, as the confrontation with chaos, is plotted by Deleuze as a 'diagram'. Deleuze argues that the diagram provides the central, non-coded formula of the painting, which "acts as an agent of transformation" between the figurative form and the Figure (Deleuze 2005: 109). The diagram thus acts as the nodal point from which the artist's confrontation with chaos can be materialised, and then move into the forceful affective sensation evoked by the painting. In circumscribing the diagram Deleuze seems to provide or intend a topography of Figural sensations, as though trying to pin down this movement and the evasion of form, in order to define a concept that can install a machine.[3] In the *Logic of Sensation* he describes this as something specifically applicable to a certain type of painting, exemplified and illustrated here by Bacon. This calls for critique,

since the nature of the concept Figure surely lies with disrupting such particularity, in bursting boundaries and transgressing representative types, existing as affect 'bloc' or assemblage of sensations (Deleuze and Guattari 1994: 164).

Deleuze firmly condenses his account of artistic methods, in relation to their rupturing representation and confronting chaos, by considering only three particular modes or genres – the Figure, expressionism and abstraction. He describes how the Figure builds the framework of a diagram, which dissolves the tactic-optical duality into a haptic function, thus allowing the term to burst into its capitalisation, as the paint bursts its figurative shape. Alongside this expressionism and abstraction are categorised according to how they respond to and paint the 'nonfigurative chaos' that Deleuze describes as inherent in attempts to disrupt representation, and also how this is balanced in relation to the overall 'pictorial order' of a painting. To rupture through representation and reach pure fact requires confronting and 'deploying' chaos as a catastrophe, and creating from this a 'pictorial order' and rhythm which maintains and provokes this in terms of *sensation* (Deleuze 2005: 37, 72).

Deleuze moves from colour to space, describing how abstract and expressionist attempts to transgress representative space through their respective 'linear' or 'frenetic' styles. He argues that they each produce, separately, merely senses of manual or tactile and optical space (which raises the tactile-optical duality), thus remaining either, in his words, 'a simple symbolic coding of the figurative' or a 'veritable "mess" ', whilst the Figure bypasses both to attain direct sensation (Deleuze 2005: 77).

iii) Sources and origins of this term and its application

The theoretical sources of Deleuze's Figure demonstrate the conceptual ground of this term, which illustrates clearly the way the *Logic of Sensation* is responding conceptually to the central problem that spreads across modern art and philosophy, namely the thesis of rupturing representation via sensation. At the beginning of *Logic of Sensation* Deleuze refers to Jean-François Lyotard's notion of the figural, as a key source for his term Figure (Deleuze 2005: 125, n. 1). These two terms are intricately linked by their shared intention to break out of the figure as a representative construct. This remains a complex predicament since both terms still use that word, figure, to indicate a fissure and reverse the meaning by capitalising it. Both terms involves a subtle, technical and complex argument that is trying to categorise a space or event

(as a work of art) that perturbs form, in seeking a force or sense of existence that evades or precedes representation.

Lyotard's term weaves a critique of both Saussurean structuralism and phenomenology from Merleau-Ponty to describe the corporeality of the world encoded by structuralists and suggest the framework for a new post-structuralist, discursive dimension using Freudian libidinal forces (Lyotard 1983: 333–357). The significance of this for Deleuze lies in how Lyotard *shifts* the binary, representative model held within a figure or discourse, as visual image or rhetorical text. He does this by conceptualising a radical and disruptive manifestation of space that cannot be represented, or representative. The point is to replace or displace a representational, dialectical system based on semiotic code or opposition with a momentous plane that encompasses an immanent topography of the incommensurable.

Deleuze does not follow Lyotard's Freudian route to the unconscious or desire, nor his wider consideration of abstraction, but what he takes from the figural is the intention to rupture representation and delineate a new sense by engaging forces. From these Deleuze wishes to create an intensive threshold that can, as Bogue argues, 'delineate a space of sensible autonomous forces' (Bogue 2003: 116). But Deleuze, in 'delineating', compartmentalises this 'space of sensible autonomous forces' – allowing his Figure to provoke or construct whilst *deconstructing* this. Abstraction, meanwhile, is quarantined as unduly cerebral and unaffecting.

To build his Figure from Lyotard's figural, Deleuze takes the idea of force or affect and returns to the ancient meaning of *aesthesis*, where aesthetics or art concerns *sensation*. The figural concerns desire for Lyotard, while the Figure concerns sensation for Deleuze. Lyotard's figural remains in the psychological realm of fantasy or desire, while Deleuze's Figure involves a phenomenal, bodily space, and specifically the nervous system. Deleuze thus seems to reach back to the phenomenological roots of these 'Figure/al' terms and the Greek notion of aesthetics. A Merleau-Pontyian 'chiasm' or flesh entails a more Figural weight for his purposes than Lyotard's underlying erotic or political ideology. In this he relies heavily on Henri Maldiney's theory of rhythm and sensation, which connects sensations to art and force, through Erwin Straus's psychological analysis of sensation and perception.

Maldiney's phenomenological, psychoanalytical analysis of art in terms of sensation, rhythm and confronting chaos is significant to Deleuze in a number of important ways. *Regard Parole Espace* begins by asking the very question that grounds Deleuze's *Logic of Sensation* – the

quest to rupture representation brings, by Maldiney's analysis: 'The false dilemma of painting: Abstraction or Reality' (Maldiney 1973: 1, my translation). Deleuze takes from Maldiney the importance of sensations in attempts to 'surpass' this dilemma, and also Maldiney's assessment of abstraction.

Deleuze's term for abstract expressionism, 'art informel', appears to come directly from Maldiney's *Forme et Art Informel*, and has its own complex definition, relevance and historiography (Deleuze 2005: 73; Maldiney 1973: 102).[4] Deleuze's account of 'abstraction', which considers Kandinsky and Mondrian, also seems to have come straight from Maldiney. Maldiney's 'art informel' in fact seems to fit with Deleuze's 'abstraction' more than his 'expressionism', which is confusing, unreferenced and raises difficulties around what they are both trying to describe. The influence of Maldiney thus poses problems for the clarity of Deleuze's *Logic of Sensation*.

II. Critique: Abstraction alongside Figure in Deleuze

i) Figure versus abstraction

Deleuze's Figure relates to affect, the form connected to a sensation and the violence of this sensation, rather than its figurative shape, so evidently a Figure does not have to resemble a figure to transgress this and convey sensation. Deleuze contrasts Figure with abstraction (describing Figure as the 'more direct and more sensible' path to transgress representation), which remains within the tactile-optical duality that the Figure alone, here, is said to have 'surpassed' (Deleuze 2005: 8, 113).

It is important to notice the careful precedence that Deleuze gives to art that fits with his Figurally disruptive purposes, over any 'abstract' art, which he does not consider sufficiently here. Deleuze's take on abstraction owes a great deal to Maldiney's aesthetics as has been seen. Maldiney describes and labels Kandinsky's abstraction as 'The expression of an authentic Euclidean aesthetic' governed by tension, one made in the effort to liberate form from its material structure and initiate some higher, spiritual existence (Maldiney 1973: 108–9).[5] Deleuze clearly takes this into account when he describes how 'abstraction' deals with chaos. It is, he says, 'a path that reduces the abyss or chaos (as well as the manual) to a minimum: it offers us an asceticism, a spiritual salvation' (Deleuze 2005: 73).

They both read this by limiting the notion of 'abstraction' to the Euclidean, geometric lineation supposedly synonymous with Mondrian

or Kandinsky. Abstraction, on this model, in its efforts to rupture representation, produces not a *diagram*, with the haptic, sensuous connotations that are found in Deleuze's Figural paintings, but, he argues, a 'purely optical space' which 'can easily become a simple symbolic coding of the figurative' (Deleuze 2005: 73, 77).

Deleuze denigrates abstract attempts to reach beyond representation by claiming that the abstract code, in his words, 'is inevitably cerebral and lacks sensation' due to the supposed (rather than proven) fact that such geometric forms have no affect on the nervous system, but rather promote (mere) cerebral effects on the brain (Deleuze 2005: 76).[6] In Deleuze's sense of abstraction there are no sensations and such works remain figurative, meaning superficial, whilst the non-abstract figurative work of Bacon destroys figuration to become Figural. This is all gauged in terms of *sensation* and encountering intensive forces in the nervous system, but Deleuze's argument is unclear since Figure seems to point towards something abstract, whilst abstraction is posed as figurative.

Meanwhile 'expressionism', which for Deleuze is just abstract expressionism epitomized by Jackson Pollock, takes the opposite direction – rather than producing an optical code in reaction to chaos, now chaos is exploded until, he says, the entire canvas becomes an 'optical catastrophe', composed by and of 'manual rhythm' (Deleuze 2005: 75). So in abstract form, with its two tight components of 'abstraction' and 'expressionism' Deleuze presents a duality – the hand/eye or manual/optical duality that he finds throughout the history of Egyptian, Byzantine or Gothic art, so it thus remains largely representative; whilst he carefully positions Figure, with the paintings of Francis Bacon, to break out of it by its composition of the haptic function and diagram, and, primarily, because of its affective sensations.

All this is riddled with contradiction, which is exactly what the Figure is trying to deconstruct, which Deleuze says abstraction bypasses. For Deleuze, abstraction, in response to this same intention of solving the contradiction, has the effect of reducing and reconciling the continued confrontation with chaos, and in so doing passes over, rather than truly, violently grappling with it as Bacon's Figures do. In this it produces *analogy* rather than direct, sensuous (Figural) fact.

Deleuze describes Kandinsky's paintings as though they build what he calls a 'digital code' made from certain shapes, lines and colours, which brings forward a (misguided) image of Kandinsky's paintings that he defines as 'vertical-white-activity, horizontal-black-inertia' (Deleuze 2005: 73). Deleuze argues that these works intend to salvage man from what he calls 'the abyss' of chaos, and offer 'a spiritual state'

within this superficial, optic space. He takes it further to say that in so doing Kandinsky is still reliant on the material form that he wishes to disrupt, and to refute objective form is to refute what is binding, which is impossible. Though such art believes it has 'escaped' its inherent contradiction it has in fact merely confirmed it. Therefore, in Deleuze's *Logic of Sensation*, following Maldiney, Kandinsky neither disrupts representation, nor produces sensation, nor even constructs an effective code. This is placed in significant contrast to Bacon and Deleuze's term Figure, which connotes the disruption of binary boundaries by Figural disfigurement, as sensation.

Trying to source this inaccurate analysis of Kandinsky, the 'linear tension' ascribed by Deleuze can be seen from a late phase, around the time that Kandinsky worked at the Bauhaus, 1922–33, when his work was indeed characterised by geometric abstraction. This can be seen from specific works such as 'Composition VIII' (1923) and throughout his woodcuts and etchings of this time (Kandinsky 1994: 770).[7] These works are characterised by the tight lineation and geometric syntax synonymous with Kandinsky's later constructivist style,[8] where 'tension' is a dominant tool. Kandinsky documents this in his 1926 'Point and Line to Plane' (Kandinsky 1994: 573). These paintings present a sense or function of order that seems compatible with Deleuze when he postulates that abstract works seek to turn 'chaos into a simple stream we must cross in order to discover the abstract and signifying Forms' (Deleuze 2005: 73).

Thus a late Kandinsky or Mondrian, summing up Deleuzian 'abstract form', perhaps raises a barricade over representation rather than rupturing through it Figurally. Although abstraction is non-representational and nonfigurative in shape, from such narrow, singular examples it might seem to provide an optic code that steps over or bypasses figuration rather than wrestling with and deconstructing it to reach Fact, in stark contrast with Bacon's spasmodic Figures.

But this involves a sweeping, selective compartmentalization that raises the very boundaries which Deleuze's Figure intends to rupture. In defining how his term Figure ruptures through representation via sensation, Deleuze cuts off a vast source of Figural energy that can be found in or received from abstract art. As Rodowick argues in *Reading Figural Form*, for Deleuze abstraction *martyrs* representation, rather than violently destroying it (Rodowick 2001: 23). From Bacon's masochistic figures, Deleuze's Figure becomes a post-structuralist, deconstructive agent that rips up and regurgitates representation in terms of 'the brutality of fact'.[9] On the other hand, the abstract form from

Kandinsky remains a modernist, superficial, optical bypass, avoiding the (disruptive) point.

But the regenerative or spiritual function that Deleuze categorises as 'abstraction' cannot be precisely sourced from the particular geometric art that he considers. This function is more akin to Kandinsky's earlier works, from around the time of his *Concerning the Spiritual in Art*, than his later, more technical, geometric manifesto. Deleuze cites the earlier work in the notes of his *Logic of Sensation*, but by the time of Kandinsky's geometric phase this intention has moved towards a more scientific – Kandinsky himself terms it – 'theoretical examination', examining 'tension' and 'direction' in order 'to discover the living, to make perceptible its pulsation, to establish the law-governed nature of life' (Deleuze 2003a: 192, n. 18; Kandinsky 1994: 672, 573). In *Synthetic Art* (1927), Kandinsky writes about 'the most extreme contradictions' and 'catastrophes' which defined the time of his life, which he said 'can be characterized by *one* word: *chaos*' (Kandinsky 1994: 710–713). He felt an 'inner necessity', as an artist, to confront such chaos, Indeed, Kandinsky's oeuvre seems to evolve around confronting the same chaos that Deleuze says his art avoids or bypasses.

His earlier paintings, contemporary to *Concerning the Spiritual in Art*, demonstrate a colossal confrontation with this chaos, which surged from the evolution of abstraction that he pioneered with the intention of breaking through representation. Moreover, he described the purpose of painting as: 'Like a thundering collision of different worlds that are destined in and through conflict to create that new world called the work . . . by means of catastrophes' (Kandinsky 1994: 373). This produced a very different style of abstraction to how Deleuze terms it, from later linear works, which seem to be both retreating from and trying to order the earlier confrontation. There is no 'simple stream' to cross, but a Deluge of sensations to contend with.

ii) Abstraction as Figure

This can be seen in Kandinsky's *Composition VI*, *The Deluge* (1913).[10] Placing this towering painting within Kandinsky's volcanic oeuvre and watching his various stylistic changes and phases narrate his encounter with this new sense of the world and new visual language that abstraction brought. This constitutes a bold effort to rupture through representation and reach pure, essential form. In that, this abstract painting resounds with Deleuze's *Logic of Sensation*. It *throbs* a summit

of this intent and the need to rupture representation, rather than any Deleuzian 'digital code' assigned to typify all abstraction and can be directly compared to or described by the way Deleuze forms his term Figure, from its rhythmic composition, sense of engulfing space and vibrating colour that seems to explode off the canvas as sensations that shudder, erupting what seems to be that same 'brutality of fact' as the convoluted f/Figures of Francis Bacon.

It is hard to describe this painting since it is not representative, and does not look like anything figuratively recognisable. It is loaded with smouldering primary colours – a blue that moves to turquoise, organic green, with tinges of red – which are propelled into a thundering, dark rhythm by long black lines which leap across to mould the enormous canvas, raising a stave that seems to yelp in this new, incommensurable sense of space and form. Kandinsky's painterly dexterity applies a diagonal pace in thick brushstrokes, revolving a rhythm that is constant yet staggering in its effusive affective dimensions – provoking sensations as colours tremble and leap from their ground. Following the fluid gestures and contours that command the canvas, the textural network of interwoven colours erupt in what seems a crushing, crashing response to the world, a breaking through figurative motifs to reach the world itself.

The conflict between figuration and abstraction fuels this, for the viewer as much as for the painter. Near the bottom of the canvas, on the right hand side, there are grey-tinged lines that seem to form a digital gesture trying to grasp reality, but this is constantly shifting and slips away into the abstract visual whole, as colour flicks into a cobalt tint, pressing inside and rumbling within this disruptive, Figural space.

This abstract painting seems to present a Deleuzian (not delusional) Figure. It demonstrates the artist's tsunamic skirmish with the discursive barricades of representation opposing the incommensurable chaos, producing the ineluctable diaphora that shapes the problem of modern art and philosophy. The abstract painting bursts through this. Here is, to use a Deleuzian or in fact Guattarian (certainly this becomes more prominent following Guattari's input) term, a *chaosmos* – as the work shudders sensations, extends its dimensions and provides an all-encompassing aesthetic experience that seems to engulf the viewer into this unknown, chaotic space. As such, this work presents the diaphora, rupturing through material and representative constraints by existing like a Deleuzian 'bloc of sensations' – which one receives as a result of this piercing dynamic, vibrating through the colours.

Diaphoric dichotomy remains the source of these sensations, and provides the work of art as they disrupt it. Kandinsky wrote about his continual conflict with this – he termed it as a battle between 'Spirit' and 'matter', 'external impression' and 'inner sound' (Kandinsky 1994: 385–8). These conflicting oppositions provided an energy which fuelled him to paint, which 'trembles' between them (Kandinsky 1994: 385–8). From this confrontation there erupts 'The Deluge', as a painting which can pose the counterpoint to the Figure by demonstrating how the *Logic of Sensation* exceeds over the boundaries of this concept. The way Kandinsky engages chromatic effects to produce sensuous affects confronts dichotomy, since he meant to dissolve and resolve conflictive binary forms (between abstraction/realism, matter/spirit, subject/object) with his evolution of abstraction. Kandinsky wrote at length about the importance of colour, and his whole oeuvre can be described as one bursting from the myriad or cacophonic crescendo of colours that break out of objective form or motif into abstract, affective shapes on the canvas. He continuously describes colours in terms of their composition as 'vibration', and their 'enormous power, which can influence the entire human body as a physical organism' (Kandinsky 1994: 159).

As Kandinsky shifts between percept and concept (a method which seems, again, ironically Deleuzian), driven by an 'inner necessity' to find and paint essential form, he poses what Deleuze defines as 'the general fact of modern painting' and seeks from this abstraction to answer the question, which was (and still is): 'how to pass from the possibility of fact to the fact itself?' (Deleuze 2005: xiv, 112).

Margaret Olin's description of Kandinsky's abstraction as 'validated by touch' is useful in thinking about how this painting seems to appropriate a Deleuzian Figure (Olin 1989: 165). Her argument seems to fit with Deleuze's consideration of the haptic sense, how it activates the Figure and transgresses or ruptures the tactile-optical duality. Both Olin and Deleuze describe how the haptic function can offer a primary, raw, visceral sensation; which is what Deleuze says 'seizes hold of life' in Figural works of art, or, in Olin's words, is 'grasping reality' in Kandinsky's abstraction (Olin 1989: 155). Thus, from the haptic sense evoked by both Francis Bacon's f/Figures and Kandinsky's abstraction, representation is ruptured through, and in sensing this motion one can *touch reality* as Figural fact.

Though Deleuze approaches his theory via the arid colours in Bacon's destructive, blood-shod figures, whilst Kandinsky writes with idyllic, synaesthetic passion about his 'inner need' to paint 'the harmony of

colours... touching the human soul', colour remains the continuous essence for both Kandinsky and Bacon – as a vibrating force that ruptures any compartmentalisation by inducing sensation (Kandinsky 1994: 160). By rupturing through representative form and erupting an abstract myriad of colours that shake in response to this, Kandinsky's Deluge bursts through the constructed, constrictions posed by figuration. In this the surface of the painting emanates sensation. It is as though material form has dropped out and the abstract composition is the *surface*, no longer attached to an object, now the epicentre, the nodal point, the moment of energy that moves from the painting as a static object, now a bloc of sensations, into the nervous system of the viewer. The surface is where the diaphoric dichotomy in its different forms, between essence and appearance, the tactile and the optical, abstraction and figuration, disintegrates in the immanent sense of interaction. This occurs as the surface vibrates from the rhythm of the painted colours, which resonate from the canvas. By rupturing through representation in this way the binary disintegrates, figuration or appearance is dropped, and Kandinsky's abstraction is no work 'divorced from reality', as Hegel's description defined abstraction at the beginning here. It is as though, standing here with these chaosmic sensations, this *is*.

Kandinsky believed that as a consequence of his evolution of abstraction he had found the essence of matter in spirit, and so concluded: 'What thus appears a mighty collapse in objective terms is, when one isolates its sound, a living paean of praise, the hymn of that new creation that follows upon the destruction of the world' (Kandinsky 1994: 388). In these sensations he perhaps postulated (or, in Kandinsky's terms, *felt*) that by rupturing through or destroying representational form he had found essence and could truly seize hold of life.

Although there is more catastrophe than resolution here, almost immediately following the epiphanic shuddering in 'Composition VI' Kandinsky's colours darken and the lines contract into a more modernist, geometric abstraction, which seem to retreat aesthetically. Early, plump colours and eruptive energy shifts to an ordered, tight tonal range and structural design, which appears to be a reaction to and retreat from what he unfolded and expressed by his early abstract works. This is where Deleuze finds the 'optic code' by which he labels all 'abstraction'.

Now, returning to Francis Bacon, by looking in particular at one painting – *Head VI* (1949) – one can see just how Bacon's f/Figural painting (and thus, Deleuze's concept) directly corresponds with Kandinsky's abstraction.[11] This is quite a small, sketchy painting of the head and shoulders of a figure set within a cuboid structure marked

out by thick white lines. The resulting image is of a man, whose upper head and eyes, lower arms and hands are cut off from view. The image is inchoate, unfinished and ephemeral. It shows a spatial likeness of, and was influenced Diego Velazquez's *Portrait of Pope Innocent X* (1650), an image that Bacon was 'obsessed' by according to his official biographer Sylvester (Sylvester 1975: 24).[12] But this image is no mere representative copy. It lightly inhabits the canvas, painted on the less absorbent unprimed side, hence the finish is dry with a granular texture. It is remarkable how the brushstrokes, quickly grazing the ground, erupt and leap off it – not as a figurative illustration, but an *abstract*, tactile, aural shudder which hauls in the viewer to become participant. Looking at the shape, resounding between the paint and canvas threads which wobble as light shifts through the sharp undulations, the figure itself screams. So on one level this sound can simply be 'read'. Bacon professed a fascination with the shape of the open mouth and said 'If you scream, you are always prey of the invisible and incomprehensible forces which obstruct every spectacle and which even exceed the pain and the suffering' (quoted in Oosterling 1988: 101).

His success is that there is no obligation to 'read' and project how this mouth releases the sound reacting to this pain and suffering, for it opens a void as the black paint sucks the canvas, leaps off that ground and reverberates through the muscular tension around the chin, the neck, the rippling shapes on the cape, hitting tight teeth, tinged with white, blurred to grey and then dripping. Such depth and resounding interplay around the entire canvas transforms a sketchy image into a powerful yearning which pulls you in. Whether this is because the basic image resembles, and so enables the viewer to project further dimensions and sensations by triggering their own experiences or fantasies, or that Bacon's paint together with the forms it shapes on the canvas, stimulates a haptic, aural vision that encompasses the raw, fundamental, primal senses that define this artist's violent mastery, either way the paint touches us with powerful sensations.

The painting is somewhat mediated by being cut off from the viewer with glass, which wobbles reflections that demonstrate the viewer's involvement and increases the visceral, ambivalent reality that vibrates on so many different levels. The figure itself is cut off by a square, linear 'space frame' that Bacon uses as a compositional, technical device, but also presents an essential part of what is going on here. The Pope screams, he has no eyes or hands – he cannot see because vision is subsumed – this is more mirage and visceral than any conscious image. He is caged by a cube and as though also by a fate – staged here

aesthetically as one walks past to engage with what seems suffering here. This stimulates senses from *abstract*, emotive forces within the figure – haptic, aural affects at the pain, horror and terror implied and provoked by the scene. It is as though the Pope is trying to leap off the canvas, escape his incarceration upon a Velazquezian, gold tinged throne, or more fundamentally, to leap from the flesh and blood – *the figure* – that tie him down there. The device of the cube seems to construct, yet deform and make monstrous, the figure and enclose a threshold of surging, pulsating forces. One can see the Pope straining and screaming, charged and deformed with these forces. They seem to encase a space (in extension and duration) in the painting – as the nodule of potential intensities that can purvey every aesthetic encounter. This act conceptualized is a Deleuzian 'Body without Organs'.

Bacon's paintings break through their figuration by erupting emotive, sensuous affects that seem composed of a frustration or terror at remaining trapped by their external reality, always trying to rupture that – hence so injured, so mortal, such pain, *disfigured*. Deleuze postulates that by capitalizing the word *Figure* he can redefine the term and convey how Bacon's figures paint 'fact' and transcend their figuration by stimulating such acute, intense sensations that tear through their representative shape. And yet these sensations occur in what remains the overall, immediate shape of a figure, touching viewers by their *dis*figurement, their attempts to go beyond the figure and the raw 'injury', 'violence' and pain at remaining entrenched to bodily form. For Bacon himself it certainly attunes to his life experiences, marred by troubles with gambling and alcoholism. That is important because he wanted to paint mortality, vulnerability, 'the violence of reality', the 'brutality of fact' (Sylvester 1975: 81). It is as though he wants to escape these, and from the human body that traps him too, hence his figures are painted with such mutilation. For they are thwarted by their figuration. It is as though, as one commentator astutely recognises, 'The spirit drowns in the flesh' (Oosterling 1988: 1).

The abstract, emotive charge of this painting, in affect, propels a dynamic that shifts its figurative genre by bursting through the surface of the painting, tearing through the skin of the figure, and bringing immanent sensation to the viewer, as described here. This rupturing at and of the surface corresponds with what was felt from Kandinsky's 'Deluge', and Deleuze's *Logic of Sensation*. Thus, by juxtaposing Kandinsky and Bacon one can defy and shift the discursive dichotomy pronounced by their genres of abstraction and figuration, which meet in the same intent and Figural, sensuous affect. The terms or genres of

abstraction, figuration and the Figure are now confused, since Deleuze's Figure raises the very boundaries which his *Logic of Sensation* ruptures through. This is shown by Deleuze's tight, complex definition of Figure as separated from abstraction, when sensations from both (and thus, their Logic) demolish this division. In this confusion there is convergence in the incommensurable new space at the surface, where both abstraction and the Figure have ruptured through representation and produced sensations. This surface disintegrates the dichotomy and provides an open interface, defined by sensation.

III. Critique: Abstraction and Figure converge according to the *Logic of Sensation*

i) Convergence

Bacon's paintings provide an apt source and illustration for Deleuze's concept Figure, but they also remain largely figurative works, and so themselves set up the very binary that Deleuze poses between these two terms. Those sensations which indicate the rupture of figuration seem provoked by the contorted figures' pain at being *unable* to be freed from this form, hence so *dis*figured, rather than breaking out of it. Considering these, theoretically, alongside Kandinsky's abstraction poses another binary situated between the opposing genres of abstraction and figuration, whose antagonistic connotations express a primordial, diaphoric essence that is confronted and addressed throughout modern art and philosophy as the quest to rupture the Platonic notion of mimetic representation.

Within Deleuze's argument Bacon and Kandinsky are juxtaposed for their differing responses to this aim, which extends to form that overriding 'binary logic of dichotomy' (which was described at the beginning of this paper) visible in these painters' efforts to break through figuration and present a new sense of essential form (Deleuze and Guattari 2004: 6). Enunciated in such dry words, this monumental intention loses the sensuous, rippling and thunderous affect that resounds, means and directly *is*, which can be immediately received when standing in front of these great works of art. Deleuze describes how this is so with Bacon's f/Figures, showing how they break through their figurative shape (as though ripping through the skin) to exist as a violent sensation, which he uses to define the concept Figure. Concurrently, though, he passes over Kandinsky's abstract efforts to achieve the same aim, arguing that this Russian painter bypasses figuration, and produces

an ineffective, unaffecting code rather than any sensuous, violent fact. This division presents yet another contradiction in Deleuze since it attends to that same kind of thinking which both artists wish to break free from and which Deleuze intends to rupture through by presenting a new kind of logic, a sensuous logic. The way he does this is fraught by his placement and encasement of the rupturous concept Figure, which the *Logic of Sensation* that it is based from and is the true insight here, overflows.

And so the aching, irresolvable diaphora seems clings to every attempt to abscond it. However, these oppositions which intertwine it come to converge and unfold at the surface. Here is that rupturing dynamic, the moment of energy transmission and interaction – where coloured paint conjugates a vibration and rhythm from and with the canvas, which ruptures through its objective form so that the artwork exists, as Deleuze and Guattari conclude in *What is Philosophy?*, a 'Monument' of 'sensation' (Deleuze and Guattari 1994: 164). That this is the nodal point for rupture and convergence emphasises the diaphora by providing another paradox, but at the surface is an interface or equator between these opposites. This is the new kind of logic – the sensuous, forceful logic, at which, as Deleuze defines, is 'the frontier, the cutting edge, of the articulation of the difference between the two terms, since it has at its disposal an impenetrability which is its own and within which it is reflected' (Deleuze 2001: 35).

The common boundary on the surface, which connects but separates, interrelates, and equates these works and their affects, provides the interface for the diaphora. This seems to unfold its 'primal strife' and expose that ineluctable, incommensurable chaos that provides such a compelling, provoking, visceral experience when one looks at Kandinsky's cacophonic colours' crescendo and Bacon's disturbing, beautiful f/Figures. There is a parity now between them, where the surface of the paintings vibrates, provides an immanent interface, or, in Deleuzian terms, a 'plane of composition' (Deleuze and Guattari 1994: 196). Since this occurs from sensations produced as a result of disrupting representation and connecting with chaos, the interface is not just a merely 'logical limit' or 'theoretical distinction' because it is the ongoing affect of interacting with these artworks that defines them. This continues as sensations that connect, erupt and provide a recurrent, dynamic, palpable logic.

Thus these sensations, at the interface, disintegrate or dissolve the division or paradox which separated the paintings (in their divergent genres), which separates us from the paintings (as physical objects which

affect our subjective selves/nervous system), which separates us from the world (the discursive constructs of binary contradiction). Where representation is ruptured – as the dry, smarting paint tears through the skin of Bacon's trapped, screaming Head, and as the thunderous rhythm of Kandinsky's Deluge shakes through what has dried to canvas, so one can receive the chaotic dynamic that vibrates from these paintings, as they resound and seem to envelop in multi-sensual dimensions.[13] There it is that one seizes hold of life.

The binary constructed to separate and segregate disintegrates as the paradox shifts to a parity (which is as unknown and incommensurable as the chaos, and so *is* chaos) – at the surface. The sense of 'twoness' is unfolded and opened, no longer tightly binomial but multiple. In this the diaphora is not synthesised or resolved, but opened. Kandinsky's abstraction shakes – perhaps in terror at the unknown incommensurable that he had found, perhaps from something less naïve since it seems so recognisably empathic. His consequent paintings almost immediately retreat and try to order what had been fractured. Bacon's f/Figures remain trapped and seem pained by their efforts to break from figuration – it is these efforts and their need that tends Figural sensation, rather than a resolution, whilst Deleuze, in describing them both, raises the same boundaries that he intended to rupture through with his concept of Figure.

What is important is the surface, where an interface between antagonistically juxtaposed efforts to confront or resolve this diaphora unfolds to provide a parity or coexistence between them. This provides a sense of *chaosmos* – a word which Deleuze insinuates with his impression of composing or containing chaos via the diagram produced by the Figural composition, and is taken up and emphasised by Guattari in his later writings. Chaosmos brings the sublime sense of an interface, or chaosmosis, between that primal paradox of cosmos and chaos, which is set up for us in these paintings.

ii) Conclusion

The Figure represents Deleuze's attempt to conceptualise this profound, necessary sense of being and the world, but also the inability of any such conceptual categorization to contain this fundamental dynamic. Any firm distinctions posited between the genres of abstraction, figuration and the Figure dissolve, just as when paintings disrupt their boundaries, as sensation. Deleuze's *Logic of Sensation* depicts this sense of sensations, but his constrictions to abstraction and the Figure within

this overflow these, and demonstrate that they cannot in fact be captured in this way.

This suggests that Deleuze's term, or *any* term used to differentiate and segregate genres, such as figure, Figure or abstraction, cannot accurately survey those paintings and sensations that they refer to or categorise. Capitalising a word does not seem to engender or ensure its transcendence of meaning, and it remains questionable as to whether or how any term can acquire sufficient dynamism to encompass and follow the shifting sensations that it intends to refer to. Perhaps the Deleuzian Figure exceeds its concept, and so Deleuze has created an aesthetic notion in rendering the *Logic of Sensation*, which surely extends beyond his book on Bacon. Certainly the critique provided here could be seen to show this, and in using sensations to critique their Deleuzian Logic one can see an extensive, explosive aesthetic of affective art. In this the diaphora, unfolded, remains – with and from those sensations' 'brutality of fact' that one can receive from Figural, abstract or *any* affective works of art. Deleuze invokes this, but his argument falls down owing to his problematic separation of Figure from abstraction. It is the sensations – gained not from logic or labels but from the artworks themselves, whose work it is to connect, affect, disrupt – that are immediate when one stands to look.

This then moves from a complex philosophical or art critical analysis to a basic reception of sensation. Here Guattari's psychoanalytic understanding moves Deleuze's *Logic of Sensation* away from the problematic, semiotic term Figure (swashed by Kandinsky's Deluge) into an understanding of how the aesthetic experience can rupture through what is named mere 'games of representation', where paradoxes unravel and erupt an affecting, chaosmotic interface which is, in conclusion 'not a question of representation and discursivity, but of existence' (Guattari 1995: 93). Here, as Deleuze and Guattari would say, we sense, and 'seize hold of life.'

Notes

1. The etymological roots of *diaphora*, or διαφορά, bring forward a sense of difference, distinction (i.e. separation and excellence), and dissonance. Aristotle's use of the term in *The Metaphysics* (5, 1013b-10186) shows that the notion of a difference requires that what is said to be different in fact to share the same essence. This shift between difference and essence is fundamental – as shall be discovered, on the concluding sensuous interface, in this paper.
2. With Guattari's input Deleuze considers abstract art elsewhere (e.g. Deleuze and Guattari 2004: 549–51), but his misapprehension of abstraction and Kandinsky in his *Logic of Sensation* raises the need to reconsider the placement of abstraction in relation to his concept Figure, and to think about how this might critique or extend Deleuze's aesthetics of sensation.
3. Indeed, after his work with Guattari Deleuze might even call this an *abstract* machine. Certainly Deleuze's later engagement with abstraction seems more Figural, although this is not clearly stated (hovering amidst the nomadic disorientation of *A Thousand Plateaus*). See Deleuze and Guattari 2004: 549–51; 562–6).
4. Maldiney references this term – 'Art informel', from various sources. He does not instantly link this to Jackson Pollock or abstract expressionism, as Deleuze does, but relates it to 'abstraction' and the future of art, as 'une voie d'acces à l'être'

i.e. art is a way of accessing being – a powerful statement that surely connects with and influences Deleuze's 'saisir sur le vif'.

5. In other words, as a geometric, codified, abstract design. Though not using Euclidean geometry to describe Kandinsky's work, Deleuze clearly takes this model to assign all of 'abstraction', and its differentiation from Figure.
6. But Deleuze's position clearly changes by the time he writes *What is Philosophy?* with Guattari (which perhaps explains this) in 1994. In this work he concludes that 'The brain is the junction' where art, science and philosophy (as 'chaoids') meet, on the plane of immanence. (Deleuze and Guattari 2004: 208).
7. Many plates printed in 'Point and Line to Plane' resemble the curious description of 'vertical-white-activity' that Deleuze describes as Kandinsky's style, following Maldiney. See Kandinsky 1994: 696.
8. Kandinsky did not define himself as a 'Constructivist', differentiating the Constructivist artist with the 'Abstract' artist in 1935. The link is made here in relation to the tight, geometric nature of his paintings produced at this period.
9. The 'Brutality of Fact' became Francis Bacon's trademark, the title of the publication of his interviews with David Sylvester, and also seems to represents the bloody reality of post-structuralist deconstruction.

Two Ways to the Outside

Petr Kouba Charles University

Abstract

Are Lévinas and Deleuze two allies in their effort to break away from the Western ontology, which is based on the logic of the One and the Same, or do their philosophies represent two distant galaxies? The purpose of this paper is not to argue for either possibility, but to show the issue in all its complexity. Conjunctions as well as disjunctions of Lévinas' metaphysical thinking and Deleuze's nomadic philosophy should be dealt with on the background of the problems of sexual difference and human face that play an important part in both conceptions. The analysis of these phenomena shall allow us to see the common denominator of both philosophical conceptions in the relation of thought to the outside, even though they approach the outside in two different ways.

Keywords: the outside, heteronomy, disintegration of the self, multiplicity.

I. The Thought of the Outside

The title of this paper is meant as an allusion to Foucault's essay 'La pensée du dehors', where a strange form of thinking comes into focus (Foucault 1998). The thought of the outside is a way of thinking that leaves behind the interiority of the thinking subject and situates itself in an inherent relation to the outside. This relation to the outside, however, does not mean a relation to an objective reality that is reflected from the subjective perspective. The thought of the outside does not simply pull subjectivity out of its interiority into the exteriority of objective reality. Rather than confronting subjectivity with an external reality that is to be interiorised in the consciousness of the thinking subject, the thought of the outside makes thought leave the realm of subjectivity in a much more radical way: it pulls thought beyond the very limits of subjectivity, it shows these limits from the outside, where the identity

of self-awareness is dispersed. The thought of the outside exposes thinking to emptiness, from which the thinking subject cannot return back to his interiority, for it is there that he irrevocably disappears. But the dispersion of the thinking subject does not imply that thought as such becomes impossible. In relation to the outside, thought is still possible, but only on the condition that it resigns from its autonomy and accepts fundamental heteronomy as its basic disposition. Contrary to the interiority of the traditional philosophical reflection, the thought of the outside is not autonomous, but heteronomous.

Nevertheless, the thought of the outside would be a mere proclamation unless it were based on some experience. If there were such an experience, it would be the experience of the outside. The experience of the outside would prove that the nature of thought is not necessarily autonomous and that there is such a thing as an outside that places thought into a necessarily heteronomous position. But even if the experience of the outside were no illusion, the question remains: how to grasp it? Can we express this form of experience in a way that is adequate to it? How can we preserve the experience of the outside in its purity? Foucault is fully aware of the fact that the experience of the outside eludes reflection because reflection has the regrettable tendency of transcribing the relation to the outside in terms of interiority. Reflection tends to grasp experience as a consciousness of something. For this reason, the experience of the outside can be easily misunderstood as an experience of some external entity, outer space or other will that turns itself against our own will. To prevent such a misunderstanding, it is necessary to concretise the thought of the outside with some examples. In 'La pensée du dehors', the thought of the outside is examined with respect to the experience articulated in Blanchot's notion of attraction, in the emptiness of Sade's desire, in the absence of Hölderlin's missing god, or in Bataille's transgression that goes beyond limits while breaking through the structure of subjectivity. All these experiences are experiences of the outside.

The aim of this paper, however, is not to summarise Foucault's remarks on the various forms of the thought of the outside. Instead of repeating his comments on Blanchot, Sade, Hölderlin or Bataille, we should introduce other representatives of the thought of the outside and on the basis of their work try to articulate basic difficulties and pitfalls of the philosophical discourse that focuses on the experience of the outside. The thinkers we intend to deal with are Levinas and Deleuze with Guattari.

II. Beyond the Autonomy and Unity of Thought

At first sight, it is difficult to imagine two more incompatible styles of philosophical thought than those of Levinas and of Deleuze and Guattari. Despite their seeming incompatibility, however, it is still possible to confront both styles of thinking with each other provided that we manage to uncover a common ground which would allow us to put them side by side. Such a common ground can be found precisely in the relation to the outside, which deprives thought of its autonomy and throws it into the state of heteronomy. Thought can preserve its own autonomy as long as it shields its interiority, out of which it expands and to which it returns with the prey of knowledge. But as soon as it is based on the relation to the outside, it becomes necessarily heteronomous. The affinity between the styles of thinking represented by Levinas and Deleuze with Guattari consists in the fact that, contrary to the main tendency of the Western philosophical tradition, they are not attached to the old philosophical dream in which thought appears to itself as an autonomous process, or a process capable of becoming autonomous. Instead of searching for the ground of philosophical thought that would be inherent to it, they situate thought in the position of the principal, irrevocable heteronomy. While traditional philosophical discourse has the tendency to enclose thought in the dimension of interiority, both Levinas and Deleuze and Guattari attempt to liberate thought from this captivity and to open it to the outside. The answer they give to the question 'What is thought?' is the following: 'A relation to the outside.' Be it a metaphysical exteriority that announces itself as the exteriority of the Other, or the outside of all social systems, territorial structures and regimes of signification, thought is articulated as a relation to the outside that is beyond the reach and capacity of our comprehension.

Within the framework of the relation to the outside, we also find the topic of desire that plays a crucial role in Levinas' philosophy as well as in Deleuze and Guattari's philosophical joint venture. Desire was always understood as an act of thinking that deprives man of his autonomy, reminding him of the fact that he is not self-dependent, but reliant on something else. In this sense, desire corresponds to the elusive and unfathomable nature of the outside that attracts thought all the more it is elusive and unfathomable. But the act of thinking that brings us into a relation to the outside can be called 'desire' only if we do not understand it as a desire for an object. Only if desire exceeds all objects, if it affects us as pure passion, can it express the basic relation of the outside. Only desire so conceived proves to be synonymous with the relation

to the outside. Only then can desire appear as the primordial experience of the outside.

As for Levinas, the original relation to exteriority is expressed as the metaphysical desire for the infinite. The relation to the exteriority of the Other appears here as the desire for the infinite. The metaphysical desire for the infinite differs from the common need that always presupposes some deficit or incompleteness. As opposed to the common need, which can always be satiated in some way, nothing can satisfy metaphysical desire, for it does not lack anything. Metaphysical desire does not mean any lack. The paradox of this desire consists in the fact that it can never be fulfilled, since the closer it comes to its infinitely distant aim, the more it grows. 'Desire', as we read in *Totalité et Infini*, 'is desire for the absolutely other' (Levinas 1991: 34).[1] It is 'a desire without satisfaction which, precisely, *understands* the remoteness, the alterity, and the exteriority of the other' (Levinas 1991: 34).[2] The metaphysically oriented desire longs for the absolutely other that surpasses all familiar and reachable horizons; its strange positivity consists in the unsurpassable distance from the longed-for aim, which never comes out of its exteriority and never becomes our property.

In a similar way, Deleuze and Guattari do not confuse desire with need when opposing the classical conception of desire, which is based on the idea of the lack. Desire, according to them, does not arise from an insufficiency or a lack of something. Neither a material, nor a symbolic object is lacking in desire. 'Desire does not lack anything; it does not lack its object', claim Deleuze and Guattari (Deleuze and Guattari 1983: 26).[3] Instead of being an expression of a deficit, desire is characterised by a surplus and excess. In *L'Anti-Œdipe*, we encounter an effort to release desire from the logic of lack and to bestow on it an excessive character, which marks the relation to the outside (Deleuze and Guattari 1983: 25–8). A positive character, appearing in the excessive nature of desire, is given by the relation to the outside that is constitutive for desire as such. 'For desire does not survive cut off from the outside' (Deleuze and Guattari 1983: 357).

Another important aspect of the excessive relation to the outside is the principle of multiplicity. Advocating the inherent heteronomy of thought, Deleuze and Guattari subvert not only the autonomy, but also the very identity of the thinking subject, which is reflected in the notion of the *asubjective multiplicity*. What is important in this respect is the fact that the asubjective multiplicity is not a mere privation of unity; it does not refer to any lost unity. Yet, to avoid the misunderstanding Manfred Frank commits in *Was ist Neostrukturalismus?*, it is necessary

to realise that the notion of multiplicity Deleuze and Guattari work with not only replaces the principle of unity by the principle of multiplicity, but overcomes the very opposition between unity and multiplicity (Frank 1984). What they are aiming at is not a dualism of unity and multiplicity, but the process of individuation that does not mean any *a priori* unifying synthesis, but a consolidation and a conglomeration of disparate elements. Since such a process of consolidation and conglomeration has its place in the disintegrating leverage of the excessive relation to the outside which no rigid identity can resist, it can never be completed, but must restart again and again.

Another mode of excess that puts in question the abstract dualism of the 'one' and the 'many' comes to the surface when Levinas attempts to describe the phenomena of fecundity and paternity. He argues that fecundity and fatherhood cannot be understood on the basis of the logic that associates Being with unity; they can be made comprehensible only through plurality that, as the basic ontological schema of interpersonal relations, is not to be reduced to a decay or deficiency of unity. The phenomena of fecundity and paternity cannot be comprehended as long as multiplicity is subordinated to unity, or simply opposed to it. It follows from the analysis presented in *Totalité et Infini* that if we are to see fecundity and paternity in their proper light, we must replace the supposition of personal identity by the notion of a self that transgresses its own particularity in order to find itself in its descendants (Levinas 1991: 277, 278). 'The I breaks free from itself in paternity without thereby ceasing to be an I, for the I *is* its son' (Levinas 1991: 277).[4] Although parents cannot fully identify themselves with their descendants, as descendants remain always external in relation to them, thanks to fecundity, they disengage themselves from their own particular identity and find their place in the historical line, where discontinuity and multiplicity rule. This is why we can say with Levinas that 'fecundity evinces a unity that is not opposed to multiplicity, but, in the precise sense of the term, engenders it' (Levinas 1991: 273).[5]

III. Metaphysical Desire versus Productive Desire

All the abovementioned structural analogies, however, should not overshadow the fundamental difference between the way Levinas conceives of the thought of the outside and the way Deleuze and Guattari expose thought to the outside. In both cases, the outside is experienced through desire, but this desire is not always viewed in the same way. Keeping in mind the fact that in both conceptions,

desire mediates the relation to the outside (in fact, it is a basic medium of this relation), we can grasp the difference between them as a distinction between metaphysical desire and productive desire. Although the Levinasian explication of fecundity seems close to the notion of 'desiring-production', in which Deleuze and Guattari connect desire with the process of production, its difference is too obvious to be ignored.

Forasmuch as, in *Totalité et Infini*, fecundity is described as a relation, in which the self transcends its own limits without merging with the exteriority of descendants, it is not surprising that the notion of transcendence functions here as a key to the relation to exteriority as such. 'The fecundity of the I is its very transcendence', affirms Levinas (Levinas 1991: 277).[6] Transcendence, however, is not limited to the relation to descendants, for it alludes not only to the exteriority of descendants, but to exteriority in the strong sense of the term, that is to the absolute otherness of infinity. As the metaphysical exteriority of infinity cannot be made accessible to our cognition, the movement of transcendence does not diminish the radical otherness of the Transcendent, but rather preserves and cherishes it. On the other hand, transcendence does not break the personal integrity of the human existence; the otherness of the Other does not negate my own Self. The individual does not dissolve in the relation to metaphysical exteriority, but keeps the identity of Self that is guaranteed by the sphere of interiority. Thanks to the sphere of interiority that secures the separation and isolation of existence in all its needs and in the work through which one acquires one's possessions, the self can keep its identity in all changes and alterations it undergoes. Without interiority there would be no relation to exteriority at all, and without the sameness of the self there would be no experience of otherness. As Levinas puts it:

> The alterity, the radical heterogeneity of the other, is possible only if the other is other with respect to a term whose essence is to remain at the point of departure, to serve as *entry* into the relation, to be the same not relatively but absolutely. *A term can remain absolutely at the point of departure of relationship only as I (*Levinas 1991: 36).[7]

Yet, this is not to say that the self experiencing the exteriority of the Other can simply return to its interiority with the prey of the knowledge. The self can never possess and control the otherness of the Other. Rather, its relation to otherness is like a journey of no return, like a journey that never ends. Levinas expresses the relation to otherness in a

metaphorical way, comparing the self to Abraham leaving Egypt. Unlike another classical figure of the European thinking – Ulysses – Abraham sets out for a journey, from which he can never return. But the fact is that his identity cannot disappear on his way out of Egypt; Abraham cannot get lost in the desert, he cannot forget his mission and lose his identity, but must remain in principal the same, as he was on the beginning of his journey. The relation to exteriority is thus possible only as a constant leaving of interiority, which does not go so far as to make sameness of the self – the basic structure of interiority – disappear.

Nevertheless, it is this proclaimed relation of the Same and the Other, in which the permanent identity of the self is guaranteed, as well as the relation between interiority and metaphysical exteriority, that is extremely dubious for Deleuze and Guattari. What they call into question is the very sameness of the self that exposes itself to the outside. For if the relation to the outside places thought into the heteronomous position, the identity of the self cannot be exempt from this heteronomy, but must be shown in its radical contingency and fragility.

What is even more suspect according to Deleuze and Guattari is the notion of the transcendence that is related to metaphysical exteriority. In *Mille plateaux*, transcendence is denounced as a typically European disease (Deleuze and Guattari 1987: 18). It is a disease of the European thought, and the only way how to cure thought infected by transcendence is, allegedly, to introduce it to the plane of immanence. One could thus say that Deleuze and Guattari are Spinozist thinkers, while Levinas is the least Spinozist thinker of all. But the transition from transcendence to immanence as conceived in *Mille plateaux* does not mean that thought must be closed in its interiority as in a solipsistic reclusion. The rejection of metaphysical transcendence does not imply the abolition of the basic relation that binds thought to the outside; rather, it elicits its radicalisation and culmination. The relation to the outside remains a fundamental characteristic of thought, even if it has nothing to do with the metaphysical exteriority of infinity. But what is the outside that is released from the metaphysical idea of the infinity and together with it shifted from the transcendent plane to the immanent plane? And how does it affect the nature of thought that relates to the outside through the basic act of desire? Tentatively, we may indeed say that the relation to the outside that remains on the plane of the immanence is essentially productive, but such a characterisation remains too vague if we cannot elucidate it by means of concrete phenomena.

IV. Sexual Difference

In order to comprehend the nature of the difference between the relation to exteriority that is situated on the transcendent plane and the relation to the outside that is located on the immanent plane, let us first focus on the way this difference is projected in the philosophical interpretation of phenomena such as sexual difference or the expressivity of the human face. It turns out that the explanations of sexual difference and the significance of the human face that we find in Deleuze and Guattari can be understood as polemics with Levinas's views about these phenomena.

As to sexual difference, Levinas views femininity, which inspired his meditations on the Other from the very beginning, as a question of an irreducible difference. As he puts it in *Le temps et l'autre*, femininity appeared to him 'as a difference contrasting strongly with other differences, not merely a quality different from all others, but as the very quality of difference' (Levinas 1987: 36).[8] The primary encounter with the other sex is for him a model situation, in which transcendent otherness reveals itself. Femininity is the mystery of otherness *par excellence*. In femininity, the exteriority of the Other appears in a nudity that has nothing to do with a mere exteriority of an object, for it is chastity and self-concealment. The otherness of femininity consists in the fact that femininity conceals itself from the light of the understanding.

It is, however, questionable to what extent this femininity that hides in 'the very dimension of the otherness' allows us to comprehend states where the difference between femininity and masculinity vanishes and where sexual difference ceases to be visible, as in the cases of homosexuality, transsexuality or transvestitism. If sexual difference is a matter of an absolute difference, it is possible to grasp these sexual phenomena only as the cases of incomprehensible perversity and monstrosity. It is therefore interesting to see how Deleuze and Guattari attempt to make sexual difference relative when critiquing the psychoanalytical differentiation of the masculine and feminine sexual identity. Considering the fact that nobody is perfect man or pure woman, since everybody has both masculine and feminine qualities, they refuse the disjunctive logic, according to which one can be either man, or woman, but nothing else. In this respect, they make a distinction between molecular bisexuality and molar sexual identity, in which the masculine or feminine pole statistically prevails (Deleuze and Guattari 1983: 69, 70).

Together with it, Deleuze and Guattari avoid the traditional interpretation of the difference between the masculine and feminine

sexual identity, which is based on the contrast between activity and passivity, light and darkness. Even though Levinas criticises Plato for understanding femininity in terms of passivity, he still comprehends it on the basis of the metaphors of darkness, or absence (as opposed to presence); this is all the more evident when he explains femininity as 'the welcoming one par excellence, welcome in itself' (Levinas 1991: 157).[9] As he affirms in *Totalité et infini*, 'the other whose presence is discreetly an absence, with which is accomplished the primary hospitable welcome which describes the field of intimacy, is the Woman' (Levinas 1991: 155).[10] The woman, however, is not only receiving, but also, and above all, giving, which is attested by the act of birth. Since Levinas, in the period of *Totalité et infini*, understands fecundity primarily in terms of paternity, he seems to forget that birth is an excess of giving whose positive character is the expression of the relation to the outside. The excess of birth is the basic experience of the outside. The inherent quality of this experience is suffering, through which excess proves its excessiveness. By suffering birth, a woman not only becomes woman, but also animal when listening to the natural impulses of her body. Both becoming-woman and becoming-animal appear in the excess of birth. The excessive quality of birth thus indicates that woman, as opposed to man, must be understood not in terms of lack or absence, but in terms of the excessive relation to the outside. Deleuze and Guattari seem to be aware of it when arguing that femininity does not mean any absence or lack; and has a positive character of desire that relates to the outside (Deleuze and Guattari 1983: 294, 295).

The uniqueness of birth, however, still speaks in favour of the disjunctive logic according to which one is either man or woman, but nothing else, only attributing a negative value to man. This would scarcely please Deleuze and Guattari who attempt to thematise sexual desire as the excessive relation to the outside, no matter whether it concerns masculine or feminine forms of desire. While the idea of absence and lack, according to them, belongs to the molar representation of sexuality, that is, a representation determined by abstract or statistical categories, there is no place for an absence or lack in the molecular process of desire. Both in the masculine and in the feminine elements, the molecular processes of desire 'know' only the surplus and abundance that are discharged in the relation to the outside. On the molecular level, desire is nothing but the excessive relation to the outside. In moments of excessive pleasure as well as in moments of the unbearable suffering that overwhelms us we lose control over ourselves to the point that we cannot integrate them into the order of our experience; in these

excessive moments the unity of our consciousness collapses and we are beside ourselves. And even if we pull ourselves together again we realise that we are not same as we used to be. In the relation to the outside, we do not remain same, but we change and become other. We can expose ourselves to the outside only by becoming other than we were before. Such a transformation does not leave the masculine and feminine elements in us intact; it releases and reshuffles them despite the rigidity of our molar sexual identity. The excessive nature of desire that connects us with the outside thus indicates that not only can a woman become woman, but a man also can enter the process of becoming-woman. In view of this process it is then possible to make sense of homosexuality or transsexuality without degrading them to an incomprehensible monstrosity. Instead of discommending homosexuality or transsexuality as something unnatural, Deleuze and Guattari come to the conclusion that we are all transsexual beings on the molecular level of desire (Deleuze and Guattari 1983: 296). Becoming other, however, does not open space only for such processes as becoming-woman, but also for becoming-child or becoming-animal, through which we go beyond the anthropomorphic representation of our existence. All these processes prove that our existence is not limited to only two sexes, but has a potentially unlimited number of sexes that express the excessive nature of desire. And it is precisely in these processes that our relation to the non-metaphysical outside is accomplished to the maximum degree (Deleuze and Guattari 1983: 296).

V. The Function of the Human Face

Apart from the question of the feminine otherness, another important topic of Levinas' philosophy is the phenomenon of the human face. Irreducible otherness, which originally revealed itself in the mystery of femininity, finally found its purest form in the face of the Other. According to Levinas, the face attests to the fact that the Other is not the same as me; that he or she preserves his/her inalienable otherness in relation to me. The Other standing face to face with me is a stranger left at my mercy, and therefore raising the highest ethical demand – thou shall not kill! The authority of the face makes me absolutely responsible for the Other. The face-to-face position, however, places me not only into the relation to the exteriority of the Other, but – because of its ethical demand – also into the relation to the absolute otherness of the

metaphysical exteriority. It is therefore possible to say that for the finite being the face is an epiphany of infinity. As Levinas puts it:

> The idea of infinity, the infinitely more contained in the less, is concretely produced in the form of a relation with the face. And the idea of infinity alone maintains the exteriority of the other with respect to the same, despite this relation (Levinas 1991: 196).[11]

However, the conception connecting the phenomenon of the face with the absolute otherness of metaphysical exteriority collides with the critique of the face, or more precisely, of 'faciality' (*la visagéité*), made by Deleuze and Guattari, who attempt to locate the social and cultural conditions of its emergence (Deleuze and Guattari 1987: 115, 116, 123, 167–91). Even if they do not mention Levinas in this respect, it is obvious that the critique pursued in *Mille plateaux* applies – among others – also to him. What follows from this critique is that the face, when it serves as a means of identification (thanks to which we are identified and can identify others), is a condition for the transformation of the human body into the individual subject. Nevertheless, there exist societies in which the face plays a very limited role. As an example, it is possible to bring up the so-called primitive cultures that ensure the asubjective facelessness of their members with the help of masks, body-paintings and tattoos (Deleuze and Guattari 1987: 176). Thanks to all these measures the human head does not become a face; instead, it becomes an integral part of the body that opens itself to animal impulses and structures of behaviour. Primitive shaman, hunter, or warrior can set out for a journey of becoming-animal without eliminating his own spirituality. For his spirituality does not consist in transcendence towards metaphysical exteriority; rather, it remains in an immanent relation to the outside, which can be concretised in the form of an animal, or a demon. This spirituality is all the more powerful, the more it is based on corporeality, on the integral connection of the head with the body. "Primitives' may have the most human of heads, the most beautiful and most spiritual,' claim Deleuze and Guattari, 'but they have no face and need none' (Deleuze and Guattari 1987: 176).[12] It is therefore obvious that the face is not a universal phenomenon; in *Mille plateaux* it is linked only to the signifying and post-signifying regime of signs that characterise the Judeo-Christian civilisation.[13] The face belongs to the signifying and post-signifying regime of signs, where it becomes an obsession that calls for an infinite interpretation of its hidden meaning. Besides the call for the interpretation, the face is also

connected with the processes of signification and subjectification that characterise the signifying and post-signifying semiotics.

It is no coincidence that something similar can be said about the Levinasian notion of the face that provokes the obsession with the otherness of the Other. The face as a trace of infinity haunts thought related to the metaphysical exteriority. In *Autrement qu'être ou au-delà de l'essence*, the obsession disturbing all serenity and equilibrium is the expression of the relation to metaphysical exteriority, which announces and conceals itself in the face of the Other. Thought obsessed with the face of the Other is a passionate thought, if passion means the act of thinking which cannot grasp what attracts it. But this passionate thought is never free from subjectification and signification, for the face of the Other serves as a point of subjectification (the subjectiveness of thought remains in the subjection to the Other, for whom is one absolutely responsible) and its signification calls for an interpretation, even if it is 'signification without a context' (Levinas 2004: 146; cf. also 29, 159, 161, 162). In any case, the genealogical investigation of faciality, as performed in *Mille plateaux*, makes it evident that Levinas' assertion that the face exists 'by itself, and not by reference to a system,' is problematic, at least to the extent that it does not question its own rootedness in the semiotics of the modern White Man, which is the combination of the signifying and post-signifying regime of signs.[14]

VI. Racism and Eurocentrism

Speaking about White Man's semiotics, how could we forget the problem of racism? As we read in *Mille plateaux*, European racism is unthinkable without the normative ideal represented by the face of the average ordinary European (Deleuze and Guattari 1987: 178). Depending on the degree of deviation from the given norm, population is then divided into people of the first, second or third category. 'Of course,' writes Franz Kafka in one of his *Letters to Milena*, 'there's no doubt that for your father there's no difference whatever between your husband and me; for the European we both have the same Negro face.' In spite of all appearance, modern racism does not operate through techniques of exclusion or marginalisation of those who are perceived as different; rather, it draws the circles of sameness which determine the degree of tolerance to the actual divergence from the normative ideal given by the face of the typical European man. 'Racism never detects the particles of the other; it propagates waves of sameness', Deleuze and Guattari claim (Deleuze and Guattari 1987: 178).[15] One can say

that modern racism systematically denies otherness from appearing in the social field by excluding those who do not conform to its norms. And since there is no sense for otherness in society, there can be no place for exteriority, either. 'From the viewpoint of racism, there is no exterior, there are no people of the outside' (Deleuze and Guattari 1987: 178).[16] Modern racism does not draw the line between the inside and the outside, as it reduces everything to the interiority of one normative system.

There is no doubt that Levinas would agree with such a condemnation of the cruelty and stupidity of racism. He could have certainly argued that racism ignores or suppresses the exteriority that announces itself in the face of the Other. Yet, whatever means he has for effectively reproaching the racist view of the Other, it is questionable how far his critique can go if he does not demur to the genealogical roots of racism, which grow out of the despotic and authoritative features of the semiotic characteristic of European thought. Levinas himself affirms in one interview that the real thought is the one of the Greeks and the Bible; everything else is nothing but 'dancing'.[17] Such a philosophical Eurocentrism might be legitimate if we take into consideration the fact that philosophy was born in ancient Greece and that it was brought up in the Judaic-Christian tradition of thought. But if we are considering the notion of the relation to the outside, the question is how far this particular relation reaches and how radical it can be. Should the relation to the outside be limited to the semiotics of the White Man, or should it go beyond the limits of the signifying and post-signifying regimes of signs that determine European thought? It is obvious that Levinas has decided to remain within the limits given by the Greek and Jewish (rather than Christian) thought and to articulate the relation to the outside as an obsession with the metaphysical exteriority gleaming through the face of the Other. Deleuze and Guattari, on the contrary, intend to extricate the relation to the outside from European representation of man and to push it to the extreme, where thought escapes from the signifying and post-signifying regimes of signs.

VII. Escaping from the White Man's Semiotics

But how can thought escape from the semiotics of the modern White Man, whose structure harbours the permanent danger of racism and cultural imperialism? According to Deleuze and Guattari, it is certain that this semiotics is hostile to all pluralist, polyvocal, a-signifying and a-subjective semiotics (like the pre-signifying semiotics

of 'primitive' societies, or the contra-signifying semiotics of nomads), for it views them as domains of barbarism, savagery and irrationality (Deleuze and Guattari 1987: 180–2). From the perspective of the White Man's semiotics all the polyvocal, a-signifying and a-subjective elements represent a threat coming from the outside, a threat that must be neutralised by the procedures of signification and subjectification. Contrary to the pre-signifying semiotics of the 'primitive' societies or the contra-signifying semiotics of nomads, the semiotics of the modern White Man is distinctive by its tendency to control the relation to the outside through procedures of signification and subjectification. These two procedures function as the basic means of power in the signifying and post-signifying regimes of signs.

And it is due to these two procedures that Levinas' view of the relation to the outside is possible only as the relation between the Same and the Other, that is, as a relation which has its firmly given starting point and a desired – though unattainable – goal. Even if in his late work changes the accent of his elucidations of the relation to the metaphysical exteriority, laying more and more emphasis on the otherness of the Other instead of the sameness of the self, he still preserves the unity and subjectivity of the self. Even though the subjectivity of the subject does not mean anything but the fact of its being fully subjected to the Other, its unity issues from the responsibility for the Other and from the irreplaceability of the self in its relation to the Other. The responsibility for the Other is the principle of absolute unification and subjectification, since the non-indifference to the Other would not be possible without the difference between me and the Other. The exteriority of the Other is thus what constitutes the unity and subjectivity of the self. On the other hand, the responsibility for the Other would be impossible without the unity and subjectivity of the self. For this reason Levinas can never do without the principal unity and subjectivity of the self, much as he wants to show the contingency of the self in its relation to metaphysical exteriority. This corresponds to the basic arrangement of the signifying and post-signifying regimes of signs. All other features of the relation to metaphysical exteriority, including its proclivity for negative theology, issue no less from the fact that the relation to the outside is understood in the context of the signifying and post-signifying regimes of signs.

Therefore, if Levinas claims that the face separates the Other from its given context and turns him or her into a stranger, Deleuze and Guattari would probably object that such a de-contextualisation of the Other does not proceed far enough, as it is only negative. The escape from the semiotics of the White Man can succeed only if

de-contextualisation is absolute and positive at the same time. Absolute de-contextualisation in the positive sense of the term, then, does not mean a return to the primitive forms of thought and social life (nothing would be more naive than to seek lost innocence in forms of exoticism), but rather a creative line of flight from the signifying and post-signifying regimes of signs, which put the face into the central place in their system of power. In other words, absolute de-contextualisation of the Other is positive when we manage to escape the authoritative power of the face, when we lose our own face as well as the sense of the face of the other (Deleuze and Guattari 1987: 188–90). This happens, for instance, in the process of becoming-animal, which liberates us from the anthropomorphic representation of life and brings us closer to the non-metaphysical outside. '... when the face is effaced, when the faciality traits disappear, we can be sure that we have entered another regime, other zones infinitely muter and more imperceptible where subterranean becomings-animal occur, becomings-molecular, nocturnal deterritorialisations overspilling the limits of the signifying system' (Deleuze and Guattari 1987: 188–90).[18] Such a de-contextualisation, however, would not be possible without the breach of the structures of signification, subjectification and unification that belong to the signifying and post-signifying regimes of signs. To put it simply, we can escape the semiotics of the modern White Man only when we manage to escape the power of signification, subjectification and unification. Only then is the de-contextualisation of the Other both absolute and positive.

Yet, we already know that without the unity and subjectivity of the subject there would be no responsibility. Does this not mean, then, that the total responsibility for the Other is replaced by a total irresponsibility? Deleuze himself seems to confirm this impression, when he claims in *Pourparlers* that the very concept of responsibility – which is so important for Levinas – belongs rather to forensic psychiatry than to philosophy. But we shall not take this statement too literally.

It is true that Deleuze and Guattari sometimes seem to underestimate threats inherent in the movement of de-contextualisation. In *L'Anti-Œdipe*, where they understand de-contextualisation as the driving principle of the desiring-production, they claim that the movement of de-contextualisation can never go too far: 'It should therefore be said that one can never go far enough in the direction of deterritorialization' (Deleuze and Guattari 1983: 321).[19] The process of de-contextualisation can be, allegedly, dangerous only if it is interrupted or irritated by the process of re-contextualisation, that is by the process of creating and preserving signification and the structures of subjectivity. While

re-contextualisation represses desire by confining it to signification and subjectivity, de-contextualisation liberates desire by making the signification and the structures of subjectivity explode. Whereas the structures of signification and subjectification are forms of interiority, de-contextualisation brings desire into the relation to the outside that has nothing to do with the objectivity of objects, nor with a transcendental world. Thus, what is potentially dangerous is the sphere of interiority rather than the relation to exteriority established by the process of de-contextualisation.

But already in *Mille plateaux*, Deleuze and Guattari realise that the very process of de-contextualisation is potentially dangerous. If the movement of de-contextualisation is too abrupt or violent, the destruction of the system of signification and subjectification can easily change from a liberating escape into pure self-destruction (Deleuze and Guattari 1987: 503). In a similar way to the escape from the system of signification and subjectification, the flight from the system of faciality in which the face is dismantled is not without danger:

> Dismantling the face is no mean affair. Madness is a definite danger: Is it by chance that schizos lose their sense of the face, their own and others', their sense of the landscape, and the sense of language and its dominant significations all at the same time? (Deleuze and Guattari 1987: 188)[20]

Dismantling the face should not therefore just deface all faces and destroy their meaning; instead, the breaking through the system of faciality should free something like the 'probe-heads' that will serve as guidance devices in the search for new forms of being-with-others (Deleuze and Guattari 1987: 190–1). This is the true meaning of the de-contextualisation of the Other. But the acknowledged dangerousness of de-contextualisation makes Deleuze and Guattari seek criteria allowing them to distinguish the creative line of flight, which opens up a space for new possibilities of existence, from a pathological collapse, in which the very relation to the outside collapses and de-contextualisation ends in the void instead of preparing a space for unexpected possibilities. If we want to escape from the constraints of the White Man's semiotics, we cannot bank on any pre-formed regime of signs, but we must realise our relation to the outside by means of experimentation, which, nevertheless, requires much caution and sobriety. If experimentation should not turn into a catastrophic collapse, it is necessary to preserve small, provisory doses of signification and subjectification that are to serve as operators of the relation to the outside. This provisory supply of signification and subjectification, however, must not govern the relation

to the outside; instead of subjugating the process of de-contextualisation, it must be used by it and make possible the full realisation of the relation to the outside. If this is the case, signification and subjectification as the forms of interiority are then not simply opposed to exteriority, but function as components of de-contextualisation, in which the relation to the outside is realised.

One could thus say that in Deleuze and Guattari's depiction of the relation to the outside, the contrast between the sameness of the self and the otherness of the Other is relativised just as the sexual difference grasped by Levinas as the absolute difference between masculinity and femininity is relativised. The sameness of the self is not a necessary counterpart of the otherness of the Other; rather, it is a relative factor in a becoming-other that inseparably belongs to the relation to the outside. It is not possible to relate to the outside without becoming-other, which does not mean to become same as the Other. Instead of an identification with the Other, becoming-other means a fundamental metamorphosis in the relation to the outside. Considering that in *Mille plateaux* the relation to the outside is fundamentally connected with the excess in which the established structures of subjectivity and significance as well as the system of faciality disintegrate, it is always the *intensity* of the excess that makes the difference between the various types of de-contextualisation. When the excess is subjected to the mechanisms of subjectification, significance, to which faciality also belongs, de-contextualisation can only be negative or relative. But if the intensity of the excess reaches its climax, the excess must either destroy itself or break through all structures of significance and subjectification that hinder a full exposure to the outside. If that is the case, it is precisely the liberating excess that grips and drifts the disorganised remains of subjectivity and signification that is marked as absolute de-contextualisation in the positive sense of the term.

VIII. Summary

We can finally summarise the basic difference between Levinas' conception of the relation to exteriority and Deleuze's and Guattari's view of the relation to the outside. Even though the relation to the outside is in both cases connected with the moment of excess, the nature of this excess is understood in different ways. Since both Levinas and Deleuze with Guattari are fully aware that the moment of excess is inseparable from the relation to the outside, they do not simply reduce it to a quantitative surplus, but endeavour to reveal its special phenomenal

quality. Different understandings of the fundamental relation to the outside, however, result in two different views of the excess that we find in *Le temps et l'autre*, *Totalité et infini*, or *Autrement qu'être ou au-delà de l'essence* and in *L'Anti-Œdipe* or *Mille plateaux*. In his analysis of fecundity and fatherhood, Levinas conceives the excessive relation to exteriority as transcendence, while Deleuze and Guattari understand it in terms of immanence. This is why, for them, the basic quality of the excessive relation to the outside is not extension, but intensity. In order to distinguish the relative or negative de-contextualisation from the absolute de-contextualisation in the positive sense of the term, they use a simple criterion: whereas in the first case the excessive relation to the outside still has some extension, in the second it becomes pure intensity. If we apply this criterion to Levinas' conception, it is evident that the relation to exteriority conceived of as transcendence is still far from absolute and positive de-contextualisation, for it is limited only to extension. Despite the repeatedly declared effort to understand metaphysical exteriority not as spatial exteriority, but as the exteriority of the future, or of the unattainable past, Levinas cannot do without spatial metaphors. In order to keep the distance between interiority and exteriority, which makes it possible to maintain also the difference between the sameness of the self and the otherness of the Other, he must repeatedly return to spatial images, time and again. Then, it is practically impossible to avoid the idea of metaphysical exteriority understood as a mysterious sphere beyond our world.

IX. Postscript

This conclusion would not be very satisfactory if it did not help us to find a way out of the impasse in which Levinas gets stuck on his way to the outside. For Levinas' conception of the relation to the outside has the potential to escape from the impasse of transcendence. Such a potential might be hidden in the 'phenomenological' exploration of suffering that overwhelms human existence in sadness, sorrow, physical pain, disease, aging and dying. In the essay 'Useless Suffering', or in Levinas' comment on Philippe Nemo's book *Job et l'excès du mal*, suffering is described not as the expression of some deficiency or imperfection of the human existence, but as an overwhelming excess.[21] Instead of being determined by the negativity of the lack, the experience of suffering is determined by the surplus of excess. Through suffering we are exposed to an excess that is stronger than us. But the nature of this excess does not consist simply in the fact that suffering surpasses

all measure, that there is too much of it; rather, it consists in the fact that suffering as such cannot be integrated. Suffering has an excessive character because it is non-integratable to the integral structure of experience. Suffering is the experience of the outside, which cannot be integrated into the classical structure of experience. The non-integratable character of suffering means that the excess of suffering cannot be integrated into the unity of consciousness. More precisely, suffering is not just a *datum* in consciousness; it is not even a *datum* refractory to the synthesis of the Kantian 'I think', for it is opposed to the very synthetic unity of consciousness that unites and embraces the disparate *data* into a meaningful whole. Since the excess of suffering disturbs and destroys the very unity of consciousness, Levinas claims that it is non-synthesisable. What characterises the excess is, according to him, its non-synthesisable character. As excess, suffering cannot be taken to consciousness through the receptivity of our senses, for it makes impossible the very act of 'taking' that constitutes apprehension. Suffering bereaves thought of all its autonomy, which is granted by the synthesis of 'I think', and throws it into radical heteronomy, where it becomes pure undergoing. In suffering, thought is so heteronomous that it can not unite the multiplicity of sensations any more. Moreover, since the excessive character of suffering deranges the unity and autonomy of thought, it withholds all meaning and destroys the order of experience. The excess of suffering as an irreducible derangement thus throws thought into chaos, concerning which Levinas says that 'it is the not-finding-a-place, the refusal of any accommodation with . . . , a counter-nature, a monstrosity, the disturbing and foreign in itself' (Levinas 1998b: 128).[22]

Nevertheless, what is most important in this respect is the fact that the excess of suffering does not point to any pre-existing exteriority. The exteriority of the excess is not a counterpart of an interiority that maintains the synthetic unity of consciousness and the integrity of the self. Instead of being a promise of a world behind the world, the excess bears exteriority in its own exceeding (Levinas 1998b: 128). The excess exceeds all normative systems, all social frameworks, all forms of interiority. And it is precisely this exceeding of the excess what Levinas calls 'transcendence'.

When using such a term, however, he comes so close to the immanence of excess as conceived by Deleuze and Guattari that it is practically impossible to distinguish transcendence from immanence. It is as if the very terminological distinction between transcendence and immanence lost its meaning in the exceeding of the excess. What sense has the difference between transcendence and immanence if the exteriority

of the excess remains in its exceeding? Hence, although it is clear that Levinas' elucidation of the excessive nature of the excess neither solves all the problems of his conception of the relation to metaphysical exteriority nor releases his thought from its Eurocentric orientation, it can at least serve as the starting point of its reconsideration.

If we accept the challenge of such reconsideration, we do not have to deny the importance of the Other in the processes of signification and subjectification. On the contrary, we can affirm that the integral unity of the self is based on the relation to the Other, as Levinas does when claiming that the phenomenal content of suffering is not exhausted by the exceeding of the excess, for suffering is situated in the inter-human perspective, which gives it a sense of the 'bad intention', persecution or humiliation. Besides the excessive level of suffering there is also an 'intentional' level of suffering. On the first level of suffering, there is neither a pre-established interiority, nor a pre-existing exteriority, but on the second level, suffering strikes us from outside, from the exteriority from which the face of the Other talks to us. What the Other brings to the non-integratable excess of suffering is a perspective, thanks to which suffering can become concrete and determinate as *my own suffering*. The suffering coming from the perspective of the Other (which is far from saying that it is simply caused by the Other) constitutes me as an exceptional, unique being that finds itself face to face to the Other. Without the Other I would not be able to awake to myself. This is, by the way, confirmed by psychologists such as R. D. Laing, who stresses the importance of the Other, that is the mother, for the constitution of child's self-awareness and personal integrity. As he puts it in his *The Divided Self*:

> It seems that loss of the mother, at a certain stage, threatens the individual with loss of his self. The mother, however, is not simply a *thing* which the child can see, but a *person* who sees the child. Therefore, we suggest that a necessary component in the development of self is the experience of oneself as a person under the loving eye of the mother (Laing 1964: 116).

But if we assume the radical contingency of the self and its dependency on the face of the Other, we can hardly declare that the responsibility for the Other has no beginning, that we are always already responsible for the Other, as Levinas does in *Autrement qu'être ou au-delà de l'essence*, suggesting that the very exposure to the Other is synonymous with responsibility.[23] For, how could be a small child responsible for the Other, if its own self has not yet developed? If not, the responsibility for the Other cannot be absolute, but is rather relative and conditioned.

Such a notion of the relative responsibility might be acceptable even for Deleuze and Guattari, who do not want to take any oath of allegiance to any absolute authority, even if it were the authority of the face. In such a case, the discovery that the difference between transcendence and immanence in the notion of excess is not insurmountable might also be useful for the understanding of Deleuze's and Guattari's conception of the relation to the outside.[24]

Why Deleuze Doesn't Blow the Actual on Virtual Priority. A Rejoinder to Jack Reynolds

James Williams University of Dundee

Your classic Jaguar XK 120 stands useless by the roadside. Why? Because you gave priority to the admittedly gorgeous 6 cylinder straight six engine; because you privileged the highest value part. Rubber pipes perish, though, and now thanks to a leak in a cheap hose the head gasket has blown. You are stranded and facing a costly bill. More seriously, your mechanical gaffe is a sign of your misunderstanding of Deleuze. Like Sir William Lyons, he engineers systems where the concept of priority must not be confused with independence, separateness, abstraction or ethical superiority. As a good engineer, Deleuze's constructions are holistic and opposed to abstract hierarchies: if a crucial small, actual part perishes in a particular practical situation where it has a role to play, then it does not matter how much virtual power you have in reserve. Your feet are still in a pool of hot water as you survey the wasted potential of actual motion and ideal expressions, hand made in Coventry.

Jack Reynolds uses the words 'priority', 'prioritise' or 'secondary' seventeen times in his study of Deleuze's work on wounds in *The Logic of Sense*. The key to this repetition is the valuation following his use of the term. For Reynolds, taking his cue from Hallward but extending his argument from the political to the ethical, priority is an indicator of ethical value, itself leading to an irreversible order:

> As we have seen, this counter-actualisation that partakes of the virtual, although it is embodied, owes its value to that which is not embodied. As such the virtual retains an ethical priority over mere mechanism, and the 'great souls', artists and mystics, manage to embody this virtuality in its purest form. (Reynolds 2007: 160)

Reynolds's logical steps are that Deleuze gives priority to the virtual (sense) over the actual (depth). This priority is ethical. It therefore directs ethical action towards the virtual, thereby devaluing the actual. This leads to a dualist philosophy that is elitist and abstracted from concrete wounds and their 'scarification'. Reynolds wants to revalue an ethics of coping taken from phenomenology against this move 'out of this world' (*Oh dreaded misleading phrase, may it pass into the deepest recesses of dusty libraries soon!*) This revaluation is the important point of Reynolds's essay, one of the first to stress the ethical contrasts between Deleuze and phenomenology.

The sleight of hand here lies in the slippage from the necessity of embodiment to its supposed devaluation. The fundamental question is this: What does it mean to prioritise something when it is in a necessary relation to other things that its effectuation is completely dependent on? The answer to this question lies in understanding Deleuze's philosophy as *a structure of interlinked processes that only acquire determination in practical situations*. The isolation of the so-called ethical move to priority is illegitimate and leads to a misconstrual of Deleuze's crucial concept of counter-actualisation. This is because priority is not to be taken as a value term in this context since it describes a difference between processes rather than superiority of one over the other. Like the escaped convicts in Joel and Ethan Cohen's *O Brother, Where Art Thou?*, if one supposedly superior member of the chained desperados makes an independent break for it, he will rapidly be dragged back into the fold with a violent but healthy bump. Reynolds, Hallward, Badiou and Meillassoux all want to pretend that the virtual wants to flee the actual. It can't. It does not want to. In *The Logic of Sense*, priority – if we want to keep the term - accounts for what Deleuze calls the neutrality of sense or its impassibility. This in turn supports his claim for the asymmetry of processes in terms of different determinations according to dynamic and static geneses, as argued with great precision by Miguel de Beistegui in his *Truth and Genesis: Philosophy as Differential Ontology*. Neutrality and impassibility are not indicators of superiority but of a different kind of genetic function that allows for novelty without having to posit it on an inevitably violent production of the event *ex nihilo*, or the modern dogmatic version of 'the nothing' based on set theory.

Geneses of changes in identity occur thanks to the expression of sense (that which gives intensity to an actual individuation). Identities alter in terms of significance because they are associated with changes in the surface intensities associated with sense. Escapees express 'to be free' in a singular way and thrive on the new intensities running through

their worlds. But this expression does not alter sense in a symmetrical manner such that you could then predict what would happen to sense given a particular actual change. Does that mean that you privilege sense? No. It means that sense and its expression retain a distance which preserves sense from identity, thereby leaving it open for the production of novelty – new intensities. In turn, this allows intensity – the sadly missing term in dualist interpretations of Deleuze – to regain its conceptual importance.

Intensity, or the surface, is the shared transformer of the actual and virtual, or depth and sense (height). Any actual act involves genetic transformations of intensity at the level of sense and in the actual. The genius of Deleuze as engineer comes out here. Since surface or intensity works differently on the actual and the virtual these are distinguished yet always connected. The art of counter-actualisation becomes a creative actual experiment on intensity which feeds through a different work of intensity in the virtual and back to a novel demand for experimentation. You have never finished with intensity. You are always working through the surface shared by actual depth and virtual height. Privilege one or the other and you have not understood your engine. It will break and someone will get hurt unnecessarily and it does not matter how much you then claim to only have been trying to cope. Trying to cope is a misunderstanding of the way in which your actual actions benefit from an ongoing transformation because they transform the intensity operating in the world of sense. That's why there is a series in *The Logic of Sense* called 'good intentions are perforce punished'. Select any norm ('such as the first goal with respect to wounds is to cope with them') and your benevolent intentions will begin to slip down a miserable slope, as sure as any unseated toboggan rider.

Finally, it is important to insist – again and again – on the essential role of singular practice against the desire for a Deleuzian ethics (that will then be denigrated as elitist or otherworldly). *Deleuze's philosophical structure of processes of reciprocal determination is only complete in singular practices, no given practice can be a secure blueprint for another, every practice is actual, the practice is necessarily experimental, it never arrives at a goal, it is not directed towards the virtual or towards sense, and it is directed towards a clinical and critical affirmation of our actual lives and shared communication through events.*

Reynolds dislikes the lack of normative principles in Deleuze and a supposed turn away from practical wisdom: '[Deleuze's] overarching ethic is hence not one of phronesis, of practical wisdom within a given embodied and cultural context' (Reynolds 2007: 161–2). When has

cultural context not involved creativity and novelty? When was learning from contact with others not a form of practical wisdom? When has embodiment been 'given' rather than undergone as a shifting experience of varying intensities? Only if you retain too much nostalgia for norms in your practice – and your account of the given – can you hold such views.

Here is Deleuze's example of the splendour of counter-actualisation in the face of wounds. Joë Bousquet was shot through the neck in the mud and blood of the third battle of the Aisne in 1918 on the infamous ridge of the *Chemin des Dames*. He was dragged to safety in a tarpaulin half dead by comrades risking their own lives. Nursed to health by a series of dedicated nurses, he somehow survived the carnage. Left paraplegic and living protected behind a heavy curtain, needing constant attention, he became a major surrealist writer. He corresponded with Max Ernst and many of the surrealist writers of his day. He never forgot those comrades, that nurse or the wound that he affirmed by becoming a writer. His writing about them is the actual counter of the horror of his wound:

> A human disaster can summarise a malediction that the imagination sounds with difficulty; yet it nonetheless remains the light and legible sign of a happy fatality. A man is laid out, one vertebra smashed. Attached to the real, he becomes the drain for the life where he was, just yesterday, understood, he sees himself, he incarnates the ugliness of an individual starting with himself anew, he is the real presence of what existence no longer knows. What other feeling can he nourish than fear of subsistence? It is ignoble to survive when we are no longer the image of anything. (Bousquet 1979: 30–1, my translation)

This is not coping. That's always an illusion given the gradual degradation and hope for an end implied by the term. It is a creative transformation thanks to the selection of hitherto hidden intensities. Do we really need philosophers to worry at priority and normativity, when we can learn from the events and affirmations of others and affirm them anew in our singular actual creations?

Transcendental Priority and Deleuzian Normativity. A Reply to James Williams

Jack Reynolds La Trobe University

I am grateful that someone whose work I greatly admire could be the philosopher to so eloquently and succinctly cut to the heart of the problem that I posed in the previous issue of *Deleuze Studies*. James Williams' critical reply leaves me, *prima facie*, confronted by a stark alternative: *either* I have misunderstood Deleuze, *or* I have illustrated problems and lacunae in Deleuze. I will suggest, however, that this is a false alternative, and that Williams' and my divergent accounts of *The Logic of Sense* – and even Deleuze's oeuvre as a whole – is better understood as a situation of 'both/and' rather than 'either/or', and hence that my interpretation of Deleuze isn't wrong, but necessarily iconoclastic.

This is not to dispute that Williams has put forward a compelling interpretation of the work of Deleuze (both here and elsewhere), but if it can be said that my reading is mistaken at one level, let's say on the level of authorial intention and in regard to the most charitable reading of some parts of some of Deleuze's most important texts (particularly *Difference and Repetition*), I don't think I am mistaken in maintaining that something like the hierarchical evaluative component I describe (e.g. in relation to the virtual and the actual, and myriad related polarities) persists in Deleuze's work, despite the fact that the important doctrines of ontological univocity and asymmetrical reciprocal determination count against this. In this sense, I can agree with Williams when he observes that 'Privilege one or the other and you have not understood your engine.' But my suggestion would be that Deleuze *didn't* understand his own engine from time to time (who amongst us consistently does?), and that while the contested term 'priority' ought to be understood neutrally by Deleuze as Williams argues, quite frequently something else is going on in his texts, which intermittently expresses itself (to greater or lesser extents), and which philosophers like Hallward, Badiou, and myself, have attempted to

thematise, albeit in quite different ways. Unlike Badiou, I do not think Deleuze is a philosopher of eternity or the One, although I do agree that there is, at times, a reification of the virtual in Deleuze. As for whether I share Badiou's desire to discredit the appeal to the virtual entirely and speak instead of the univocity of the actual as a pure multiple, this depends upon one's conception of the transcendental, which I certainly want to retain in some form, albeit of a more grounded variety – perhaps something like an historical *a priori* – than that which is instituted by Deleuze.

I think Deleuze's *The Logic of Sense* evinces a hierarchical evaluative tendency in many places, as is indicated in my essay. That said, Williams does have me rethinking my account of counter-actualisation somewhat, through the role he attributes to intensity as a kind of middle term between the virtual and the actual, although I don't think that the many citations I make from Deleuze are thus all explained away. Nor am I sure about Williams' equation of intensity with the surface and the related argument that the relevant opposition of *The Logic of Sense* is between depth and sense (height) rather than between depth and surface. While Williams is the expert in this regard, I also wonder how he explains Deleuze's remarkable essay, 'Michel Tournier and the World without Others', where something like the virtual (or what Deleuze calls there, apparently equivalently, the 'perverse-structure' and the 'pure surface') is imagined as somehow instantiated, and a clear normative impetus is accorded to this world that has dispensed with what he calls the other-structure and its 'relations of explication'. The other-structure is envisaged as organising and regulatory: as 'imprisoning elements within the limits of bodies' (Deleuze 2004: 351). Deleuze is even 'tempted to conclude that bodies are but detours to the attainment of images' (Deleuze 2004: 352) and he asks, 'when we desire others, are not our desires brought to bear upon this expressed possible world which the Other wrongly envelops, instead of allowing it to float and fly above the world, developed into a glorious double?' He intimates that perhaps, 'the absence of the Other and the dissolution of its structure do not simply disorganise the world, but, on the contrary, open up a possibility of salvation' (Deleuze 2004: 354). These are curious remarks that seem to add weight to my interpretation that there is a value judgment attached to this order of priority, rather than merely the neutral transcendental priority that describes a difference between processes, and I argue this in greater detail elsewhere (Reynolds 2008).

Nor is it that Deleuze is merely voicing the logics of Robinson Crusoe's perversion as they are presented in Tournier's novel. After all, *Difference*

and Repetition also refers to a leaving behind of the other-structure. And Deleuze again derives an intriguing ethico-political injunction from this: not to explicate oneself too much with the Other, and not to explicate the Other too much, but to 'multiply one's own world by populating it with all those expressed that do not exist apart from their expressions' (Deleuze 1994: 260). On what basis then, does Deleuze derive his injunction to multiply these possible worlds, these *a priori* expressed others that have not yet been explicated, developed, subsumed within the forestructures of our understanding and deprived of their difference? It seems that the transcendental condition (the other as expressive of a possible world) is simultaneously a moral injunction to maximise actual occurrences of such expressivity. The spirit of this injunction is roughly equivalent to that which accompanies his valorisation in *Difference and Repetition* of the disruptive trauma of learning and apprenticeship (Deleuze 1994: 192) and his references to the child-player who can only win (Deleuze 1994: 116). I explore both these issues in another essay (Reynolds 2006), but I will return to them here because the fundamental *differend* between Williams and I seems to concern the issue of 'coping'.

But for the moment my question for Deleuze and Williams is a simple one: is the implied denunciation of relations of development and explication justified? After all, while relations of explication might come to domesticate the Other's 'otherness' and to partially deprive them of their radical difference, as Deleuze suggests, it is also the case that they open up different and more diverse kinds of relations (kinds of intensity) that cannot be captured on this view that juxtaposes the relative purity of expressed 'possible worlds' that have no ties of allegiance (that is, the different and the new), against their shutting down and increased monotony in the world of identities. To put the problem another way, even if the condition for relations of explication (a quarrel, a revelation, anything that remains with the play of identities) is the other as possible world, it does not follow from this that we could or should live privileging this transcendental condition, or perhaps even the intensities and singularities that this condition makes possible. Indeed, while Deleuze himself repeatedly insists that there is reciprocal asymmetrical determination between the actual and the virtual (which means that neither legislates and draws up limits or rules for the other, whereby we might obtain clear moral rules about what should take place in the actual), in practice it seems to me that the virtual plays the determinative role in his injunction to multiply encounters with the expressivity of others. So, in response to Williams' conclusion that as philosophers we should not be too worried about normativity, I actually

agree in a sense and I hope that I am no knight of good conscience, but my critical essays on Deleuze are meant to be immanent critiques of the intrusion of this surreptitious normative element in Deleuze's own work.

But Williams' final remarks also pose perhaps a more pointed challenge to my project, in that they call into question the value of a negative philosophical engagement with another thinker in this manner. I sometimes ask myself something like this question: Although I disagree with many of Deleuze's positions, I do not dispute that he is a great philosopher, so why do I focus upon (or even misread, according to Williams) aspects of his work that merely trouble me? Is this petty procedure what a philosopher should do, living off the backs of other long-dead philosophers? I don't think there is a simple answer to this question. I can point out in my own defence that this is done in the hope that it will illuminate my own creations on these lofty themes, particularly vis-à-vis time and transcendental philosophy, the interconnection of which serves to distinguish poststructuralist philosophy quite radically from much of what takes place in analytic philosophy. Nonetheless, Williams' questions make prescient to me that we do have a different conception of philosophy, and that there is a sense in which mine remains more closely related to what Deleuze critiques as the model of judgment. After all, what I have been doing in various publications on Deleuze is to work through some of my intuitive concerns with Deleuze, and I mean intuitions in the standard non-Bergsonian sense.

Now various questions and objections might be raised about this modus operandi. If one is a Deleuzian about philosophical method then I am likely to be exposing little more than my own encrusted assumptions and prejudices, in short my subjective presuppositions. Another way of putting this might be to say that one inevitably finds what one is looking for, as in Heidegger's version of the hermeneutic circle. Unlike Heidegger, however, Deleuze thinks that there is a way out of this dilemma, which is a version of both Meno's paradox and the paradox of analysis. Meno's paradox roughly states that if we know what we are looking for in advance, then when we find it we will merely confirm what we already knew; and yet if we do not know what we are looking for we will not know when we have found it and hence not know when to stop our enquiry. The paradox seems to suggest that the learning of something new is impossible, as is any kind of non-circular philosophical enquiry.

I think Williams and I agree that Meno's paradox is misstated, but for different reasons. For both of us, I imagine, the problem with this conception revolves around the focus on knowledge (and the atomistic understanding of what knowledge consists in). I resist this understanding by turning to a phenomenology of the body as a way out from this paradigm, whereas the Deleuzian move is to see intensity as a way out. The latter route, though, depends upon a quite elaborate metaphysics in a way that the former does not. Roughly put it requires a metaphysics of difference and the new, along the lines enumerated by Deleuze in his descriptions of the interrelations between the virtual and actual. Moreover, I think it fair to say that on the latter route judgment is more maligned than on the former route, where it is 'disciplined' by embodied and practical concerns but not necessarily cast asunder. Of course, this phenomenological route has been criticised, too, by Deleuze and others, for remaining a form of doxa. That said, Deleuze's engagement with Merleau-Ponty is insufficiently detailed to be convincing in this regard, but there is a minimal sense in which I think this is correct, as I have argued elsewhere (Reynolds and Roffe 2006). But the key question is whether doxa and common sense really ought to have nothing to do with philosophy at all, as Deleuze supposes. If we accept that conclusion, it would not merely be me, but most of us in academia, who are either pretending to be philosophers or being poor philosophers. I cannot justify this here but I find the Deleuzian critique of good and common sense hard to accept in its entirety, despite it being an amazingly powerful critical tool.

Vigilance about good and common sense is undoubtedly called for – this is perhaps what Merleau-Ponty advocates under the name 'hyper-dialectic' – but it is not clear to me that we can (or should) understand the genuine philosophical pursuit as ultimately immured of these aspects as Deleuze does. Likewise, Deleuze's positive understanding of philosophy as concept creation is also but one part of philosophy. Partly because of these metaphilosophical reservations, I am not convinced of the necessity for all of the metaphysical moves made in the Deleuzian philosophical system. Williams, however, has seen the necessity for the Deleuzian transcendental and metaphysical turn and I think that is what is at stake in his disagreement with me in regard to coping.

Williams not only shows the manner in which we need to understand intensity as a middle ground between virtuality and actuality, but he also tells us that intensity must be understood in disjunction from coping (or scarification in the terms of my *Deleuze Studies* paper), which on his view is a reactive rather than creative force and its teleological impetus

precludes new intensities and creative affirmations. I am still not totally convinced about the severity of this Deleuzian distinction between habit, skill acquisition, and learning – Deleuze and Bergson might argue that they involve differences in kind, but I see differences in degree – but I do see where Williams is coming from when he states:

> When has cultural context not involved creativity and novelty? When was learning from contact with others not a form of practical wisdom? When has embodiment been 'given' rather than undergone as a shifting experience of varying intensities? Only if you retain too much nostalgia for norms in your practice – and your account of the given – can you hold such views.

I am certainly prepared to accept that there is always some minimal creativity/change at work in any given environment, whether socially or naturalistically conceived. I should also add that I don't maintain that embodiment is given in anything but a very minor sense. I know from my one year-old daughter just how much we take for granted about 'normal' bodily motility when at one stage these activities were far from normal. All bodies – human and animal – have a minimal proprioceptive sense from the 'beginning' (i.e. the earliest stages of foetal life), that is, an unrefined positional awareness, which serves as the basis for the development of a body-schema, habits, and even intelligent skills and learning, as we seek to establish maximum grip, or optimal gestalt, with a given multiplicity. In a sense, Williams is right to say that adjustment towards one's environment is the telos of learning and skill acquisition on this view, but this does not necessarily precludes change and transformation, indeed our skills must be flexible enough so as to respond to difference. It is even arguable that it is only with certain abilities and capacities made possible by the body-schema and the acquisition of habits and skills that one can be truly attentive to the singularities that present themselves.

But this is not the view of Deleuze (or Williams) whose models of intensity are the trauma of apprenticeship and the experience of disequilibrium and discontinuity. Williams states that coping is 'always an illusion given the gradual degradation and hope for an end implied by the term'. These are strong words. In his view, coping is an illusion, a phenomenological illusion that covers over deeper intensities. Even if this were so, I'm not sure in what sense coping can be said to be an illusion unless we understand the virtual alone as real, something that Williams would not want to do. Equally strongly, Williams also contends that any philosophy that pays attention to this experiential phenomena is irremediably nostalgic. Against this view, I hold that this

embodied maintenance of intentional arcs is a fundamental part of both human and animal existence, even if transcendental arguments can be mounted to show that there is a neutral order of priority that conditions it. Am I nostalgically invoking the myth of the given in insisting on the value and importance of this embodied 'coping' or 'l'habitude'? I don't think so. It may enact a form of 'presentism' in that one responds to circumstances with a view to optimal gestalt, but I don't see why it is incurably nostalgic. Moreover, I do not, of course, want to maintain that it exhausts the dimensions of human life, or life per se. Indeed, much of my work insists on the co-imbrication of these two tendencies – equilibria and disequilibria – and is hence meant to be a corrective to what I take to be the Deleuzian view that downplays the centrality of habits, coping, and the acquisition of skills to both learning and to ethics/counter-actualisation (the embodied phronesis I talk of is based on the specificities of the human body-schema and the feedback mechanisms it makes possible).

I suspect that there is something akin to a *differend* here between my still too phenomenological account and a Deleuzo-Bergsonian response which might pose the following questions about my apparent reification of actual proprioception and what it means for animal organisms: What about embryology? What are the conditions of actualisation of bodies? Do we not need reference to the virtual? I cannot satisfactorily address these questions here, but there is certainly an important difference between a phenomenological and a more metaphysical account of intensities (and the virtual) working with the variabilities of an environment to produce bodies. If this is so, what separates Williams and I is less the desire for some series of rational or ethical norms, but, as he discusses in regard to Deleuze and David Lewis in *The Transversal Thought of Gilles Deleuze*, the differences between two kinds of pragmatism. Rather than align myself with Lewis, the relevant contrast is perhaps better exemplified in terms of the differences between a metaphysical and experiential pragmatism of the Bergsonian variety, and a more mundane pragmatist view which sees 'know how' as more fundamental than 'knowing that', with all of the various consequences that this entails. Indeed, despite the admiration that William James consistently expressed for Bergson, there is a sense in which Bergson was right to be wary of James' declarations of intellectual kinship and to insist on the differences between their respective philosophies. It seems to me that some similar differences are at work between James Williams and myself. The fact remains that some aspects of

the Deleuzian metaphysical leap are not yet ones that I have seen the necessity of taking, either intellectually or experientially.

Review Essay

History Undone: Towards a Deleuzo-Guattarian Philosophy of History

Jeffrey A. Bell

Lampert, Jay (2006), *Deleuze and Guattari's Philosophy of History*, London and New York: Continuum, 178 pages.

For those familiar with the work of Deleuze, and Deleuze and Guattari, it might at first seem unwise to pursue a Deleuze and Guattarian philosophy of history. After all, is it not Deleuze who, in an interview with Antonio Negri, argues that 'What history grasps in an event is the way it's actualized in particular circumstances; the event's becoming is beyond the scope of history'? (Deleuze 1995: 170). And more damningly, Deleuze adds, 'History isn't experimental, it's just the set of more or less negative preconditions that make it possible to experiment with something beyond history' (Deleuze 1995: 170). History, in short, is a starting point for experimental work, but it is precisely history 'that one leaves behind in order to "become," that is, to create something new' (1995: 171). Similarly in *A Thousand Plateaus*, Deleuze and Guattari argue that 'History is made by those who oppose history (not by those who insert themselves into it, or even reshape it)' (Deleuze and Guattari 1987: 295). In the very first line of his book, Lampert recognizes the possible conclusion these citations might lead one to, namely, 'Deleuze and Guattari's philosophy of becoming seems at times opposed to the very idea of historical succession' (1); and yet, as Lampert adeptly demonstrates, it would be a mistake to conclude that opposing history to 'create something new', 'something beyond history', necessarily entails being hostile to history, to the 'idea of historical succession', and thus to a philosophy of history.

To begin to see that Lampert is quite right in asserting that 'Deleuze and Guattari do have a philosophy of history' (1), we can return to the quotes with which we began. In both instances, Deleuze and Deleuze and

Guattari discuss history with Nietzsche at the forefront of their minds. In the interview with Negri, for instance, Deleuze states that leaving history 'behind in order to "become" ... is precisely what Nietzsche calls the untimely' (Deleuze 1995: 171). And in the passage from *A Thousand Plateaus*, Deleuze and Guattari argue that 'Nietzsche opposes history not to the eternal but to the subhistorical or superhistorical', adding that the 'Untimely ... is another name for haecceity, becoming ... (geography as opposed to history ... the rhizome as opposed to arborescence)' (Deleuze and Guattari 1987: 296). We will turn to the dualism of these terms below – i.e., rhizome/arborescence, geography/history, etc. – but it is crucial first to read carefully the Nietzsche passage from which Deleuze draws his conclusions concerning history. As Nietzsche argues in 'The Advantages and Disadvantages of History for Life', and as Deleuze and Guattari cite, 'The unhistorical is like an atmosphere within which alone life can germinate and with the destruction of which it must vanish' (Nietzsche 1983: 63–4, cited by Deleuze and Guattari 1987: 296). Nietzsche then immediately adds that 'only by imposing limits on this unhistorical element by thinking, reflecting, comparing, distinguishing, drawing conclusions ... thus only through the power of employing the past for the purposes of life and of again introducing into history that which has been done and is gone – did man become man' (Nietzsche 1983: 64). Deleuze and Guattari do not cite this passage but skip, by way of ellipsis, to what follows: 'What deed would man be capable of if he had not first entered into that vaporous region of the unhistorical?' (Nietzsche 1983: 64). And yet, in other places Deleuze is quiet clear that Nietzsche's point was not lost on him. In short, one does not indiscriminately leave history behind in order to experiment and create something new, for, as Deleuze admits in his interview with Negri, 'Without history the experimentation would remain indeterminate, lacking any initial conditions, but history isn't historical' (Deleuze 1995: 170).

Lampert is attuned to Deleuze's awareness of Nietzsche's point. As Lampert puts it, 'there are two forces of succession', or two histories: there is 'reactive succession whereby we submit to a predecessor, and an active succession whereby we add a power to a predecessor' (9). The first is history as the historical, 'history as nihilism', and for Lampert it is erroneous for it assumes 'that events have power centres sufficient to determine one result rather than another' (9). To the contrary, the 'theory of succession' Lampert finds in Deleuze and Guattari, the history that isn't historical, is precisely the 'active succession' which entails 'the passage of power across mutually communicating

events, [and which] implies the inheritance of the freedom to interpret' (9). It is the inseparability and co-existence of actual events and an untimely atmosphere and vapour, what Lampert will refer to as flux, that implies the 'freedom to interpret,' the freedom to create something new.

With Lampert's use of the term flux, a second figure crucial to the development of a Deleuzo-Guattarian philosophy of history emerges – namely, Bergson.[1] In a clear echoing of Bergson, Deleuze and Guattari, in *What is Philosophy?* state quite succinctly that they do not follow the traditional task of history, the task of determining precisely what actually happened, or what series of actualities gave rise to another. They seek, as Lampert would argue, to move beyond the understanding of historical succession as 'reactive succession'. The task of history that is not historical, rather, is the attempt to understand the conditions for actualization itself, and as Bergson claims philosophy ought, in pursuing this task, 'to remount the incline that physics descends' (Bergson 1911: 208). Similarly, Deleuze and Guattari argue:

> *It would be necessary to go back up the path that science descends*, and at the very end of which logic sets up its camp (the same goes for History, where we would have to arrive at the unhistorical vapour that goes beyond the actual factors to the advantage of a creation of something new). (Deleuze and Guattari 1994: 140, emphasis in original)

In a convergence of Nietzsche and Bergson, therefore, we find Deleuze and Guattari calling for a history that moves from the actual to the virtual, to the 'unhistorical vapour' that allows for the 'creation of something new'. Yet this is not an indeterminate move away from history, but a determinate undoing of history that allows for history to be done and undone again. As Lampert brilliantly puts it, if one does history as Deleuze and Guattari suggest, one must 'counter-effectuate' the actual, whereby to 'to counter-effectuate, virtuality must make the actual make the virtual. It should not make actuality vanish in an unfulfillable ideal, but make actuality into becoming-actuality' (105). Central to Deleuze and Guattari's philosophy of history, therefore, is an understanding of the relationship between the actual and the virtual, and in Lampert's book we have an effort to detail the many arguments, concepts, and terms that are deployed by Deleuze, and Deleuze and Guattari, in the process of setting forth a philosophy of history built upon this relationship. Central to Lampert's efforts is an attempt to clarify the temporal aspects associated with the virtual – namely, the theory of active succession – that are inseparable from a

'temporal ontology'. Much of Lampert's book consists in explicating the many arguments that are related to this temporal ontology.

A guiding problematic of many of Lampert's arguments concerns the apparent difficulty of reconciling a philosophy of history with Deleuze's arguments concerning the pure past. If the pure past *as past* 'is' as Lampert puts it 'virtually contemporaneous with every event' (8), then how are we to account for history if it is taken to be a chronological succession of events? If we begin with a contemporaneous pure past, how can we understand the possibility of there being 'temporal distance within simultaneity?' (8) Lampert lays out the problem by asking how there can be the co-existence of Joan of Arc in the present, or what he calls the 'Joan of Arc Effect', while also allowing that there is temporal distance between Joan of Arc and her contemporary effects. The next three chapters begin to address this problem by focusing, in turn, on the three syntheses of time (present, past, and future) as laid out by Deleuze in *Difference and Repetition*.

These three chapters are more schematic than thorough in their presentations of the arguments involved with the syntheses of time and how these syntheses are then related to the problem of 'temporal distance within simultaneity'. Lampert has a fondness for lists, and in the chapter devoted to the virtual co-existence of the past – a key chapter since this addresses the guiding problem of his book – Lampert lists thirteen different arguments in nineteen pages. The arguments are suggestive but not fleshed out or interconnected sufficiently to clarify the use Lampert makes of Deleuze and Guattari's central concepts. For example, in the fourth of thirteen arguments, 'The Argument From Two Types of Memory', Lampert makes a promising connection between Deleuze's theory of the 'pure past' and Bergson's theory of 'pure memory'. Although Lampert is strictly speaking correct here (as he is in numerous other instances in the suggestions he makes), a complex argument that could merit a book or chapter in its own right is dispatched in less than a page. Thus, when Lampert comes to the conclusion that we are to take away from this fourth argument – 'In short, the past is detached from the present, its reality is virtual, and the whole past co-exists as a totality' (36) – it is far less compelling than it could be, even if one happens to think it is correct.

Similarly, Lampert's eighth argument offers an evocative possible defence against Alain Badiou's claim that Deleuze was 'a philospher of the atemporal' (41).[2] Lampert – referring to *Proust et les signes* – rightly points out that while Deleuze does speak of the 'generality of time as the "extra-temporal"', he also, and just as importantly, 'calls it,

"time in a state of birth", the "eternity" that "envelopes the multiple in the One and affirms the one in the multiple"' (See Deleuze 1964: 57–60). Lampert concludes that for Deleuze the past is 'atemporal', but 'only in the sense that it generalizes from, and thus "complicates", the present' (41). This complication of the present will emerge as an important theme for Lampert in later chapters, yet in the context of his discussions of the second synthesis of time Lampert merely indicates possible directions one could take with these arguments, but does not follow up on them himself. In short, the central chapters of this book set forth an outline and general map of the terrain that can then be pursued later by more detailed study and explication. Given that this book is addressing a subject that has been heretofore largely untouched by Deleuze scholars, such an outline may serve a useful function for those who seek to follow through on any of Lampert's suggestive arguments.

The final few chapters of this book are the strongest and they directly address Deleuze and Guattari's call for history to return to the 'unhistorical vapour' that allows for the creation of new events. The guiding question in this discussion is 'why this now?': 'why philosophy began in ancient Greece, and why capitalism began in modern Europe' (143). In answering the question concerning the emergence of Greek philosophy, Deleuze and Guattari, following Nietzsche, argue that it is because of the unhistorical, or it is 'as a result of contingency rather than necessity, as a result of an ambiance or milieu rather than an origin, of a becoming rather than a history, of a geography rather than a historiography' (Deleuze and Guattari: 1994: 96–7). There is thus not an identifiable cause that contains, as an unrealized possibility, the Greek philosophy that is the effect of this cause. Such an account of historical origins subverts the very creativity and contingency of historical events. The historical question therefore becomes for Lampert not a question concerning origins or historical causation, but rather a question of clarifying the relationship of the virtual to the actual, or how virtuality can make the actual virtual, into 'becoming-actuality' (105). This discussion enables Lampert to draw together a number of themes that were central to the work of Deleuze and Guattari, and pivotal to Lampert's approach is the notion that temporal distance is made possible by resisting an indeterminable flux, a flux that cannot be as past, present, or present-becoming past, but is, rather, the pure past, the co-existence upon which temporality is based. For example, Lampert argues that 'Napoleon comes after Caesar just to the extent that Caesar never took place, or to the extent that Caesar takes place

simultaneously with, and not before, the Napoleon that replaces it' (93). In other words, the event that is Napoleon comes after the event that is Caesar, but as event, as Deleuze defines it in *The Logic of Sense* (and the dark precursor as Lampert points out), Caesar is actualized in states of affairs and is also the future/past that eludes 'each present, being free of the limitations of a state of affairs' (Deleuze 1990: 151). As a result, the Napoleon event that repeats Caesar is 'repeating something', as Lampert puts it, 'that has not happened' (93). It is the repeating of the event that is 'free of the limitations of a state of affairs', and yet it is the repeating of an event that is co-existent with a present state of affairs. Stating this even more paradoxically, Lampert claims 'Napoleon is after Caesar only if Caesar is not before Napoleon' (93). The temporal succession and distance between Caesar and Napoleon arises as the actuality of the successor resists and separates itself from the non-identifiable nature of the event it is repeating, the event that is nonetheless inseparable from it. For Lampert, then, 'The earlier event has to be made earlier by the force of its successor's attempts to resist identifying with it' (94). If the past, as pure past, is a flux co-existent with the present, it is the resistance to this flux that generates the temporal distance of a successor that is not to be identified with the flux; or, as Lampert argues, 'the prior is the one that is most in flux for the other' (93).

At this point the importance of capitalism comes to the fore, since capitalism, on Lampert's reading of Deleuze and Guattari, is simply the flux of capital, a flux that destabilizes markets precisely because capital is the unstable flux that becomes markets as this flux becomes resisted and captured. Add to this understanding of capitalism Lampert's claim that 'temporality is built on co-existence [i.e. flux] rather than succession'(131), then one can readily follow Lampert when he concludes that it was only capitalist-era historians who were the first to produce a 'universal history'. The reason, according to Lampert, is that 'It [the capitalist-era] is the only age that knows how to be a successor' (131). The capitalist era is the only age that knows first-hand the basic, universal nature of temporality, and hence a universal history that is founded upon co-existence and flux rather than chronological succession.[3] In short, it is the universal commoditisation associated with the co-existence of capital flows (flux) and the commodities these flows are irreducible to, that allows for the emergence of universal history, for a history that becomes possible only as the inseparability of flux and the actual – that is, the universal nature of temporality – comes into view.

One could perhaps take issue with Lampert's final conclusions. There is a sense in which essentialism creeps into the temporal ontology Lampert sets out. It is hard not to come to such a conclusion when it is claimed that a universal history is 'built on co-existence rather than succession', and this co-existence or flux is in turn taken to be a universal characteristic of temporality itself. One might say it is the very essence of temporality. That said, however, Lampert does provide an especially intriguing approach to addressing the virtual/actual distinction. As was noted earlier, there are a number of dualisms that appear to circulate throughout Deleuze's (and Deleuze and Guattari's) texts – virtual/actual, aion/chronos, active/reactive, geography/history, etc. If one approaches Deleuze and Guattari's philosophy of history as a dualistic philosophy then, unsurprisingly, one would read their criticisms of history as a call for rejecting history, or for replacing it with geography (among other things). Yet Deleuze adamantly denies the charge of dualism, and in *Dialogues* he argues that one avoids dualism only 'when you find between the terms... whether they are two or more, a narrow gorge like a border or a frontier which will turn the set into a multiplicity, independently of the number of parts' (Deleuze and Parnet 1987: 132). A Deleuze and Guattarian approach to history, therefore, will not seek to set up camp on the virtual side of the gorge, looking disdainfully across to those historians who toil insipidly within and among the actual. On the contrary, a Deleuze and Guattarian history would turn the actualities of traditional history into a problem, into a virtuality becoming-actual, into a multiplicity.

This is just how Lampert addresses the historical question concerning the appearance of capitalism in Western Europe. For Lampert it is neither a matter of discerning the actual causal factor, nor is it a matter of turning a blind eye to historical facts so as to create something new; rather, it is a matter of addressing the flux that is inseparable from the actual, a flux that becomes historical succession 'by the force of its successor's attempts to resist identifying with it' (94). In other words, the virtual is not identifiably distinct from the actual but is indiscernibly and inseparably 'co-existent' with the actual. The virtual is the problematic inseparable from the actualisation of the actual, and by inseparable we mean simply that the reality of the actual is real because it can become problematised and become other AND still other actualities. It is at this point where Deleuze and Guattari's philosophy of history converges with Deleuze's embrace of empiricism (Deleuze and Parnet 1987: 57). At this point, however, we come to one of Lampert's few criticisms of Deleuze.

As Lampert states it:

> In the final analysis, my view is that Deleuze's theory of the future in this chapter [on the third synthesis of time in *Difference and Repetition*] is correct in its approach, but that it does not adequately solve the problem it is introduced to solve. *Showing how temporal co-existence can be penetrated requires more emphasis on actual historical events than DR calls into play*. (54, emphasis added).

To understand how we can move beyond history 'to create something new' it is not sufficient, on Lampert's view, to simply analyze the third synthesis of time as repetition. As Deleuze argues in *Difference and Repetition* (and in a line cited by Lampert), 'Repetition is the historical condition under which something new is effectively produced' (57: Deleuze 1994: 121). What is needed to give flesh to this repetition, to show how actual events are becoming-actual, is to develop a philosophy of history that includes 'an ontology of what it is to have a date' (75). Lampert discusses a number of issues related to this ontology, but most helpful in this context is the contrast he makes between Deleuze and Derrida.

'For Derrida', Lampert argues, 'dating grounds history in a Husserlian paradoxical way: it subjectively grounds history as an objective being in the world' (87). In other words, a historical event acquires its objective being only as it comes to be dated. For Deleuze, by contrast, 'dating grounds history in a Hegelian paradoxical way: it accidentally actualises a potential and makes time the necessary essence of events' (87). For Derrida, the flux inseparable from a dated, actual event is not itself dated; rather, the date is made possible by an absence, by *différance*, and thus dating makes possible but forever defers a complete and total history.

For Deleuze, the date is an actualisation made possible by an excessive flux, and the actualisation of this flux entails a slowing and filtering (a differentiation of the flux, the chaos, that facilitates the differenciation of actual solutions and dates). As such, it only 'accidentally actualizes a potential and makes time the necessary essence of events' (Deleuze 1994: 122) as the resistance to this flux creates the identifiable temporal distance that becomes the very essence of historical succession. This flux, however, remains inseparable from the actuality of events, and one can, as a good empiricist, force the becoming-actual that is co-existent to the actualities and persons that come to be dated and identified. One can, therefore, as was a guiding motif of Lampert's book, produce Joan of Arc effects in the present, effects that undo historical events such that they can be redone and undone yet again, and so on.

In elaborating upon Deleuze's discussion of the 'repetition by excess, the repetition of the future as eternal return' (58: Deleuze 1994, 122), Lampert argues that 'Luther repeats Paul, the Revolution of 1789 repeats the Roman Republic, 1848 farcically repeats 1789, and so on' (57); and similarly someone can repeat Joan of Arc, for 'History', Lampert claims, 'does not consist in similarities between events, but in the actual reproduction of historical events in new forms' (57). To understand the Joan of Arc effect, therefore, one needs to emphasise, as Lampert believes Deleuze did not, 'actual historical events', actual historical individuals, for only in this way can we understand the historicity of an event, or the temporal distance that becomes identifiable only as the co-existent flux becomes resisted as an actual successor to an earlier historical event. Luther repeats Paul, yes, but with a difference, and a difference irreducible to and yet inseparable from the historically identifiable Luther AND Paul. This is thus the historical empiricism Deleuze offers us: think not the identifiable difference between Luther and Paul, the IS of historical events and individuals; think instead the AND of historical events – Luther AND Paul, Joan of Arc AND... – think the AND that can allow for the creation of something new.

We can return then to Lampert's claim that Deleuze's understanding of the temporal co-existence of the past in the present – the Joan of Arc effect – requires 'more emphasis on actual historical events' than Deleuze provides. If one stresses the empiricist aspects of Deleuze's thought – after all, Deleuze always considered himself to be an empiricist[4] – then one could begin to see that Deleuze does indeed allow for adequate emphasis on 'actual historical events.' Lampert does not discuss the empiricist aspect of Deleuze's project, which may have further supported Lampert's temporal ontology of historical events.

Here Lampert may well be trying to distance himself from Manuel DeLanda who understands the cause of actual events as being other actual events (dynamic systems in this case). To avoid conflating empirical, representational science with philosophy, Lampert may be wisely steering clear of addressing Deleuze's empiricism. Yet Deleuze's empiricism, as transcendental empiricism, is indeed a philosophy and is not to be conflated with science. Understood in this way, Deleuze's empiricism could shed further light on Lampert's claim that 'temporality is built on co-existence,' whereby co-existence would then be taken to be precisely the AND of multiplicities rather than the IS of identity, the IS of the one and the multiple. This might enable a Deleuze and Guattarian philosophy of history to avoid what appears, at times, to be hints of essentialism in Lampert's definition of temporality. These issues

might have been addressed quite adequately without turning to Deleuze's transcendental empiricism if the arguments of the middle chapters of this book had been more detailed.

Lampert is to be commended, however, for what he has done in this book. In effect, Lampert provides us with directions towards which a Deleuze and Guattarian philosophy of history might proceed. Specifically, Lampert offers (for the first time in a book-length treatment), an extensive analysis of how Deleuze and Guattari's philosophy of history understands the relationship between the reality of the actual and the reality of the virtual which makes the actualisation of the actual possible. Lampert's book provides a much-needed clarification of this relationship between the actual and the virtual. In whatever manner or multiplicity of ways a Deleuze and Guattarian philosophy of history may be pursued in the future, Lampert's book will likely prove to be an indispensable point of departure for the becoming-actual of this philosophy.

Notes

1. Among the many places where Deleuze exhibits the influence of Bergson, and especially the vitalist aspect of Bergson's thought, one could perhaps not find a clearer statement of it than what he says in a 1988 interview: 'Everything I've written is vitalistic, at least I hope it is, and amounts to a theory of signs and events' (Deleuze 1995: 143).
2. Lampert acknowledges in a footnote following the passage just cited that although Badiou's 1997 work which is heavily critical of Deleuze may be one-sided, Lampert points out that it was published for a series ('Coup Double' for Hachette) where the authors 'are expected to exhibit their own original philosophies while commenting on some great philosopher' (52). That said, I do believe Badiou would assert that his criticisms are founded upon a careful rather than one-sided reading of Deleuze. For more on this, see Smith (2003), May (2004), and Bell (2006).
3. Lampert refers to Hegel's claim that with the 1791 publication of *The Declaration of the Rights of Man and of the Citizen*, the self-consciousness of freedom has become actualized in the world. Consequently, as Lampert puts it, 'Every free act from now on is an expression of the rights of man, and every date from now on is superimposed on to 1791. The very moment when history becomes fully temporal, and ceases to be geo-cultural, is the moment that time switches over from succession to co-existence' (90). In short, we move from a history of successive events to a universal history, to the co-existence of flux (or freedom and rights in Hegel's case) and actuality.
4. In the 1987 preface to *Dialogues*, for instance, Deleuze begins by stating 'I have always felt that I am an empiricist, that is, a pluralist' (Deleuze and Parnet: 1987: viii). This self-assessment is supported by the numerous instances where Deleuze refers to his project, from his early work on Hume on through *Difference and Repetition* and to his final published essay, 'Immanence: a life', as transcendental empiricism (Deleuze 2001: 25–33).

Passions and Actions: Deleuze's Cinematographic *Cogito*

Richard Rushton Lancaster University

Abstract

When writing about cinema does Deleuze have a conception of cinema spectatorship? In *New Philosophy for New Media*, Mark Hansen argues that Deleuze does have a conception of cinema spectatorship but that the subjectivity central to that spectatorship is weak and impoverished. This article argues against Hansen's reductive interpretation of Deleuze. In doing so, it relies on the three syntheses of time developed in *Difference and Repetition* alongside an elaboration of Deleuze's notion of a 'cinematographic *Cogito*'. In this way, the article offers a way of understanding the processes of cinema spectatorship from a Deleuzian perspective.

Keywords: cinema, new media, spectatorship, interactive, Mark Hansen, *Cogito*

Although many agree that Deleuze's *Cinema* books (1983, 1985) are groundbreaking landmarks in the history of film studies, no-one seems quite sure what to do with them. A number of scholars have played the game of pitting the movement-image against the time-image in an attempt to display the superiorities of the latter, while others have gone to great lengths to demonstrate the ways in which Deleuze's approach to cinema dissolves the traditional notions of unified subjectivity that were the hallmarks of film theory in the 1970s and 1980s (see Pisters 2003; Olkowski 1999). However, very few have tried to work out *who* or *what* it is that engages with actual films from the Deleuzian perspective. From Deleuze's position, one might ask, are there *spectators* who go to see (and hear) films; which is to say, can we call the experience of watching (and listening to) a film an experience that belongs to or which is undergone by a *subject*? Given Deleuze's long-held suspicion of notions of subjectivity, such an assertion would appear to be highly

problematic. But if it is not a subject who experiences a film, then who or what is it?

In *New Philosophy for New Media* (2004a), Mark Hansen claims that if there is a spectator of cinema for Deleuze, then this spectator is one who is wholly *subjected to* the cinema. For Hansen, if there is a loss of subjectivity in Deleuze's conception of a cinematic spectator, then this is because the spectator, while in front of a film, loses all of the defining characteristics of subjecthood. By way of contrast with Deleuze's cinematic spectator, Hansen claims that the subjects or spectators of new media maintain their subjecthood. As a process of creative interaction with new media artworks, the new media spectator forms part of an expanded subjectivity, whereby that subjectivity grows, is modified, and discovers new affectivities. I do not wish to take issue with Hansen's characterisation of new media subjectivities — that is not my field of speciality. But I certainly do want to question his understanding of Deleuze's cinematic spectator. The loss of subjecthood Deleuze's cinematic spectator experiences should not be construed as a negative; it is rather one of the powers of cinema. Indeed, such losses of subjecthood are precisely what characterise the *Cogito* specific to Deleuze's conception of cinema. Deleuze's cinematographic *Cogito*, as I argue below, can be most accurately charted by virtue of the three syntheses of time formulated in *Difference and Repetition* (1968). To my knowledge, the connection between the three syntheses and a cinematographic *Cogito* has not been made before, but I argue that this connection is essential to understanding Deleuze's approach to cinema and of who or what it is that has cinematic experiences.

I. Against Deleuze: New Media Subjects

What, then, is Hansen's argument? He puts forward an ingenious hypothesis: the significance of new media does not lie in the qualities of its objects, but rather in our responses to it. The specific qualities that make new media *new* have little or nothing to do with the properties of those media, and have everything to do with what they allow subjects — those who encounter new media objects — to achieve. If a spectator engages with a new media object then it is necessary for that spectator to interact with it in order for that object's true importance to emerge. New media are therefore *interactive*; they are defined less by what I receive from them than by what I can give to them. And according to Hansen's thesis, what I give to the objects of new media is *affectivity*.

Affectivity, Hansen goes on to argue, is a bodily production of excess which occurs when the body breaks its boundaries and achieves something that it has hitherto been unable to or which it had never before had the chance to experience. Although Hansen does not mention video games, the example seems appropriate: when playing a video game I have the capacity to make things happen and therefore change the course of the game. In video games this is typically achieved by bodily manipulating controls — various buttons and joysticks — that involve genuinely new bodily skills, reflexes and motor co-ordinations, so that the body extends itself in order to respond to the game. Each new game brings with it the chance to produce new bodily skills. These are *bodily* affectivities, and furthermore, *I* am the one who makes these things happen; *I* am the one doing it. Rather than being solely at the mercy of a technology like cinema which, according to Hansen's argument, leaves me no room for manoeuvring or interacting, new media give me a role in their very coming-into-being. And my way of bringing about this coming-into-being is by creating the kinds of bodily affectivities that define what the new media experience is all about.

These activities also bring about a *virtualisation of the body*. It is as though, when playing a video game, I am stretched between the confines of my own bodily boundaries and the screen upon which the video game is displayed. There is thus a *virtual body*, partly mine, partly the video game's, a novel, hybrid body which is generated by me, my movements and activities, in the operation of bringing the video game into being. In other words, the game cannot exist without my being there to play it. There are thus two intertwined, essential qualities of new media: first, its potential to generate bodily affectivities which, second, imply a virtualisation of the body.

Hansen's prime examples of new media objects are not of video games, however, but of new media artworks. For example, he describes the effectiveness of Craig Kalpakjian's *Hall* as follows:

> *Hall* (1999) is a continuous video loop of movement through a hall without any exits, which generates in the spectator a vertiginous feeling of being trapped in a deadly, because thoroughly generic, space. (Hansen 2004a: 210)

Hall can generate affectivities and virtualisations of the body because of the severe discrepancy between the human world in which the spectator is located and the technological world of the artwork. Because this work has no 'real world referent' there is no way for the spectator to relate to it in any straightforward way. There is a *radical separation* between the human-subject-spectator and the new media object.

As such, there is no automatic connection between the subject and the object because new media objects act in ways that block, refuse, disjoint and confuse subjective responses. Human subjects are 'fundamentally excluded' (Hansen 2004a: 223) from the space of *Hall*, to the extent that Hansen describes these spaces as incompossible:

> [T]his space is a radically nonhuman one, one without any analogical correlation to human movement and perception, and one into which affection can be introduced only from the outside, as a supplement that originates in the embodied response of the viewer-spectator. (Hansen 2004a: 215)

As a result of this radical disjunction between the human and non-human environments it is necessary for the spectator to generate *something else*: the spectator must generate affections or affectivities, which are, one could say, projected into or onto the artwork as a conjunction of spectator and work, as a consequence of the spectator's virtualisation of her/his body. The spectator's bodily affections must be virtualised in order for this artwork to come into being; the virtualised bodily affections are not produced by the artwork itself but only by what the spectator gives to the artwork.

Hansen moves the arguments surrounding new media away from an obsession with its objects. Instead of focussing on the aesthetic properties, the production aspects, the materials used, the digital programmes, or new media's 'virtual' nature, Hansen focuses on the ways we respond to and interact with such objects. New media objects have certainly assumed particular forms, but what is really special about them, for Hansen, is what they allow *us* to do.

Two main lines of argument are emphasised by Hansen. One line of argument highlights the nature of the *virtual* for new media, while a second centres on the notion of *embodiment*. First of all, the virtual is no longer seen as a property of new media: the significance of new media objects is not that they are virtual or that they create virtual realities, but rather that they make *us* virtual. Secondly, the realm of bits and digits and simulation does not make real bodies obsolete, for the body is central to Hansen's notion of new media. The notion of embodiment is essential because it is the body — through its affectivities and virtualisations — that produces a unique interaction with new media objects. For example, from Hansen's point of view — though, again, this is not an example he uses — the significance of Lara Croft (the digi-character from the video game, *Tomb Raider*) is not that she is an imaginary, simulated, impossible, non-existent, unrealisable body, but rather that such unrealisable-immaterial new media images open up new

kinds of bodily processes *for us*. That is, digital images facilitate the production of new bodily affects.

II. Old Media Subjects

If new media are new, then what are the old media against which the newness of the new is measured? What exemplifies the old media for Hansen is cinema. It is cinema's treatment of the body and the virtual that are definitively different from new media. Taking his cues from Deleuze's *Cinema* books, Hansen argues that the significance of cinema is located entirely with its objects: *films*. Films function in such a way as to exclude any activities (or affectivities) of the spectator's body and they also foreclose the possibility of any virtualisation of the body. Why is this so? Films do this because their affectivities and virtualities are positioned *entirely within films themselves*. There is thus no room for interaction on the part of the film spectator: any affectivities or virtualisations are not a result of the spectator's interactions with a film; instead, *they are wholly determined by that film*. The film spectator can only passively mirror or receive the affectivities and virtualities that are produced by the film; the spectator's responses are fully determined by the film; the subject in front of the cinema screen is fully determined by the filmic object.

The distinctions between Hansen's new media theory and Deleuze's theory of cinema are therefore clear: the cinema, because it is in some way analogical, forms an intrinsic connection between the spectator's faculties of perception and the represented space of the film; any spectator is able to recognise and connect with (or 'identify' with, as traditional film theory would have it) the scenes and spaces depicted by a film. This then means that what a spectator perceives in the cinema is a represented space that is *given* to him/her; the spectator has to do nothing but receive the cinematic perceptions whose origins are external to the spectator-subject. The spectator, for his/her part, gives nothing to the cinematic object, for the perceptions of the cinema are external to this spectator.

For new media, according to Hansen's examples, the stakes are reversed. There is a distinct lack of connection between the spectator and the new media object and this lack of connection necessitates the fabricating of a connection on behalf of the spectator: the spectator must *add* to the new media object in order for its objecthood to come into being. Hence, it can be posited that, and this is the important point, the Deleuzian cinematic perceptions originate in the *film-object*, whereas Hansen's new media affectivities originate in the *spectator-subject*.

Hansen's reading of Deleuze is inadequate. He makes Deleuze's film theory into a straw target by construing his work in such a way that it appears he gives everything over to the film-object. The reality, however, is that Deleuze's cinematic theory proposes a very original and somewhat complex interaction between the spectator and the screen, that is, between the spectator-subject and the film-object. I use the word *interaction* here deliberately: cinema *is* interactive. It is a composite of subject and object in which each determines, interrogates and investigates the other.

III. Subjects and Objects in the Cinema

What, then, might a Deleuzian response be? Where are the subjects and objects of cinema for him?

Minimally, it can be acknowledged that Deleuze at least makes the claim that there are subjective, point-of-view shots in the cinema; that is, the kinds of shots that are supposed to be from a particular character's point-of-view such that they depict what that character sees. But such shots cannot be divorced from the opposite kinds of shots: objective shots. These are shots which are from the objective eye of no-one — the camera's eye – rather than that of a particular character. As Deleuze argues, even if we see a subjective shot, the only way we can know it is subjective is by way of its emplacement within an objective system of shots. 'A character acts on the screen', he writes, 'and is assumed to see the world in a certain way. But simultaneously the camera sees him, and sees his world, from another point of view which thinks, reflects, and transforms the viewpoint of the character' (Deleuze 1986: 74). In other words, a subjective shot is not merely a subjective shot; it can only be designated as subjective in relation to other, objective shots.

This may not appear to be a particularly profound point to make, except that Deleuze links this observation to what he calls a 'cinematographic *Cogito*':

> Can we not find this dividing-in-two, or this differentiation of the subject in language, in thought and in art? It is the *Cogito*: an empirical subject cannot be born into the world without simultaneously being reflected in a transcendental subject which thinks it and in which it thinks itself. And the *Cogito* of art: there is no subject which acts without another which watches it act, and which grasps it as acted, itself assuming the freedom of which it deprives the former. (Deleuze 1986: 73)

These lines from *Cinema 1* are located amid a discussion of free indirect discourse in the cinema and are explicitly related to the philosophical notion of the *Cogito* developed by Henri Bergson in an essay on 'The Memory of the Present' (Bergson 2002 [1908]). The notion of free indirect discourse has been mobilised to a limited extent by Deleuze's commentators in film studies (see Rodowick 1997: 61–2), but its radical potential has been missed inasmuch as it has not been connected to three syntheses which, from *Difference and Repetition* (1968) on, form the core of Deleuze's thought. By suggesting specific relationships between subjective and objective points of view in cinema, and between the camera and characters in films, Deleuze effectively draws a map of the way the spectator works with cinematic images and sounds.

In Deleuze's *Cinema* books, there are myriad categories of filmic aesthetics, affects and signs, but what is necessary for these categories to be possible is an underlying assumption of the ways in which films are watched. As Christian Metz astutely pointed out, in a different context, what is commonly referred to as the 'spectator' in film theory is, for the most part, something merely constructed by 'the imagination of the analyst' of any film. (He additionally points out that many analyst-spectators must also construct imaginary authors too, an observation that clearly holds true for Deleuze's analyses (Metz 1991: 760).) To construct the kinds of categories he does, then, Deleuze must have a notion of spectatorship which he uses to organise his writings on cinema.

As Deleuze and Guattari demonstrate in *What is Philosophy?*, the *Cogito* is a presupposition: it functions in thought as that which comes before thought. Deleuze's notion of a *Cogito* of art bears this out. He means that there are subjective and objective dimensions of experience: an empirical subject cannot exist without its transcendental correlate, and neither can a subject act without being doubled by a supposedly 'watching' subject that monitors those actions (the division is indebted to Kant's division between concepts and intuitions). The empirical subject acts automatically, as if they were being drawn along by their experiences, while the transcendental aspect of the subject 'sits back' and observes, monitors or watches the automatic, empirical aspect of the subject.[1] This is how Deleuze presupposes cinema spectatorship works: spectatorship in the cinema is always doubled, such that there is a dividing-in-two of the cinematic experience, so that one part of the spectator receives and responds to images automatically, while another aspect of the spectator monitors these automatic responses. On the one hand, then, there is a part of the subject that is empirical-automatic, and this aspect of the spectator is guided by the bodily senses — this

part of the spectator is embodied. On the other hand, there is a quasi intellectual or semi self-reflective aspect of the spectator, a transcendental part of subjectivity which searches for the conditions of possibility of any occurrence or act.[2] If the empirical-bodily aspect of the spectator responds mechanically and automatically then it is the task of the transcendental-intellectual aspect of the spectator to enquire into the conditions which make possible the bodily reaction.

This is where the first cracks in Hansen's reading of Deleuze can be found: Hansen works only with the first dimension of the spectator in Deleuze, the *empirical* or bodily aspect. And, yes, here one can certainly argue that the empirical-bodily spectator is, in a sense, ruled by the images presented to it: the empirical-bodily spectator responds *automatically* and *mechanically* — and at the same time viscerally and physiologically — to the image. Perhaps these might be called *subjective images*. But it is a very strange kind of subjectivity, a subjectivity with no background or backdrop, and a subjectivity that lives entirely *in the present*, as it were, reacting and responding only to filmic events as they happen. If these are subjective images, then they are certainly not images guided by a subject. Rather, they are the responses of a subject that has lost all subjecthood, that has lost the traits of agency and self-determination. So it may be a strange thing indeed to call these subjective images, for they are images without a subject produced entirely by the filmic object. It is on this level, then, that Hansen's understanding of Deleuze's cinema spectator might be correct: a spectator-subject wholly guided by the objects presented to it.

An example can help to clarify these issues. A major point of reference in Deleuze's discussion of subjective and objective perceptions in the cinema is Jean Mitry's *Aesthetics and Psychology of the Cinema* (1963). There Mitry evocatively claims that 'In the cinema ... so-called subjective impressions are *presented* to me — as is everything else: the camera moves down the street, I move with it; it climbs the stairs, I climb with it. I thereby directly experience the sensations of *walking* and *climbing* (at least this is my impression)' (Mitry 1997: 210). These are clearly *subjective* images, as Mitry acknowledges, images that seem to emanate from the point-of-view of a subject. Yet, as he further notes, if these are considered subjective images, then they are not images that are *produced by a subject*:

> Yet the camera is leading me, guiding me; it conveys impressions not generated by me. Moreover, the feet climbing the stairs I can see in the frame of the image are not *mine*; the hand holding onto the banister is not *mine*.

> At no point am I able to recognize the *image of my own body*. Thus it is obviously not me climbing the stairs and acting like this, even though I am feeling sensations similar to those I might feel if I were climbing the stairs. (Mitry 1997: 210)

Mitry therefore throws the notion of subjective images into question (he ultimately comes up with a category he calls the 'semi-subjective'): even though such images appear to be those of a subject and I as a spectator appear to be experiencing those shots subjectively, i.e., from a subjective point-of-view, such subjective shots are always *necessarily* determined by the camera. In fact, such shots are *wholly* determined by the camera: any subjectivity that I may experience in respect of what I see on the screen is imposed on me by the camera — all I can do is receive it. In this way, so-called subjective shots in the cinema are wholly determined by the cinematic object: they are *objective images imposed on a spectator-subject*. These *are* subjective shots — 'so-called subjective impressions', as Mitry remarks — but they have the taste of *objectivity*: the most seemingly subjective shots of the cinema are those that are dictated to me and which I cannot in any way change or interact with.

In this situation, the body of the spectator-subject is 'acted' (as Bergson says) rather than 'active'. The stakes of Hansen's criticisms of Deleuze are pertinent, even valid, if one restricts one's view of cinema to what is presented here by so-called subjective images. And Mitry, if confined to this one example, provides us with Hansen's view of the cinematic experience: at all times I am guided by the camera; I cannot affect or effect the presentations I see there, and *my body* cannot participate in or interact with the images that are dictated to me by the screen; at the cinema I am merely a passive receptacle. And there is no question that such a conception of the cinematic experience does exist for Deleuze, but such a conception gives us only half the story, the half of the story in which the spectator can be regarded as 'empirical'. It is this part of the subject which receives impressions imposed on it by the cinematic apparatus: automatic, mechanical, properly receptive in the Kantian sense. These images can be described as subjective ones, but the kinds of subjectivity they offer are not ones produced by a subject. And ultimately, this seems to be why Hansen has such a problem with this kind of cinematic engagement: it amounts to a denial of subjectivity, a foreclosure of the possible activities of the subject, an abandonment of subjecthood. Cinematic subjectivity is here merely a kind of subjectivity that is at the mercy of cinema's apparatus: the screen, camera, projector, loudspeakers, and so on.

IV. A Transcendental Spectator

There is another dimension to the cinema spectator for Deleuze: the *transcendental* aspect, that which for Deleuze is associated with the potential for objective perception in the cinema. The best definition of an objective perception in the cinema is, for Deleuze, a negative one: an objective shot is one that is not subjective, which is to say, one that is not from a particular character's point of view. 'We should be able to say, in fact', writes Deleuze, 'that the image is objective when the thing or the set are seen from the viewpoint of someone who remains external to that set' (Deleuze 1986: 71). This, then, is the first point to take on board: it is extremely difficult to isolate *objective* images or shots. Rather, any sense of objectivity can only arise from the *relations between different shots*. It is a matter of finding or designating the conditions by means of which certain shots can be read and interpreted or understood: *this* is the transcendental aspect. Again Deleuze shows his debt to Kant, for by 'transcendental' Deleuze means the conditions of possible experience, the conditions which allow something to be experienced *as* an experience. And these are precisely the kinds of questions that the transcendental aspect of the spectator asks: 'Why is this happening?' 'Why did this occur?' and so on. There is, however, a significant difference between Kant's approach to the transcendental and Deleuze's. Kant grants transcendental authority to the *active* processes of the faculty of understanding (which faculty thus overrides the passive receptions of empirical intuition) whereas, for Deleuze, transcendental processes remain wholly *passive*: they are *not* the result of subjective effort. Rather, they emerge *without the active or conscious provocation of the subject*. In other words, these transcendental conditions *happen to* the subject rather than being *caused by* the subject.

There are objective shots in the cinema, but any quest for objectivity, from the spectator's point-of-view, is accompanied by a transcendental reflection — to reiterate Deleuze's claim noted earlier: 'an empirical subject cannot be born into the world without simultaneously being reflected in a transcendental subject' (Deleuze 1986: 73). If we think about the possibility of objectivity in the cinema in association with this transcendental aspect of the spectator, what will we find? Edward Branigan has very convincingly pointed out the necessity of a seemingly objective relation to filmic events. When watching films, Branigan argues, a spectator continually makes theoretical leaps between different occurrences in the narrative and constructs vague hypotheses about what will happen or what may have happened in order to convey upon the filmic material some sense of structure or organisation. That is, the

spectator tries to put the pieces of a film together in order that the events of the film conform to some sort of potentially objective system. When a spectator engages in such an activity, then this activity, Branigan argues:

> represents a hypothesis . . . we are making about our perception of the world of the characters as we understand *that* world by apparently being *in* it; that is we are perceiving the world of the characters through projecting and imagining a situation in the diegesis whereby declarative knowledge of the relevant kind could be obtained and a description produced. (Branigan 1992: 165)

A film typically demands the construction of some kind of potentially objective diegetic world in which the events of the film are contained and unfold according to the expectations of that diegetic world. The assertions that, in a film, *this* happened, or *that* happened, can only be made in accordance with an objective, though hypothetical realm within which the events unfold. As Branigan puts it, 'This film's world *as itself an object* must be independent of certain angles of view' (Branigan 1992: 165). The film's world is defined by the specific shots (and editing patterns) of the film as they occur, but only insofar as these shots (or edits) are embedded in a world-as-object that the spectator puts together. The spectator constructs objective patterns within which the subjective material (the 'actions') of any film unfolds. This is what Deleuze means by 'transcendental': the conditions of possible experience, i.e., the conditions of possibility within which the events, actions, situations and contemplations of a film occur.

Branigan adds something more: he claims that if the spectator is intimating or inferring certain conditions of possibility, then that spectator makes these inferences on the basis of apparently being *in* this world. A fine example of this is provided in Max Ophuls' *Letter from an Unknown Woman* (1948). A young woman, Lisa, falls in love with a concert pianist, Stefan. It is a love from afar, however, as Stefan knows nothing of Lisa's passionate desire for him. One day, Lisa manages to sneak into Stefan's apartment when he is not at home, and she immediately makes her way to the piano which she has heard him play so often. Branigan concentrates on the two shots which chart Lisa's movements towards Stefan's piano. The first shot, a long shot from behind Lisa, shows her at quite some distance from the piano which is located in the background of the frame. The shot that immediately follows, this time from directly behind the piano, now shows Lisa standing right beside the piano. What occurs in the gap between these two shots? Do we, as spectators, infer that Lisa has somehow miraculously travelled twenty feet in an instant? Of course

we do not! But we do, Branigan argues, fill in the missing time which the edit erases.

> Our anticipation is an imaginary time attributable to Lisa's desire for Stefan through his piano. Fixated on the piano, she advances toward it, and the spectator completes the action; or rather, the spectator constructs a virtual time in which the action is realized. (Branigan, 1992: 182)

This simple example of two shots can clearly demonstrate the difference between the empirical and the transcendental aspects of the spectator from a Deleuzian point of view. On the one hand, that which enables the spectator to discern that the second shot occurs after the first one is *empirical*: our ability to infer a direction to time from one event to another, from the past to the future via the present, is a function of what Deleuze calls 'the passive synthesis of habit' in *Difference and Repetition* (Deleuze1994: 70–9), the first of the three syntheses of time which are central to Deleuze's philosophy. Derived as it is from notions of Kantian intuition (though Deleuze's most explicit reference is to Hume), the first synthesis enables us to situate events 'in' time. We intuit that an edit designates a flow of time and that during the time of this edit Lisa has crossed the room (there is certainly no sense in which these scene, with its potentially strange cut, is in any way difficult to understand).

But there is another dimension at work here. As Branigan suggests, there is 'an imaginary time attributable to Lisa's desire for Stefan through his piano' (Branigan 1992: 182). There are a whole series of *conditions* that make possible a deeper understanding of this filmic situation. The relation between the two shots could be said to be motivated by Lisa's desire — which is to say that these shots are, more or less, motivated by everything in the film that has preceded them. Our remembering of Lisa's unrequited love for Stefan and our knowledge of her many attempts and sacrifices made to be close to him, give Lisa's movement from the first shot to the next an added depth. In Deleuzian terms, this is a function, for the spectator, of the 'second passive synthesis of memory': the motioning towards the conditions of possibility of any event based upon our past experiences; the present can only function as 'present' on the basis of a past which conditions it *as* present (Deleuze 1994: 79–88). These are, then, as they are for Kant, *transcendental* conditions.

What, then, may be said of the *subjective* and *objective* aspects of the spectator? The *empirical* dimension of the spectator is not necessarily as subjective as it might at first appear, so does this mean that the *transcendental* side of the spectator is likewise not necessarily objective?

The transcendental conditions that make possible the relation between these two shots — conditions like our knowledge of Lisa's unrequited desire for Stefan — could be said to be objective insofar as one would have great difficulty understanding the film without such conditions. But if by objective one means *elements of the film that are put in place by the film itself without the input of the spectator* — that is, things in the film that are *not* determined by the *subjects* who experience this film — then the claim for objectivity cannot hold. As Branigan claims, 'the spectator completes the action; or rather, the spectator constructs a virtual time in which the action is realized' (Branigan 1992: 182).[3]

The transcendental spectator-subject of the cinema is crucially *subjective*, even if it is this aspect which offers an objective dimension of spectatorship. These are the images or concepts of a film that simply would not exist were it not for the fact that there is someone to watch, listen to and make sense of them. It is nothing less than what the spectator, at any point during the viewing of a film, *adds to* that film. This is manifestly a transcendental level of understanding: what a subject adds to the viewing experience in order to grant that experience a potential objectivity.

It is not merely the preceding events of a *film itself* that add to this transcendental level of understanding, but rather, as Deleuze would have it, *the whole of one's past*.[4] This is not as mysterious as it may at first sound, for what can it be that makes *Letter from an Unknown Woman* so romantic and compelling for many viewers? Surely one reason, an important one, is that many viewers of the film have loved from afar and thus share a deep sympathy for the situation Lisa finds herself in. One might even go so far as to say that an element of personal, deeply subjective memory might, for the spectator, be said to infuse itself with the past of the film and that it is only on the basis of such pasts that the film could be said to be enjoyable, engaging or memorable for any spectator (conversely, an absence of such memories might amount to making the film entirely uninteresting for a spectator).

Would not this then be a very important form of *interaction* for the spectator? Indeed, that which makes a film a *film* requires an enormous amount to be given to the film by the spectator-subject. The spectactor-subject is, as Metz put it, a midwife to the image:

> I'm at the cinema. I am present at the screening of the film. *I am present*. Like the midwife attending a birth who, simply by her presence, assists the woman in labour, I am present for the film in a double capacity (though they really are one and the same) as witness and as assistant: I watch, and I help. By

> watching the film I help it to be born, I help it to live, since only in me will it live, and since it is made for that purpose: to be watched. (Metz 1982: 93)

V. Passions and Actions

For Hansen to claim that the cinema spectator cannot interact with films — to imply that the spectator at the cinema is simply at the mercy of the filmic object and automatically plays along to its tune, and that Deleuze's cinema spectator is therefore merely 'the passive correlate of linkages between images' (Hansen, 2004a: 7) — is to grossly underestimate the input the spectator necessarily makes to the unfolding of any film.[5] And yet, such a spectator is not at the same time necessarily *active*, for all of the activities I have been describing by way of Deleuze as transcendental are, at their foundation, passive.[6] The kind of experience of monitoring or recollecting that Deleuze attributes to the transcendental *passive* synthesis of memory is one that *happens to* us and which *affects* us, but without our necessarily consciously knowing it, and certainly without our consciously activating it.

Again, the passivity of Deleuze's cinema spectator can be compared with the active new media spectator theorised by Hansen. Hansen argues, for example, that Douglas Gordon's post-cinematic works, such as *24-Hour Psycho* (1993), offer a 'refinement' of the sensorimotor processes of classical cinema:

> Unlike the sensorimotor interval at work in the cinema of the movement-image, this refined sensorimotor interval [as exemplified by Gordon's works] is not immanent to the logic of the image or of film as the art of moving images, but emerges directly from the human processing of information. Consequently, it is a sensorimotor interval that taps the potential of the body to exceed its own contracted habits and rhythms. (Hansen 2004a: 246–8)

In this case, then, the body asserts its activeness, an activity that emerges 'directly' (for reasons which are very unclear to me) 'from the human processing of information', over and against what must be an inherently inactive new media image. The body exceeds its own limits as a result of its own activity and thus the origin of the new media object lies in the empowerment it offers to the spectator-subject. *I* make the new media world in the image of my own excess: 'it is the viewer's body *in itself* (and no longer as an echo of the work's "content")', argues Hansen, 'that furnishes the site for the experience of [new media] "works"' (Hansen 2004a: 31). For Deleuze, on the other hand, the cinematic sensorimotor subject does not simply impose itself on the world in a mode of mastery, but rather acknowledges the necessity of negotiating

with the world and its objects — including cinematic ones — in the hope of being able to 'reconnect man to what he sees and hears' (Deleuze 1989: 172). This subject is not one who is isolated from the world, cocooned in a subjectivity that it continually tries to assert over the world, but is rather part of a world with which it is in continual symbiosis.

Hansen's attempt to theorise new media in terms of our responses to it, rather than theorise its objects, necessitates a notion of subjectivity that actively creates or contributes to the very objects of new media: 'the [new media] image does not comprise a representation of a pre-existent and independent reality, but rather a *means* for the new media user to intervene in the production of the "real", now understood as a rendering of data' (Hansen 1994: 10). Because of this, 'the [new media] "image" itself has become a process and, as such, irreducibly bound up with the activity of the body' (Hansen, 1994: 10). Thus, the new media image does not exist without the bodily affects that are added to it by the spectator-participant. As a result, the new media image may be considered fundamentally interactive and therefore a *process* more than a product inasmuch as the spectator-participant's activity is crucial to the object's creation and existence.

Against this conception of the spectator's interactivity with new media, Hansen posits the 'old' cinematic medium as one of immobility, passivity, and non-interactivity (Hansen 2004a: 34). His chief target in conceptualising the oldness of the cinematic medium is, as we've seen, Deleuze, who, according to Hansen's reading, 'cannot account for the primacy of the subjective dimension of the body' (Hansen 2004a: 194). For Hansen, Deleuze's conception of cinema is one that aims to 'disembody the center of indetermination [by which Hansen, borrowing from Bergson, means 'human'] and thus free cinema to operate an "inhuman" perception' (Hansen 2004a: 70). According to Hansen, then, Deleuze erases all embodiment from human subjects. As we've seen, this is clearly not the case for Deleuze, for whom the body and bodily processes of the to-ing and fro-ing of the empirical and transcendental aspects of the spectator are fundamental to the conception of the cinematic experience.

Hansen also charges that Deleuze erases the *subjective dimension* of the body, thus bringing about the conditions of an inhumanity. Again, as we've seen, it must be remembered that so-called subjective experiences in cinema are never *caused by* subjects. Rather, they are subjectivities which *happen to* subjects and which thus help to create those subjects as processes. Hansen, it seems to me, regards subjects or subjective bodies as agents: as the active causes of the processes which create both

new media objects, and by extension, their own subjectivities. Hansen's conception may thus be seen as an embodied, and hence inverted, version of the Cartesian *Cogito* ('I affect, I am') as distinct from Bergson's or Deleuze's complex *Cogito*.

Against Hansen's reification of the embodied subject, Deleuze's conception of subjectivities — and these are subjectivities fundamental to the cinematic experience — is one that posits them as composites of subject and object in states of deformation and reformation which respond to and act upon the fluctuations of empirical reception and transcendental structuration. Against notions of 'the subject', Deleuze declared a preference for terms such as *pre-individual singularities* or *non-personal individuations* (Deleuze 2006: 351). Such individuations are inhuman only insofar as they reject notions of isolated, self-created and self-creating subjects who are masters of all they affect. For Deleuze, 'Underneath the self which acts are little selves which contemplate and which render possible both the action and the active subject' (Deleuze 1994: 75).

VI. Clarifications

Hansen's new media spectator adds two things to the new media object (and these properties are those which make new media objects 'new' for Hansen): *affection* and a *virtualisation of the body*. These concepts are, for Hansen, reversals of Deleuze's cinematic notions of affection (or 'affection-image') and the virtual. Hansen grants the powers of affection and the virtual to the body of the *subject*, whereas (on Hansen's reading) Deleuze makes *objects* the seat of affection and the virtual.[7]

On affection, Bergson (from whom Deleuze and Hansen borrow liberally) does indeed claim that 'my perception is outside my body and my affection within it' (Bergson 1988: 57). Deleuze confirms this view when he writes that affection is the way the subject 'experiences itself or feels itself "from the inside"' (Deleuze 1986: 65). Bergson also goes on to argue, in *Matter and Memory*, that 'Affection is, then, that part or aspect of the inside of my body which we mix with the image of external bodies' (Bergson 1988: 58). And again it seems that Deleuze agrees with Bergson that affection is 'a coincidence of subject and object' (Deleuze 1986: 65). No clear division is made here between subject and object, for affection is a mixture or conjunction of the two. In his book on *Bergsonism*, Deleuze even states that, as fundamental to his project, 'Bergson shows how the lines of objectivity and subjectivity, the lines of external observation and internal experience must converge at the

end of their different processes' (Deleuze 1991: 30). The all-too-clear divisions between subject and object that Hansen relies upon are clearly non-existent.

As for the notion of the virtualisation of the body, Hansen relies on the same strict division between subject and object. Whereas the virtual image in cinema consists of something 'emanating from the image itself' (Hansen 2004a: 215) — that is, from its *objects* — the virtualities of new media objects are 'not images of empirical spaces' (Hansen 2004a: 214); they are not virtualities that emerge from outside the body; rather, they function as catalysts for the virtualisation of the body. Thus, they are the provenance of *subjects* (Hansen, 2004a: 214). Hansen's subjects are endowed with sovereignty, while it is claimed that Deleuze gives everything over to the cinema's objects. Such a view flies directly in the face of Deleuze's explicit statement that in cinema 'The actual is always objective, but the virtual is subjective' (Deleuze, 1989: 83).[8] What Deleuze here means by the virtual can be placed alongside his formulation of the transcendental in cinema: the transcendental conditions of experience are *virtual*; they are evocations of the past and, as such, are not actual. Certainly these designations are not straightforward: the virtual 'preserves the past' (Deleuze 2002: 151) but can also be actualised in the present. At the limit, the virtual and the actual become indistinguishable (for the cinema, this is what Deleuze calls the time-image), though such indistinguishability only ever occurs 'inside someone's head', as Deleuze puts it (Deleuze 1989: 69). And furthermore, the virtual is primarily passive, inasmuch as it is never a product of consciousness, and not active (an active summoning up of one's past is what Deleuze calls the 'recollection-image', whereas the form of memory which corresponds to a passive instantiation of the virtual is designated, after Bergson, *pure recollection* (Deleuze 1989: 79–80). The virtual is not produced by consciousness, but instead *produces consciousness*. It is therefore subjective, but it is a subjectivity that *happens to* the subject rather than one that is caused by the subject, 'the affection of a passive self which experiences its own thought' (Deleuze 1994: 86).

Finally, I have mentioned in detail only two of the three syntheses Deleuze theorises in *Difference and Repetition*. There is a good reason for this: I believe the third synthesis (Deleuze 1994: 88–91), is chiefly important for the spectator of modern cinema, that is, for the spectator of the time-image who discovers 'a little time in the pure state' (Deleuze 1989: 169). Insofar as Deleuze characterises the third synthesis as 'the empty form of time' or the 'pure order of time' (Deleuze 1994: 88), then the connections to be made between the third synthesis and

the time-image are certainly suggestive. The time-image, as much as the third synthesis, occurs when the past returns as a disruption which realigns past, present and future. It is also the point at which any sense of subjectivity it pushed to its limits and produces a 'man without a name, without family, without qualities, without self or I' (Deleuze 1994: 90). 'In the third synthesis', writes Deleuze, 'the present is no more than an actor, an author, an agent destined to be effaced' (Deleuze 1994: 94).

Notes

1. These ideas are quite explicitly taken from Bergson: 'a compenetration of states which melt into one another and even coincide in immediate consciousness will represent them by a duplication of the self into two different personages, one of which appropriates freedom, the other necessity: the one, a free spectator, beholds the other automatically playing his part' (Bergson, 2002: 149).
2. The division between the intellect and the body is an artificial one insofar as Deleuze does not theorise any division between the two. He states, rather, that sensations are formed by 'contemplation' for example (see Deleuze 1994: 70–75), and (writing with Félix Guattari) that 'Sensation is no less brain than the concept' (Deleuze and Guattari 1994: 211), while sensations and concepts make up the 'first two aspects or layers of the brain-subject' (Deleuze and Guattari 1994: 213).
3. It is worth noting that much of Branigan's discussion refers to notions unpacked in great detail in his *Point of View in the Cinema* where, for example, he outlines his 'reading hypothesis theory': 'According to a reading hypothesis theory, then, the camera is not a profilmic object which is shifted from place to place, but a construct of the spectator, a hypothesis *about space* — about the production and change of space' (Branigan 1984: 54).
4. As Deleuze asks, 'The entire past is conserved in itself, but how can we save it for ourselves? (1994: 84). Also see Deleuze's comments on the famous cone diagram from Bergson's *Matter and Memory* (Deleuze 1989: 294, n. 22).
5. See, for example, Francesco Casetti's discussion of cinema as 'interface' (Casetti, 1998: 129–30).
6. This passivity of the spectator can, from another point of view, be compared with the 'reactivity' of forces Deleuze finds in Nietzsche. As for reactive forces, any spectatorial passivity should follow the dictum to go to 'the limit of its consequences' (See Deleuze 1962: 66).
7. For a more detailed discussion of these issues see Rushton (2004) and Hansen's response (2004b).
8. Deleuze's full statement of the issue is thus: 'Subjectivity is never ours, it is time, that is, the soul or the spirit, the virtual. The actual is always objective, but the virtual is subjective: it was initially the affect, that which we experience in time; then time itself, pure virtuality which divides itself in two as affector and affected, "the affection of self by self" as definition of time' (Deleuze 1989: 82–3).

Painting as Hysteria: Deleuze on Bacon

Tomas Geyskens Catholic University Leuven

Abstract

Deleuze's work on Francis Bacon is an aesthetic clinic of hysteria and an implicit critique of the psychoanalytic conception of hysteria. Bacon's paintings reveal what is at stake in hysteria: not the symbolic expression of unconscious representations, but the pure presence of the body, the experience of the body under the organism. Inspired by the work of the phenomenologist Henri Maldiney, Deleuze argues that Bacon's paintings become non-figurative without being abstract. In this way, painting shows the hysterical struggle of the body to escape from itself in the rhythm of its movement.

Keywords: hysteria, body, presence, pity, Maldiney, Bacon, Freud

Great clinicians are artists. When the French psychiatrist Lasègue first isolated and defined exhibitionism in 1877, he did not begin his article with a description of cases of manifest exhibitionism, but rather with a story about a man who followed a woman in the streets each day. In order to introduce a new syndrome, it seems necessary to write a short story first and only then describe cases of manifest pathology (Deleuze 2004: 275). During a discussion in the Wednesday Circle, Freud, too, argued that case studies are pointless if they are only objective reports of what has been said during the analytical sessions. Something of the unconscious can only be conveyed by case reports when they are presented in an 'artistic' way, says Freud.[1] The unconscious is a matter of style. On this point, *le point littéraire*, the clinical encounters the artistic (Deleuze 1989: 14; Deleuze 2004: 273).

Great artists are clinicians. Whoever reads the works of Sacher-Masoch discovers a symptomatology of masochism that is far superior to the later attempts by Krafft-Ebing, Freud or the DSM. Pleasure in pain, for example, which plays such an important role in the psychoanalytic idea of masochism, is of secondary importance for Sacher-Masoch and must be understood as following from elements which *are* essential

to masochism, such as the contract, the fetish, the education of the woman into the ideal cold mother, and the suspension of sexuality (Deleuze 1989). One finds the same clinical acumen in Sade on sadism, in Dostoevsky on epilepsy, in Burroughs on toxicomania, and in Bukowski on alcoholism. That these artists themselves may have suffered from one or other of these pathologies is less important than that they are its finest symptomatologists: 'For authors, if they are great, are more like doctors than patients' (Deleuze 2004: 273).

The critical-clinical project is continuously elaborated and purified in the development of Deleuze's thought. In *Présentation de Sacher-Masoch* (1967) he argued for a fruitful collaboration between literary criticism and psychiatric or psychoanalytic clinical work (Deleuze 1989: 14). More than ten years later, in *Francis Bacon. Logique de la sensation* (1981), this project – although not abandoned – had been transformed. Deleuze now aimed at a purely aesthetic version of the clinical, independent of both psychiatry and psychoanalysis.[2] *Francis Bacon* is in this sense not only a book about painting, but also about the clinical essence of painting: hysteria.[3] But how must we understand this clinical/aesthetical relation between painting and hysteria? And why is the work of Francis Bacon so appropriate to elucidate hysteria as the clinical essence of painting? And what is wrong with, for example, the psychoanalytic theory of hysteria, that it must be replaced with a clinical-aesthetic, independent of psychoanalysis and psychiatry? We shall try to answer this last question first, even though in his book on Bacon Deleuze does not treat this question himself.

According to Freud the hysterical body tells a story. The hysterical symptoms, the convulsions, the anaesthesias and hyperaesthesias, the paralyses, the disorders of sensory activity, etc., are symbolic representations of traumatic memories or repressed fantasies. The most remarkable symptom of hysteria, the *grande attaque*, was also analysed by Freud and Breuer as the expression of a psychic representation:

> The constant and essential content of a (recurrent) hysterical attack is in the return of a psychical state which the patient has already experienced earlier - in other words, the return of a memory. We are asserting, then, that the essential portion of a hysterical attack is comprised in Charcot's phase of the attitudes passionnelles. In many cases it is quite obvious that this phase comprises a memory from the patient's life and frequently, indeed, that memory is always the same one. (Freud 1966: 152)

When such psychic content is missing, and the attack is limited to corporeal phenomena—epileptic convulsions or cataleptic sleep—Freud

nevertheless finds a psychic representation to which the somatic symptoms seem to correspond: 'Even in such cases examination under hypnosis provides definite proof of a psychical mnemic process such as is usually revealed openly in the phase passionnelle' (Freud 1966: 152). Freud's article is a beautiful illustration of the famous transition from the diagnostic *looking at the body* of Charcot, to the therapeutic listening to the psychic content in Freud's *talking cure* (cf. Didi-Huberman 1982).

Freud's emphasis on 'psychic content' was certainly the beginning of psychoanalysis, but not the key to the world of hysteria. By isolating the level of psychic representations, Freud neglected the corporeal and affective madness of hysteria: 'Freud 'neurotified' hysteria. [...] By interesting himself exclusively with the theatrical fantasising in hysteria, Freud abandoned at the same time the pole of passion – which one called hysterical madness (*folie hystérique*) which left its trace in the 'attack'. In fact, these hysterics were no more neurotic than psychotic. They were 'mad'. (Green 1972: 220) It is this madness of the body in hysteria, the ridiculous 'acrobatics of the flesh'[4] neglected by psychoanalysis, that Deleuze has in mind in his discussion of Bacon's paintings. For Deleuze, hysteria should not be understood from the perspective of literature or the narrative procedures of psychoanalysis, but from the perspective of painting.[5] Hysteria is the clinical essence of painting, but this only becomes visible in painting, because the painter succeeds where the hysteric fails. Painting adds to hysteria precisely that which it fatally misses: *un peu d'art*.[6] By adding 'a little art' to it, painting shows what is at stake in hysteria: not the symbolic expression of a psychic content, but the 'pure presence of the body' (Deleuze 2003: 52).

Deleuze's clinical-aesthetic of painting as hysteria has gained clinical importance now that hysteria has become highly resistant to psychoanalytic therapy. In symptoms such as anorexia, bulimia and self-mutilation, contemporary hysteria disposes of Freud's 'psychic content' and only shows the excessive presence of the body, the quivering of the flesh that does not speak but works directly on the nerves. In contrast to psychoanalysis, painting can reveal the sense of this hysterical body in a positive manner. For contemporary psychoanalysis this pure corporeality is, after all, merely the symptom of a deficient 'mentalisation' or symbolisation. In this, psychoanalysis shows its affinity with psychiatry: it can only determine pathology in a negative way, as deficiency (Deleuze 2006: 24).

In a way, Deleuze returns to Charcot, who was not only a great clinician of hysteria but also a great artist of psychiatry.[7] Freud writes of him: 'He was not a reflective man, not a thinker: he had the nature of an

artist – he was, as he himself said, a 'visuel', a man who sees, [. . .] who bubbled over with vivacity and cheerfulness and who always had a joke on his lips' (Freud 1962: 12, 18). Charcot made hundreds of sketches and photographs of hysterics in outrageous poses and positions, and he kept his painting studio for his entire life.[8] However, he probably did not distinguish clearly enough between the eye of the camera and that of the painter, as a result of which his clinical-aesthetic of hysteria remained captive to the spectacular and the illustrative. According to Deleuze, avoiding the trap of the spectacular and the illustrative is not as simple as turning from Charcot's 'looking' to Freud's 'listening'; rather one has to turn from photography to painting. But *how* does painting succeed in making the pure *présence* of the body visible in a positive manner? And why is Francis Bacon the painter of hysteria *par excellence*?

To make the presence of the body visible, painting must first enter into a combat with the figurative. Painting is not photography. It has been claimed, even by Bacon himself some times, that the rise of photography made it possible for painting to detach itself from the task of representing, narrating, or illustrating. In the course of the 19th century, so this narrative goes, photography would have taken over this task from painting, whereby the latter obtained its freedom from the figurative. But this view presents two striking weaknesses: first, it underestimates the power of photography and of our visual culture on the whole; second, it establishes a radical break between (classical) painting before photography and (modern) painting after the advent of photography.

Photography, and by extension our whole culture of images, is not just a way of representing things; it has become the way in which we see things. Before the painter begins to paint, the canvas is already virtually filled with all sorts of images, clichés, representations, and phantasms.[9] The gaze of modernity is subjugated to these photographic representations.[10] Painting is the attempt to neutralise this tyranny of virtual representations, in view of something completely different, what Deleuze with Cézanne calls 'la sensation'. But, is this not a lot of strain for nothing? Is not sensation the most simple, spontaneous given, the 'data' that we always already have at our disposal when we perceive? Deleuze completely reverses this schema of classical psychology. Sensation is not the most immediate or the most subjective, but the end result of a very specific procedure, painting.

In his analysis of sensation, Deleuze depends heavily upon phenomenology, especially the work of Henri Maldiney. In *Le devoilement de la dimension esthétique dans la phenomenologie d'Erwin*

Strauss (1966), Maldiney distinguishes two aspects of sensation: the representative and the 'pathic'. Sensation is not just the material for or the announcement of perception.[11] In sensing, we relate first of all in a pathic, non-representational way to the world. Or better, we are *affected* by the world before we *relate* to it.[12] Subject and object do not stand against each other here; 'I' and 'World' are only two indissolubly interconnected sides of this being-affected.[13] The yellow of Van Gogh's sunflowers is not just one of the 'secondary qualities' of these flowers; for Van Gogh the yellow is in the first place 'la haute note jaune de cet été' (Maldiney 1973: 137). Yellow *sets the tone* before it is identified as the quality of a specific object: 'Van Gogh does not refer to a descriptive colour that helps him to identify a field of sunflowers. When he uses the musical term "note," it is because the world resonates in this yellow (*dans ce jaune, le monde sonne*); and it resonates in so far as in this yellow Van Gogh inhabits a world which is not yet crystallized into objects' and in which Van Gogh is not yet crystallized into a subject (Maldiney 1973: 137, my translation). But this pathic dimension is not logically or chronologically prior to that of representation; it is *brought about* by painting. For this reason, a phenomenology of 'sensation' remains abstract so long as it does not begin with the concrete experience of painting. This is why Deleuze does not so much describe *what* 'sensation' is, but show *how* a painter like Bacon brings about this 'sensation'.

The *deformations* of the figurative, the violent spasms of the sunflowers, show how in Van Gogh's later works the representative moment can hardly hold the enormous power of the pathic moment. So also does Bacon deform the figurative in a variety of ways, beyond representations, clichés, and phantasms, to paint the pure presence of the body. The first deformation Bacon carries out in his canvases is that of the relationship between figure and background. Figurative painting and photography establish the relationship between figure and background in such a way that it inevitably opens a space for the narrative and the illustrative. No matter how vague or *clear-obscure* the background is, the painting becomes a kind of window or a scene. To break with the figurative—without making the leap into abstract art or *action painting*—it is crucial that this relationship between the figure and the background will be deformed. Bacon does this through a number of rather simple interventions.

First he places the figure in an oval or a circle, in a ring, an oval bed or a chair. Sometimes the figure is also surrounded by a parallelogram, or sits in a glass cube. In this way Bacon isolates the

figure from the background. But this only works because the background is also deformed. Bacon's backgrounds are not landscapes or interiors. By rubbing out large fields in bright colours and by the addition of meaningless spots and circles, a flat field emerges that no longer stands *behind* the figure, but beside or around it. Because of this, the 'background' comes as close as the figure itself. So that the background and the figure stand next to each other and no room is left where a story could slip into the painting. Therefore the figure is surrounded by a totally closed space, which seems to turn or to be able to revolve like a pedestal. The inaccessibility of Bacon's spaces is, remarkably, not the result of obscurity or depth, but caused by their being so flat, bright and simple. Everything is equally close.[14] These deformations totally isolate the figure. Through this isolation of the figure the figurative disappears. Bacon's paintings do not tell a story, they are not pictures or illustrations of any pre-given reality. The figures are freed from the figurative. That does not mean that nothing happens in the painting, but this happening is not representational. It is not a spectacle. For this reason Bacon sets out to remove all references to a spectator from his paintings. In the second version of *Study for Bullfight no. 1,* for instance, the stands where the audience sits are painted over. Only the bull and the bullfighter remain (Deleuze 2003: 13). Still, the figure sometimes needs a second figure, but as a witness rather than as a spectator, who functions as an 'equal', a 'standard weight' against which the figure will vary.[15] In this way, the witness shows what happens to the figure. The figure becomes the 'anomaly' of the witness.[16] The figure undergoes a series of deformations. A first deformation comes about as a result of the impact of the field ('background') on the figure. Because the space around the figure seems to be turned over or displaced, and because each trace of the spectator is eliminated, the figure becomes enclosed in the surrounding space. This forces the figure to an incredible effort, 'a derisory athletics, a violent comedy' (Deleuze 2003: 15).

The convulsive effort of the body is not only the effect of the movement of the field. The body takes over this movement in an attempt to escape from itself. In *Figure Standing at a Washbasin* (1976) we see a figure at a washbasin. But this figurative scene is being deformed into a Figure that puts its efforts to the limit to escape through its mouth into the drain of the washbasin. Hysteria is not about me escaping from my body, but about the body trying to escape from itself through one of its openings, in an immobile spasm: 'It is a scene of hysteria. The entire series of spasms in Bacon is of this type: scenes of love, of vomiting and excrement, in which the body attempts to escape from itself *through* one

of its organs, in order to rejoin the field or material structure' (Deleuze 2003: 16). This interpretation also makes sense of the specific role that the shadow and the mirror play in Bacon's work. The shadow of the figure in Bacon's work is always just as full and solid as the figure itself. As the duplicate of the figure, it has liberated itself from the figure's spasm and now spreads or runs out into the background (Deleuze 2003: 16). The mirror accomplishes the same remarkable function as the shadow. For Bacon the mirror is not a reflecting surface, but a mostly black, dark space. The figure sits *in* the mirror where it becomes stretched out and flat, after the body in an extreme spastic effort has escaped from itself through its mouth, anus, throat or through the toilet or in the drain of the washbasin (Deleuze 2003: 50).

According to Deleuze, Bacon's paintings always show this spasm of a body that wants to escape from itself through some little hole that is always much too small. It is this spasm that leads Deleuze to a clinical-aesthetic of hysteria: the hysterical spasms in Bacon's paintings form a series with the hysterical hyperesthesias, hysterical pity, the hysterical scream, the hysterical smile, and the hysterical fall. It is important to note that this series is not a mere enumeration of pathological traits, as in psychiatry, or a displacement of symptoms, as in psychoanalysis. Deleuze holds a Jungian or Szondian rather than a Freudian conception of psychopathology.[17] Hysteria is not so much a pathological state or syndrome, but a moment of crisis and passage, a transition from the spasm to the smile and the fall. How, then, must we understand the sense of this series?

In *Studies on Hysteria* (1895) Breuer warns his readers (and his co-author?) that the cathartic method is limited to the representational or ideogenic aspect of hysteria. This warning is subsequently disregarded, but it nevertheless shows that Breuer had a greater feeling for the somatic side of hysteria than Freud:

> Let us consider an everyday instance. A woman may, whenever an affect arises, produce on her neck, breast and face an erythema appearing first in blotches and then becoming confluent. This is determined by ideas and therefore according to Moebius it is a hysterical phenomenon. But this same erythema appears, though over a less extensive area, when the skin is irritated or touched, etc. This would not be hysterical. Thus a phenomenon which is undoubtedly a complete unity would on one occasion be hysterical and on another occasion not. (Freud and Breuer 1955: 188)

Breuer's doubts concerning the exclusive importance of representation in the clinical account of hysteria show themselves at another level as well.

In the introduction of his theoretical contribution to *Studies on Hysteria*, he emphasises that he will only speak in psychological terms: 'Psychical processes will be dealt with in the language of psychology' (Freud and Breuer 1955: 185). But only a few of pages later, he develops a theory of affects in the language of electromechanics:

> We ought not to think of a cerebral path of conduction as resembling a telephone wire which is only excited electrically at the moment at which it has to function (that is, in the present context, when it has to transmit a signal). We ought to liken it to a telephone line through which there is a constant flow of galvanic current and which can no longer be excited if that current ceases. Or better, let us imagine a widely-ramified electrical system for lighting and the transmission of motor power; what is expected of this system is that simple establishment of a contact shall be able to set any lamp or machine in operation. (Freud and Breuer 1955: 193).

When Breuer—in spite of his earlier proclamation—makes the transition from a psychology of representations to an electromechanics of affects, he anticipates Deleuze's conception of hysteria. The bodily sensations that characterise hysteria are not expressions of representations or meanings; they are primarily *vibrations* (Deleuze 2003: 45). An electrical current goes through the flesh, and works *directly* on the nerves.[18] It is well-known that such vibrations or forces that affect the body do not obey the organic unity or the anatomical structure of the body. But, that does not mean that they are imaginary. What the hysteric feels and painting reveals is how the body as pure vitality and thus as pure pathos puts the organic-organised body under pressure.[19] In the hysterical body, forces are at work that are too powerful for the organic organisation of the organs, 'like the forces of the cosmos confronting an intergalactic traveller immobile in his capsule' (Deleuze 2003: 58). Because of this, a convulsive disorganisation and re-grouping of the organs takes place. Freud says: 'Certain regions of the body, such as the mucous membrane of the mouth and anus, seem, as it were, to be claiming that they should themselves be regarded and treated as genitals' (Freud 1953: 153). But also the other way around, sexual organs can also function as mouths or anuses (Deleuze 2003: 47). For what is at stake is not a deformed expression of the sexual instinct, but the experience of the body *under* the organism:

> The body is felt *under* the body, the transitory organs are felt under the organisation of the fixed organs. Furthermore, this body without organs and these transitory organs are themselves *seen*, in phenomena known as internal or external 'autoscopia': it is no longer *my* head, but I feel myself inside *a*

> head, I see and I see myself inside a head; or else I do not see myself in the mirror, but I feel myself in the body that I see, and I see myself in this naked body when I am dressed... and so forth. (Deleuze 2003: 49, italics in the original)

The hysteric feels and *sees* how the body becomes detached from the organism. According to Deleuze, this hysterical body painted by Bacon cannot be recuperated by *le corps vécu* of phenomenology.[20] When Deleuze speaks about the body as flesh, he does not refer to it as 'la chair' but rather as 'la viande', the French word for 'meat', or the 'flesh' we eat. To understand this idea, we must look at the paintings of Bacon. Deleuze remarks that, even when Bacon paints portraits, he does not paint a face but a head. The face is a more or less independent, structured organisation that, for this reason, hides the head. On the other hand, the head is only one end of the body (Deleuze 2003: 20). The face belongs to the bones, but the head is meat. In Bacon's paintings the meat and the nerves are detached from the bones. The quivering flesh falls from the bones and the 'fleshy' head is set free from the face (Deleuze 2003: 22).

When Bacon reveals the head beneath the face, it does not mean that he deprives his portraits of their soul by reducing them to mere bodies. Bacon's portraits do have a soul, but that soul is bodily through and through. The soul in Bacon's work is the sighing of the beast.[21] This hysterical *rapport* with the cries and moans of beasts is not, however, based on a hysterical identification or an excessive sympathy for animals. When, in Turin, the mad Nietzsche embraced a moaning horse, this historical, hysterical scene is not about pity for a horse, but rather pity for the meat, where the distinction between human and animal recedes in the background.[22] Nietzsche's 'pitié pour la viande!' is a hysterical pity for life as a slaughterhouse (Deleuze 2003: 23). Bacon's red-green-bluish butcher's meat is not—as has sometimes been claimed—an expression of the painter's sadism, but of hysterical pity. For Deleuze this pity for the meat is also the kernel of all hysterical religiosity: 'Bacon is a religious painter only in butcher shops.' (Deleuze 2003: 24) Deleuze quotes Bacon: 'I've always been very moved by pictures about slaughterhouses and meat, and to me they belong very much to the whole thing of the Crucifixion.... Of course, we are meat. If I go into a butcher shop I always think it's surprising that I wasn't there instead of the animal' (Deleuze 2003: 24). Bacon's interest in meat is not sadistic but merciful. It is not without good reason that even militant atheists like Charcot and Freud,

at the end of their careers, have bowed their heads before the great Mercy of Lourdes.[23]

This pity for the meat reaches its crisis in the hysterical scream. Bacon always tried to paint this scream. The problem is not so much how to paint a sound, but how to make visible forces that otherwise remain invisible. That is, after all, the task of painting for Deleuze: making invisible forces visible. In the case of the hysterical scream, this means that the scream cannot be a response to an already visible spectacle, a spectacle before which—or about which—one screams. In that way, we would relapse into the figurative. The hysterical scream that Bacon has in mind, is something totally different. Bacon's scream is not just an expression of pain, nor is it merely a reaction to some horrible event. The scream is the result of something greater than the pain one is capable of feeling, and greater than the spectacle about which one screams.[24] What then is this invisible and intangible force? Deleuze is very brief on this 'more profound and almost unliveable Force' (Deleuze 2003: 44). He seems to leave to painting the task of tracing this force and making it visible.[25]

Maldiney—Deleuze's *companion de route* throughout the whole Bacon book—seems to go further. In his *Penser l'homme et la folie*, he invokes the scream in his description of the 'pathic'. Sensation relates to perception as the scream relates to speaking. The scream belongs to the dimension of the pathic, just as speaking belongs to the dimension of representation. It is this pathic dimension of sensation that Deleuze aims at when he speaks about the vibrations of the flesh, where the difference between humans and beasts recedes into the background. However, the fact that humans suffer like beasts ('every man who suffers is a piece of meat'), does not erase the distinction between humans and animals, and that distinction, according to Maldiney, is discovered in the scream. The human being who screams, says Maldiney, screams the world (crie *le monde*): 'The world that is disclosed in this scream is not the one that is expressed by language, but neither is it simply the sound of a living creature' (Maldiney 1990: 203). In the scream, nothing is perceived or expressed; in the scream the body discovers its excessive presence, 'la pure presence du corps'. Maldiney writes: 'The wondering about the miracle of the 'there is' is absolutely contemporaneous with the scream' (Maldiney 1990: 204). But Maldiney's description remains rather pious. When it concerns an event that affects us before we intentionally relate to it, the astonishment is more like a wound than like wonder. The hysterical scream does not reveal the world of being-in-the-world, but the 'world' as pure affect. It is only this excessive presence

(*cet excès de presence*[26]) that breaks with the 'photographical' world of representations, clichés and phantasms.[27] The hysterical scream is the pure pathos of presence.

But this excessive presence not only shows itself in screaming and suffering: 'Bacon suggests that beyond the scream there is the smile' (Deleuze 2003: 28). Bacon calls this smile hysterical, and adds, modestly, that he never succeeded in painting this smile (Deleuze 2003: 28). Since Leonardo da Vinci, the mysterious smile of hysterical girls has always been the highest goal in painting. Art historians and psychotherapists seem to believe that such a hysterical smile *hides* something, but for Bacon and Deleuze the smile is what *remains when the body disappears* (Deleuze 2003: 28–29). To clarify this bizarre idea, Deleuze discusses Bacon's triptych from 1953, *Three Studies of the Human Head*. Bacon's triptychs are not comic strips; they should not be read from left to right; they do not tell a story.[28] The bringing together of the three panels does not tell a story, but initiates a *rhythm*.[29] Only with this rhythm Bacon's work really comes into its own, because rhythm is the essence of sensation. In a strict sense, one cannot perceive a rhythm, one can only feel it.[30] Hence, it is only in this rhythmic movement that Bacon's work frees itself from the figurative and the representational, without becoming abstract.[31]

According to Deleuze, we can differentiate three rhythms in Bacon's triptychs (Deleuze 2003: 71). First there is the witness-rhythm (*le rythme témoin*). In the triptych of 1953, this witness is located in the smile of the figure in the left panel. As a result of its horizontality and relative stability, this smile forms a more or less fixed element in the rhythmic movement of the triptych.[32] In opposition to this stable, horizontal element, the two other figures move in opposite directions.[33] In the central panel one sees a man who screams, which gives the rhythm an upward movement. In the right panel we see a figure that falls and disappears. According to Deleuze, all of Bacons triptychs are characterised by this triple movement that connects the three panels in a bizarre trapeze act or an acrobatic dance. Bacon's triptych from 1953 is experienced as a rhythmic series from the scream, to the smile, to the fall. The fall is the active moment that pushes the scream in the opposite direction. The horizontality of the hysterical smile forms the point of reference against which this double movement varies.

When Deleuze says that in hysteria the body tries to escape from itself, this does not mean that the body wants to transcend itself into a state beyond the body, but that the body frees itself from itself in the *rhythm* of its movement.[34] In painting and hysteria, however, this

rhythm remains entangled in a combat with the weight of the flesh or with the materiality of the paint. That is why music begins where painting ends, because unlike painting, music 'strips bodies of their inertia, of the materiality of their presence: it disembodies bodies. … This is why music does not have hysteria as its clinical essence, but is confronted more and more with a galloping schizophrenia' (Deleuze 2003: 54–5).

Psychoanalysis has domesticated the hysterical body by considering it to be a corporeal expression of unconscious representations. Its therapy, based on the narrative procedures of literature,[35] neglects the pure presence of the body, its rhythms, vibrations and paroxysms. It takes a painter like Bacon to see in the hysterical postures the pure presence of the body at the mercy of invisible forces. To see the presence of the body instead of its representations, one needs the eye of the painter, not the ear of the psychoanalyst or the gaze of the psychiatrist-photographer. Painting turns the eyes into organs of touch: 'One might say that painters paint with their eyes, but only insofar as they touch with their eyes' (Deleuze 2003: 155). Of course, such a clinical-aesthetic does not involve a therapy of hysteria in any medical-psychiatric sense of a cure or a return to 'normality'. On the contrary, it produces a radical change of perspective.[36] Bacon's aesthetic-figural approach to hysteria reveals why the hysterical poses and spasms are the most natural of postures *in view of the forces they confront*: 'The body seems to enter into particularly mannered postures, or is weighed down by stress, pain, or anguish. But this is true only if a story or a figuration is reintroduced: figurally speaking, these are actually the most natural of postures, as if we caught them "between" two stories, or when we were alone, listening to a force that had seized us' (Deleuze 2003: 161).

Notes

1. 'Eine gewissenhafte, aber "künstlerische" Darstellung wie in der Dora' (quoted in Lavagetto 2002: 225).
2. 'It is true that there are numerous dangers in constructing a clinical aesthetic (which nonetheless has the advantage of not being a psychoanalysis) (Deleuze 2003: 51). '[U] nder the rubric of a purely aesthetic clinic, independent of any psychiatry and psychoanalysis' (Deleuze 2003: 54). 'Masoch is neither a pretext for psychiatry or psychoanalysis' (Deleuze 1998: 53).
3. 'Can we speak of a hysterical essence of painting? … This problem concerning the essence of each art, and possibly their clinical essence, is less difficult than it seems to be' (Deleuze 2003: 54).
4. 'The athleticism of the body is naturally prolonged in this acrobatics of the flesh' (Deleuze 2003: 23).
5. One could argue that, in Deleuze's earlier works on Masoch, Sade, Carroll and Lasègue, literature has a specific clinical affinity with perversion, while in his later works (after *Anti-Oedipus*) he relates literature, particularly American literature, to schizophrenia. Maybe Freud could understand hysteria only as a 'negative perversion' because he approached it from the perspective of literature?
6. 'With painting, hysteria becomes art. Or rather, with the painter, hysteria becomes painting. What the hysteric is incapable of doing-a little art- is accomplished in painting' (2003: 52).
7. 'If we look at the "picture" of hysteria that was formed in the nineteenth century, in psychiatry and elsewhere, we find a number of features that have continually animated Bacon's bodies' (Deleuze 2003: 49).
8. 'He brought an artist's eye to the study of hysterical bodies. Charcot had planned to become an artist and always maintained a studio in his home where he could

paint. He and his interns sketched hysterical patients during their attacks, and he even installed a full photographic studio, with a professional photographer, Albert Londe, to record the women's movements and expressions' (Showalter 1997: 31).

9. 'Modern painting is invaded and besieged by photographs and clichés that are already lodged on the canvas before the painter even begins to work' (Deleuze 2003: 10–11).
10. 'They are not only ways of seeing, *they are what is seen, until finally one sees nothing else*. The photograph "creates" the person or the landscape in the sense that we say that the newspaper creates the event (and is not content to narrate it). What we see, what we perceive, are photographs' (Deleuze 2003: 91, italics in the original).
11. 'Avec le percevoir, qui est le premier niveau de l'objectivation, nous sommes déjà sortis du sentir' (Maldiney 1973: 136).
12. 'Le rapport moi-monde, lié par le "et", lié par le "dans" ou par le "avec" n'a pas la structure de l'intentionnalité' (Maldiney 1990 : 205).
13. 'Sensation has one face turned toward the subject (the nervous system, vital movement, 'instinct', 'temperament' – a whole vocabulary common to both Naturalism and Cézanne) and one face turned toward the object (the 'fact', the place, the event). Or rather, it has no faces at all, it is both things indissolubly' (Deleuze 2003: 34).
14. 'What concerns us here is this absolute proximity, this co-precision, of the field that functions as a ground, and the Figure that functions as a form, on a single plane that is viewed at close range' (Deleuze 2003: 6).
15. 'We will see that, in his paintings and especially in his triptychs, Bacon needs the function of an attendant, which is not a spectator but part of the Figure. [. . .] They are attendants not in the sense of spectators, but as a constant or point of reference in relation to which a variation is assessed' (Deleuze 2003: 13).
16. 'An anomaly is a fact of individual variation which prevents two beings from being able to take the place of each other completely' (Canguilhem 1978: 77). For Deleuze and Guattari on Canguilhem's analysis of 'anomaly', see Deleuze and Guattari 1987: 243–6.
17. For this distinction between Freud, Jung and Szondi, see Szondi 1963: 43–54. For the connection between Deleuze and Szondi, see Deleuze and Guattari 2004: 318–20. For Deleuze's Jungianism, see Kerslake 2007: 69–102.
18. 'First of all, there are the famous spastics and paralytics, the hyperesthetics or anesthetics, associated or alternating, sometimes fixed and sometimes migrant, depending on the passage of the nervous wave and the zones it invests or withdraws from' (Deleuze 2003: 49).
19. 'There is a special relation between painting and hysteria. It is very simple. Painting directly attempts to release the presences beneath representation' (Deleuze 2003: 51–2).
20. 'The phenomenological hypothesis is perhaps insufficient because it merely invokes the lived body. But the lived body is still a paltry thing in comparison with a more profound and almost unlivable Power (*Puissance*)' (Deleuze 2003: 44).
21. 'It is not that the head lacks spirit; but it is a spirit in bodily form, a corporeal and vital breath, an animal spirit. It is the animal spirit of man' (Deleuze 2003: 20).
22. 'Bacon does not say, "Pity the beasts", but rather that every man who suffers is a piece of meat. Meat is the common zone of man and the beast, their zone of indiscernibility' (Deleuze 2003: 23).

23. 'In the late 1880s and early 1890s Charcot himself sent patients on a pilgrimage to Lourdes' (Showalter 1997: 32). 'I do not think our cures can compete with those of Lourdes' (Freud 1964: 152).
24. 'If we scream, it is always as victims of invisible and insensible forces that scramble every spectacle, and that even lie beyond pain and feeling' (Deleuze 2003: 60).
25. 'The task of painting is defined as the attempt to render visible forces that are not themselves visible' (Deleuze 2003: 56).
26. 'The hysteric is at the same time someone who imposes his or her presence, but also someone for whom things and beings are present, *too* present, and who attributes to every thing and communicates to every being this excessive presence' (Deleuze 2003: 50, italics in the original).
27. 'La prise de l'étant comme tel a lieu dans la surprise de l'être. Dans le sentir il y a et j'y suis. E. Straus a raison de l'assimiler au cri' (Maldiney 1990: 204).
28. 'The triptych does not imply a progression, and it does not tell a story' (Deleuze 2003: 69).
29. 'The coexistence of all these movements in the painting is rhythm' (Deleuze 2003: 33).
30. 'Un rythme n'est pas objectivable dans l'espace. Il ne saurait au sens propre être perçu. Il prend fond dans le sentir' (Maldiney 1990 : 207).
31. 'Le rythme dépasse toute espèce de perception figurale' (Maldiney 1973 : 157).
32. 'This horizontal can be presented in several Figures. First there is the flat hysterical smile' (Deleuze 2003: 75).
33. 'What matters in the two opposable rhythms is that each is the "retrogradation" of the other, while a common and constant value appears in the attendant-rhythm' (Deleuze 2003: 80).
34. ' "Ruthmos" désigne la forme dans l'instant qu'elle est assumée par ce qui est mouvant, mobile, fluide' (Maldiney 1973 : 157).
35. 'It still strikes me myself as strange that the case histories I write should read like *short stories* and that, as one might say, they lack the serious stamp of science. I must console myself with the reflection that the nature of the subject is evidently responsible for this, rather than any preference of my own. The fact is that local diagnosis and electrical reactions lead nowhere in the study of hysteria, whereas a detailed description of mental processes such as we are accustomed to find *in the works of imaginative writers* enables me, with the use of a few psychological formulas, to obtain at least some kind of insight into the course of that affection' (Freud 1955: 160–1, my italics).
36. 'Abjection becomes splendour, the horror of life becomes a very pure and very intense life' (Deleuze 2003: 52).

The Determination of Sense via Deleuze and Blanchot: Paradoxes of the Habitual, the Immemorial, and the Eternal Return

Eugene Brently Young Emory University

Abstract

Eternal return is the paradox that accounts for the interplay between difference and repetition, a dynamic at the heart of Deleuze's philosophy, and Blanchot's approach to this paradox, even and especially through what it elides, further illuminates it. Deleuze draws on Blanchot's characterisations of difference, forgetting, and the unlivable to depict the 'sense' produced via eternal return, which, for Blanchot, is where repetition implicates or 'carries' pure difference. However, for Deleuze, difference and the unlivable are also developed by the living repetition or 'contraction' of habit, which results in his distinctive characterization of 'force', 'levity', and sense in eternal return.

Keywords: Blanchot, eternal return, difference, repetition, sense, habit, memory, forgetting, life

While Deleuze devotes several well-known book-length studies to major figures, his treatment of the work of his contemporaries, with the exception of Foucault, tends to be much less overt. Maurice Blanchot is an important case in point. References to Blanchot can in fact be found scattered throughout all of Deleuze's work, and Blanchot himself also makes references to Deleuze in his writings from the early 1970s and again later to expand his own theory of the loss of identity, force, and the eternal return, marking a sort of dialog between the two. Blanchot's early significant writings (written in the aftermath of the Second World War) predate Deleuze's, such as *Difference and Repetition*, by about two decades, and could be seen to have indirectly prepared the ground for his thought as is evident in the fact that Deleuze makes reference to Blanchot in his early significant writings at critical junctures in his thought process.

Moreover, the topics he discusses with reference to Blanchot reappear at other critical junctures when Blanchot is not explicitly cited, especially death, forgetting, difference, and, most importantly, the eternal return.

Typically, Deleuze does not simply draw from Blanchot to incite his own thought processes, he also extends and complicates Blanchot's reading of the eternal return. The dimension he adds to Blanchot's reading turns not on the problem of death, memory/forgetting, or the loss of identity, but on the problem of experience and habit. Through investigating how their approaches diverge, Blanchot's contribution to the paradox of eternal return, and what Deleuze draws from it, can be better understood. Deleuze in fact elaborates an aspect or element of experience that is intentionally elided in Blanchot's works (not just from the perspective of Deleuze's thought, but as a trend by and large in Blanchot's approach) in accordance with his unique vision. The way in which the present 'returns' for Deleuze has to do not only with memory in an indeterminate and unlivable sense, but also in a determined and lived sense. This dimension of experience exists in Deleuze's thought because of his study of thinkers as diverse as Benedict de Spinoza, David Hume, Lewis Carroll, and Henri Bergson, which sets him apart from Blanchot in the consideration of issues such as habit, life, determinism, affect, automatic memory, and other similarly corporeal or temporal questions. When Blanchot elaborates his version of experience, he always deliberately frames his discussion around questions of the immemorial, the unlivable, and/or the indeterminate, thus setting him apart from Deleuze in important ways. This Blanchotian aspect of the experience of the unlivable is not unfamiliar to Deleuze (both Deleuze and Blanchot write on Proust, for example, who foregrounds many of these concerns); however, in his complex writings on empiricism and immemorial memory, Deleuze only distinguishes between these dimensions to show their paradoxical interaction through eternal return.[1]

The eternal return is the ideal paradox that accounts for the interplay between paradoxes of difference and repetition, a dynamic at the very heart of Deleuze's philosophy, and Blanchot's approach to this paradox, even and especially through what it elides, further illuminates it. Nietzsche's well known version of the paradox of eternal return appeals to Deleuze and Blanchot for several reasons. If there is no state of existence that the world, or we as individuals, may achieve; that is, if the past is infinite and can only 'return', then we cannot give presence to or represent meaning, because that process would involve either reference to a completed past that does not return, or an unveiling of the past

in the future (neither of which are possible if the past is infinite and all-inclusive) (Nietzsche 2003: 178–9). The very idea that everything that could have happened has already happened indicates that nothing achieves or 'becomes' its final state. Insofar as the return of the past is eternal or unending, it would seem that presence itself, whether thought of as determinate or indeterminate, is paradoxically the return of the past such that it differs from what it was (that is, insofar as it does not resemble or have the same meaning as what it was). Deleuze and Blanchot both call this the fundamental 'inequality' of presence in the eternal return, where that which exists is eternally becoming what it is not (or returning as what it is not), but what it is not refers neither to what it was nor what it will become.[2] This idea that the present, insofar as it is a *return*, is never 'equal' to, or the same as, what it was, appeals to Deleuze and Blanchot because it is an alternative to representation for describing that which is present.

Presence described as eternal return is relevant to Deleuze's early work, where he sought to describe the paradoxes of time with regard to habit and memory, especially as those paradoxes apply to difference and repetition. Similarly, because Blanchot is interested in describing the revelation of the absence of an origin in the work of art (which cannot be represented), Nietzsche's eternal return is, for him, a space where meaning returns even after its origin has ostensibly been destroyed. This is perhaps why he calls it the 'nihilist thought par excellence, the thought by which nihilism surpasses itself absolutely by making itself definitively unsurpassable' (Blanchot 1993: 148/223). When the capacity to make annihilation 'present' fails, that is, when what is destroyed returns, nihilism has exceeded itself by giving presence to that which has lost all ostensible meaning but which is, paradoxically, not devoid of meaning since it differs from what it was. The eternal return, which Blanchot calls the 'extreme point' of nihilism, is perhaps appealing to commentators on Nietzsche since he reveals it primarily through innuendo, and only explicitly discusses it briefly in his late, fragmentary writings, as if it is an implied conclusion in his work that falls to his successors to explicate. Deleuze and Blanchot are among those successors who recognise some of the same paradoxes of the eternal return.

Both Deleuze's and Blanchot's reading of the eternal return concern the loss and return of *sense*.[3] Both Deleuze and Blanchot agree that the eternal return is ultimately an *affirmation*, even if it is one based on a 'no', on loss, or on paradox, and what is being affirmed in many cases is *sense*: there is still a sense of things, they have not lost all meaning and fallen into an existential abyss.[4] For Deleuze, the sense

of anything that exists cannot be given in terms of the completed past or the present.[5] Sense neither results from what the mind derives from and expects based on habitual experience nor from a capacity to reminiscence which lies beyond the recalling of an experience. Sense 'returns' in that it is produced by those aspects of habit and memory which do not involve empirical generalisation or reminiscence, and rather from those paradoxical aspects of habit and memory regarding time that are confluent with the paradox of eternal return. This very question of sense, or meaning, also testifies to the diverse applications of both Deleuze's and Blanchot's works: literary interpretation, and also the sense of politics, culture, religion, and so on. Sense also has its own temporal properties, which provoke certain questions: how is it 'presented' without representing a past or a future? How is it determined? How does it differ? And, what is the role of repetition?

The distinction between Deleuze's and Blanchot's approaches to these questions and the paradox of eternal return can be summarised as follows: while Blanchot characterises the eternal return as 'the difference that repetition carries' ('la différence que porte la répétition'), Deleuze's characterisation of the eternal return involves difference that both implies and is explained by repetition (Blanchot 1992: 16/27).[6] At first glance, they may seem to be talking about the same thing; however, Blanchot's view involves difference that *implies* or is 'carried' by repetition such that it always differs from what it is, whereas Deleuze's view involves both that implicating difference as well as the living repetition or 'contraction' of habit that explains or develops difference. This subtle divergence can be clarified by their conflicting approaches to experience. Blanchot radically frames all questions regarding experience around memory and forgetting, to render what he calls an indeterminate or a maddening form of meaningless meaning that was never and can never be lived, and is a relation apart from the forces that determine it. Blanchot's version of repetition, in fact, emphasises the 'weight' of the eternal return, a well known Nietzschean figure (Nietzsche 2001: 194–5), in a way that contrasts with Deleuze's depictions of weight and levity, and his version of plurality conflicts with Deleuze's version of force. Deleuze appropriates Blanchot's understanding of memory, forgetting, relation, and death regarding the eternal return, but distinguishes the paradoxes of habit from those Blanchotian paradoxes of forgetting.

Perhaps the reason that notions of difference and repetition are useful to Deleuze is because they enable him to navigate between the paradoxes of habit and the paradoxes of memory. With regard to habit, Deleuze

claims that 'contractions' within the imagination result in experience.[7] He insists that such contraction (an 'organic synthesis'), apart from its *contemplation*, 'is not a matter of reflection', but is instead the succession of particular imaginary phenomena (Deleuze 1994: 73/99, 70/97). So, for repetition in this case to be feasible, the mind, albeit paradoxically, contracts something that is in the past and present and does not reflect it. Since occurrences are not reflected, despite their repetition, there is no resemblance between them, and such repetition proceeds only by dissemblance. While the time of contraction may be indeterminate, what is repeated is always *determined*; as Deleuze notes, contraction is a '*material* repetition [which] comes undone even as it occurs' (Deleuze 1994: 85/114). These phenomena occur in succession with their previous occurrence, and the paradoxical *sense* of this repetition is not *re*presented because their repetition does not entail re-presentation (that is, the occurrences cannot be separated as such so that one would present the other); real difference is therefore only explained by repetition and does not itself explain repetition. Generic difference, by contrast, represents and explains repetition by drawing off (*soutirer*) a difference from contracted repetitions, and is therefore rooted in what Deleuze calls a 'contemplation' *by* the mind of the difference between 'contractions' *in* the mind ('*dans* l'esprit'). The generic difference extracted from habit is an 'expectation', which Deleuze associates with *good sense*: 'Testifying to a living present [. . .], it goes from past to future as though from particular to general' (Deleuze 1990: 225/290). By focusing on the paradoxes of habit and repetition, however, aside from the problematic, generic, or 'good' sense extracted from it, we encounter the other dimension of eternal return that both Deleuze *and* Blanchot treat: the paradoxes of memory and forgetting.

The repetition of habit is implicated by the differences of memory because the mind would never have been able to 'contract' successive instances if those instances were not actually occurring *simultaneously*, or outside of lived time. The paradox of memory involves the co-existence of timeless differences; that is, presence that is constituted such that it always differs from what it is regardless of the order in which it is lived. What Deleuze, influenced by thinkers such as Bergson and Proust,[8] calls the 'pure' past contains timeless differences, and does not concern a memory which has been forgotten from experience, as would be the case with forgetting an empirical memory:

> Empirical memory is addressed to those things which can and even must be grasped: what is recalled must have been seen, heard, imagined or thought.

> That which is forgotten, in the empirical sense, is that which cannot be grasped a second time by the memory which searches for it (it is too far removed; forgetting has effaced or separated us from the memory) [...]. (Deleuze 1994: 140/183)

Empirical memory depends on the capacity to 'contract' a habit, and to forget an empirical memory entails an inability to contemplate that which is contracted, or to grasp it 'a second time'. The pure past, by contrast, does not concern this living presence of phenomena; instead, it transcends presence and time, and, as Deleuze claims, concerns 'the being of the past as such and the past of every time. In this manner, the forgotten thing appears in person to the memory which essentially apprehends it' (Deleuze 1994: 140/183). This is why the pure past is also referred to, with slightly differing connotations, as immemorial memory, transcendental memory, and reminiscence. 'Repetition' in pure memory repeats the past as a whole to apprehend that which is not grasped from an empirical order, and instead apprehends any or all difference untouched by lived time. This 'timeless' memory does not generate living time because what it apprehends was never lived to begin with. So, habit involves a repetition which 'contracts' differences in time such that repetition explains or develops difference, and the paradoxes of memory, by contrast, involve difference includes or implies repetition: a repetition of *all* difference whose origin is oblivion.

The role of repetition in the pure past creates a problem which is not unlike the problem created by the role of difference contemplated by the mind with habit. In the case of habit, when real repetition is explained through generic difference, determining sense, the difference between the repetition of the past in the present is dependent on a representation of the past and the present. Such generic difference essentially eclipses the sense and real difference of each occurrence by projecting or drawing fabricated meaning from repetition. In the case of memory, there is a dimension correlative to that generic difference, which, because of the way sense is created out of time in it, also runs contrary to the paradoxes of time in the eternal return: rather than *generic difference* subsuming and explaining *repetition*, a *generic repetition* implicates *difference* (contrary to the *paradox* where repetition is implicated *by* difference). This occurs because repetition in immemorial memory is no longer the repetition of living time; that is, immemorial memory does not concern a particular, inhabited repetition, from which generic difference can be extracted, but what could be called a *generic repetition* outside of living time which generalises all particular occurrences or 'repetitions' of

difference. Repetition in this case takes place on the level of generality in that it is the repetition of *all* difference (or any difference), and when repetition is *general*, *difference* is liberated from any generic status, but at the expense of expelling plurality from *repetition*. This takes place because, as Deleuze claims, reminiscence cannot evade the problem of its own presence in time: 'the pure past [. . .] is itself still necessarily expressed in terms of a present, as an ancient *mythical* present' (Deleuze 1994: 88/119). Thus, the repetition that produces real difference is timeless, but the problem arises when repetition grounds real difference so that the timeless is mystified via its experience in time. This is also why reminiscence repeats: the real difference that constitutes the pure past is outside of time but *must* be repeated in order to be lived in the present; however, in order to be lived it circulates around the *same* repetition, generalising differences through their coexistence and identity in that circle.[9] In this case, memory, as what Deleuze calls a 'ground' (*fondement*), 'coexists' with the *absence* of a living presence, lacking what he calls the 'foundation' (*fondation*) of habit.

> [It] remains relative to the representation that it grounds. It elevates [. . .] resemblance, which it treats as a present image: the Same and the Similar. [. . .] The ground then *appears* as an immemorial memory or pure past, a past which itself was never present but which causes the present to pass, and in relation to which all the presents coexist in a circle. (Deleuze 1994: 88/119)

It is because the immemorial was never lived that it needs to be lived, and memory circulates by imposing that which is indeterminate on that which arises in a determinable present. So, the present, in reminiscence, always seems mysterious because the forgotten thing through which the memory is apprehended never corresponds to the determined presence in which it is experienced. Instead, it always 'differs' from that experience, and the paradoxical aspect of difference which implied a timeless repetition is therefore eclipsed by its lived presence in time, making generic repetition the agent which implicates real difference. Repetition in this case has lost all plurality as well as the determinable foundation of habit, originating instead from an indeterminate source. The indeterminate then makes itself felt as a problem to be solved in the present, or a mystery to be revealed through the real difference that it determines and represents. So, unlike the *determined*, living presence of habit, this indeterminate and timeless presence can only determine itself and become temporal through a circular recognition that identifies it. This is the basis of *common sense*, which 'brings diversity in general to bear upon the form of the Same', or gives difference a sense that holds it

in common (Deleuze 1990: 78/96). To 'reminisce', or live in the pure past is to be outside of the living present, but it is also, as Deleuze claims, to 'determine the indeterminate' (Deleuze 1994: 275/352). He further adds that real difference 'distinguishes itself', but the problem arises because 'that from which [the ground] distinguishes itself does not distinguish itself from it' ('ce dont il se distingue ne se distingue pas de lui' [(Deleuze 1994: 28/43]). That from which the ground distinguishes itself is its indeterminate origin; memories seek to be present by determining the indeterminacy of their origin, but this origin implicates itself in any determination.

The generic repetition of memory corrupts the sense of difference by determining the indeterminate, and the generic difference of habit corrupts the sense of repetition. However, in order to apprehend *real* sense that is corrupted neither by generic difference nor generic repetition (neither 'good' nor 'common' sense), as it relates to topics correlative to the eternal return, one needs to turn towards the notion of *force* Deleuze derives Nietzsche. Force is an important point of intersection between Deleuze and Blanchot; it is precisely with regard to the notion of force that Blanchot makes an explicit reference to Deleuze. Deleuze makes a specific connection between force and sense:

> We will never find the sense of something (of a human, a biological or even a physical phenomenon) if we do not know the force which appropriates the thing, which exploits it, which takes possession of it or is expressed in it. (Deleuze 1983: 3/3)

Sense, then, is developed by force, as it is developed by the repetition of habit before generic difference is extracted from it. In fact, when looking closely at Deleuze's explanation of force, we encounter similar paradoxes as we did with habit and memory. Firstly, Deleuze does not refer to the substance (*matière*) of force as indeterminate *per se*, perhaps because the shifting of forces is like matter that is constantly determining and being determined, and, rather, it is the *relation* of forces, that is, their absolute difference, that is indeterminate. Thus, like habit, force has an indeterminate dimension constituted by its persistent and necessary plurality. So, Deleuze does not only emphasise that forces are plural because they are always in a relation with other forces, but also claims that the relation of forces, and not forces taken for themselves, involve difference:

> Every force is [. . .] essentially related to another force. The being of force is plural, it would be absolutely absurd to think about [a] force in the singular. A force is domination, but also the object on which domination is exercised.

> A plurality of forces acting and being affected at distance, distance being the differential element included in each force and by which each is related to others – this is the principle of Nietzsche's philosophy of nature. (Deleuze 1983: 6/7)

In his explanation of force in Nietzsche, Deleuze fluctuates between the terms 'determination' and 'domination'; these terms are comparable in that they both connote causality, fixation, and control. Now, the object upon which force is exercised or determined is always at a distance from that force. This distance is the *real* difference that is between forces before they are seen only as determined, just as there is real difference enveloped within the repetition of habit before it is effaced in favour of corrupted, generic difference.[10] The real difference that repetition explains cannot be reduced to repeated occurrences, much like the 'differential element' of force cannot be reduced to the plurality that explains it. So, what may have seemed to be the determined shifting of forces involves an indeterminate dimension (plurality and distance), just as that which is determined by the repetition of habit is also indeterminate because it was repeated. Perhaps, then, the *difference* of memory that implicates the 'contraction' of habit parallels the indeterminate *relation* that implicates force(s), since that which constitutes repetition (time and difference) and that which constitutes force (relation and difference) is indeterminate and external to that which is determined by habitual 'contraction' and that which is determined by relation.

Aside from the paradoxes of plurality, difference, and determination, Deleuze also characterises both force and habit in terms of *life*, possibly because both, whether spoken of in terms of difference or relation, are perishable. Deleuze describes the limited relationship of forces in terms of the body:

> Every force is related to others and it either obeys or commands. What defines a body is this relation between dominant and dominated forces. Every relationship of forces constitutes a body – whether it is chemical, biological, social or political. Any two forces, being unequal, constitute a body as soon as they enter into a relationship. (Deleuze 1983: 40/45)

When two forces – both dominant and dominated – change, so does the 'body' constituted by that relation. This characterisation of the body is complementary to the familiar metaphor of the political or social body: the 'life' of a political body is analogous to the life of a biological or human body because both are limited by the forces which constitute them. A political 'body', for example, would last only as long as

correlative economic and cultural forces dominate or are dominated by political forces. Similarly, in his account of habit, Deleuze describes the imagination as an 'organ' of contraction, noting also that 'fatigue' marks the limits of contraction and contemplation where that which we 'contract' can no longer be contemplated (Deleuze 1994: 73/100, 77/105). 'Contraction' is not without its own limits and depends upon an organism's capacity to receive or endure an impression.[11] In this case, the imagination behaves like a 'sensitive plate' that 'retains one case while another appears' (Deleuze 1994: 70/96). If the organism can no longer retain a case, then that which is contracted can no longer appear and a habit may dissolve, which would change the nexus of habits and the disposition of the body itself. Likewise, forces would be unlimited were they not constantly altered, determined, or dominated by another force (which is only possible hypothetically): political or social bodies thus depend on forces or perhaps the 'habits' which dispose them. So, new relations of forces dissolve or produce 'bodies', while the repetition of habit likewise affects and can exhaust or destroy an 'organism' which is constituted by those habits.

Insofar as a body is constituted by *difference* (relation), this difference can no longer be developed by repetition when the repetition or (the plurality of) force that produces it changes, dissipates, or is exhausted. If the relevance of the paradox of habit and force to the paradox of eternal return is the way in which difference is developed by repetition, then the relevance of the paradox of memory and relation is the way in which the unequal or 'differential element' (Deleuze 1983: 50/56) implicates force or repetition. With regard to habit, the 'contraction' within the mind that takes place *before* that difference is represented generically parallels repetition in the eternal return, since the paradox of succession does not imply the generalisation that would annul real difference. With regard to memory, real difference is that which 'returns' via eternal return (and implicates the plurality of force) *before* difference is identified with an instant or subject that repeats it. Presence in the eternal return, then, is the ideal paradoxical interplay between repetition and difference because it expels all generality from repetition and difference. This results in what both Deleuze and Blanchot call its 'inequality', where that which exists is eternally returning as what it is not, such that it corresponds neither to what was nor what it will be. Deleuze discusses this presence in terms of the 'final synthesis of time':

> [I]n this final synthesis of time, the present and past are in turn no more than dimensions of the future: the past as condition, the present as agent.

> The first synthesis, that of habit, constituted time as living present by means of a passive foundation on which past and future depended. The second synthesis, that of memory, constituted time as a pure past, from the point of view of a ground which causes the passing of one present and the arrival of another. In the third synthesis, however, the present is no more than an actor, an author, an agent destined to be effaced; while the past is no more than a condition operating by default. [. . .] [this involves] refusing the content of a repetition which is more or less able to 'draw off' difference (Habitus); refusing the form of a repetition which includes difference, but in order once again to subordinate it to the Same and the Similar (Mnemosyne); [. . .] expelling the agent [the present] and the condition [the past] in the name of the work or product; making repetition, not that from which one 'draws off' a difference [as in habit], nor that which includes difference as a variant [as in memory], but making it the thought and the production of the 'absolutely different'; making it so that repetition is, for itself, difference in itself. (Deleuze 1994: 94/125–6 translation modified)

In the case of eternal return, rather than the dimensions of habit and memory interacting by way of a *repetition* determined as *different* (but generic through expectation), and a *difference* that is determined *repeatedly* (but generically through the experience of memory), the dimensions interact by way of the determined repetition of habit (the paradox of contraction and succession) and the indeterminate difference in memory (the paradox of real difference that is never determined), 'so that repetition is, for itself, difference in itself' (Deleuze 1994: 94/126). So, in this case, the determined repetition of habit and the indeterminate difference of memory are conflated. Real difference was, all along, the indeterminate dimension of habit that simultaneously implicated lived repetition and gave it a sense. Also, the paradoxes of habit and memory are of themselves not enough to completely parallel eternal return: if difference is *only* explained by repetition, then generic difference can in turn explain repetition, and if difference *only* implies repetition, then generic repetition can in turn implicate or ground difference. With the eternal return, however, the past is not projected onto the future through expectation, nor is the 'never lived' projected onto the present mysteriously from the immemorial past; both are 'refused' such that the *unlived future* includes the past 'by default' and is *lived* and developed in the *present*. In other words, time is determined neither through habitual generalities nor through the mnemonic recognition of difference that makes it circular, but instead through the living repetition of habit and the unlivable difference of memory. The present, rather than being the contemplation of the past or the experience of the never-lived past, is

instead effaced and experienced as a 'dimension of the future' through the repetition, or return, of real difference. The living present, in turn, does not form expectation by going from the most to least differentiated (as with good sense[12]), but goes in the reverse direction, from the *least* to *most* differen*t*iated, such that sense is the very presence of 'differen*c*iation' itself.[13] The 'thought' and sense produced by eternal return is therefore presented but never *represented*, that is, mediated by generic difference or repetition, because it refers neither to a completed past that can be expected in the future nor a forgotten past in a mythical present.

For Deleuze, difference is never explained with reference to anything from which it differs, but only the repetition of the 'indifferent instant'[14] which is in turn implicated by timeless difference. The 'eternal' aspect of the return involves timeless difference which 'returns' through the recurrence of living presence. In contrast, Blanchot does not characterise the interaction between repetition and difference in this way, since he sidesteps any inclination to describe repetition in the eternal return as initially determined or as lived. However, because he is interested in artistic experience and the absence of an origin to the work of art, he characterises experience not in the context of determination or life, but in the context of memory and the undetermined:

> [P]oetry is [not] the expression of a rich personality, capable of living and of having lived. Memories are necessary, but only that they may be forgotten: in order that in this forgetfulness — in the silence of a profound metamorphosis — there might at last be born a word, the first word of a poem. 'Experience' here means contact with being, renewal of oneself in this contact — an experiment, but one that remains undetermined. (Blanchot 1989: 87/105)

Blanchot's notion of experience can be understood as the experience *of* the 'undetermined' or the 'forgotten memory' which does not have to do with the repetition of habit, but is the experience of a confrontation with real difference that cannot be or was never lived. In this way, Blanchot does *not distinguish* between what Deleuze calls empirical and immemorial memory. Similarly, his approach to determination can be contrasted with Deleuze's along these lines. Habit involves determined repetition, albeit paradoxically, through the real, indeterminate difference of the immemorial which implicates it (or which it develops). It is the impossibility of determination, this lack of origin to forgetfulness (as opposed to the identity of the origin of reminiscence), which marks Blanchot's contribution to characterising sense, or meaning, in the eternal return. Blanchot often stresses that

poetry accomplishes nothing, and acknowledges that pure 'writing' is detached from any determined condition of meaning and yet produces 'the meaning of the meaninglessness', noting elsewhere that 'To write is perhaps to bring to the surface something like absent meaning [...] This meaning does not pass by way of being, it never reaches so far; it is expired meaning' (Blanchot 1995a: 329/318; 1995b: 41–2/71). In these terms, as well as those borrowed from Deleuze, meaning does not 'pass by way of' the determined repetition of habit, but is perhaps already 'expired' because it was never determined or lived, and therefore is, as Blanchot says, 'determined by its indeterminacy' (Blanchot 1989: 89/108). So, for Deleuze, the indeterminate nature of unlivable difference is affirmed as an element of the determined repetition of habit, but in Blanchot's view, the indeterminate is affirmed as an element of the determined repetition of memory. The *forgotten* would thus exist within memories or the imagination as an 'undetermined' element, not as the meaning which the artist wishes to unveil *per se*, but as that which paradoxically presents or reveals itself as absent, unrevealable, and meaningless.

Despite Blanchot's insistence on the experience of the forgotten, he nevertheless discusses what he calls 'everyday' experience where, for example, he claims that from the perspective of art, 'everyday speech [...] lacks meaning', and that 'art feels it is lunacy to think that in each word some thing is completely present through the absence that determines it' (Blanchot 1995a: 332–3/321). In other words, 'everyday speech' cannot evoke the *lived presence* of any world, but only the world as a *whole*, since from this artistic perspective, everyday speech takes this lack of meaning, or whole, as its starting point, and, as Blanchot claims, 'subsists on false meanings: it represents the world for us [...]' (Blanchot 1995a 333/321). Everyday speech, then, does not so much represent what Deleuze may call an empirical world of significance, nor is it based on the 'contemplation' of contraction, but instead represents the immemorial, 'total' world of reminiscence, and what Blanchot calls a false, imaginary whole. Blanchot further claims that art 'is a search — an investigation which is not undetermined but is, rather, determined by its indeterminacy, and involves the whole of life, even if it seems to *know nothing of life*' (Blanchot 1989: 89/108 my emphasis). The 'whole of life' described here involves the determined, generic repetition of memory; forgetfulness and negligence about life, by contrast, are responsible for real difference and the poetic 'work' (*oeuvre*). (Blanchot 1989: 107/134, 170/ 224) So, the imaginary whole that is evoked by everyday speech (as the generic repetition of memory) cannot hold itself together, being

that it is unlivable, and Blanchot claims that it is the task of the artist not to represent the whole but, paradoxically, to present realities or memories 'in their forgetfulness'; that is, present their difference without grounding it through repetition or the identity of the world (or the self who has experience in the world).

While Deleuze claims that the eternal return expels *both* 'the content of a repetition which is more or less able to "draw off" difference (Habitus)', *and* 'the form of a repetition which includes difference in order [. . .] to subordinate it to the Same', Blanchot focuses exclusively on the expulsion of latter (Deleuze 1994: 94/125–6). This is because the false whole which Blanchot's artist refuses or 'expels' was never constituted by the paradoxes of lived repetition to begin with, the role of repetition being confined to its erroneous implication of difference in terms of identity or 'the Same' (and to its expulsion). While Deleuze would associate that lived repetition with *fatigue*; for Blanchot, fatigue results from the artist's incessant demand to demonstrate the unlivability and unreality of the whole, that is, the necessary inability to 'accomplish the whole'. In other words, because there are no determined limits of contraction and contemplation, and *only* generic repetition is 'expelled' such that it is implicated by difference, generic repetition is at the same time inexhaustible and must be expelled incessantly. This process 'exhausts' false difference such that it can no longer differ in an identifiable way, and therefore truly differs (Blanchot 1993: 78/110).[15] Such an eternally returning presence is 'unequal' in Blanchot's terms in that the 'different' is presented only as unbearably 'indifferent',[16] and, in this sense, the indifference of a timeless repetition corresponds to difference in an unusual way that neither explains nor is explained by it as such. Thus the artist may use imagery or memories to convey sense, but this sense is not determined by anything remembered or lived. So, for Blanchot, unlike Deleuze, the repetition of habit does not 'expel' generic difference, yet he is still concerned on some level with the expulsion of difference implicated by repetition in memory (such that difference instead implicates repetition) in terms of the literary or artistic product.

Blanchot's account of sense must also be related to his characterisation of force, which is framed around the false, 'imaginary whole'; that is, the realm of the immemorial and artistic experience. This false world of the immemorial, even when the immemorial memory is expelled or 'forgotten', is where the indeterminate is revealed, and even determined, as a force which has no specific relation, or is *only* relation, and is what he calls a 'neutral' force (or simply 'the Neutral'). This puts Blanchot in contrast with Deleuze's understanding of *sense* that is derived from *both*

force *and* its relation. In an essay published four years after Deleuze's work on Nietzsche[17], Blanchot discusses relation and force with regard to Deleuze:

> [W]hoever says force says it always as multiple; if there were a unity of force there would be no force at all. Deleuze expressed this with a decisive simplicity: 'All force is in an essential relation with another force. The being of force is plural, it would be absurd to think it in the singular.' But force is not simply plurality. The plurality of forces means that forces are distant, relating to each other through the distance that makes them plural and inhabits each of them as the intensity of their difference. [...] Thus the distance that separates forces is also their correlation—and, more characteristically, is not only what distinguishes them from without, but what from within constitutes the essence of their distinction. In other words, what holds them at a distance, the outside, constitutes their sole intimacy; it is that by which they act and are subject, 'the differential element' that is the whole of their reality, they being real only inasmuch as they have no reality in and of themselves, but only relations: a relation without terms. (Blanchot 1993: 161/241)

The relation that Blanchot describes here is an *absolute* relation separate from the 'terms' or the forces which would determine it. If, as Blanchot claims, force is *only* the relation of force, then the conclusion that there are *only* relations indicates that the 'distinction' and 'intimacy' of forces is *only* indeterminate, and that determination as such has expired. From Deleuze's perspective, all force involves relation, and all relation is differential, but it is the plurality of *singular* forces which, through their relation, are differenciated. Relation spoken of in terms of *the* distance that makes it plural renders relation indeterminate, and relation apart from its determinable terms elides the particularity of relation and the plurality of force. Distance or plurality may 'inhabit' forces ('la distance [...] est en elles comme l'intensité de leur différence'), but a *given* or *particular* distance only inhabits a force insofar as that force is *determining* and being *determined* by other forces (Blanchot 1969: 161/241). Here a parallel can be drawn to Blanchot's characterisation of artistic experience: like his version of the origin of experience (the false whole), his version of the origin of force, *relation*, is also not constituted by plurality, repetition, or plurality. In the case of experience, it is the false whole or the forgotten, separate from any living presence; likewise, in the case of force, it is *the* 'distance' or *the* 'relation' that is separate from any singular force or particular relation of forces. From Deleuze's perspective, the 'differential relation' of force requires a *plurality* of *determined* and *determining* forces, the plurality of singular forces being that which produces a difference in quantity and a relation of force or

'body'. So, by departing from the repetition involved with experience and the plurality involved with force, Blanchot elides the living or perishable nature of relation and of difference itself. For Deleuze, in contrast, the unlivable difference of the pure past cannot be experienced in itself without the plurality of repetition for itself; that is, the generic repetition of memory, or the false 'whole', cannot be expelled without the living repetition of habit.

Blanchot's intentional neglect of the plurality of force and lived experience results in an intriguingly excessive vision of forgetfulness. Firstly, he characterises the 'distance that separates forces', or what he calls, in this context, the 'outside', as *madness* (Blanchot 1992: 122/166), and this profound error and maddening abstraction from all lived experience both toward and away from the (im)memorial qualifies him to uniquely express the way in which forgetting relates to memory via the eternal return, producing indeterminate meaning in what Deleuze may call its 'extreme form'. The notion of forgetting is quite relevant to Deleuze, as he notes that forgetting becomes a 'positive power' through repetition, and is a force that is 'an integral part of the lived experience of eternal return' (Deleuze 1994: 7–8/15). Blanchot perhaps best characterises forgetfulness when describing a return of forgetting to *its own* indetermination through paradoxical self-reference (or non-reference): 'Forgetting forgotten. Each time I forget, I do nothing but forget that I am forgetting'(Blanchot 1993: 195/290–1). This kind of forgetting would not be an 'event' that we would 'arrive at', and would not determine the *presence* of the forgotten, as in the case with immemorial memory, but, as he claims, 'nonetheless would be determined only by forgetting's indetermination' (Blanchot 1993: 195/290–1). Here 'forgetting' is undetermined in relation to *itself*; forgetting is only forgotten; the term no longer indicates anything but its own 'eternal' and perhaps *maddening* difference in relation to itself. Difference here neither explains nor is explained by the repetition required to forget, but still implies that repetition; in other words, forgetting being determined by its indeterminacy does not 'determine the indeterminate' by grounding it in 'the Same', but instead proceeds by self-differenciation. It is as if Blanchot seeks to describe the very 'eternal' space of difference and relation itself.

Blanchot's radical treatment of 'forgetting's indetermination', which leads to his depiction of life and the world as a 'whole' that is forgotten, elides any notion of determined repetition, and without this dimension of habit, it is logical for him to conclude that the thought of the eternal return would not only be maddening, but also '*tragic*' and result in

'an uninhabitable world in which one is obliged to dwell' (Blanchot 1993: 99/142). This thought is what he calls the 'great refusal' which, when confronted with the *contrariety* produced by difference, would be 'perpetuating the other by the repetition that difference [. . .] calls forth endlessly', resulting in an indifferent, 'eternal oscillation' between differences (Blanchot 1992: 77/108). For example, Blanchot considers the past and future as oscillating terms which are sustained and affirmed by repeating their difference within the 'absence of [the] present', which would rule 'in the simplified form of forgetfulness' (Blanchot 1992: 16/27). The 'experience of a presence' in the eternal return would therefore involve 'a time without present [that] would bear the weight of this exclusion', and, in excluding the past and future, presence would oscillate between those contraries (Blanchot 1992: 23/34). For Deleuze, *sense* or the event is 'brought about' by the 'living present', while the 'pure event', or sense *itself*, is 'eternally neutral', and 'has no present. It rather retreats and advances in two directions at once' (Deleuze 1990: 22/34, 63/ 79).[18] This eternal relation or oscillation can, as Deleuze notes, be between the past and future, where neither can be represented and the event is instead 'the perpetual object of a double question: What is going to happen? What has just happened?'(Deleuze 1990: 63/79).

So, in Deleuze's terms, Blanchot elides precisely that which *brings about*[19] sense – the living presence of *repetition*, and focuses instead entirely on the presence of *difference*: repetition is instead what he calls the 'indifferent difference' through which the oscillation occurs, producing meaning that is, due to its mode of repetition, 'meaningless'. Presence as well as the habitable world are thus refused or excluded through the *repetition that 'carries' difference*,[20] and are in turn weighed down tragically by that which repetition excluded. This is why difference neither explains nor is explained by repetition, and is instead 'carried' by it, *implying* repetition such that it can not be identified as 'the Same'. Curiously, Blanchot claims that this 'paradox of a yes and a no simultaneously affirmed' results in a 'refusal that is not general and abstract but constant and determined', where the *difference* between a yes and no (or anything contrary) is affirmed through a repetitive refusal (Blanchot 1993: 101/145). Lightness or levity therefore concerns not the form of forgetfulness in the present, since presence is negated, but the 'constant and determined' affirmation of that which is deferred from the present. Perhaps Blanchot claims that this presence is not 'general and abstract' because the general and abstract is *refused* through a general and abstract *repetition* that carries real difference, and the refusal returns as such, weighing down the levity of the affirmation.

Blanchot's portrayal of the meaningless repetition that 'carries' difference and gives weight to the eternal return can be contrasted with Deleuze's claim that 'difference is light, aerial and affirmative. To affirm is not to bear but, on the contrary, to discharge and to lighten' (Deleuze 1994: 54; 76). For Deleuze, repetition is not in the position to bear the weight of the difference of the past and present, perhaps because difference in the eternal return already implicates the living or 'light' contraction of habit which, insofar as it develops difference through repetition, undoes the contrariety that would weigh it down.[21] That is, if difference is affirmative, then the role of repetition is not to produce an oscillation between differences, but to differ from itself by developing that difference *through* repetition:

> [R]epetition is the formless being of all differences [. . .] which carries every object [*porte chaque chose*] to that extreme 'form' in which its representation comes undone [. . .] Thus, the circle of eternal return, difference and repetition (which undoes that of the identical and the contradictory) is a tortuous circle in which sameness is said only of that which differs. (Deleuze 1994: 57/80)

Deleuze uses the same verb as Blanchot here (*porter*) to describe how difference is 'carried' by repetition in the eternal return. At first glance, this passage may sound Blanchotian; however, Deleuze's claim is that difference is only carried such that it is 'expelled', lightened, or lived, undoing the 'contradictory' character of difference. Only that which differs can be considered 'the same': differences are not explained through a repetition that would identify them as different, but only through the repetition or dissembling 'sameness' that they imply and embody. This is because when difference is considered via sameness or the form of resemblance, it is actually through a representation that renders it generic. To undo representation is to 'expel' the generic difference of habit that would seek to re-present the past as an expectation toward the future, and also to 'expel' the generic repetition that would seek to re-present all difference and the unlivable in the present by grounding it there, such that a 'formless' repetition develops and explains difference through a 'light' and 'aerial' living presence and an unlived future.

It is perhaps because Blanchot elides the 'living' dimensions of habit and the plurality of forces that produce 'relation' that he excels in describing death and the unlivability of real difference that both he and Deleuze depict. Deleuze in fact often refers to his radical notion of death to discuss the experience of impossibility that is associated with the unlivable, eternal nature of time.[22] Since presence is never living

or determined for Blanchot, it is always an 'absent present', and it is here that what he calls the *other death* occurs. Now, ordinary death is contrary to the eternal return in that it presumes or represents a final state. The other death, by contrast, 'is too light to die' and excludes the 'experience of a presence' of death, where death would instead be, as Blanchot writes, 'the thought of the Eternal Return', always incited by a timeless repetition (Blanchot 1992: 121/166, 125/170–1). Blanchot also notes that the 'other death' is not 'definitive'.

> [F]or it is that which is not accomplished, the interminable and the incessant [. . .] It is inevitable but inaccessible death; it is the abyss of the present, time without a present, with which I have no relationships; it is that toward which I cannot go forth. (Blanchot 1989: 154–55/202)

Deleuze cites Blanchot's notion of the other death when commenting on real difference, interpreting the first death as an 'encounter in a present which causes everything to pass', where the presence of death is disguised and determined, as would be the differences determined mysteriously by immemorial memory (Deleuze 1994: 112/148). The other death, as Deleuze interprets it, is 'neither present nor past but always coming', or is 'an incessant multiple adventure', and also claims that 'the eternal return [. . .] affirm[s] only the excessive and the unequal, the interminable and the incessant' (Deleuze 1994: 112/148, 115/151).

While incessance parallels the paradox of pure difference, the ideal paradox of the eternal return parallels Blanchot's notion of the outside or pure madness. Paradox itself is defined by Deleuze as 'the unthinkable that can only be thought', and this exact formulation is repeated when he and Guattari characterize Blanchot's outside (Deleuze 1990: 74/92; 1994b 59/59). Incessance is, as Blanchot notes, a feature of the outside, and it is important to keep in mind that repetition is only paradoxical by virtue of the simultaneity that is *outside* of the succession in living presence. While Blanchot's incessance 'never fixes itself in a present, refers to no past and goes toward no future' (Blanchot:1993: 45/64–5), Deleuze's version of incessance would necessarily be developed in the presence and dissemblance of successive, determined repetition (albeit a repetition that is infinite rather than proceeding via expectation). Such interminability and incessance of presence in the eternal return, where nothing achieves or 'becomes' its final state, parallels the experience of Blanchot's other death which is not definitive and has no determined presence. Blanchot, when speaking about this death with regard to the eternal return, also characteristically claims that its weight or 'slowness' which 'lags behind dying' (because death can never be present)

would mean to die 'mad' (or become aware of the eternal return and the madness that accompanies all death), as he claims Nietzsche did (Blanchot 1992: 121/166).

The Blanchotian notion of forgetting as an affirmative experience in the eternal return, as well as the other death, appeals to Deleuze because the impossibility of the experience of death indicates that death cannot be an event that would, like generic repetition, identify or explain all the differences of memory. The 'other death', in accordance with Deleuze's version of real difference, involves that which does not differ from life and the subject who lives in an identifiable way. In this sense, we do not 'experience' the other death and it has no living presence *per se*; it is not an immemorial memory lived through a mysterious presence, but is instead, paradoxically, a forgotten presence. Also, like real *sense*, the other death cannot be *represented*, as a final state or otherwise, because its presence, that is, real difference itself, cannot be revealed *per se*. So, Blanchot characterises the 'outside' and the 'other death' through both the weight of madness and the tragedy of an uninhabitable world, and while Deleuze appropriates the idea, in his terms it would be 'light' even in the face of the 'tortuous circle' of the dissolution of identity. Because 'presence' in the eternal return, for Deleuze, involves both the dimensions of memory and of habit, it does not oscillate between contraries/differences that would refuse a final or determined state, but is *lived* as the dissembling sameness that explains difference itself (and not as difference that explains it). This example of the other death, as well as Blanchot's characterisation of forgetting and 'weight', illustrate a presence of difference that does not explain the presence of repetition; his version of real difference, unlike Deleuze's, requires that it always paradoxically differ from itself and never be present in a repetition that would explain it.

If Blanchot is intentionally negligent toward lived experience, it is because he is all the more attentive to the unlivable. This attentiveness enables him to uncompromisingly depict meaninglessness (that is never determined) as meaningful, pure, and maddening, since meaning in this case differs *incessantly* by, in Deleuze's terms, always expelling the 'whole', or the generic repetition of immemorial memory, that would seek to include it. This is, finally, why Blanchot characterises the eternal return as repetition that 'carries' difference: it is difference that consistently, incessantly returns through the interminable expulsion or forgetting of the imaginary whole; difference that is always both burdened by, and differing by virtue of, the repetition of the 'neutral' force that is outside of all relations of force and lived experience

('a relation without terms' that has 'no reality') (Blanchot 1993: 161/241). This difference neither explains nor is explained by that repetition, though it implicates repetition; furthermore, because this difference has no living presence, reality, or memory, it is best described via forgetting, the tragic, or the 'other death'. Deleuze is indebted to Blanchot for this notion of difference, yet in his characterisation of the eternal return, the real difference of the pure past implies the *living* repetition of habit that explains those differences and renders them 'light, aerial, and affirmative'. It is in this way that the two thinkers have conflicting approaches to the determination of *sense*. For Blanchot, 'meaningless meaning' is determined by the unlivable difference of artistic experience, paradoxically creating an image out of forgetfulness. For Deleuze, it is the product of the determined 'contraction' or living repetition of habit (and the plurality of force), and also of real, timeless, and unlivable difference (and relations of force) which paradoxically implicate and are developed by that lived repetition.

Notes

Note that in all citations of Deleuze and Blanchot page references given within the text are first to the English translation and second the original French.

1. See notes 8 and 9 on Proust.
2. See, for example, Deleuze 1994: 41/60, 242/312 and note 16.
3. The question of 'value' is also relevant.
4. See Blanchot 1992: 23/ 36, where affirmation in the eternal return is based on the *exclusion* of presence and that which would give totality its realized meaning. Deleuze will distinguish between reaction, where denial precedes affirmation, and action, where affirmation precedes denial (Deleuze 1983: chp. 4 and 5). He also notes that 'the eternal return [. . .] produces an image of the negative as the *consequence* of what it affirms' (Deleuze 1994: 301/385).
5. I will usually translate the French term *sens* as *sense*, but also use 'meaning' when appropriate.
6. While Deleuze uses the terms implication and explication especially in chapter 5 of *Difference and Repetition*, and also in his work on Spinoza, I am placing emphasis on the terms 'imply' and 'explain' to summarize his approach and compare it to Blanchot's. I use the term 'explain' not to denote interpretation or clarification, but to denote unfolding sense or meaning.
7. See Deleuze 1991: 68–9; 66, for a distinction between habit and experience.
8. Deleuze appropriates many of the concepts surrounding simultaneity from Proust and Bergson. For example, the repetition of habit and memory loosely parallel Proust's voluntary and involuntary memory, and Bergson's motor memory (learning, habit) and spontaneous memory (the pure past).
9. The question of remembering through forgetfulness also concerns the ways Deleuze and Blanchot read Proust. In Deleuze's account, something in the world impels the search for meaning, even if worldly signs are devoid of meaning (which, from a Proustian perspective, makes lived time a 'race to the grave') while Blanchot characterises lived time for Proust as destructive and an impediment to forgetfulness (Deleuze 2000: 6–7, 18, 84–5/12–13, 26–7, 104).
10. See Deleuze 1991: 67/63–4, where he insists that habit cannot be reduced to pure mechanism.

11. Though Deleuze's attitude toward the term 'organism' changes in his later work with Guattari and his work on Francis Bacon, I use the term here with regard to its characterisation in *Difference and Repetition*.
12. Good sense goes 'from the most to the least differentiated, from the singular to the regular, and from the remarkable to the ordinary [. . .].' (Deleuze 1990: 76/94).
13. Deleuze uses this term distinctively from differen*t*iation. Differen*c*iation concerns 'immediate relation' and 'the self-different which relates different to different' (Deleuze 1994: 119/156). Differen*t*iation has to do with other topics such as the dialectic and the virtual.
14. For the phrase 'indifferent instant', which is borrowed to describe the repetition of habit, see Deleuze 1994: 84/114.
15. See also *L'Attente l'oubli* where the characters are 'exhausted' by attempting to 'say everything', and Deleuze's essay on Beckett, 'L'épuisé'.
16. For Blanchot, the inequality of the difference that implicates indifference is associated with eternal return (Blanchot 1992: 83/115–6). He also portrays the indifference of place 'impersonal' and unlivable, where the characters can only 'conjure up this same room inhabited by someone else' (Blanchot 1997: 6/13). The characters are 'unbearably' indifferent to one and other, which nevertheless 'clarifies' and renders their presence 'attractive' and 'unequal' (Blanchot 1997: 53/78).
17. Originally (December 1966) 'Nietzsche et l'écriture fragmentaire', in *Nouvelle Revue Française* n. 168, pp. 967–983, and (January 1967) n. 169, pp. 19–32.
18. Deleuze's comments here cannot be read as a response to Blanchot's cited above (but rather to his earlier work), as *Le pas au-delà* was published after *Logique Du Sens*.
19. It is important to note that 'bringing about' the event does not mean to realize it (Deleuze 1990: 22/34). In the terms from this essay, the event would only be brought about by recurrence or repetition that cannot be represented.
20. Blanchot 1992: 16/27. See also Blanchot 1997: 71/102.
21. Nietzsche's aphorism 'The Greatest Weight' could perhaps be interpreted differently via Deleuze and Blanchot here. See Nietzsche 2001: 194–5.
22. For Deleuze's explanation of Blanchot's other death as it relates to time for the Stoics (Aion and Chronos), see Deleuze 1990: 63/79, 151/177.

Deleuze, Bakhtin, and the 'Clamour of Voices'[1]

Fred Evans Duquesne University

Abstract

This paper pursues two goals. The first concerns clarifying the relationship between Deleuze and the Russian linguist and culturologist, Mikhail Bakhtin. Not only does Deleuze refer to Bakhtin as a primary source for his emphasis on voice and indirect discourse, both thinkers valorise heterogeneity and creativity. I argue Deleuze's notions of 'deterritorialisation' and 'reterritorialisation' parallel Bakhtin's idea of 'heteroglossia' and 'monoglossia'. Clarifying the relationship between Deleuze and Bakhtin leads directly to the second of my two other goals. I will argue that an important difference in their characterisation of voice reveals a strong point in Deleuze's philosophy, one related to the political sphere. At the same time, however, Deleuze's particular way of articulating this point conceals a weakness, one related to the idea of the subject. I will conclude my paper by suggesting a way to address this weakness.

Keywords: absolute deterritorialisation, agency, body without organs, constellation of voices, elliptical identity, heteroglossia, radical democracy, virtual-real

In *The Logic of Sense*, Gilles Deleuze claims that 'Being is Voice' (Deleuze 1990: 179). He identifies Being with voice because '[Being] is said,' and said 'univocally,' that is, 'in one and the same sense,' of all events, a 'single voice for every hum of voices,' even though these events otherwise differ from one another (Deleuze 1990: 179–80). This use of voice in relation to Being echoes an earlier statement in *Difference in Repetition*: a 'single and same voice for the whole thousand-voiced multiple . . . a single clamour of Being for all beings' (Deleuze 1994: 304).[2] In addition to mentioning voice, both passages convey Deleuze's well-known conviction that Being is univocal only insofar as it is at the

same time multiple, indeed, the very division of itself into difference, into many distinct voices.

Deleuze's explanation for identifying Being with voice – that it is *said* univocally of everything – is mysterious. Without further elaboration, it suggests that someone, perhaps Being itself, says Being univocally of all things. Such a suggestion would violate Deleuze's rejection of anthropomorphism. A more satisfactory explanation can be garnered from his use of voice in *A Thousand Plateaus* (1987), where he deploys the term to characterise 'indirect discourse,' the linguistic structure he feels is at the heart of language and expression. However, his characterisation of indirect discourse involves an encounter with another advocate of voice, the Russian linguist and culturologist, Mikhail Bakhtin, and leads ultimately to a problem concerning political agency. In responding to that problem, I will introduce an idea that I think remains within the spirit, if not the letter, of Deleuze's philosophy, our 'elliptical identity' with the clamour of voices.

I. Voice as Indirect Discourse

Deleuze cites Bakhtin as a primary source for his emphasis on voice and indirect discourse (Deleuze and Guattari 1987: 77–78, 82, 84, 523n.5, 524n10).[3] One of the reasons why he cites Bakhtin in this context is that both thinkers reject language as the unitary system of linguistic constants and universals presented to us in grammar books or traditional linguistic theory (Deleuze and Guattari 1987: 7, 92–3, 102–4; Bakhtin 1981: 288). In place of this traditional view, Deleuze argues that language is always involved in an 'immanent process of variation' with respect to its phonemic, morphemic, and syntactical elements, a process he refers to as 'becoming-minoritarian'. This is a process intrinsic to language, which manifests as a relentless and intrinsic division of language into myriad 'minor' languages or voices, for example, American English 'becoming' Black English, Spanglish, and an outpouring of literary experiments (Deleuze and Guattari 1987: 102–6). Bakhtin similarly declares that 'language is heteroglot from top to bottom', that is, a plethora of intersecting 'social languages' or 'voices', the 'co-existence of socio-ideological contradictions between the present and the past, between differing epochs of the past, between different socio-ideological groups in the present, between tendencies, schools, circles, and so forth, all given bodily form' (Bakhtin 1981: 291; see also 170, 365).

Deleuze follows Bakhtin in taking a form of reported speech, namely indirect discourse, as the central structure of language. Both Deleuze and

Bakhtin hold that every utterance is ultimately an instance of this type of speech. To clarify the meaning of indirect discourse, we can begin by contrasting it with the form of reported speech known as 'direct discourse'.[4] Direct discourse is the reproduction of another's words as faithfully as possible. For example, the statement, 'They protested: "US, get out of Iraq!"', reproduces what protesters have said with virtually no accenting on the part of the reporter. In contrast, indirect discourse, 'They protested that the US should get out of Iraq,' diminishes the exclamatory character of the protestors' discourse, transforming it almost entirely into the relatively 'neutralised' content of the reporter's own discourse. But there is another form of indirect discourse that is particularly prized by Bakhtin and Deleuze, 'quasi-indirect discourse' or 'free indirect discourse'. In this form of indirect discourse, the two earlier statements become 'They protested: "The US, they shouted, should get out of Iraq!"'. The reporter's and the protester's voices are mixed in the statement, yet, relative to the other two forms, neither voice is absorbed into the other. In other words, free indirect discourse helps Deleuze and Bakhtin illustrate their claim that every utterance involves a constellation of interacting voices. Both Deleuze and Bakhtin argue that free indirect discourse and the interplay among voices it implies is the core of language. But, as we will see, the levels upon which they locate this interplay differ and carry profound implications for the meaning of voice, the status of communication, and the sources and meaning of political life. Thus my exposition of Bakhtin in this essay has several purposes. It helps clarify Deleuze's use of voice, makes a comparison that should be of particular interest to both Deleuze and Bakhtin scholars, and plays an important role in dealing with the issue of political agency in relation to Deleuze's notion of voice.

In his treatment of indirect discourse, Deleuze speaks of 'all manner of voices [being contained] in a [single] voice' and claims that one 'draws' his or her voice from 'the constellation of voices' (Deleuze and Guattari 1987: 77, 84; see also 80).[5] But Deleuze also holds that this drawing of a voice takes place on the 'unconscious' ('*l'inconscient*') rather than the conscious level of our existence. Specifically, he says that this constellation of voices is related to the 'collective assemblage of enunciation', a 'molecular' or multi-voiced assemblage that 'is not given in my conscious mind, any more than it depends solely on my apparent social determinations, which combine many heterogeneous regimes of signs' (Deleuze and Guattari 1987: 84). Because our voice is drawn from this collective assemblage, Deleuze emphasises that 'my direct discourse is still the free indirect discourse running through me, coming from other worlds or

other planets' (Deleuze and Guattari 1987: 84). In other words, what Deleuze calls 'drawing upon' in this context is actually the enunciation of a set of interrelated voices that have already been made prominent for us in the collective assemblage of enunciation. We are many voices, as many as are in the assemblage, but different ones are salient on different occasions. We speak as if the words we use are our own when we are really enunciating or 'reporting on' the dominant voice for that occasion and, from its heights, explicitly or implicitly referring to the others. Thus Deleuze can say of one of his joint works with Félix Guattari, 'The two of us wrote *Anti-Oedipus* together. Since each of us was several, there was already quite a crowd' (Deleuze and Guattari 1987: 3).

In this context, Deleuze does not use 'unconscious' in the Freudian sense of the term. Rather, he has in mind a use much closer to Michel Foucault's idea of a 'positive unconscious',[6] that is, a discourse or voice that frames our conscious activity without our immediate awareness of its doing so, and is not repressed or requiring of therapeutic techniques for its possible identification by us. Deleuze's appeal to this unconscious dimension of enunciation has the striking effect of leading him to declare that indirect discourse is logically prior to dialogic exchange and has 'nothing to do' with 'intersubjective communication' (Deleuze and Guattari 1987: 78, 85).[7] The unconscious voices determine the roles we play in conscious communication with each other. Deleuze reinforces and further elaborates this idea of the unconscious dimension of enunciation when he relates the voices in the collective assemblage of enunciation to what he calls 'order words'. In clarifying this term, Deleuze insists utterances are always the enunciation of a discourse or voice that has preceded us, the transmission of what someone else has said. Indeed, he says that language itself is the transmission of these order words and compels our obedience: 'Language is not life; it gives life orders' (Deleuze and Guattari 1987: 76, 77). When we speak, therefore, we are passing on the way that language has already ordered a social situation: we implicitly transmit another's voice or social discourse, one to which we primarily and necessarily conform, one that, to use Althusser's term in a qualified manner, 'interpellates' us, provides us with our identity and our 'social obligations' (Deleuze and Guattari 1987: 79).[8] It should be clear that 'another's voice' here refers to an anonymous social discourse and not to the personal or individual sense of 'other'.

Order words are recognisable as 'incorporeal transformations'. Their utterance transforms the social status of the subjects and objects they are applied to. More specifically, Deleuze says that the collective assemblage

of enunciation and its voices are a complex of acts as well as the statements which accomplish these acts (Deleuze and Guattari 1987: 80, 81). When, for example, judges pronounce someone guilty, they, as the subjects of *enunciation*, transform the accused person, the subject of the *statement*, into a convicted criminal. The condemned person doesn't change corporeally but is nonetheless given a new social status. Correspondingly, the judges, in their enunciations, maintain themselves in their judicial identity through the relation of the same statement to its larger discursive context, the legal system. In short, both agent and patient are incorporeally transformed in the occurrence of the statement and its relation to the larger legal discourse (the voice of the law) as well as to the collective assemblage of enunciation. Ultimately, Deleuze argues, the very possibility of language depends upon the indirect discourse of the collective assemblage and its order words and the incorporeal transformations they involve:

> [I]f the collective assemblage is in each instance coextensive with the linguistic system considered, and to language as a whole, it is because it expresses the set of incorporeal transformations that effectuate the condition of the possibility of language and utilize the elements of the linguistic system. (Deleuze and Guattari 1987: 85)

Like Deleuze, Bakhtin emphasises the powerful role of language in shaping reality. He says, for example, that each social language or voice is a 'form' for conceptualising its surroundings and is 'characterised by its own objects, meanings and values' (Bakhtin 1981: 382, 356). Each of these languages, moreover, is reflexive and evaluative, that is, each is 'a particular point of view on the world and on oneself, the position enabling a person to interpret and evaluate his own self and his surrounding reality' (Bakhtin 1984: 47).[9] Bakhtin also holds that each voice interacts with other voices in every utterance. More specifically, he argues that indirect discourse is an example of what he calls 'double-voicing' or 'hybridization', that is, 'a mixture of two social languages within the limits of a single utterance, an encounter, within the arena of an utterance, between two different linguistic consciousnesses, separated from one another by an epoch, by social differentiation or by some other factor' (Bakhtin 1981: 358, 304).

The mixture of social languages in indirect discourse can be explicit or implicit. If we make a parody of someone else's speech, we explicitly cite that person's voice and make it serve our opposing view of the subject matter. If, on the other hand, we omit explicit reference to an opposing or related voice, this other voice nonetheless persists implicitly

in our discourse. For example, if we praise democracy, we tacitly and disapprovingly refer to autocracy even though we don't mention it by name or overt description: its negation is part of the meaning of democracy. Because each social discourse includes an explicit or implicit response to other ones, ultimately to every discourse in one way or the other, we can extend Bakhtin's point to mean that all the voices of society make reference to one another, are what they are in light of each another, or, more dramatically, resound within one other. Note, however, that these references to one another are diacritical in nature, each voice playing a role in establishing the others through its difference from them rather than by way of a Hegelian absolute spirit or any other form of totalising synthesis.

This hybridisation of voices also implies that every word and object is overlaid with the 'accents' or points of view of the different voices. Thus Bakhtin says that objects are 'entangled, shot through with shared thoughts, points of view, alien value judgments and accents', and therefore appear to us 'by the "light" of alien words that have already been spoken about them' (Bakhtin 1981: 276). For Bakhtin, then, the world reflects back to us what we are, beings of dialogue, and in the strong form of hybridised voices, that is, voices literally shot through with one another.[10]

Despite the apparent similarity between Bakhtin's notion of hybridisation and Deleuze's notion of collective assemblage of enunciation, Bakhtin does not agree with Deleuze that indirect discourse is prior to intersubjective communication. He holds instead that dialogue is the core of indirect discourse and language. Indeed, Bakhtin sees dialogue as the basis of human life itself (Bakhtin 1984: 293). Nonetheless, he equivocates on whether these dialogic subjects are the active agents or passive vehicles of the voices they articulate. In other words, he does not say clearly whether or not subjects are interpellated, constituted, in advance by social languages – does not proclaim whether our role is that of agent or mere vehicle in the unconscious 'selection' of the voices that constitute our identity. For example, he says that dialogue is 'a struggle among socio-linguistic points of view, not an intra-language struggle between individual wills or logical contradictions' (Bakhtin 1981: 273). But then he claims that 'the speaker's speech will is manifested primarily in the *choice of a particular speech genre*', such as a familiar greeting or the specific idiom of a professional group (Bakhtin 1986: 78; italics in original). Is he here referring to an autonomous will that chooses a specific speech genre, or is the choice made always under the tutelage of a social language that includes speech

genre alternatives but no choice about the social language itself on the part of the subject who expresses it? Equally enigmatic with respect to the issue of the relation between subjects and social language, Bakhtin says that dialogised heteroglossia is 'anonymous and social as language' but 'simultaneously concrete and accented as an individual utterance' (Bakhtin 1981: 272). Does the notion of 'individual' here imply subject agency or simply subjective presence?[11]

II. The Virtual-Real and Voices

Bakhtin and Deleuze differ on the status of communication. For Bakhtin, it is the core of language and life; for Deleuze, it is merely an off-shoot of the constellation of voices that comprise the collective assemblage of enunciation. This difference deepens when we consider that Deleuze sees the collective assemblage of enunciation as only one component of a more encompassing structure that he also refers to as an assemblage (*l'agencement*). It is only in light of the assemblage, and more particularly Deleuze's distinction between the 'virtual-real' and the 'actual-real' which is central to it, that it becomes possible to answer the question why does Deleuze claim that 'Being is Voice'.

For Deleuze, assemblages are the basic organisational units of humans and other territorial animals (Deleuze and Guattari 1987: 323, 503). Functioning on both a micro and macro scale simultaneously, assemblages are interrelated with each other and involve subjects and their surroundings as the vehicles of their incessant becoming or variation and metamorphosing. Each of them includes the collective assemblage of enunciation and a 'machinic assemblage of bodies' among its components. Because the collective assemblage of enunciation is 'superlinear', that is, allows for greater variation, Deleuze assigns it and its incorporeal transformations priority over the machine assemblage of bodies.[12] Deleuze refers to the collective assemblage of enunciation as 'expression', that is, semiotic system, and to the machinic assemblage of bodies as 'content', that is, objects in conjunction with the socially organised bodies that perceive them (Deleuze and Guattari 1987: 85–6).

Although it has priority, expression is limited to the degree that the full relation between the collective assemblage of enunciation and the machinic assemblage of bodies is based on the 'abstract machine' and the 'diagram' that Deleuze places at the core of the assemblage proper. He holds that the abstract machine and its diagram 'pilot' the becoming of an assemblage and thus determine the relation between its collective and machinic components.[13] Because of the piloting by the

abstract machine and its diagram, the relation between the collective and machinic components is not reducible to either of the two ways in which the relation between expression and content, language and perception, is usually construed. It is neither one of expression determining content nor of content dictating expression. Rather, the two components are connected by what Deleuze calls 'reciprocal presupposition'. According to this notion, expression and content each have their own open route of variation as initially set for them by the abstract machine and its diagram. But within their lines of variation, each can affect the other: a poem, for example, can produce a variation within content – a new way of seeing or ordering things – and an unexpected sight can occasion a new combination of words. Because of the abstract machine's guiding diagram, expression and content, the collective assemblage of enunciation and the machinic assemblage of bodies, are isomorphic in relation to each other rather than homogenous or unilaterally determined the one by the other (Deleuze and Guattari 1987: 108).[14] Although this is not immediately pertinent, Bakhtin's emphasis upon social language as a 'form' for conceptualising and evaluating one's surroundings implies that he accepts a unilateral relation between expression and content, the former largely determining the latter. However, Bakhtin never states this explicitly.

The relation that Deleuze postulates as holding between expression and content is only the 'horizontal axis' of an assemblage. Deleuze says that a second, 'vertical' axis also operates in each assemblage as an event (Deleuze and Guattari 1987: 88). As an event, the assemblage is 'always already complete as it proceeds and so long as it proceeds' (Deleuze and Guattari 1983: 382). This proceeding, moreover, is the event's continual line of variation or metamorphosing. Deleuze indicates the importance of this mode of variation by calling it 'absolute deterritorialisation.' Indeed, he says that this movement of deterritorialisation is what holds an assemblage together, providing it 'consistency' or solidity, in the very act of taking the assemblage beyond itself and producing new differences, new metamorphoses (Deleuze and Guattari 1987: 336; see also 56, 70, 294, 323, 328–9, 337).[15] He therefore assigns absolute deterritorialisation ontological priority over another force to which it is symbiotically related, namely 'reterritorialisation' (Deleuze and Guattari 1987: 56, 270; see also 174, 303, 337, 368, 415, 473, 496–7). The movement of reterritorialisation limits the degree of deterritorialisation or novelty that can take place with respect to the assemblage. It thereby provides some continuity among the singular metamorphoses that make up an event's becoming and ensures that Deleuze's cosmology does

not repeat the unfettered creativity proclaimed by discredited doctrines of vitalism – it ensures, in other words, that Deleuze can replace the opposing concepts, 'cosmos' and 'chaos', with what he calls, following James Joyce, 'Chaosmos'.[16]

The abstract machine and absolute deterritorialisation operate and advance an assemblage's becoming on what Deleuze calls 'the plane of consistency'. Deleuze refers to this plane and its two operatives as 'virtual-real' in contrast to 'actual-real' (Deleuze and Guattari 1987: 270; see also 270, 267–68, 510, 511;).[17] As is well known, the virtual-real functions as a principle of creativity and metamorphosis; it is the driving-force of the cosmos in Deleuze's philosophy. More specifically, the abstract machine and absolute deterritorialisation are 'anexact', or relatively open forces, that give rise to and are effectuated into the exact or 'actual-real' expressions and contents that appear upon 'the plane of organisation'.[18] Despite the role of the plane of organisation and reterritorialisation – the actual-real – in limiting the assemblage's immediate range of variation, the assemblage will be carried away and transformed once again by the ongoing and Proteus-like activity of absolute deterritorialisation.

This distinction between the actual and virtual dimensions of an assemblage suggests that the voices within the collective assemblage are virtual realities prior to becoming the actual discourses that constitute or interpellate us on the plane of organisation. Thus when Deleuze refers to Being as the 'single and same voice for the whole thousand-voiced multiple', as a 'clamour of voices', he is referring to the constellation of virtual voices or abstract machines – the same forces that, in conjunction with absolute deterritorialisation, produce the continuous variation of actualised voices or order words and interpellated subjects like ourselves, thus constituting society.[19] Deleuze refers to this actualising process as the 'effectuation' brought about by the assemblage's machinic component and says that it, in conjunction with reterritorialisation, transforms absolute deterritorialisation into a more limited 'relative deterritorialising' (Deleuze and Guattari 1987: 56, 508–10). Thus the virtual voices exceed their actual versions and the order words that constitute us as subjects or egos on the plane of organisation.

So why does Deleuze identify Being with voice? Three reasons stand out. First, voice is associated with expression in normal parlance, and Deleuze grants priority to expression over content in the becoming of an assemblage or event. Because this expression is an immanent aspect of a becoming, it requires no one other than itself to speak its piece, that is,

no one to say it of the many events of which it is univocally said. Second, Deleuze emphasises that abstract machines intersect with one another. The idea of intersection makes sense on the level of our experiences with voices: we hear other voices clamouring within our own, as when we unexpectedly sound to ourselves like our parents or some other figure that has become salient in our lives. Unlike the traditional notion of matter, voices can capture the 'clamour of Being', the resounding of all 'vocal' events within each other, their mutual intersecting or 'composed chaos'. And unlike the traditional notion of mind, voices are spatial-temporal beings (in either their virtual or actual forms), rooted in nature, thoroughly immanent. Voices, or abstract machines and their assemblages, therefore surpass and replace the traditional notions of matter and mind. Third, voices are more than the actual discourses associated with them: in their intrinsic reference to each other, the ongoing interplay among them, each of them is an infinite variation of itself. For at least these three reasons, we can see why Deleuze would want to say that 'Being is Voice'.

III. Voices and the Political

When Deleuze assigns priority to absolute deterritoralisation, he means that this priority holds in nature, society, and political life. Moreover, his adherence to the Nietzschean *amor fati* means that we should embrace absolute deterritorialisation as our guiding force in society and politics. But absolute deterritorialisation is no more separate for Deleuze from 'solidarity' (the intersection of all abstract machines, or the 'mechanosphere' – Deleuze and Guattari 1987: 514) and 'difference' or 'heterogeneity' than it is from fecundity or the continual creation of difference. Thus when Deleuze speaks favourably of 'a cosmic people' and 'a cosmic world', we can infer that this means a people who affirm all three of these dimensions of the cosmos, solidarity, heterogeneity, and fecundity. If these people were to speak of their society as 'democratic', it would be fair to assume that they would have in mind not traditional 'procedural democracy' but a more profound form, a way of life that emphasises the achievement of solidarity, heterogeneity, and fecundity, striving to live up to all three without sacrificing one for the other. A leading commentator on Deleuze's political philosophy suggests a similar view:

> *A Thousand Plateaus* ... is a political ontology ... [and] an ethics in the sense that, as for Spinoza, normative commitments are immanent to their

> philosophy of nature as well as their social ontology. In all cases, it presents a world understood as a complex of interconnected assemblages (earth, territory, forms of deterritorialisation and reterritorialisation), where the overriding norm is that of deterritorialisation. By [Deleuze and Guattari's] account, philosophy is utopian in the sense that it opens up the possibility of new forms of individual and collective identity, thereby effecting the absolute deterritorialisation of the present in thought. (Patton 2000: 9)

In this quote, Patton says that 'the overriding norm is that of deterritorialisation'. But one can add that his mention of the 'complex of interconnected assemblages', along with the fact that absolute deterritorialisation is fecund and produces difference or heterogeneity, should have led him to say that all three of these dimensions, the affirmation of each of them, constitutes the full norm of the political for a cosmic people. Such a qualification is important: it prohibits slaughtering others on the basis of any of these three dimensions taken by itself, for example, forced labour in the name of the fecundity that gave us the pyramids or other artistic wonders, or the elimination of differences in the name of a fascistic form of solidarity. Thus when we say that absolute deterritorialisation is the 'overriding norm', we should understand it as including the other two dimensions as well. Unlike traditional ontologies or metaphysics, however, this philosophical support for radical democracy does not base itself on epistemological foundationalism, for example, the Rationalists' innate ideas or the Empiricists' indubitable sense data. Rather, and as Deleuze himself suggests, this philosophy must establish itself by making itself compelling within the *agon* of contesting views. In that setting, it employs logical argument, evocative rhetoric, and all other implements of thought in order to assert itself and counter-effect tired lines of thinking.[20]

Given this view of politics, we can see why Deleuze thinks, contrary to Bakhtin, that communication is at most a secondary development in relation to his version of indirect discourse, that, to repeat it again, indirect discourse has 'nothing to do' with intersubjective communication (Deleuze and Guattari 1987: 78, 85). The voices that make up the virtual realm are primary and give rise to the order words that interpellate the subjects who then communicate with one another. Furthermore, these voices are interrelated, heterogeneous, and intrinsically productive of metamorphosis, thus providing ontological support for the three aspects of radical democracy just enumerated: social solidarity, heterogeneity, and fecundity. In contrast, Bakhtin seems reluctant to commit himself on this ontological level. He complements his notion of hybridisation with the idea of 'dialogised heteroglossia'

(Bakhtin 1981: 272–3). This term refers to the struggle between two socio-linguistic tendencies in society. The first of these, 'monoglossia,' is the tendency for a 'master language' to subordinate all other idioms and practices to itself. The second of the two socio-linguistic tendencies, 'heteroglossia,' counters the first by continually stratifying the master language into a multitude of more particular social languages (Bakhtin 1981: 276). As an example of the conflict between these two tendencies or dialogised heteroglossia, Bakhtin points to how the 'low genres' or speech habits of the disadvantaged socio-economic classes in Renaissance Europe continually opposed the hegemony of the literary and other master languages of the officials and upper classes (Bakhtin 1981: 273).[21]

Superficially, Bakhtin's ideas of heteroglossia and monoglossia are like Deleuze's 'absolute deterritorialisation' and 'reterritorialisation'. But Bakhtin does not unambiguously declare that heteroglossia and monoglossia are tendencies that are inherent, built into, natural and social reality. In reference to monoglossia, for example, he says that 'a unitary language gives expression to forces working toward concrete verbal and ideological unification and centralisation, which develop in vital connection with the processes of sociopolitical and cultural centralisation' (Bakhtin 1981: 271). He does not seem to take the unitary language as itself an endogenous force, for he says that it 'is not something given [*dan*] but is always in essence posited [*zadam*]' (Bakhtin 1981: 271).[22] Are the 'forces' he speaks of linguistic in anything but a contingent sense? Are the forces dependent upon non-linguistic structures and dynamics for their unitary status? And are these forces, whether linguistic or non-linguistic, intrinsic to human social and historical existence, or is the centralisation Bakhtin has in mind itself contingent on the changing desires or wills of the actors involved – the members of some societies or historical periods may prefer centralisation, yet others may reject it or give it at most a secondary role? The same issue seems to be true of heteroglossia for Bakhtin: he links the empirical reality of the 'languages of social groups, "professional" and "generic" languages of generations and so forth' with the 'uninterrupted processes of decentralisation and disunification' (Bakhtin 1981: 272). But he leaves it unclear as to whether these processes are intrinsic to socio-linguistic life or dependent upon the variable wills of individuals or on some other non-linguistic factor.

The question of heteroglossia's contingency is especially important within the context of political life. The tendency towards heteroglossia in society would seem to guarantee that new voices and formerly

marginalised voices can always come to the fore no matter how strong the tendency toward monoglossia might be at any period. But if this tendency is only pervasive and not intrinsic to social life, the many voices at play in indirect discourse could always be overridden by a voice with the power to interpellate subjects exclusively within its own discourse and thereby silence the other voices initially in dialogue with it or resounding within it – could always eliminate the interplay among multiple voices involved in indirect discourse, establishing, for example, a society akin to Orwell's *1984*. In other words, Bakhtin's dialogised heteroglossia and hybridisation build in no guarantee for the actualisation or approximation of the radical democracy described above. The interplay among the voices of the assemblage could all be brought to a screeching, possibly irreversible halt by a voice that has raised itself to the level of an unchallengeable oracle. Heteroglossia could always be trumped by monoglossia. Furthermore, one could no longer appeal to *Amor Fati* and the ontological reality of absolute deterritorialisation as a basis for justifying radical democracy as the proper political philosophy for societies.

In contrast to the ambiguity of Bakhtin's position, Deleuze's idea of virtual voices ontologically establishes the ineluctability of the production of new voices and hence an ineliminable basis for democracy. The intrinsic open texture of these voices and absolute deterritorialisation ensure that heterogeneity and novelty – the becoming of new voices – will always be reasserted even when society is in the throes of oppression. In other words, beneath the level of communication or Bakhtin's dialogised heteroglossia, beneath the merely contingent conflict between heteroglossia and monoglossia, virtual voices and absolute deterritorialisation ensure the accualisation to one degree or another of a virtual democracy that exemplifies the three-fold character of solidarity, diversity, and fecundity.

Does absolute deterritorialisation's support for democracy justify the claim that it has ontological status as an ineliminable feature of reality and society? Deleuze appeals to phenomena in science, art, literature, and other realms in order to indicate that variation underlies and is masked by identities and laws. Moreover, Merleau-Ponty and other phenomenologists argue that we are aware in perceptual experience of the indeterminate – akin to Deleuze's (and Husserl's) 'anexact' – as a 'positive phenomenon' rather than as the merely mistaken or vague presence of things to us. That is, we experience things as calling upon us to provide creatively both them and ourselves with a greater degree of completion or significance in each perceptual event.[23] None of

these considerations provide a final proof for the primacy of absolute deterritorialisation and the virtual. But together, and relative to the agonistic dispute with the other paradigms that operate within our historical epoch, they make a compelling case for this claim.

IV. The Dilemma of a 'Cosmic People'

Deleuze's radical treatment of voice and indirect discourse, its ontological guarantee of a novel form of democracy, comes at a philosophical price – one that paradoxically threatens to undermine our role as political actors and any valorisable meaning the notion of democracy could have for us. The relationship between the Deleuzian idea of virtual voices and democracy leaves us with an unsettling question: could this democracy have anything to do with 'us' as citizens or political actors? Are we left with the dilemma that guaranteeing the future actuality of radical democracy means the elimination or de-humanisation of us? That is, the loss of any sense in which we play an active role in our political destiny? On the plane of consistency and absolute deterritorialisation, Deleuze describes forces so anonymous that they seem to have little to do with us and preclude our role as responsible agents in forming our political trajectory. On the other hand, within the collective assemblage of enunciation, we are merely the interpellation, not the creators or establishers, of the voices whose discourses we enunciate. We can only obey the order words these voices provide for us. Thus Deleuze says,

> The social character of enunciation is intrinsically founded only if one succeeds in demonstrating how enunciation in itself implies *collective assemblages*. It then becomes clear that the statement is individuated, and enunciation subjectified, only to the extent that an impersonal collective assemblage requires it and determines it to be so [...] Indirect discourse is not explained by the distinction between subjects; rather it is the assemblage, as it freely appears in this discourse, that explains all the voices present within a single voice, the glimmer of girls in a monologue by Charlus, the languages in a language, the order-words in a word. (Deleuze and Guattari 1987: 80)

In short, Deleuze's treatment of (free) indirect discourse is so indirect in relation to us that we seem left out of the new world that he prophesises.

This worry increases when Deleuze speaks of 'egos' and 'bodies without organs'. Deleuze usually equates the interpellated or plane of organisation version of ourselves with 'egos' produced by society – in our own time by an axiomatic of capitalism that channels our desire

in a predetermined direction in accordance with what he calls 'control society' (see especially Deleuze and Guattari 1983: 70–3; Deleuze and Guattari 1987: 492; Deleuze 1995). If we are to have a creative role in the trajectory of our lives, it must therefore take place on the plane of consistency and in alignment with abstract machines and the absolute deterritorialisation that pilots the becoming of the assemblage, that is, in relation to virtual voices. But Deleuze says that on this plane '[h]umans are made exclusively of inhumanities' (Deleuze and Guattari 1987: 190).[24] These inhumanities are the anonymous intensities, speeds, and cutting edges of deterritorialisation that are the non-totalised 'parts' of what Deleuze calls the 'body without organs'. The body without organs signifies that as bodies we do not have an intrinsic organisation – that a gestalt-like organism is the result of reterritorialisation and prior neither to the body's non-totalised parts nor the absolute deterritorialisation to which the body without organs is most akin within the assemblage (Deleuze and Guattari 1983: 40–1).[25] This means, then, that when we are not reterritorialised, not congealed egos on the plane of organisation, we are the anonymous forces of the body without organs, a positive state of affairs from Deleuze's point of view. Either way, socially congealed egos or anonymous inhumanities, we are nothing that we recognise as ourselves and most certainly not as beings that can play a responsible role in political democracy or as a member of the 'cosmic people', a role in which we are agents rather than the mere vehicles or conglomeration of anonymous forces.[26]

In short, Deleuze's virtual voices and absolute deterritorialisation has landed us in a dilemma: the ontological basis he provides for a cosmic people and radical democracy makes questionable the agency of we who participate in this cosmic democracy, makes problematic any sense in which it is 'our' democracy. In order to escape this dilemma, we cannot return to Bakhtin. Like Deleuze, he supports the idea that we exist as a fecund interplay of voices, a dialogic or dynamic hybrid, a postmodernist rather than a univocal or modernist identity. But his idea of the agency of this postmodernist subject is, as we have seen, equivocal, and his notion of heteroglossia and monoglossia, his dialogised heteroglossia, does not provide the ontological basis for the political ideal we seek even though it shares Deleuze's spirit of adventure. It has been important to compare Bakhtin and Deleuze: Deleuze refers to him, and discussing the similarilties and differences between their notions of voice has clarified each view. It has also helped in establishing the importance of the ontological status that Deleuze's assigns to absolute deterritorialisation (as well as to solidarity and difference). But, for the reasons just given,

he cannot do anymore to help us with the dilemma at hand. We must therefore try to establish a self that is not entirely a product of interpellation within the assemblage, a self that encompasses and exceeds both the ego and the body without organs instead of being an epiphenomenon or mere residium of anonymous forces. And yet this self cannot be the fully conscious and autonomous sort, cannot fully extricate itself from the voices that interpellate it, for we must admit that we find ourselves continually carried along by flows of social discourse and practices as well as often being the serendipitous authors of new thoughts or forms of living. Our task, then, must be to reveal a sense in which we are a force *within* as well as *of* the other forces that make up us and our milieu. This must be accomplished, furthermore, without retunring to the modernist form of subjectivity or identity that Deleuze eschews.

V. Elliptical Identity

In attempting to settle into the place where we see ourselves as ourselves, we must first note that the very structure of language hems us into having to choose between two equally problematic positions: that we are either an autonomous free will or a mere vehicle of alien forces. Language forces us to speak of ourselves either in the active voice that grants us authorship of our actions, 'I did such and such' or in the passive voice that places us under the absolute tutelage of forces external to ourselves, 'such and such was done to me'. In short, the structure of English, and indeed most languages (there are perhaps exceptions), makes us either absolute agents or absolute patients and leaves no obvious means of finding another role for ourselves between these two alternatives.

We need, then, a way of understanding ourselves that avoids the active-voice, passive-voice alternatives and yet still leaves room for absolute deterritorialisation. In broad outline, we need to be able to say that we are 'elliptically identical' with (rather than reducible to or independent of) the virtual voices and, through them, the becoming of the assemblages in which we find ourselves. We need to be able to say that we, as conscious egos, *are* the virtual voice of an assemblage and yet acknowledge that this voice and absolute deterritorialisation carry us beyond ourselves into the voice's ongoing exchanges with the other voices in its milieu. This voice is therefore more than us at the same time that we are it. Moreover, the elliptical character of our identity with the voice that we would call ours is further accentuated by the other voices that resound within this, our voice: we are also those voices

but with less saliency or audibility than with our present and now most characteristic voice and its particular social discourse. In other words, our identity is hybrid, a fecund interplay among the voices resounding within us, and hence not the univocal identity that Deleuze rejects. The elliptical character of our identity, then, is due both to the dynamism of the dialogue in which we are always engaged, that always throws us ahead of ourselves, and to the rest of the voices that are part of our voice, that is, part of our identity and yet simultaneously our other.

This idea of an elliptical identity can be made more acceptable if we note that language allows us locutions which place us outside the stark alternatives left to us by the active-voice and passive-voice linguistic constructions. More specifically, we can speak of 'giving ourselves over to' or 'becoming more fully' the trajectory established by the virtual voice, or, alternatively, of 'moderating' and 'fettering' this voice that 'is us', or even of 'relinquishing' it and then 'slipping into' another of the virtual, anexact voices which resound within our current primary voice and make up the constellation of voices in our collective assemblage of enunciation. When we speak this way there is no clear boundary between us as the actors and the voices as the actors. Thus this combination of resistances and surrenders, stops and starts, plays an author's role, or at least a co-author's role, in the creative variation of voices, in the variation which we both are and are not, which is us and yet throws us ahead of ourselves into the clamour of society's many voices.

On this view, we might claim that the becoming of what Deleuze calls the human or alloplastic stratum establishes human society as a constellation of the virtual voices with which we are elliptically identical in the way just indicated. We are made up of these forces or voices – we are 'of them' and particularly 'of' the one we find ourselves enunciating most prominently, that is, to the extent that we could hardly imagine ourselves as being otherwise. But we are also a force 'within' these voices – we can 'bear with' the one that we find ourselves enunciating, or we can, usually over time, but sometimes abruptly and traumatically, 'slip into', 'give ourselves over to', one of the others resounding within the one we thought we truly were, for we are 'of' this other voice, and the rest, too. In other words, we play a role in the effectuation of virtual voices – in their expression and actualisation as the constellation of voices that make up the collective assemblage of enunciation and its indirect discourse.[27] We live, therefore, in a social body with both an anonymous and a personal dimension. Moreover, we can adapt Deleuze's terms and say that we are often *almost* the congealed ego he disclaims when we become enshrouded by an 'oracular voice' that

ignores or otherwise excludes the other voices at play within it and the collective assemblage of enunciation. And equally, we are *almost* the body without organs, that is, the loosening up of any hierarchical structure that the voices might have established among themselves – a loosening up that allows for new voices to emerge with greater audibility (new in the sense of having greater saliency than in the past or as a new voice generated from the interplay among the others). I say 'almost' because we are both this ego and body without organs at once and yet, like the abstract machine or the virtual voice(s), encompassing and in excess of both. As such an excess and encompassing self, we are the voices *of* which we are 'made' and *within* which we give over to one as our primary voice or move away from it and into another, perhaps even newly created, voice. It is to this new idiom and the idea of elliptical identity, then, that I claim we must look if we are to accept Deleuze's 'cosmic people, cosmic world' and the tacit promise of the actualisation of the three aspects of a radical democracy, solidarity, heterogeneity and novelty – if we are to do so, that is, without precluding democracy as a politics within which we participate as agents who are at least partly responsible for it.[28]

Notes

1. An earlier and shorter version of this paper was presented at the Ninth Annual Comparative Literature Conference, 'Gilles Deleuze, Image and Text: An International Conference,' 5–7 April 2007. I am grateful for the helpful criticism and encouragement I received during the conference from the participants in the session of which I was a member. I am also indebted to Keith Robinson, Ian Buchanan, and two anonymous referees for comments that led to significant improvements in the original text.
2. Deleuze immediately adds that this relation between Being and beings holds only 'on condition that each . . . voice has reached the state of excess'. The 'state of excess' here refers to a voice as undergoing continual metamorphosis, as always different, as always 'returning' but never as identically the same.
3. Although Guattari is the co-author of this text, I will, for the sake of convenience, use Deleuze's name alone when I refer in the body of my article to works he has co-authored with Guattari. However, the notes and/or reference will provide the full attribution. Deleuze's specific reference is to Voloshinov (1986), but he identifies Bakhtin as the actual author of this book. Deleuze also refers to indirect discourse and Bakhtin in his *Cinema 2: The Time-Image* (1989: 242). Scholars disagree as to whether Bakhtin wrote some of the works that were signed by his friends and fellow Soviet linguists, Voloshinov and Medvedev, presumably in accordance with Bakhtin's wishes during a period in which he (but not the other two authors) was in political disfavor with Stalin's regime. See Clark and Holquist (1984) and Morson and Emerson (1990) for contrasting positions on this issue. The texts signed by Voloshinov are more explicitly Marxist in orientation than those under Bakhtin's own name.

Indeed, Morson and Emerson claim that they are a '*monologization* of Bakhtin's thought' (1990: 118). However, Deleuze is here focusing on indirect discourse, a concept whose immediate or more restricted treatment is largely the same in the books signed by either Voloshinov or Bakhtin. For the differences between Bakhtin and Voloshinov with respect to the larger context of indirect discourse or 'double-voicing' as Bakhtin often refers to it, see Morson and Emerson (1990: 124–5).

4. The examples of reported speech that I give below follow Voloshinov's account (1987: 129, 150–5). Also see Morson and Emerson 1990: 169–70, 325–44, for a lucid account of reported speech in Bakhtin.
5. For brevity's sake I will follow Deleuze's lead and use 'indirect discourse' as if it means the same as 'free indirect discourse' unless otherwise stated.
6. Foucault 1970: xi.
7. See also Deleuze and Guattari 1987: 430: '[I]f there is language, it is fundamentally between those who do not speak the same tongue. Language is made for that, for translation, not for communication.'
8. Deleuze and Guattari say that 'Indirect discourse is the presence of a reported statement within the reporting statement, the presence of an order-word within the word' (1987: 84). In this context, Deleuze and Guattari themselves appeal to Althusser's notion of 'interpellation' (1987: 130), but, while accepting it as a term denoting 'the constitution of social individuals as subjects', they criticize Althusser for linking it to a 'movement of ideology' rather than seeing that it is 'tied' to the much deeper level of 'an assemblage, in other words an organization of power that is already functioning in the economy'. I will continue to use the term 'interpellate' in Deleuze's name, but with the meaning and qualification just specified. Even at the more immediate level of the collective assemblage of enunciation, Deleuze eschews the human subject. Each of the four semiotic systems of signs that Deleuze recognizes in the context of the human or alloplastic stratum determines the identity of the subjects involved and sets the contours of their thinking and thus their actions. In the case of the postsignifying semiotic system, the one closest to modern, including democratic, societies, Deleuze says that 'there is no subject, only collective assemblages of enunciation' and that '[s]ubjectification is simply one such system and designates a formalization of expression or a regime of signs rather than a condition internal to language' (Deleuze and Guattari 1987: 130). This assemblage or 'organization of power' is even prior to ideology, for example, capitalism. Ultimately, absolute deterritorialisation, which holds the assemblage together and takes it to its limit, along with reterritorialisation, which can save this becoming from self-abolition or otherwise place constraints upon it, determine the destiny of subjects such as ourselves (see below).
9. Bakhtin sometimes uses the term 'form-shaping ideology' to capture these three aspects – form, reflexivity, and evaluation – of social languages (Bakhtin 1984: 92–3). Morson and Emerson 1990 elaborate 'form-shaping ideology' effectively in their treatment of Bakhtin's linguistics and culturology.
10. Bakhtin's emphasis on the verbal-laden character of objects qualifies one of the remarks Voloshinov (or Bakhtin) makes in an earlier work about the 'extraverbal context of the utterance.' This context involves the interlocutors' 'spatial purview' of their surroundings and their shared knowledge and evaluation of the latter. Such a shared situation accounts for the possibility of communication among the interlocutors. It is, moreover, an 'enthymemic scenario' in that, like the unexpressed premises of a truncated syllogism, it is an 'assumed' rather an explicitly acknowledged part of the dialogical

exchange (Voloshinov 1987: 98–102). We now see, however, that this dialogical situation is plurivocal: rather than a homogeneous enthymemic scenario, we have a multitude of overlapping ones, that is, voices resounding within one another. In other words, the enthymemic scenario is a Bakhtinian version of the Deleuzian 'collective assemblage of enunciation' that we discussed above. Even if the books signed Voloshinov turn out not to have been authored by Bakhtin, Voloshinov's notion of 'purview' is similar to Bakhtin's later idea of 'apperceptive background' (Bakhtin 1986: 96; Bakhtin 1981: 282). Morson and Emerson say that this background is the 'totality of the dialogues within us' and that it is an analogue to Voloshinov's notion of 'reported speech': because of our apperceptive background, we in effect 'report on,' and receive in the manner provided for by that background, every speech utterance we hear and understand (1990: 204). The notions of spatial purview and apperceptive background are also related to Bakhtin's idea of a 'chronotope', that is, the historically changing time-space framework of literature and, by extension, of our existence (Bakhtin 1981: 84, 243, 250, 252, 258). A separate paper might concentrate on the relation between Bakhtin's idea of chronotope and Deleuze's notion of 'anexact space-time' (Deleuze and Guattari 1987: 407) and its role in the assemblage (*l'agencement*) (see below).

11. Voloshinov (or Bakhtin) says that 'individual consciousness is not the architect of the ideological superstructure, but only a tenant lodging in the social edifice of ideological signs' (Voloshinov 1986: 13). But even if this sentence implies that the subject is merely a vehicle for sign systems, the later writings that I have cited in the above paragraph suggest that Bakhtin fluctuated on this view and so the problem of the status of the subject still remains. Moreover, Voloshinov complicates matters and perhaps reintroduces equivocation of subject agency when he says that 'individual subjectivism is correct in that individual utterances . . . *do have* creative value in language' (1986: 93).
12. For the contrast between the collective and the machinic assemblages, and expression and content, see Deleuze and Guattari 1987: 145; see also 71, 72, 141–3. For 'superlinearity' and the 'priority' of the collective over the machinic assemblage of bodies, of expression over content, see Deleuze and Guattari 1987: 91–143; also 62, 85, 86. Note that along with versatility, superlinearity refers to operations of 'overcoding' and is closely associated with the virtual-real (see below). Deleuze also indicates the priority of expression in his favorable outlook on the primacy that Foucault assigns expression (the 'statement') over content, though ultimately Deleuze sees the 'diagram' in his own work and Foucault's as bringing about and piloting the relation between expression and content. See Deleuze 1988: 61, 67–9, 87.
13. See Deleuze and Guattari 1987: 510–12, and also pp. 141–3, for 'abstract machine' and its 'diagram.' For the latter's 'piloting' role, see p. 142.
14. This story is complicated because Deleuze speaks of a 'machinic assemblage' that, through its 'effectuation' or actualization of the abstract machine, differentiates the collective assemblage of enunciation/expression and the machinic assemblage of bodies/content (Deleuze and Guattari 1987: 145). He says in the same passage that this distinction holds on the 'strata' and hence on what he and Guattari call 'the plane of organization.' But in another passage, he places the two component assemblages on the contrasting plane of consistency (Deleuze and Guattari 1987: 91). In that he always has expression and content on the plane of organization, and they seem almost identical with the two (component) assemblages, I assume that these two components properly belong on that plane as well.

15. Note that because absolute deterritorialisation takes an event beyond itself into new variations or singular events, it is not the same as teleology, at least in the traditional sense of tending toward a single homogeneous or convergent goal.
16. For explicit references to 'chaosmos' by Deleuze and Guattari jointly, see Deleuze and Guattari 1987: 6, 313 and Deleuze and Guattari 1994: 156, 204, 208; by Deleuze singly, Deleuze 1990: xiii, 111, 176, 264; Deleuze 1993: 81, 137; and Deleuze 1994: 57, 123, 199, 219. In Deleuze and Guattari 1987: 313, the authors equate chaosmos with 'rhythm-chaos,' and imply that a milieu would return to chaos without rhythm to link it to other milieu – rhythm, then, is one way of articulating the kind of divergence that preserves communication among the heterogeneous elements of 'composed chaos'.
17. Deleuze and Guattari also refer to the plane of consistency as 'the plane of Nature' (1987: 266), 'the plane of life' (1987: 54), as well as the 'plane of immanence' (1987: 266). In the *Logic of Sense*, Deleuze calls it 'a transcendental field' (because it is what makes actualities possible) (1990: 102, 105).
18. For the idea of 'anexactness' (as opposed to 'exactness' and 'inexactness'), see Deleuze and Guattari 1987: 367, 407–9, 507 and, for the 'plane or organization', 255, 265, 269–70, 335, and 507.
19. This double entry of voice is also indicated in *Logic of Sense* when he speaks of voice as having 'the dimensions of a language without having its conditions' and as 'awaiting the *event* that will make it a language' (1990: 194), that will communicate 'the univocity of being to language' (1990: 248), that, in the later language of *A Thousand Plateaus*, will result in the virtual voices effectuation as the collective assemblage of enunciation.
20. See Deleuze and Guattari 1994: 4, 28–29 for his praise of the *agon* and its relevance to philosophical dialogue.
21. Bakhtin analyses Carnival as well as Rabelais' novels as prominent manifestations of this revolt.
22. Morson and Emerson (1990: 140), make particular note of this quotation. They also hold that although Bakhtin fluctuated on whether polyphony supplanted monologism as an obsolete form of the novel, he ultimately concluded that both forms were to be included in that genre and that they maintain a dialogic relation to one another (301; and see Bakhtin 1984: 271).
23. Merleau-Ponty 1962: 6.
24. In one place in *Difference and Repetition*, Deleuze says that beyond the ego, or rather 'the self and the I,' we find 'not the impersonal but the individual and its factors, individuation and its fields, individuality and its pre-individual singularities' (1994: 258). He equates the 'individual' here with 'intensities' and the 'dissolved Self' (254) but gives no clue as to any sense in which this self is 'not impersonal.' Indeed, in *A Thousand Plateaus* he says that we should 'reduce ourselves to the abstract line… and in this way enter the haecceity and *impersonality* of the creator' (1987: 280; my italics); see also, his *Pure Immanence* (2001: 25).
25. The body without [fixed] organs refers to the malleability of an assemblage's plane of consistency: 'The BwO is opposed not to the organs but to that organization of the organs called the organism' (Deleuze and Guattari 1987: 158; see also 61, 159–161, 171–72, 285). This depiction of the subject also corresponds to what Deleuze and Guattari say in *A Thousand Plateaus* (1987) about the self as BWO: 'You are longitude and latitude, a set of speeds and slownesses between unformed particles, a set of nonsubjectified affects' (262). Or, 'the self is a threshold, a door, a becoming between two multiplicities' (249). Or, '[the plane of consistency is a plane] of non-voluntary transmutation' (269).

In *Anti-Oedipus* (1983), Deleuze and Guattari say that 'The only subject is desire itself on the body without organs' (72).

26. Patton (2000: 84) argues convincingly in attributing to Deleuze a notion of 'critical freedom' that deems a person free 'to the extent that they are able to distance themselves from the structure of values [and desires] with which they grew up and to acquire others'. This type of freedom is a laudable virtue, even if it carries, as Patton points out, the risks of the unknown; but the question I am raising concerns 'who' has that freedom, and can that 'who' be in any way the self with which we identify as an agent in its own destiny? Although I disagree with Hallward, *Out of This World*, in relation to the charge of vitalism (his incorrect claim, at least in relation to *A Thousand Plateaus*, that change, time, and history are in no way mediated by actuality (2006: 162–3), I think he is closer to the mark in criticizing Deleuze's notion of the subject as lacking the power of self-determination (2006: 162–3).
27. In *Difference and Repetition* (1994), Deleuze speaks of the ego as existing at the point where the 'circle' of real objects serving as correlates of 'active syntheses' intersects the circle of virtual objects serving as 'an extension of passive synthesis', that is, the crossing of the figure 8 (100). This might be taken as the ego's elliptical identity with the passive synthesis, except that here the passive is immanent in the sense of taking place before the ego or a subject can become involved in it – the ego may exist at the crossing of the two circles but it plays no agent role there (cf. Lampert (2006): 17). Also, Deleuze and Guattari speak of 'conceptual personae' or thinkers on the plane of immanence who 'counter-effectuate' events, freeing the latter so that they may produce new variations of themselves (Deleuze and Guattari 1994: 69–70; 159–162). These conceptual personae are represented on the 'historical state of affairs of society' by 'psychosocial types'; the two 'refer to each other and combine without ever merging' (70; see also Patton 2000: 28). In other words, conceptual personae and psychosocial types appear, in the plateau of philosophy, to correspond respectively to the circles of passive and active syntheses just mentioned and to the body without organs and the ego spoken of earlier. They therefore suggest the elliptical identity of which I am speaking but still retain the problem, unsolved, of anonymity, of a body with which we cannot identify and an ego that is only a vehicle for other forces. This worry is increased when we note that in *The Logic of Sense* Deleuze links 'counter-actualization' and a 'counter-self' with 'an eternal return which is no longer that of individuals, persons, and worlds, but only of pure events which the instant, displaced over the line, goes on dividing into already past and yet to come' (1990: 175–76).
28. Another way to put my point might be to say that 'elliptical identity' allows us to avoid what some might call 'bourgeois individualism' by affirming the anonymous side of our existence and the idea of a democracy that involves solidarity as well as heterogeneity and fecundity; and to avoid what some might call 'bourgeois romanticism' by affirming both heterogeneity and the degree of agency as persons – 'responsibility' – that we have in the becoming of the events or voices that involve us. I have tried to work out these ideas, including their political ramifications, in greater detail in Evans (forthcoming).

Expression, Immanence and Constructivism: 'Spinozism' and Gilles Deleuze

Thomas Nail University of Oregon

Abstract

This paper is an attempt to explicate the relationship between Spinozist expressionism and philosophical constructivism in Deleuze's work through the concept of immanent causality. Deleuze finds in Spinoza a philosophy of immanent causality used to solve the problem of the relation between substance, attribute and mode as an expression *of* substance. But, when he proceeds to take up this notion of immanent causality found in Spinoza in *Difference and Repetition*, Deleuze instead inverts it into a modal one such that the identity of substance may be said only of the difference of the modes. Complicating this further, Deleuze and Guattari claim in *A Thousand Plateaus* that substance, attribute, and mode are each, themselves, multiplicities. *What is Philosophy?* takes up immanent causality once again, this time through a constructivist lens aimed at resolving the question of the relation between philosophical multiplicities: 'plane,' 'persona,' and 'concept.' By following the different formulations of immanent causality in these works this essay hopes to discover the relationship between Spinozist expressionism and philosophical constructivism in Deleuze's work.

Keywords: expression, immanence, constructivism, Spinoza, Deleuze, philosophy, Badiou

> Spinoza, the infinite becoming-philosopher: he showed, drew up, and thought the 'best' plane of immanence – that is, the purest, the one that does not hand itself over to the transcendent or restore any transcendence, the one that inspires the fewest illusions, bad feelings, and erroneous perceptions. (Deleuze and Guattari 1994: 60)

I. Introduction

Deleuze's notion of Spinozism and his invocation of the concept of immanence have been subjected to considerable critical attention in recent years (Agamben 1999; Hardt and Negri 2000; Smith 2001; Gillespie 2001; Badiou 2004; Beistegui 2005). But this attention makes apparent several ambiguities in Deleuze's thought. In part this is because Deleuze's concept of Spinozism is blatantly not consistent throughout his work. From *Expressionism in Philosophy: Spinoza* to *What is Philosophy?* the concept of immanent causality, far from remaining homogenous, undergoes several modifications that render it much more internally dynamic than it was originally conceived. How are we, for instance, to understand Miguel De Beistegui's claim that immanence is the source of Deleuze's thought when the concept of immanence has been articulated quite differently in each of Deleuze's works (as substantial expression in his Spinoza books, as modal expression in *Difference and Repetition*, and as constructivism in *What is Philosophy?*)? Even Dan Smith's excellent essay on the medieval philosophy of univocal or immanent causality and its relation to Deleuze's thought ends its history early on focusing almost entirely on *Difference and Repetition* and neglecting Deleuze's later Spinozist constructivism. But more importantly how are we to take seriously Alain Badiou's poignant criticisms of Spinoza's 'closed ontology' he claims Deleuze inherits, when such a conceptual inheritance is in such obvious metamorphosis throughout Deleuze's oeuvre? (Badiou 2004: 81).

Badiou claims that Spinozism excludes the 'event' by precluding excess, chance and the subject, and opts unequivocally for a geometrically closed ontology. The 'there is' in Deleuze and Spinoza, Badiou claims, is indexed to a single name: absolutely infinite substance or life. But such a reading neglects the explicit transformations Deleuze's Spinozism makes away from such a single substance vitalism throughout his work. In particular, Deleuze and Guattari's final constructivist formulation of Spinozism bears uncanny resemblance to Badiou's own positive reading of Spinoza. In Badiou's critical reading of Spinoza the intellect is the infinite mode that includes all others in-itself and thus both secures itself as the foundation of a subjective truth procedure and establishes Substance as absolutely infinite. This self-inclusion is an illegal interruption into pure multiplicity that Badiou claims Spinoza does not want to admit, but instead 'naturalizes' as substance. Thus, insofar as the coupling function of the intellect's interruption is 'natural' or 'inevitable' it closes off all future evental interruptions. Deleuze

however, does not require that Spinoza meta-reflectively know his own plane of substance *qua* interruption (for Deleuze a thinker cannot conceptualize their own plane as long as they are on it). Instead, Spinoza's constructivism is to have drawn up 'a plane of immanence' or substance immanent *only* to its own creative interruption (and not to a naturalized transcendent referent). Badiou's argument is further unraveled by Deleuze and Guattari's Spinozist inspired claim in *A Thousand Plateaus* that there are multiple 'planes of substance': not a typical Spinozist kind of claim. Deleuze thus reads Spinoza's monism as 'a' plane of consistency (perhaps called, 'a' consistent truth procedure in Badiou's vocabulary) not a closed ontology or representational count of the count (as in Badiou). Interestingly both Badiou and Deleuze understand Spinoza's constructivism in terms of an undecidable intervention into pure multiplicity via the reciprocal presupposition of intellect/substance/modes, that 'sets up' a certain consistency. Badiou's reservations about closure still remain crucial: the 'always already' effect of substance is the consequence of a subject's intervention, and to the degree that it is not recognized as such risks becoming the totalitarian seal of representation and closure. Deleuze and Badiou both recognise this danger and create new concepts to avoid it. But in order to really assess the relevance and strengths of Badiou's criticisms of Deleuze's Spinozism it is necessary to examine the transformations these concepts undergo throughout Deleuze's oeuvre: something Badiou fails to do. While Badiou and many other scholars have certainly contributed greatly to a better understanding of Deleuze's work, none have attempted to tie Spinoza's expressionism to Deleuze and Guattari's constructivism in a way that would take into account the significant changes that occur to the concept of immanent causality throughout Deleuze's work. Through this neglect, Spinozism and immanence have been rendered inert.

In order to understand the relationship between expressionism and constructivism without assuming the homogeneity of the concept of immanence we must proceed by marking four distinct formulations of this concept in Deleuze's work. While the formulations found in Deleuze's reading of Spinoza's expressionism and Deleuze and Guattari's philosophical constructivism will naturally receive the most attention here, their relationship cannot be understood apart from the two intermediary articulations found in *Difference and Repetition* and *A Thousand Plateaus*.

(1) Deleuze's first formulation of the concept of a Spinozist immanent causality is to be found in his 1968 book *Spinoza et le problème*

de l'expression (translated as *Expressionism in Philosophy: Spinoza* in 1990). Here Deleuze demonstrates that Spinoza utilises the concept of 'expression' to resolve the problem of the relation between substance, attribute and mode. As opposed to eminent or analogical causality, immanent causality or 'expression' posits an equality or reciprocal presupposition of substantial self-causality within attribute and mode, such that God is said of His creatures in the same sense in which the creatures are said of God. This heretical position is what we may call Spinoza's 'substantial expression'.

(2) The second formulation is found in *Difference and Repetition* (also published in 1968). This time however, Deleuze criticizes Spinoza's substance for remaining 'independent of the modes, while the modes are dependant on substance, but as though on something other than themselves' (Deleuze 1994a: 40). *Difference and Repetition* remedies the problem by inverting the substantial relation in a 'general categorical reversal according to which being is said of becoming, identity of that which is different, the one of the multiple' (Deleuze 1994a: 40). 'Substance must itself be said of the modes and only of the modes' (Deleuze 1994a: 40). According to this position Spinozist immanent causality should be understood as a 'modal expression' rather than a 'substantial expression'.

(3) Deleuze's third formulation occurs in *A Thousand Plateaus*, co-authored with Félix Guattari in 1980. Here, instead of insisting merely on the inversion of substance and modal multiplicity, Deleuze and Guattari multiply substance, attribute and mode: making each a multiplicity in their own right. 'Thus each individual is an infinite multiplicity, and the whole of Nature is a multiplicity of perfectly individuated multiplicities' (Deleuze and Guattari 1987: 254). 'A continuum of all substances in intensity and of all intensities in substance... all BwO's pay homage to Spinoza. The BwO is the field of immanence' (Deleuze and Guattari 1987: 154). It is significant that Deleuze describes Spinozist substance in the plural or multiple: as 'substances'.

(4) Deleuze's final formulation of Spinozist immanence occurs in 1992 in *What is Philosophy?* also co-authored with Guattari. Just as Spinoza had used the concept of immanent causality to resolve the problem of causality between substance, attribute and mode, Deleuze and Guattari here employ it in order to resolve the problem of constructive causality within the philosophical milieu: planes of immanence, conceptual personae, and concepts. This time however, following *A Thousand Plateaus*, each term has become a multiplicity

itself. Spinoza's substance becomes one plane among others: he draws out its concepts and personae based on the presupposition of his plane. But Spinoza remains different from the others. He is the 'prince of philosophers', the one who drew up the 'best' plane of immanence because he alone begins by reciprocally presupposing his plane, persona and concepts immediately without deducing them from each other or from some other transcendent source. Each is both distinct yet immanent to the other. This new constructivist position reaffirms a version of Spinozist immanent causality while simultaneously multiplying planes of substance.

II. Spinoza and the Problem of Expression

It is with Spinoza that the problem of expression, originating in medieval philosophy according to Deleuze, is for the first time resolved through the concept of immanent causality. However, it is also with Spinoza that expression becomes most what it is: a problem, a paradox, a vertigo. Spinoza's immanent expression is both one in relation to what expresses itself, and multiple in relation to what is expressed. Causality must move in two directions at once. But how can something which has its being in itself and is not dependant on anything allow itself to be determined by that which is dependent upon it? Spinozist expression, for Deleuze, presents us instead with a triad, a third term linking each pair:

> In it we must distinguish substance, attributes and essence. Substance expresses itself, attributes are expressions, and essence is expressed. The idea of expression remains unintelligible while we see only two of the terms whose relations it presents. Substance and attribute are distinct, but only insofar as each attribute expresses a certain essence. Attribute and essence are distinct but only insofar as every essence is expressed as an essence of substance. (Deleuze 1990: 27)

Substance and attribute are distinct but only insofar as they express the essence of the other. This mutual expression of God and creatures stands opposed to the necessity of a God remaining beyond His creatures and creating them by emanation or analogy.

Spinoza poses the problem of relation between substance and attribute in the first page of the *Ethics*. First, he defines substance as 'what is in itself and is conceived through itself, that is, whose concept does not require the concept of an other thing, from which it must be formed' (1994: I, D3)[1]. Substance is the immanent condition thought gives itself to think itself: it is in itself and conceived through itself – a radical form

of immanent self-reference and positing. 'By attribute' Spinoza says, 'I understand what the intellect perceives of a substance, as constituting its essence' (1994: I, D4). Attributes express the essence of substance as perceived from within the attribute of thought itself: the intellect. The intellect thus perceiving itself from within itself, as an attribute of substance, also expresses an immediate form of self-positing. But what is the relationship between substance and attribute? According to definition six, substance is absolutely infinite and consists in an infinity of attributes, which express the infinite essence of substance. But, as Descartes had reasoned, 'if each of the attributes is really distinct as a separate thing, then for each really distinct attribute there would be a distinct substance whose essence they would express' (Descartes [1637] 2000: 363). How is it then that each attribute does not entail a distinct thing which would then entail yet another substance? And how is it that substance can have an infinity of attributes that are distinct and yet still be indivisible (as substance)? Or as Edwin Curley frames the question, 'How can we remain true to Spinoza's language, which regularly speaks of substance as a complex, in which each of the attributes is an element, without suggesting that substance could somehow be decomposed into its various elements, or that some of these elements might exist apart from the others?' (Curley 1988: 30).

The relation of the attributes to substance has always posed an enormous problem for Spinoza scholarship. Jonathan Bennett, in *A Study of Spinoza's Ethics*, understands the difference between substance and attribute as a difference between two distinct countable things by suggesting that Spinoza has, 'carried this too far by implying that attributes are substances' (Bennett 1984: 64). Bennett can only draw this conclusion if he has understood 'distinct attribute' as a distinct thing, which necessarily entails a relationship to another 'distinct thing', in this case many distinct substances. But this is not the only way one can read Spinoza. Propositions eight, nine, the scholium to proposition 10, and definition six are the most important in relation to the question of substance's essence as expressed through the attributes. It is here that Spinoza must demonstrate the possibility of a substance with infinite attributes that are both distinct and indivisible as constituting the essence of a single substance.

> Although two attributes be conceived as really distinct, that is, one without the help of the other [*unum sine ope alterius*], still we cannot deduce therefrom that they constituted two entities, or two different [*diversas*] substances. For it is in the nature of substance that each of its attributes be

> conceived through itself, since all the attributes it possesses have always been in it simultaneously, and one could not have been produced by another; but each expresses the reality or being of substance. So it is by no means absurd to ascribe more than one attribute to one substance. (1994: I, P10, Scholium)

What does this notion of 'real distinctness' entail that does not make them 'two constituted entities'? There is no temporal or ontological priority of substance or attribute, neither has any existence outside the other, and yet they are still really distinct. Since 'every substance is necessarily infinite', (1994: I, P8) and 'the more reality or being a thing has, the more attributes it has', (1994: I, P9) then of course, 'an absolutely infinite being, that is substance consisting of infinite attributes' (1994: I, D6) must have reality. If there were several substances and one had attributes the other did not have then this other would be finite, which is absurd (1994: I, D6).

But the problem, Bennett suggests, is that the notion of a substance composed of infinitely distinct parts seems to indicate an aggregate of a kind that Spinoza clearly denies (Bennett 1984: 64). Spinoza's says, an 'absolutely infinite substance is indivisible... By "a part of substance" nothing can be understood except a finite substance, which by (1994: I, P8) implies a plain contradiction' (1994: I, P13, Scholium). If one attempts to think only part of being, then this implies that the whole of being is not part of this part as thought, in which case we have only parts and no whole. The difficulty of the Spinozist problem of substance and attributes is similar to the Parmenidian problem of the One and the Many. The difficulty of both lies in beginning from a principle of identity and unity to understand difference rather than showing how this 'identity' or unity emerges or is generated from an immanent differentiation.

In *Expressionism in Philosophy: Spinoza* however, Deleuze claims that Spinoza resolves the problem of substantial relation by employing the concept of immanent causality. As Deleuze shows, since for Spinoza neither substance nor attribute had ever been considered a discreet thing, one produced or deduced from the other, both Curley and Bennett's positions are misguided from the outset. If substance is defined through itself as itself (self-caused) and the attributes perceived through themselves (qua intellect) as themselves the essence of substance, both simultaneously presupposing the other without any relation of direct emanative causality, how then are we to understand this a relation? While it may seem strange to Spinoza scholarship, Deleuze suggests that such a reciprocal expression of essence between substance and attribute

in the opening pages of the Ethics constitutes the rare and unique philosophical position of immanent or expressive causality. Instead of deducing substance as a discreet object of common sense and attempting to further deduce its attributes of thought and extension as aggregates or parts of this thing, Spinoza proceeds in a wholly different manner. His method relies not only on a mutual self-positing but on a distinction of two kinds taken from Descartes (according to Deleuze) and turned against him: numerical and real.

Deleuze thus recounts Spinoza's argument in the scholium to proposition eight in the following way to account for a single univocal substance with an infinity of attributes:

1) Numerical distinction requires an external cause to which it may be referred; 2) But a substance cannot be referred to an external cause, because of the contradiction implied in such a use of causal principles; 3) So two or more substances cannot be distinguished in numero, and there cannot be two substances with the same attribute (Deleuze 1990: 27). Thus if Numerical distinction is never real [or qualitative]; then conversely, real distinction is never numerical. Spinoza's argument now becomes: attributes are really distinct; but real distinction is never numerical; so there is only one substance for all attributes (Deleuze 1990: 27).

Thus to answer the question of how substance can be both composed of an infinity of attributes and also be indivisible, we must think the attributes as indivisible qualities, in the sense that they cannot be numerically distinguished or counted; rather, they are infinite, in the sense that they express truly distinct essences. Deleuze claims, 'There is one substance per attribute from the viewpoint of quality, but one single substance for all attributes from the viewpoint of quantity' (Deleuze 1990: 31). Substance is self-caused and thus cannot be numerically divided. One way to think of this is as a figure-ground gestalt. In the case of a single image in which both a young woman and old woman can be seen in the same drawn lines, there is one image composed of two simultaneous and yet distinct images. The old and young woman's images exist as distinct attributes but not as different countable 'things' separate from a single image, which is both. Under each image, young woman or old woman, the picture is given in its full being, yet they are distinct in some sense. Are there two images or one in the gestalt? The 'same sense' of expression is the sense in which old woman and young woman are the same images: two attributes of the same substance.

What then is the relation between substance, attribute and mode? Spinoza sets out his description of modal production by saying that, 'in

the same sense that God is said to be self-caused he must also be the cause of all things' (1994: I, P25, Scholium). Just as substance and attribute had been said in the same sense of their reciprocal presupposition, so substance, as cause of itself, is said in the same sense as it is the cause of the modes. The causal relation between 'substance as self-caused' and 'substance as cause of the modes' is the same immanent causality in which all three, substance, attribute and mode are simultaneously and distinctly presupposed, or mutually 'self-caused' qua the expression of the essence of substance. Not only does substance produce while remaining in itself (as cause of itself) but its affections (modes) are said in the same sense as this causality: that is, immanently self-caused. Substance is at once distinct from the modes as their cause and yet immanent to them in their mutual self-positing (as they express its essence). Opposed to this, emanation and equivocity (two different 'things') entail that substance must be caused in a different sense then it is the cause of its modes. In this way substance places itself beyond its effects.

Much of Spinoza scholarship, however, continues to disagree with Spinoza's account of the relationship between substance to its modes. Curley, in *Behind the Geometrical Method*, says that, 'If we can form no clear concept of substance in abstraction from its attributes, then there will be nothing interesting to say about the relation between substance so conceived and its modes' (Curley 1988: 38). Again the problem seems to be the way in which the difference between substance, attribute, and mode is configured as either a strict identification or a strict separation. With a strict identification between substance and mode there would be no differentiation and hence no production in a completely closed and absolute system; on the other hand a strict separation (the 'clear concept' Curley is calling for) would make their causal relation impossible.

But why does substantial expression entail modal existence? Spinoza provides two arguments: the argument from understanding and the argument from power. 'God acts with the same necessity by which He understands himself, that is, just as it follows from the necessity of the divine nature that God understands himself, with the same necessity it follows that God does infinitely many things in infinitely many modes' (1994: II, P3, Scholium). God must produce as He understands; if there were something God did not produce but understood He would be finite, and this would be absurd. So if God understands an infinity of things, then as He understands He produces that infinity. Thus all modes are expressive of God's understanding, and He is the cause of Himself in the same sense in which He is cause of the modes. Spinoza's second

argument, the argument from power, is that, 'God, or Nature, acts from the same necessity from which he exists' (1994: IV preface). The more power a thing has, the more it can be affected in a greater number of ways. And if God by necessity has an infinite power of existing, then God is affected in an infinite number of ways. In the same sense in which God is the cause of Himself, so the attributes produce an existing modal infinity.

The movement of expression is thus complete: substance is essentially expressed in the attributes, which also express the essence of substance in the same sense as they were expressed (as immanently self-posited). The attributes then re-express themselves in the modes in the same sense as substance expressed the essence of the attributes. The modes then express the essence of the attributes in the same sense in which the attributes express them (as immanent modifications). Substance then can be said to express itself in the modes in the same sense in which the modes express substances' self-causality. In each moment there is a double expression or mutual presupposition wherein each requires the other. Rather than beginning with three separate elements (substance, attribute, and mode) and attempting to deduce or produce them in terms of emanation, Spinoza instead begins with their expressive simultaneity (essence) and demonstrates their immanent causality or 'unity' of expression qua substantial self-cause.

III. Modal Expression in *Difference and Repetition*

Deleuze's second formulation of Spinozist immanent causality, presented here, is found in *Difference and Repetition*. While Deleuze's monograph on Spinoza describes in great detail the way in which Spinoza employs a theory of immanent causality to solve the problem of relation between substance, attribute and mode, in *Difference and Repetition* Deleuze expresses reservations regarding this formulation. Substance is not said of the modes in as equal a way as the modes are said of substance. Spinoza's theory of immanent causality thus remains ultimately too substantial: the identity of substance in Spinoza comes prior to modal difference.

Spinoza's immanent causality is based on the mutual presupposition of both substance and mode in the same sense: expression. This same sense, however, remains a substantial one. Modes are modifications of substance. Thus, according to Deleuze there remains in this first formulation of Spinozism a vestige of the superiority and independence of substance in relation to the modes his own critique rejected. Spinoza

is not a thinker of emanation, but in *Difference and Repetition* Deleuze argues that Spinoza has not thought radically enough the constructive power of difference in the finite modes that produced his substance. In Spinoza, modal difference remains dependent upon a strictly substantial expressionism. Deleuze says,

> Nevertheless, there still remains a difference between substance and the modes: Spinoza's substance appears independent of the modes, while the modes are dependant on substance, but as though on something other than themselves. Substance must itself be said *of* the modes and only *of* the modes. Such a condition can be satisfied only at the price of a more general categorical reversal according to which being is said of becoming, identity of that which is different, the one of the multiple. (Deleuze 1994a: 40)

Deleuze's inversion of Spinoza is to make Spinoza's modal multiplicity the creative and productive composer of substance: to make substance said of modes. Or, as Dan Smith has suggested, we can consider *Difference and Repetition*'s 'inversion' a 'Spinozism minus substance, a purely modal or differential universe' (Smith 2001: 175). This, of course, forms part of the more general project in *Difference and Repetition* of making identity said of difference: or what Deleuze calls 'repetition' (Deleuze 1994a: 41). In this sense the identity of Spinozist substance becomes a 'secondary power' whose identity is only the return or differential repetition of 'the different' itself: modal multiplicity (Deleuze 1994a: 41). Understanding this criticism of Spinoza is key to understanding *Difference and Repetition*, but also to understanding the significance of the further modifications made to the concept of Spinozist immanent causality in Deleuze's work.

The reversal is philosophically transformative. 'All Spinozism had to do for the univocal [substance] to become an object of pure affirmation was to make substance turn around the modes – in other words, to realise univocity in the form of repetition in the eternal return' (Deleuze 1994a: 304). A single and same univocal substance for the thousand voiced multiple. The concept of difference in-itself is based on the inverted immanent causality of Spinoza: a modal, differential creative multiplicity.

IV. Immanent Causality in *A Thousand Plateaus*

Twenty-two years later with the 1980 publication of *A Thousand Plateaus*, Deleuze's account of Spinozist immanent causality changes once again. Rather than the substantial expression of *Expressionism*

in Philosophy: Spinoza, which made the modes said of substance, or the modal expression of *Difference and Repetition*, which made 'substance said of the modes' as 'identity is said of difference in itself,' *A Thousand Plateaus* makes all three: substances, attributes, and modes each multiplicities. This time Spinozist substance is identified in the plural form, as substances. Just as Spinoza had used the concept of immanent causality to resolve the relation between substance, attribute and mode, and Deleuze had used it in *Difference and Repetition* to resolve the relation between identity, difference and repetition so Deleuze and Guattari employ a similar version of immanent causality to resolve the problem between the 'body without organs' and the 'intensities' that pass across it.

> There is a continuum of all of the attributes or genuses of intensity under a single substance, and a continuum of the intensities of a certain genus under a single type or attribute. A continuum of all substances in intensity and of all intensities of substance. The uninterrupted continuum of the BwO, immanence, immanent limit. Drug users, masochists, schizophrenics, lovers—all BwO's pay homage to Spinoza. The BwO is the field of immanence of desire. (Deleuze and Guattari 1987: 154)

There is a 'formal multiplicity of substantial attributes' that compose the quantitative unity of a single substance. Their reciprocal presupposition or 'immanent continuum' is said to constitute a vital homage to Spinoza. But what is confusing about these passages is that the quantitative unity of a single substance, which had been previously defined in Deleuze's Spinoza book as 'numerical distinction' has become multiple. Numerical distinction meant that substance was one in terms of quantity yet multiple in terms of quality or its attributes. The claim that there could be a multiplicity of substances would seem absurd to Spinoza. Substance does not require the concept of another thing for its formation (1994: I, D3). Likewise, in both *Expressionism in Philosophy: Spinoza* and *Difference and Repetition* Deleuze never dared to utter such an absurdity. How are we to understand the significance of this new formulation of Spinozist immanent causality?

Since Deleuze and Guattari do not announce their new formulation of Spinoza as explicitly as Deleuze had in *Difference and Repetition* a reconstruction is required. While it seems clear that Deleuze and Guattari do not abandon the thesis of *Difference and Repetition* entirely when they say, 'what we are talking about is not the unity of substance but the infinity of the modifications that are part of one another on

this unique plane of life' (Deleuze and Guattari 1987: 254), they have also more completely drawn out the implications of the concept of immanent causality qua multiplicity. Numerical and real distinction now become two kinds of multiplicity: qualitative and quantitative. If substance is said only of the multiplicity of the modes, it certainly seems to follow that substances too would become multiplicities composing and composed of other multiplicities. 'Each individual', they say, 'is an infinite multiplicity, and the whole of Nature is a multiplicity of perfectly individuated multiplicities' (Deleuze and Guattari 1987: 254). True to their claim that 'all they talk about are multiplicities' (Deleuze and Guattari 1987: 4), substance, attribute and mode have all become immanent to one another as multiplicities composed of other multiplicities: modal, attributive, and substantial multiplicities.

But the immanent ontology of multiplicities in *A Thousand Plateaus* also comes with a new dilemma. Given such a pure multiplicity of immanence, how is any particular multiplicity or arrangement of multiplicities (*agencement*) composed or constructed? What are the particular conditions, elements and agencies that make it work? What kinds of dangers and thresholds does it have? Not only does *A Thousand Plateaus* radically multiply substance, attribute and mode in a new way that diverges from previous 'Spinozisms', but it also reorients the entire task of thinking their relation toward a more general logic and politics of their arrangement (assemblage). While *Difference and Repetition* attempts the difficult task of 'raising the cry of the multiple',[2] *A Thousand Plateaus* begins a more sober and political constructivism. 'In truth', Deleuze and Guattari say, 'it is not enough to say, "Long live the multiple." Difficult as it is to raise that cry... The multiple must be made' (Deleuze and Guattari 1987: 13). This is accompanied by a more general move from the logic of the 'is' to the logic of the 'and' or what they call, 'the overthrow of ontology'.[3] In an interview given after the publication of *A Thousand Plateaus* Deleuze described the central theme of his and Guattari's current work as follows: 'The analysis of assemblages, broken down into their component parts, opens up the way to a general logic: Guattari and I have only begun, and completing this logic will undoubtedly occupy us in the future' (Deleuze 2006: 177).

Consistent with this expression of a commitment to a constructivist logic Deleuze and Guattari's final book together, *What is Philosophy?* takes up immanent causality one last time to resolve the relation between the philosophical components of this constructivism.

V. Immanent Causality in Deleuze and Guattari's Philosophical Constructivism

Twelve years after the publication of *A Thousand Plateaus*, Deleuze and Guattari, take up the concept of Spinozist immanent causality once more. This time, however, they employ it as an element of a philosophical constructivism in order to resolve the relation between philosophical components: plane of immanence, conceptual personae, and concepts. Just as Spinoza had used this concept to resolve the problem of the relation between substance, attribute and mode, so Deleuze and Guattari use it to resolve the problem of the relation between the plane of immanence, conceptual personae, and the concepts. But instead of a 'substantial' or 'modal' expressionism, the philosophical constructivism of *What is Philosophy?* continues the changes begun in *A Thousand Plateaus* toward a more immanent and developed constructivist logic. While *A Thousand Plateaus* undertook to develop a general logic of assemblages in almost every milieu (from geology to music) it left out one very important domain: philosophy itself. *What is Philosophy?* attempts the final and most developed account of a constructivist logic by drawing on one of the oldest and most important concepts in Deleuze's work: Spinozist immanent causality.

The problem of *What is Philosophy?* is how to think the creative practice of philosophy. How is it that so many philosophical systems succeed each other in history? In relation to what do they create their concepts and map out the conceptual personae that populate these conceptual worlds? What are the elements of philosophical practice and how do they function in relation to each other? Against definitions of philosophy as reflection, contemplation or communication, Deleuze and Guattari define philosophical practice as constructivism, that is, as 'the creation of concepts'. Philosophical practice, they claim, is composed of three distinct elements each considered for themselves, that is, unconditioned by any source external to their own:

> Philosophy presents three elements, each of which fits with the other two but must be considered for itself: the pre-philosophical plane it must lay out [tracer](immanence), the persona or personae [les personages pro-philosophiques] it must invent and bring to life (insistence), and the philosophical concepts it must create (consistency). (Deleuze and Guattari 1994b: 74)

(1) In order for philosophy to occur, thought must situate itself in relation to some basic condition, which allows for thought to occur.

But how can thought set a condition for itself if the condition is necessary for thought's creation of the condition? This problem, according to Deleuze and Guattari, entails a paradoxical self-positing of both thought and its condition at once. They define this positing as a 'presupposition' or 'plane of immanence' that philosophy poses for itself. It gives itself its own 'image of thought'. For example, 'In Descartes it is a matter of a subjective understanding implicitly presupposed by the 'I think' as first concept; in Plato it is the virtual image of an already-thought that doubles every actual concept' (Deleuze and Guattari 1994b: 40). In Spinoza it is his 'plane of substance' (Deleuze 1990: 11). A philosophical 'plane of immanence' like Spinoza's substance is laid out immediately and defined through that which it is the condition for, 'what is in itself and is conceived through itself', as Spinoza says. 'Concepts', Deleuze and Guattari say, 'are like multiple waves, rising and falling, but the plane of immanence is the single wave that rolls them up and unrolls them' (Deleuze and Guattari 1994b: 36). As such, the plane is thought everywhere in thinking but does not appear as a specific concept within thought. It is thought's immanent condition for itself.

(2) But philosophy also requires a way to connect the concepts it creates to the philosophical plane that is its condition or presupposition. Deleuze and Guattari call these 'conceptual personae'. Considered in themselves, they act as operators or connectors between the plane of immanence and its concepts. 'Concepts are not deduced from the plane. The conceptual persona is needed to relate concepts on the plane, just as the plane itself needs to be laid out. But these two operations do not merge in the persona, which itself appears as a distinct operator' (Deleuze and Guattari 1994b: 76). There are many examples of personae in the history of philosophy: the Idiot, the one who wants to think on his own and can take on another meaning; the Madman, who discovers in thought the inability to think; or, the Friend who has a relationship with another but only through the thing loved, potentially producing the Rival. Socrates is the conceptual persona of Platonism. The Intellect is a conceptual persona of Spinozism. The infinite intellect is defined as a mode of the attribute of thought which has an idea of infinite substance. The paradox of the intellect in Spinoza though is that it must presuppose itself as infinite in order to prove an infinite substance, yet infinite substance must be presupposed for there to be an intellect having an infinite power to discern an infinite substance. Thus the conceptual persona of the intellect must perform an immanent connection between mode and substance through the attribute of thought: all three presupposed simultaneously.

(3) Most importantly, philosophy is defined by its creation of concepts. Philosophical concepts, Deleuze and Guattari say, 'populate' the plane bit by bit, constituting its 'skeletal frame or spinal column' (Deleuze and Guattari 1994b: 36). While the plane is 'the breath' that suffuses them. Concepts have components as well. For example, Descartes' 'cogito' is a concept. It has three components: doubting, thinking and being. 'Myself who doubts, I think, I am, I am a thinking thing' (Deleuze and Guattari 1994b: 31). The concept of the cogito holds together three heterogeneous elements (doubting, thinking, being) which condense to form the 'I'. Given Descartes' presupposition of subjective understanding, the cogito and its components form the basic elements or working parts of this understanding: doubting, thinking, being. The modes are concepts in Spinoza's philosophy. Just as each modal body in Spinoza composes and is composed by at least one other modal body, so each concept in philosophy has components that define the endo- and exo-consistency of a conceptual body.

But the problem of philosophical constructivism is thus: How is it that a single plane of immanence or presupposition can be one in relation to what is expressed and yet multiple in relation to what expresses it (personae and concepts)? If each of the personae are really distinct as separate things, then why doesn't each really distinct personae entail a distinctly different philosophical plane of immanence or presupposition? If philosophical concepts are distinct elements why can't they be composed separately from their plane of immanence? If philosophy is the creation of concepts, and these concepts form its 'working parts', why is the plane of immanence not just another concept like the others? Torn between the absolute identity and absolute separation of these elements, Deleuze and Guattari face similar problems to those of Spinoza in the *Ethics*. However, just as treating each of these elements as discreet numerical things has misled Spinoza scholarship throughout the ages, so we should not be so misguided here.

Just as Spinoza had begun the *Ethics* with the rapid un-deduced definition of substance as 'what is in itself and is conceived through itself' (1994: I, D3), a self-caused thing, so Deleuze and Guattari tell us that philosophical concept creation 'has no reference; it is self-referential; it posits itself and its object at the same time as it is created' (Deleuze and Guattari 1987: 22). Just as in Deleuze's Spinozism neither substance, attribute, or mode are ever deduced or induced from one another in any relation of eminent causality, so Deleuze and Guattari say that, 'Since none of these elements are deduced from the others [plane, personae, concepts], there must be a coadaptation of the three. The philosophical

faculty of coadaptation, which also regulates the creation of concepts,' they say, 'is called taste' (Deleuze and Guattari 1994b: 77). Not only is the plane of immanence a presupposition considered for itself, its very presupposition also presupposes the conceptual personae and concepts required to connect it up and maintain it (Deleuze and Guattari 1994b: 78).

Spinoza displays a similar 'taste' in the concept of expression. Within the first page of the *Ethics* Spinoza simultaneously presupposes the immanence (self-causality) of substance, attribute, and mode connected together, in the same sense, through 'expression'. That is, substance, attribute and mode form a reciprocal presupposition required for each other's being in an immanent expressionism. Similarly for Deleuze and Guattari, 'the plane of immanence and the conceptual personae presuppose each other' (Deleuze and Guattari 1994b: 75). Deleuze and Guattari's usage of the concept of 'reciprocal presupposition' and philosophical 'taste' thus follow Spinoza's own usage of expressionism or immanent causality in the first book of the *Ethics*.

It is important however, not to confuse philosophical taste with rational pragmatism. 'It is certainly not for 'rational or reasonable' reasons that a particular concept is created or a particular component chosen' (Deleuze and Guattari 1994b: 78). In fact, it is not a matter of a 'willed choosing' at all. Philosophy does not rationally consider, debate, judge or reason which concepts are best to solve whichever problem it would like. Philosophy may be a constructivism, but this does not mean that it may be employed by any means whatever. Constructivism renders incoherent all forms of directed intentionality which would pre-exist its concepts. What meaning can rational utility have if problem and solution are given at the same time? Unconditioned by any external reason or transcendent cause, their coadaptation is rather one of taste.[4]

Philosophical 'taste' and 'reciprocal presupposition' bring us back to the exemplary case of Spinozist immanent causality. Just as Spinoza had used a qualitative difference to reconcile the unity/multiplicity of substantial expression, in *What is Philosophy?* Deleuze and Guattari use a qualitative distinction to reconcile the unity/multiplicity of philosophical creation. 'Constructivism has two qualitatively different complementary aspects: the creation of concepts and the laying out of a plane' (Deleuze and Guattari 1994b: 36). Rather than considering each constructivist element as a distinct quantitative thing, Deleuze and Guattari posit each for-themselves as qualitatively distinct. But considering a plane of immanence as qualitatively multiple and not a quantitative unity does something different than Spinoza. In *What*

is Philosophy? Deleuze and Guattari claim that there are, in fact, a multiplicity of planes of immanence (something which Spinoza would never have claimed). There is a different plane of immanence for each thinker succeeding and merging with each other in history, each with their own immanent logic and construction of the plane (Deleuze and Guattari 1994b: 39).

Despite the modifications that Deleuze and Guattari's philosophical constructivism makes to the Spinozist notion of immanent causality, there remains something 'princely' in Spinoza's thought. For Spinoza, Deleuze and Guattari write, 'immanence does not refer back to the Spinozist substance and modes but, on the contrary, the Spinozist concepts of substance and modes refer back to the plane of immanence as their presupposition' (Deleuze and Guattari 1994b: 148). It is not as if immanence refers primarily to substance or mode. Substance and mode (in Spinoza) refer only to their own immanent reciprocal presupposition. Spinoza never looks to illusory transcendent sources to deduce his concepts. It is by weeding them out that he (immanently) fulfills the conditions of philosophical constructivism: hence he is the prince of philosophy (Deleuze and Guattari 1994b: 48). This final constructivist formulation redeems Spinoza not for his substance or mode at all, but for the immanence of his philosophical constructivism.

Review Essay

The Full Body: Micro-Politics and Macro-Entities

Jason Read

DeLanda, Manuel (2006) *A New Philosophy of Society: Assemblage Theory and Social Complexity*, London: Continuum, Pb, 142pp.

Of the many areas of research and philosophical problems opened up by Deleuze (and Guattari's) writing, one of the most crucial has to do with the nature of society itself; that is, the question of a social ontology, or the fundamental question of what it means to say something like 'society' exists, and how this relates to other entities such as individuals, institutions, markets and states. In general the question 'what is society?' has been poorly posed, and badly answered. The dominant answers to this question either posit the individual as an irreducible building block of society, constructing the social from a sum total of individual actions and decisions, as in the methodological individualism of economics; or, society is grasped first as more than the sum of its parts, as a totality, from which the individuals are deduced, as in functionalist or organic conceptions of society. Thus the question 'what is society?' leads to a dichotomy between the individual or society, a micro-reductionism or a macro-reductionism. This dichotomy is also an impasse, framed in such a way it is impossible to go from the individual to society or vice versa, the individual precludes any account of society as anything other than the sum effect of individual actions and society excludes any concept of the individual other than an effect of society.

These two concepts, the individual and society, were central targets of what has been broadly defined as post-structuralism, as well as the work of Gilles Deleuze and Félix Guattari in particular. Deleuze and Guattari are perhaps unique in this loosely defined trend of critical authors in that they did not simply engage in a critical destruction of concepts of the individual or of society, but also constructed their

own vocabulary and ontology to address social relations, rethinking society as made up of abstract machines, assemblages, strata, full bodies, and desiring machines: a vocabulary that has as its specific goal an attempt to avoid the pitfalls of holism and individualism. Deleuze and Guattari rethink the individual as the basic building block of society, revealing the micropolitics of desire and power that underlie it, while at the same time critically rethinking the totality, as itself an integral element of power relations, as a full body. It is perhaps for this reason that there has been a great deal of interest in Deleuze and Guattari's social ontology. In the case of such philosophers as Maurizio Lazzarato, Paolo Virno, Alberto Toscano, Michael Hardt, and Antonio Negri this interest has taken the form of a reengagement with the trajectory of minor thought that informs Deleuze (and Guattari's) social ontology. There has thus been a parallel revival of interest in Gilbert Simondon's account of transindividuality, Gabriel Tarde's understanding of a micro-sociology of imitation, and Spinoza's concept of the multitude, all of which propose an understanding of the relationship between the individual and society that is irreducible to holism or individualism. Manuel DeLanda's *A New Philosophy of Society*: *Assemblage Theory and Social Complexity* takes a fundamentally different direction; rather than return to the sources of Deleuze (and Guattari's) social ontology, DeLanda focuses on the central concept of assemblage, expanding it to encompass a general redefinition of society that encompasses the work of Fernand Braudel and Max Weber. As such DeLanda's recent work, like such books as *A Thousand Years of Non-Linear History* offer not so much an interpretation of Deleuze as an application to the central problems of social ontology.

The term 'assemblage' [agencement] primarily appears in *A Thousand Plateaus* and thus represents a later stage of Deleuze's thought, although arguably it is the culmination of a tendency towards a constructivist or constituent ontology that runs throughout Deleuze's thought. According to DeLanda, at its most fundamental level an assemblage is defined as multiplicity of heterogeneous elements, the only unity of which is defined by a particular and specific co-functioning (Deleuze and Parnet 2002: 69). As such it is defined by two dimensions, the first defines the role different components play, material or expressive, bodies or statements, each defined by specific relations of causality; while the second is distinguished by whether or not the components, or relations, contribute to the stability of the given assemblage (territorialisation) or lead to its loss of identity (deterritorialisation). The consistency of any given assemblage is defined by its relations, and not any intrinsic

characteristics; an assemblage exists as a singular, historically produced, intersection of relations. DeLanda stresses that an assemblage is first and foremost characterised by what he calls 'relations of exteriority'; the elements of an assemblage are situated, but not determined by their place within the assemblage. This differs from any functionalist or organic conception of a totality in which the parts, or elements, are entirely defined by their place within a totality (DeLanda 2006: 10). The elements of an assemblage can be inserted into a new assemblage, creating new relations, which have different effects. This does not assert the primacy of the individual over the relation, but merely underscores that the quality of different elements emerge or are transformed by the different relations that they enter into. Elements are not individuals whose qualities are given in advance, but capacities the properties of which emerge in different relations. As Deleuze stresses, following Spinoza, things are defined by their capacity to affect and be affected, and these capacities emerge in the course of the new relationships that engage them (Deleuze and Guattari 1987: 257). Defined in such a way the concept of an assemblage is poised on a veritable tightrope between the pitfalls of totality and individualism.

The critical angle of DeLanda's utilisation of this concept is oriented much more towards the functionalist, or holistic, side of the impasse than the individualistic side of the problem. This is in part an effect of the specific context of DeLanda's writing. Due to the influence of Marxism on radical politics and social theory the concept of totality has maintained a greater purchase than the concept of the individual. Although it should be noted that this is only true of a context defined by a specific political (left), disciplinary (philosophy, critical theory, and sociology), and regional orientation (European or continental in influence); in other contexts, such as economics, it is the individual and not the totality that reigns supreme, to the point where there are even (analytic) Marxists committed to the idea of 'methodological individualism'. This political background and polemical focus of DeLanda's argument against the idea of totality is given greater clarity in his contribution to the recently published collection, *Deleuze and the Political* edited by Ian Buchanan and Nicholas Thoburn, 'Deleuze, Materialism and Politics' (2008). As DeLanda writes, underscoring the persistence of totalising concepts in the social and physical sciences, 'Unfortunately, Deleuze himself tends to fall into this trap, moving too fast to the macro-level with concepts like 'the socius' or 'the social field' (DeLanda 2008: 166). As DeLanda argues, this persistence of totalising concepts in Deleuze's writing is due his inability to completely

have done with Marx. In DeLanda's terms, it is his Oedipus, the father he has not killed.

In response to this tendency, DeLanda makes the focus of his project an attempt to either dispense with such totalities as 'the state' or 'capitalism' altogether, or to at least radically reconfigure our understanding of them such that we grasp them as nothing other than the more or less transient intersections of specific and local processes. In doing so, DeLanda follows the spirit of Deleuze's famous assertion regarding the nature of abstraction, 'the abstract does not explain, but must itself be explained' (Deleuze and Parnet 2002: vii). Rather than posit something like capital, or the state, behind every transformation of society, every manifestation of power, DeLanda endeavours to show how these entities emerge form a particular series of assemblages and relations. As he writes, 'Avoiding the use of concepts like "the state" is important [. . .] because such reified generalities are not monolithic, that is, they fail to capture the relations of exteriority that exist among the heterogeneous organisations forming a government hierarchy' (DeLanda 2006: 85). DeLanda's method on this point is similar to Foucault's, specifically his methodological argument that 'universals' such as the market and the state do not exist, or at least must be treated as they do not exist in order to grasp the concrete processes of power that structure political life and in effect give rise to such entities (Foucault 2004: 5). DeLanda's specific point of reference, though, is Fernand Braudel, for whom such entities as the 'market' and the 'state' have to be understood in primarily relative terms, as a 'set of sets' with complex intersections in which each institution, market, state, etc., has its relative autonomy and effectivity (DeLanda 2006: 118). There is not one split between the individual and society, the 'micro' and the 'macro', rather such distinctions are relative as various assemblages are 'macro' in relation to some, but 'micro' in relation to others (DeLanda 2006: 17). A local market or city organisation is 'macro' in relation to the individuals that make it up, but 'micro' in comparison to larger government structures, for which it functions as an element. This is true even of individuals, which must be seen as composed of sub-personal components (e.g., percepts, affects, and habits), while simultaneously being situated in larger assemblages (e.g., communities, networks, markets, and states) (DeLanda 2006: 33). DeLanda is not primarily concerned with determining the actual nature of these sub-personal elements, rather his goal is to relativise the micro macro distinction and replace the singular rift between the individual and

society with a series of interlinking assemblages of various scales, from those that constitute the individual to global networks.

While DeLanda's use of Braudel finds resonances with the Deleuze and Guattari's understanding of assemblages, there is perhaps greater tension in his use of Max Weber's concepts. DeLanda draws on Weber's distinction between the different levels of authority structures: traditional, in which authority is vested in time honoured practices; bureaucratic, in which impersonal rules and structures are dominant; and charismatic, in which the force of an individual's personality holds sway (DeLanda 2006: 69). DeLanda stresses that these ideal types are mixed in reality, as communities, states, and corporations employ various types of authority. However, despite this there is a tendency to map the various types of authority onto the different sizes of institutions, with small organisations dominated by charismatic authority, and so on. This focus on a graduated conception of size, situating communities, states, and organisations from smallest to largest, overlooks Deleuze and Guattari's emphasis on the molar and molecular as equally determining factors of all social relations and process. Molecular and molar do not refer to different 'sizes' of institutions, at least in the sense that would locate the molecular solely with respect to small institutions, such as families, and molar would refer to large institutions such as states. Families and states, corporations and clubs, are equally molar and molecular; the former concern delineated segments along the line of discernible entities, individuals, classes, sexes, while the latter concerns unconscious affects, perceptions, and desires (Deleuze and Guattari 1987: 213). More importantly DeLanda's use of authority structures to comprehend the deterritorialisation and reterritorialisation of assemblages overlooks the political constitution of subjectivity. Authority would seem to propose that the same subjects, the same individuals, are subject to the charms of charisma, the force of tradition, and the rule of law; without these structures these individuals would be free. What Deleuze and Guattari, stress however, is that it is not so much a matter of analysing forms of authority that act on individual subjects, but of recognising how the very constitution of individuals as subjects is itself a form of power. As Deleuze and Guattari indicate this power is all the more encompassing when it appears to leave the subjects free. Machinic enslavement reduces individuals to parts in machines, while social subjection appears to restore the autonomy of individuals only to constitute them as individuals who are constituted through their subjection (Deleuze and Guattari 1987: 458).

There is obviously a great deal of merit to DeLanda's method, especially against the context of political and social thinkers who haphazardly and lazily make reference to totalities such as 'capital' or 'the state' as underlying every specific problem. However, this does not mean we should automatically go along with DeLanda in concluding that the presence of such totalities in Deleuze (and Guattari's) writing can only be understood as a 'fall' from the rigour and challenge of their ontological system. Deleuze and Guattari's writings stand apart from many of their thoroughly de-Marxified contemporaries (as Jameson has put it) on precisely this point: they are interested in developing a theory of 'capital' and the 'state'. For Deleuze and Guattari it is not sufficient to simply grasp such entities through the heterogeneous assemblages and immanent relations that constitute them; one must also account for the way in which these relations constitute particular effects of transcendence. Deleuze and Guattari continue a critical thread that they extend from Spinoza, Marx, and Nietzsche in which the central critical task is to grasp the transcendent, i.e. the totality, as itself an effect of the immanent processes that constitute it. In *Anti-Oedipus* this project is central to their understanding of society. As Deleuze and Guattari write:

> [T]he forms of social production, like those of desiring production, involve an unengendered non-productive attitude, an element of anti-production coupled with the process, a full body that functions as a *socius*. This socius may be the body of the earth, that of the tyrant, or capital. This is the body that Marx is referring to when he says that it is not the product of labour, but rather appears as its natural or divine presupposition. In fact, it does not restrict itself merely to opposing productive forces in and of themselves. It falls back on [*il se rabat sur*] all production, constituting a surface over which the forces and agents of production are distributed, thereby appropriating for itself all surplus production and arrogating to itself both the whole and the parts of the process, which now seem to emanate from it as a quasi cause. (Deleuze and Guattari 1983: 10)

Every society, or form of social production, has an aspect that appears as the condition, or cause, rather than the effect of the productive relations, the desires and labours of society. Societies may be nothing more than the heterogeneous collection of various assemblages (desiring machines, or desiring production, in Deleuze and Guattari's language), but these assemblages produce effects of totalisation that, in turn, give rise to new assemblages that produce totalising effects of their own. What is crucial to these totalising effects, however, is their ability to appear as something other than what they are. As Deleuze and Guattari make clear in the quote above: it is labour that enables capital to

come into being, but once capital comes into being labour is radically transformed. What is produced is nothing other than an image of society itself, society as something other than the ever shifting contingent effects of various actions and assemblages, in effect it is a reification of social relations.

What Deleuze and Guattari stress in a line of thought that cuts through a series of texts and problems (many of which, such as the debate over the 'Asiatic Mode of Production', are themselves relatively obscure outside the confines of a strictly Marxist discourse), is that there is a fundamental gap between the productive relations, the interlinked network of assemblages that constitute society, and the representation or perception of these relations. The social totality does not exist strictly speaking, it is not an actual existing element of society; but, at the same time, it does exist as an effect of how society is perceived. Deleuze and Guattari stress that the totality exists alongside the relations that make up society, appropriating their effects. This effect, this perception, in turn has its own effects. The emperor may have no clothes, capital may be nothing but the effect of different and divergent labours, God may be nothing but our failure to grasp the multiple causal connections that make up nature, but these ideas, these representations have effects, they are what Deleuze and Guattari call quasi-causes. These images are thus an integral aspect of subjection; the individual sees his or herself as an effect of the full body of society, not the condition of its functioning. Thus, he or she is more inclined to accommodate his or her actions according to the norms and structures of society, in that they appear as conditions of actions rather than their effects. It is not enough, as DeLanda argues, to simply replace transcendent or essentialist accounts of the formation of society with a purely immanent set of relations: it is necessary to show how transcendence, or the idea of transcendence emerges from the these same relations, in turn falling back on them.

It could be argued, as DeLanda seems to, that Deleuze and Guattari's account of the socius or full body, as a generalised reification of social relations, is merely an effect of their residual Marxism. However, it is also a consequence of Deleuze's (and Guattari's) ontological commitment to immanence. Immanence is not simply a matter of dispensing with transcendence, it is also a matter of situating ideas and things, matter and expression, on the same plane, as equally capable of producing effects. In *Anti-Oedipus* this commitment takes the form of the slogan 'desire is part of the infrastructure'. In *A Thousand Plateaus*, however, this commitment underlies Deleuze and Guattari's attempt to rethink the relation between content and expression, which are not

placed on top of each other as base and superstructure, but continually intersect and transform each other. As Deleuze and Guattari write, 'the only way to define the relation is to revamp the theory of ideology by saying that expressions and statements intervene directly in productivity, in the form of the production of meaning or sign value' (Deleuze and Guattari 1987: 89). While Deleuze and Guattari ultimately dispense with the notion of production as inadequate to the complex causal relations of expression and content, the fundamental point remains that expression is not simply an effect of material relations, but in turn acts on those relations. This is crucial to the understanding of the question of the social totality. Following Deleuze and Guattari's perspective it is possible to argue that the state exists more at the level of expression than content, working at the level of signs, resonances, and meanings, provided that we remember that the distinction is always relative and subject to reciprocal determination (Deleuze and Guattari 1987: 425). The state sets up a relation of resonance between the multiple powers centres in society, such that heterogeneous and specific actions and practices, such as birth, death, marriage, and local power centres are made to resonate with it (Deleuze and Guattari 1987: 215). It 'overcodes' the various pre-existing codes, the various pre-existing traditions, making them appear as effects of a larger pre-existing totality: to take a US example, 'mom' and 'apple pie' become signs and effects of the nation. The state, or other totalities such as society or capital, are not just inaccurate representations of society, they are also concrete effects (and quasi-causes) of subjection.

Ultimately, it is not a matter of producing a correct reading of Deleuze and Guattari; DeLanda's work, from *A Thousand Years of Nonlinear History* to *A New Philosophy of Society*, should be credited for shifting the focus away from the task of simply defining the dense network of neologisms that make up Deleuze and Guattari's writing and turning attention towards the crucial philosophical and political positions that underlie them. DeLanda does much to highlight the innovation underlying Deleuze (and Guattari's writing), however, his own tendency to present Deleuze's thought as a radical break with certain elements of the current intellectual conjuncture overlooks the complexity of Deleuze's thought. In this review I have focused on the lingering question of totality as the most obvious of these tendencies, but, as DeLanda makes clear in other texts, his writing is also oriented against the idealism underlying 'social constructivist' accounts of society (DeLanda 2008: 162). Central to DeLanda's use of Deleuze (and Guattari) is his commitment to what he insists is 'realism', the idea

that the world exists independent of our conceptions of it. These two polemical trajectories, against totalities and social constructivism, converge on the same fundamental point: the manner in which social relations constitute and are constituted by subjection to totalities, to full bodies. These totalities become real through the very way in which people subordinate their actions to them; they are effects that have become causes. DeLanda is in some sense predisposed to overlook this central aspect of Deleuze and Guattari's thought. This is unfortunate for at least two reasons. As Spinoza, Marx, and Nietzsche recognised in different ways, it is not enough to oppose the true to the false, to replace transcendence with immanence, idealism with materialism, or essences with their genealogy, it is necessary to explain the genesis of the former from the latter, how the world appears in a manner that is opposed to its construction. This is not just a philosophical matter, a matter for interpreting the world, but a political matter as well; despite their ontological illegitimacy, the various full bodies, the state, god, and capital, are fundamental to the way in which most people inhabit and make sense of the world. If the world is to be comprehended, if not changed, then the particular consistency and resilience of these totalities must also be comprehended rather than dismissed. It is the strength of Deleuze and Guattari's social ontology that it provides not just an account of the immanent relations that make up reality, but the way these relations produce effects of transcendence.

Introduction Part I

Claire Colebrook University of Edinburgh

Could there, today, be such a person or persona as a feminist philosopher? We ask this question with two motifs in mind: the first is Deleuze and Guattari's notion of the conceptual persona, where philosophical theories are constituted through the co-production of certain characters (Deleuze and Guattari 1994), and the second is the notion of an internal pragmatism as articulated in *Difference and Repetition* (1994). It is now time to direct these questions – of the persona (which is internal to a text) and the vectors created by a text – to the Deleuzian corpus. Following not only *What is Philosophy?*, where Deleuze and Guattari argue that the production of a philosophical plane and its conceptual movements are accompanied by personae, but also *Nietzsche and Philosophy*, where Deleuze argues that the forces of texts are modes of *dramatis personae*, we might ask about the style of life that accompanies Deleuze's thought. It is that tortured concept of 'becoming-woman' that raises the question of the value of a concept, and its relation to the voice responsible for its articulation.

One possible way of answering this question would be to suggest that if Deleuze aimed at thought 'without an image' (Deleuze 1994: 208) or a becoming-imperceptible (Deleuze and Guattari 1987: 279), then – despite what Deleuze and Guattari say in *What is Philosophy?* about philosophy and personae – their own work might be one of the first moments in the history of philosophy where concepts are created without personae. That is, if all thinking up to the present has presupposed the good will of a thinker, and if this thinker has been a version of man (as the assumed standard from which others deviate) then becoming-woman would be a depersonalisation, a liberation from personification, images of thought and the notion that there are thinkers first, and then the concepts they use as tools or supplementary methods (Deleuze and Guattari 1987: 376). But there is an alternative, and that is to see a distinction between the subject of enunciation, who precedes and grounds judgment, and the persona (especially the persona that would accompany 'becoming-woman'). Becoming-woman would be crucial to

the dissolution of the subject, and to thinking of texts, ideas and concepts not as *tools* (where a thinker uses a concept for certain ends, according to whether they work) but as weapons: something thrown or projected that expends force but without a determined production (Deleuze and Guattari 1987: 287). It is in this regard that Deleuze and Guattari align becoming-woman with the 'war machine': not an actualised war, such as philosophical or 'theory' wars with opposition among combatants, but a war of forces without underlying terms (Deleuze and Guattari 1987: 278). It is always possible to see feminism as war: as a group attack on patriarchy where there would be subjects who would then need to find the best conceptual resources. In such cases war as an object would be an accident or supplement (Deleuze and Guattari 1987: 418); actual wars would appear to be deviant or parasitic. A war on men or masculinity (even a war on war) would be a justifiable temporary violence oriented to a state beyond conflict.

But Deleuze and Guattari argue that this apparent supplement or accident, or the actual occurrence of wars, indicates a war-machine that, far from being alien to rational man and humanism, enables his existence, *and* provides a means of thinking his escape. Referring to Derrida in their notion of the logic of the supplement, they insist that what appears to be an accident or an addition to the man of reason – wars, combats battles – is actually evidence of a war in general, or a war machine. It is this 'war machine' that allows something like a State, and the accompanying form of the good thinker of common sense to be formed, for the State harnesses forces and relations into organised bodies of combat. It also has its own epistemology, for by placing war as an object to be used *by men*, the State creates the idea that war is an accidental occurrence for the sake of a greater good. If, however, man and war, or the relations of bodies in combat, are the effects of a war-machine, then this would have three consequences.

First, that which we take to be the norm and ground – the man of common sense and good will oriented to peace who fights a war in order to win over others to the truth that he has discerned – covers over the war machine of life; it precludes a perception of the forces from which we are composed, the forces that create relations and the powers that thought may be able to engage. Second, this epistemology has a sexual character, again given in the structure of man as a thinking organism. (This is spelled out in Deleuze's and Guattari's theory of the oedipality of the secret.) It is from the hysteria of the child, a child who perceives a secret that is held apart and that constitutes his private being, that man 'evolves' to a position of virility. Here, there is no secret from which one

has suffered or which sets one apart from the domain of communication; rather, there is only a structure *that there is a secret, that there is the hidden*, and it is this perception of a ground beyond perception and relations that produces a structure of paranoia. And again this could be aligned with a style of agonistics and a style of war: from Kant onwards it has been the absence of a capacity to know, an anti-foundationalism, that has resigned us to conclude that all we can have is an ongoing conversation oriented towards legitimation that never arrives (Habermas 1992). Third, it is this covering over of the war machine by a State of warring bodies, that indicates or intimates becoming-woman. If virile paranoia is structured by a sense of a lost, hidden and unknowable secret, then woman – who *is* the secret – occupies not one more place in the terrain, but a different style of terrain, and possibly a different mode of persona.

This is why, I would suggest, becoming-woman is a useless and paralysing concept if it is used within theory and within wars among theoretical personae. As an example we could consider the false battle of essentialism: *either* woman exists as a substance outside the way we think of the human (which would enable emancipation, liberation and change) *or* woman is an effect of the ways in which the human has been constructed and it is the idea of construction is such that is liberating – no more enslavement to essences. Not only has the terrain of feminism actually never been that simple, as evidenced by the amount of ink spilt over deciding whether Judith Butler does away with the body and sex or grants sex a power far more efficacious than mere biology; it is also the case that if feminism means anything, then it somehow has to intervene differently in the way in which battles are fought according to meaning. So, rather than define a battle according to whether woman does or does not exist, let us imagine something more *practical* in the the Kantian sense (or what Deleuze refers to as internal pragmatics). Given that we discern the war machine or the positive play of forces only among men who are structured by a paranoid virile form of secrecy – *that there is a hidden but we do not know it and so the battle goes on* – what would it be to occupy the position of a body for whom there is no secret, for whom there is no position within a warring paranoid terrain and whose possibility (if she were to speak) would create a persona that would not be in command of forces for the sake of some end of man?: 'Such is the form of exteriority, the relation between brother and sister, the becoming-woman of the thinker, the becoming-thought of the woman: the *Gemut* that refuses to be controlled, that forms a war machine' (Deleuze and Guattari 1987: 378).

To consider a form of feminism as becoming-woman, or as associated with the war machine, requires both the dissolution of subjects as external to, or before, pragmatics and the construction of conceptual personae. Becoming-woman is not in conflict with the persona of the feminist philosopher, for the feminist philosopher is not one who thinks, who thinks well, or who directs good thinking to the right ends. The feminist philosopher as conceptual persona, as moving with the war machine rather than war, would allow a new form of agonistics – not just another persona added to the history of philosophy, but a new style of philosophy. Such a possibility is not, I would suggest, a distant, utopian or impossible future but can already be intuited in the space of feminism as we know it today. Indeed, it is the rather embarrassing, awkward, appropriating tone of this horrible concept – becoming-woman – that paradoxically requires us to evaluate concepts differently. The concept is embarrassing when it closes down thinking: when it is left to feminist philosophers to disentangle this monstrous thread, while the real Deleuze philosophy and Deleuze studies gets on with the nuts and bolts of materialism. The embarrassment and awkwardness should not be seen as unfortunate or accidental: it cannot be explained away by accepting that Deleuze and Guattari were having a French moment when they made this appeal to becoming-woman, and that what we really require is a Deleuze studies that can go beneath such figures and metaphors to the real matter. But can we, should we ('we'?), allow this distinction to be maintained between a philosophy's mere form and the matter or system that can be adjudicated systematised, translated and liberated from its style? Again we face an awkwardness, because becoming-woman is articulated as *the* way to think matter differently, and to think matter a such.[1] For becoming-woman, and its association with both the war machine and a certain form of the secret, is a way of trying to arrive at 'materials-forces' (Deleuze and Guattari 1987: 329), where there is no matter outside variation, force, relation and difference: 'The secret has its origin in the war machine; it is the war machine and its becomings-woman, becomings-child, becomings-animal that bring the secret' (Deleuze and Guattari 1987: 287). There is not a matter that is then expressed in thinking, with various positions warring over materialism *or* idealism, Marxism *or* Freudianism, feminism *or* a post-feminist liberation from sexuality.

We might begin to see that it is this concept in Deleuze studies, the concept of becoming-woman, that has at once been the most destructive – precluding the smooth transition to an understanding of Deleuze – but which in its indigestibility offers us food for thought. This

would not be the totem meal that consumes the father in order that the brothers might live on, battle on, and acknowledge that they have killed the ends of man only to arrive at a domain of communication. Rather, the taking-in of this concept of becoming-woman generates a new concept of dissonance, which is therefore a new structure of the war of thinking. One way of considering dissonance, or the incommensurability and war of opinions is through the masculine virile paranoid form: there is no truth outside the assertion, well-formedness and legitimation process of argument, so this entails a relation of ongoing battle among good thinkers. A rogue thinker – one who absented himself from conversation and claimed a fundamental intuition of the truth – would be the object of discipline, but all in the name of keeping the play of perspectives open (Rorty 1998). If, however, we adopt the practical potential of becoming-woman then the nature of the philosophical persona is quite different. If it is not the case that there is some hidden ground from which we are separated by virtue of our finitude but, on the contrary, there is matter and life only in expressions, noise and chatter *all of which express the infinite but from a singular point, with no point being in command of the whole*, then dissonance is not the failure of harmony, or a dissonance on its way to a harmony that never arrives (Deleuze 1993). Dissonance is the song of the earth as such. Becoming-woman is the most disastrous of concepts if considered as an object of war, where we could either decide that it is good or bad for feminism, or a minor moment in an otherwise serious corpus. The concept of becoming-woman creates embarrassment for the serious thinkers who need to leave it aside while granting women the right to a squabble regarding its efficacy. By pushing this disastrous embarrassment further, though, we might avoid the worst peace of perpetual management and begin to think those dissonances that take us beyond organic quiescence. Becoming-woman, as a concept with its attendant personae, is intrinsically opposed to the good will of the thinker, and it is for this reason that it has done violence to feminism and Deleuze studies.

In order to see how this is so let us ask this question: what would it mean to shut down this concept once and for all? Two possibilities: a philosopher demonstrates that 'becoming-woman' is pragmatic: we happen to confront a plane of thinking that has been organised according to sexual binaries, with man at the centre, but this is not essential. We begin with trying to think another figure, woman, and then move beyond figures (Lambert 2006). (The war is localised and temporary, and oriented to arriving at good sense, where sense is the

sense of the true Deleuzian spirit and the right form of life.) Second possibility and one that I would suggest we begin to pursue: we do away with the notion of the inessential figure, the accident or cliche that befalls thought as if from outside. We regard the intrusion of this ugly concept into an otherwise respectable corpus not as an unfortunate lapse in rigour, nor as a throwing of a salvo to give women something to think about – pragmatically – while the boys get on with ontology. Rather, we begin to think the ways in which it is the very awkwardness of concepts that makes a philosophy possible – its creation and daring, and breaking free from figures – that will also do a twofold violence to the corpus.

As an example I would cite one of the earliest interventions in what was not yet 'Deleuze Studies.' In *Patterns of Dissonance* Rosi Braidotti (1991) argues for a feminist subject who would be a necessarily presupposed, positive and constructive persona. Her existence is neither prior to feminist questions nor a simple discursive and illusory effect of the performance of feminist interventions. In *Patterns of Dissonance* Braidotti was already posing Deleuzian style problems that took the risk of refusing what Manuel Delanda (2006) has berated as 'the linguistic paradigm': there is not only a tactical or strategic problem in denying the possibility of the subject of enunciation; there is also an ontological or vital problem. Life cannot be reduced to the systems or structures that are known and actualised, for there are potentialities or living tendencies that exist, insist and inflect that orders of discourse and action we negotiate. The feminist subject of *Patterns of Dissonance* is therefore best read, I would suggest, as a refusal of discursive or negative approaches (where subjects are nothing other than nodes of subjection, points of interpellation) and as a rejection of a pre-philosophical or *transcendent* empiricism where one simply posits what women literally are. Instead, it makes sense to see the feminist subject as a consequence of a transcendental empiricism: all we have is this one dynamic and dissonant life, with no overarching or unifying system of relations (empiricism), but this life that we live, feel and negotiate is always *more than* its actualised terms. The task of the transcendental (in *Patterns of Dissonance*) takes the form of the production of a feminist subject. This is a subject who is the positive potentiality to question, mobilise, become and *think* the desires and relations that subtend the array of discourses, or the patterns of dissonance that compose any philosophical or political terrain. So we might at one and the same time affirm the necessity of thinking of the feminist philosopher as conceptual persona: it is she who asks *whose* discourse, whose statement, whose subjection, performance, passion or negativity is expressed in this or that specific dissonance.

At the same time, as *feminist*, this persona is not a figure defined by its active predicates – the one who doubts, affirms, negates and arrives at certainty – but is in a pattern of dissonance. For a new persona is only possible if something occurs in a text that marks a threshold and requires a reorientation in thinking; awkwardness is essential if thinking is going to be more than the free flow of easy conversation, or the war of one body against another.

To attempt to state this awkwardness less awkwardly let us look at how this concept of becoming-woman has been evaluated in terms of external pragmatics. Two male philosophers create a concept that seems to give women a role not only in thinking, but in life as such, in a new theory of matter, perception and creativity. But herein lies just the problem: for it seems as though thinking, just at the moment when it wishes to express daring and becoming, falls back into an appeal to the feminine: not women, but 'something' that women, too, need to tap into (Jardine 1985). So perhaps, here, we need to overcome the external pragmatism of 'becoming-woman' – deciding whether 'we' accept or reject this concept, whether it should be justified or expunged – and think about becoming-woman in its most scandalous, least appealing and *stupid* potentiality. Rather than read Deleuze and Guattari theologically – aiming for the spirit of the text beneath the unfortunate French letter – we should take this concept of 'becoming-woman' as evidence (as if evidence were needed) that the matter of thinking always comes from elsewhere: from figures, cliches, and war zones that have organised prior battles of forces. This stupidity can be evaluated from the outside: here we would ask whether 'we' should still think in terms of man and woman? Alternatively, we can seize hold of this stupidity and refuse the exclusive disjunction of regarding 'becoming-woman' as *either* good or evil.

If thinking does not proceed from a good will, and if the forms of thought are not mediations of matter, then we might confront the benevolent stupidity and malevolent intelligence of the matter-expression of thinking. There is not a thinking that confronts matter as some object to be formed, nor a good thinking that follows from the proper development of matter. Against thought as the extension or evolution of a life oriented towards good sense and self-recognition, Deleuze and Guattari create the concept of becoming-woman to at least begin to *demoralise thinking:* both thought without a morality, and a thought that confronts its breakdown and absence of guarantee. This is not an 'on the one hand, on the other hand' logic (Deleuze 1994: 282), where we see that while we might need to begin with the idea

of woman in its most cliched and stupid form (associated with secrecy, celerity, girlhood and birdsong) we would then need to move on and start thinking without such figures. Rather, becoming-woman is thought *and* unthought at one and the same time. It is matter expressing itself, with the human organism giving order to chaos by referring to sexed bodies as coded in the familial assemblage; at the same time it is an attempt to create a style of thinking that is not a correct representation so much as a style of provocation that has no external criteria.

Let us consider this broad-brush and possibly overly literal beginning of becoming-woman in terms of philosophical conceptual personae. The persona that follows from a philosophy of becoming-woman and becoming-imperceptible is a curious hybrid: Deleuze and Guattari warned against a complete or absolute deterritorialisation, and instead emphasised the creation, not dissolution, of masks and styles. They insisted on personae, or thought figures, rather than masters who would act as grounds for judging either the value of a text or its sense. When Deleuze argues for an 'internal pragmatiism' he suggests that we do not simply trace back a philosophy's force to its institutional and authorial proper names, but instead look at how modes of argument, concept-creation and problem-production effect ways of living. If a philosophy is excessively organised, or assumes a relation of powers narrowed to man as a speaking, rational, calculating and rule-following being, then the wide range of 'what a body can do' is domesticated by one of the body's functions.

We might note, today, with all the work undertaken on the body as an autopoetic unity geared towards its own equilibrium and homeostasis (Damasio 2003; Maturana and Varela 1987; Thompson 2007), that we are in the presence of a highly rigid plane, where the human organism is figured in a hysterically normative manner. Further, such an articulation occurs with a very clear conceptual persona of the philosopher as emancipator. We are, we are constantly told, suffering from centuries of flabby metaphysics and Cartesian images of mind as spirit; what we need to do is return to an accurate model of vital life, recognise man as a practical organism for whom thinking is an *extension* of life-sustaining movement, and regain a proper view of the world (Varela, Thompson and Rosch 1991). We undertake a global war on the lures of bad metaphors: mind as machine, mind as computer, mind as ghost in the machine or mind as separate substance (Flanagan 2007). The corrective for such stupidities is a theory of systemic life, thoroughly grounded in the organism and meaning. Man is now a self-maintaining bounded machine, and the world is nothing other than the milieu of

potential responses according to man's ongoing, dynamic and responsive selfhood. One of the ways in which Deleuze has functioned as a proper name has been to consecrate a return to living systems, a rejection of any notion of mind or sense independent of living bodies. This appeal to vitalism functions, despite Deleuze and Guatari's insistence that their vitalism is technical and machinic, as a return to genetic life, life as genesis or unfolding.

When Deleuze has been *accused* of vitalism (rather than read with a nuanced sense of what vitalism might mean) it has been this aspect of supposed literalism that has been targeted (Hallward 2006). Against a Deleuzian return to 'life' as some monist flux beyond the entities of this world, Alain Badiou has asserted the subject *as function;* for it is only in the act outside calculation and the already enumerated that something like thought can occur (Badiou 2005). It is perhaps not surprising that Badiou appeals to the tradition of the radical subject, and that such an appeal has force: for the mantra of anti-Cartesianism that defines theory today has had the effect of retreating back into the primacy of the self as an organism. We are left with an exclusive disjunction: either we consider life in terms of organic systems, their milieux, and the always located meaning a body makes of its world, *or* we posit the subject as a potentiality to think. Such a subject would be nothing other than a break with, or negation of, organic plenitude. And it is here that we can see the beginnings of the force of the feminist conceptual persona. Theory today battles itself out among combatants: either Badiou *or* Deleuze, either Deleuze *or* a Deleuze modified by Derrida. This battle has an internal style, which we can discern in the constant use of diagnostics: either we lament the fall into Cartesianism that can be overcome by theories of life (Damasio 1994), or we lament philosophy's fall into poetry and regard it as redeemable only through a radically formal mathematics (Badiou 1999). And then there is that ragbag of lesser 'thinkers' known as feminists, who do not create systems in order to mark out a proper name as a terrain, but occupy and move with forces.

If Deleuze can be thought, today, with the concepts and figures he contributes – including 'becoming-woman' – it is in relation to a plane that has become rigidified around the opposition subject-organism. Either thinking and living is grounded in organic and meaningful life, with thought being an extension of self-maintaining processes (Hansen 2000) *or* we can posit subjects as negations of that constituted domain. Either Cartesian dualism or an organic monism (Zizek 1999). As an example of this type of plane, with its attendant persona, we need only think of the new anti-Cartesian man of cognitive science, who

has broken away from metaphysics, and found himself in a new and manageable domain of systems theory. Defined against old models of centralised thinking, man is now stratified between his body as an equilibrium mechanism and a milieu that is given as always meaningful from the point of view of the organism (Thompson 2007). To think of Deleuze as a philosophical persona (as a possible figure for a different style of thinking, one that will confuse science and poetry, sexual figures and physical models) may release us from this highly gendered model. Deleuze regarded the attainment of the body without organs as the end of his philosophy of becoming: rather than maintain a balance among powers, or be oriented by the organs acting in concert to regulate one's external world, the 'body without organs' would extend sight to the point of thinking the invisible in the visible, the ear to hearing the sonorous in sound, and the brain to thinking beyond the given, the lived and the communicable.

Notoriously, Deleuze opposed the self-authoring man of philosophical systems – whose world and others would always be in accord with his own organic striving – with a violent production of philosophical progeny. To take a previous philosopher 'from behind' (Deleuze and Parnet 1987) would create a future of the philosophical text not anticipated in the original text's genesis. The Deleuzian persona is avowedly monstrous, neither a man of insemination giving form to a matter that awaits his potency, nor an oedipalised son striving to maintain and expand the proper legacy of the history of philosophy. True philosophical fidelity, being a true son of a philosophical father, requires bastardry: do not extend, but pervert those powers in a text that did not flow organically from a preceding good will. Read a text for its potential to expand rather than normalise the human organism. As an example of Deleuze's own reading we might think of Bergson's concept of pure perception, which is the intuition of the power to perceive liberated from the sensory motor complex of the specific speed of the human body. Despite Bergson's orientation in *The Two Sources of Morality and Religion* (1985) to arrive at a humanity that would extend the intellect to perceive spirit as such, Deleuze used the concept of intuition to create concepts of becoming-imperceptible: concepts that tend towards a liberation from the body perceived as self-bounded unity and towards a becoming of the world as such. As Rebecca Hill notes in this volume, Bersgon's philosophy harboured its internal stupidities, those moments when it defined thinking as such according to a limited and localised body of Western man. Perhaps that stupidity is overcome and intensified in becoming-woman, for this concept at once recognises

just how imbricated the image of thought is with man as an organism, but in defining the passage beyond that as 'becoming-woman' takes an incalculable risk of cliche. Deleuzian concepts are those, then, that recognise minimal and supple degrees of stability, and work towards impersonality. The persona that attaches to this style of concept is not that of the good and upright thinker who precedes style, but a thought that creates a body through style, a body that perhaps is at odds with self-maintenance and life-furthering.

Certainly one would release such a philosophical persona from *gender*, for the philosopher could not be the man of insemination nor the woman of care and nurturance. This becoming liberates itself from the man oriented to good sense, common sense and the equilibrium of the faculties, beginning with at least one other style of perception and relation to the outside that has not been determined in advance by a norm of right reason. This raises the question, then, of what type of persona is enabled by the taking up of this becoming-woman, for Deleuze and Guattari suggest that the persona of becoming-woman is a persona on its way to becoming-imperceptible, moving away from a molar subject, which may be necessary but should only be a passage toward 'thought without an image.'

If the affect created by a certain form of literature can be called 'Dickensian,' 'Kafka-esque,' or 'Lawrentian' (where we refer neither to any specific character, nor any sentence or content so much as a mode of living one's milieu), then the concepts created by philosophers can be referred to as 'Kantian' – concepts that are formal, constructivist, transcendental – or Cartesian, in their commitment to dualism, foundation, clarity. The personae that attach to these concepts are not biographies, so much as the figure or character whose style of thinking would have unfolded a certain mode of problem: a doubting Descartes, an always questioning Kant, a cantankerous Schopenhauer. Could such personae be female or feminist? Luce Irigaray suggested that if such personae were to occur then the nature of philosophy would be altered radically, not just in a reconfiguration of the plane of all philosophical concepts (as Deleuze suggests, where each new name and concept creates a re-reading of the whole), but in a ground-shattering and almost affective re-ordering of the very orientation of thinking. We would not have, in Irigaray's feminist philosopher, a single persona but something like a couple. Irigaray suggests this in *I Love to You* (Irigaray 1996) where a sexually different persona would undertake questioning, proposing, doubting, affirming, remembering or disputing always in relation and conversation with an other who would, in

turn, be both affected by and affective towards the address. Irigaray's philosophy created its own exegetical battles in the theory world – 'for and against essentialism' – even though the mode and style of her text, which spoke through the figures and tropes in philosophy showed the ways in which the logic of essence and accident occurred only through a certain agonistics and a certain relation to the outside. It is that relation to the outside that also marks Deleuze's commitment to life, and has perhaps lured us into a literal laziness, where becoming-woman appears as a stylistic tic rather than an necessary act of war the Deleuzian corpus took upon itself.

Now it is here, in this curious commitment to a theory of life, that we can find in Deleuze and Guattari a means of thinking personae beyond Deleuze's ambivalently virile image of 'taking a philosopher from behind.' Let us consider this figure in terms of philosophy's clichés and desires: if Platonism imagined the formative power as giving life to a chaotic matter, and if creative insemination is always master of itself because all emanations reflect and recognise their divine and grounding source, then Deleuze suggests a new sexual motif for creative time: not fathering through insemination, but a form of sterile and suggestively violent coupling resulting in bastard offspring that would seem to have no natural genesis. Elsewhere Deleuze (1990) refers to creations of sense as sterile, incorporeal and monstrous, often opposing violence to the man of common sense, and also aligning the war machine (and the man of war) with the feminine *against* majoritarian man. So let us pause to ask a tired old question: is becoming-woman in Deleuze and Guattari's philosophy a hackneyed gesture of reappropriation in which the speaking subject deploys an imagined fecund and extra-rational source in order to overcome his historical and emasculating rationalisation? Or, is this gesture towards becoming-woman an opening of thought, appealing to women not as they are, but as they might become once released from the normative binaries of bourgeois, capitalist, familial and productive norms? How might we decide such a question? The simple answer is through reading, but this then raises the question of how we read Deleuze: from behind, without due reverence, hoping not for fathered children but for monstrous ramifications? Or, is it more complex? Did Deleuze, because he wanted to tear Freud, Marx and others away from the familial and organic idea of man as a productive and self-maintaining body read these philosophers against their implicit theories of life (Freud's death drive, Marx's species being)? How then do we read Deleuze and Guattari's 'becoming-woman'? I would suggest that fidelity – explaining, justifying,

condemning this concept as a lapse – remains within a highly theological mode of reading whereby a text is the material expression of a spirit, a spirit that should be maintained, consecrated and corrected in its surface detail according to its proper sense. But there are resources within Deleuze's own philosophy that allow us to read otherwise. Here, it would not be a question of identifying a figure, such as becoming-woman, and then negotiating how that serves a group of readers, or how it allows us to judge an author. Such a theological reading, that regards texts as vehicles that might be judged according to the proper intent of their origin and the proper unfolding of their consequences amounts to an external pragmatism, where we evaluate styles according to already constituted (in this case organic) bodies. Let us suggest another path, one that follows from the *problem* of Deleuze and feminism: problems can be well posed or badly formed, but are opportunities for creation and transformation.

Deleuze suggests that in addition to women as a constituted population, created in a territorial relation with men through a historical assemblage of families, literary figures, cultures of reproduction and modes of reading, there is also a becoming-woman in which the very capacities that create women as part of a territory potentially open out onto a new assemblage. So this would allow us to think not of changing women's status within an assemblage, nor of giving women more power, and certainly not of escaping power and arriving at a woman's being-in-itself before all relations. On the contrary, becoming-woman allows for a different mode of agonistics: not women taking on a different role, but transforming just what it is to play a role, what it is to form a territory, what it is to make sense, and therefore what it is to read. Reading should not be the disclosure of a hidden secret, the unveiling of a sense that is the causal ground for being; nor is reading a creation ex nihilo with no relation to the outside. In Deleuze's own figure, taking a philosopher from behind seems at once to extend a masculinism in philosophy that creates from itself with no relation to the other, at the same time as it acknowledges that reading is an encounter, but one that is not appropriately figured through conventional couplings of a fruitful marriage, conversation, reflection or discourse.

In *A Thousand Plateaus* Deleuze and Guattari make two manoeuvres that complicate a ready association between thought as productive insemination, and reading as disclosive fidelity, and in these two manouvres they refigure sexual difference through a twisted binary. The first manoeuvre is their sexualisation of the secret, which is the sexualisation of styles of question rather than bodies; the second

manoeuvre is their suggestion of a 'war machine' beyond male-male combat. We can deal with these intertwining motifs in sequence before returning to the problem of the feminist persona, a problem that should alert us, today, to some of the risks of 'Deleuze studies.' For it is the idea that there is a secret to Deleuze, a sense held by a band of brothers who have killed the father of logocentrism, that is intrinsically sexual and comes ready-made with its own forms of combat: do we read Deleuze as a materialist, a spiritually-inclined vitalist, a proletarian-despising high modernist or the great sustainer of late Marxism? As I indicated earlier, Deleuze and Guattari describe a passage from the secret as hysterical childhood event (something that occurs that defines a content that cannot be given proper form of expression) to the secret as an infinite paranoid virile form: there is a secret but it has no content, and all we can do is be enslaved to a certain never-knowing, while regarding ourselves as the beings we are – man – just through this loss of knowledge. The 'secret' as infinite paranoid virile form structures a style of speaking, questioning, discoursing and proposing that can be studied, as Deleuze studies his own philosophers, according to an *internal pragmatics*: we do not, here, look at the institutions, contexts and bodies in order to assess the force and power of positions, but look at the ways styles of position create fields and modes of force. That is, if there is some ultimate hidden sense or genetic ground, then arguments would concern a transcendent term and combatants would evaluate each other to the extent to which they were more or less in accord with that norm. (Such a logic applies to certain feminist arguments: is 'becoming-woman' good or bad for women, us women, we women, the women we ought to become?) A certain mode of reading, a certain style of subject effected in relation to knowledge takes a 'paranoid virile form': there is a secret, a sense, a ground and origin; but not only can such a secret not be known or disclosed, all we are left with is a pure form – *that there is secrecy, that there is the hidden* – with no positive content outside our emasculated position of not knowing. We have passed, they suggest, from a childhood hysteria (whereby my being is marked by a secret event whose logic I play out but do not know) to an adult paranoia: there is nothing to be discovered, nothing to be disclosed, but we are all subjected, finite and diminished by an origin or past that is no less paralysing for being fictive. Another mode exists, which Deleuze and Guattari describe as becoming-woman: nothing is hidden, everything is transparent, and there is a high degree of chatter. Rather than relations among bodies being organised around a contested ground or privileged object, and rather than agonistics being determined by a

norm outside relations (such as a contestation for women as the spoils of war), becoming-woman is allied both with the 'war machine' and a becoming-imperceptible of the secret.

The war machine is the play of forces not yet assembled into opposed bodies placed in a terrain; for terrains, bodies, positions and their identifying traits occur through the play of forces. Rather than functioning as a ground or criteria of ethics, the Idea of the war machine, and the concept of becoming-woman with which it is associated, aims at a new style of ethics: for it does not posit an outside or other of force and violence but regards actual wars, combats and the persons and positions of terrains as ways in which violence is managed. This brings us to the curious, and possibly unpalatable, connection between becoming-woman and a truly violent war machine that would oppose actualised wars. Becoming-woman is neither the occupation of a position nor the evaluation of strategies and forces from some actual or imagined ideal. The 'man of war' for Deleuze and Guattari is associated with becoming-woman and the 'feminine line' precisely because he flees from constituted political battles. This can be thought concretely, according to a logic in which Deleuze and Guattari can be seen to be offering a sober analysis. Their description of the State's appropriation of the war machine describes actual war as a *supplement*, or outcome of a necessary synthesis. War is not a separate accident, an aberration that occurs despite or against humanitarianism; there are actual wars – bodies in identifiable combat – because there is the war machine, forces irreducible to persons and interests. As a consequence every battle and war draws upon a violence it must manage, but that can also deviate from the identifiable rationalisations of the State. We could think here of the ways in which the military can only operate by training bodies to kill other identifiable bodies for certain causes and in certain domains, but that this State war always opens the risk that those same forces will deviate or create a line of flight from the legitimised battle. As the recent documentary on abu ghraib – *Standard Operating Procedure* – disclosed, the war on terror was also a highly sexualised fleeing from clearly demarcated and purposive battles, becoming a highly cliched erotic assemblage in which bodies were pictured, posed, placed into narrative scenes and accompanied by dynamics of desire that were at once typically hetero-normative (prisoners humiliated through sexual passification) but also evidence of a line of flight, beyond man as sovereign agent and active manager. But why see aberration as becoming-feminine, and what can it tell us about secrecy, reading, and internal pragmatics? To understand this I would suggest that the

complex tying becoming-woman with the war machine and the feminine form of secrecy precludes sense and good judgment.

That is, both the Idea of the war machine (as a force beyond combating bodies) and becoming-woman as a relation to personification and sense that has abandoned identifiable and reliable content, do violence to good thinking. This is in two senses. First, there is a way in which this concept of becoming-woman has remained inassimilable in theory and has functioned to consolidate both a state of war, and a virile and paranoid mode of secrecy: either we need to make this concept work by restoring it to sense, or get to the heart of Deleuze's good sense beyond such messy notions. Second, becoming-woman opens a new mode of persona, where there is neither a feminist *use* of Deleuze nor a Deleuze that is allowed to develop within feminism while the masters get along with the work of Deleuze as a good and upright thinker and an object of Deleuze studies. If this concept enters the corpus of Deleuze and Guattari in an awkward and violent manner, it does so as a provocation and weapon that suggests – audaciously – that the one thing worse than a terrain of bickering, chatting, squabbling women with no real sense of the good is a perpetual philosophical peace in which problems are managed in reasonable conversations. Becoming-feminine considered through these two remarks regarding the war machine and the secret is at once a refusal of transcendence – some ultimate or final ground across which, or for which, combat takes place; at the same time it is a mode of relations without centre, ground, limiting polity, predefined stratification or object. But this does not preclude truth. On the contrary: truth is not some ground *given through* perspectives and styles, *for the truth is that there are styles*. 'Life' is not some One or secret that recedes and withdraws but is an infinite swarm of chaos, given and lived in moments of minimal order. If we were to read Deleuze and Guattari's becoming-woman according to the logic of internal pragmatics that it suggests then it would lead, I would suggest, to a different mode of writing: not a writing that either follows from a proper master, nor a writing that presents itself as the master. Such writing would be chatter: a multiplicity of voices that creates a pattern, a field of force, but does so without external justification. This would be different, also, from Deleuze's notion of 'taking a philosopher from behind,' which for all its irreverence still suggests a rebellion against the father. To think of a different mode of conceptual persona – the feminist conceptual persona – along the line suggested by becoming-woman and secrecy would enable a new mode of combat, a new voice or style that is no longer that of *the* philosopher who attaches to a concept, but something like a dissonance that distributes a field of phrases, response, questions and

styles – never sure of *who* is speaking, and often – perhaps – rendering the secret master of the text indiscernible, imperceptible. If we consider women as a historically constituted group, not defined essentially, but produced as an identifiable social body through culture and history, then a philosopher who creates a concept of 'becoming-woman' and then goes on to see this mode of becoming as transitional certainly does appear to be appropriating or cannabilising feminism for the sake of a philosophical end. But if we consider woman as a new mode of creating problems where the production of questions opens a new terrain, and does not set itself in exclusive disjunction (Deleuze *or* Derrida, Badiou *or* Deleuze) then we move from theory as the creation of territories to theory as the positive production of nomadic thought.

As concluding example, I would cite Elizabeth Grosz's *Chaos, Territory, Art* (2008), for it is marked by three features, at least, that indicate a new mode of persona. First, this book does not take a philosopher (or philosophy, or theory) 'from behind.' It leaves its philosopher behind. It is as though Grosz has decided not to care about Deleuze's ontology, about his war with Kant, Hegel or Derrida; instead the lectures ask how we might look at art if we think of art not as an object (delimitable, with definitions) but as something that would make us perceive birdsong, fish, stones and bodies differently. Second, it takes contemporary Australian indigenous art, not as what art truly or properly is, but as something that has occurred, here and now, and that has left behind the tortured post-colonial annihilations of whether 'we' can encounter the 'other.' It simply looks at these artworks – not as the body of an Other who might give the lost secret of the West – but as they are presented, displayed, as creating a space. Finally, and subsequently, it is this absence of reverent scholarship to Deleuze as master thinker, and to ethics as some approach to a radical other who might restore one's status as a subject, that marks out a new persona. For this is not a book at war with others; there is no marking out of one's own terrain as the next step in a development of hypotheses, or as a break with the blindness of a past condemned to distance from the great secret.

So we might at one and the same time affirm the necessity of thinking of the feminist philosopher as conceptual persona: it is she who asks *whose* discourse, whose statement, whose subjection, performance, passion or negativity is expressed in this or that specific dissonance. At the same time, as *feminist*, this persona is not a figure defined by its active predicates – the one who doubts, affirms, negates and arrives at certainty – but is in a pattern of dissonance. Thus we could consider Rosi Braidotti's feminist subject (in *Patterns of Dissonance*) and Grosz's performance of an enquiry into art without asking 'what is art

essentially?' in contrast with Deleuze's description of the Leibnizian monad, where each soul is composed of all the perceptions, affections, events and encounters that constitute its singular unfolding of infinity, (and with Deleuze's concomitant history of philosophical concepts and personae who act to reconfigure the entire plane with each of their textual creations). Leibniz's monad is harmonious: each soul sings its own tune, but because each soul is an expression of one infinite divine world, there is a resulting and felicitous harmony. Braidotti insists on dissonance, both because the tunes sung or expressed are not expressions of a preceding, implied, or divinely unfolded ground, and because no soul sings alone. Similarly, in Grosz there is a distance taken from Deleuze studies, and from philosophy *of* art, with there being less of a war on other thinkers, than a positive war or battle in composing strands of birdsong, buildings, human paintings, dance and sexuality (whatever that turns out to be). There is a din of voices: the dissonance presupposes that we can chart, think and trace the dissonances that make up any terrain, but the pattern of this dissonance has neither a transcendent origin, nor a pre-given goal of possible or ideal harmonisation. The din or dissonance is irreducible because voices cannot be uncoupled, nor can they step outside or above the cacophony. The subject is nomadic, in a constant state of metamorphosis and transposition, not just because it is one fragment of an open infinite that is never given, but because it is coupled; this persona is in dialogue or polylogue, at once different from any single system of matrix, and different *to* (or in relations of constantly differing difference) with the others with whom it is attached.

I therefore invite the reader of this volume to regard its opening onto chaos – its clear absence of a grasp of Deleuze – as the beginning of a problem, as an open secret.

Notes

1. I use the term awkwardness here as suggested by Bergson's (1911) essay on laughter. It is when the human sensory-motor organism does not function efficiently – as in slap-stick or 'screwball' comedy where actions and conversations occur in a manner that displays the body's rigidity – that we are given a sense of just how organized the human animal has become, and therefore how it might be otherwise.

Introduction Part II

Jami Weinstein

In her editorial introduction to this volume, Colebrook mischievously and provocatively chooses to leave the reader with 'the beginning of a problem, an open secret.' Before doing so, she meticulously outlines one of the central issues feminists have had with deploying the work of Deleuze and Guattari: how are we to understand that pesky *becoming-woman* formulation? As she rightly describes it, feminists often believe that the task of 'grasping Deleuze' hinges on whether the concept of becoming-woman is 'good or bad feminism,' wondering how to make sense of two male philosophers granting women 'not only a role in thinking, but in life as such.' As Colebrook ultimately points out, these are the wrong questions to ask, the wrong concerns to have. Taking becoming-woman in this direction means looking at this concept as a momentary lapse in philosophical rigor, as somehow separate and apart from analysis of the creative and transformative ontological issues Deleuze exposes – those that are the domain of real (read: male) philosophers. This, as she claims, has 'disastrous and embarrassing' consequences – one could almost say it is evidence for a self-marginalizing process produced by feminists who want to perpetuate the need for feminism, more on this later. Since the project of grasping Deleuze's work itself is false according to an understanding of his work, we need to pay heed to Colebrook's reformulation of the so-called 'becoming-woman problem' as a tool for creating dissonance via refigured relationships to the war machine and its concomitant secret. We could thus allow it to spawn new lines of ontological flight, rather than closing down thinking, and we could understand it not as a lapse but as a central element of the rigorous ontological reclamation project that typifies the work of Deleuze.

What Colebrook's introduction suggests is that a productive linkage between Deleuze and feminism can only be made on the back of a more wide-spread dispelling of pesky concepts and theoretical and conceptual misdirection, even if this means opening into the chaos and ceding hard-fought wars that at least seemed to create new possibilities of more libratory foundational ground. The force and creativity of

Deleuzian ontology can indeed be harnessed for feminist purposes but to do this we may need to bite the bullet on a variety of unproductive interpretations of the war machine. To this end, I propose we dredge up one other pesky concept: that of the fundamental ontology of sexual difference. If we are to 'bring the secret' through becoming-woman as Deleuze suggests (Deleuze and Guattari, 1987: 287), and part of exposing the secret is to open ourselves up to chaos and dissonance as Colebrook suggests, we also need to attend to the question of sexual difference anew, with a Deleuzian flair for truly transformative materialist ontology, rather that get fixated on any particular assemblage that gives the appearance of being foundational, even if that seems libratory.

In *Deleuze and Feminist Theory* Colebrook asked the question: 'Is Sexual Difference a Problem?' On the tenth anniversary of that publication, and in light of her own hints in the introductory essay to this volume that this problem *is* a problem, at least in the Deleuzian sense, I would like to now revisit her question. Yet, rather than repeating her question, I will take her suggestion that it is a problem and attempt to answer her two-fold call: (1) to redirect feminist interpretation on at least this pesky concept and (2) to think differently through the question of sexual difference. I will do this through a repetition of difference, asking not 'is sexual difference a problem?' but rather, if sexual difference is taken as a real problem, the sort that evades embarrassing and divisively marginalizing consequences for feminist theory, how might it be, as a concept, 'inventive: creating new concepts, new questions and new problems.' (Colebrook, 2000: 114) I do not pretend I will give an exhaustive account of the new concepts, questions, and problems that the problem of sexual difference creates. I wish only to investigate and provoke thinking on one fertile ground: zoontology and the repudiation of Enlightenment Humanism.

Sexual difference as a concept has been fantastically successful in helping us realize that we are living under an oppressive ontology of the One, a logic that pervades all aspects of thought, science, language, culture, psychoanalysis, philosophy, etc. But what it helps us *think through* via its prescient claim to move toward an (at least) dual ontology is the possibility of an ontology based on a fluid multiplicity. I see in the logic of sexual difference theory the possibility of re-imagining human ontology and repudiating Enlightenment Humanism, not simply by redefining human ontology as the ontology of two irreconcilable subjects but by using the concept of sexual difference to catapult ontology beyond humanism more generally through taking account of animality. As Colebrook noted, '(i)f sexual difference is

not theorised *from* a metaphysics, but is confronted as a problem, then we might take the issues of sexual difference and use them to *think*.' (Colebrook, 2000: 126) Thus, rather than conceptualize sexual difference as the constitutive foundation for all differences, or theorize sexual difference as a fundamental ontology, I would like to use sexual difference as a starting point for thinking differently about human ontology more generally. I believe this move toward fluid multiplicity is part of the sexual difference line of flight, virtually present within the concept itself. It is taking the concept of sexual difference in this direction that it becomes a proper philosophical and ontological project rather than merely a crumb on which feminist philosophers can chew.

Deleuze himself recognizes that there is no end only a beginning of a new question in the realization of sexual difference when he remarks about women's 'true ontological status:'

> the being of woman is never realized, and can never be realized without contradiction, without dissolution... Woman is neither object nor subject... she is not yet that which is; she is the *élan* of the object towards subjectivity. Neither an object in the world nor the subject of a possible world. She is not a subject, she does not reach being. (Deleuze, 2002: 23)

In other words, the realization of sexual difference, women's subjectivity, would only serve to dissolve sexual difference itself. This is the bullet we must bite in order to more productively engage Deleuze for feminist purposes: that subjectivity, once reached, is its own dissolution. But to what end?

If my suggestion that the concept of sexual difference has virtually within it a more fundamental question of an ontology of fluid multiplicity is accurate, that would be the reason we should be willing to bite that bullet. In what follows, I will sketch this trajectory and why I think pursuing this line of flight might be even more productive in the long run for feminists.

PHILOSOPHICAL CONCEPTS

If we are to take feminist philosophy seriously *qua* philosophy, and we grant Deleuze and Guattari's claim that, '(p)hilosophy is the discipline that involves *creating* concepts,' (Deleuze and Guattari, 1994: 5) then we must acknowledge sexual difference as a concept. As Deleuze and Guattari note, however, 'concepts need conceptual personae that play a part in their definition.' (Deleuze and Guattari, 1994: 2) Given that concepts are multiplicities, at least double or triple, (Deleuze and Guattari, 1994: 15) investigating the concept of sexual difference must

reveal conceptual personae aside from feminist philosophers who play a part in their definition. Before revealing the outcome of this analysis, we need to think through this theory of the concept a bit more.

Deleuze and Guattari argue that, 'All concepts are connected to problems without which they would have no meaning and which can themselves only be isolated or understood as their solution emerges.' (Deleuze and Guattari, 1994: 16) As Elizabeth Grosz explains, 'every concept requires a delimitation to give it some 'identity,' however historically provisional; it also requires a ground, a mode of connection to the world.' (Grosz, 2005: 159) She continues that, 'They are connected to the resolution of problems or questions, for it is problems or questions which occasion concepts, and concepts are developed as a mode of addressing questions.' (Grosz, 2005: 159) What I will argue here is that the concept of sexual difference is historically provisional even though it emerges from a material connection to the world. Our need for it is connected to the resolution of a problem, the problem of correcting sexism for example. Once we have understood the problem and the concept, as we will observe, we realize that the concept is not about ontological differences between men and women at all, but a logic. It is this logic that pushes the philosophical value to a deeper level.

Deleuze and Guattari tell us that, '(t)he concept speaks the event, not the essence or the thing.' (Deleuze and Guattari, 1994: 21) This is in line with sexual difference as a concept as long as we recognize, as Irigaray certainly does in acknowledging it as not yet realized, that the concept is, 'the contour, the configuration, the constellation of an event to come.' (Deleuze and Guattari, 1994: 32–3) However, Irigaray and others argue that the event to come is the materialization of a fundamental ontology of sexual difference, the coming into existence of the subject woman. I think that this is *part* of the event to come, but stopping there does not tell the full story of the more important event that the concept of sexual difference can bring. Proposing sexual difference as foundational simply sets up new questions. Thus, if sexual difference is a concept, as I am arguing it is, it is more properly a 'center of vibrations' (Deleuze and Guattari, 1994: 23) or a dissonance (as Colebrook, in her introduction, suggests becoming-woman to be) than it is about some ontological truth of the matter. As is the case with all concepts, according to Deleuze and Guattari, if a concept is unable to constitute itself, it is likely the result of it being mired in other problems. Further, perhaps due to the vibrations and forces within the concept itself, it evokes an event that helps create future concepts to better resolve the problems to which it was originally linked. To wit, I am suggesting that the inability of sexual difference to materialize is linked to the problem of humanism in general.

THE LOGIC OF SEXUAL DIFFERENCE

In the domain of contemporary feminist ontology, the trend seems to be to argue (following the work of Luce Irigaray) that because *le féminin* has been unspoken, unwritten, and non-existent in the hegemonic versions of human ontology, we need to attend first to the business of speaking and writing it into existence. What both generates and follows from this project is the claim that there has been a grave error deep within the backbone of our mainstream understanding of human ontology. That is to say that ontology up until now has been seen as monadic, fundamentally singular, about the One — where the phallocentrically patriarchal model codes all knowledge, language, science, forms of representation, the symbolic order, and socioeconomic structures as masculine, woman is relegated to the untheorized lack. What sexual difference theory has brought to the fore is that human ontology is, rather than the masculine One and the feminine lack, an ontology of (at least) Two—where woman and man are irreducible others.

I am sympathetic to this project, for it is true that the concept of woman has not been historically a concept of woman at all but rather 'not-man.' In the ontology of the One the human becomes man and not-man, woman never even enters the picture. Woman has been (un)conceptualized into a void, or pure negation of the masculine, but has never been theorized as a positive subject. I do not argue with this analysis. There is something intuitively and even logically true about this story. However, what I want to argue is that this story, while accurate, is not the story of a *fundamental* ontology, the precondition for all other differences. As a fundamental ontology, sexual difference would be considered 'the difference that precedes the entities it produces' (Grosz, 2005: 174), not merely a social difference attributed to bodies of particular kinds. I want to claim that achieving a world in which we have a well articulated, irreducible, dual sexual ontology would not exhaust the human ontological picture. Rather, it is merely a first stage along the path to understanding what it is to *be* human. In other words, sexual difference ontology does tell part of the story of becoming human, the part that delimits what it is to be human. If our interest is what it is to *become* human, we cannot dub that story the most fundamental of stories of human ontology. Thus, we must have neglected to interrogate a deeper question virtually present within the concept of sexual difference.

UNDOING SEXUAL DIFFERENCE (IMPERCEPTIBILITY)

So, what I propose is that once we arrive at the point where we can understand sexual difference as a concept and understand the logic of the One it exposes, we then need to think through it and propel it further philosophically. By that I mean that we need to undo sexual difference once we finally conceived it, in order not to remain egotistically anthropocentric. But this undoing is not a return to the state we are now in, where women are lack or merely 'difference from a norm,' it is not a return to the humanism of the past with its hidden and untheorized phallocentrism. It is a repetition of difference, pure difference, not a repetition of the same.

I know this logic will worry those feminists who would be loathe to relinquish the hard won subjectivity we were (and still are) denied for fear of a return to the patriarchal sameness, solidity, false binaries, and domination of the ontology of the One. But their fears are unwarranted. As I said, this is not a return to the same. It should be noted that these same feminists would also be hesitant about, if not completely antagonistic to, the idea that a fully successful feminist strategy is to aim for its own eradication — in other words, once the goals of the movement are achieved, we will have reached a state in which there is no longer a need for feminism. The misunderstanding of the goal of feminism (as recognition and visibility rather than imperceptibility) is one of the reasons I think that the problem of sexual difference is a false problem: most advocates of sexual difference as a fundamental ontology would theorize sexual difference into perpetuity and thus establish a basis upon which feminism would always exist. For example, according to Irigaray, sexual difference of an ontologically fundamental kind has not yet happened. Thus, it remains a virtual possibility, one that may never fully be realized and one for which we cannot have a blueprint. According to Grosz, this means that the time of sexual difference is the future. However, if the time of sexual difference is always already the future, feminism must take as its ultimate goal simply the perpetuation of an unrealized virtual force.

On the contrary, I am inclined to argue following Deleuze and Guattari that the ultimate goal of human becoming is becoming imperceptible. This means, following Grosz, that 'the future feminine must render itself obsolete or the object of profound and even inhuman (or imperceptible) becomings rather than itself rest on the forms of femininity as they have been represented and idealized in sexual indifference, or within patriarchy as it has existed up to now.'

(Grosz, 2005: 177) This is, as Grosz says, 'a politics of imperceptibility and acts not one of identities and recognition.' (Grosz, 2005: 189) Becoming-woman and its underlying sexual difference would be useless concepts if measured according to visibility and identity. They would serve only as tidbits to distract feminist philosophers from the real work of philosophy. Feminist strategies would be better aimed toward mobilizing these concepts toward a politics of imperceptibility, as Deleuze and Guattari themselves recognize when they assemble the triad: becoming-woman, becoming-animal, becoming-imperceptible. This feminist move toward the imperceptible, suggested by Grosz, would take the following form:

> Instead of a politics of recognition, in which subjected groups and minorities strive for a validated and affirmed place in public life, feminist politics should, I believe, now consider the affirmation of a politics of imperceptibility, leaving its traces and effects everywhere but never being able to be identified with a person, group, or organization. It is not a politics of visibility, of recognition and of self-validation, but a process of self-marking that constitutes oneself in the very model of that which oppresses and opposes the subject. The imperceptible is that which the inhuman musters . . . (Grosz, 2005: 194)

We find the key in her last sentence, also found in her argument on page 177 cited above: becoming-woman and sexual difference *qua* concepts tend toward *in*humanity, a deterritorialization of the human, a repudiation of humanism, a transhuman perspective. It is here we find the move to a transspecies zoontology virtually present in the concept of sexual difference; it is here that the open secret is revealed and the deeper philosophical problem can begin.

MOBILIZING THE LOGIC OF THE ONE—THE MOVE TO ZOONTOLOGY

The recent attention given by feminist theorists to the value of questions of animality and the concomitant desire to refigure the relation between humans and animals reveals the need for a more subtle and profound zoontological theory. Once we do have a working zoontological theory, however, we must determine its place in relation to human ontology; it is important to come to terms with how this shift in focus toward the zoontological might fit with other theories of decidedly central importance to these theorists. Notably here, the issue of an ontology of sexual difference. We need to reassess the value of maintaining sexual difference as the fundamental ontology in light of a move away from humanism in general, for sexual difference seems predicated on at least some form of humanism, or at least

an historical speciesism.[1] Though the positioning of sexual difference as a fundamental ontology is undeniably controversial, even among feminist philosophers, we need to conceptualize how or if that view might gel with a fundamental transhumanism based on zoontological premises. We must also understand how marshalling the logic of the One invented through the concept of sexual difference for the task of deconstructing humanism's inherent speciesism actualizes the virtual concept present in sexual difference theory in such a way that a more productive relationship between becoming-woman and the war machine can be discerned and the conceptual persona of the Feminist Philosopher becomes a proper philosopher.

To recapitulate, following sexual difference theorists like Irigaray, the goal of feminism should be to move from the logic of sexual indifference, or the logic of the One, to the logic of (at least) Two through the articulation of woman and, thus, an ontological sexual difference. Irigaray holds this ontology as the most fundamental human ontology. I agree that this is an important phase in the deconstruction of one insidious hierarchy embedded in Enlightenment Humanism. However, we must not stop there, it is merely an initial step. If we stop here, we once again arrive at a logic of the One: the humanistic, speciesist logic of the One. For, what it is to be animal in the post-enlightenment world is to be untheorized lack, or not-human. In other words, once the logic of the One is detected as virtual within the concept of sexual difference, we need to harness it to think through another important ontological piece of the humanism puzzle: the logic of the One present in the human/non-human animal binary.[2] What needs to take place then, is the move to what I would call a transspecies zoontology[3]. In moving to this element of the deconstruction of Enlightenment Humanism, we must take heed of the advice to become-imperceptible. This involves biting the bullet and undoing the human sexual difference now conceptually articulated. In other words, to fully realize imperceptibility, we must transform the (albeit hard won, if it has even been won at all) logic of the Two with a logic of fluid multiplicity and this means that the irreducible man-woman binary will multiply both internally and externally. It is here that we arrive at a *more* fundamental conception of human ontology[4] and we can grasp the philosophical importance the concept of sexual difference has virtually within it.

What I suggest is that we expand and multiply the logic of the (at least) Two to the logic of the imperceptible multiple in order to deterritorialize the human and *become*, paradoxically more fully human. In the dichotomy of human and non-human animal, we establish another mythology of an ontological dualism that does not really

exist: a human/non-human animal *in*difference. Underlying this is the presupposition that there is one thing human and one thing animal to which we are referring. If we acknowledge (via sexual difference theory) that there are at least two irreducible ontological human entities (woman and man), we must then admit that counterposing some singular concept of the human against some singular concept animal is misguided. This demonstrates a key misinterpretation of the speciesist logic of the One without even attending to the fact that a singular notion of 'the animal' is simply specious. Thus, if we counterpose a multiplicity human against a multiplicity animal, we reduce our analysis to mere nonsense if it is founded on singular logics. For what is a human? Against which animal is it measured?

In recognizing the fluid multiple ontology called forth through these dual logics of the One, we must note that this is part of the function of all becomings, as Deleuze and Guattari remark that, 'becoming and multiplicity are the same thing. [I]ts variations and dimensions are immanent to it.' (Deleuze and Guattari 1987: 249) Becoming is also figured in contrast to teleology, a sentiment subtly echoed in sexual difference theory. To wit, Deleuze and Guattari claim that, 'a line of becoming is not defined by points that it connects, or by points that compose it; on the contrary, it passes between points, it comes up through the middle . . . a line of becoming has neither beginning nor end, departure nor arrival, origin nor destination . . . a line of becoming has only a middle.' (Deleuze and Guattari 1987: 293) Irigaray, too, recognizes this when she advises, '(b)e what you are becoming, without clinging to what might have been, what you might yet be.' (Irigaray, 1985: 214) The point of this process of becoming is not to transform into another pure entity or being but rather to become other and ultimately become imperceptible.

This move toward a fundamental transspecies zoontology is located within the realm of a Deleuzian pure difference (or what I would call horizontal difference) rather than a 'difference from a norm' (or what I would call a vertical difference). It is a return to a concept of human ontology that is not founded on sexual *in*difference (this state is one in which sexual difference has *never* passed through a stage in which the concept of sexual difference has already been articulated, much less been considered fundamental) but rather one that is *no longer* founded on sexual difference; it is an extrapolation out from the ontological Two into the plane of the multiple. In other words, it is a return of sorts but not a going back to the same. It is an ontology of fluid multiplicity with sexual difference as *no longer* fundamental predicated on a prior moment of sexual difference as conceptually fundamental.

In conclusion, for the larger project of deconstructing Enlightenment Humanism, demarcating sexual difference does seem like an important place to start, since it is from within that concept that we find the logic of the One, a central tool for unpacking the human/non-human animal binary. Additionally, from within the concept of sexual difference, we come to understand some of what has been left out of the *human* picture – woman. However, to call this ontology of sexual difference fundamental, the constitutive difference of all other differences, belies a deep-seated anthropocentrism. If we do not attend to the fact that claiming this as a fundamental ontology is a teleological error, we will be left in a revised form of humanism; it cannot be the ontology that precedes all other differences unless the so-called later stages of evolution are the only ones that count. Hence, what I have sketched here (albeit very schematically) is that, while sexual difference might be an interesting and even important difference, one for which we need to account, it is not the unique, most interesting, or fundamental difference typifying human being. However, the concept of sexual difference remains squarely philosophical and Feminist Philosophers become philosophers insofar as the concept they spawned contains all the virtual fodder necessary to do 'real' ontology. The concept of sexual difference contains the vibrations and the virtual logic that push us through the problem of humanism more fully. Thus, it is by thinking through the concept of sexual difference that we may be able to arrive at zoontology, a robustly *human* transspecies transhumanism.

DELEUZE AND FEMINIST PHILOSOPHY – THIS ISSUE

A quick gloss of the pieces in this volume shows that contemporary feminists working with Deleuze have come to terms with what Colebrook and I are both suggesting – that in order to produce a more productive linkage between Deleuze's work and the aims of feminist philosophy, we must do away with the pesky concepts, the philosophical crumbs, and *do* philosophy. We must think through becoming-woman and sexual difference to the more inventive philosophical concepts they produce. We must go beyond the good or evil, the marginalizing he said-she said approach, and attend to the creative ontological task that philosophical concepts present to us.

Colebrook suggests in *Deleuze and Feminist Theory* that:

> (s)exual difference might open the question of different bodily comportments, different responses to the given within the given . . . it might be time to

> think of the body in its various distributions. This would not mean offering a Deleuzian theory of the body, but would look at the body to think differently … Mightn't the anorexic body, which posits a radical disjunction between body-image, lived body and empirical body, disrupt the dreamed-of unity of the phenomenological subject?' (Colebrook, 2000: 125)

Branca Arsic, in her analysis of anorexia in this issue, answers Colebrook's call for that 'bodily philosophy' arguing that, '(a)norexia is both the process of experimenting with the form of the body – its resexualization – and the politics of disturbing the socially imposed order of everyday life.' Further, she does this without falling into the trap of doing a philosophy *of* the body. She understands this when she argues that, '(a)norexia should be understood to represent a particular strategy of resistance, and rescuing it from the inane ideology of an 'eating disorder,' as well as from the brunt theory of a 'consumption' neurosis is a function of such a resistance,' envisioning anorexia as an experimentation in line with Deleuze's Humean empiricism. Concluding that, '(i)f the main goal of the micropolitics of … anorexia is to invent the body of waves, the body without organs, then the success of such an experiment means, paradoxically, that the body without organs will never be fully realized, for such a realization is pure and simple death,' Arsic understands that feminist philosophers must meet the challenge of conceptual lack of origin and telos; they must see to it that we do not end up with the static, 'frozen body' potentially theorized by misdirected interpretations of becoming-woman and some reductive forms of the ontology of sexual difference.

Gillian Howie highlights the ways in which the micropolitics of becoming-woman are neither 'innocent nor without context.' Along the way through her careful philosophical argument about empircism and the relationship and slippages between ontology and epistemology, she reveals the material, corporal, ontological, and non-utopian means by which feminists can analyze this concept. While she agrees with its success at avoiding the 'dimorphic essentialism' implied in some versions of sexual difference, she cautions that we risk, 'de-contextualizing and appropriating the affective body.' She, argues that becoming-woman is a '*dis*embodiment … arguably at odds with any productive and beneficial social critique of invested desire … certainly a long way from feminist phenomenology.' In other words, citing Braidotti, she holds that, '(becoming-woman) is a theory of difference with no room for sexual difference.' According to what Colebrook and I have argued, and what Howie seems to be implying here, this may not necessarily be a conclusive failing of becoming-woman as a concept. Like Colebrook,

Howie seeks to rescue this concept from its theoretical uselessness by understanding the ways in which it, 'manages to reintroduce sexual difference, silently, through the back door.' She, thus, seems to call forth my argument (with a healthy bit of caution about how we might fall into the traps Colebrook outlined) about ways we might refigure our understanding of sexual difference. In other words, she demonstrates how becoming-woman speaks and thinks the open secret of the concept of sexual difference, configured not as an end but as a means.

Similarly, Tasmin Lorraine argues in this issue that:

> This division of humanity into two sexually differentiated groups obscures a wide range of social investments of the contemporary social field stratified into various configurations of power by highlighting sexed identity as key to determining who one is and how to live one's life. A variegated range of differences among human subjects is thus reduced in significance when compared to identification with one of the two categories, woman or man.

This clearly indicates that, while, as she states, 'sexed, gendered, and sexual identity are central features of the oedipal subject, making the question of sexual difference a crucial one,' as I have argued, its ultimate import may not be about a fundamental sexual difference at all. That, as she says, '(f)eminism, as a theoretical and pragmatic process, can intuit ways of living our sex and gender that are more affirming of the continuous range of variation in being sexed and gendered becoming-human entails.' In other words, that becoming-human through deterritorializing the human, or eradicating *humanism*, might be accomplished *through* sexual difference without sexual difference being assessed as teleologically fundamental. It might simply be the concept that provides the anti-humanist tools we need.

Rebecca Hill also subtly argues this point. In exposing Bergson's open system as implicitly sexed and phallocentric in its formulation of the relationship between life and matter, she claims that, 'Bergson's commitment to dualism can be read as symptomatic of a disavowal of a sexed hierarchy at the very heart of his open system.' She notes that '(t)he sexed hierarchy . . . is perhaps most pronounced in his account of evolution,' which demonstrates, 'the valorisation of a hyper-masculine theory of life and corresponding devaluation of matter as feminine.' She hints at my argument that sexual difference can help us rethink Enlightenment Humanism when she implies that Bergson's sexed hierarchy of life over matter can be read as part of a more insidious humanist hierarchy. This can be seen where she claims that, '(f)or Bergson, Man is distinguished from animals by a difference in nature

and presented as the 'end' of evolution. He warns that Man is the 'end' in a special sense . . . because he alone allowed life to triumph over the 'obstacle' matter.' The suggestion here seems to be that thinking through sexed differences and hierarchies pushes us right back to questions of humanism in general and to the important ontological war traditionally waged between human and non-human animals or, as Hill calls it, the 'phallic anthropomorphism.'

Dorothea Olkowski, in a creative exploration of logic and the feminine, also touches on themes of embodiment and animality; these motifs, like the feminine, are traditionally associated with the underground world inhabited by Alice when she descends into Wonderland. Olkowski argues that, 'Wonderland may not be all that wonderful,' if indeed the formal structures upholding traditional logic are abandoned. In the end, Olkowski concludes that there is a hidden sex difference at the heart of becoming-woman because, 'woman has to become-woman for man to become-woman,' which 'evinces a fundamental binarism at the heart of (Deleuze and Guattari's) philosophy.' If her final assertion is correct, however, that because Alice 'understands the limits of language and logic, the limitless world of possibilities, a world without causality and identity, without the arrow of times, without signification or reference,' she is, 'a thinker . . . a philosopher,' we are once again back at the question of what the concepts becoming-woman and sexual difference *do* philosophically. And we have returned to the question of concepts. Her references to embodiment and animality, I think, once again provide the clue. For, a world (Wonderland) without identity and causality ensconced in a world of traditional logic *is* Irigaray's phallocentric world of the not yet existing *féminin* subject. On this read of becoming-woman, feminist philosophers are unable to *do* philosophy and remain trapped chewing philosophical crumbs alongside the man's world of *real* ontology. But, Olkowski's various references to animality and corporality lurking beneath the surface questions of the logic of the One and the identities it both produces and erases beckon us to the *philosophical* concepts virtually present in becoming-woman and an ontology of sexual difference. These questions also ask feminists to do philosophy, ontology, and ultimately repudiate humanism at a more fundamental level.

So it is clear that this volume brings together a variety of feminist linkages to Deleuze that return feminist philosophy to the job of philosophy. We hope this will serve as an inspiration to other philosophers who seek to continue to unpack the open secrets.

Notes

1. While I acknowledge that many non-human animals reproduce sexually, this is certainly not the case for all living non-human creatures. It is important here to recognize the multiplicity always part of the construct 'animal' for, neglecting to do so already begs the question of the humanistic logic of the One, where 'the non-human animal' is a singular lack to the singular human One.
2. I must acknowledge that the same argument could possibly be made in reverse. That is to say, if we started with the human/non-human animal distinction, detected its logic of the One, we would still be left with the problem of sexual difference, especially since the case could easily be made that many animals reproduce sexually. So what I am suggesting here is that the ontology of sexual difference is a necessary part of the deconstruction of Enlightenment Humanism but so is zoontology. However, my suspicion is that zoontology would trump the ontology of sexual difference along the path toward foundational ontologies insofar as it gets to the core of the humanist logic and its human chauvinism.
3. I will not take the liberty of presenting my theory of transspecies zoontology here nor will I explain why it more thoroughly responds to core problems of Enlightenment Humanism. However, suffice it to say (as I have said elsewhere) that the concept 'human' has been a relatively modern construction, one that relies on a clear distinction from what is deemed to be 'animal.' It is precisely the moment that 'animal' came to be seen as other to man that Foucault, in the *Order of Things* indicates when he asserts that man as an epistemological entity, as a species, came into being. Humanity then became the subject in contrast to the animal object. But, as Nietzsche forewarned, this was the great error of the arrogant modern man.
4. I am not proposing that there is a single fundamental ontology or ever could be, as I am not sure that trying to determine a foundation can ever be a productive strategy for progressive political battles.

The Experimental Ordinary: Deleuze on Eating and Anorexic Elegance

Branka Arsic State University of New York, Albany

Abstract

The paper discusses Deleuze's concept of the feminine through exploration of the questions of eating, cooking, and specifically anorexia, as well as an 'anorexic relation' to fashion and dressing. It argues that anorexia should be understood as a micro-political experimentation in fashioning one's own body on its flight to becoming woman. In accordance with Deleuze's ontology of the surface, the anorexic body can be seen as the invention of the BWO that forms an assemblage with clothes and, in so becoming different, invents for itself different desires.

Keywords: body, ascesis, anorexia, eating, cooking, fashion, desire.

Feminine desires activate various processes in Deleuze. They set intensities on paths called 'becoming-woman'; they gesture towards secrets; or else they make pacts with larval selves so as to change more global gendered or mental set ups. They also activate a series of micro-political practices of asceticism, which destabilise the mind to the point of doing away with persons. Masochism is one such pragmatics: in experimenting with pain it works to unsettle the formation of personal boundaries. However, the varieties of ascetic politics – masochism, anorexia, drug addiction, alcoholism – differ, even if sharing some features. They are all 'assembled' by a desire that experiments on and with borders and they are all seduced by anomalous or abominable unions, while producing different effects: 'If the machine is not a mechanism, and if the body is not an organism, it is always then that desire assembles. But it is not in the same way as a masochist assembles, or a drug addict, or an alcoholic, or an anorexic. Etc.' (Deleuze 1987: 109). Whereas masochism works with waves and rhythms, hence often outside the specular, anorexia works within the domain of visual perception. It represents experimentation with the production of visual

signs, disturbing the way we distinguish among forms of organs or bodies, persons or sexes. Whereas masochism is a micro-politics that operates between the 'I' and the 'You' in order to negate the force of identity politics and explore ways in which I becomes You, anorexia operates between the 'I' and smaller social groups, such as, for instance, a family. Whereas masochism is about restructuring the organs of one's own body, anorexia restructures the relations among many bodies and signs: food, clothes, drinks, sexuality. Anorexia is thus both the process of experimenting with the form of the body – its resexualisation – and the politics of disturbing the socially imposed order of everyday life. In what follows I will examine how codes that dominate female bodies are turned against themselves in anorexia and employed in the contrivance of new experimental femininities.

Deleuze's understanding of anorexia differs fundamentally from the common understanding of *anorexia nervosa*. To label it 'nervosa' is itself ideologically charged and so signals its own political position. To call anorexia a neurosis is to suggest the answer to its enigma. Hence, according to the famous reading offered by Freud and Breuer, hysterical nervousness is the repetition of reminiscence; the anorexic suffers from an unsuccessfully repressed past trauma. Anorexia would thus have its origin in a type of genealogical disorder. Whereas most psychic disorders obey the dictum 'when the cause ceases the effect ceases,' in hysterical nervousness this genealogical principle is reversed and the cause finds a way to survive and directly affect the body:

> We may reverse the dictum 'cessante cause cessat efectus' ['when the cause ceases the effect ceases'] and conclude . . . that the determining process continues to operate in some way or other for years – not indirectly, through a chain of intermediate causal links, but as a directly releasing cause – just as a psychical pain that is remembered in waking consciousness still provokes a lachrymal secretion long after the event. Hysterics suffer mainly from reminiscences. (Breuer and Freud 1956: 58)

Healing anorexic nervousness would involve imposing a genealogical order by curing the 'origin;' it would require the analyst to detect the cause and then to try to weaken its force, so that once the cause ceased so would the effect. Such ideas of origin, order, genealogy and reminiscence guide this interpretation; and while it remains important in signaling the power of affection in anorexia – as a directly inflicted pain – it nevertheless hides the fact that the origin exists only as the phantasm of origin, hence itself a 'cause' of neurosis, thus blocking the access to the 'nature' of anorexia.

Anorexic Betrayals

To call anorexia an eating disorder is to suggest not only the existence of a phantasmatic origin but also a fantasised order, since it is to insist that there is a proper eating order. In contrast to that, Deleuze will argue that the idea of eating order confuses the fact that the organism has to live on something (but on what, precisely?) with a particular order of eating: 'The anorexic void has nothing to do with a lack, it is on the contrary a way of escaping the organic constraint of lack and hunger at the mechanical mealtime' (Deleuze 1987: 110). Finally, to say that the anorexic has a different image of her own body, which does not adequately represent the 'real' shape of it – to say for instance, that she sees her body as big in spite of the 'fact' that it is becoming thinner – is to suppose the normalising instance of a shared perception: one should see one's own body the way everybody else sees it.

In contrast to these readings of anorexia Deleuze will claim that the anorexic is not driven by a refusal of the body but rather by the refusal of a certain ideology of the body. The anorexic refuses the idea of the 'organised,' or organic body: 'It is not a matter of a refusal of the body, it is a matter of a refusal of the organism, of a refusal of what the organism makes the body undergo. Not regression at all, but involution, involuted body' (Deleuze 1987: 110). Anorexia is therefore an experimentation with the emancipatory invention of a body that would not subject us to its demands.

It is also a politics of betrayal of natural hunger. Anorexics 'betray hunger, because hunger tricks them by making them subject to the organism' (Deleuze 1987: 110). Not to eat when the organs are hungry is to overcome the demands of specific organs in order to reach the fullness – immanence – of the body; it means forcing the organs to live without expectations and thus to become ascetic. Anorexia is therefore a praxis of asceticism.

The asceticism Deleuze has in mind – making the body lighter, while maintaining its materiality – aims to replace extensive quantities with intensive qualities of lightness and fastness. The anorexic experiments with becoming ever lighter so that in moving faster she turns extensions into intensities or pure affects. But to transform extensions (of organs) into intensities (of affection) is also to negate the limitations formed by organs and to produce a body made of alterations. Such a body, Deleuze suggests, is a rhythm of affects, intervals and appearance of new affects. The anorexic thus experiments with the affects of 'void' and 'fullness:' 'The anorexic consists of a body without organs, with voids

and fullnesses. The alternation of stuffing and emptying: anorexic feasts, the imbibings of fizzy drinks. We should not even talk about alternation: void and fullness are like two demarcations of intensity; the point is always to float in one's own body' (Deleuze 1987). The anorexic is an inventor of a light and liquid body.

However, the anorexic betrays not only hunger (by eating irregularly, for instance) but also food, by never eating those large assemblages commonly called meals. What is more, she is experimenting with the possibility of eating that would be neither carnivorous nor involve eating 'fresh' life. She tries to find out whether it is possible to live on something without necessarily killing any 'body.' In so resisting the consumption of other bodies – and it is here that we see how anorexia becomes political – the anorexic resists the idea of being consumed by them: 'Anorexia is a political system, a micro-politics: to escape from the norm of consumption in order not to be an object of consumption oneself' (Deleuze 1987: 110). The anorexic eats bits and pieces, takes mouthfuls or sips, steals crumbs after the dinner is over, takes little bites from somebody else's plate, lives on the leftovers: 'I'm starving,' she says, grabbing two 'slimming yoghurts' (Deleuze 1987: 111). In other words, she assembles her body by collecting the particles of what has already been eaten. She composes her body out of already inorganic bodies in order to give herself a body that is equally inorganic. 'Her goal is to wrest particles from food, minute particles with which she will be able to create her void as well as her fullness, depending on whether she gives them out or receives them' (Deleuze 1987: 110).

Doing Cooking

The anorexic politics of tricking food by assembling a meal out of crumbs can become particularly subversive if she develops a taste for cooking; for then, as Deleuze says, she will turn 'consumption against itself: she will often be a cook, a peripatetic cook, who will make something for others to eat, or else she will like being at the table either without eating, or else multiplying the absorption of little things, of little substances' (Deleuze 1987: 110). The peripatetic cook turns consumption against itself because she does not let herself be consumed by the consuming. Everything is prepared for consumption and yet consumption does not occur since peripatetic cooking is precisely about enjoying the process of preparation without devouring its result; the anorexic is thus not entrapped by cooking for she does not eat what is cooked.

In *The Practice of Everyday Life* Luce Giard calls this praxis of cooking 'doing cooking' in contrast to simple 'cooking.' Doing cooking has nothing to do with eating what one has cooked:

> I discovered bit by bit not the pleasure of eating good meals, but that of manipulating raw material, of organising, combining, modifying, and inventing. I learned the tranquil joy of anticipated hospitality, when one prepares a meal to share with friends in the same way in which one composes a party tune or draws: with moving hands, careful fingers, the whole body inhabited with the rhythm of working, and the mind awakening, freed from its own ponderousness, flitting from idea to memory, finally seizing on a certain chain of thought, and then modulating this tattered writing once again. Thus, surreptitiously and without suspecting it, I had been invested with the secret, tenacious pleasure of *doing-cooking*. (Certeau, Giard and Mayol 1998: 153)

Doing-cooking is thus a version of the process of composing a tune or drawing. It is the art of making a body, reorganising particles, reassembling them, and doing so through the repetition and difference of rhythms and motions of one's own body. But it is also about inventing a spiritual intensive body, since the motion of body gives rise to the chain of thought which one inhabits rhythmically in order to move the mind. Doing-cooking is thus not only about tactile joy but about making hand and thought indistinguishable, about 'seizing on a . . . thought' that would fall in with the rhythm of the body, which then inscribes itself into a new body it is contracting ('modulating this tattered writing once again'). By inscribing its rhythm into the body of prepared food such cooking produces a textuality; it is not about eating but about writing and reading. In the words of a woman quoted by Luce Giard:

> When this became clear in my mind, it was already too late. It then became necessary to try to explain its nature, meaning, and manner to myself in the hopes of understanding why that particular pleasure seems so close to the 'pleasure of the text,' why I twine such tight kinship ties between the writing of gestures and that of words, and if one is free to establish, as I do, a kind of reciprocity between their respective production. (Certeau, Giard and Mayol 1998: 153)

Doing-cooking is therefore about writing a text and then enjoying reading it: watching other people eating it, without participating in the meal or participating peripatetically, as a spectator who is only passing by.

By eating little substances from the plates of others after they have finished eating, or by cooking and serving the food without eating it,

anorexic politics not only betrays hunger and food but also the ideology of family meals. Anorexia, Deleuze suggests, should thus also be seen as a protest against family meals and the dynamics of love and power traversing them (Deleuze 1987: 110). By the same token, when the anorexic prepares food for her friends and then watches them eating she is refusing to believe that only the ritual of 'eating together' – the ritual of sharing the dead bodies of others – can bring us closer. Instead, peripatetic cooking – the process of creating a new body as the gift for the guest – is her way of hosting: 'tranquil joy of anticipated hospitality.'

Case Study: Kafka

Kafka's love story with Milena can be read as an experiment in non-eating (together), thus as an effort to come closer to another without eating with her or, more radically, without eating at all. Kafka worked at evading the universal law that one has to eat in order to live. Not only was he a vegetarian who found pleasure in contradicting his sanatorium neighbor according to whom 'a meat diet [was] absolutely essential' for mental work (Kafka 1953: 70), advocating the perverse common-sense idea that thinking depends on eating life. More radically, Kafka experiments with the anomalous possibility of living without eating at all: 'the eating which I resumed again today (yesterday I ate nothing)' (Kafka 1953: 40). If he sometimes eats, he explains, it is only because there is always that 'call for dinner,' the 'mother's call,' a plate in front of him that his mother put there, which always faces him with the circumstance that 'unfortunately' food 'wouldn't disappear from the plate save by being swallowed' (Kafka 1953: 126), whereas he would rather avoid swallowing (is it possible to live without swallowing others?). Similarly, he explains to Milena, he will eat while in the sanatorium only in order to be able to travel to Prague and Vienna to see her: 'on the ground floor of my building is, obligingly enough, a vegetarian restaurant where I'm eating, *not in order to eat* but to bring with me to Prague a certain amount of weight' (Kafka 1953: 61) – even though he realises that his economy, the fact that he takes a mouthful or two for love of the mother or lover, is non-economical since he is in fact trying to do away with that economy. Here is the secret of his politics of the body: to the torturous question so often asked by the members of his family – How much weight have you put on this time? – he wants to be able to answer not, 'I have put on or lost this or that much weight,' but 'And one is losing weight' (Kafka 1953: 70). Where there was an 'I' ('I lost weight') now there is 'one,' some body becoming lighter, an impersonal and inorganic body.

Such a body thus enters the outside of the law and becomes not a body that performs or fulfills tasks, obeys or demands, does or does not respond to calls (finally free from the 'call for dinner'), but one that approaches the joyful irresponsibility of lightness and freedom that Kafka's literary characters strove, always unsuccessfully, to achieve. This light body, Kafka explains, is alive, but belongs to no citizen of the world, for it is a non-trust worthy body:

> don't you know that only fat people are trustworthy? Only in these strong-walled vessels does everything get thoroughly cooked, only these capitalists of the airspace are, as far as it is possible for human beings, protected against worry and madness and are able to go calmly about their business, and they alone are, as someone once said, useful in the whole world as world-citizens, for in the North they warm and in the South they give shade. (Kafka 1953: 49)

In contrast to the citizens who eat, Kafka's body is so light that it is 'weak-walled' (becoming the body without organs), approaching the ecstasy of forms through trance-formation. It is the body of a lumpen-proletarian of the airspace that barely breaths, even though it is still alive, inhabiting the very boundary between life and death. Kafka sees it as a body that has become so small and imperceptible that it is 'incapable of dying,' even when 'the angel of death, the most beatific of all angels' comes and looks at it and calls it. It is a body become so light that it is incapable of sleeping: 'how could I have slept, since I, too light for sleep, circled around you . . . ' (Kafka 1953: 45). The anomalous logic of Kafka's anorexic thinking suggests that sleeping requires a certain amount of weight: that one has to eat in order to dream. Sleep is possible only under the law of what Derrida calls 'carno-phallogocentrism,' the law of the carnivorous virility that constitutes the 'human' world: 'I would like to explain *carno-phallogocentrism*, even if this comes down to a sort of tautology or rather hetero-tautology as a priori synthesis . . . it suffices to take seriously the idealizing interiorization of the phallus and the necessity of its passage through the mouth, whether it's a matter of words or of things, of sentences, of daily bread or wine, of the tongue, the lips, or the breast of the other' (Derrida 1995: 280). But a body that does not swallow, breathe, sleep, dream or die, which is how Kafka wants his body, becomes an inorganic and living sensuality that, by falling outside the human, evades its 'carno-phallogocentrism.'

Kafka described the life of such a body in a series of his 1922 diary entries. Comparing his life to that of his bachelor uncle, he wrote: 'Both living the most unvarying lives, with no trace of any development, young to the end of your days ("well-preserved" is a better expression)'

(Kafka 1976: 403). A well-preserved life, an eternally young life, exists outside of time, or as an inorganic life of the body without organs. But it is not dead for being out of temporality; rather it is liberated from the self-mediation by which it could appropriate itself and set itself on the course of development. Kafka does not want to develop his life: 'I don't want to pursue any particular course of development.' It is easy to pursue paths, he suggests; for that it is enough to split oneself, 'it would be enough if I could exist alongside myself, it would even be enough if I could consider the spot on which I stand as some other spot' (Kafka 1976: 405). In other words, it would be enough to become a subject. But Kafka's subjectivity remains a hypothesis – 'if I could' – out of reach; his weakness is his inability to host a firm personal identity. As long as he remains incapable of self-mediation his life is without history (therefore outside of time), a life without genesis. It is a nameless life that feels without localising the feeling. Kafka described it as a hesitation that occurs before inhabiting a person: 'Hesitation before birth. If there is a transmigration of souls then I am not yet on the bottom rung. My life is a hesitation before birth' (Kafka 1976: 405).

Manners: The Body of the Cook-Model

A life without development is not in stasis; it does not follow the path of organic, linear progress and escapes the connection between cause and effect, but it still has its motions and intensities. Located outside genealogy, historical formation and the organism, it wants to invent a different logic and different signifiers, to construe signs that would not be representative of something, but be bodies in themselves. The anorexic thus opposes symbolics to cartography, since her body is not the symbol of a lack of food, of psychic disorder, or of a disturbance of desire, but is instead, a chart of newly invented signs which are its very matter. As an anomalous chart of signs that defy symbolics the anorexic embodies a negation of the differences between genus and species or between genders. The anorexic is neither masculine nor feminine but – contrary to such a distinction – a process of becoming a woman, the 'woman-becoming of every anorexic' (Deleuze 1987: 110).

Nor is the anorexic's inorganic body an asexual one: 'There is a whole plane of construction of the anorexic, making oneself an anorganic body (which does not mean asexual: on the contrary...).' It is, as I have suggested, about the production of certain fluxes and its sexuality will be an exercise in the fusion of those fluxes: fluxes of food (crumbs, tiny substances); fluxes of liquids (the imbibing of fizzy drinks); fluxes of

abstinence or consumption; fluxes of signifiers that disrupt genealogy. Deleuze suggests that in anorexia all these fluxes mix, get assembled and reassembled in order finally, to be, combined with the fluxes of clothes: 'The case of anorexia. It is a question of food fluxes, but combined with other fluxes, clothes fluxes, for example (specifically anorexic elegance)' (Deleuze 1987: 110). Thus, not only can it happen that the anorexic is a peripatetic cook; she will also often be a model: 'She will often be a model – she will often be a cook . . . Cook-model, a mixture that can only exist in this assemblage, this system, and which will be dissolved in different ones' (Deleuze 1987: 110). Deleuze thus obviously wants to do away with the idea that models are simply an effect of the socially imposed image of the body. According to this misconception, the body of the model would be fashioned after the already existing image of a perfect female body, which is to say as a regulative representation that imposes the norm of the erotic body. Such an image would be a phantasmatic vehicle aimed at disciplining female bodies, making them uniform according to a presupposed, but equally phantasmatic masculine desire. Models would thus be an image of the feminine body that responds to masculine desire. The image of the model, then, enables both the circulation of socially desirable bodies and the masculine desire that controls feminine bodies. But such an interpretation is itself caught in the ideology of two sexes, Deleuze suggests, since in supposing that the masculine fashions the feminine it itself fantasises the existence of a universal masculine desire. However, desires are neither masculine nor feminine but always singular, assemblages of various masculine, feminine, vegetable, animal and inorganic components. And it is the particular singularity or admixture of those components that produces the specificity of anorexic desire.

To 'have' an anorexic cook-model body is precisely to experiment with its fashioning by mixing fluxes of food with fluxes of clothes, which will turn the body into a texture of specifically anorexic signifiers. For that reason the question of fashion becomes so important for the anorexic. Here, Deleuze wants to avoid another widespread prejudice. Anorexic elegance, he will claim, is not about consuming – having things that everybody has – but rather about existing in a mode that subverts the difference between genus and species. It tries to find its way out of the opposition between being and non-being by entering the existence of becoming or, more precisely, of manners. Anorexic elegance, then, is about modal existence, and its signifying logic is similarly one of manners. The formula of anorexic elegance, therefore, is not fashion and consumption but fashion and manners or style ('style. . . a 'mode of life' [Deleuze, 1987: 3]).

Manners are the operators of modal logic; based on adjectives and infinite verbs modal logic is the force of what Deleuze calls 'differentiating being,' itself a motion made of a 'plurality of centers,' or becomings. As the logic of multiplicity without substance, modal logic is one of intensities – of the 'being of the sensible' (Deleuze 1994: 57) – and it is with that being that the cook-model experiments. The formulaic version of modal being – "the same returns not, save to bring the different' – is something Deleuze takes from Benjamin Blood's *Anesthetic Revelation*, quoted by William James. Deleuze also elaborates modal being through James' radical empiricism, which owes a great deal not only to Blood but also to Emerson. It is therefore not surprising that the logic of manners, and by extension of fashion, which Deleuze seeks to elaborate, leads to the American philosophers whose thinking was nothing if not a fascinating effort to articulate a manneristic ontology. The radicality introduced by these thinkers into the Western understanding of manners, and the kind of body that is at stake in the manneristic body of the cook-model, become evident once one examines the logic proposed by Emerson and James, which is echoed by Deleuze in *Difference and Repetition.*

Manners, says Emerson, are not rituals: 'The maiden at her first ball, the country-man at a city dinner, believes that there is a ritual according to which every act and compliment must be performed, or the failing party must be cast out of this presence. Later, they learn that good sense and character make their own forms every moment' (Emerson 1996: 520). Manners are opposed to rituals because they are opposed to forms: 'For there is nothing settled in manners, but the laws of behavior yield to the energy of the individual' (Emerson 1996: 519). Emerson, thus elaborates a novel concept of manners that works against the etymology of the word. For manners (from *manere, maniere*) etymologically refer to what is accustomed or ritualised. Colloquially understood, then, the word refers to our habitual ways of behavior, to a usual form of acting. By defining manners as what unsettles the habitual – what Benjamin Blood, cited by Deleuze, refers to as the 'wild' (Deleuze 1994: 57) – Emerson signals that they are a way of being that goes against not only our 'natural' needs (our so-called 'first nature') but also against our habits ('second nature'). The manneristic way of life, he implies, is thus a 'technology of the self,' which could be determined as the praxis of ridding us of a habit. Manners become a painful exercise that forces one to re-shape one's identity while declining from relying on anything firm or formed. Manners are differentiating processes before the establishment of differences, what Deleuze would come to call 'lines of flight.'

Manners are unsettling because, says Emerson, they are the effect of a momentous 'fine perception' (Emerson 1996: 523) that registers what passes as imperceptible for everybody else. They belong to what he calls 'the energy' of the individual, resulting from motions that escape the perception of the 'I;' they happen to the I, they are never designed by it. In contriving themselves as differences produced by life rather than by a reflective self they lead the self to abandon its habits. And since manners force the 'I' in us to yield to the laws of behavior that constitute it, by the same token they force the I to give up on itself; they are the expression of a life freed from the obstacles of personhood: 'Manners aim to facilitate life, to get rid of impediments, and bring the man pure to energize. They aid our dealing and conversation, as a railway aids traveling, by getting rid of all avoidable obstructions of the road, and leaving nothing to be conquered but pure space' (Emerson 1996: 517). Manners do not exist as 'mine' but are possible only as the effect of the relation that connects impersonal lives. They are processual yet a-temporal, negating the 'I' that always remains conditioned by time. Manners are a purely exterior relation that belongs to nobody, styles in sheer space ('leaving nothing to be conquered but pure space'). For that reason they amount to a most profound criticism of western ontology, subverting the distinction between being and non-being. They are, but they are 'nobody's,' 'points and fences disappear,' Emerson says, there is only flying and fleeing. They therefore 'introduce' being – since they are – but in such a way that nothing particular can be ascribed to that being, neither substance nor essence. When Deleuze talks about anorexic elegance and style, and when he specifies style to be a mode or manner of life, he is evoking this idea of manneristic living as an experiment in the impersonal, in the diminution of the 'I' that gives way to an intensified life. It is precisely with such a way of being that the anorexic-model conducts its experiments.

To return to Deleuze via Emerson once more, the 'style' this 'non-individual' singularity is produced precisely by fashion. In its objectless existence, fashion becomes the profound enactment of manneristic existence: 'the objects of fashion may be frivolous, or fashion may be objectless, but the nature of this union and selection can be neither frivolous nor accidental' (Emerson 1996: 519). To hold that fashion is objectless is to suggest that it does not signify or represent anything; it is not an idea of a body that a subject wants to convey to another subject. Rather, it is the materiality of its own presence; it is the body fashioned. Fashion crafts the body in such a way that it mutates and appears in its outsideness, manifesting itself on the surface; in becoming inorganic the body becomes its clothes. But since the disappearance of

the organic body is, in fact, the vanishing of the self – for self is located in the image of its own body – fashion becomes the force of absorption of the self into itself; by negating both body and self it produces an assemblage of subjectless-objectless clothes in motion. The radicalism of experimentation with fashion lies, then, in the fact that the prosthetic body contrived of clothes becomes the only body there is. Fashion is thus the operation through which the organic body and its self takes off into inorganic flight.

It is only by means of Emerson's identification of fashionable manners with the occurrence of a rhythmical and 'musical nature' (Emerson 1996: 529) or with a 'more transparent atmosphere,' that one can understand Deleuze's sparse remarks on anorexic elegance and the body of the model. Manners are atmospheric because they are a purely external relation, existing in the outside as a selfless and objectless 'something.' They move impersonally through the bodies of others, traversing their perceptions and so affecting them. Manners – styles, modes – therefore have the nature of a Deleuzian event.

The event is what Deleuze refers to as the happening – an almost imperceptible occurrence – of *something*; something without any representable identity and hence without sufficient reason. An event, therefore, always occurs as 'something that happens' and not as a 'this' or 'that' that is going on (Beckett gave perhaps its most precise formulation in saying 'something is taking its course' [Beckett 1958: 32]). And because this happening of something cannot be represented or identified, it happens to no one. Once the event is identified it has already taken place; identification of it comes only in retrospect. But while it is happening it is the only entity there is, non-appropriated, unnamed, unimagined, just 'something' taking its course. Entities are thus neither things nor objects, neither thoughts nor concepts, but purely external relations or manners. The reverse holds too: only manners are events since, according to Deleuze's equation 'true Entities are events, not concepts . . . . ENTITY = EVENT; it is a terror, but also great joy (Deleuze 1987: 66).' The terror derives from an annihilation of the 'I', but it is also the great joy of no one caused by something since the joy is never personalised or appropriated (the gestures that transform joy into the pleasure of the subject). It is an impersonal excitement of little motions that change the direction or rhythm of all perceptions; Deleuze compares it to the breeze in a desert, or else to 'small,' 'delicate' things: 'Making an event – however small – is the most delicate thing in the world: the opposite of making a drama or making a story' (Deleuze 1987: 66). Again, this delicate thing is a terror

because it inflicts the suffering of constant displacement without the comfort of reterritorialisation (becoming is unsettling, there is nothing pleasurable about becomings); and it is joy because the terror of slight dislocations – the feeling that one is never quite in one's place – brings with an 'atmospheric variation,' ushering in the fresh air that enables breathing. As Deleuze says, echoing Emerson: 'Loving those who are like this: when they enter a room they are not persons, characters or subjects, but an atmospheric variation, a change of hue, an imperceptible molecule, a discrete population, a fog or a cloud of droplets. Everything has really changed' (Deleuze 1987: 66).

The anorexic model experiments precisely with such real changes in the atmosphere, with events. In his 'Homage to Fanny' Deleuze specifies that anorexic experimentation works not only with clothes – a body becoming an inorganic patchwork, a design, a style – but also with variations and alternations of stuffing and emptying, ever so slight (Deleuze 1987: 110). When an anorexic cat-model enters the room what actually walks in is not a person, character or a subject, but 'a discrete population' of clothes, voids and ways of walking – a manner – whose delicate being will cause an atmospheric variation.

Fashion and Radical Empiricism

It was William James who, in his *Psychology: Briefer Course,* drew radical consequences from Emerson's hints about manners and fashion. In chapter XII, on 'The Self,' James differentiated among the material, social and spiritual Me, identifying the body as the inner core of the material selfhood:

> The *body* is the innermost part of the material me in each of us… The clothes come next. The old saying that the human person is composed of three parts – soul, body and clothes – is more than a joke. We so appropriate our clothes and identify ourselves with them that there are few of us who, if asked to choose between having a beautiful body clad in raiment perpetually shabby and unclean, and having an ugly and blemished form always spotlessly attired, would not hesitate a moment before making a decisive reply. (James 1992: 175)

The clear distinction between body and clothes – body comes first, the clothes next – is thus made only in order to be blurred. Since people always prefer nice clothes and an ugly body to a beautiful body and bad clothes, James will come to reverse the prioritisation of his initial distinction and claim priority for clothes. Clothes come before the body

because the self identifies with them more intensely than with its body, thus in fact turning the clothes into the body, literally or materially, producing the body out of inorganic artificial textures. The innermost core of the material self is thus its clothes. But this inversion doesn't affect only the material self; in order for clothes to morph into the material self, what James calls the 'spiritual me' – the self 'proper' as it were – has to identify with them and so appropriate them as its own body. Not only, then, do clothes become the body, but through the process of identification they enter the spiritual me. The innermost core of the spiritual turns out to be textile. The scandal of the self that James signals, thus lies in the spiritual's contrivance as inorganic exteriority. The logic of James' argument is similar to Emerson's since here, too, through its identification with clothes, the object (the body) is removed, and fashion enters the spiritual self, absorbing it into an assemblage of selfless clothes.

If this reading seems idiosyncratic one should remember that after describing various 'states of consciousness,' (attention, conception, discrimination, emotion and will) James added an 'Epilogue' to the *Course* that destabilised the existence of the 'I' and blurred distinctions among 'interiority,' spirituality, personality and exteriority. In fact, he wrote there that the psychology he himself had outlined was a 'mere provisional statement from a popular and prejudiced point of view' (James 1992: 432), based on the premise of an interiority whose existence could not be proven. The real question, the question of the existence of the 'I' and the 'states of consciousness,' remained for him disturbingly open, for everything pointed to its non-existence:

> States of consciousness themselves are not verifiable facts . . . . Neither common-sense, nor psychology so far as it has yet been written, has ever doubted that the states of consciousness which that science studies are immediate data of experience. 'Things' have been doubted, but thoughts and feelings have never been doubted. The outer world, but never the inner world, has been denied . . . . Yet I must confess that for my part I cannot feel sure of this conclusion. Whenever I try to become sensible of my thinking activity as such, what I catch is some bodily fact, an impression coming from my brow, or head, or throat, or nose. It seems as if consciousness as an inner activity were rather a *postulate* than a sensibly given fact. (James 1992: 432)

This conclusion supports my reading of James' chapter on clothes and the Self. In contrast to the metaphysical voices dismissing the external as a mere superfluous accident, James claims exteriority to be the only thing there is; the 'I' with its apparatus of interiority and spirituality is only a fragile hypothesis, a postulate effected by our 'will to believe'

in it, whereas it is in fact impossible to sense, feel or think. There is, thus, only a multiplicity of points and lines, whose intensity gives them a certain extension that composes an exteriority, an exteriority that has to be called pure as it depends on no interiority. The is why the only sustainable hypothesis is that of an exterior that thinks and affects itself, what James called 'radical empiricism.' The lines of motion of these thought-affects constitute the living world, are its cartography.

The Deleuzian anorexic cook-model, I am suggesting, is in those terms a radical empiricist. Her experimenting with fashion is guided by a weakening of the 'will to believe in the 'I," since her acts are directed against the prejudice of its existence. She experiments with becoming a 'multiple exteriority,' whose body and self are assembled from the artificial materials of clothes and their motion. In that way she invents a body transformed into the lines of a specific functioning: the motion of clothes, the void of the body becoming the rhythm of walking, and the walk – the 'cat walk' – turning the rhythm of the walk into an anorexic becoming animal. As Deleuze suggests, such a body works, but loses both its organic and its social functionality. Because her body is neither objectivised – but, to the contrary, is made objectless – nor subjectivised – since she is impersonal – it escapes the demands the social wants to impose on it. Its functioning renders social codes inoperative. That is why Deleuze specifies anorexia as a micro-political rebellion. Far from being an effect of obedience to consumer neurosis, the anorexic experimentation is: 'a feminine protest, from a woman who wants to have a functioning of the body and not simply organic and social functions which make her dependent' (Deleuze 1987: 110).

Only from the perspective of the modeling of the anorexic body can the question of a specifically anorexic elegance be addressed. What perhaps remains to be understood is Deleuze's identification of the 'wholly trinity' of anorexic elegance: Virginia Woolf, Murnau, Kay Kendall.

Waves, Cardigans and Facelessness

Virginia Woolf figures prominently in the anorexic cartography because of the ways in which she turns assemblages of things – words, clothes, bodies – into the motion of waves. Waves are passages, the paradoxical existence of a non-being, with which the anorexic also experiments. As Deleuze and Guattari explain:

> Waves are vibrations, shifting borderlines inscribed on the plane as so many abstractions . . . In *The Waves*, Virginia Woolf – who made all of her life and

> work a passage, a becoming, all kinds of becomings between ages, sexes, elements, and kingdoms – intermingles seven characters, Bernard, Neville, Louis, Jinny, Rhoda, Suzanne, and Percival. But each of these characters, with his or her name, its individuality, designates a multiplicity (for example, Bernard and the school of fish). Each is simultaneously in this multiplicity and at its edge, and crosses over into the others . . . . Each advances like a wave, but on the plane of consistency they are a single abstract Wave whose vibration propagates following a line of flight or deterritorialization traversing the entire plane. (Deleuze and Guatarri 1988: 252)

A wave, then, is this multiple individuality that at the same time resides within itself, at the edge separating it from other bodies, and crosses over into those bodies; no longer itself, but nothing definitive yet, leaving itself while arriving only at motion, a motion engaged simultaneously in various alliances.

Take the example of Rhoda. She herself signals an anorexic pragmatics by experimenting with the lightness of the body, with its becoming ever thinner, so she can become imperceptible and thus enter Susan, Jinny or Bernard, but never to stay Rhoda or become her again. She wants to have a body that can 'fall through the thin sheet now;' she wants to be able to 'spread my body on this frail mattress and hang suspended.' She wants to become so light that her body will be turned into a ray of light and finally fly over the body of Earth, never again pressured by the force of gravitation: 'I am above the earth now . . . All is soft, and bending . . . . Out of me now my mind can pour . . . heap themselves on me; they sweep me between their great shoulders; I am turned; I am tumbled; I am stretched, among these long lights, these long waves, these endless paths, with people pursuing, pursuing' (Woolf 1959: 28).

Rhoda's gesture is one of protest, protest against a world made of people 'pursuing, pursuing,' or functioning, functioning, in order to become alive, a dysfunctional multiple wave. But she cannot flee and fly, without becoming faceless. In fact, she is becoming faceless in order to be able to inhabit faces, not only Susan's or Jinny's, but those of all nameless women, and thus in order to realise the paradox of assuming the face of *a* woman, an impersonal, unknown face: 'But I attach myself only to names and faces; and hoard them like amulets against disaster. I choose out across the hall some unknown face and can hardly drink my tea when she whose name I do not know sits opposite. I choke. I am rocked from side to side by the violence of my emotion' (ibid.: 43). The anorexic living on tea chokes on it, interrupting its liquid flux, leaving that line and moving into an impersonal assemblage composed

of unknown faces. It is that very moving in and out that puts her on the line of intense rocking, that of 'the violence of my emotion.'

But Rhoda knows that this becoming a 'rocking' emotion by passage through names and bodies is also related to becoming other women's clothes. As she explains, it's not only a matter of having Jinny's stockings or Susan's skirts, but also about wearing stockings the way Jinny does, wearing skirts the way Susan does; thus, it is about combining various women's styles, picking up on the way they wear their clothes: 'See now with what extraordinary certainty Jinny pulls on her stockings' (Woolf 1959: 28). To wear the clothes of women in the multiple ways they wore them is to experiment in composing variable abstract planes of signs, to assemble impersonal styles into new modes of immanence; but to do so is also to compose a whole cartography of diverse histories – to spatialise time – since Rhoda's assemblages crystalise the whole history of women's clothing, moving and gesturing in a moment of almost perfect composition, the moment of being rocked from 'side to side.'

Such is the temporality of anorexic elegance: time embedded in a place in space and appearing out of it; the whole history of a body swallowed by the now of a thing. That is how I read Virginia Woolf's sentence quoted by Deleuze and Guattari as a formulaic expression of the organic stepping over the threshold of the inorganic: 'The thin dog is running in the road, this dog is the road' (Deleuze and Guattari 1992: 263). Similarly, the thin Rhoda is walking in everybody's clothes, Rhoda is those clothes. This anorexic becoming of an impersonal place enacts the production of feeling spread out through space, in a world where humans become a summer and plants morph into an afternoon: 'That is how we need to feel. Spatiotemporal relations, determinations, are not predicates of the thing but dimensions of multiplicities . . . We are all five o'clock in the evening, or another hour, or rather two hours simultaneously, the optimal and the pessimal, noon-midnight, but distributed in a variable fashion. The plane of consistency contains only haecceities, along intersecting lines. Forms and subjects are not of that world' (Deleuze and Guattari 1992: 263). Rhoda's clothes embody such a haecceity; they represent not other women and their habits or sexuality, but the line of motion of a woman, the trajectory of movement of an abstract and impersonal woman. Her clothes are, therefore, not symbolic; rather, her motion outlines a chart: 'A cartography and never a symbolics.' The hope of the anorexic-model is that her abstraction – her clothes produced as the perfect combination of signs signifying nothing and calling for nothing – will outline a chart of her movement; her hope is that she will become a cartography taking an impersonal walk and

constructing an altogether different London, with neither streets nor people but only fleeting stares or glares.

Virginia Woolf experimented thus: long cardigans, hair pulled back, everything working towards becoming ever longer and thinner, only a curve, a line taking a walk:

> Virginia Woolf's walk through the crowd, among the taxis. Taking a walk is a haecceity; never again will Mrs. Dalloway say to herself, 'I am this, I am that, he is this, he is that.' And 'She felt very young: at the same time unspeakably aged. She sliced like a knife through everything; at the same time was outside, looking on . . . She always had the feeling that it was very, very dangerous to live even one day. Haecceity, fog, glare.' (Deleuze and Guattari 1992: 263)

Or, as Deleuze also suggests, shadows and contrasts.

The Dynamic Sublime and the Question of Make-up

If Virginia Woolf stands in the trinity of anorexic elegance for becoming the clothes of the body, Murnau stands for becoming the shadow of the face. For it was Murnau, says Deleuze, who broke with the principles of organic composition without substituting for them the 'mechanics of the quantity of movement in the solid or the fluid.' Instead, there is 'a dark, swampy life into which everything plunges, whether chopped up by shadows or plunged into mists. *The non-organic life of things,* a frightful life, which is oblivious to the wisdom and limits of the organism, is the first principle of Expressionism' (Deleuze 1986: 50–1). Such a life is frightful only from the perspective of the organic, which insists on the fundamental difference between 'natural' and 'artificial,' believing that confusing the two brings life into the dangerous vicinity of death. That is why the body of the anorexic model transformed into clothes, as well as her face contrived by make-up, represents for the organic point of view an artificiality that negates the 'depth' of the face, announcing prosthetic death. However, Murnau's experiment – and this is why the anorexic likes him – far from being about death, is in fact about expanding life into the 'inorganic,' making things tremble by putting everything in motion:

> From this point of view natural substances and artificial creations, candelabras and trees, turbine and sun are no longer any different. A wall which is alive is dreadful; but utensils, furniture, houses and their roofs also lean, crowd around, lie in wait, or pounce. Shadows of houses pursue the man running along the street. In all these cases, it is not the mechanical which is opposed to the organic: it is the vital as potent pre-organic germinality,

> common to the animate and the inanimate, to a matter which raises itself to the point of life, and to a life which spreads itself through all matter. (Deleuze 1986: 50–1)

The attempt to reach the potent pre-organic vitality shared by animate and inanimate alike, the life that precedes and comes after any death, is what drives Murnau's invention of 'facelessness.' Take the anorexic Nosferatu as a case in point. His pale face signifies lifelessness and turns him into a phantom only from a perspective such as the Freudian, which privileges death over life, from the vantage which, as Deleuze notoriously put it, operates according to the 'white wall, black hole' distinction, and which thus functions in the organic terms of a difference between living subject and mortified object. Deleuze's point is that the 'white wall, black hole' distinction is rendered inoperative by Nosferatu, who in fact has no face at all, not even a 'Gothic' face of paleness against a dark background. To think of the Gothic (for example, fashion) as an insistence on black (clothes) versus white (face); or to think of a Gothic face as the difference between its whiteness and an intensely red lipstick, is to ignore that Gothic esthetics works not with faces at all, but rather with the convulsions that contrive formlessness. Murnau's or Worringer's invocation of the Gothic is thus driven by the

> opposition of vital force (*élan vital*) to organic representation, invoking the 'Gothic or Northern' decorative line, a broken line which forms no contour by which form and background might be distinguished, but passes in a zigzag between things, sometimes drawing them into a bottomlessness in which it loses itself, sometimes whirling them in a formlessness into which it veers in a 'disorderly convulsion'. (Deleuze 1986: 50–1)

The annulled distinction between form and background suggests that broken lines are not drawn in an already existing space of forms – which alone is what makes faces possible – but within the logic of a specifically 'Gothic geometry . . . [which] constructs space instead of describing it.' The point is therefore not to try to recognise forms but to follow the points of their intersection, where there occur the blurred contrasts of shadows or motions of formless colors.

Within such a visuality for example, the intersection of black and blue will constitute not a form but a degree of darkened white in contrast to a 'toned down' black:

> It is as though two degrees were apprehended in an instant, points of accumulation which would correspond to the upsurge of colour in Goethe's theory: blue as lightened black, yellow as darkened white . . . . Goethe explained precisely that the two fundamental colours – yellow and blue

> as degrees – were grasped in a *movement of intensification*, which was accompanied in both cases by a reddish reflection. (Deleuze 1986: 52)

In contradistinction to a Newtonian optics based on forms, Murnau follows Goethe's optics of the intense motions of colors, which transcend form. For that reason that it would be wrong to call Nosferatu a dead face, or a mask made of intensely white foundation contrasted with red lipstick playing the role of the black. If Nosferatu is faceless, it is because the intensity of the contrast between white and black is transformed into a presentation of pure colors. What one sees is precisely the imperceptible, or intensity:

> In Murnau, in particular, *Nosferatu* does not merely pass through all the spects of chiaroscuro, of back-lighting and of the non-organic life of shadows, he does not merely produce all the moments of a reddish reflection, but he reaches a climax when a powerful light (a pure red) isolates him from his shadowy background, making him burst forth from an even more direct bottomlessness, giving him an aura of omnipotence which goes beyond his two dimensional form. (Deleuze 1986: 53)

The pale face of the anorexic-model, her red lipstick and black clothes, are not about the Gothic trivially understood as the representation of 'dark forces' invoked by insistence on the sharp forms of the body, face, lips or eyes. Rather, if the anorexic appreciates Murnau, it is because she has learned his lesson: how to produce a motion of pure colors at the point of intersection of black, white, yellow, blue and red. Anorexic elegance, therefore, works not on a contrast of white and black but on the point of their intersection – shades and shadows – where blue or yellow appear. The lipstick on the anorexic face does not delineate those lips against the backdrop of that face but casts a reflection of red on white, blue or black, producing an atmosphere of pure redness, the force of pure intensity. What is more, her face does not have lips, eyes, jaws or nose. It is paleness or whiteness becoming red, the intensification of whiteness into the blazing red. Thus she experiments in the same way as Murnau's expressionism, trying to turn the face into a formless intensity or, differently, into a certain type of the sublime: 'Kant distinguished two kinds of Sublime, mathematical and dynamic, the immense and the powerful, the measureless and the formless. Both had the property of decomposing organic composition, the first by going beyond it, the second by breaking it' (Deleuze 1986: 53). But in contrast to the mathematical sublime, in which 'the extensive unit of measurement changes so much that the imagination is no longer able to comprehend

it,' anorexic elegance or the 'Murnau experiment' produces the dynamic sublime:

> In the dynamic sublime, it is intensity which is raised to such a power that it dazzles or annihilates our organic being, strikes terror into it, but arouses a thinking faculty by which we feel superior to that which annihilates us, to discover in us a supra-organic spirit which dominates the whole inorganic life of things: then we lose our fear, knowing that our spiritual 'destination' is truly invincible. (Deleuze 1986: 53)

Thus, the anorexic-model works with pure terror, namely with what annihilates us. But she does that because it is, counterintuitively, through that terror, through the intensity of the annihilation of the organic, that she acquires the power to lose her fear while reaching and feeling pure life.

However, the body become the motion of clothes and impersonal walks, assuming the anomalous position of being at the same time inside and outside (Virginia Woolf); and the annihilation of the face, its turning into the process of intensification of colors, its becoming atmosphere (Murnau) constitute only two components of anorexic elegance. What is still needed is the power to turn the walks, the motions, the intensities and the terror of annihilation, into the joy of doing it time and again, thus reinventing life. That is the function fulfilled by Kay Kendall in the anorexic trinity.

Les Girls

It was Kay Kendall who invented the art of imperceptible glamour. She mixed little black dresses and big black hats with white pearls and a lot of fur (Murnau's esthetics), combining them with her long, thin body, moving slowly in order to remain imperceptible. The *Star Archive* claims that 'she hasn't become the same sort of cult figure that say Dean or Monroe became, but then she was far too sensible for that sort of nonsense,' since their glamour was molar. Instead, Kay Kendall entered the becoming of a girl. The little dancing girl (she was a dancer in the chorus at the Palladium by the time she was twelve) became the trumpet player (*Genevieve*) who, thanks to Vincent Minnelli, then became *The Reluctant Debutante*, a dizzy socialite following the rhythm of music and fizzy drinks, finally merging with Cukor's *Les Girls*, becoming one of the girls, a girl, many girls, the French-English-American mixture of accents, motions, languages and tastes. The anorexic goal was thus realised in this reluctant becoming a girl of the woman.

Importantly, most film encyclopedias and archives refer to Kendall's various roles as one, and speak of her 'screen persona' as if the various girls she played or was became one. But that oneness doesn't contradict the differences among Kendall's performances. For what those film scholars refer to as Kendall's 'persona' is, in fact, a mode of the impersonal. For they write as if of an atmosphere composed of unstable mixtures of 'fifties poise,' 'glamour,' 'sensuality,' 'elegance,' and a particular way of walking that bordered on dancing. Thus Kendall managed to merge varieties of screen persons into what Deleuze and Guattari called the 'aesthetic figure':

> Aesthetic figures, and the style that creates them, have nothing to do with rhetoric. They are sensations: percepts and affects, landscapes and faces, visions and becoming. But is not the philosophical concept defined by becoming, and almost in the same terms? Still, aesthetic figures are not the same as conceptual personae. It may be that they pass into one another, in either direction, like Igitur or Zarathustra, but this is insofar as there are sensations of concepts and concepts of sensations. It is not the same becoming. Sensory becoming is the action by which something or someone is ceaselessly becoming-other (while continuing to be what they are), sunflower or Ahab... Conceptual becoming is heterogeneity grasped in an absolute form; sensory becoming is otherness caught in the matter of expression. (Deleuze and Guattari 1994b: 177)

The aesthetic 'persona' thus becomes an impersonal proliferation of percepts and affects caught in the matter of expression such that the expression becomes the matter itself; the immaterial expression.

Style is the vehicle of this becoming a pure expression of percepts, as Deleuze specifies. The aesthetic 'persona' is the effect of styles, which 'are not constructions, any more than are modes of life.' As becomings 'they are the thing which is the most imperceptible, they are acts which can only be contained in a life and expressed in a style.' Becoming style, as the expression of percept and affects, is not an effect of something or somebody: 'There is nothing to understand, nothing to interpret' (Deleuze 1987: 4). There is nobody behind the style since style is not an expression of somebody's desires, nightmares or fantasies. Rather, it is the pure, impersonal motion of affects. Kay Kendall, therefore, is not a glamorous person but the atmosphere of glamour from which everything personal has vanished. The final goal of anorexic experimentation is to become such an aesthetic 'persona,' the sensory becoming of otherness that affects by the force of percepts and overwhelms by the sheer power of assemblages of hats, pearls, little black dresses and a touch of a perfume. By reaching towards impersonal life the anorexic turns her

body-clothes into an aesthetic persona in the same way that she turns food into abstract textuality and enacts a sort of enjoyment in the text.

The Enthusiast

The fact that the anorexic tends towards the dynamic sublime, and that her experimentation represents the devastation of the personal self, finally explains what might be understood as Deleuze's principal claim about anorexia, that 'anorexics are enthusiasts.'

A story related by De Certeau places the anorexic-enthusiast not only at the very origin of institutionalised Christianity but interprets her experimentation along the lines of Deleuze's thesis, as a micro-politics directed both against the Father and the ideal of the Virgin Mother, in short, against the symbolic field. De Certeau quotes this passage from *Lausiac History*:

> In this monastery there was a virgin who pretended to be mad, possessed by a demon. The others became so disgusted with her that no one ate with her, which she preferred. Wandering through the kitchen, she would render any service. She was, as they say, the sponge of the monastery. In reality, she was accomplishing what is written: 'If someone intends to be wise among us in this life, let him become a fool to become wise.' She had tied a rag around her head – all the others are shaven and wear hoods – and it is in that attire that she performed her duties. Of the four hundred [sisters], not one ever saw her chew anything during the years of her life; she never sat at table; she never broke bread with the others. She was happy with the crumbs she wiped up and the water from the pots and pans she scoured, without offending anyone, without murmuring, without speaking little or much, though she was beaten with blows, insulted, laden with curses, and treated with disgust. (De Certeau 1992: 34–5)

Without going into de Certeau's analysis of the specifically enthusiastic 'logic' of thinking, which thinks without the object, I quote his conclusion to establish a fundamental connection between anorexia and becoming a woman:

> A woman, then. She doesn't leave the kitchen. She doesn't leave off *being* something that has to do with the crumbs and leftovers of food. She makes her body from them. She maintains herself by being nothing but this abject point, the 'nothing' that puts people off... Around her hair, a dishrag. No discontinuity between her and this refuse: she doesn't 'chew'; nothing separates her body from the offal. She is what is left over, without end, infinite. The opposite of the imagery that idealized the Virgin Mother, who is unified by the Name of the Other, without any connection with the

> reality of the body . . . [she is] totally within the unsymbolizable thing that resists meaning . . . she loses herself in the unassertable, below the level of all language. (De Certeau 1992: 34–5)

This then, can serve to summarise what I have been trying to advance concerning the anorexic: the kitchen, the circulation of little substances, the body made of crumbs, cooking but not eating, the body turned into a dishrag (or black hat since everybody has their own style), separation from the Name of the Other, from the body of the Mother, thus bodiless, nameless and impersonal.

But to say that she escapes the symbolic, that she resists meaning and remains 'below the level of all language,' is also to point again to the radicalism of anorexic micro-politics. It is to claim that such a politics is about a double divergence. As Deleuze puts it in a passage, referred to earlier, that explains how enthusiasm relates to this politics:

> Anorexics are enthusiasts: they live treason or the double turning-away in several ways. They betray hunger, because hunger tricks them by making them subject to the organism; they betray the family because the family betrays them by subjecting them to the family meal and a whole family politics of consumption; finally, they betray food, because food is treacherous by nature . . . Trick-the-hunger, trick-the-family, trick-the-food. In short, anorexia is a history of politics: to be the involuted of the organism, the family or the consumer society. There is politics as soon as there is a continuum of intensities (anorexic void and fullness), emission and conquest of food particles (constitution of a body without organs, in opposition to a dietary or organic regime), and above all combination of fluxes (the food flux inters into relation with a clothes flux, a flux of language, a flux of sexuality: a whole, molecular woman-becoming in the anorexic, whether man or woman. Above all, it is not a matter of partial objects. It is true that psychiatry and psychoanalysis do not understand, because they bring everything down to the level of a neuro-organic or symbolic code ('lack, lack . . . '). (Deleuze 1987: 111)

Never about lack, it is always about rhythm, about the succession, waves and fluxes of voids and fullness.

Danger and Death

In thinking about anorexia I don't intend to recommend it. It is up to everybody to invent their own micro-politics of pain. Anorexia should be understood to represent a particular strategy of resistance, and rescuing it from the inane ideology of an 'eating disorder,' as well as from the blunt theory of a 'consumption' neurosis is a function of such resistance.

Needless to say, the experimentation called anorexia can be dangerous, indeed lethal. The anorexic has to be able to guide the experiment without being guided by it. She has to experiment without ending in the failure of experimentation, the point at which the experiment turns against the experimenter and becomes deadly. The point is to keep the experiment going and thus to keep whoever experiments alive, even if not within the same banal everyday conception of what life is. If the main goal of the micro-politics of masochism or anorexia is to invent the body of waves, the body without organs, then the success of such an experiment means, paradoxically, that the body without organs will never be fully realised, for such a realisation is pure and simple death: a frozen body. The danger of this micro-politics (the same holds for all other such experiments, with drugs, alcohol, food, sleep, but also for molar experiments, for experimentation by definition involves danger) is, as Deleuze puts it, that it can come 'close to going off the rails, to becoming lethal.' That is not a reason to give up on such micro-politics but a call to address the question of the danger that it involves: 'What are the dangers it constantly skirts and the dangers into which it falls?' However, this question should be neither raised nor answered from the perspective of a psychoanalysis capable only of ridiculing the micro-politics of pain with its ready-made answers about the desire to return to the origin and the death drive: 'This is a question that must be taken up by a method other than psychoanalysis: we must try to find out what dangers arise *in the middle of* a real experiment, and not the lack dominating a pre-established interpretation. People are always in the middle of some business, where nothing may be designated as its origin. Always things encountering each other, never things diminishing each other's contribution' (Deleuze 1987: 111).

Feminist Lines of Flight from the Majoritarian Subject

Tamsin Lorraine Swarthmore College

Abstract

This paper characterises Deleuze and Guattari's conception of the majoritarian subject in *A Thousand Plateaus* as a particular – and inevitably transitory – manifestation of sexed and gendered subjectivity emerging with late capitalism from the always mutating flows of creative life and suggests that their notion of the schizo or nomadic subject can inspire feminist solutions to the impasses posed by contemporary forms of sexed, gendered, and sexual identity. Feminism can thus be conceived as a schizoanalytic practice that fosters the kind of alternative subjects for which Deleuze and Guattari call: subjects that move beyond oppressive self–other relations towards a form of subjectivity that can welcome differences as well as the differentiating force of life itself.

Keywords: Deleuze, Guattari, gender, feminism, identity, subjectivity.

Gilles Deleuze and Félix Guattari, in works they wrote separately as well as together, present an ontology of becoming, a conception of the modern subject of late capitalism, and intimations of future forms of humanity with intriguing implications for feminism. Their ontology posits humanity as a flux of always mutating becoming intertwined with creative flows of non-human and inhuman life, and thus contests essentialist views of women and men as well as a binary division between the two. Their conception of the modern 'autonomous' subject posits the latter as inevitably shot through with a multitude of social flows in shifting configurations that can be mapped with respect to specific locations in larger social wholes, and thus suggests a subject produced through collective processes that we can better understand and invites discriminating genealogies of gender in its imbrications with other aspects of social identity. And their notion of the schizo or nomadic subject dramatises possible 'lines of flight' from dominant forms of

subjectivity, and thus inspires feminist solutions to the impasses posed by contemporary forms of sexed, gendered, and sexual identity.

In what follows, I characterise Deleuze and Guattari's conception of the modern subject as a particular – and inevitably transitory – manifestation of sexed and gendered subjectivity emerging with late capitalism from the always mutating flows of creative life and I explore the implications of their conception for a feminist project of social change. Although Deleuze and Guattari do not pursue this point the way I will throughout this essay, sexed, gendered, and sexual identity are central features of the oedipal subject, making the question of sexual difference a crucial one, at least if one wants to endorse their project of promoting schizo subjectivity as a project, as I will propose, of moving beyond oppressive self/other relations toward a form of subjectivity that can welcome differences as well as the differentiating force of life itself.

I. Oedipal Subjectivity and the Majoritarian Subject

According to the story Deleuze and Guattari tell in *Anti-Oedipus*, oedipalisation as a psychic structure of human subjectivity arose in the wake of capitalism's deterritorialisation from the social systems of meaning of previous cultures. *Anti-Oedipus* is in large part a critique of psychoanalysis for further entrenching oedipal subjectivity rather than (as Deleuze and Guattari propose) moving us beyond it, but it is important to remember that Deleuze and Guattari 'have never dreamed of saying that psychoanalysis invented Oedipus. Everything points in the opposite direction: the subjects of psychoanalysis arrive already oedipalized, they demand it, they want more' (Deleuze and Guattari 1983: 121). Although they think that psychoanalysis gets the unconscious wrong and has fallen for the ruse oedipal subjectivity entails – that what the subject wants but cannot have is an incestuous relationship with his mother (rather than, as they see it, to engage in forms of desiring production that might unravel or revolutionise the social status quo) – the oedipal subject characterised by psychoanalysis is an ideal type of a fleeting form of modern subjectivity. This type may be actually manifest in a relatively small number of instances given the deterritorialising flows that undermine it as well as the vagaries of family life, but it is a form of subjectivity whose further unravelling they hope to promote. If the oedipal subject is the retrenchment of a more traditional form of subjectivity precipitated by the frantic deterritorialisation of capitalism, the schizo subject is a new form of subjectivity also

precipitated by the deterritorialisation of capitalism – and it is the latter subject that Deleuze and Guattari prefer to support.

Although sexed and gendered identity may appear to be primary aspects of personal identity (checking off one's race or religion may or may not be required, but checking off one's sex usually is), on Deleuze and Guattari's view, oedipal subjectivity obscures the multiple social flows implicated in family life. Markers of difference that have stable social significance in the territorial and despotic social formations Deleuze and Guattari describe lose their credibility in a capitalist social formation. Deference to abstract calculations of the market such as the need for workers who can migrate from one workplace to the next in keeping with the skills needed to produce the products that will sell the best take precedence over the significance of concrete relations with others in a variety of relatively stable social networks. Cultural and institutional support for various identities is weakened by the commodification of ethnic and cultural differences. The flows affecting a subject's life are organised around sexed and gendered identities produced through a process of oedipalisation that requires constituting oneself as a lacking subject and taking up a position on either side of a sexual divide. Sexual difference becomes a crucial structural feature in the psychic structure of a personal self who can negotiate the speeds of capitalism without unravelling, but the flows affecting subjects are social, economic, political, cultural, racial, pedagogical, and religious, as much as sexed or gendered (see, for example, Deleuze and Guattari 1983: 274).

While sexual difference is important to the territorial and despotic social formations Deleuze and Guattari describe, it is not personalised in the form of sexed and gendered identity and sexual preference the way it is in modern society.[1] According to Deleuze and Guattari's view, human subjects enter into polyvocal and multiple relations with their world. A child is always making assemblages – pushing an ant along with a stick, jumping in a puddle to see the water splash, blowing bubbles in the milk to see them cascade over the sides. These assemblages unfold not as expressions of the secret desires of a personal self, but through body parts becoming the working parts of assemblages that connect with the world in terms of their capacities to affect and be affected (air plus throat plus milk in glass make bubbles that spill over). Oedipalisation requires the subject to internalise the prohibitions of paternal law: to regain a substitute for the prohibited mother (an incestuous relation with whom, in some sense, comes to represent, according to Deleuze and Guattari, engaging in unregulated desiring production with its immanent

satisfactions), one must identify with the father and become an active agent of the law he represents, or become the object desirable enough to obtain passive access to phallic power. This produces a subject whose desire is premised upon lack (one desires what one has lost and cannot have until one lives up to one's ego ideal) rather than upon the creation of connections with the world that unfold creative capacities in living.

Internalisation of paternal law suppresses pursuit of the mutant lines of deterritorialisation that emerge from the swiftly changing circumstances induced by the incessant drive for profit, allowing relative stability of the oedipal subject (if of a paranoid sort) despite the breakdown in traditional codes in living and the habitual patterns of life that actualise such codes. Barred from the creative transformation of productive connection with the world, the oedipal subject of capitalism maintains self-sameness with respect to interchangeable objects of desire through repetition of personalised patterns of meaning and behaviour. Her desiring production is restricted to fantasising the objects that once acquired will give her the satisfaction she seeks. She is thus diverted from engaging in the immanently satisfying production of machines that would connect her in various ways to the flows around her (machines that would extend her capacities and engage her in the kind of on-going metamorphosis that makes subjects hard to pin down). The desire to connect, make things happen, and extend one's capacities and powers to affect and be affected (the productive desire that constitutes active participation in the creative diverging of life) becomes the private desire of a personal self to obtain a substitute for an object of desire prohibited by paternal law (where the latter is understood as the dominant processes regulating social existence in its current configurations).

In *A Thousand Plateaus*, Deleuze and Guattari's characterisation of the modern subject de-emphasises the role of the family in the production of oedipal subjectivity and elaborates the larger social flows that resonate and affirm the constricted desires of a subject premised upon lack. From the moment a child is born, she is immersed in flows of signification and subjectification, and she enacts, through her perceptions, thoughts, actions, and emotions, the habitual patterns and orientations of her location on the social field with its particular configurations of human and non-human flows. The subject emerges from myriad routines and habitual patterns of living in which she understands herself and what she says and does through meanings made available by the practices engaged in at home, at school, at work, at places of worship, at the doctor's office, at court, and so forth, as well as by multiple forms of cultural production ranging from network news

and printed materials to video games and cinema. Deleuze and Guattari's notion of the faciality machine suggests that the triangulation of identity with respect to sexual difference in the family is replicated and affirmed with respect to multiple flows of the social field in a way that fixes the subject on a 'white wall' of signification where she can always be categorisable and plunges her into a 'black hole' of subjectification where her psychic habits of self devolve into sterile patterns. Everyone must submit to the dualism machines of subjectification, either identifying their subjective experience with one of two opposing categories in a series of opposing categories or being subjected to such identification by others. A recognisable subject with a specific position vis-à-vis what Deleuze and Guattari call the 'majoritarian subject' is thereby produced 'depending on which faciality trait is retained: male-(female), adult-(child), white-(black, yellow, or red); rational-(animal)' (ATP 292).

The faciality function shows us the form upon which the majoritarian subject is based: 'white, male, adult, "rational," etc., in short, the average European' (Deleuze and Guattari 1987: 292). Faces are produced 'only when the head ceases to be a part of the body, when it ceases to be coded by the body, when it ceases to have a multidimensional, polyvocal corporeal code' (Deleuze and Guattari 1987: 170). Mutant fluxes and flows of the body, for example, various forms of becoming-animal, are no longer elements that are taken up into the socially sanctioned organisation of human individuals. 'Bodies are disciplined, corporeality dismantled, becomings-animal hounded out' (Deleuze and Guattari 1987: 181). The complexity of embodied existence is reduced to what can be captured and coded through the faces that are socially recognisable (faces that show up on society's white wall as readable) and psychically convincing (faces that can be internalised as one's personal identity). Faces thus entail a reduction of one's lived experience of another human being in all her specificity to the selected perception of another in terms of relatively fixed social categories of identity. They also entail a personal psychic identity that comes to, in a sense, stand in for the unrepresentable subtlety, variation, and ambiguity in the lived experience of one's own corporeality.

Sexed and gendered identities are crucial to the stabilising identifications required by the faciality machines; taking up a definitive stance with respect to a transcendent representation of desire separated from the differentiating flux of life – the phallus as signifier of whatever one might desire (with its implications of the passive or active relation of the sexed subject vis-à-vis the likelihood of achieving satisfaction) – renders the lines of becoming connecting one to the world

imperceptible and thus totalises a self that can be ranked with respect to the majoritarian subject. Forming a central identity as a woman or a man with a specific gender identity thus entails a conception of self in relative autonomy from the world who takes a passive or active desiring stance with respect to that world. This division of humanity into two sexually differentiated groups obscures a wide range of social investments of the contemporary social field stratified into various configurations of power by highlighting sexed identity as key to determining who one is and how to live one's life. A variegated range of differences among human subjects is thus reduced in significance when compared to identification with one of two categories, woman or man. This binary configuration allows resonating patterns of binary identifications that situate subjects with respect to the majoritarian subject in ways that clearly delineate one's position according to a relatively static social hierarchy.

At the level of the lived orientation of embodied subjectivity, each subject, whether oedipalised or not, lives out her life as a unique configuration of the concrete flows of physiological, corporeal, and semiotic processes that inform her day-to-day life. How well this orientation fits with the categories through which she is designated and interpellated by the various practices she engages depends upon her specific situation. No subject in contemporary society can escape dealing with sex and gender categories in one form or another. Whether one lives out these designations and interpellations in comfortable conformity or painful dissonance depends upon whether the multiple forces converging in the durations one lives resonate with dominant memory (that is, the representational memories and history sanctioned by the mainstream) or induce varying tendencies toward counter-memories and minoritarian resistance. Furthermore, binary sexual difference turns out to entail a form of subjectivity structured in terms of bifurcating categories that valorise some subjects by marginalising others. Identification with one or the other of two sexually differentiated positions (despite the molecular connections subverting or complicating that identification) is paradigmatic for other selections made from the faces of the faciality machines. The active/passive dichotomies of sexual difference are replicated in other social binaries with one identification of two possibilities being always better or worse (that is, either closer to or further from the majoritarian subject).

If a variegated range of social flows (from physiological and cultural flows related to one's able-bodiedness and race to economic and political flows related to one's class and political affiliation) become subsumed under one's sexed and gendered identity with respect to a familial story

about sexual difference (one is a disabled woman or black woman rather than a disabled or black human being; one is disabled *or* abled, black *or* white, just as one is a woman *or* a man), then the latter will loom large in one's attempts to live a meaningful life. Troubling the waters of binary sexed and gendered identities by revealing the complexities subverting them as well as their imbrications with other aspects of identity would thus appear to be especially threatening to forms of subjectivity organised with respect to the majoritarian subject. If this is the case, the feminist imperative to map sex and gender in relation to other social designations could be said to be a project of mapping forms of subjectivity structured in terms of their divergence from a normative subject in order to explore and experiment with the possibilities implicit in our present of a subjectivity that could welcome differences without ranking them. Mapping subjectivity in terms of sex and gender from this perspective respects the importance they play in orienting lived experience in its contemporary formations at the same time as it fosters lines of flight that could lead to forms of subjectivity that do not require marginalising others.

II. Lived Orientations and Feminist Genealogies

Linda Alcoff, in an insightful essay on identity, argues that we need to conceive identity as more than a category. Identity entails an interpretative horizon that 'should be understood not simply as a set of beliefs but as a complex (meaning internally heterogeneous) set of presuppositions and perceptual orientations, some of which are manifest as a kind of tacit presence in the body' (Alcoff 2006: 113). She cites George Lakoff and Mark Johnson's work demonstrating that the concepts we use in everyday life emerge from 'largely unconscious embodied conceptual systems' (Alcoff 2006: 113). And she draws from the phenomenological descriptions of Maurice Merleau-Ponty, Simone de Beauvoir, Sandra Bartky, and Iris Young to indicate how a lived orientation of the body in the world constitutes a kind of implicit knowledge. On Alcoff's account, identity is an orientation to the world lived in the gestures, movements, and actions of the body at a non-conscious level as well as in the presuppositions, assumptions, and beliefs of a linguistic orientation. Both together comprise an interpretative horizon that grounds a subject in a perspective that is lived as her own. Social identity is not simply the categories into which one fits, but an interpretative horizon shared with certain others that affects what and how one perceives. These identities are experienced in terms of the

imbrications of social flows that converge in the various assemblages through which day-to-day life is lived rather than the abstract categories of identity to which people are often reduced. Identity is thus not necessarily something that is inflicted upon one by others; it is an orientation experienced as one's own that emerges through participation in collective patterns of corporeal and symbolic activity. This is why claiming an identity through a rewriting of dominant history can be so important. In articulating and asserting such an identity, a perspective grounded in patterns of collective living experienced by a minoritarian group is brought into conscious awareness and made the basis for an alternative epistemological claim to that of the dominant culture about the nature of social reality. 'Real' identity is thus, according to Alcoff, experienced as an orientation grounded in often non-conscious patterns of body, mind, and speech so habitual that they can appear (if they appear at all) to be inevitable or natural.

What Alcoff calls 'real' identity is, from Deleuze and Guattari's perspective, the perceptual, cognitive, affective, and embodied orientations of a subject sustained through the habitual patterns of physiological, social, and cultural processes that constitute one as an embodied human subject. Orientations constituted and sustained through organic processes experienced in imbrication with the semiotic and corporeal signifying and subjectifying processes of human living inform how one experiences the world. If one's corporeal and/or psychic anomalies are such that one cannot take up positions with which one can identify without dissonance, then one will experience a sense of discomfort, a sense of not being at home in the world.[2] This discomfort will deepen if dissonance results in derogatory descriptions or exclusion. Subjects marked in terms of their divergence from the majoritarian norm are designated as somehow less entitled to other forms of social power. Unless one can find alternatives, practices available to others as an extension of their capacities into action in the world (of a more or less powerful sort) will block one's lines of becoming and decrease one's power. Individual and collective orientations suffer damaging marginalisation and uncomfortable dissonance when they are subjected to faciality machines in ways that mark their divergence from the majoritarian norm and block potential capacities for affecting and being affected from unfolding.

When the lived orientations Alcoff describes as 'real' identity are extended and elaborated in the minoritarian form of, for example, a feminist gender identity or an antiracist raced identity, identity becomes a form of self-naming that extends some of the lines of flight always insisting in any subject in its divergence from the majoritarian subject.

The faciality machines that designate either/or identity positions through prevalent ways of speaking and patterns of activity that resonate with the majoritarian subject attempt to cancel out the corporeal and conceptual fluxes that would lead human subjects in their becoming to resist the dominant patterns of signification and subjectification: you are a man *or* a woman, you are black *or* white. Resistant identities are identities in process – they create new identities rooted in fluxes of living that continually vary from the dominant norm, refusing to let those variations be assimilated to binary categories or their implicit tendencies blocked from unfolding new ways of living.

Subjecting a range of evidence to abstract social categories like race and gender tends to obscure the imbrications of social flows as well as the 'intensities' (implicit tendencies that could unfold in new ways of being) insisting in them. Understanding identity categories such as those designating one's gender, race, (dis)ability, or sexuality in terms of the concrete situations in which they are used reveals the varying flows that converge in the pragmatic contexts in which embodied subjects are submitted to and/or identify with specific categories. Mapping these flows with respect to one another allows one to see how various flows of meaning produce identity categories inflected by the specific forms social flows take in a given time and place. For example, Abby Wilkerson's mapping of erotophobia, in an essay using disability and queer perspectives to explore continuities in the effect of erotophobia on oppressed groups, shows how social flows can be coded in divergent and yet mutually reinforcing ways. Wilkerson argues that a paraplegic may be coded as asexual, an African American as hypersexual, and a lesbian as perverted, but in all cases, the effect is to render the lived experience of one's sexuality less comfortable, thus blocking one's power in the world to a greater or lesser extent. She presents some examples of how erotophobic judgements of the sexual behaviours or 'natures' of members of various groups suggests that

> [c]ultural erotophobia is not merely a general taboo against open discussions of sexuality, and displays of sexual behaviour, but a very effective means of creating and maintaining social hierarchies, not only those of sexuality but those of gender, race, class, age, and physical and mental ability. (Wilkerson 2002: 41)

Medical literature that presents moralising restrictions on the sexuality of the physically or cognitively disabled, hypersexualised images of African American and Latino men, legal obstacles to the sexual agency of lesbian, gay, bisexual, and transgender people, the shame and alienation

connected to the sexuality of heterosexual women that Sandra Bartky discusses in her book, *Femininity and Domination* (Wilkerson 2002: 42–5): these are some of the effects of social practices that designate certain bodies as deviant. From Deleuze and Guattari's perspective we can say that it is through such practices that bodies and their desires are delineated in terms of their distance from the majoritarian subject acting as an orienting reference point (in more or less overt forms) in those practices. Such delineation, through more or less subtle approbation (a doctor who refuses to discuss birth control with a disabled patient) or outright exclusion (laws against sodomy) renders certain lines of becoming uncomfortable, dissonant, or impossible, diminishing the power of those groups and their individual members to affect and be affected in the process.

Feminists inspired by the Foucauldian notion of genealogy have mapped various aspects of the social field to investigate how identity designations have evolved over time, leaving legacies in the present that might not be immediately obvious. If we look at some feminist genealogies of race, for example, we discover not only a telling resonance with Deleuze and Guattari's notions of faciality and the majoritarian subject, but how designations of the Eurocentric faciality machines are implicated with capitalist and colonialist investments of the social field, and how sex and gender designations intertwine with race designations according to the configurations of forces of specific times and places (see, for example, Lawrence 2003, McWhorter 2004, and Warnke 2005). Other feminist genealogies show that sex and gender are not only intertwined with race, but with other perhaps less obvious (at least if you are closer to the majoritarian norm) designations of cognitive and physical ability. For example, Anna Stubblefield argues that the concept of feeblemindedness became linked with ' "off-white" ethnicity, poverty, and gendered conceptions of a lack of moral character' (Stubblefield 2007: 162) in the eugenics movement of the first three decades of the twentieth century in the US. The eugenics movement was widespread and according to Stubblefield its impact still influences scientific research and public policy. In her investigation of how, in particular, 'feeble-minded' white women became subject to coercive sterilisation, Stubblefield examines distinctions white elites drew between the white race and other races; (untainted) whites (supposedly) have the intellectual capacity to produce 'civilisation':

> the development of agriculture, science and technology (in forms that white elites recognize); sophisticated (according to white perception) cultural

> products such as literature, music, and art; and the development of complex (according to white perception) societal organization and forms of government. (Stubblefield 2007: 169)

Stubblefield cites research by scientists such as Paul Broca, Robert Chambers, and J. Langdon Down, in the mid-nineteenth century that investigated how to measure intelligence by first assuming that white people were more intelligent than black people, and then, on the basis of that assumption, construing differences between white and black people as reasons for why white people were further along an evolutionary path of ethnic types than black people. When Henry Hubert Goddard, writing in the early twentieth century, described intelligence (understood in terms of this model of ethnic evolution) as hereditary and impervious to environmental influence, the stage was set for designating 'heritable' forms of white impurity (Stubblefield 2007: 172).

In 1908, Goddard adapted Alfred Binet's intelligence test for use in the United States by adding the category of 'moron' (designating people with a mental age of eight to twelve) to the original scale that included the 'idiot' (designating people with a mental age of two or younger) and 'imbecile' (designating people with a mental age of three to seven years). The notion that extreme poverty was hereditary and linked to the moral defect 'of a supposedly shameless willingness to live on public charity' (Stubblefield 2007: 173) was a widespread belief that became increasingly linked to the concept of the moron in family studies done in the early twentieth century. Feeblemindedness became linked with 'white poverty, off-whiteness, and lack of civilization-building skills' and the 'category of the moron – the feebleminded person who appears normal but who is prone to immorality, incapable of being a contributing citizen in a democratic society, and who will pass feeblemindedness on to his or her offspring' became 'a powerful device for drawing a distinction between tainted and pure white people' (Stubblefield 2007: 176). In addition, white women who demonstrated their failure to understand their role in the advancement of civilisation by engaging in unchaste behaviour manifested, like impoverished white women and off-white women, a 'lack' of intellect that tainted their whiteness. Thus, intertwined constructions of race, class, gender, and cognitive dis/ability came together in a conception of feeblemindedness that 'became gendered in a way that led to women bearing the brunt of eugenic sterilization' (Stubblefield 2007: 178–9).

'Disabled' subjects may be divergent enough from the majoritarian norm that their disability becomes a salient feature of their designated

identity. Even in such cases, however, their sexed and gendered identity will be central to how that identity is interpreted and lived. Stubblefield's mapping reveals specific physiological, economic, colonising, and cultural flows in the use of the term 'feeble-minded' that manifest the imbrications of gender, race, cognitive (dis)ability, and economic status in that designation in a way that belies the primacy given to sex and gender in organising and understanding the converging flows of concrete individuals. A wide range of practices resonate with familial positioning in order to reinforce and naturalise distance from the majoritarian subject. Maps like Wilkerson's reveal the social investments and configurations of power that such positioning conceals.

In addition to revealing the multiple forces that come together in one designation of social identity, feminist maps reveal critical points in the present where intensification of various sorts could result in significant change. Thus, Wilkerson and Stubblefield's genealogies reveal relations of flows of which we may not have been aware that condition our understanding of disability. Intensifying these connections in new ways of understanding designations of disability and racial designations, as well as the social practices related to them, could in turn lead to action from within the relevant practices that shift them (to a larger or lesser extent) into divergent forms of those practices or directly challenge them (through discursive critique or some other form of resistance). These genealogies, incomplete as they are, show how important it is to understand how identity designations – be they those of sex, gender, sexuality, race or otherwise – emerge and are interpreted in keeping with specific investments of the social field best understood in terms of the confluence of multiple forces of particular durations. The bifurcating sorting of personal identity into yes/no categories obscures the shifting vagaries of their evolution as they are put into effect in a multitude of day-to-day situations. Although an emphasis on the personal identity of an autonomous subject and the demand for clearly defined identity designations tend to suggest that a given identity is a property of persons, on Deleuze and Guattari's view, identity is produced, reproduced, sustained, and transformed through the unfolding of social life over specific periods of time in particular places.

A designation of gender, race, or disability can never, from Deleuze and Guattari's perspective, be a static category. Its meanings inevitably shift along with the faciality machines (as they are actualised in specific patterns of meaning and activity) that enact it as well as the molecular flows of lived orientations and identifications that resist those machines. Such shifts are in response to the convergent forces affecting the

relevant assemblages and will resonate with patterns organised around the majoritarian subject or proliferate lines of flight. Words such as 'disabled' or 'feeble-minded' and the racial, gendered, and economic connotations associated with them, leave traces in the present of which we may be unaware, even if those specific words are no longer used. Ways of speaking and doing become habitual patterns that self-replicate even if in doing so they continually diverge from past repetitions. Mapping an association among variations in cognitive style, skin colour, financial income, and cultural practices of the duration connecting us to an earlier time renders some of the relations now only implicit explicit, making us more aware of the habitual patterns informing our naturalised reality, and thus provide insight into how to shift those patterns in ways we can support.

These genealogies track social practices that constitute subject positions informing the categories through which people are designated as well as identify themselves. These practices, from Deleuze and Guattari's perspective, are corporeal and semiotic assemblages that tend to replicate and extend themselves, thus settling into stratified configurations of power. Individual human beings with their personal identities and desires emerge as individual solutions to the problem of subjectivity from processes they collectively share in various ways with others. Although sexed and gendered identity is a crucial feature of dominant forms of subjectivity, these genealogies show how other investments of the social field are equally, if not more, crucial. Even when one's personal identity is still experienced in terms of one's sex, gender, and sexuality (for example, one's primary identification is as a woman), these genealogies show the myriad social investments that coalesce around that identity (it turns out a woman who primarily identifies as a woman may be more likely to be relatively closer to the majoritarian norm and so has not been confronted with other ways that she differs from that norm – that is, she is a physically and cognitively 'normal,' white, heterosexual, middle-class woman).

From Deleuze and Guattari's perspective, modern subjectivity, insofar as it is oriented with respect to the majoritarian subject, thus entails organising multiple flows and investments of the social field in terms of sexual difference. This structuring plays out through the oedipalising function of the family and the faciality machines that confirm and elaborate the binary structure of oedipalisation. Oedipalisation and the faciality machines that produce the personal identity of modern subjectivity thus operate not only to render the continuous variation in human becoming that might extend into new forms of subjectivity

non-productive, but also to turn collective stories about power investments into personal stories about achieving meaningful lives. Although Deleuze and Guattari do not themselves pursue this point, this makes feminism an intervention that targets sex, gender, and sexuality as a crucial fault line in modern forms of subjectivity that is just the starting point for unravelling multiple configurations of power detrimental to our collective unfolding.

III. Nomadic Subjectivity and Feminist Change

The deterritorialising of cultural codes precipitated by capitalism opens human existence to an unprecedented amount of creative evolution by releasing old constraints upon proliferating change. Thus, capitalism actually enacts more of the differing and diverging becoming of life and so, according to Deleuze and Guattari, on the one hand, puts us in a better situation to become more aware of life as process, but on the other hand, has produced a reterritorialisation onto oedipal or majoritarian subjectivity, the reduction of productive desire to desire premised on lack, and the incessant pressure to produce and consume. The former tendency they align with their notion of schizophrenia and a nomadic subject able to creatively evolve and the latter tendencies they associate with paranoia and absolute systems of belief where all meaning is, as Eugene Holland helpfully puts it, 'permanently fixed and exhaustively defined by a supreme authority, figure-head, or god' (Holland 1999: 3). Thus, along with the high speeds of contemporary life with its frantic pace of technological change and globalisation goes paranoid reterritorialisation onto consumerism as well as fundamentalist religion and fascist politics. Faciality machines are not universal to human life; subjectivity in modern capitalism requires excluding more of the corporeal fluxes running through any line of human becoming than the other two social formations Deleuze and Guattari describe (although this, in itself, does not guarantee the kind of desiring production Deleuze and Guattari would like to promote). Rather than explore possible connections among micropercepts and affects that could lead to aggregates of perception and feeling that violate current opinion and consensus representations of reality, faciality machines interpret sensation as the meaningful experience of a recognisable subject. Rather than pursue the physiological, social, and cultural permutations that inevitably result from hybrid forces converging in particular locations, faciality machines interpret anomalies as exceptions that do not affect the norm or as exceptions that require new categories that resonate with the system as a whole. This entails cancelling out subtleties

in individual and collective experience and blocking exploration of alternative connections.

Facialisation entails an embodied orientation organised in terms of a personal identity. That is, all desires of the body are of *one* body with a psychic self that is (more or less) unified with a coherent history that can be represented and collated with the narratives of other members of the community. Sexed and gendered identity forms an important fault line of this self since it is through familial positioning with respect to sexual difference that the multiplicity of social flows affecting subjectivity are totalised in a self that is assimilable to the faciality machines of capitalism. Personal identity, especially as it is regulated by the faciality machines that percolate throughout the semiotic and corporeal practices that insist on clearly delineated subjects with identities that fit into already laid out parameters (to register for public school, I need to designate age, sex, and residence; to walk into a restroom I need to know to which sex my body conforms), becomes the organising reference point for lived experience. If a lived experience cannot be referred to such reference points, it may be unrepresentable and excluded from having an impact (the knowledge I gain independently of a recognised school may not gain me entry to the conference I want to attend), or it can render lived experience either dissonant or unlivable (ambiguous sexed or gendered identity can make life painfully confusing). But on Deleuze and Guattari's view, personal identity is not necessary for non-psychotic subjectivity. Habitual refrains and some sort of constriction on desiring production are necessary for relatively stable forms of human subjects to be sustainable. But subjectivity is a self-organising system of becoming with relative autonomy from surrounding flows grounded in a wide range of territorialised processes that allow emotions, perceptions, and day-to-day life to stabilise into habitual patterns. In a social formation premised upon a lacking subject threatened with a loss of humanity insofar as she or he breaks the rules (where the majoritarian subject is the norm for what it is to be human and any deviation from that norm is carefully observed and marked), unregulated refrains in living are not allowed extension into new patterns. Productive desire must be reduced to the lacking desire of a self still waiting to be completed (the child's desire to swirl water into dirt to make mud must give way to the desire *to be* a chef or a scientist rather than simply to make connections), and identity must be computed from the bifurcating patterns of social recognition that select constants from a wide range of continuous variation in order to plug those constants into already delineated rules of living (a woman who is disabled must no longer be interested in sex since she no longer fits the subject positions designated in countless narratives

and scenarios emerging in multiple social practices about 'what happens when one is sexual,' a mother who does not feel the kind of 'maternal' love for all her children depicted in various forms of cultural production as well as assumed in social practices connected to childcare, pedagogy, and citizenship must be an inhuman monster).

From a psychoanalytic perspective, immersion in a world of partial objects where corporeal fluxes connect (or do not connect) in immanently unfolding flows with surrounding flows where neither self or other, subject or object, are points of reference is a psychotic nightmare. Deleuze and Guattari present us with the provocative possibility that desire does not have to be about what a personal self wants, but could be about connecting with the world, making things happen, and experiencing what happens in ways that defy subject/object and self/other dichotomies. Self/other dichotomies obscure the physiological, social, and cultural flows I share with others; I live at the same speed as other organisms with similar configurations of processes (as I discover in the assemblages I make with others) and the semiotic and material assemblages that condition my individual speech and actions are often the same. On Deleuze and Guattari's view, a personal self or identity as a totalised point of origin to which to refer all desire operates as a kind of stranglehold on the individual and the capacities it could unfold as well as the assemblages into which it could enter. By referring my desires to a sexed self with a gender and a sexuality computed according to the faciality machines, I block off intensification of other tendencies insisting in me – tendencies concerning sense experience and perception as well as emotions and beliefs – that could be extended into new ways of living my subjectivity and new ways of connecting with my world including the other subjects within it.

The famous case of John/Joan (who I will henceforth call by his real name when living as the sex he ultimately chose, David) is a sad example of how difficult it can be to live one's humanity in a social formation that demands a recognisable identity sorted through the faciality machines.[3] When a botched circumcision led to an anomaly in organic sex (David's penis was damaged beyond repair), a choice was made to try and repress the anomalous range of continuous variation in human organisms he manifested by surgically altering him, designating him as female, and concealing from him his initial status as male. Judith Butler's rendition of his story brings out the violence to which the people trying to deal with his situation subjected him. Although as he grew older he refused to comply, he was submitted to practices designed to remake him organically so that he would fit certain categories (surgery and hormone therapy), as well as subjectively so that he would

identify in particular ways (socialisation that encouraged him to engage in 'feminine' behaviour such as cooking and playing with dolls and interviews that encouraged him to have 'feminine' desires).[4]

From Deleuze and Guattari's perspective, there was no true self attached to either David's 'real' sex (his clearly male body as it existed before the accident) or his gender identity as it had been promoted through subjectification procedures designed to create a female gender identity (being identified and treated as a girl, being subjected to interviews designed to elicit 'female' desires and so forth). David's flow of individuation involved a convergence of physiological, semiotic, and subjectifying forces to which he – as a self-organising process of subjectivity needing to navigate the practices of his social location – had to respond in order to solve the problem of living a life. Although David did achieve his desire to marry and have a family, his life was, by all accounts, difficult, and he committed suicide at the age of 38. It is impossible to know why he made the choice to end his life, but one can imagine how painful dissonance between one's lived experience in all the molecular complexity of one's lived orientation and the molar subject positions designating one's identity in a way that demands the erasure of such complexity can become. His situation was anomalous in a way that could not be easily cancelled out; he simply was neither male nor female in the same way as his peers, given physiological anomalies as well as anomalies in his socialisation.

Susan Stryker, a male-to-female transsexual who refuses assimilating explanations of her actions (such as the explanation that she was 'really' a woman who simply needed to change her body to fit her true identity), is a happier example of how anomalous gender identity can play out in that she is able to intensify and extend her capacities to affect and be affected by the world in ways that challenge the binaries of the faciality machines. She speaks out publicly about her situation and she is a respected member of a transgender community that challenges binary designations of sexed and gendered identity. She thus defies erasure of the range of continuous variation manifest in her particular actualisation of humanity despite her deviance from the norm. She gives a provocative challenge to those who would denounce her and her choices (in a performance piece presented in, as she puts it, 'genderfuck drag' at an interdisciplinary, academic conference)[5]:

> I find no shame… in acknowledging my egalitarian relationship with non-human material Being; everything emerges from the same matrix of possibilities…. [T]he Nature you bedevil me with is a lie. Do not trust it to protect you from what I represent, for it is a fabrication that cloaks

> the groundlessness of the privilege you seek to maintain for yourself at my expense. You are as constructed as me; the same anarchic Womb has birthed us both. (Stryker 1999)

David and Stryker both, in different ways, resist the faciality machines that would recuperate their inassimilable differences to binary categories of designation and interpellation. If David had difficulties in identifying with the categories assigned him (when he was forced to identify as a girl despite his lived dissonance with that designation) as well as the categories he finally chose (by choosing to identify as male upon discovering some of what had been hidden from him about the story of his life), it was not because he wanted to challenge traditional notions of sex and gender. What he wanted was to live a meaningful life. What his story shows, perhaps, is how important a sense of self that coheres with one's lived orientations is to making one's life meaningful and therefore livable. We want to connect with the world, affect and be affected, in ways that resonate with a self-understanding and life narrative that makes sense to us, whether or not that sense of self is conventional or dissonant. In Deleuze and Guattari's terms, we might say that subjects need to extend not only their embodied capacities to make things happen, but also their psychic, cognitive, and emotional capacities to make sense of how they fit into larger wholes. David's lived experience was too dissonant for a number of reasons (anatomical, hormonal, cultural, familial) to easily fit into social patterns of making sense – ways of speaking, interpreting, and behaving available to him through collective practices of the social field dictating intelligible behaviour and interpretations – making it difficult for him to feel worthy as a human being.

Deleuze and Guattari's characterisation of subjectivity posits a subject who emerges from collective physiological and social processes as an individual process in its own right by sustaining habitual patterns distinguishing it as an individual from other processes around it. As a specific formation of physiological, social, and linguistic matter with actualised capacities – replete with hidden potential and tendencies structured by virtualities that are part of the wider non-human as well as human field conditioning its becoming – the subject is able to affect as well as be affected by what is around it. But its separation is always provisional, its form always on the verge of differentiating into something else, and the actualisation of its capacities always dependent upon the actualities and intensities that it is and with which it comes into contact.

Nomadic subjects emerge from collective patterns of living with the configuration of social and non-human forces unique to the becoming of specific processes of individuation. The individuation of such subjects cannot be represented. It emerges as a lived orientation constituting one's perceptions, thoughts, emotions, and perspectives through the territorialisations of unique individuations and communities grounded in the material reality of shared patterns of living. Some orientation with respect to the identity designations of mainstream social practices is necessary for subjectivity. One's 'personal' identity can be thought in terms of the 'molar' designations of the faciality machines that enable negotiation of dominant social systems of meaning or in terms of lived orientations too subtle to be captured through such designations, but which one could choose to assert by naming them. Heightened awareness of converging flows and the habitual patterns that orient one along with a sense of one's own location and places to intervene in order to affect individual and collective forms of self-production could allow resolution of the dissonance often arising between the two forms of identity as well as enable collective compositions that enhance mutually joyful becoming. Nomadic subjectivity as an alternative to oedipal subjectivity invites us to engage in a dynamic process of self-naming rather than reduce ourselves to static self-representations. Identity designations are representations that do not capture the nuances of lived orientations and can block lines of flight by putting people in opposition with one another despite the orientations they share. Drifting from the identity designations of faciality machines in order to experiment with joyful connections entails relinquishing some of the control derived through representational intelligence with its penchant for categorisation in order to trust the affective guidance of intuitive insight into processes of becoming. Becoming more aware of how one's subjectivity is produced allows one to participate more actively in one's self-production, develop skilful ways to synchronise becoming with others, and deterritorialise from identity designations in order to unfold new solutions to the problems life poses. Flexible living entails individual deterritorialisation from personal identity as well as collective deterritorialisations from majoritarian subjectivity. A politics influenced by Deleuze and Guattari would investigate different durations, the mutually reinforcing reference points of the faciality machines among those durations, and the places where intensification of virtual tendencies might unfold new answers to how to live together.

Deleuze and Guattari's conception of human subjectivity emphasises its continuity with the inhuman force of creative life. This emphasis

fosters working with rather than against the differentiating forces of life of which we are a part. This ontology conceives individual human beings as singular individuals who more or less diverge from the flows of life currently sustaining themselves in the recognisably human forms with which we are familiar. The question of one's humanity thus shifts from that of measuring up to an essential form of humanity (with respect to which many are found wanting) to the question of what diverging flows of humanity we want to foster in the inevitably diverging and differentiating flux of human life. Shifting the question in this way has practical impact on identity questions key to feminist thought. Women, as well as others who are 'other' to the paradigmatic subject of contemporary culture, have been denigrated for somehow failing to measure up to an ideal norm of what it means to be human. But such a norm assumes an ontology where the form one's humanity takes may well count as a deviation. One strategy of feminism, understandably enough, has been to contest what that essence is in order to make room for women. Shifting to an ontology of becoming suggests a different kind of strategy. If what it means to be human is not fixed, if human becoming entails creative evolution – if what it means to be human consists in the specific forms humanity actually takes and could unfold rather than a human essence that is then instantiated more or less well – then what feminists need to do is map where we are in order to find the best places to intervene and foster the human forms we would most like to support. The question then becomes not who we have always been and always will be, but how to make the mechanisms that create subjects and identities better function in keeping with our own becomings.

Feminism could be seen as an untimely schizo practice designed to intervene with contemporary configurations of modern subjectivity that involve suppression and oppression of subjects that deviate from a majoritarian norm with the fault lines of sexed, gendered, and sexual identity as its starting point. Deleuze and Guattari provide a narrative about the formation and production of those subjects that suggest critical points of intervention that could move us beyond binary categorisation of sex and gender and the oppression it entails. By distinguishing subjectivity as patterns of lived activity from faciality machines that designate identity they give us a way of understanding how we could be subjects without the binary designations that we currently think of as crucial to being any kind of subject at all. But they do not think we can simply choose to leave those binary machines behind. Rather, they recommend carefully mapping where we are in order to find vitalising paths that extend the tendencies resisting binary

designations. And they suggest that rather than be paranoid about the anarchic chaos we imagine moving beyond such binaries could cause, that we consider the capacities we could unfold if we could open up to the impersonal and inhuman flows around us. They present us with alternative conceptions of subjectivity as relatively stabilised patterns of physiological, corporeal, and semiotic activity that mutate over time in keeping with the flows that constitute them and the flows with which they come into contact, but which, as self-organising systems, and, in particular, human self-organising systems with the capacity to intuit the durational whole, can consciously participate in their creative evolution. And while such participation does not entail the masterful control of the autonomous subject as conceived by traditional modernity, it does entail ways of being more skilful than others in coming into joyful synchrony with the flows around it. Feminism, as a theoretical and pragmatic process, can intuit ways of living our sex and gender that are more affirming of the continuous range of variation in being sexed and gendered becoming-human entails. By mapping where we are and finding lines of flight from majoritarian subjectivity that can extend our capacities in ways that synchronise with others, feminists, along with other forms of minoritarian and schizo becoming, can promote a joyfully collective and open-ended process of becoming-human.

Notes

1. Deleuze and Guattari's account is compatible with Foucault's reading of sexed identity as taking on new importance in the circulation of biopower and the management of large groups of people emerging in the eighteenth century. Whereas one's sex in premodern times had significance in the role one would play and the patterns of social living in which one participated, it was not key to personal identity, on both these accounts, until the emergence of a modern subject with its increasingly interiorised psychic structure (see Foucault 1978). See Nietzsche's *Genealogy of Morals* for an account of the interiorisation of subjectivity in the context of Christianity that influences Deleuze and Guattari's account (Nietzsche 1989).
2. Sara Ahmed presents an example of an evocative phenomenological account of how a queer orientation can precipitate such dissonance (Ahmed 2006).
3. 'John/Joan' was actually David Reimer. For more information on this case from various perspectives, see Colapinto 1997, 2000, and 2004, Diamond 1997, Diamond and Sigmundsen 1997, and Money 1997. I am particularly indebted to Judith Butler's provocative rendition of this case that brings out the problem David posed to the people who responded to him by attempting to render him intelligible from competing perspectives as a problem of a humanity that exceeds intelligibility. On Butler's view: 'it is precisely the ways in which he is not fully recognizable, fully disposable, fully categorizable, that his humanness emerges' (Butler 2004: 73).
4. David's situation was particularly contentious since there were at least two views of who he 'really' was that were being promoted and contested. To oversimplify what were more complicated and evolving positions over the course of a long

debate, John Money, a medical psychologist and founder of the Gender Identity Institute at Johns Hopkins University, thought gender identity was malleable and hoped David's case would prove him right (it helped that David had an identical twin – the perfect complement to an experiment in manipulating gender identity through socialisation) and Milton Diamond, a sex researcher involved in a long-standing battle with Money, believed gender identity had a hormonal basis. See Diamond 1997, Diamond and Sigmundsen 1997, and Money 1997.

5. Stryker describes her outfit as 'combat boots, threadbare Levi 501s over a black lace body suit, a shredded Transgender Nation T-shirt with the neck and sleeves cut out, a pink triangle, quartz crystal pendant, grunge metal jewellery, and a six-inch long marlin hook dangling around my neck on a length of heavy stainless steel chain' (Stryker 1999: 2). There are, of course, social flows involved in transgender identity that are the subject of heated discussion in feminist and transgender debates that I do not here address.

Becoming-Woman: A Flight into Abstraction

Gillian Howie University of Liverpool

Abstract

In this paper I argue that the idea 'becoming-woman' is an attempt to transform embodied experience but, because it is unable to concern itself with mechanisms, structures and processes of sexual differentiation, fails in this task. In the first section I elaborate the relationship between becoming-woman and Deleuze's 'superior' or 'transcendental' empiricism and suggest that problems can be traced back to an underlying Humean empiricism. Along with Hume, Deleuze, it seems, presumes a bundle model of the object which dissolves things into episodic objects of perception and leaves the subject unable to distinguish between fanciful objects, erroneous perception and any other thing. The empiricist ontology thus has consequences for epistemology and leaves us unable to question the conservative tendencies of common sense. As an alternative to transcendental empiricism, the second section considers how transcendental realism, with its ontological commitment to the mind-independent character of things, may provide a more fruitful and productive line of enquiry. Given that there is such a choice, in the third section I speculate as to the specific desires that drive such philosophical abstraction; abstraction which culminates in the non sex-specific figure becoming-woman whilst disguising the mind-independent character of the mechanisms, structures and objects that affect the subject. So I conclude that, despite all appearances of radicalism, the philosophical model 'becoming-woman' – aligned as it is with schizo-processes and the philosophical loss of mind-independent things – is more of the same and sexual difference remains a hidden term. Due to this, I believe that feminists should view it with suspicion.

Keywords: abstraction, becoming-woman, body-without-organs, feminism, schizo-processes, sexual difference, transcendental empiricism, transcendental realism, Deleuze, Bhaskar, Jameson.

The figure 'becoming-woman' is often associated with *A Thousand Plateaus* but first appears in the first volume of the Capitalism and Schizophrenia series: *Anti-Oedipus*. The *Anti-Oedipus* was written during a time reverberating from the impact of the revolt of 1968.[1] Exploding the liberal myths of stability and integration, the noisy events of 1968 forced an epistemic and philosophical shift (Buchanan 2000: 13).[2] Deleuze describes May 1968 as an 'intempestif': an untimely irruption of pure virtuality (Conley 2000: 22). Accordingly, 'event 1968' signifies a rupture when, for a moment, there was a sense of life replete with new beginnings and potential 'becomings'. Between this moment and the reestablishment of Gaullist political order is the figure 'becoming-woman' which, alongside 'becoming-animal' and 'becoming-imperceptible', reveals a view of life as indeterminate creative process.

If a Deleuzian event signals a moment of productive intensity, a process without determinate outcome whereby new possibilities are revealed, then the association not just with affirmative becoming but also, and specifically, with becoming-*woman* requires – and has received – special attention. Where 'becoming' is the actualisation of an immanent encounter between forces, becoming-woman is supposed to mark degrees of intensities and states. Becoming-woman should thus be construed as a topological position, as a line of flight, a passage that by-passes empirical women (Braidotti 2005: 303). Indeed, working in the abstract, 'becoming-woman' stands with 'becoming-animal' and 'becoming-imperceptible' as a form of minoritarian-becoming. But there seems little to say about the peculiarities of becoming-*woman* rather than, say, becoming-insect.

The transformation of identities so envisaged is clearly not the same as that envisaged in calls for emancipation and liberation; the blood pulsating through the macro-political enlightenment project of feminism. There are two main differences between, what might be called, the macro political project of feminism and the micro process 'becoming-woman'. The first difference concerns the nature of goal-oriented activity. By defining 'becoming' as indeterminate, Deleuze attempts to signal numerous possible outcomes given in an event. It could be argued that the feminist project closes down all but those that fit with modern ideas of rights. While I remain unconvinced about this, as there are as many outcomes for the feminist project as there are feminists, it is the case that just about all feminisms posit a system whereby one identifiable group, men, benefit from the oppression of another group, women. Whether this is presented in psychoanalytic, sociological or

economic terms, there remains an underlying philosophical commitment to some form of identity and a political commitment to changing that state of affairs. Neither Deleuze nor Guattari would really demur from this, admitting that: 'it is of course indispensable for women to conduct a molar politics with a view to winning back their own organism, their own history, their own subjectivity'.

They continue, however, by warning that it is dangerous to confine oneself to such a subject 'which does not function without drying up a spring or stopping a flow'. Their comparison between such a dried up molar subject and a molecular 'becoming-woman' takes me to the second main difference. Within recent feminist theory, the 'body' has gained a privileged theoretical position. As Sara Ahmed notes, this is probably because feminist theory has identified the association of reason with masculinity and femininity with the body as the condition for the exclusion of women from theoretical enquiry and marginalisation from public discourse (Ahmed 2000: 40). As a response to such sex-based dimorphism, there has been a tendency within feminist theory to return to phenomenological analysis in order to rethink the body as something which is neither given in nature nor as a separate substance from mind. In a similar vein, becoming-woman focuses attention on the body but, and here lies the second main difference, becoming-woman requires us to reconstruct the physical body of macro-political movements into a 'body-without-organs'.

The body-without-organs is the virtual dimension of the body, with all the potential connections, affects and movements.[3] In order to reconstruct the physical body in this way we are encouraged to abstract relations of movement and rest, speed and slowness and emission of particles from the body (Deleuze and Guattari 1987: 276). Abstraction here is not supposed to be the work of reason but, instead, to indicate a material process. And this is the point of contention. While becoming-woman may focus critical attention on the historical and socially structured quality of bodies, this move into abstraction could equally well be described as *dis*embodiment, and disembodiment is arguably at odds with any productive and beneficial social critique of invested desire. It certainly seems a long way from feminist phenomenology which looks to explore how (inter)subject experience is lived and felt in the flesh.

In her paper 'Discontinuous Becomings,' Rosi Braidotti (1993) helpfully articulates the problem that concerns me here. Deleuze postulates a general 'becoming-woman' and simultaneously fails to take into account the historical and epistemological specificity of the female feminist standpoint: it is a theory of difference with no room for sexual

difference (Braidotti 1993: 42). Rather than becoming-woman resulting in the dissolution of identities, where new forms and connections might emerge, this process of becoming seems to be 'sex specific, sexually differentiated and take different forms according to different gendered sex-positions' (Braidotti 1993: 52). I believe that Braidotti is right to suspect that the idea 'becoming-woman' empties out the idea of sexual difference but also, I maintain, manages to reintroduce sexual difference, silently, through the back door.

The problem, I contend, lies in the tension between the wish to transform embodied experience and the means by which this is thought. Whether or not becoming-woman is a flight from the specificity of any particular body as engaged with other living bodies, or is a way to disorganise the socially-structured body, it *is* the case that the alignment of becoming-woman with schizo-processes catches women in an epistemic bind. I shall be arguing that this theoretical model not only naturalises social principles of organisation but also removes critical epistemic tools. Thus, despite all appearances of radicalism, the philosophical model is unable to offer any practical insights and feminists should view it with suspicion.

Object Lost

In *Empiricism and Subjectivity* we find elaborated the empirical principles of immanence and experiment, which are key features of the 'positive ontology' expressed in the leitmotif becoming-woman (Sotirin 2005: 99). Indeed, Deleuze's transcendental empiricism, famously formulated in *Difference and Repetition*, has its origins in this study of Hume. There is much to be said about Hume's empiricism and its influence on Deleuze, but Rajchman manages to distil four themes from *Empiricism and Subjectivity* that inform Deleuze's later work. These themes are: the idea of probability replacing that of necessity, the idea of creative experimentation, the idea that the self is not given but formed and the claim that apparently mind-independent identities are actually dependent on the intercession of images, passions and ideas (Rajchman 2000: 6–7, 17). All these themes evolve from the primary claim that complex ideas or impressions are formed from simple ones which are associated according to principles of the imagination. Because all ideas can be traced back to sense experience and ideas are brought together by the imagination, Deleuze believes that he can discern an empiricist path to experiment and creativity. Because the idea of 'becoming-woman' requires us to follow this empiricist path,

I believe that we can trace back some of the problems with 'becoming-woman' to the conceptual distinctions first found in Hume's empiricism and, specifically, in Deleuze's reading of Hume. I am interested in how the social - patriarchal - organisation of experience is mystified and, in order to explore this, I shall concentrate on the confusion between real and fanciful objects of experience within both Hume and Deleuze's empiricism.

Eugene Holland detects a change in emphasis between the *Anti-Oedipus* and a *Thousand Plateaus* and notes that the optimism of the former gives way to a slightly more hesitant portrayal of the relationship of desire to the body-without-organs in the latter (Holland 60). In the latter, wishing to avoid either 'over-coagulation' or 'wild chaos', Deleuze and Guattari develop the idea of a difference-engine: a body-without-organs continually forming and reforming passionate attachments (Deleuze and Guattari 1988: 61). Returning to this either-or in *What is Philosophy*, they suggest that we need a little Humean order to protect us from slipping into the fantastical chaos of madness (Deleuze and Guattari 1994: 201). I am interested in the relationship between the apparently welcome loss of the 'object a' in a *Thousand Plateaus* – a joyful deliverance from fixation on any naturally, socially or neurotically imposed object or activity – and the protective Humean rules which reign in our most fantastical ideas. There is much of interest in *Empiricism and Subjectivity*, not least the account of passion in relation to belief, but I shall have to restrict the scope of this paper in order to explore whether a demarcation between 'real' and 'fanciful' ideas can make sense without the idea of a mind-independent object of some sort. I shall return to a distinction between object and thing in the next section when I investigate whether Roy Bhaskar has anything to contribute to the idea of a minor science.

In *Empiricism and Subjectivity* Deleuze affirms the conceptual machinery of the *Treatise* and *Enquiry*.[4] According to Deleuze, the given is the idea as it is in the mind, without anything transcending it (Deleuze 1991: 28). This certainly resonates with Hume's assertion that we are only ever immediately acquainted with the content of our own perceptions, indeed 'to hate, to love, to think, to feel, to see; all this is nothing but to perceive' (Hume 1978: 1.1.V1). In *A Treatise of Human Nature* Hume divides perceptions into impressions and ideas, distinguished only by force and liveliness. Impressions are the first appearance of mental content and ideas are derivative weaker copies. The difference between ideas and impressions can be summed up as that between experiencing x and thinking about x (Shand 1993: 144). It

could thus be said that every perception appears both as an impression and an idea and every simple idea can be traced back to an impression.[5]

However, there are impressions of sensation and reflection. The first are really sense experiences. The second are new impressions derived from the way we react to sense experience. For this reason we could say that ideas derived from impressions of reflection depend in part on the nature and working of the mind (Hume 1978:1.1.1/2). If an idea derives from an impression of reflection only, then it is not an objective feature of the world but one that depends on our natural propensity to react to experiences in certain ways. Hume argues that perceptions are distinct from each other, that they can exist at different times and that they can be conceived as existing separately without contradiction (Hume 1978: 1.1.3). Therefore any connection, if indeed there is any such, is contingent and not necessary. It is the human mind which, according to certain natural propensities, associates perceptions that have logically distinct existences and between which no necessary connections can be discovered either by reason or observation. This problem of natural necessity as expressed by Hume helps Deleuze develop an account of probability.

Further developing the line of argument which leads from necessity to probability, Deleuze notes the Humean questions: why do I expect B to follow from A, and how can I explain my idea of necessary connection? Sticking close to the Humean analysis of inductive reason, Deleuze's starting position is that all ideas can be traced back to an impression and that each impression is distinct. As 'if A then B' is not an idea of reason (we can always imagine B without A) we have to look to sense experience to give us grounds for our belief. But because we do not perceive a causal relation between A and B the connection has to be explained by something in the perceiver (Williams 2003: 87). For Hume the constant conjunction of ideas (AB) in the past produces a habit in the mind. We infer that where there is an A there will be a B, or where a B there was an A, on the basis of custom which is a subterranean phenomenon (Sedgwick 2001: 24). The distinction then between constant conjunction and necessary connection can only be the force of the expectation. Similarly, according to Deleuze, causality is felt: it is a perception of the mind and not a conclusion of the understanding' (Deleuze 1991: 26). From this he establishes the principle that necessity belongs to the subject only insofar as the subject contemplates and not insofar as it acts.

So, there are impressions and ideas, and ideas are associated according to principles of connection, namely resemblance, contiguity

and causation. All complex ideas are derived from a combination of simple ideas and can be divided into three kinds: those concerning relations, modes and substances. Cause, permanence of objects and subject identity are all ideas of reflection: an habitual response to an impression of reflection – itself a (natural) response to sensation. The world as it is described through our beliefs, with objects and subjects that persist over time entering into causal relationships, is a result of associating ideas and impressions according to these principles of association. But because the idea of, say, substance is not traced back to an impression of sense experience it is not an idea of an objective feature in the world.

Identifying the essence of empiricism with the principles of association, Deleuze suggests that empiricism is more a philosophy of the imagination than of the senses. This definition also underlies the distinction between 'simple empiricism' and 'superior empiricism'. The former is mainly concerned with sense impressions and ideas that can be traced to such impressions whilst the latter is directed to the way imagination moves from one idea to another. Through associating ideas, moving from one impression or idea to another, the subject inhabits a world of subjects, objects and causal relations, a world filled with things it has never actually seen or touched. For this reason, the subject could be said to 'transcend' the given (Deleuze 1991: 24). Deleuze goes further than this however. The subject transcends what is given only because it has already experienced constant conjunction. So, Deleuze infers, before there can be belief about the world, the world must have already been organised into a constant, regular, coherent world of common sense.[6]

The roots of transcendental empiricism lie in the distinction Deleuze draws between what we might describe as rationalist and naturalistic transcendentalism. So, when he writes 'nothing is ever transcendental' (Deleuze 1991: 24) he is referring to rationalist transcendentalism. Instead, by giving a naturalist account of the principles of association and by describing the mind as passive, he attempts to give a non–rationalist explanation for how our world of experience transcends, goes beyond, 'the given'. Association, he claims, is a law of nature, defined through its effects rather than known as a cause. As we have seen, even the idea of *necessity* can be traced back to an impression of reflection, which is a feeling of compulsion accompanying the connection of two ideas. The difference between a series considered a case of constant conjunction and a series considered to be necessary lies in the degree of anticipation felt by the perceiver (Deleuze 1991: 68).

That a distinction might be drawn between these two series is significant and strays onto Kantian territory. How do we distinguish between a constant conjunction that indicates causality and one that is merely a long-standing coincidence of AB? Earlier I noted that ideas, which are derived from impressions of reflection, differ from those ideas derived from sensation, with only the latter correlated to objective features of the world. Thus we may have an idea of 'evil' but because there is no correlative impression of sensation we have to trace it back to an impression of reflection: a response to a different impression of sensation. Necessity, likewise, seems to be a projection into the world of an idea of an inner state. The way to distinguish between two beliefs, for example 'the sun will rise tomorrow' and 'this Irishman will not be witty' is not through appealing to an idea of necessity but to experience itself. Repetitions in experience give probable grounds for believing that the sun will rise tomorrow but experience gives no probable grounds for believing that 'this Irishman will not be witty' (Deleuze 1991: 69). The implication of this, for Deleuze, is that we must restrict our speculations to objects as they appear to us through the senses (Deleuze 1991: 88). The object of philosophical probability is supposed to lie in the coherent relationship between habit and experience. For the feminists amongst us, this should already cause some alarm bells to ring.

This relationship between habit and experience does seem to provide us with a number of epistemological tools. First we can question the distinction between fanciful claims to necessary connection and inferences based on probability by pointing out that that there is no impression of sense that corresponds to 'necessity'. We are, though, not left floundering in a skeptical soup because we can, secondly, distinguish between justifiable and unjustifiable beliefs based on probability of past sense experience. But we are left with an ontological problem. To describe that which appears in experience as an 'object' disguises the underlying constructivist ontology: 'without passive synthesis there would be no chair to consider'. Persistence and substance are ideas with no corresponding sense impression.

For both Deleuze and Hume the idea that the world might display any objective (mind-independent) feature is compromised. Throughout the *Treatise*, Hume is at pains to demonstrate the arbitrariness of mechanisms that lead us to believe 'quite falsely, that we are aware directly aware of an external world' (Fogelin 1993: 127). Similarly, Deleuze suggests that the very idea of a thing external to perception, or a mind-independent object, is a contradiction – one that we live with but a contradiction nonetheless. The perceptual object is the only real object

(Deleuze 1991: 88). Along with Hume's philosophical refutation of an independent external world is a refutation of representational realism and causal theories of perception. Arguing against causal theories of perception, Deleuze maintains an empiricist line which is that a 'causal relation' could only exist between two objects in experience whereas causal accounts of perception hold a mind-independent thing responsible for that perception.

The only criterion of truth, the only reason to assent to any view, is a strong inclination to consider that the object *is* as it *appears*. This inclination is explained as a propensity of the imagination worked on by experience and habit; memory and sense. The memory, senses and understanding are, therefore, all of them founded on the imagination, or 'the vivacity of our ideas' (Hume 1978: 1.1V.V11). This strong inclination would explain why we believe, and are justified in so doing, that the sun will rise tomorrow and do not believe that we will encounter a unicorn in the office this afternoon. However, this does seem to confuse rational and causal explanation. An inclination may well be an explanation but it is not itself a reason for believing or assenting. Nor does the invocation of 'inclination' help to explain error: prosaically, we may be inclined – quite wrongly – to believe the stick is bent rather than straight when perceived in water. Less prosaically, if in my experience all women have been responsible for domestic work, made the tea in meetings and been paid less than men for the same work is my belief that 'woman x will (probably) do these things' be legitimate? To put it otherwise, how may we explain that which is perceived as habitual and regular and how may we correct our erroneous expectations?

Of course, appeal to an inner nature will not do. Nor will an appeal to a mind-independent thing help to distinguish between the fanciful idea of a unicorn and the perceptual event, or hallucination, of a unicorn or between the hallucination of a unicorn and the sun. Deleuze argues instead that there is a difference between the fictions of continuous and distinct existence and other imaginative fancies: between ideas of the sun and ideas of unicorns. In the former case, the imagination, he says, does not offer the understanding continuous and distinct existence as objects of possible experience, but this does not mean that the ideas are *merely* fanciful. Instead, he suggests continuous existence is a characteristic of the World in general: 'it is not an object because it is the horizon which every object presupposes' (Deleuze 1991: 80). For the sake of coherence we presuppose, as a principle, that the object of sense, which we only encounter episodically, is a mind-independent thing. That we experience something is not in doubt, its mind-independent nature is

a postulation. At the same time, reason acknowledges that the world of mind-independent objects is 'an outright fiction of the imagination', 'a fictive foreign world' but it is a fiction that cannot be corrected. The result is a number of delirious compromises: 'the mind is no longer anything but delirium and madness' (Deleuze 1991: 81).

Because our intellectual grasp of nature has to be corrected according to experience, Deleuze considers the philosophy of experience to be a critique of the philosophy of nature. Yet it is the naturalistic description of the principles of association which allows Deleuze to define the relationship between the transcendental and immanent (Deleuze 2001: 26–8). It is an interesting transcendentalism, however. Deleuze has argued that it is rationalism which (falsely) transfers or projects mental determinations – necessity, truth, universality – to external objects. Because the idea of necessity is a projection onto a series of constant conjunctions, he can introduce radical contingency into his own transcendental argument in two ways. First, any claims about the principles of association can only be probable; second, Deleuze introduces the possibility of radically different experiences. Because there is no (real) basis for regularity – let alone necessity – except habit, there is no direction to future events except that given by sensation.

> In a word we always return to the same conclusion; the given, the mind, the collection of perceptions cannot call upon anything other than themselves. But as it calls upon itself, what exactly is it calling upon, since the collection remains arbitrary, and since every idea and every impression can disappear or be separated from the mind without contradiction? (Deleuze 1991: 89, 90)

His answer is that natural principles of association settle the imagination (Deleuze 2001: 41).

Dismissing *ad hominem* philosophical arguments, Deleuze suggests that an adequate approach to the history of philosophy is not one which criticises philosophical assumptions but rather one which addresses problems as they concern the particular philosopher. Hume was absorbed with the questions about whether or not we could justify our beliefs in necessity, regularity, and causality and, if not, whether we would have to abandon beliefs in the uniformity of nature and scientific experiment. These questions result from a more fundamental philosophical problem: as we have no grounds for believing that which we do not observe, what should we believe and how do we explain the origin of our ideas? We are left asking whether we can say anything meaningful about that which we do not directly perceive or that which is a reaction to that which we perceive. Hume's conclusion is that, for

the most part, the fundamental beliefs of ordinary people are either false or unfounded and the philosophers' attempts to 'put anything better in their place is wholly insignificant or unintelligible' (Fogelin 1993: 111).

There is with this sort of empiricism a slip between epistemology and ontology, which is often disguised within phenomenology.[7] The epistemological problems noted above arise from a *metaphysical* presumption that objects can be best understood as a bundle, whether that bundle be of ideas, impressions or perceptions. This bundle model of the object tends to collapse ontological questions (such as those relating to the mind-independent or dependent nature of the thing) into problems arising from the philosophy of perception (objects of sense experience). Objects are re-described merely in terms of how they are perceived: in this case as a succession of distinct and independent perceptions, where every idea could disappear without contradiction (Deleuze 1991: 87, 90).

Object Recovered

When Deleuze recommends concern only with the question of the subject and with the claim that relations are external to ideas, he focuses our attention on the relationship between ontology and epistemology. This ontological commitment to a bundle model of the object tends to reduce things simply to objects of perception. These objects are not considered to be in any meaningful relationship to an external or mind independent 'substantial' thing. Whilst this might play to phenomenologist sensibilities, these particular commitments are more radical and encourage a Deleuzian reading of Hume which first attends to the role of subjectivity in creating the object of perception as a persisting thing and then makes 'the subject' itself a consequence. But we need not take these steps. A philosophical concern with the repetition of resemblances does not need to be a meditation either on the nature of memory or on perception; nor is it, necessarily, a fruitless search for an irretrievably lost object or a recovered trauma. Intuitions can remind reason of its (historicised) blind spots without having to postulate a realm of 'pure difference'.

A helpful comparison can be made between transcendental empiricism and transcendental realism. Both aim to reveal the conditions of events, work through abstraction, investigate the relationship between events and essences or powers and give experimentation a privileged place. Both too might describe themselves within the philosophical history of 'process philosophy'. However, although they are both directed

towards disturbing the status quo and reconnecting the subject to their potential – to that which they might become – they differ as to their conception of objects and events; differences which impact on their respective theories of affects. Here I wish merely to suggest possible points of intersection in order to indicate alternative trajectories.

According to the critical realist Roy Bhaskar, Hume's apparent denial of ontology actually results in the generation of an *implicit* ontology and an implicit realism. Commenting on this empiricist realist tradition in *A Realist Theory of Science* Bhaskar claims that the collapse of epistemology into ontology covers or disguises an ontology based on the category of experience, and a form of realism based on the presumed characteristics of objects of experiences, that is, atomistic events and their relations. Hume has, in effect, replaced Locke's ontology of real essences, powers, and atomic constitution with an ontology of impressions (Bhaskar 1975: 40). Hume has also set out an epistemological frame of reference, whereby an analysis of perception and perceived events exhausts our knowledge of nature: that is, our grasp of the world is reduced to sense experience. But the language of 'impression' is really metaphorical: an impression is always an impression 'of something'.

In *Empiricism and Subjectivity* we find nothing that demurs from these fundamental Humean principles and, as we have seen, Deleuze maintains that a number of core beliefs – in mind-independent things, in causal theories of perception, in the continuous and persistent existence of objects – are without proper foundation. Deleuze also considers the distinction between the object (of perception) and the World or Nature to be misleading but unavoidable. Any theory according to which relations are derived from the nature of things is, for Deleuze, non-empiricist. This too is the point of demarcation for Bhaskar but he, unlike Deleuze, develops the idea that relations and powers can ultimately be traced back to (mind-independent) entities.

All versions of realism embrace the claim that what can be said to exist is not confined to that which can be displayed to the senses, or to that which appears as empirical data. That said, Bhaskar's critical realism is not to be strictly identified either with external realism or scientific realism. The former holds the view that the World (reality or universe) exists independently from our beliefs, ideas about it and the impression it makes on us. Scientific realism extends this to the independence of theoretical objects. Bhaskar's critical realism argues that structures and mechanisms exist independently of events and experience (Kaidesoja 2005: 30). Crucially, these mechanisms and structures can explain the

events or particular experiences – an explanatory route denied to the Humean.

Critical realism, in particular, is grounded in categories of entities that are characterised by their powers. As Rom Harré notes, the fact that power is not observable in itself but only in its effects is, as Thomas Reid pointed out two hundred and fifty years ago, not an adequate ground for throwing it out as an ontological concept (Harré 2001: 23). Although disagreeing with Harré as to what sort of things can have powers, the efficacy of power is central to Bhaskar's realist theory of science. But these are powers of enduring and transfactually acting things. Realist ontology is thing – rather than event – centered. For Bhaskar things may include powers, forces, mechanisms, characteristics or sets of relations (Bhaskar 1975: 226). These things possess characteristics and tendencies to interact in particular ways with other things. Further, a tendency is more than a power (Bhaskar 1975: 230). It depends upon distinguishing from within that class of actions naturally possible for a thing (in virtue of its being the kind of thing that it is) those that are characteristic of the thing. It is the function of this idea of tendency to individuate natures within kinds, species within genera, individuals within classes etc.

Bhaskar begins by asking: 'what must reality be like in order to make (scientific) experimentation an intelligible activity? (Bhaskar 1975:23). Whereas Deleuze separates realms into the real, virtual and actual, Bhaskar distinguishes between the real, the actual and the empirical: (i) the empirical world is what we experience, the limit of reality according to restrictive forms of empiricism present in the positivist approaches to science; (ii) the actual domain is the realm of events, not all of which are experienced by people; (iii) the real is the domain of the generative mechanisms or structures responsible for events, but which are themselves *unobservable*. Transcendental realist ontology includes specific claims about the ontological structure of the world. Events are certainly not deductively predictable: 'a stray bullet', 'an unhappy childhood affecting the course of history'. However, Bhaskar posits an analytic distinction between a pattern of events and the basis of causal laws – understood as powers of things – inhering in the things themselves as tendencies (117). Unobservable structures and generative mechanisms can generate, but exist independently of, the experience and patterns of events. These can become objects of scientific research; which means that transcendental knowledge of structures is possible. Science attempts to discern the nature of these things, to identify characteristics and tendencies of interaction. Because interaction is not invariant, scientific laws are best understood as explication of tendencies. Causal powers of

things are real features of the world. Kind terms, defined in terms of resemblances, are not assemblages – if by assemblage we mean a loose (and subjective) grouping together.

The Humean Deleuze certainly sheds light on the role of habit, demonstrating that the problem of transcendence disappears if the present is in itself a continual state of creative renewal. But in order to establish this, Deleuze makes use of a transcendental argument and appeals to an idea of pure difference. This pure idea of difference functions as a dummy concept. Michael Ayers suggests that Locke's concept of substance is also a dummy concept that can help to explain co–existing sensible qualities. Although such concepts cannot be derived either from reflection or from sensation, it is still not illegitimate to use them to the extent that they help to explain what is sensed by reference to something else, in this case underlying causes. One consequence of using a dummy concept of substance, in the way that Bhaskar does, is that one can accept the self–directed quality of transcendental arguments without also being forced into idealism; indeed one can develop a thoroughly naturalised account.

Both Deleuze and Bhaskar attempt to naturalise Kant's transcendental argument. But whereas Deleuze naturalises it through naturalising the synthetic act and the principles according to which the action is performed, Bhaskar uses arguments that combine *a posteriori* premises and a priori transcendental reasoning (Kaiesoja 2005: 45). Bhaskar assumes both the intelligibility of science and our ability to justify *a priori* the claim that it is a necessary condition of the possibility of certain (located) scientific practices (such as experimentation) and that the ontological structure of the world contains certain features (structures and mechanisms) that are ontologically independent of any pattern of events (Bhaskar 1975: 32). Although necessity is interpreted in a rather Kantian way, he does not posit a bundle model of the object, and so the object of perception as a thing in the world retains a degree of independence from the subject. As Kaidesoja points out whereas concepts are for Kant subject-sided they are, for Bhaskar, object-sided (Kaidesoja 2005:34).

Deleuze relies on a working distinction between the World and beliefs about that world, between states of affairs and propositions, but is unable to account for this 'workability' or coherence except in terms of transcendental doubling.[8] The Humean suggestion, that only a psychological attitude demarcates the fanciful object of perception (unicorns) from the (fanciful) object of perception (substance or mind independent object), not only has little explanatory force but also

commits us to a passive subject merely responding to the given: indeed, without being able to account for that given. I am not suggesting that the critical realist contribution to social science is straight–forward, but, if the philosophical arguments are found at least in part convincing then given the similar trajectories as identified at the beginning of this section, a positive way forward could be to explore intersections between critical realism and process philosophy. Bhaskar's distinction between mechanisms (powers) and events might be a helpful way to approach Deleuze's virtual; a comparison between the Real and the Virtual, singularities and powers. Such a productive comparison may be able to retain the spirit of creative transition and combine it with a commitment to social scientific research: a commitment required by feminists. In the current context it may be illuminating to consider what happens when the object is claimed for a (passive) subject, who is unable to tell the difference between fanciful and (fanciful) objects of perception.

Becoming-Woman

In the introduction I suggested that there is a tension between the desire to transform embodied experience and the means by which this is thought. In the first section I elaborated the means by which it is thought as 'superior' or transcendental empiricism. The second section offered transcendental realism as an alternative to transcendental empiricism. The focal point has been that 'becoming-woman' is defined in terms of schizo-processes and schizo-processes depend on the empiricist philosophy of experimentation. Empiricism presumes a bundle model of the object, which dissolves things into episodic objects of perception and leaves the subject unable to distinguish between fanciful and any other object. Despite all the talk about materialism and empiricism the thing – or mind-independent character of the object – disappears. Repeating the Copernican moment, objects become fanciful affects of the subject. In this section I consider the psychology behind the philosophical loss of the mind-independent object and I allow myself to speculate as to the specific desires that drive such philosophical abstraction; abstraction which culminates in the non sex-specific figure 'becoming-woman'.

In psychoanalytic theory, schizophrenia is considered to be a response to a frustrating external world, an instinctual flight in which energy cathexis is withdrawn from external objects. Deleuze and Guattari do not eulogise this clinical condition of schizophrenia, indeed they consider it to be a pathological response to a specific configuration

of capital. For Deleuze and Guattari, schizophrenic pathology reveals something profound about the relationship between desire and the social production of identities (subject and object), a relationship which becomes more conspicuous in times of social upheaval, or 'decoding' and 'deterritorialisation', and most obvious during particular stages of capitalist development. In response to the limits of and closures within late capitalism the individual withdraws and ends up as a clinical entity; catatonic and unproductive.

But Deleuze|Guattari still do insist that processes can be adequately described as *schizo*-processes. According to Holland Deleuze|Guattari assign the name 'schizophrenia' to desiring-production in its absolute indeterminate free-state (Holland 2005: 57). For Lambert, although it is a term to be mobilised more within critical theory than clinical practice, it is also indicates 'the orphan unconscious' (Lambert 2000: 139). The unconscious is not to be understood as a kind of theatre where a self is staged and performed through a series of imaginary identifications but, instead, as a productive process. Indeed they describe schizophrenia as an intense and pure process where singularities are brought together in a machinic assemblage and take schizophrenic experiences of unbearable intensities to be the primary level of experience. Intensities are defined in terms of delirium; the result of tension brought about by exterior relations (Goodchild 1996: 84).

Whether they are postulating an ürground of desire[9] or investigating how psychic and social production are manifested in a schizophrenic's delirium, or trying to express schizophrenic experience, the critical method they deploy carries all the hallmarks of clinical schizophrenia. 'Becoming-woman' is one element of this 'schizophrenic thought' where ideas are liberated from the model of logic and words behave like bodies: as asignifying or machinic–material substance(s) (Goodchild 1996: 85). According to Goodchild, the real schizo is someone who temporarily enters into a process, a transition, or a voyage in intensity. 'Schizophrenia is a move to a different quality of consciousness: the *fantasy* of desiring-production' (1996: 90).

Discussing Freud's case of Judge Schreber in the *Anti-Oedipus*, Deleuze|Guattari write that Schreber did not *hallucinate* the experience of becoming-woman and being impregnated by God but rather it was a lived experience: 'the actual lived emotion of having breasts does not resemble breasts, it does not represent them… nothing but bands of intensity, potentials, thresholds, gradients' (Deleuze and Guattari 1984: 19).[10] There is no distinction to be drawn between that which is real and that which is experienced as real. The idea shifts but only slightly

in a *Thousand Plateaus,* where they insist that 'becoming–woman' is an experience that men and women can have (Deleuze and Guattari 1988: 275); although it is an affect which can destabilise dominant identities, molar forms and relations and, arguably, empirical women are more likely to experience (pass through) these bands of intensities. Just why empirical women are more likely to become-woman is without explanation, unless, of course, women are more delirious, perhaps even slightly hysterical.

The description of these processes as schizophrenic is a nudge back to Freud. However for both Freud and Melanie Klein although hallucinations are experienced *as* real they can be distinguished *from* the real. The subject acquires and requires an ability to distinguish between object relations over-determined by particular traumatic memories and object relations that conform to objective demands. But the schizophrenic condition is where words predominate over things. Substitution is not based on resemblance between things but between words that are used to express them: a form of expression where the concrete thing is taken *as though* it were abstract.

Deleuze and Guattari's eulogy to abstraction involves the loss of the concrete object and the appropriation of the World to the subject. If we combine this with the textual absence of any real way to figure the parent–child relationship – which is neither Oedipal nor an arbitrary assemblage – we are reminded of the Freudian description of the origin of psychotic cathectic withdrawal from the object as a narcissistic neurotic denial of mother-other. Irigaray describes this move in the context of transcendental idealism as 'copula without copulation' (Irigaray 1985: 184). It begins to look as though 'becoming-woman' is a sadistic reincorporation into the same. Goodchild then is right, it is a fantasy but more a phantastical move that deflects from formal questions about the relationships between peculiar and specialised abstractions of what we used to call capitalism and patriarchy and how they can be found in cultural texts.

Although 'becoming-woman' is privileged over masculine narcissistic identity in Deleuze and Guattari's work, philosophical abstraction allows sexual difference to be a hidden term. The obvious problems, that women must 'become-woman' and the role played by the motif girl, can be overlooked; we are happy to be that forgiving to many philosophers. But the suspicion is that there is something more profound and structural.[11] Addressing this, whilst commenting on Deleuze's remark that eating bored him', Nicole Shukin investigates *A Thousand Plateaus* and discovers that Deleuze and Guattari dichotomise nomadology (the

raw: intense) and the regulatory (the domestic) (Shukin 2000:147). This does seem to be an old-fashioned duality between nature (power: movement of the infinite: the involuntary) and convention, where convention is judged according to ethical criteria discerned in nature. There appears, as Jerry Fleiger notes (2000: 40) a worn-out essentialism here, an association of the non-subjectified woman, nature, flows, springs, excess, difference, differences even gaps and tears – the very underbelly of enlightened modern reason. Women, then, are of interest (to whom?): 'only in their capacity to quicken the blood; carriers of strange winds and estrangement that provide Western man with the conduit he needs to abdicate himself' (Shukin 2000: 148).

These familiar dualisms do indicate something about the movement of the text which is disguised in the abstraction associated with schizo-processes. More profound, I believe, is the way in which the empiricism attempts to neutralise experience under the guise of introducing passion and affect. The bundle model of the object reduces things to episodic objects of perception and, in the end, throws the weight of objectivity onto the subject. If the principles of association, external to their terms, are actually *social* principles of organisation, there is something ominous about the description of regularity as the result of passive contraction. The suspicion that Deleuze opens the philosophical space to elide the natural and social is confirmed by his own description of the supposedly 'natural' principles of association: 'The moral problem is the problem of schematism, that is the act by means of which we refer the natural interests to the political category of the whole or to the totality that is not given in nature... The moral is the system of means which allow my particular interest, and also the interest of the other, to be satisfied and realized' (Deleuze 1991: 40–1). This point is also made clearly in his later essay on Hume: 'What is called a theory of association finds its direction and its truth in a casuistry of relations, a practice of law, of politics, of economics, that completely changes the nature of philosophical reflection' (Deleuze 2001: 36).

But we have to ask whether the empiricist philosopher, even a philosopher of superior empiricism, is able to distinguish between the natural and social clearly enough to demarcate the origin of the principles, the conditions of an event, or to identify whose desires are being satisfied. The empiricist slip between ontology and epistemology disguises the mind-independent character of the mechanisms, structures and objects affecting the subject whilst undermining our ability to say anything about them. Any proposition has as much status as any other '(in my experience) women are hysterical' because justification remains

at the surface: how it appears to particular subjects and according to (their) desires, experience and, indeed, interests. This problem is especially acute where the philosophical move not only undermines our ability to respond to the question 'in whose interests?', but also dissolves the very integrity of other subjects.[12] Gender remains latent in the text of *A Thousand Plateaus* because the abstraction, that is the schizophrenic move, drops things and so the context of the idea or the affective intensity from sight. Deleuze expresses boredom with eating because he can take it for granted (Shukin 2000: 148). The labor of women and our actual, embroiled lives are sacrificed in the text.

Conclusion

The concept 'becoming-woman' has obvious heuristic potential. The idea that becoming can be a process which is not governed by a stable centralised self who somehow manages to supervise their own unfolding (Braidotti 2005: 303) expresses a way to release (the thought of) identity from dualistic and hierarchical constraints of a 'normalised', organised and thoroughly social body. The alignment of becoming-woman with schizo-processes indicates how subject identity might be more mobile if it were free from the (psychic) constraints of oedipal organisation and the legal and moral constraints of an overregulated social world But the interrogation of Deleuze's superior empiricism must raise a question about the therapeutic value of a philosophy of affect, unable to address itself to the context or location of the affect, of a philosophy of event, unable to address itself to the conditions of the event, and of a philosophy of becoming unable to tell the difference between fantastical objects and mind-independent objects.

Unlike Deleuze and Guattari, Fredric Jameson believes that schizophrenia is primarily a social and political condition whereby reference is confused, ideas come to stand for objects, each idea is presumed interchangeable with others and concrete things are taken *as though* they were abstract. It actually marks the cultural condition of late (developed) capitalism in which the loss of the real object contributes to social and political confinement.[13] According to Jameson, in late capitalism, the monadic – rather than nomadic – subject can no longer look directly for the referent in the real world but must, as the subjects in Plato's Cave, trace mental images of the world on confining walls (Jameson 3). For Jameson, then, there is nothing inherently redemptive about schizo- processes; indeed the loss of objects in the process of abstraction poses and disguises real threats to the subject. The most

that can be hoped for within postmodernism is that subjects can grasp this schizophrenic confinement and this can shock them out from Plato's Cave.

When mind-independence is described as fanciful and persisting identity as a consequence of subject involvement then to all intents and purposes objects disappear. Here we can see a slip between empiricism and idealism/rationalism (Zizek 2004: 22; Howie 2002: 2, 206). But as we know by now, ideas and objects are not the same thing and mind-independent objects only disappear from philosophical discourse. The belief in immediacy concedes the very principles of containment and closure it was mobilised to break apart, so that the longed-for outbreak is an outbreak into the mirror. Unless these things are recovered in theory, it will be more difficult to resist patriarchal organisation of difference and becoming-woman will not trigger a new plane but remain the same: phantastical self-creation.

There is a sense in which Deleuze plays across two surfaces: a Nietzschean/Heideggerian critique of reasoning in the name of 'unreason' (Lewis Carroll/Artaud) and a critique of bourgeois rationality in the name of 'another' (molar/molecular). The aesthetic space between discursive barbarism (logical positivism) and poetic euphemism (utopianism) is one into which the philosopher can burrow. But the idea that *all* becomings are minoritarian and *will* unsettle the status quo is one side of that movement: utopic. It is premised on an economic model of the psyche that proposes a theory of circulation of intensities: a kind of redemption that eliminates mediation. Deleuze writes that some ideas, such as becoming-woman, should be seen as governing principles; as schemas or rules of construction. Yet the true nature of the schematism might be ultimately revealed as the interest of gendered industrial society – where things are apprehended through the process of manufacture and administration; productive assemblages where everything is converted into repeatable replaceable units or blocks and labour segregated by race, sex and class.

Let us return to the problem of transcendence reconfigured as states of renewal. The problem expressed in Deleuze's semiotics is to make sense, sense that is more closely related to nonsense than propositional sense, and so make thinkable what we have not yet been able to think, to make visible that which we have been unable to discern (Rajchman 2000: 67). In this case, how may we think outside the perimeter of sex/gender? Trying to do something similar, whilst keeping in mind the dangers of abstraction, Theodor Adorno writes that nothing can be experienced as living if it does not contain a promise of a creative

transition, which at its heart suggests an impossibility of thinking that which nevertheless must be thought (Adorno 1988: 145). The new in this way shudders along and this shuddering response to the new is both a reaction to the cryptically shut, which is a function of indeterminacy, and a reaction to abstraction. The abstraction of the new is bound with – but not reducible to – the commodity character; an aesthetic seal of expanded reproduction with its promise of undiminished plenitude. If the new itself becomes a fetish there is usually a problem between new means and old ends (Adorno 1997: 21–3). In this case, because the means remain the same (social principles of association), the end is already predictable (reterritorialisation). The problem of means and ends, unthinkable without an idea of the object, can affect a falling-back into the ever-same.

Becoming-woman suggests a radically androgynous transvaluation of values, and it certainly appears to leap over the risk of dimorphic essentialism in an un-gendered becoming. It does so by risking, instead, de-contextualising and appropriating the affective body; interning the same dimorphic values whilst cutting the ground from critical interjection. The welcome idea that each moment already contains creative transition, immanent transcendence, opens the future to radical contingency. But the idea of 'becoming something else' is neither innocent nor without context. Immanent transcendence was figured by Deleuze in his interview with Parnet as a holy trinity: Brain (god/concept), marrow (son/affect), tongue (holy spirit/percept). My shudder, an affective response to the place from which I speak, is that the brain, the marrow and the tongue, might figure another – and the same – holy trinity.

Notes

An earlier version of this paper will be appearing as 'Becoming-Woman: the brain, marrow, the tongue or copula without copulation' in Deleuzian Events: Writing |History ed H Berressem and L. Hakerkamp (Hamburg: Lit 2008)

1. The connection between becoming-woman and the events of 1968 is made by Conley in *Becoming-Woman Now*. In 1968 Deleuze also began to teach in the experimental department of philosophy of the University of Paris at Vincennes.
2. This point is made clearly by Michel Foucault in the Preface to Schizophrenia and Capitalism.
3. The BwOs is also defined as a recording surface which functions according to a disjunctive syntheses and as a surface which is inscribed containing both what is inscribed and the energy that inscribes it (AO 78, 327). See also Buchanan 147.
4. In his essay on Hume in *Pure Immanence* Deleuze considers the principal difference to lie between ideas/impressions and principles of association rather than between ideas and impressions of reflection and sensation.
5. This idea could support claims made in *Expressionism* (Deleuze 1990) that in some sense a mode is in – or a modification of – both the attribute of thought and the attribute of extension. However it raises similar problems, for instance, is it the case that whenever I think about the day I broke my hand I experience it?
6. By making nature or mind the condition for the uniformity of nature, Deleuze does seem to address the more sceptical elements of Hume's empiricism but only at the cost of engaging more directly with transcendental argument.
7. It is exactly this problem that Jean-Paul Sartre addresses in the Introduction to *Being and Nothingness*.
8. This is resolved in *Expressionism* through the parallelism, but the parallelism itself depends on a number of rationalist principles to get off the ground.

9. This would be supported by the claim that the unconscious belongs to the realm of physics and that the BwOs and its intensities are not metaphors but matter (AO: 283)
10. Fleiger (2000), referencing David Santer, draws out potential socio-political connections between the molecular (or minoritarian) and becoming-woman through an analysis of Freud's own account of investment in the social field. Although suggestive, this still requires a tougher realism than that afforded by Deleuze's empiricism (49).
11. This same issue makes an appearance in Deleuze's work on Spinoza see Howie 2002: 181–5.
12. Questions concerning the role of theory intersect with questions concerning the mind as it is figured in feminist discourse, especially in relation to the body. There is a nice clear exposition of this in Kaufman (2000: 135).
13. For a comparison between Jameson and Deleuze Guattari see Buchanan pp. 158–62 and Paretti.

After Alice: Alice and the Dry Tail

Dorothea Olkowski University of Colorado

Abstract

According to Gilles Deleuze, the underground world of *Alice in Wonderland* has been strongly associated with animality and embodiment. Thus the need for Alice's eventual climb to the surface and her discovery that everything linguistic happens at that border. Yet, strangely, in spite of the claim that Alice disavows false depth and returns to the surface, it seems that it is precisely in the depths that she finally wakes from her sleepy, stupified surface state and investigates the deep structures, the rules of logic. In this investigation, Alice questions many formal structures, such as causality, identity, reference and the rules of replacement. She discovers that Wonderland does not generate consequential conduct; in fact, it generates no conduct whatsoever! In other words, when it comes to consequences, Wonderland may not be all that wonderful. Yet, we do not live in Wonderland and therefore, our actions have consequences. The question this poses is, why organise language so as to escape causal relations and why choose the little girl as emblematic of this organisation?

Keywords: Alice in Wonderland, surface, deep structure, linguistics, logic, causality, little girl.

The Long Fall

On a very hot day, raised out of her sleepy state by the astonishing sight of a rabbit removing a watch from the pocket of the waistcoat it was *wearing*, a little girl named Alice runs after the creature. She races across a field and, without hesitation, follows it down a large rabbit-hole hidden under a hedge. She falls from the surface of the earth into the depths, seemingly endlessly, into the rabbit's hole, ' "Down, down, down. Would the fall never come to an end?"'[1] The fall takes so long that Alice starts to get sleepy again and she shakes herself out of it, perhaps, not surprisingly, by talking to herself, and perhaps, somewhat

surprisingly, by beginning to engage with the conventions of logic: Does 'All A are B' convert, she asks, to 'All B are A' as in the questions, 'Do cats eat bats?' and 'Do bats eat cats?' (Carroll 1974: 16). But because she is unable to provide a solid empirical answer for herself regarding the dietary habits of the creatures in question, she forgets about this problem the moment she finally lands upon a heap of dry leaves. However, on her feet once again, but now deep underground, she begins exploring this place in which she finds herself, and she continues articulating her discoveries in terms of logical rules.

Perhaps this is startling, for the underground world has been strongly associated with animality and embodiment. Only animals, it has been said, are deep, and depth is no compliment. 'The entire first half of Alice still seeks the secret of events... in the depths of the earth, in dugout shafts and holes which plunge beneath, and in the mixture of bodies which interpenetrate and coexist' (Deleuze 1990: 9 [19]).[2] This leads, we are told, to Alice's eventual climb to the surface and her disavowal of false depth, her discovery that everything linguistic happens at that border. Yet, strangely, in spite of the claim (coming from Gilles Deleuze), that Alice disavows false depth and returns to the surface, it seems that it is precisely in the depths that she finally wakes from her sleepy, stupefied surface state and investigates the deep structures, the rules of logic. In this investigation, Alice questions many formal structures, such as causality, identity, reference and the rules of replacement, and as we shall see, she discovers that as wonderful as unleashing these formal structures might be, nevertheless Wonderland does not generate consequential conduct. In fact it, generates no conduct whatsoever! In other words, when it comes to consequences, Wonderland may not be all that wonderful.

Finding herself in a long hallway of locked doors and spotting a tiny gold key on a table, Alice again talks to herself, this time addressing herself with a disjunctive proposition. *Either* the locks are too large *or* the key she finds is too small to open any of the doors in the great hall. This is followed by a set of hypotheticals. *If* eating the little cake she finds under the table makes her larger, *then* she can reach the key that she left on the table. However, *if* it makes her smaller, *then* she can creep under the door leading into the lovely garden. Having begun her musings with these disjunctive propositions, Alice alerts the reader to the possibility of putting into play the so-called 'rules of replacement:' rules governing logically equivalent expressions which permit an inference from any statement that results from replacing any component of that statement with a logically equivalent statement (Copi and Cohen 1994: 387–8).[3]

Therefore, given any hypothetical statement, 'if p, then q,' which consists of a relation between two propositions, 'p,' and 'q,' and which invokes a causal relation between 'p' and 'q,' the statement can be reformulated using the rule of material implication to arrive at its logical equivalent, 'not p or q,' (Devlin 1994: 48).[4] In this way, Alice can be said to create a series of disjunctive terms, beginning with, '*either* the locks are too large *or* the key she finds is too small to open any of the doors in the great hall.' From there we proceed to the next set of disjunctions in the series. *Either* it is not the case that the bottle named 'DRINK ME' will make her smaller *or* she can go through the little door. So we are lead to the discovery, with Alice, that propositions that might have been stated as linear and causal hypotheticals can be transformed into a series of disjunctions bearing no causal relation to one another. This is the reason why anything is possible. By evading causality, one may evade consequences. Evading consequences implies that actions are mere events with no before and no after, no causes and no effects, no actors and no one or no thing responsible. In other words, Alice discovers a world without good sense.

Of course, even after opening our and her eyes to the replacement of the series of causal relations that would have allowed her to proceed in the manner of good sense, Alice remains cognisant of causality. In other words, using good sense, the sense of temporal or causal relations, she remains cognisant of the arrow of time, and thus constitutes the relation between what is most differentiated (poison, which might be the contents of the bottle named DRINK ME) and so fixed in the past, and what is less differentiated and oriented as the future (the disagreeable results of drinking poison) (Deleuze 1990: 75 [93]). She does this with the aid of memory. Alice remembers that a red-hot poker will burn you if you hold it too long, that cutting one's finger very deeply with a knife usually results in bleeding, and that drinking from a bottle marked 'poison' will indeed have disagreeable results (Carroll 1974: 18–9). But it must be stressed that these relations are all things she merely remembers and that her current adventures continue along a disjointed trajectory. In this sense, she is correct, as she puts it, to 'think that very few things indeed were really impossible,' at least while she is underground (Carroll 1974: 18). Drinking from the bottle named 'DRINK ME,' she shrinks to a mere 10 inches, but having left the key on the table, she is still unable to get through the door into the lovely garden. (*Either* she will not shrink any further *or* she will go out like the flame of a candle.) Upon finding a very small cake named 'EAT ME' under the table, she states the following: *Either* it is not the case that eating the cake will make her larger *or* she

can reach the key. And, *either* it is *n*ot the case that the cake will make her smaller *or* she can creep under the door (Carroll 1974: 20).

It seems that it is the power of disjunction, as much as, if not more than, the things she drinks and eats that convince Alice, at least at this point, that it would be dull and stupid for life to go on in the common way. Yet memory supplies her with the recollection of little children, who suffered burns, had been eaten by beasts, or suffered other disagreeable outcomes because they did not remember the simple rules about these sorts of things. However, insofar as eating the cake is disjoined from its effects, then it cannot provide Alice with any causal information that she might apply to drinking from the bottle. Disjunction convinces Alice that as long as the bottle is not named 'poison' (something she merely remembers) she need not concern herself with the arrow of time. Alas. For when she drinks from the bottle, tasting as it does of a very nice concoction of flavors, not only does Alice grow so large that she can barely even see her own feet, but more: she begins talking what she refers to as nonsense, carrying on speaking to herself about her feet as if they were not part of her and might walk off in a different direction if she is not kind to them, so that her feet need to be convinced not to do this. It seems that her ability to proceed according to disjunctive statements leads her to what logicians call, the 'vicious circle principle,' which is that 'no entity can be defined in terms of a totality of which it is itself a possible member' (Tiles 1991: 72).[5] In other words, if a name is taken to be a label for an empirically given object, it is a logically proper name with reference but no sense. If it is a descriptive expression, it identifies an object in terms of its relations to other objects or as constructed out of previously given objects. The logical problem here is that no entity can be constructed out of itself and no verbal expression can be defined in terms of itself (Tiles 1991: 79–81).[6] Yet this is precisely what Alice tries to do. And so, speaking to herself concerning her feet has taken her to the point of speaking nonsense. Her problem is that insofar as, 'an element cannot be part of the sub-sets which it determines' (for example, Alice and her feet), nor a part of the set whose existence it presupposes (thus, her feet and Alice), logically, she is engaged in a vicious circle. Either way, she is not making sense! (Deleuze 1990: 69 [86]).

Not only does Alice begin speaking nonsense but additionally, while fanning herself with a fan dropped by the White Rabbit whom she frightens (as she is now 9 feet high), Alice begins asking questions about her own identity: 'Was I the same as when I got up this morning? I almost think I can remember feeling a little different. But if I'm not

the same, the next question is, Who in the world am I?' (Carroll 1974: 24). As we can see, this is not just pretend angst. Poor Alice has changed so much that she can no longer recite her multiplication tables, nor can she remember geography or recite a short verse correctly. In other words, the past is not carrying into the present; good sense is not functioning, and this is having an effect on her identity. So it may be that having forgone good sense, Alice is now faced with the loss of common sense as well, if common sense is in fact what 'subsumes under itself the various faculties of the soul, or the differentiated organs of the body, and brings them to bear upon a unity which is capable of saying "I"' (Deleuze 1990: 78 [96]). 'Let me think,' she asks herself, 'was I the same when I got up this morning? I almost think I can remember feeling a little different. But if I'm not the same, the next question is, "Who in the world am I?"' (Carroll 1974: 24). And she resolves not to return above ground until her identity is resolved to her satisfaction. Contemporary philosophers often take such a turn of events to be a positive development. The disappearance of the author or of the self is celebrated as an encouraging step away from the concept of a centered, egoistic subject. But for Alice, it could have serious consequences: she could in fact go out like a flame! Fortunately, just before shrinking completely out of sight, Alice realises that there is a causal relation between fanning herself and growing small again and she stops fanning just in time.

A Dry Tail

Good sense at least partially restored, Alice nonetheless falls into the pool of tears that she, herself has cried. Suddenly and inexplicably surrounded by strange creatures (a Duck and a Dodo, a Lory and an Eaglet, a Mouse and others), who simply appear and fall into the water, then follow her to shore, Alice is once again faced with logical and linguistic problems.[7] In particular, the Mouse has trouble with the *sense* of words. The Mouse tells the driest story it knows in order to dry off the company who are all wet from falling into the pool of tears, and when it offers to tell a long *tale*, Alice can only imagine a long *tail* (Carroll 1974: 30–6). The problem that interferes with communication here seems to be related to the question of distinguishing sense and reference. Sense and reference have been defined, most notably, by the philosopher, Gottlob Frege. For Frege, a sign or a name represents a proper name which must have a definite object as its reference. Moreover, although a definite sense corresponds to the sign, certain signs (the extinct Dodo) have sense yet no reference. The reference of a sign is an object able to be perceived

by the senses (the long tale that we hear or the long tail that we see) of which we may form an internal image, an idea, arising from memories of sense impressions (Frege 1952: 57–9). What *this* means is that sense does not assure that there is a reference and therefore, the same sense is not always connected with the same idea (Frege 1952: 59).

The Mouse and Alice connect different ideas to the name *dry*. Alice wants to dry off because she is wet, cold and shivering. The Mouse wants to tell a dry story: thus the importance of reference. The reference of tale, tail or dry is an object which we designate, but the idea is wholly subjective (to dry off or to tell a dry tale) (Frege 1952: 60). 'In between lies the sense, which is indeed no longer subjective like the idea, but is yet not the object itself' (Frege 1952: 60). 'A proper name (word, sign, sign combination, expression) expresses its sense, stands for or designates its reference. By means of a sign we express its sense and designate its reference' (Frege 1952: 61). And, just like the Duck, who demands to know what 'it' means when the mouse dryly relates that 'Stigand, the patriotic archbishop of Canterbury, found it advisable,' Frege also finds that when we say something we presuppose a reference and preferably, something with a proper name (Carroll 1974: 30; Frege 1952: 61). For the Duck, *it* refers to a frog or a worm that the Duck has actually found (and not simply thought about) and so *it* must have both a sense and a reference in order for saying *it* to matter to us at all. We want the proper name to have a reference, Frege states, because of our concern with truth value. Poems and stories that convey only sense and feeling through their images do not lend themselves to truth. Thus the dry tale is not meant to delight but to convey something true. Truth value is identified with reference and all true sentences must have the referent 'true' and all false sentences have the referent 'false.' This allows the Duck to replace frog or worm with the name *it*, but still seems to undermine the Mouse, who wished to tell a dry story, a story with truth value (Frege 1952: 64–5). For the Mouse's *it* may have sense, yet it appears to be without reference.

And so, one might argue that Alice is beginning to recognise the limits of undoing causality and the problems associated with sense and reference, and it is this that eventually sends her fleeing back to the surface. When the White Rabbit abruptly orders her to find his gloves and fan, taking her to be the maid (she is a girl after all), Alice also finds a bottle named 'DRINK ME.' She seems to take this name to be an imperative, even though this time, she *knows*, as she puts it, that something interesting (as she also puts it), will happen each time she eats or drinks anything (Carroll 1974: 38). She does not just remember that there have been causal relations between eating and drinking and

something interesting in the past, but she claims to *know* that causal relations are operating in her present as well. Moreover, Alice's identity is not the only one in question. Little pebbles are thrown at her, in an unsuccessful effort to kill her or drive her out, as she sits despondently in the White Rabbit's house where she has gone to fetch the gloves and fan. As they hit her, the pebbles turn into little cakes; fortunately, she anticipates that by eating them, she will shrink again (Carroll 1974: 43). Indeed, this is exactly what happens. Good sense seems to be once again operating even though Alice's identity remains uncertain and problematic. Thus the question 'Who are you?' when posed by the hookah smoking Caterpillar is more than appropriate, even though, as the story makes clear, 'This was not an encouraging opening for a conversation' (Carroll 1974: 47). Alice cannot explain *herself* but the Caterpillar does not understand this at all and continues to speak to Alice with some contempt, prodding her eventually to try to recite a verse correctly, at which, of course, she completely fails, offering instead, an irreverent parody of the original, in which the old and corpulent father threatens to kick the inquisitive son down the stairs, a story that is 'wrong from beginning to end' (Carroll 1974: 54).

It is in light of such stories, Gilles Deleuze asserts, that Lewis Carroll detests boys in general. The male baby in Alice turns into a pig. Boys, it seems, are associated with animality, with organs, with the objects of smell, taste and touch that are perceived, imagined or remembered. And boys are associated with the self that breathes, sleeps and walks following the laws of a determined system (Deleuze 1990: 78 [96]). In *Silvie and Bruno*, Deleuze claims, the little boy is the inventive thinker only by becoming a little girl, passing from reality to dream, from bodies to the incorporeal, bringing to language becoming and its paradoxes (Deleuze 1990: 10–1 [20]). By contrast, the little girl is said to eagerly abandon good-sense and common-sense, to undo causality and identity, and this it is implied is to be something laudable. Indeed, it ends (in Deleuze) with the girl or the woman being characterised as the molecular becoming of the molar boy or man. Yet Alice does not necessarily associate boys with animality and with the senses. She is concerned when the baby is nearly hit in nose by the shower of pans, plates and dishes thrown by the cook. ' "Oh please mind what you're doing!" cried Alice in an agony of terror. "Oh, there goes his precious nose;" as an unusually large saucepan flew close by it, and very nearly carried it off' (Carroll 1974: 58). Certainly the Duchess seems to abuse the little boy, violently shaking and tossing him and recommending (in her so-called lullaby) speaking roughly and beating him! But then, she speaks roughly

to Alice as well, ordering the cook to chop off her head; and the cook is throwing pans at the Duchess, Alice and the baby! (Carroll 1974: 59–60). The Duchess finally throws the child at Alice who reflects that, 'If I don't take this child away with me, . . . they're sure to kill it in a day or two: wouldn't it be murder to leave it behind?' (Carroll 1974: 60). And, upon hearing the baby grunt, she looks at it anxiously while 'the poor little thing sobbed again' (Carroll 1974: 61). It is only when it finally transforms completely into what she calls a rather handsome pig that she lets it go, thinking about other children she knows who might also be pigs. And such transformations, as we have seen, are entirely possible in a world of disjunction, where causal chains have been torn apart. Perhaps it is the Cheshire Cat who provides the best explanation of what is going on, claiming that everyone there is mad, including itself. And as it too invokes the vicious circle principle, appearing and vanishing so that only its grin remains: how can the grin be defined as belonging to, as part of the cat? If it does belong to the cat, then it cannot be distinguished from the cat. To do so, might not be madness, but it is certainly nonsense.

Tea and No Sympathy

Reaching the Mad Hatter's, Alice is again met with considerable rudeness. She is offered wine when there is none. She is told that she needs a haircut. She is told she is stupid and generally treated rudely. She is given a riddle to guess, but it has no answer. She is tricked into making logical errors. Hoping to guess the answer to the riddle, she is asked ' "Do you think that you can find out the answer to it?" . . . . "Exactly so," said Alice. "Then you should say what you mean" . . . . "I do," Alice hastily replied – "at least I mean what I say – that's the same thing, you know"' (Carroll 1974: 67). Of course, it's not the same thing. Of course, the problem still involves the relation between sense and reference. Alice *means* that she can solve the riddle, but also she *says* that she means that she can solve the riddle. For her, there are two different references, so in fact, it's not the same thing. She must sort this out for herself so as not to be caught in a logical error, such as that of declaring that the referent of the name 'Time' is a 'he' and that the sense of the expression 'killing time' can result in a murder and a permanent 6 o'clock, which just happens to be tea-time (Carroll 1974: 70).

In his analysis of the significance of sentences, Bertrand Russell argues that there are three sorts of sentence, those that are true, those that are false, and those that are nonsensical (Russell 1940: 172). The latter are

clearly not true but also, they are not false; when a sentence is nonsense, or meaningless as Russell calls it, then so is its negation. Paradox arises from sentences that seem to signify something but really do not. Still it is not clear how to distinguish sentences that signify something and those that do not. Significance, according to Russell, must be propositional, able to be true or false (Russell 1940: 175). This, in turn, relies on perceptual experiences that can be imagined or that actually occur, making us use a phrase as an assertion. The phrase uttered during tea by the Dormouse, 'They were learning to draw . . . everything that begins with an M –' can be significant if it is true (Carroll 1974: 74). However, what is *expressed* must be distinguished from what makes a statement true. Expression is a state of mind, a belief or even a desire that others should have this belief (Russell 1940: 175). For Alice, since the drawing lesson is supposed to be taking place at the bottom of a treacle-well, this claim strains her credulity; she does not believe it. Assertion, however, is not the same as expression. One does not assert the belief that is being expressed, rather one asserts that the *object* of the belief is true or false. Thus, asserting that three little girls are sitting in the bottom of a treacle well learning to draw things that begin with the letter M (things such as mouse-traps, moon, memory and *muchness*) truly confuses Alice! No wonder she declares, 'Its the stupidest tea-party I ever was at in all my life!' (Carroll 1974: 75). Lacking significance, the Dormouse's story is pure nonsense. That Alice's credulity is challenged and that she slips away is evidence that her identity is less in question, even if she does not yet notice this.

The order of language just set out is severely questioned by Deleuze. Addressing Russell's assertion that denotation, manifestation (the statement of beliefs or desires), and signification are the three accepted relations holding for a proposition, Deleuze brings the proposition back to nonsense (Russell 1940: 171).[8] That is, manifestation is precisely the relation that Alice comes to expect and when it does not occur; what she hears *she* takes for nonsense. At the tea party, she expects that beliefs or desires are causal inferences that correspond to the proposition (Deleuze 1990: 13 [23]). Following Russell, Deleuze states that desire is an inference between the internal causality of an image and the existence of an object or state of affairs. Belief is also an inference; it is the anticipation of an object or state of affairs produced by external causality (Deleuze 1990:13 [23]). Manifestation, the statement of beliefs or desires, always involves the 'I,' so that, for example, what Alice believes – her belief – grounds her judgment regarding denotation. Denotation is the relation of the proposition to an external state of

affairs. Alice has a hard time believing the Dormouse's story that three little girls are living in a treacle-well. 'True,' would signify that the denotation is fulfilled by a particular state of affairs; 'false' signifies that the denotation is not fulfilled. But Deleuze reads this differently from Russell. Russell, we noted above, demands that significance be propositional (meaning true or false) and this, in turn, relies on perceptual experiences, something Deleuze clearly rejects. Referring not to significance but to signification, Deleuze never mentions perception or experience. Instead, he states that signification is the relation of a word to universal or general concepts; it involves good sense (Deleuze 1990: 14 [24]). It seems that Deleuze departs from Russell and returns here to the same ideas as those asserted by Frege who, we have noted, states that sense does not assure that there is a reference, thus doing away with the necessity of empirical verification (Frege 1952: 59). Since the sense is no longer subjective like the idea, but is also not the object, it must be something else (Frege 1952: 60). Sense is, it seems, a fourth dimension. Specifically, as Frege has stated, a proper name (word, sign, sign combination, expression) *expresses* its sense and stands for or designates its reference.

To make sense of sense, Frege asks that we consider a sentence and not merely proper names. Sentences contain thoughts, that is, objective content, something capable of being the common property of several thinkers (Frege 1952: 62). This objective content is the sense of the sentence, but it seems possible that sentences may have sense but no reference at all! 'The Dodo fell into the pool of tears,' seems to be one such sentence. And, if one wanted to go no further than this thought, *there would be no need to assign a reference*. The thought remains the same whether 'Dodo' has a reference or not. Truth forces us to abandon certain affects, particularly those such as aesthetic delight (Frege 1952: 63). But truth also forces language away from the 'idea' or the 'Idea' and back to the perceptual, the phenomenological. Still, if we are not concerned about truth, we need not be concerned about reference. Thus we can understand why, strictly speaking, if we are not concerned about reference, sense does not exist outside of the proposition that expresses it (Deleuze 1990: 21 [33]). Sense is therefore a logical attribute, but one that does not and is not compelled to describe a physical state of affairs; it does not require a referent; it is the event that is *no longer causally linked* to what came before or what comes after: 'The event belongs essentially to language' (Deleuze 1990: 22 [34]). With this, Deleuze pushes a bit, revising the arguments of the logicians: 'It seems difficult to say… that the fantastic work [of Lewis Carroll] presents simply

the traps and difficulties into which we fall when we do not observe the rules and laws formulated by the logical work' (Deleuze 1990: 22 [34]). Admittedly, Carroll's work is about signification, implication and conclusions, but to what end? Is it, as Deleuze argues, in order to introduce paradoxes that signification does not resolve and even creates, or is it to raise other still unanswered question?

Molecular Becoming, The Making of a Philosopher

Escaping the tea party through a door that she notices in a tree, Alice finds herself back in the long hall, a curious return. Spying the little golden key on the glass table, she recalls her previous experience and puts into play her causal knowledge. First she takes the key and unlocks the garden door, then she nibbles carefully a bit of the mushroom which she had saved! Now only a foot high, she can at last walk through the door and go into the beautiful garden with its bright flower-beds and cool fountains (Carroll 1974: 76). There she finds gardeners who are nothing but playing cards (two, five and seven of hearts are painting the white flowers red), as well as soldiers, courtiers, kings and queens, and finally 'THE KING AND QUEEN OF HEARTS' (Carroll 1974: 78). Although she is very small, Alice does realise, 'they're only a pack of cards, after all. I needn't be afraid of them' (Carroll 1974: 78). And even when the Queen, in a fury, screams, 'Off with her head!,' meaning Alice's head, nothing unfortunate happens. In Wonderland, where words do not signify and causality is disjoined, such statements have no consequences. Invited to play a very odd sort of croquet with playing cards for wires, flamingos for mallets and hedgehogs for balls, Alice remains concerned about the Queen's constant demand for beheadings and she notices that no one plays fairly, that the game has no rules, and that it is very confusing with everything alive and moving all the time. Moreover, during the entire game, the Queen never stops quarrelling with the players, till Alice feels quite frightened again. The Duchess appears (released from prison where she was placed for boxing the Queen's ears). Informing Alice that, 'Everything's got a moral, if only you can find it,' she squeezes herself up unpleasantly close to Alice, putting her sharp chin on the little girl's shoulder (Carroll 1974: 86). And the Duchess does have a *moral* for everything; but in Wonderland its no surprise that the moral has nothing to do with the event for which it is supposed to be the moral! When Alice timidly states that the game is going better, the Duchess responds that the moral of that is 'tis love, 'tis love that makes the world go round!' (Carroll 1974: 87).

With almost all the players in prison for various faults, Alice is taken by the Queen for one final adventure, the Mock Turtle's story. There she listens to the Mock Turtle's sad tale, which is that once he had been a *real* turtle who had studied a wild list of courses from the Master turtle called 'Tortoise' (because he taught them) (Carroll 1974: 92). They teach her to dance the lobster quadrille and although Alice is rather bored by much of this, she struggles to be polite. They do not notice the extreme nonsense of their own stories, school subjects such as 'the different branches of Arithmetic – Ambition, Distraction, Uglification, and Derision' as well as '– Mystery, ancient and modern, with Seaography; then Drawling –' (Carroll 1974: 94, 95). But when Alice tells them her own story, they readily agree that her recollection of the poem, '*Father William*' is seriously flawed, uncommon nonsense. Alice 'sat down with her face in her hands and wondered if anything would *ever* happen in a natural way again' (Carroll 1974: 102).

The final episode erupts when the Gryphon hears the call to come to the trial of the Knave of Hearts, accused of stealing tarts which sit on the table in front of all in the courtroom. At the trial, Alice is pleased to be able to identify the judge and the jury, but forgets her manners and cries out that the jurors are stupid because they must write down even their names, lest they forget them. Problems with identity are spread far and wide. During the trial Alice begins to grow again, physically, and seeing the tarts makes her feel quite hungry. It is as if embodiment and growth are having an effect. She also grows impatient with the illogicality of the court. The judge (who is the King) does not seem to be able to discern what is and what is not evidence and commands the jurors to write down nearly everything said, no matter how foolish. When witnesses are called, the King threatens to execute them if they act nervous or if they cannot remember. Of course, given that causality has been abandoned, it would be surprising if any witness could remember anything. When an unsigned letter is introduced as evidence, the King takes its lack of signature as evidence that the Knave must be guilty or he would have signed it. And, in spite of the fact that the letter contains no names, no references whatsoever, the King believes it points in the direction of the Knave's guilt.

As Alice begins to grow, she also grows up. When the King announces, 'Rule Forty-two, *All persons more than a mile high to leave the court,*' and proclaims it to be the oldest rule in the book, Alice is quick to assert that she is not a mile high and that anyway, if it were the oldest rule it would be Number One (Carroll 1974: 114). Nor is she afraid of stating that there's not an atom of meaning in the anonymous letter

read to the courts. When, following the well established convention of Wonderland, the Queen calls for the sentence before the verdict, Alice loudly objects: 'Stuff and nonsense!' she scoffs, 'The idea of having the sentence first!' (Carroll 1974: 119). Enraged, the Queen orders Alice to hold her tongue and when Alice refuses, the Queen commands, 'Off with her head!' which only incites Alice to proclaim the lot of them to be nothing but a pack of cards (Carroll 1974: 119). And when the cards rise up and attack her, she beats them off and then finds herself once again lying on the bank with her sister, waking as if from a dream.

Feminist philosophers have noted the unusual role that Alice in particular and the little girl in general play in Deleuze's work. Catherine Driscoll asserts that, 'Deleuze frequently aligns Alice with becoming, and through Alice insists that becoming is a paradox defined as "the affirmation of both senses or directions at the same time.". Becoming always suggests a movement across time, indeed becoming as transformative process is not necessarily opposed to standard models of development: there is a quite commonsensical sense in which one might be becoming mad, becoming tall or becoming woman. But becoming for Deleuze is strictly opposed to any linear conception of time' (Driscoll 2000). Rosi Braidotti adds that Deleuze complains that 'feminists refuse to dissolve the subject "woman" into a series of transformative processes that pertain to a generalized and "postgender" becoming,' and that although politically correct, this is conceptually mistaken (Braidotti 1994: 116). Clearly, Deleuze and Félix Guattari recognise this. Below Oedipus, for example, they claim to discover a molecular unconscious; beneath the stable forms, functionalism; under familialism, polymorphous perversity (Deleuze and Guattari 1987: 283–96). And so, beneath woman or even man, the little girl, Alice in Wonderland, releases becoming from the constraints of reference, signification, identity and causation, making it possible to take apart whatever has been joined together and to reverse direction and deny the arrow of time. Underlying all this is the distinction between the molecular and the molar, the microphysical and the statistical.

In the most formal, mathematical sense of the term, the molecular refers to Avogadro's number, the number of atoms needed such that the number of grams of a substance equals the atomic mass of the substance. An Avogadro's number of substance is called a mole (Schneider and Sagan 2005: xi).[9] Avogadro's hypothesis was key to solving many problems in the chemical sciences in the 1800s. For chemistry, molecules and moles are a matter of physical relations, ascertaining that equal volumes of gases with the same pressure and temperature contain the

same number of molecules. By analogy, these terms reveal several possibilities: first that 'the machine taken in its structural unity, the living taken in its specific and even personal unity, are mass phenomena or *molar aggregates*... merely two paths in the same statistical direction' (Deleuze and Guattari 1983: 286). From the point of view of molar or statistical aggregates in physical relations, there is no difference between machine and life; *molar machines* may be social machines, technical machines, or organic machines. As such, they may be language machines. And what of the molecular? All becomings are molecular. So the becoming-woman and becoming-child do not resemble the woman or the child, which are the molar forms arising with language that signifies and refers, enacts causality and identity (good sense and common sense).

But what is quite *curious* is that the woman has to become-woman in order for the man to become-woman. In writing, atoms of woman-hood, particles sweep across the social field and contaminate even men! (Deleuze and Guattari 1987: 276). Society steals the girl's becoming and imposes a history on her, makes her an object of desire, an example and a trap. Is the entire history of men's writing then nothing more than an escape from this trap, an escape from consequences and the arrow of time (Deleuze and Guattari 1987: 276)? Carroll points to the idea that, in Wonderland, where causality and reference no longer reign, anything is possible. Causal links of any kind are dissolved. But in fact what occurs is that *nothing happens*. A tea party is eternal. The Queen orders beheadings all day long and not a single one occurs. A trial is seemingly held but no evidence is gathered. And in any case, if something does happen, it's a simple matter to undo it; the pig could just as well turn back into a baby. By implication, therefore, no one is responsible for anything because nothing takes place and, in any case, lacking reference, all is Idea, nothing but Idea. This is, Deleuze and Guattari state, the only way to get outside of dualisms, by producing an Idea, the universal girl, the key to all becoming.

Yet, we do not live in Wonderland and therefore, our actions have consequences. That Deleuze and Guattari choose the little girl as the origin of all becomings evinces a fundamental binarism at the heart of their philosophy. Molecules are neither male nor female; such a determination is purely molar. Why choose girls, unless their molar existence is already in question? Why organise language so as to escape causal relations, unless to eliminate the possibility of that a little girl might grow up? Let us not forget Alice's *older sister*, 'sitting just as she left her, leaning her head on her hand, watching the setting sun, and thinking of little Alice and all her wonderful Adventures' (Carroll 1974: 120). Her

surface world comes alive with all the creatures of Alice's adventures, but the older sister knows that these creatures and events are versions of the reality around her. Carroll calls it 'dull reality,' but describes something quite different. He describes grass rustling in the wind, a pool rippling to the wave of reeds, tinkling sheep-bells, the shepherd-boy's voice, the confused clamor of the busy farm-yard. Truly, are these dull realities or are they part of the beauty and joy of life? And Alice? Through all her years, she would keep the simple and loving heart of her childhood, gathering other children about her to tell them her tales. She would feel their sorrows and find pleasure in their simple joys. But Carroll leaves out one thing. He forgets to say that Alice will also understand the limits of language and logic, the limits of a limitless world of possibilities, a world without causality and identity, without the arrow of time, without signification or reference. And in understanding this, Alice will be not just a woman with a simple and pure heart but a woman who understands: a thinker . . . a philosopher.

Notes

1. I am using Lewis Carroll (1974), *The Philosopher's Alice in Wonderland and Through the Looking-Glass*, Introduction and notes by Peter Heath, 15. This edition is subtitled 'The Thinking Man's Guide to a Misunderstood Nursery Classic,' but I have found little in the notes to enlighten a thinking *woman*.
2. References are to the English version with the French original (1969) in [ ].
3. 'In any truth functional compound statement, if a component statement in it is replaced by another statement having the same truth value, the truth value of the compound statement will remain unchanged' (Copi and Cohen 1994: 387–88).
4. If p then q = (not p) or q.
5. Bertrand Russell's solution to this was to create a hierarchy of types of objects and a corresponding hierarchy of concepts so that no individual is a member of its own class.
6. The position is atomist in that it accords reality only to empirical objects and their relations, not to structure (Tiles 1991: 85).
7. As we have seen, no causal explanation for their sudden appearance is necessary.
8. Russell argues that assertions have a subjective side and an objective side. The subjective side is found in the expression of the speaker's beliefs or desires. The objective side is the assertion's intention to indicate an object. Russell identifies the significance of a sentence with what it expresses. True and false sentences may be equally significant but in order for a string of words not to be just nonsense, it must express the beliefs or desires of the speaker. Additionally, if the string of words is nonsense, it cannot have an effect on a hearer.
9. They refer here to the poet, Joseph Brodsky, who wrote that humans are closer to the big bang than to Rome (Schneider and Sagan 2005: xi).

Phallocentrism in Bergson: Life and Matter

Rebecca Hill Royal Melbourne Institute of Technology

Abstract

Henri Bergson's philosophy presents the relationship between life and matter in both dualistic and monistic terms. Life is duration, a rhythm of incalculable novelty that approaches pure creative activity. In stark contrast, matter is identified with the determinism of homogeneous space. After *Time and Free Will*, Bergson concedes some share of duration to matter. In this context, his dualism can be understood as a methodological step towards the articulation of a monistic metaphysics of duration. This article suggests that the distinction between life and matter is also motivated by an unconscious imperative to establish a sexed hierarchy. Bergson repeatedly presents life as seminal, while matter is figured in terms of passivity.

Keywords: Bergson, sexed hierarchy, matter, life, duration, monism, dualism, extension.

In Henri Bergson's open system, life is conceived as duration. Famously, the creative evolution of life cannot be reduced to numerical calculation or adequately symbolised in any diagram. It is a flow of heterogeneous and continuous becoming that radically exceeds the present[1] (Bergson 1983: 2–4/496–8). In stark contrast, matter is defined as 'a present which is always beginning again' (1981: 139/281). For Bergson, each of matter's presents is 'practically equivalent' to the next one, which means in theory that it is possible to calculate a moment of the material world from its previous moment (1981: 247–8/376–7). In this sense matter is almost indistinguishable from the pure intelligibility of homogeneous space.

Bergson construes the relationship between life and matter in both dualistic and monistic terms. Gilles Deleuze has argued that Bergson's use of dualism is methodological. Bergson dichotomises in order to recover real duration from the disfiguring medium of

homogeneous space, which occludes becoming by submitting it to calculability (Deleuze 1988: 29). After disentangling purely temporal living phenomena from space, Bergson is able to reintegrate life and matter into an evolving whole in which the difference between the creative speeds of life and the almost determined rhythm of matter is a difference in temporal tension (Deleuze 1988: 29). While I am in partial agreement with Deleuze's suggestion that Bergson's predilection for dualism is a provisional step in the establishment of a monistic metaphysics, I claim that the tendency to dichotomise is more than a methodological manoeuvre. Bergson's commitment to dualism can be read as symptomatic of a disavowal of a sexed hierarchy at the very heart of his open system. Further, I suggest that Bergson's celebrated monistic integration of the divergent tendencies of life and matter maintains this sexed hierarchy.

The sexuation of Bergson's thought is betrayed in his use of metaphor and image. This is particularly significant because in Bergson images and metaphors are privileged in his method. For Bergson, language is spatial in essence, which means that he cannot present the intuition of duration as such. Therefore precise use of image and metaphor is often a better way to convey the mobility of real time because they can 'suggest' the intuition of duration in a 'direct vision' (Bergson 1992: 43/1285).

I. Dualism as Method and Disavowed Masculinism

Bergson's use of dualism is directly related to his critique of the failure of the western tradition to trace the impact of the demands of practical life upon human knowledge. Before anything else, all forms of life are obliged to obtain food and shelter and seek protection from threats of injury and death. Bergson calls this the law of 'attention to life' (*l'attention à la vie*) (1981: 173/ 312).

According to Bergson, human beings have evolved a highly motivated form of knowledge to fulfil their bodily needs: intellection. The intellect is at home working with inert objects. When confronted with mobile and enduring phenomena, human intellectual representation dissolves the passage of time and mobility into static symbols such as points, axes, and lines sketched onto a grid of space. For Bergson spatialisation stems from the vital tendency to action that precedes the systematic formulations of the Greeks. He calls it, 'a latent geometry, immanent to our idea of space, which is the main spring (*le grand ressort*) of our intellect and the cause of its working' (1983: 211/674). In other words, the projection of homogeneous space, masquerading as an adequate measurement of

time is one of the primary functions of the intellect. Indeed, for Bergson, the structure of human understanding demands the masking of duration. It enables us to delimit objects with clear and distinct outlines that are perfectly suited to facilitate our actions upon them (1983: 211/674).

Bergson's claim that spatialisation derives from a vital human tendency is Eurocentric. The intellectual procedure in which a subject isolates objects as immobile and delineates them with clear outlines in homogeneous space is alien to many Aboriginal philosophies. For example, Irene Watson, a Nunga feminist legal scholar describes Nunga ontology in these terms: 'We are not merely on and in the land, we are of it, we speak as one voice of the Creation, the voice or song law. Land and people are one voice one song' (Watson 2002: 7).

While Bergson's account of how homogeneous space obfuscates duration does not hold as a universal description of human knowledge, it is a salient description of the cover up of time in Western thought. His critique demonstrates the need in Western philosophy for a method of thinking that is capable of grasping time, the method he calls intuition. Where intellect limits its scope to the preparation of action, Bergsonian intuition extends to the whole of living reality. Real time and mobility are the primary objects of intuition. This is the context in which dualism emerges as a necessary step in the task of recovering enduring phenomena. By separating (geometrical) space from real time, Bergson articulates a philosophy of process which strives to follow the very passage of time's becoming rather than pulverising its dynamic progress into a line of equivalent points set out in a diagram.

Bergson's first major work *Time and Free Will* is strictly dualist. Matter is identified with homogeneous space and differentiated sharply from human consciousness, which is nothing but qualitative change or duration. The flow of unforeseeable novelty that characterises consciousness as duration is praised as the ground of the human self's creativity. This is not sexually neutral. Bergson writes 'the act which bears the mark of our personality is truly free, for our self alone will lay claim to its paternity' (1913/173). Here, paternity (presumably the act of insemination) is a metaphor for the very freedom of a durational act.[2]

From *Matter and Memory* onwards, Bergson concedes some share of duration to matter. This gesture allows him to reintegrate the divergent tendencies of matter and consciousness into a temporal monism. While Bergson relinquishes the stark dualism of *Time and Free Will*, he barely modifies the hierarchically sexed terms of his thinking when he shifts from a subjective focus to the more ambitious question of the life and matter relationship. In this sense Bergson's use of dualism is more than

a methodological manoeuvre; it betrays a sexed hierarchy at work in his metaphysics.

II. The Force of Ascent and the Force of Descent

In *The Creative Evolution* Bergson traces a line of demarcation between the inert and the living (197–8/663). Within the whole, each inclines in the opposite direction: the movement of the inert is one of descent, whereas life is a movement of ascent. Materiality adds nothing new to the whole from moment to moment, and, in principle, its pulsations 'might be accomplished almost instantaneously, like releasing a spring.' It merely unwinds a roll ready prepared. In contrast, the ascending movement of life 'corresponds to an inner work of ripening or creating.' Becoming is life. It '*endures* essentially, and imposes its rhythm on the first [matter], which is inseparable from it' (1983: 11/503).

Bergson affirms repeatedly, insofar as inert matter is bound up in the duration of the universe, it endures. 'The universe *endures*... The systems marked off by science *endure* only because they are bound up inseparably with the rest of the universe' (1983: 11/503). He provides what is now a famous example to support his argument. If sugar is mixed in a glass of water, the observer cannot speed up or draw out the process of the sugar melting. The observer's impatience is not something thought, such as the mathematical time of the physicist; it corresponds to something lived. Waiting for the sugar to melt is not relative because the parts of time cannot be unfurled at will. It is absolute. The whole universe then, has a particular, irreducible rhythm of duration that is something like a consciousness (1983: 10/502). In other words, matter is irreducibly implicated in the duration of the living.

Intuition provides Bergson with the means to elucidate the relationship between life and matter. Characteristically, Bergson calls for the philosopher to reflect upon his own interior life.[3] In his view, this act of thinking introduces the philosopher to an intuition of the two contrary movements that make up the Whole, the movement of life and the movement of matter. To accomplish the movement of life, 'we' must seek, within 'our own' experience, 'the point we feel ourselves most intimately with our own life. It is into pure duration that we then plunge back, a duration in the past, always moving on, is swelling unceasingly with a present that is absolutely new.' (1983: 199–200/664–5) This effort is strenuous because it goes against the ingrained human habit of spatialising time. While this is an act of reflection upon the 'inner life', the temporal rhythm which the philosopher strives to discover here

is not the not duration of his own life, but the duration of life itself. Bergson emphasises that the intuitive thinker can never reach this limit of pure duration, which is nothing other than freedom itself.[4]

Materiality tends in the opposite direction. From the effort of contracting as much as possible of 'our' past into the present in an undivided continuity, Bergson invites 'us' to dilate our consciousness, as far as possible.

> If the relaxation (*détente*) were complete, there would no longer be either memory or will – which amounts to saying that, in fact, we never do fall into this absolute passivity, any more than we can make ourselves absolutely free. But, in the limit, we get a glimpse (*nous entrevoyons*) of an existence made of a present which recommences unceasingly – devoid of real duration, nothing but the instantaneous which dies and is born again endlessly. (1983: 200–1/665)

Materiality *inclines* in the direction of absolute passivity but never fully dilates. If it did, it would become pure space.[5] As Bergson concedes, 'analysis resolves it into elementary vibrations, the shortest of which are of very slight duration, almost vanishing, but not nothing' (1983: 201/665). Matter and consciousness are thus defined as two opposing tendencies: the ascending movement approaching creation and freedom and the descending movement inclining toward pure repetition. In this context Bergson is able say that matter is the interruption of duration (1983: 201/665–6). Given that the entire universe endures, and materiality is irreducibly bound up in all aspects of the whole, this interruption occurs within duration, although it inclines in the inverse direction to the one articulated in the becoming of life.

For Bergson, the double effort of contraction and dilation in consciousness proceeds from the plane of experience but incites the philosopher beyond it, toward the purely qualitative and purely quantitative. Intuition is really a traversal between two extremes: unextended qualitative duration, which is absolutely continuous, and extended quantitative repetition, which lends itself to calculation and division. For Bergson:

> the intuition of duration ... brings us into contact with a whole continuity of durations which we should try to follow, either downwardly or upwardly: in both cases we can dilate ourselves indefinitely by a more and more vigorous (violent) effort, in both cases we transcend (*transcendons*) ourselves. In the first, we advance towards a duration more and more scattered (*éparpillée*), whose palpitations, more rapid than ours, dividing our simple sensation, dilute its quality into quantity: at the limit would be the pure homogeneous,

> the pure repetition by which we define materiality. In advancing in the other direction, we go toward a duration which stretches, tightens, and becomes more and more intensified: at the limit would be eternity. This time not only conceptual eternity, which is an eternity of death, but an eternity of life. It would be a living, and consequently still moving eternity, where our duration would find itself like the vibrations in light, and which would be the concentration of all duration, as materiality is its dispersion (*l'éparpillement*). Between these two extreme limits moves intuition, and this movement is metaphysics itself. (1992: 187–8/1419)

We can see from the vertical movement of intuition described in this passage how Bergson reconciles the dualisms. Between the extremes of freedom and necessity, there are so many different degrees of tension, so many different degrees of extension.[6]

Bergson's temporal monism plainly privileges life over matter. On the one hand, life is celebrated for approaching freedom, and on the other hand, matter tends towards necessity. Where life has the dynamic capacity to draw upon the virtual and engender new configurations in the actual, matter is confined to the plane of the present, in which it ceaselessly makes itself from moment to moment. This hierarchical relationship is not explicitly sexed. Nonetheless, Bergson deploys traditionally phallocentric images to describe life and matter. Matter is associated with 'absolute passivity', an expression with well known feminine connotations in the misogynist sense (1983: 200/665). In contrast, life is presented in heroically masculine terms as a movement of ascent approaching freedom. It is not just Bergson's use of metaphor that is sexed; the very structure of the spatial relations Bergson that deploys in his image of duration as a monism has phallic connotations. Pure duration is at the summit of the Whole, while matter serves as the base.

III. Seminal Creativity

The sexed hierarchy in Bergson's formulation of the relationship between life and matter is perhaps most pronounced in his account of evolution. Paradoxically, the emergence of sexual generation, as such, receives scant attention in his description of evolution's dynamic progress.

Bergson posits the *élan vital* as a virtual multiplicity, which in its initial impulsion held an immense reservoir of forces within itself. These forces contained mutually antagonistic aspects. In order to allow them an ability to grow, the forces were obliged to split up into distinct tendencies. We have arrived at one of the central theses of Bergson's

most famous work: evolution proceeds by means of dissociation (1983: 100/579–80). This process is nothing other than the acts by which the multiplicity of the *élan vital* is actualised. Evolution proceeds through the differentiating movement of duration, which draws on the *élan vital* to create distinct tendencies.

While Bergson does not ascribe a common purpose to life, the *élan vital* is understood monistically. It is the very force from which life arises (1983: 51/ 538). At this virtual source, all of the tendencies of life abided together because their features did not yet need to be differentiated. In Bergson's vision of the Whole as an incalculable multiplicity of different degrees of tension discussed earlier, the *élan vital* is virtually implied as the force of all of the different rhythms of duration.

Tendencies are not defined by the possession of particular attributes. On the contrary, they are characterised by the aspects that have the most emphasis. Animals, for instance, tend to accentuate movement while plants incline towards immobility. Most aspects of the Whole continue to abide in a specific tendency in a virtual state. 'There is no manifestation of life which does not contain in a rudimentary state – either latent or virtual – the essential characters of most other manifestations [translation modified]' (1983: 106/585). In this sense, something of the virtual Whole abides in all of the dissociated tendencies that make up life (1983: 54/540).

The first great bifurcation in Bergson's account of evolution is the division of the *élan vital* into life and matter. For Bergson, the reason for this dissociation is found in the divergent characters of these two tendencies. Life contains an unstable and explosive balance of forces to which inert matter is tremendously resistant (1983: 98/578). Their dissociation enabled these antagonistic aspects of the *élan vital* to express themselves. It is should be remembered: the *élan vital* is virtual. It functions as the 'reservoir' from which life engenders new tendencies, which in turn give rise to actualities. The emergence of matter and life, then, must be understood as an act of creation. When Bergson describes matter in negative terms, for instance, as the inversion or interruption of duration, he is speaking of it as a tendency distinguished from the inventive duration of life (1983: 186–271/653–725; Deleuze 1991: 100–3). Bergsonian matter is construed as a positive fact. Yet it is precisely the antagonism between the explosive force of life and the rhythm of near necessity found in the force of matter which led to their bifurcation. Matter was an obstacle to life's creative dynamism.

The dissociation between life and matter is the first of many bifurcations in the movement of evolution. Although Bergson doesn't say

this explicitly, the first divergence within the tendency of life engenders what he calls 'sexual generation.' In a section of twelve pages devoted to the bifurcation between plant and animal, he makes a fleeting remark:

> sexual generation is perhaps only a luxury for the plant, but to the animal it was a necessity, and the plant must have been driven to it by the same *élan* which impelled the animal thereto, a primitive, original *élan* anterior to the separation of the two kingdoms [translation modified]. (1983: 119/596)

What I want to emphasise here is less the thesis that sexual reproduction is perhaps a luxury for plants, than Bergson's admission that this bifurcation arises from a 'primitive, original *élan*.' He readily admits that not all of the directions of life hold the same interest for him. Bergson is particularly concerned with the path that leads to 'Man' (*l'homme*) [sic] (1983: 105/584). Bergson's treatise on evolution thus attends carefully to the dissociation between plant and animal and the bifurcation between instinct and intellect. Yet his allusions to the emergence of sexual reproduction are few. Surely sexual generation occupies an important place in the path that leads to the human species?[7]

Bergson's marginalisation of sexual generation is interesting in relation to the sexed hierarchy I suggest is at work in the images and metaphors he draws upon to articulate his thought. In my view, emergence of the sexed hierarchy precedes the primitive *élan* that Bergson credits as the force that impels the emergence of sexual generation. I think it motivates the very desire to split the 'antagonistic' forces of life and matter. While Bergson largely abandons an analysis of sexual generation, he repeatedly invokes images of ejaculation, explosion and erection to account for the evolution the life and matter relation.

I alluded earlier to Bergson's use of a paternal metaphor to describe the genesis of the free act in *Time and Free Will*. In *The Creative Evolution* he draws upon the image of paternal creativity to elaborate another kind of free act, the organising act. While the free act characterises human consciousness, the organising act is fundamentally transhuman; its source is the *élan vital*. This act is particularly important because it creates complex structures such as the human eye. Bergson writes:

> The organizing act… has something explosive about it: it needs at the beginning the smallest possible place, a minimum of matter, as if the organizing forces only entered space reluctantly. The spermatozoon, which sets in motion the evolutionary process of the embryonic life, is one of the smallest cells of the organism; and it is only a small part of the spermatozoon that really takes part in the operation. (1983: 92/574)

This procreative image confers all of the creative force upon the purely temporal act which enters the space of matter 'only reluctantly.' In addition to emphasising the immateriality of the organising act here, Bergson's image downplays the materiality of sperm. It as though the truly creative aspect of sperm is not reducible to its material status.[8] This is, arguably, the most explicit use of a hierarchically sexed image in Bergson's account of evolution, yet there are many more instances in which he theorises the relationship between life and matter in sexist terms, at least implicitly.

In a particularly puzzling formulation, Bergson suggests that life is an immaterial force making itself, while matter is unmaking itself. Matter's tendency towards spatiality, or what Bergson calls extension, can be understood as a temporal tension that is interrupted. He proposes that matter should be imagined as a falling weight (1983: 245/703). Conversely life is a movement of ascent. These opposed movements must be understood together, especially given that, as Bergson admits, the creative activity of life evolves with matter on the surface of Earth. 'If it were pure consciousness, *a fortiori* if it were supraconsciousness, it would be pure creative activity' (1983: 245/703). This formulation suggests that life could exist independently of matter. Indeed, in the Huxley Lecture he makes precisely this claim (1922: 35/835).[9]

The evolution of life on Earth has always been attached to matter. Life is '*riveted* to an organism that *subjects* (*la soumet*) it to the general laws of inert matter. But everything happens as if it were doing its upmost to set itself free' (1983: 245/703). Bergson contends that life retards the descent of matter by acting upon matter with its explosive energy. He turns to the cholorophyllian function of plants. Plants accumulate energy, as in a reservoir, that can be discharged suddenly through the nervous systems of the animals that eat them. Bergson hypothesises that prior to the dissociation between plant and animal, life was accumulating 'explosives' to be released through movements. 'It is like an effort to raise the weight which falls' (1983: 246/704).

Matter is a weight that the explosive force of life attempts to mould and transform with tremendous effort. In my view, this scenario is reminiscent of a violent figuration of heterosexual intercourse in which a man fucks a woman whose inertia approaches 'absolute passivity' (1983: 200/665). Woman is figured here as an 'inert' weight acted upon by a frenzied man.

The phallocentrism of Bergson's life-matter relation is also evident in a number of images that he proposes for understanding the relation between them. He invokes his readers to think of a vessel full of steam

at high pressure. The vessel has a few cracks and steam escapes its enclosure, in a jet:

> The steam shot (*lancée*) into the air is nearly all condensed into little drops which fall back (*retombent*), and this condensation and this fall (*chute*) represent simply the loss of something, an interruption, a deficit. But a small part of the jet stream subsists, uncondensed, for some seconds; it is making an effort to raise the drops which are falling (*tombent*); it succeeds at most in retarding (*ralentir*) their fall (*la chute*). So, from an immense reservoir of life, jets must be shooting out (*s'élancer*) unceasingly, of which each falling back (*retombent*) is a world [translation modified]. (1983: 247/705)

Bergson warns against taking this comparison too far. The cracks, the jets of steam, the forming of the drops are subject to the laws of inert matter and the creation of a world is a free act. So he proposes instead the image of the action of an arm raising itself. For Bergson, the effort to lift the arm gives a better sense of life's freedom, while the tendency of the arm to fall back down reveals the direction of matter unmaking this effort. 'In this image of a *creative action which unmakes itself* we . . . have a more exact representation of [animate] matter' (1983: 247–8/705). This image, like that of jet stream shooting forth from a vessel, is reminiscent of a penis becoming erect in arousal and falling back into detumescence. And Bergson proposes yet another metaphor with strongly phallic connotations.

> Consciousness or supraconsciousness is the name for the rocket whose extinguished fragments (*les debris*) fall back as matter; consciousness . . . is . . . that which subsists of the rocket itself, passing through the fragments and lighting them up into organisms. (1983: 261/716)

'Inert' matter is the debris of the *élan vital's* immense effort to create. Some of this debris gets animated by the passage of consciousness through 'it' and thus engenders organisms. However, it is the tendency of life itself that is credited as the true creator of the living being.

In my view these passages demonstrate the valorisation of a hyper-masculine theory of life and corresponding devaluation of matter as feminine. This is not a binary hierarchy because Bergson's concepts of life and matter are never actualised as pure activity and pure space. He emphasises that there is always a trace of the characteristics of most other tendencies within any of the actualised tendencies of life (1983: 106/585). For this reason, matter's inclination towards pure repetition is never fully achieved. There are some oscillations in matter's rhythm that are analogous to the dynamic transformations articulated in the duration of life. At the same time, life is not manifested as pure creative energy. Life is riveted to matter, and can only actualise free acts through its

inverse tendency. Moreover, Bergson admits that if materiality was pure repetition, consciousness could never have installed itself within matter's palpitations. In a key passage from the Huxley lecture, he writes:

> Life would be impossible were the determination of matter so absolute as to admit of no relaxation. Suppose, however, that at particular moments and at particular points matter shows a certain elasticity, then and there will be the opportunity for consciousness to install itself. It will have to humble itself at first; yet, once installed, it will dilate, it will spread from its point of entry and not rest till it has conquered (*obtenir*) the whole, for time is at its disposal, and the slightest quantity of indetermination, by continually adding to itself, will make up as much freedom as you like. (1920: 18/824–5)

At particular moments, matter 'offers a certain elasticity' that allows life to transform it. Consciousness could never have succeeded in creating organisms without the emergence of these fluctuations at certain points within matter's rhythm. A number of important questions emerge from this passage that Bergson does not address. Why does matter generate fluctuations in its rhythm? Is elasticity merely a fortuitous accident or are the oscillations in matter provoked when consciousness seeks to install an action upon it? Does this imply that matter anticipates the imminence of a new act, which exceeds the plane of actuality that Bergson frequently insists matter is confined to? We could say what Bergson does not say: when the force of consciousness stimulates matter, it does not merely repeat its past. Matter actualises alterations in its tension that constitute new configurations in the becoming of the world. But this is still to accept the terms of Bergson's dualism. Perhaps we would do better to reconsider the life-matter relation beyond dualism?

Let us return to what Bergson says in this quotation. Far from modifying the violent hierarchy of life over matter by allowing matter, however infinitesimally, to participate in engendering new actualities in the world, Bergson declares that material elasticity allows consciousness to install itself. Once consciousness has entered matter, 'it will not rest until it has conquered the whole' (1920: 18/824). In sexed terms, matter's elasticity makes her amenable to the power of the masculine tendency to create. She offers herself to life and allows him 'to conquer' (*obtenir*) her.

Given the sexual violence of Bergson's figuration of the life-matter relation, it is no surprise to find him asserting that the subjugation of matter is most successful in 'Man' (*l'homme*). In the same essay, Bergson praises 'man alone' for his ability to force matter into the status of a 'mere instrument' (*à l'état d'instrument*). He has this ability because he can oppose every habit he has contracted with a contrary habit and

this gives him more freedom to act upon matter than any other animate creature.[10] In other organisms, freedom remains riveted to the 'chains' of matter. At most they are able to stretch these chains.' But, in Man, 'a sudden bound (*un saut brusque*) is made.' Freedom is unleashed. 'Freedom, coming to itself whilst necessity is at grips with itself, brings back matter to the condition of being a mere instrument. It is as though it has divided in order to rule' (1920: 26/830).

For Bergson, Man is distinguished from animals by a difference in nature and presented as the 'end' of evolution. He warns his readers that Man is the 'end' in a special sense. Bergson does not mean to imply that Man's success realises a ready-made plan. The divergent actualisations of the *élan vital* were contingent and radically unpredictable. Man is only one species among a number of them. Nonetheless, Man is the great success of evolution because he alone allowed life to finally triumph over the 'obstacle' of matter (1983: 263–6/718–21). Despite his argument to the contrary, Bergson's celebration of Man as the 'end' of evolution" tends to undercut the innovation for which his philosophy is justly famous: the claim that duration articulates an incalculable flow of novelty (1983: 266/720–1).

Keith Ansell-Pearson has voiced grave reservations about these humanist assertions in Bergson's corpus. According to Ansell-Pearson Bergson's evolutionary philosophy elevates the 'form' of Man in a gesture of 'residual perfectionism' (Ansell-Pearson 1999: 158–9). I support Ansell-Pearson's call to move beyond the 'residual perfectionism' and 'anthropocentrism' at work in this aspect of Bergson's *oeuvre* (Ansell-Pearson 1999: 159). But it is not just a case of exceeding the problematic elevation of 'Man' in Bergsonism. The privilege conferred upon life as a movement of ascent and creation and the simultaneous degradation of matter as an obstacle to the progress of life must be called into question. This violent hierarchy articulates a kind of phallic anthropomorphism, where matter is the stuff or dead weight that paternal life must impregnate or overcome in order to incarnate animate beings and introduce free acts into the world. At his most extreme, Bergson valorises a spiritual position that is nothing short of somataphobic. He speculates that human consciousness may have 'an intenser life' no longer riveted to the body (Bergson 1920: 35/ 835).

IV. Rethinking Material Elasticity

I have suggested that Bergson's split between life and matter is bound up in the disavowal of a hierarchical conception of sexual difference. The implications of this split are troubling, not only from a feminist

perspective, but also a philosophical approach that seeks to affirm the dynamism and duration of matter.

Manuel de Landa's thought strikes me as a promising resource in rethinking Bergsonian materiality. He draws upon complexity theory that has shown matter's capacity to exceed the tendency towards entropy in far from equilibrium conditions. In these instances, 'inert' matter is capable of organising itself and acting in ways that exceed mathematical prediction. For de Landa this suggests that 'matter can "express" itself in complex and creative ways' (de Landa 1992: 133). He emphasises that the virtual arises from the duration of matter. This is not to say that the virtual is actualised; it means that the virtual has a material foundation, or better, it arises from a material rhythm.[11]

I do not think this is strictly unfaithful to Bergson. In *Matter and Memory*, Bergson describes the Whole as 'concrete extensity' pervaded by, '*modifications, perturbations* changes of *tension* or of *energy* and nothing else' (1981: 201). In this monistic formulation life and matter might be thought together as enduring tensions capable of actualising the new.

Notes

1. All references are to the English translations of Bergson's work. The second page reference refers to French edition of Bergson's *Oeuvres* (1959).
2. For a close reading of this remark in Bergson see my 'Interval, sexual difference: Irigaray and Bergson' (2008).
3. Reflection upon the 'inner life of the self' is the cornerstone of Bergson's intuitive deduction of duration. This procedure is first elaborated in *Time and Free Will*. Bergson presents this as purely temporal. Contra Bergson, I ague that that the deduction of duration is a both embodied and sexuate in 'Interval, sexual difference: Irigaray and Bergson' (2008).
4. William E. May argues that the limit of pure freedom described in this passage is how Bergson conceives of God (1970: 637).
5. As I have already indicated, it is only in his first book, *Time and Free Will*, that Bergson identifies matter with pure space. In all of his subsequent publications, the absolute passivity sketched in this passage is a pure limit beyond the actual. See May 1970: 614–5.
6. It is noteworthy that, in this instance, Bergson defines materiality, without qualification, as *pure* repetition. In the passages from *The Creative Evolution* I have just discussed, Bergson says matter stops short of *pure* repetition. The passage comes from his important essay 'An Introduction to Metaphysics' (Bergson 1992: 159–200) which was published several years after *Matter and Memory*, but before *The Creative Evolution*.
7. Bergson refers to 'sexuality' in the first chapter of *The Creative Evolution*. He also makes a few references to sex cells (59–60/ 563–4; 79–80/545–6). The neglect of this primitive differentiation is even more marked in Deleuze's reading of *The Creative Evolution*. Deleuze provides a diagram summarising the divergence of the *élan vital* into distinct actualities but omits what Bergson calls 'sexual generation' (Deleuze 1988: 102).
8. It is perhaps unfair to chastise Bergson for neglecting to mention the egg in this image. After all, the active part played by ovum in the selection of sperm to create an embryo was not discovered until the second half of the twentieth century.
9. Bergson speculates that the mind may outlive the body. He suggests that living in the conventional sense may prepare consciousness for 'more efficient action, an intenser life', no longer harnessed to the matter of the body (1920: 35/835).
10. Bergson also identifies the complexity of the human brain, social life and languages in his argument for Man's superiority over of life forms on this planet (1983: 264–5/719–20).
11. De Landa's excellent discussion of the scientific background to Deleuze's conception of multiplicity is a particularly valuable contribution to this field. See especially chapter one 'The Mathematics of the Virtual: Manifolds, Vector Field and Transformation Groups' (De Landa 2002: 9–55).

Rosi Braidotti (2002) *Metamorphoses: Towards a Feminist Theory of Becoming*, Cambridge: Polity Press.

Rosi Braidotti (2006) *Transpositions*: *On Nomadic Ethics*, Cambridge: Polity Press.

A desire for an affirmative and invigorating concept of identity, relations and ethics within feminism in these 'strange times'[1] where 'strange things are happening'[2] forms the generative *modus operandum* in Rosi Braidotti's complementary sister-contributions to critical theory. Indeed, the acknowledged strangeness of contemporary Western spatio-temporal subjects forms one of the crucial tenets in Braidotti's emancipatory agenda. *Metamorphoses* and *Transpositions* develop a strategy formed on Irigaray's emphasis on the importance of sexual difference and constructive materialism, and achieved through a Deleuzian conception of simultaneity and nomadism. Subjectivity is, for Braidotti, always already in motion and bodies and spaces are materialised in the act of becoming different or strange. The significant task of a nomadic feminist ethics is to harness and relish bodies' capacities for transformation and to discover their potential for mapping flux, in shaping localised traces of becoming.

Braidotti thus prepares a conceptual space where the de-essentialised subject of Western deconstructivist thinking can take pleasure from and explore the possibilities of social construction and material being. She provides a possibility of 'multiple singularities without fixed identities'[3] in the act of 'legitimating and representing a multi-centred, internally differentiated female feminist subjectivity without falling into relativism or fragmentation'[4]. These singularities are, however, not singular stand-alone concepts, nor is the subjective space plane. 'Just like travellers can capture the "essential lines" of landscape or of a place in the speed of crossing it, this is not superficiality, but a way of framing the longitudinal and latitudinal forces that structure a certain spatio-temporal "moment".'[5]

In emphasising corporeal experience and refuting both a coherently essential and a purely superficial idea of the sexed and/or gendered body, Braidotti forms a concept that is not in opposition to, but goes beyond both the third and the second waves of feminism. Is Braidotti's project signalling the emergence of a fourth wave of feminism; or even a form of feminism which should be conceived of outside of the linearity of conceptive 'waves'?

Although Braidotti shares a conception of gender constructivity with certain third wave feminist philosophies, she differentiates her viewpoint from less materialist feminist thought, such as is formulated in the early work of Judith Butler. Braidotti argues that there are certain socially constructed identity-shaping loci of becoming, but these are cartographical points within inter-, trans- or internal materialising processes rather than external impositions. She allows that 'To enact different steps of this process of becoming, one has to work on the conceptual coordinates,'[6] but these never remain superficial. The types of transformations that Butler urges onto the body remain figural, because processes of becoming 'are neither easily accessible nor free of pain. In other words, changes hurt and transformations are painful; this does not mean that they are deprived of positive and even pleasurable side-effects, of course.'[7]

The affective facet of transformative bodily positioning – or what may more appropriately be termed transpositioning – is a vital element in Braidotti's project. *Metamorphoses* and *Transpositions* encounter a number of cultural amalgamative becomings, such as becoming-woman/animal/insect/machine/cyborg/other, considering these as 'process[es] of intersecting forces (affects) and spatio-temporal variables (connections)'.[8] Through the produced affects each process of becoming is connected to other processes of becoming at loci of empathetically joint and shared sensation. 'A "location", in fact, is not a self-appointed and self-designed subject-position. It is a collectively shared and constructed, jointly occupied spatio-temporal territory.'[9] She establishes that 'These multi-layered levels of affectivity are the building blocks for creative transpositions, which compose a plane of actualization of relations, that is to say points of contact between self and surroundings.'[10]

Rhizomatic affect is thus the means by which the subjective becomes general and the general becomes subjective. It comprises the cartographical points of becoming-world and becoming-ethical. Braidotti refers to works from the schools of eco-feminism and viral politics, developing a theory of shared affect or 'care', where

'anti-essentialist yet vitalistic figurations'[11] prepare space for 'a model of porosity, fluidity, multiple interconnections and symbolic interrelation, a transversal subjectivity'.[12] These figurations are 'hybrid figurations',[13] a stand-alone complex, requiring transpositioning processes of becoming, which 'negotiate with the generative powers of *zoe*, this life in "me" which does not bear my name and does not even fully qualify as human'.[14] Braidotti returns to Deleuze and Guattari and the concept of the Body-without-Organs or incorporeal, arguing that the process of becoming-ethical starts where a 'primacy is given to the Relation over the terms'[15]: it is the becoming of 'the affective being of the middle, the interconnection, the Relation'.[16]

Braidotti's notion of ethics is a process that has nothing to do with either dominant morality or relativism: 'Rather it contains clearly set limits that are activated by careful negotiations.'[17] She argues that 'To accept differential boundaries does not condemn us to relativism, but to the necessity to negotiate each passage.'[18] Becoming-ethical involves an affirmation of the limits and boundaries-in-shaping. They need to be considered 'points of encounter and not of closure: living boundaries and not fixed walls'.[19]

For feminism, as well as for any other emancipatory discourse, Rosi Braidotti's project opens up an alternative to the 'loss, failure, melancholia and ontological lack',[20] which she claims to be central to much contemporary, especially psycho-analytic, theoretical discussion. It presents an opportunity to pursue a political agenda without adhering to fusty binary power structures. One may question what happens after the living boundaries have been embraced: once we are celebratory participants of the process of becoming-affirmative, what happens next? However, I believe that this question belongs to a future configuration within the theorising negotiation that Rosi Braidotti is taking part in.

Martin-Jones, David (2006) *Deleuze, Cinema and National Identity: Narrative Time in National Contexts*, Edinburgh: Edinburgh University Press, 256 pages.

David Martin-Jones's cinematic application of Deleuze as a form of 'philosophical sodomy' is provocative from the outset. His distinctive assemblage of the time–image, the movement-image and the politics of national identity is bound to fuel ongoing arguments that reverberate beyond the field of theory. As Martin-Jones indicates, film scholars remain 'bemused' by or 'concerned' about Deleuze's value to their field. This is particularly the case with Anglo-American film studies. The book intervenes in the long–standing and often highly partisan debate between formalism (film as art form and aesthetic experience) and culturalism (film as representational socio-political practice). In tandem with this, opposing camps often contest the relative political values of 'experimental', frequently modernist-inflected art and popular genres.

Deleuze's position as a Parisian cinéaste with a predilection for the art-house canon is well known and has been contested, both by lovers of both popular mainstream film and world cinema. As Martin-Jones and others have reminded us, Deleuze's personal view of film history is predominantly Eurocentric. The majority of his examples are modernist–inflected works from European art film and 'deviant' Hollywood directors such as Welles, and he locates the birth of the time-image in the new waves that developed in the wake of post-war Italian neo-realism. Deleuze's approach to Japanese directors such as Ozu and Mizoguchi is philosophical/aesthetic rather than being motivated by the politics of Japanese nationalism.

Yet of course Deleuze and Guattari's joint work is overtly informed by an astutely radical political awareness espousing micropolitical

oppositions to local, international and global abuses of power. Actively involved in the events May 1968 and their aftermath, Deleuze and Guattari do not indulge in pure aestheticism, though they certainly privilege art as a potentially radicalising force. Seeking to refute both psychic interiority and fixed semantic systems, Deleuze and Guattari insist that art is an immanent process 'a being in sensation and nothing else: it exists in itself' (1994: 164). Art 'undoes the triple organisation of perceptions, affections, and opinions in order to substitute a monument composed of percepts, affects, and blocs of sensation' that replace language (1994: 176). By this apparent refutation of ideological content, Deleuze and Guattari advocate looking elsewhere than representational equations or Oedipal symbolism. Schizoanalytic approaches to art thus replace representation by material capture. Deleuze's cinematic applications seek an experiential rather than a significatory approach to the moving image; one that deterritorialises perception via the machinic automatism of the medium.

As Martin–Jones indicates, the 'localised historical dimension' is deliberately absent from Deleuze's solo work on cinema. Using this absence as a motivation for his own exploration of film and national identity, he expands the parameters of the cinema books by drawing on relevant insights from the works co–authored with Guattari. For Deleuze and Guattari, the forces of reterritorialisation and deterritorialisation are much more than an intense aesthetic encounter. Rather than being for its own sake, art is always intended as 'a tool for blazing life lines'. Here, the strengths of Martin–Jones's critique emerge, as he uses his film readings to express a politically-committed analysis of shifting international power-relations. Setting out to link formalism and culturalism with philosophy, he puts the forces of Deleuzian theory to work in an engaged and engaging critique of national identities in recent films.

Martin-Jones begins with Deleuze's location of the time-image in the cinema of post-1945 Europe, with its fragmentation of linear narrative time. His response to these more labyrinthine forms of narrative is also marked by David Bordwell's very different typology of film based on the classification of narrative structures. Despite its structuralist and cognitive approach, Bordwell's category of the parametric art–film has, arguably, some commonality of content, though not of perspective, with Deleuze's own cinematic taxonomy. The book's case-studies are chiefly generic hybrids such as *Eternal Sunshine of the Spotless Mind* (Michael Gondry, 2004) that mix independent/art house devices with popular box-office appeal. Other Deleuzian film theorists (among them, Patricia

Pisters, Barbara Kennedy and myself) also find this type of hybrid film very productive for Deleuzian-inflected explorations, but Martin-Jones is consistently led by the distinct socio-political focus on national identity.

Deleuze, who elsewhere discusses 'minor literature', introduces the concept of 'minor cinema' in *Cinema 2: The Time-Image* (1989). As Martin-Jones notes, Deleuze's consideration of films by John Cassavetes, Jean Rouch and Charles Perrault does not overtly address issues of national identity per se. Rather than pursuing this agenda, Deleuze discovers in these films a different 'revolutionary' challenge to move beyond subjective identity. The rhizomatic processes of becomings–other move instead towards a more radical embrace of collective identity, which may or may not be nationally motivated.

The time-image exceeds fragmented narrative form and politically explicit thematic content. Asserting that 'the brain is the screen' (in his eponymous essay), Deleuze argues that by bringing 'a little time in its pure state' onto the screen and breaking up conventional narrative patterns, it offers a temporal hiatus with potential to trigger new thought and new forms of micropolitical engagement. This distinct political focus could explain Deleuze's 'reticence' about dealing with macropolitical issues of nationhood per se in the context of the cinema books. Yet, rather than following this line of enquiry, Martin-Jones re-works major national discourses and 'minor actions' to produce an original ideological analysis of narrative strategies in selected films. He develops his tightly constructed agenda by locating major/minor forces in the same films and revealing their antithetical dynamics at work in a struggle for national identity. *Deleuze, Cinema and National Identity* offers a clear and accessible introduction to Deleuze's two main categories of cinematic time. It provides ample textual examples to anchor chief concepts and to key in the subsequent argument. The structure of the exposition is rigorously constructed and its direction is frequently signposted. It develops dialectically along the clear trajectory of a series of contested binaries: movement-image/time-image, major/minor, and reterritorialisation/deterritorialisation.

One area in which Martin-Jones takes creative liberties with Deleuze appears in his alignment of the movement-image to an unproblematic presentation of national narrative time, and the time-image to 'multiple, jumbled or reversed' narrative time that expresses national struggles. He strikingly asserts that the contested ground of movement and time make these films either 'time images caught in the act of becoming movement-images' or 'movement-images caught in the act of becoming

time-images'. Yet rather than staging such a battle of clearly opposed forces, Deleuze's account reveals a complex intermeshed taxonomy that puts certain films and directors to work across both books. Deleuzian film theory, in its focus on the ontological properties of the medium, is applicable in some degree to *all* films, regardless of explicit subject-matter, style or genre. Movement and time in cinema inevitably use both temporality and movement as their modus operandi. Film images move in time and the interlinked process of the brain's own temporally moving images problematises dialectically neat divisions at both macro and micro levels.

In a productive move, Martin-Jones links Deleuze's two-plane model of temporality and Homi Bhabha's conceptualisation of national identity formation via 'rhetorical figures' that produce a double time-structure: the technological and progressive present and the timeless past. One contentious issue here is that Bhabha's rhetorical figures are emblematic but Deleuze's cinematic figures are stylistic devices that operate elsewhere than overt image content. Nevertheless, as Martin-Jones indicates, Bhabha selects the stylistically experimental *Handsworth Songs* (John Akomfra 1986) to argue that the film's presentation of successive waves of immigrants to the UK disrupts the homogenising tendency of national discourse. Overall, though, the political specificity of Bhabha's ideological concepts does not align neatly with either Bordwell's Classic Realist Text/parametric narration or Deleuze's movement and time images. Again, Martin-Jones's argument challenges us to dialectical activity by making new theoretical assemblages.

The first chapter provides a clear, workable outline of Deleuze's cinematic applications of Bergsonian memory. This is connected with the national theme via the occluded contexts of racial Mexican anxiety (Hitchcock's *Vertigo*, 1958) and the displaced status of Catholic heritage in the Italy of 'the economic miracle' in Fellini's 1963 film $8\frac{1}{2}$. Here, Martin-Jones unfolds a confidently handled series of parallels between film text and ideological context more typically associated with sociohistorical and culturalist approaches to film studies. He thus sets up and seeks to integrate two distinct frames of reference in a way that neither 'party' might find entirely satisfactory but which throws us the gauntlet to engage with further reflection on the limitations of these respective agendas when working with film.

Martin-Jones further explores national identity via contemporaneous fantasies of the global city as progressive, egalitarian marketplace, as seen in Nora Ephron's 1998 *You've got Mail*. His focal cities are

London in Peter Howitt's *Sliding Doors* (1997) and Berlin in Tom Tykwer's German film, *Run, Lola Run* (2000). Here he interrogates the relations of time and memory, connecting labyrinthine narrative structures relevant to changing national contexts. In his reading of *Sliding Doors*, Martin–Jones considers the Americanisation of London and its implications in relation to national memory loss. In *Run Lola Run*, the focus is on the reconstructed post-wall Berlin. He asserts that its centrality as meeting place of global networks and its embrace of materialist values is conveyed via the film's 'fractal' structure. Both films remove evidence of their location city's representative national past and replace this with vibrant contemporaneous images of internationalism unmarked by problematic issues of ethnicity. At the same time, films like *Sliding Doors* use nostalgic notions of quintessential Englishness as a 'structuring absence', evinced by the casting of American star Gwyneth Paltrow and her adopted 'plummy home Counties accent'.

The argument shifts focus to a different national scenario, tackling two cinematic takes on the first Gulf War and American triumphalism: *Memento* (Christopher Nolan, 2000) and *Saving Private Ryan* (Steven Spielberg, 1998). *Saving Private Ryan* remains closer to a conventional narrative with flashbacks. Deleuze analyses the temporal complexities of flashback in the films of Joseph Mankiewicz and others. Martin-Jones here aligns them with the time-image as the implications of American national memory are re–fashioned and mythologised via narrative discontinuities. Through an ethnically diverse group of soldiers, the film presents American diasporas as united in the 'quest to save America', drawing 'historical' inspiration from the Civil War and Abraham Lincoln's address.

Martin-Jones indicates that the film makes Deleuze's any-space-whatevers literally visible via location images of devastated European cities. He deploys the movement–image to equate the linear order of the troops with American political order as it seeks to control and realign the chaotic breakdown of social structures wrought by war. For Deleuze, though, the complex and shifting formation that is the movement-image is far from being unproblematically repressive. His main concern is to highlight and explore the category's diverse capacities to stimulate particular types of perception and concept formation via the multi-layered reverberations of affective forces in the screen/brain assemblage.

The nationally inflected reading of *Memento* has less overtly Deleuzian currency. This temporally and subjectively labyrinthine film is placed in Martin-Jones's category of movement-image 'caught in the act' of becoming time-image. Here, his interpretation is rendered more

speculative than the previous case-study. He aligns the protagonist's personal 'getting away with murder' and the Gulf War via an allegorical use of the oil refinery setting. This kind of parable-construction engages worthwhile speculation but is less obviously Deleuzian in its inspiration.

The mainstream movement-image film *Terminator 3* (Jonathan Mostow, 2003) figures in Martin-Jones's analysis of the apocalyptic mood triggered by 9/11. He addresses more complex narratives via the 'structuring absence', a tactic that evokes psychoanalytical scenarios of the play of absence and presence. The Deleuze/Bergsonian 'Elsewhere', however, is outside or between the frame's represented content. It is durational not macropolitically representational in its ideological intent. The author makes the case that the 'structuring absence' of triumphalist narratives is 'smuggled in' to films that appear to be about time and personal memory. From Martin–Jones's perspective, these exemplify the time–image becoming movement–image. In the light of this thesis, in *Eternal Sunshine of the Spotless Mind*, post 9/11 paranoia seeks to reterritorialise the film's labyrinthine time–image with a homogenised model of national identity. Confusing narrative patterns retaliate by deterritorialisation as they struggle to keep national identity fragmented. The theme of memory erasure is Martin-Jones's other focal point. He maps the need to return to the causes of 9/11 onto Joel's and Clementine's quest to piece the past together after amnesia via the device of an audio-tape. Again, this reading deploys national allegory in intriguing, but perhaps not-strictly-Deleuzian ways.

An important element of the book's agenda is to extend Deleuzian applications not just to previously untheorised recent Western films, but to international cinemas outside the strictly Deleuzian canon. The less familiar we are with a culture and its national identities the more likely we are to rely on media images of that culture, including fictional feature films. Chapter Five analyses films from the Pacific Rim. Here, Martin–Jones offers a strongly argued reading of the play of possibilities and narrative oscillations between deterritorialisation and reterritorialisation. His political and ideological contextualisation is informed by sharp-eyed identification of the salient features in each country's twentieth and twenty first century political past.

The Cantonese gangster comedy *Too Many ways to be Number One* (Ka-fai Wai, 1997) convincingly indicates how the twice repeated narrative can be used to reconsider the handover of Hong Kong to China. Martin-Jones return to firmer ground here as he acknowledges the film's overt use of allegory regarding the choices of Hong Kong's population to throw in their lot with China or with Taiwan, both with attendant fears of national erasure. For Martin–Jones this is a

'time-image caught in the act of becoming a movement-image'. As before, his assertion is based on the equation of the time–image with non-linear narrative structure and an open ending. Here, the protagonist's emblematic choices of death (reincorporation with mainland China) or disability (throwing in its lot with Taiwan) is a decision deliberately left unresolved at the end of the film.

The Japanese film *Chaos* (Hideo Nakata, 1999) presents its narrative outcomes before their causes. Martin-Jones uses the jumbled and ambiguous narrative structure to problematise gender issues. He signals that the film's recollection-images have similarities to those of *Vertigo* in terms of the plot's 'indiscernible female double'. The narrative confusion between Satomi as femme fatale and Saori as dutiful wife is viewed as representative of the changing roles of women in contemporary Japan. Satomi's leap from the cliff, temporally frozen on freeze frame, is thus presented as a microcosm of the ambiguity of women's roles and possibilities in the nation's future.

New Korean cinema is illustrated by Chang-dong Lee's 2000 *Peppermint Candy*, a fictionalised scrutiny of South Korea's national narrative over two decades, hence its deployment of a less open-ended narrative structure than the previous films in this section. *Peppermint Candy*'s allegorical intent is made overt, but is rendered more complex by a reverse narrative. Martin-Jones suggests that moments of potential change are signalled by the character's temporary sensory-motor incapacity as manifest in a limp. The protagonist Yong-ho's potentially Bergsonian search in the past to find an image that matches the present is indicated, but Martin-Jones's deployment of the time-image remains consistently macropolitical rather than philosophical in its remit.

The underlying theoretical trajectories of Martin-Jones's thesis retain clear acknowledged links with Bordwell's narrative schema and Comolli and Narboni's categories of politically motivated film form. His readings privilege the films' representational narrative content above the expressive style of images, their affects, percepts and the new mental concepts to which these give rise. Yet, as part of the temporal hiatus between perception and action, the affective interval is crucial to thinking Deleuzian aesthetics and its impact on us. Affect is strongly and horribly operant in some of Martin-Jones's examples: the torture sequences in *Peppermint Candy* immediately spring to mind, and a further consideration might have encountered significant layers of perceptual and conceptual response as well as the important focus on represented content.

His argument that some films reterritorialise the time-image by defining national identity through the movement–image and

deterritorialise the movement-image by the reverse process sets up a sharply dialectical contest between these categories that initially appears very different from Deleuze's multivalent taxonomic agenda. Yet, this deliberately chosen critical distance offers us in itself a productive hiatus for further thought. Deleuze and Guattari's perspectives encourage innovative development rather than purely scholarly exegesis. The cinema books are concerned with how rather than what we think and how this might be changed. Rather than producing another philosophical explication of Deleuze's Eurocentrically inflected cinema books, *Deleuze, Cinema and National Identity* mobilises their concepts by engaging them in critical and creative action in a crucial new field.

Overall, Martin-Jones's book raises some crucial questions on the nature of Deleuzian-inflected critique and its use/value for film studies. He argues indubitably that we need to increase the scope of Deleuze's theories to include the shifting fabric of cinematic work produced by nations in process. A consideration of this diverse and widely viewed range of films is timely. With their complex forces of deterritorialisation and reterritorialisation, generic conventions and formal experiments, they map out '*undecidable alternatives* between circles of past, *inextricable differences* between peaks of present' as time-image components gravitate against the extrinsic sensory-motor links of movement-images.

Martin-Jones reiterates his priorities of his thesis in the book's conclusion: to use Deleuze's film-theory to 'add another dimension to our understanding of the way national identity is constructed in cinema'. His ideologically engaged and systematically structured discussion links areas of inquiry often at loggerheads, philosophy, aesthetics, politics and history, to find ways they might co-operate as a viable assemblage. By moving from the letter to the spirit of Deleuzian critique, Martin-Jones's lucid, impressively argued book makes a provocative intervention in both Deleuze studies and film studies. This distinctive and politically engaged assemblage demands our closest attention.

Christian Kerslake (2007), *Deleuze and the Unconscious*, London and New York: Continuum, 246 pages.

This work arrives as the first book-length study devoted to examining Deleuze's relationship to various conceptions of the unconscious, psychoanalytic or otherwise. Anyone interested in this question would be well advised to consult the wealth of bibliographical and historical information that Kerslake has gathered together and, like him, not to neglect Deleuze's more 'esoteric' references which, as *Deleuze and the Unconscious* so forcefully shows, are undeniably present in his work. The originality of Kerslake's project is striking. It does, however, also present several shortcomings.

The first, perhaps minor, shortcoming relates to the ultimate aims of the book. Indeed, the title of the book is a little misleading since, as Kerslake admits, the 'book is not a general introduction to Deleuze (or even to Deleuze and the unconscious)' (3). The most appropriate description of the purpose of the book is, then, Kerslake's own, less encompassing one: 'a series of attempted raids on Deleuze's hive of ideas about the unconscious' (3). But what guides these 'raids', since there are, as Kerslake admits, 'plenty of omissions and probably lots of oversights too' (3)? Kerslake tells us from the outset that he will not deal with *Anti-Oedipus* (1983), since a very good introduction to this text has already been published (see Eugene Holland 1999), and since he is trying to uncover the theoretical background to that work. This is, of course, all well and good. But then we must wonder why he omits without explanation an examination of Deleuze's early references to Lacan in *Difference and Repetition* (1994), *The Logic of Sense* (1990a) and 'How Do We Recognize Structuralism?' (1998), for example; or why he does not examine Deleuze's sustained engagement with psychoanalysis in the second half of *The Logic of Sense*, which includes long analyses of the works of Freud, Klein, Leclaire, Laplanche and Pontalis, and so on. Based on the material examined by Kerslake, it seems that the Deleuzian ideas about the unconscious in which he is most interested relate to Deleuze's most obscure, esoteric, and even 'disavowed' references: Bergson's theory of instinct, Carl Jung, Johann Malfatti, and so on. However, given that these references are comparatively marginal to the Deleuzian corpus, scholars interested not only in the question of 'Deleuze and the unconscious', but also in Deleuze's pre-*Anti-Oedipus* takes on psychoanalysis and the unconscious, would perhaps be entitled to question the merit of devoting an entire book to their examination.

In any case, in what amounts to a highly original undertaking in its own right, Kerslake primarily wants to show that Deleuze's work

is based in part on certain esoteric ideas about the unconscious (184). Indeed, he often expresses himself on this point in very strong terms.[1] However, examining the text, we can be dissatisfied with the strength of these claims for several reasons.

First of all, on several occasions, Kerslake moves without ample justification from the postulation of highly speculative 'genealogical' hypotheses to the unreserved affirmation of these hypotheses. For example, Kerslake deciphers in one of Jung's lectures on 'archetypes', a lecture that Deleuze appears to have read, the 'mention of "*a priori* conditions for fantasy-production"... as gesturing to a possible connection with Kant's theory of productive imagination'. He then proceeds to assert that, since archetypes take the form of problems, and since 'Deleuze's aim [in *Difference and Repetition* and in his work on Kant] is to show how the productive imagination is ultimately a receptacle for the harnessing of problematic Ideas., it 'can be *argued* that Deleuze takes up [Jung's] model in his theory of problematic Ideas in *Difference and Repetition*' (91–92 – my emphasis). To highlight this as a *possibility* is well and good. But it is quite another thing when, a few pages later, noting Deleuze's *only* substantial reference to Jung in *Difference and Repetition* – a footnote of uncertain value, to which we will return below – Kerslake fully affirms that Deleuze does indeed take up Jung's model, even going so far as to assert the Jungian '*origins*' of certain aspects of Deleuze's theory of the unconscious (96; 100). Indeed, in the absence of any analysis of the concept of the 'problem' such as it appears in *Difference and Repetition* – and to which, without mentioning Jung at all, most of the fourth chapter is devoted – this seems to be at best a rather exaggerated claim. What is more, in *Difference and Repetition*, when Deleuze does talk concretely about unconscious problems in the context of psychoanalysis, he predominately talks in Lacanian-structuralist terms about the displacement of the virtual object or 'phallus' in differential series, in the manner of Lacan's analysis of *The Purloined Letter* (Deleuze 1994: 106–7). We can thus be dissatisfied not only that Kerslake moves with only limited justification from very interesting genealogical speculations to their unequivocal affirmation, but also that he does not discuss certain other, and perhaps more pertinent, 'conceptual components' of the Deleuzian differential unconscious.

Besides Jungianism, Kerslake tracks down and argues for the persistence of several other 'esoteric' references in Deleuze's work. For instance, based on the selection of texts that Deleuze made for the collection *Instincts et Institutions* (1953), and on the short article 'De Sacher-Masoch au masochisme' (1961) where Deleuze turns in part to

the Jungian coupling of the notions of 'instinct' and 'archetype', Kerslake sets himself the task of demonstrating that, in various guises, the ethological, 'somnambulist theory of instinct' profoundly preoccupied Deleuze from 1953 to 1961 and beyond (53; 91–92). One cannot help but admire in this work Kerslake's eye for detail. It does seem, however, that Kerslake at times makes too much of the sparse textual evidence available for such claims. For example, quite a bit of weight is given to the above-mentioned footnote on Jung in *Difference and Repetition*. As noted above, Kerslake effectively concludes from this 'important reference' that 'Deleuze takes up Jung's model in this theory of problematic Ideas in *Difference and Repetition*' (96). However, since this note only appears in the context of a critique of the Freudian conflictual model of the drives and of Deleuze's counter-postulation of its 'differential' basis, perhaps it would be more appropriate to the evidence to argue that Deleuze is here simply signaling with a footnote that the notion of a differential or problematic conception of the unconscious, such as he himself is developing it throughout *Difference and Repetition*, is not completely foreign to psychoanalysis.

Several other shortcomings can be identified as weakening Kerslake's claims. Firstly, in order to suggest the similarity of their ideas, Kerslake sometimes juxtaposes long analyses of Bergson, Jung or Schopenhauer, with citations from Deleuze which have been isolated from their context and which are devoid of any conceptual elaboration. The problem here is that, left in such a state of generality, Deleuze's pronouncements can do no more than 'recall' or suggest an analogy with the work of these other thinkers, rather than demonstrate, as Kerslake seems to want them to do, Deleuze's conceptual debt to them. Thus, for example, we are asked to compare a citation from Deleuze's *Expressionism in Philosophy: Spinoza* (1990b) with Kerslake's long analyses of Jung and Schopenhauer, but without any real discussion of what is at stake in *Expressionism* as a whole or in the Deleuzian concept of 'expression' which is, moreover, the focus of the citation (151). Or again, after a long analysis of Jung, when Kerslake claims that 'Deleuze's and Guattari's theory that desire must be articulated in terms of intensities is not so far from the Jungian theory of psychic energy', the ensuing brief discussion of several references to *Anti-Oedipus* (not one of which mentions the concept of 'intensity') does not seem enough to justify the conclusion that Deleuze never really left behind 'the most fundamental Jungian principles' (74).

It also detracts from Kerslake's arguments that he sometimes does not clearly distinguish 'who' is speaking in the Deleuzian texts that he analyses, about 'what' and with what problem or aim in mind. This

is particularly apparent when Kerslake all but identifies Deleuze's own views with his editorial 'selection' for *Instincts and Institutions*, when he treats the text of Deleuze's foreword to Jean Malfatti's *Études sur la Mathèse ou Anarchie et Hiérarchiede la Science* (1946) as the expression of a youthful Deleuze's own thought, and, finally, when he examines the essay, 'De Sacher-Masoch au masochisme'. While it is true that Deleuze's own ideas and interests permeate his work on other thinkers, this does not authorise the assimilation of Deleuze's thought with the particular figure under consideration in this or that Deleuzian text: that is, at least, not without asking what is at stake in that particular engagement. Thus, for example, it seems too hasty to claim that in 'De Sacher-Masoch au masochisme' Deleuze 'seems to endorse a Jungian, epochal view of history, with Anima and Animus as the main protagonists' (77), particularly when we add that Deleuze's aim in this essay was to develop a psychoanalytical account of masochism which differed from the unsatisfactory Freudian model, and that he found in Jung certain conceptual tools that seemed appropriate to Sacher-Masoch's texts and, moreover, to the suggestive imagery to be found therein.[2]

Finally, it would have strengthened Kerslake's 'genealogy' of Deleuze's views on the unconscious if, in his discussion of Deleuze's introduction to Malfatti, he had tried to establish the reasons why Deleuze retracted his acknowledgement of this text. Kerslake writes that it 'is not an *a priori* mistake to take a philosophical text written by a twenty-one-year-old seriously' (213, n.23). This is, of course, quite true. But without an account of *why* Deleuze might have disowned this text, it is difficult to see the *continuity* between this early work and Deleuze's later writings. The terminological coincidences between Malfatti's and Deleuze's work that Kerslake notes in order to bolster his argument do not suffice for this task, since, in the absence of further analysis and elaboration, terminological coincidences do not automatically make for conceptual coincidences:

> [O]ccult themes run throughout Deleuze's work: not only does the term 'mathesis' appear at crucial points of *Difference and Repetition*, along with a weird emphasis on the esoteric use of the mathematical calculus, but his interest in somnambulism, the notion of the world as an egg, the theory of the second birth and the recurring image of the hermaphrodite all refer back to ideas found in Malfatti's book. (125)[3]

Kerslake's book is thus, in short, a very promising, if ultimately unsatisfying attempt at establishing Deleuze's relationship to certain esoteric notions of the unconscious. Kerslake's painstaking research

has, however, garnered a wealth of historical and bibliographical information which will be of great interest to Deleuzian scholars.

Notes

1. To list some examples: 'Jungianism continues to shape [Deleuze's] theory of the unconscious right up to *Difference and Repetition*' (69); 'It is not clear that Deleuze ever really left behind the most fundamental Jungian principles" (74); '[H]e seems to endorse a Jungian, epochal view of history, with Anima and Animus as the main protagonists' (77); 'The notion of a "second birth", rebirth or renaissance [which has an esoteric background] is fundamental to Deleuze from the beginning' (81); '...Deleuze's attempt to ground his own Jungian notion of the symbol in Kant's aesthetics...' (105); 'In 1961, Deleuze fully affirms Jung's notion of symbolism' (111); 'In effect, Deleuze follows up the relationship between fate and the death instinct by turning to Jung's theory of synchronicity' (146); 'Deleuze thus finds a way to defend the Hermetic idea that the microcosm contains the macrocosm' (160); and the oft-found 'following Jung...', applied to Deleuze (99; 106; 151).

2. Indeed, if we base ourselves on this more cautious reading of the reference to Jung in 'De Sacher-Masoch au masochsime', it comes as less of surprise that in Deleuze's 1967 essay on Sacher-Masoch, 'Le froid et le cruel' (1967), while maintaining the same aim, Deleuze altogether drops the reference to Jung.
3. Indeed, Kerslake often makes use of these terminological coincidences in order to strengthen his general claim that that Deleuze's work is based in part on certain esoteric ideas about the unconscious. To list several of them: 'Deleuze may have come across Jung's notion of archetype while researching the theme of repetition. Not only are archetypes, apparently, impressions of ever-repeated typical experiences, but, at the same time, they behave empirically like agents that tend towards the repetition of these same experiences' [a citation from Jung's collected works]' (88); 'Jung's emphasis on the role of condensation in symbols suggests that condensation involves a different kind of synthesis, perhaps involving something like the "condensation of singularities" Deleuze discusses in relation to the determination of the Idea in *Difference and Repetition*" (109); or finally, 'The language of invisible rays runs through both magical and psychotic writings. Deleuze's appeal to the language of "flows", "intensities", "force" and "power" is rooted in that curious convergence' (173 – for further examples, see: 69–70 and 172).

The Image of Thought*

Jean-Clet Martin

Abstract

The image of thought that Rembrandt proposes with his *Philosopher in Meditation* still wears the mask of the old philosophical pedagogy based on ascent and the heights, but it ushers in new percepts and affects corresponding to the philosopher's concept, fold, that Leibniz elevates to the status of the principle of Baroque variation. The fold unleashes a power that carries forms and statements over a variety of disjunctive statements.

Keywords: Fold, Rembrandt, *Philosopher in Meditation*, Leibniz, image of thought, rhythm, style, Romanesque, Gothic, Baroque, Focillon Henri, counter-curve, Bacon Francis

Rembrandt, *Philosopher in Meditation*, Amsterdam, 1631. Emerging from a pitch-black wall, a half-open window admits the diffusion of an uncertain glow. We can see nothing beyond the window. And yet, coming from it there is plenty of light, ample incandescence, illumination, a whole world of fires and glowing embers – a diaphanous and yet impenetrable burst of universal light reflected on a white facade. Here, in the hollow of this artificial opening, the eye witnesses something brilliant, each particle of which explodes in the vicinity of all the others. In the centre of the room, a flight of stairs unfurls its shell-like helix in silence. Positioned between the intangible light and the spiral staircase that carves out the space of the ascending steps, the philosopher composes himself – folded hands resting on legs covered by his dimly lit coat. We do not know whether this person is dozing or lost in thought. Could he, perhaps, be contentedly fixated on the wrinkled lines leading from one hand to the other over his interlaced fingers? Or, perhaps, with unfocused eyes, he is absorbed by a point whatever on

* Adapted translation of chapter III of Jean-Clet Martin's *Variations: The Philosophy of Gilles Deleuze*, translated by Constantin V. Boundas and Susan Dyrkton, forthcoming from Edinburgh University Press.

the intersecting slabs of the floor. At any rate, the angle of his head reflects a redistribution of shade and light upon his face that exactly mirrors those chiaroscuro areas that shape the curve of the staircase. From bottom to top, towards the vaulted summit of this peaceful room, a crack contorts the visible space. Its S-shape arabesque unfolds as it exhausts the entire spectrum of light that diagonally expands. Along the length of this modulating line, this winged, spiral staircase, every step offers a new incline, a fresh face towards the window from which the light unfolds. In its contorted expansion, the flight of stairs traverses the entire spectrum of the chiaroscuro on its inner border, as it advances from one step to the next, either in a smooth and twisted groove, or in fitful, discrete, and successive stages. And as such, two kinds of light surface: one smooth and continuous, the other scalar and discontinuous. On the slope of a typical spiral, all the degrees of light and all the stages of visibility are exposed. A staircase: the spiral of the visible with a border in continuous variation and isles disposed in a scalar progression. On one side of the room, we have the spectral white, a burst of white that displays in its intensity all the degrees of which it is capable – all the colours, pale and dimly lit, that the vaulted walls of the room reflect. On the other side of the room, we have the flight of stairs, every step of which liberates a threshold – a gradient actualising in extension the degrees that the light is enveloping in intensity. Still and silent, the philosopher waits for midnight, when, one after another, the illuminated steps of noontime will disappear as the descending ray silently retreats, from top to bottom, along with the receding sun and moon. Rembrandt develops an image of thought around the staircase, which borrows its material from the traditional image of philosophy, an ascetic image, whose uplifting character he preserves, but only after substantial modifications.

As Deleuze so beautifully says, apropos of Nietzsche, a force would not survive if it did not first borrow the face of previous forces, against which it had struggled (Deleuze 1983: 5). A new image of thought wears the mask of its predecessor, given that it is to its advantage to be mistaken for its forerunner in order to survive the opposition and resistance that it will encounter.

At first glance, Rembrandt's painting says nothing new. A philosopher meditates at the side of a staircase that leads him to the heights and the true. This is Plato's ladder, symbolising elevation, purification, transcendence. We know it already: thought presupposes the axes and orientations that draft its image, even before one begins to explore it. The exercise of thought, therefore, is subjected to an entire

geography and to a system of coordinates that is vertically organised. Philosophy cannot escape the clichés that overdetermine its proper exercise (Deleuze 1990, 18th series). Before painting, Rembrandt must assess the proliferation of prejudices which he has at his disposal. The white canvas is, in fact, already teeming with orientated vectors and polarities that direct the system of places distributed by the double axis of the canvas, and which predetermine the painter's actions. Unless he follows the orientation of this geometry with the intention of perverting the game, Rembrandt must fight a preconceived image of thought if he aspires to create, which is why it is necessary for him to purge the canvas of the clichés and the polarities that haunt it.

At first glance, if philosophy is confined to an objective that stands for both ascension and conversion of the principle from which thought emanates, the flight of stairs that Rembrandt places around the philosopher is bound to relate to the traditional image of thought.[1] But to this image of the Epinal, other forces are superimposed – forces that would be immediately neutralised had they not borrowed the appearance of a cliché. Beneath the mask of ascension and elevation, Rembrandt has another vision in mind: the crack of thought in front of the S that lines the space of the visible with a zebra-like pattern – smooth and slithery like a serpent whose scales reaffirm the continuous variation of light – whereas individual steps convey the discontinuity of the light's spectrum. Leibniz translates Rembrandt: there is no opposition expressed between the continuous and the discrete. There is no arithmetical dualism found between the principle of indiscernibles and the principle of continuity. There is no more incompatibility between the continuous and the discrete than between the internal border of the spiral and the external, serrated border extended by the suspended staircase. A unique and continuous S gives a zebra-like pattern to the visible space, like a diagram, despite the fact that on this helix no two steps can receive light from the same angle. Being unequal in terms of their iridescence, they are *ipso facto* always singular.

The fold, Deleuze says, is the genetic element of a baroque thought, a line of variable curvature from which one can deduce many differentiated points of view, much like in a suspended staircase, the interior space of which would be dilated after being exposed and hollowed by means of a disquieting and inordinate outside.[2] It is then that a new image of thought is portrayed on Rembrandt's canvas devoted to philosophy. And this image resembles neither that of de La Tour nor Velasquez, even though they each suggest a rupture in the orientation of thought.[3]

If Velasquez inaugurates the representational apparatus, Rembrandt to the contrary invents the power of continuous variation. From one image to the next, a complex arrangement unravels the thread of its dispersal, the principle of its distribution, even if the historical distance between Rembrandt and Velasquez is negligible. The arrangement of Velasquez's *Las Meninas* and the apparatus of Rembrandt's *Philosopher in Meditation* do not obey the same geography, even if they belong to the same era. We are so much in the habit of thinking of historical mutations over long periods that are hard to move that we become deaf to the din belonging to a definite moment of history. In fact, each age constitutes an inextricable tangle of flows that are very erratic in its distributions – resulting in a multilinear map with a variety of different apertures. It is true that the Velasquez painting develops an image of thought suitable to the novel distribution of subjects and objects in the constitutive process of classical representation; but this image is only one particular vector on a large map of an entire era. It necessarily enters into a relationship with other images that inevitably capture it, transform it or weigh it down according to strategies the modalities of which must be individually defined.

Between Velasquez and Descartes, de La Tour and Pascal, Rembrandt and Leibniz, there are interferences and exchanges that render the idea of a homogeneous history obsolete. One can certainly discern procedures of exchange and follow the articulation of sign regimes specific to a period, but one is incapable of saying on which axis and which semiotics provide the rhizome with an orientation. One can always identify the vanishing points and interpret them in terms of results and goals, but it is on an alternative line that the rhizome can resume its growth and recompose its forces.

From this point of view, it is inconceivable that history reflects upon itself and orientates itself towards absolute knowledge. We do not have absolute knowledge. History is a surface in flux upon which things can be distinguished and become visible at the same time that certain expressions become readable. Velasquez makes an image of thought visible by tracing its axes and coordinates – representation of representation.

> Perhaps, in this canvas of Velasquez, there is something like the representation of the classical representation and the definition of the space that it exposes. Indeed, it tries to be present in all its elements, with its images, the eyes to which it is offered, the faces that it renders visible, and the gestures that bring it about. But at the point where this dispersion both disseminates and gathers together, an essential void shows itself categorically from all sides:

> the necessary disappearance of that which grounds it [. . .]. The subject itself has been elided. And made free of the relationship that kept it prisoner, representation can now offer itself as pure representation. (Foucault 1966: 19)

One can always follow this image of thought in order to see how it expands in an apparatus where general grammar, natural history and economy of wealth amalgamate. But such an image of thought is not alone: other forces may disguise themselves within it to expose themselves in another cut-out. There are many clashing images of thought on the same geo-historic stratum. Even if a historico-discursive formation distinguishes itself on a stratum, this is not done without dragging along a procession of forces that refuse to distinguish themselves from it (the principle of asymmetric distinction). On the labour of representation one can superimpose other forces, another history, another image. Baroque staircases, folds, Rembrandt, Leibniz – another semiotic, another apparatus. Let us pay homage to Deleuze for his Baroque machines! Indeed, from Velasquez to Rembrandt, the distribution of elements and signs is not the same. The Baroque regime of the fold profoundly modifies the status of the subject and object. The space that it inaugurates belongs to perspectivism more than to the domain of representation.

To the space of representation, the Baroque superimposes the twist of the fold. The continuous fall of a circle's arc along which discrete fields of visibility expose themselves, resembling planes laid out in tiers, differing greatly in the way they sparkle and in their way of gathering the light. Where Velasquez distributes objects in a space of stable coordinates and marks the place of a withdrawn subject setting up the possibility of a coherent representation, Rembrandt's flight of stairs deploys a surface with variable curvature, each power of which proposes a threshold of new visibility. From the height of its obscurity, a continuous helix drops down, caressing the light of its shell – a spiral tangential to an infinity of points and to an infinity of curves. Under such circumstances, no object can be conceived in reference to an essential form. There is no longer an essence for things. There is no essence on the basis of which one could determine the accidents of things by referring them to their necessary form; rather, every object describes a fold, a singular inflection, a series of variable declinations in a state of incessant modulation.

This is a new understanding of the object, one capable of supporting a becoming where sounds and colours are flexible, on a voyage in the same place comparable to those Lowry's consul experiences on his capsized skiff. From the represented object, one passes to the inflections of things,

to the folds that carry it off – an *objectile*! But we are not yet done. With respect to the subject, the Baroque produces a similar mutation. In a way, we could say that the subject itself, instead of founding the process of representation from its missing place, becomes a linear focus and a viewpoint. The mutation seems negligible and imperceptible if by 'viewpoint' we understand the pre-existing orientation of a subject capable of unveiling the view of what Heidegger inscribed within the horizon of transcendence.[4] If we must think of the viewpoint as a constitutive element, as the act of objectification understood as a pre-existing openness in a horizon of visibility, we have not yet left the apparatus of representation behind but, on the contrary, we have sunk deeper into the orientated space that makes representation available.

If the subject must be conceived as a linear focus, it is in a very special sense. Subject, says Deleuze, is what comes to a viewpoint. The subject is not at all the opening of a horizon or the fundamental orientation of representation. It is not the origin of perspectives but rather it designates the point where all perspectives intersect: the singular point where, beginning with a branch of inflection, all lines perpendicular to the tangent meet one another (Deleuze 1993: 25–6).[5]

Subject is what comes to a viewpoint – in our case, the point where the variation of light on the staircase becomes tangible. Rembrandt places the subject where we can follow the spectrum of light that fades on the sequence of steps with the fluid colours. The subject is nothing but a product, the focal point of a lens where the entire fan through which the light passes is reflected, the site from where the luminous spectrum is decomposed and spreads out in a crescent of coloured spikes. No one has done better than Rembrandt to reveal these forces of becoming in the register of the chiaroscuro. With Rembrandt, the qualities of objects also become flexible, while the object exists only through the declination of its profiles in Baroque anamorphosis.

Perspectivism is an image of thought that enters into a war against the forces of representation and can be extended to the vicinity of a network of lines where philosophy, architecture, projective geometry and painting come together in a multi-linear ensemble, the reverberations of which can also be heard in molecular biology, embryology, morphogenesis, ethology and so on. At any rate, the concept, fold, allows Deleuze to follow the display of a map whose axes extend themselves with a great deal of suppleness. Everywhere, the branches of inflection cancel out the copies of representation as well as the masks of sedentary distribution. There is no reason, therefore, to privilege the process of representation at the expense of other sign regimes, whether

diagrammatic or transformational that make up a geo-historic stratum. That one among them becomes dominant during an entire epoch is beyond doubt! But, in taking hold of other regimes of signs, in scaling the variable possibilities of visibility that agitate a stratum, the dominant semiotic necessarily submits itself to the powers of treason that it harbours. If such a semiotic system deploys endless strategies of reappropriation and structures that resist change, the forces it orientates and tries to mobilise remain nevertheless very active.

This is exactly what Deleuze and Guattari mean to say when, to the genealogical and arborescent logic, they inject the grass-like existence of rhizomes. One can understand nothing of rhizomes if one opposes them unceremoniously to centenarian trees. Evidently, opposition is not a good concept and it would be difficult to conceive of a history that corresponds without further ado to the dialectic of opposition, negation and sublation. Hegel is a poor historian. The real is no more rational that the rational is real. Such a belief confirms that an image of thought is extremely poor and reactive to boot. Besides, the idea of leaving Hegel behind, of overcoming his dialectic which feeds on oppositions, is not worth much. To exit Hegel is a false problem. This image of thought contributes to the idea that there is something to overcome, whereas becomings are made elsewhere and according to other procedures. For a long time now, biology has abandoned the model of teleology in order to expose evolution as a question of mutation rather than one of overcoming. We must stop thinking of our history in terms of cumulative progress or revolution, but rather as the mode of mutation and metamorphosis. Every civilisation mutates. The West itself is a product of treason, the result of a contagion that places heterogeneous codes in variation. Like a virus, there are always minorities that take hold of the Roman Empire and the Judeo-Christian culture in order to fuse them together – year one thousand! The barbarian is comparable to the virus that takes over the cat or the baboon. As it transports the genetic and semiotic material from one to the other, it creates an alliance against nature. It is on this new image of thought that Deleuze and Guattari elaborate: *A Thousand Plateaus* – the book of treason!

Be that as it may, it cannot be a question of opposing the rhizome-like existence of multiplicities to the arborescence of representation. Deleuze's philosophy does not tolerate dualisms. The images of thought do not oppose each other but rather they sketch orientations and assembled vectors according to *clinamen*s and unpredictable declinations. In fact, thought is always involved in the topological network of countless courses with irrational branches and multiple

crossroads. How can one travel on this changing map, along which axes, following which lines of flight? This is the problem. No itinerary precedes the peregrination limned by the course, and this map extends itself uniquely according to the problems that we encounter. An image of thought is nothing but the sum total of bifurcations that draw the line of a problem.

> I think there's an image of thought that changes a lot, that's changed a lot through history. By the image of thought I don't mean its method but something deeper that's always taken for granted a system of coordinates, dynamics, orientations: what it means to think and to 'orient oneself in thought' … . It's the image of thought that guides the creation of concepts, It cries out, so to speak, whereas concepts are like songs. (Deleuze 1995: 148)

A complete geography of problems exists, pulling thought along diverging paths. Thought, sooner or later, stumbles against singular points and problems that require a new image, a network of cases demanding heterogeneous solutions. The image of thought is certainly not the solution to a problem. Rather, it is the geometric projection of a plane, following which a problem is disarticulated along incompatible lines. It is the composition of a mental space that has nothing to do with ideology. And it is derived from an art of problems that Deleuze defines as noology. Indeed, an image of thought surges whenever thought encounters a problem, whenever chance is born in thought, compelling thought to choose and to distribute itself among many examples of solutions. We never think while under the influence of our good will but rather while under the constraints of the outside. Whenever thought stumbles against a problem, a map with forking paths is necessarily designed. A moment of great uncertainty arises in which all possibles are realised at the same time according to a number of trajectories whose violence is experienced by thought in its entirety. At this moment of indecision, all issues are drawn in an image that divides thought according to the capacity of the issue on an extended surface of the map.

It is clear that the problem sketched by representation does not have the same map as that created by the problem of perspectivism. From one image to another, we do not deal in the same way with the labyrinth that unfurls at the forefront of our thought. Not every problem takes hold in the same way. It is not the same geography that carries us away, nor the same wind that pushes us from behind. The fact is that, on each map, we find the moment of uncertainty responsible for its dimension. Each map has its suspense, its point of uncertainty, its line of flight. Each thought

has its own image and each image digs its own dimensional line, despite the fact that the issues are neither the same nor equivalent.

Every image, according to Deleuze, exposes the suspense of its dimensional line and makes an appeal to thought; every image proposes its own problem and question. This is the way to experience both the difficulty and the lifestyle, and these are not the same. There are two ways for thought to trace its burrow and to experience its labyrinth: one finds as many images of thought as one wants. But there is a way of living these images, whether active or reactive, affirmative or negative, intensive or extensive, without installing this difference in a metaphysical dualism. There are two ways of experiencing the labyrinth that do not oppose each other. Deep down, it is a question of the differences between Ariadne–Theseus and Ariadne–Dionysos that Deleuze already thematised in his book on Nietzsche.

As long as Ariadne subjects herself to Theseus, he needs a guiding thread to help him through the labyrinth – a thread that reduces to nothingness the other paths that thought represses: 'As long as Ariadne remained with Theseus, the labyrinth was interpreted the wrong way around, it opened out onto higher values, the thread was the thread of the negative and ressentiment, the moral thread' (Deleuze 1983: 188).

It is enough for Ariadne to turn her back on Theseus for the labyrinth to no longer be a source of knowledge and morality, for the thread to become useless and for every point of the labyrinth to repeat all the others, taken up by other roads in the process of the eternal return. The labyrinth is no longer the road on which one risks losing herself; it is now identified with the road that returns. Yet these two experiences of the labyrinth do not oppose each other: it is the same labyrinth envisaged either as standard or as singular. Ariadne considered every point of her thread as a regular instance, prolonging itself analytically over one and the same series. When she loses the thread, every point becomes singular and, from then on, finds itself in other series without common borders, in which case, every point will be absorbed by diverging series. In this respect, all roads lead to the same point where, if we prefer, every point finds itself on all roads, much like a vague essence or a nomadic singularity.[6] To follow the thread does not oppose the affirmation of all paths. What changes from one to the other is the use of synthesis, and we are reminded of Yu Tsun who Borges placed in a labyrinth. With each gesture, Yu Tsun feels echoes taken from other worlds proliferate around him, disjunctive syntheses with all points having become singular and surrounded with a halo of virtuality that expresses their positions in other series and their repetitions in other spaces.

A labyrinth, therefore, can be lived in different ways. One can make one's way much like one moves from one tree branch to another, but one can also follow it according to an analytic extension, like a rhizome, not from one point to the other, but rather by encountering new roads at each point, and by forming on each spot an association with the new worlds. This would be to jump on the spot across all possible worlds – Fang = X, and to be astride all the planes of the real. We encounter experiments of this nature everywhere – in Vasarely, Proust, Huxley, Mallarmé and so on – at points of flight, lines of transit and voyage. This is what coming to the viewpoint means: leaping on the spot where all worlds in a neo-baroque perspectivism are torn.

From Rembrandt to Leibniz by way of Spinoza and Nietzsche, an image of thought sketches itself, and it is difficult to rediscover in it Velasquez, Descartes or Heidegger. We owe this noology – that marks the mutation of images of thought and the endeavours to follow their entanglement – this geo-historic cartography that renews our relationship to philosophy, to the work of Deleuze and to his gallery of portraits. With Deleuze, every philosophical epoch stumbles and stutters. Philosophers are related to one another by substituting for their usual figure a singular form that bleeds in all directions – Spinoza and Nietzsche, Nietzsche and Spinoza, both cocooned within the same aura and under the same halo.

It does not matter if we lose the thread, because from one philosopher to the next a number of singularities coexist in a geographic way rather than in an historical one. To the histories of philosophies, a topology that connects with them also superimposes itself the way one travels from one road to another, with the possibility of rediscovering the same road a little farther along at another intersection with new crossroads. On this map, one can see zones with speeds and slownesses, roads and landmarks, each one of which reveals another image of thought so that none of these images is capable of offering a definitive orientation to the process of connections.

There are styles of thought that we can locate in Antiquity that are less classical than those we qualify as modern. In this respect, *The Logic of Sense* offers a typology of images and a noology erected around three stylistic variables. A style is a variable, a spatio-temporal ensemble made consistent within a block whose harmony is not given; it is sought after and can always unravel. This is why, in every style, we find bendings and flexions that carry a block of space-time, concept and networks of concepts, towards new becomings. A style always defines a series of heterogenous connections between concepts, as a diagram. As such,

noology as the study of stylistic movements must account for two factors: on one hand, it is indispensable to think of how styles that vary can coexist in sufficiently narrow, even unique regions. We must also note, on the other hand, that not all styles develop in a homogeneous manner in the various concepts to which they apply, and that to each concept we must associate another charge of affects and another form of visibility. Each style lives according to an internal logic and external encounters. Considered according to its internal development, each style produces a solid chain, a block of space-time and a consolidated arrangement that extends itself much like a curve. But at each of these sensitive points, each curve is associated with numerous experiences that function like a shock of the outside that reverberates on affects and to new percepts. Viewed from this angle, the logic of the percept, the concept and the affect do not necessarily overlap and can come loose in a Baroque or expressionist way.

The divergence of these three types of logic can be attributed to the various states of the life of styles. In the experimental state, these three dimensions search one another and are endlessly relaunched in the form of hesitant consolidation. On the contrary, the classical state manifests the rigid moment of style – its forced equilibrium. But each style is marked by a Baroque or flamboyant slope which unravels the equilibrium and destroys the unity of affects, percepts and concepts, at which point Ariadne will have lost her thread.

The Logic of Sense analyses many images of thought that are distributed according to three categories of style. In a way, everything begins with Plato and the Platonic equilibrium on which the popular image of the philosophy in the clouds depends as much as that of the philosopher taken up on the wings of the intelligible world and made to account for sensitive appearances. This style is based entirely on height, with its retinue of rising and falling, with its cyclothymic, manic-depressive affectivity and its blind-blinding perception. This version of the sun, this heliocentrism, this orientation according to height – the centre-height – already displays a hardening of style, a segmentary dual stratification, and the breathlessness characteristic of the classical moment of style. In fact, this dimension is not alone. There is an experimental state of style and a flamboyant state that cannot be reduced to the classical equilibrium that the duo, Socrates – Plato, had imposed:

> There are dimensions here, times and places, glacial or torrid zones never moderated, the entire exotic geography which characterizes a mode of thought as well as a style of life. Diogenes Laertius, perhaps, in his best

> pages, had a foreboding of this method: to find vital Aphorisms which would also be anecdotes of thought – the gesture of philosophers. The story of Empedocles and Etna, for example, is such a philosophical anecdote. It is as good as the death of Socrates but the point is precisely that it operates in another dimension. The presocratic philosopher does not have the cave; on the contrary, he thinks that we are not involved enough or sufficiently engulfed therein. In Theseus' story, he rejects the thread: 'What does your ascending path matter to us, your thread leading outside, leading to happiness and virtue . . . ? Do you wish to save us with this thread!' (Deleuze 1990: 128)

This is another way of conceiving, experiencing and perceiving a new vital articulation, another lifestyle. What the Platonic height had in some way stratified is the experimental state of the Presocratic depth – another philosophic vector, a complete style of multiple and lacerated images. But we can also find a different orientation, a new style between height and depth, a conquest of surfaces inhabited by the Megarians, the Cynics and the Stoics. It is the image of height and the image of depth that change in this reorientation of thought. Depth now becomes the index to mixtures of bodies – Diogenes strolling while a herring dangles at the end of his string; Chrysippus behaving like a pig; Thyestes devouring his own child. In all that, height is liberated from the weight of ideas and basks in the incorporeal lightning and thunder, the pestiferous haze and fog, while between the sky and the earth a strange art of surfaces subsists. Likely, each epoch of history must be read as a combination of the three styles: the experimental, the classical and the baroque. Of course, we never deal with the same experimental or the same Baroque style. The flamboyant is not to be confused with the Baroque *strictu sensu*, and the Baroque does not allow us to understand the development of expressionism. Nevertheless, as we move from one to the other, we discover the same singularities, but according to another block of space-time and situated on other layers of style. Between the Stoic reorientation of thought, for instance, and that which Nietzsche rediscovers when he redistributes the relations of surface, height and depth, we encounter the spurt of flamboyant gesture that perverts both the tiered dualism of the Cartesians and the depth of transcendental philosophy.[7]

This original understanding of philosophical style offered by Deleuze is close enough to the one that Focillon attributes to the life of artistic forms.[8] It is important to distinguish between two planes of style that run through every moment. Each style traverses several epochs and moments and is able to actualise itself in accordance with many images. The states that it realises successively can be fairly intense, fairly swift, according to the geo-historical conditions that the style encounters.

This resembles what Deleuze stresses with respect to cinematographic transformations:

> There is a whole history. But this history of images doesn't seem to me to be developmental. I think all images combine the same elements, the same signs, differently. But not just any combination's possible at just any moment: a particular element can only be developed given certain conditions, without which it will remain atrophied, or secondary. So there are different levels of development, each of them perfectly coherent, rather than lines of descent or filiation. That's why one should talk of natural history rather than historical history. (Deleuze 1995: 49)

The history, therefore, that Deleuze paints with bold strokes should not be based on evolution understood as genealogy. The way in which a film-maker or a painter reorients the elements of style with its particular geography cannot be understood as an eclectic recapitulation of the regimes that succeed one another in history. No doubt we must rediscover the same elements and their differing arrangements on the strata under consideration. A classification of images and signs should then strive to account for two lines of confrontation between which the styles are able to develop: a line of the outside and a line of the inside, an external logic and an internal logic. From this point of view, the way in which Bacon traverses the history of painting is instructive.

On any of Bacon's canvases, there are numerous semiotic regimes, many elements that can be found in each painting, to the extent that a work always distinguishes itself from that which does not distinguish itself from it, according to a principle of asymmetric distinction. Artwork cannot be actualised on the surface without other elements refusing to distinguish themselves from it and following it like a comet's tail or a halo of virtuality. Bacon's paintings are pervaded by an untimely din, the first element of which is Egyptian. There is an Egyptian style in Bacon, in virtue of which form and ground, related to each other by means of the contour, constitute a unique plane capable of producing a near vision and a planar perception. This style is the first insistence – a transcendental determination that escapes history and is counter-effectuated in painted works of art.

Aside from the Egyptian line, Bacon's work brings about the coexistence of other a priori elements of style. We can even find in him the *malerisch* treatment of the chiaroscuro, with its capacity for realising an optical world founded on a difference of values. But to the relations of values, Bacon juxtaposes relations of tonality within an arbitrary colourism. From the Egyptian element to the

malerisch by way of colourism, Bacon rearticulates all the tendencies that run through painting like a curve and left behind remarkable masterpieces (Deleuze 2003: 111–14). There is an internal logic in the development of painting, permitting tendencies that follow one another in an almost necessary and continuous way. This curve of regulated progression, however, and this movement of tired stratification are swept away by events and catastrophes that represent *clinamen*s and points of bifurcation.

As we consider the Egyptian side of Bacon's style, with his near vision and haptic perception, we are bound to discover an unusual declination. We could say that the Egyptian element spreads out to neighbouring post-Cubism, to the extent that the ground–form relationship acquires a little depth. From this point on, the form no longer presents the contour as if the former were an essence; rather, it is randomly produced where the dimensions of the foreground and the background intersect. Likewise, as we study the interactions between chiaroscuros, we inevitably notice a similar declination. A new catastrophe forces the *malerisch* treatment towards an expressionist tendency that cancels the optical coordinates through an aleatory sweep of the canvas. As for the rest, Bacon is one of the greatest colourists since Van Gogh, and in his work, the art of modulation accedes to a completely oversaturated dimension that carries painting along a Byzantine line. The curve upon which the moments of style have been stratified constantly challenges accidents that cause it to split. The artist, as a result, always reaches back to the molecular plane where all the elements of the painting coexist virtually in order to extract from it another draw.

The history of painting and cinema develops like a natural history with its internal and external, organic and inorganic logic. Wörringer and Focillon were the first to consider art under the appearance of natural history, where an organic and genealogical regime confront a crystalline and inorganic one according to orientations and dynamisms that involve new images. On this confrontational line between the inside and the outside, the organic and the inorganic, we find many stylistic regimes that never deplete themselves in a specific work of art that will rediscover them in another constellation of the semi-aleatory dicethrow. This will be the nomad line that Deleuze discovers in his analysis of the barbarian arts–the line that crosses the ages in order to expose them to the non-actual and to the power of the untimely. In fact, we find in every site and in every period of our history constellations and arrangements with the same formal characteristics, the same constitutive

elements, albeit according to a line of confrontation that tirelessly redistributes them.

> A line that delimits nothing, that describes no contour, that no longer goes from one point to another but instead passes between points, that is always declining from the horizontal and the vertical, that is constantly changing direction … . This streaming, spiraling, zigzagging, snaking, feverish line of variation liberates a power of life that human beings had rectified and organisms had confined, and which matter now expresses as the trait, flow, or impulse traversing it. (Deleuze and Guattari 1987: 497–9)

This is why the history of style does not draw a singular and ascendant line, but rather it unfurls on a multilinear plane – possessing an organic line, an inorganic line and also, from the one to the other, a line of confrontation – a median line that achieves an infinite classification of images and signs. This multilinear ensemble refers to the principle of classification that Deleuze develops in his *Francis Bacon* (2003) and in his book on cinema; and it is this same semiotic programme that prompted the writing of his book, *What is Philosophy?* (1994).

Ever since *A Thousand Plateaus*, this multilinear taxonomy has marked Deleuze's work, and strives time and again to extract the transcendental determinations that we also find *with other dynamisms* in every empirical moment of style. In philosophy, the friend, the lover, the suitor, the rival are as many transcendental determinations actualised in each epoch with the help of differing conceptual personae, each one of which reveals new relations and new rhythms and limns a complex semiotic, thereby affecting philosophy[9] with mutations. But these transcendental determinations do not imply that concepts can be found ready-made in an intelligible heaven. A concept is never a simple essence, it has to designate the circumstances and name the event – no longer the essence. There are no concepts when the transcendental determinations no longer collide with the line of the outside, which causes the concepts to enter *new networks*, new maps, new agencies and new rhythmic personae.

In this sense, the a priori elements of style are applied to new experiments on the basis of a variable alliance designated as 'confrontation.' The connection between stylistic elements and circumstances, contexts and historical conditions, define concepts and spatio-temporal dynamisms in agreement with the modalities of struggle, confrontation or resistance. This confrontation, this shock of the outside, has nothing empirical about it. Rather, it confirms the

connection between principles and domain and this is one way to justify subjecting the domain to principles assigned by Kant to the transcendental. In other words, the relationship and struggle between principles and a specific domain is never given and never determined in experience. The empirical provides the concrete figure on the strength of which principles are assembled in a domain whatever, but does not explain what makes this assemblage possible. The empirical registers how an apparatus is actualised in history. What history retains of the shock and the confrontation depends on its actualisation in an original figure, but its becoming and its event are not indebted to history. As Deleuze has often said, history only indicates the sum of the fairly negative conditions that cultivate the effectuation of something that is not historical.

And so, it is not history that determines the mutation of the images of thought and its concepts but quite the opposite. Relating a concept to a space-time block is not an act that is given; it is, instead, a door to the outside by means of which something new arrives. An act of this nature is going *to subordinate* the a priori elements of style to a new diagram not offered by *experience* – a diagram that, alone, is able to produce an experiment with the outside. The connection between elementary logic and a poetic diagramatics that elicits mutations is one between the inside and the outside, the struggle of the internal and the external, the organic and the inorganic. Without the shock of the outside, the constitutive elements of philosophy, science and art would always stratify themselves or link together in a series based on a centralised organic process in order to lay the foundation for a necessary curve of development.

In this context, it is common to associate Gothic architecture with the progression of a theorem. There is no better situation under which to witness the submission of matter to the law of form. And, beginning with the vault, nowhere else are far-reaching consequences unleashed – consequences capable of determining the association of masses, the articulation of the empty and the full, the distribution of visibility and so on. However, this curve that appears to be genetic is not exempt from the catastrophes and *clinamen*s by means of which it reconstitutes the whole gamut of relationships. The vault becomes acquainted with events and declinations that are neither historical nor structural but rather exhaled breath, a call for air where the thundering untimely is to be found. One can certainly say that the architecture of the thirteenth century already contained the counter-curve internally, so that its blossoming in France was genetically determined. The counter-curve was perhaps already enveloped in the trajectory of relatively old

forms, so that the encounter between the Gothic arch and the lower lobe of a four-leafed clover shaped its plan. But with the development of the flamboyant style, it became necessary for this element to *confront* a new state of architecture – a new diagram – in order for the counter-curve, enveloped within the old forms, to be seen by this logic as a principle contrary to the stability of architecture and to the coherence of results. The principle of the counter-curve was not compatible with the unity that governed this logic and had therefore to be sought elsewhere – in the mutation of either a style or an image of thought and in the emergence of a new percept.[10]

Architecture poses problems, therefore, which exceed all theorems and confirm a constant struggle with an outside prepared to hollow the inside, in accordance with extremely variable relations:

> Human movement and action are exterior to everything; man is always on the outside, and in order to penetrate beyond surfaces, he must break them open. The unique privilege of architecture among all the arts, be it concerned with dwellings, churches or ships, is not that of surrounding and, as it were, guaranteeing a convenient void, but of constructing an interior world that measures space and light according to the laws of a geometrical, mechanical and optical theory that is necessarily implicit in the natural order, but to which nature itself contributes nothing. (Focillon 1992: 74–5)

According to Focillon, there is an extreme divergence between the mechanical logic of structure, perspective and geometric reasoning, depending on the images of style and thought, but also according to the epochs of the life of the forms. In every noological diagram, a complex game persists between geometry, optics and mechanics – a game that mobilises dynamisms between spaces that have no common border. Architecture is developed in a variety of spaces of '*n*' irreducible dimensions. The laws of optics, mechanics and geometry are never presented on the same space. The space created by light is not the same as that which settles over immobile masses. Similarly, the space that hollows mass volumes through an internal relief mobilises motifs that have nothing in common with the stability of the mural economy. The same silhouette pierces through one sheet of space to the next, and the same transcendental elements hover about. Obviously, neither the Romanesque, nor the Gothic, nor the baroque crosses the various spaces in a uniform way. One never has repeat access to the same concept. In fact, a conceptual silhouette animates this peregrination in space, according to the smallest value of time – a block of space-time. And a

conceptual sketch limns the variation of stylistic elements on blocks of incommensurable space.[11]

A variety of spaces with no common measure – haptic, optic, digital, mechanic – constitutes a fragmented universe: a labyrinth of forking paths. This variety, along with its modalities, constitutes, for each stylistic event, the transcendental part that must be distinguished from what is actualised in history. The task of the philosopher is to extract a concept from this silhouette which will be the event – the singularity of a dynamism that crosses the various spaces and reorganises the elements according to their intensities and without any extension. The concept, therefore, is not so much the passage of one stylistic element to another, but rather, of one form to a dynamic space – the erratic passage of a form upon *all* planes of space. The concept is a method of transposition, of metamorphosis – a line of flight. And it is characterised by a power of variation that traverses the heterogeneous states of numerous spaces. It is due to this method that a form or an utterance is compelled to cross all the variables that might affect its contents in the shortest moment of time. And *at the same time* a concept relays a form along *all* the heterogeneous dimensions of space, thereby drawing an arabesque that could connect rebirths and regressions of the ordinal, modular or processual style in a series of positions.

I inscribed this putting into variation in the process of a transformational semiotic. But this semiotic is possible only if a line of confrontation is drawn between the inside and the outside. A concept does not become a diagram simply because the latter is related to a pre-philosophical, pre-aesthetic and pre-scientific plane, like an image of thought. It is, in fact, inseparable from an image of thought. *The diagram sketches out the orientations and coordinates in accordance with which a concept develops* and is able to produce its arabesque within a variety of spaces without common borders. Style qualifies the entire movement from diagram to concept and from concept to the constitution of the spatio-temporal blocks within the framework of a natural history. Styles, diagrams, concepts and space-time blocks constitute the pure elements of natural history.

This is why we find the same concepts and styles in Gothic and Romanesque eras albeit *with different degrees of development*, and within other silhouettes and under other profiles of visibility. Hence, concepts that animate Gothic space may be the same as those that we find at work in Romanesque space, even though their *orientation* is not the same. The concept of the fold intervenes both in the Gothic and in the Romanesque eras. But it finds its full measure only within the Baroque

diagram. Indeed, concepts alter their dynamism and their orientation only under the constraint of a new diagram or new ways by which the different leaflets of space intersect. Such a stylistic reorientation marks the birth of a new image of thought in a natural history that juxtaposes all ages of style. This is why one can find in the same moment anticipations and relics as well as the coexistence of late and innovative forms. As Henri Focillon aptly states, time is occasionally on short waves and occasionally on long ones. It follows a rhythm that beats at many speeds of flow.

> History is not unilinear: it is not pure sequence. We may best regard it as the superimposition of very widely spaced present moments. From the fact that various modes of action are contemporaneous, that is, seized upon at the same moment, it does not follow that they all stand at an equal point in their development. At the same date, politics, economics and art do not occupy identical positions on their respective graphs, and the line joining them at any one given moment is more often than not a very irregular and sinuous one. (Focillon 1992: 140)

Natural history neither progresses in a synchronised movement nor does it proceed according to a chronological or synchronic rhythm. On the contrary, we see in natural history asynchronic movements and becomings, decelerations and accelerations that carry forms and concepts along vectors that are divergent, dissimilar and without common measure. Style, therefore, cannot be reduced to the internal logic of genealogical development. It confronts a line of the outside, an inorganic line that redistributes its elements by imposing new orientations and new images of thought and matter. Natural history involves complex formations of coexistences and sign regimes, the articulation of which is no longer dialectical but diagrammatic. In this respect, the historian's duty lies in recovering the flows of differentiated passages, in pointing out the periods of coexistence or the simultaneity of movements, in marking the entanglement of the empirical and the transcendental, in composing a multi-linear semiotic with the help of diagrammatic, transformational and generative regimes, and in liberating the image of thought where, through deterritorialisation and reterritorialisation, it finds itself. This is the multi-sided programme of *A Thousand Plateauxs* for a philosophy of the future (*avenir*) or a philosophy of the occurrence (*advenir*).

Consequently, the image of thought that Rembrandt mobilises with the motif of the *philosopher in meditation* is especially instructive and helps make sense of the pragmatics that Deleuze develops in his analysis

of the Baroque style. To hollow space from the outside, to experience the outside, constitutes an experiment that Rembrandt's flight of stairs skirts. It focuses on the spiral, the inside of which is constantly widened by the outside, along a line of force that folds material into a helix, marking the confrontation between the inorganic and the organic, the continuous and the discrete, the smooth and the striated, the sinuous and the scalar. Rembrandt's flight of stairs crosses over many spaces where the space of light no longer overlaps the dynamic space of the hub. The latter must still be distinguished from mechanical space unfurled by the successive steps. This image of thought that Rembrandt develops around the staircase is already present in the philosophical understanding of the real, even if it behooves the philosopher – and no one else – to create the concepts that correspond with the aesthetic percepts and the affects of an ethical origin. If philosophy creates concepts according to its own curve, this curve necessarily intersects with creative forms that are not concepts but productions suited to the sciences, to the arts and to practices with dynamisms that are compliant with other rhythms and under other occurrences. With Rembrandt's flight of stairs as image of thought, philosophical concepts, mathematical functions and diverse artistic endeavours are associated.

In Leibniz, we find Rembrandt's proposed concept that corresponds with the slope of the staircase. The fold, according to Deleuze, designates an inflexion that Leibniz successfully elevates to the status of concept. Fold is the Leibnizian concept from which one can consider the principle of baroque variation. It unfurls a power that carries forms and statements over a *variety* of disjunctive spaces:

> Yet the Baroque is not only projected in its own style of dress. It radiates everywhere, at all times, in the thousand folds of garments that tend to become one with their respective wearers, to exceed their attitudes, to overcome their bodily contradictions, and to make their heads look like those of swimmers bobbing in the waves. We find in painting, where the autonomy conquered through the folds of clothing that invade the entire surface becomes a simple, but sure, sign of a rupture with Renaissance space (Lanfranc, but already Il Rosso Fiorentino). Zurbaràn adorns his Christ with a broad, puffy loin-cloth in the rhingrave style, and his Immaculate Conception wears an immense mantle that is both open and cloaked. And when the folds of clothing spill out of painting, it is Bernini who endows them with sublime form in sculpture, when marble seizes and bears to infinity folds that cannot be explained by the body, but by a spiritual adventure that can set the body ablaze. His is not an art of structures but of textures . . . . (Focillon 1992: 121–2)

The fold not only designates what happens to the texture of materials and forms in each particular art, but it also marks the point of passage from one art to another. This does not mean that philosophy, literature, painting and architecture belong to the same category. On the contrary, one must distinguish between all these practices to the extent that each one actualises its own task on its own curve. Together, philosophy, art and science gather a multi-linear ensemble of relations and mutual resonances with melodic curves alien to each other. Leibniz and Rembrandt, philosophers *and* architects … . Obviously, in architecture, the modulation of a formal element over a variety of spaces does not amount to a concept, even if we were to have, in each case, a *differenciated concept* for these spaces. It is the philosopher who produces the concept, on his specific line. But from architecture to philosophy, we follow the movement of a diagonal that introduces obvious intersections. As always, a philosophical concept cuts across the neighbourhood of concrete entities that architecture, sculpture or paintings actualise along their own trajectories. It is from the side of philosophy that architectural modulation releases concepts according to methods and conditions that no longer belong to architecture. From this perspective, Deleuze's analysis of the labour of the concept monad in Leibniz is instructive. What preoccupies architecture also confirms a power of modulation that Leibniz will raise to the status of concept through dissimilar methods. There are always resemblances by means of which things do not resemble one another. That the monad is without doors or windows is something extraordinary and must be taken in a literal sense, even if it does not concern inhabitable space. The monad is visualised against the model of a dark chamber, together with a diversified canvas and the help of moving folds. Shining effects emerge from this interior texture, folded in all directions, as the many incorporeal events that Leibniz refuses to assimilate to predicates:

> For ages there have been places where what is seen is inside: a cell. A sacristy, a crypt, a church, a theater, a study, or a print room. The Baroque invests in all of these places in order to extract from them power and glory … . The monad has furniture and objects only in trompe l'oeil … . The monad is a cell: It resembles a sacristy more than an atom. A room with neither doors nor windows, where all activity takes place on the inside. (Focillon 1992: 27–8)

In short, the concept of monad expands on a geography, where one discovers the layers and dynamisms that correspond to 'the architectural ideal [of] a room of black marble, in which light enters only through orifices so well bent that nothing on the outside can be seen through

them, yet they illuminate or color the décor of a pure inside' (Focillon 1992: 28). The individual substance is, therefore, more like a texture rather than an essence, a texture whose folds and pleats designate events, polished effects rather than predicates – marblings, tissue, cloth, the kind of fold that stretches to infinity. And so, the concept of monad corresponds with an image of thought that partakes in a world of diverse rhythms and thresholds. It also forms a counterpoint to the Baroque house. Concepts, affects, percepts develop themselves in accordance with a philosophy, an ethic and an aesthetic that establish a contrapuntal world in a system of resonance and correspondence – the Romanesque, Baroque, Gothic worlds, the diagrams of which are neither given nor imposed. Then how is a world created? What produces a world? How is it that two curves as unlike as those of architecture and philosophy, for example, can be constituted so that the motifs of the one agree with those of the other? How should we determine the event that incorporates philosophy, art and science in a network of points and counterpoints?

There are moments of time when men simultaneously think of similar forms, as if the same impulse runs from one discipline to the other and is already present in new material. But the influence is somewhat weak. The work of an affinity is never sufficient to describe it. An influence and a postulated translation never account for anything. Besides, in order for an influence to succeed on a given line, we must be able to account for the conditions that this influence is unable to produce. Imitation explains nothing. We can say, in fact, that the development of the counter-curve in France corresponds with the English influence inherited from the Hundred Years War. But for such an influence to be possible, conditions of acceptability, reception and expectation are necessary and these are not established by influence alone. The meeting of two different states of style produces mutations only through deterritorialisation. This is a becoming that occurs between two stylistic states – it is a phenomenon of double capture, of aparallel evolutions, where each term snatches particles from the other and becomes something else – an explosion between two heterogeneous series!

In fact, the English counter-curve *becomes*, it transforms itself completely as it deterritorialises along the French line that will, in turn, metamorphose itself. The introduction of a foreign contribution would mean nothing without this shared deterritorialisation that inscribes the contribution in a new configuration.[12] The notion of mimetic transference is a poor concept to account for mutation. Indeed, one cannot isolate a style from the geographic milieu that has an effect on a foreign element. The program of architecture is found in material – a

sky, a site or a city – that accepts the transfer by modifying the content in an unpredictable way:

> Brick, stone, marble and volcanic materials are not merely elements of color: they are elements of structure. The amount of rainfall determines the steepness of the gables; it call for the gargoyles and the gutters that are installed on the weather-faces of flying buttresses. Aridity of climate the substitution of terraces for steep roofs. Brilliant sunlight implies shadowy naves. Where the weather is customarily dark, a multiplicity of windows is needed. The scarcity and high cost of land in populous towns control corbeling and the overhanging of stories. (Focillon 1992: 148)

From one milieu to another, no matter how hard we try to create resemblance, it creates itself through non-resembling means – and this changes everything. Moreover, the notion of milieu itself is not homogeneous. Each milieu is established through topological variables that never develop themselves according to the same rhythm and because of this, milieus cannot be separated from a differentiated temporal flux. Furthermore, if architecture inscribes itself within a milieu, this milieu never stops fleeing, deterritorialising itself on a border whose growth one cannot prevent. Actually, there is no single milieu: rather, they are superimposed in a way that one never inhabits more than once in the same way, with laws that cannot be reduced to a uniform principle:

> But Venice has worked on Venice with a most extraordinary freedom. The paradox of its construction is its struggle *against* the elements: it has installed Roman masses on sand and in water; it has outlined against rainy skies oriental silhouettes that were first conceived for use in perpetual sunlight; it has waged an unending war against the sea by devices of its own invention – the 'maritime tribunes,' the works of masonry, the *murazzi* – and finally, it has seen the overwhelming preference of its painters for landscape, for the green depths of forest and mountain that lay so close at hand in the Carnic Alps. (Focillon 1992: 150)

What is true of Venice represents the charm and the singularity of every other city, each one of which combines a number of very important milieus. It is precisely at the intersection of these coexisting milieus that a strange element resonates in a new way, according to new relations and new territorial counterpoints. And so, the counter-curve, which will be developed in France around the thirteenth century, enters a universe that puts it in variation and proposes to it heterogeneous milieus that react on its trajectory, with unexpected tonalities. In this way, no milieu is ever simple – they are not suspended over the time that possesses and modifies them. Geography itself consists of milieus and rhythms. Milieus

do not cease to clash, to slide beneath one another, as they snap up each other's periodically repeated components.[13]

Rhythm is established at the same moment an element transposes itself from one milieu to another and begins to oscillate between them. Rhythm designates the repetition of a term on different planes in continuous variation. How is the counter-curve going to roam around all milieus and according to which rhythm? The coordination of milieus depends on a singular rhythm, and this testifies to the temporal character of geography. This is why, at any given moment, the components of milieus intersect in accordance with a rhythm that corresponds neither with another period nor an influence of a mimetic order. Each epoch and its region manifests an original system of world-making, precisely where all divergent milieus meet. The Baroque, Romanesque or Gothic worlds designate a variable multiplicity of elements and lines that, each time, follow other rhythms. And what is true of architecture is equally true of interdisciplinary intersections. Art, science, philosophy do not encounter one another without causing the rise of milieus and rhythms, spaces and waves, in accordance with a non-given world that must be snatched from chaos in a semi-aleatory process, similar to the toss of a dice. The event is this: a contact or a contrast that provokes the intersection of unequal development and incompatible heterogeneous lines in a non-chronological and ahistorical time. In a language that resonates with Deleuze's concepts, Focillon has this to say: 'This immense multiplicity of factors is in complete opposition to the harshness of determinism, into which, by breaking it down into endless action and reaction, it introduces cleavage and discord at every turn' (Focillon 1992: 156).

Deleuze on Intensity Differentials and the Being of the Sensible*

Marc Rölli

Abstract

The present essay on the being of the sensible investigates the individuation of intensity differentials. This is Deleuze's theme in the fifth chapter of *Difference and Repetition*, where he places individuation in the context of his 'transcendental empiricism'. The mechanisms of subjectivation are conceived as spatially-temporally determined actualisations (of the virtual) whose implicit intensity relations are neither accessible empirically nor are they governed by transcendental conditions (in the conventional sense). Central to the discussion is the distinction, stemming from Kant, between intensive and extensive magnitudes.

Keywords: individuation, intensity, subjectivation, spatial-temporal, intensive and extensive magnitudes, virtuality and actualisation, transcendental empiricism

> In the West one has always avoided thinking about intensity . . . Deleuze has now freed it in a thought that will become the highest, the sharpest, and the most intensive. (Foucault 1969: 11)

> Est aliquid praeter extensionem imo extensione prius. (Leibniz)

I. First Overview

Deleuze's interest in the philosophical history of the calculus is connected with the time-honoured question whether infinitesimal magnitudes are

* This essay is a chapter out of Marc Rölli's book, *Gilles Deleuze: Philosophie des transzendentalen Empirismus*, published in 2003 in Vienna by Turia & Kant. It will appear in English as *Gilles Deleuze and the Advent of Transcendental Empiricism: From Tradition to Difference in Philosophy*. The essay is presented here without the copious footnoted commentaries and secondary sources found in the original German. **Translated and edited by Peter Hertz-Ohmes**.

responsible for the continuous variation of qualities in perceived objects. There is in the history of philosophy a wide spectrum of doctrines by naturalist philosophers, psychologists and physicalists that all take their start in one way or another from Leibniz and his somewhat ambiguous metaphysical definitions of the differential. For our purposes we should mainly keep in mind various post-Kantian positions which precisely in light of their decidedly non-atomistic stance tie in nicely with Kant's indispensable distinction between intensive and extensive magnitudes. It is from these sources that Deleuze develops his empiricist yet empirically critical practices. He applies them first to Hume and then to Nietzsche before reverting to Leibniz himself in order to develop a transcendental psychology of perception comprehending both the differential and sub-representative relations of intensity and the processes of becoming which are presupposed by every objectively oriented perception.

Kant, with his doctrine of principles, certainly inspired ideas relative to the range and conditions of mathematics, as for example in the sections in the *Critique of Pure Reason* from the 'Axioms of Intuition' to the 'Anticipations of Perception' – ideas which Hermann Cohen later worked out in exemplary fashion. Kant also anticipated certain important questions to be raised in philosophical psychology from Herbart to Fechner and beyond, which becomes evident in the critique of psychologism later carried out by such diverse authors as Bergson and Cohen, again with reference to the Kantian distinction between intensive and extensive magnitudes. These historical connections are noteworthy because when Deleuze embarks on his own fundamental criticism of Hume's classical empiricism on the basis of Kant's theory of intensity and intensity differences, he expressly takes his cue from Cohen and, with some reservations, from Bergson.

To put it succinctly, the Humean bundles of perceptions, as extensive magnitudes (at least in the case of visual and tactile perceptions), display a degree of intensity – but it remains unclear how the two orders of magnitude are connected. Furthermore, to speak with Kant, impressions of sensation seem to be perceptions that show relatively indistinguishable characteristics of intuition and sensation. So Hume's interpretation is fraught with difficulties as long as he insists on a philosophical understanding of psychology that blocks the overcoming of its naturalistic limitations. On the other hand, however, it is precisely empiricism's obdurate and steadfast stance in wanting to base itself on (subjective-psychological) experience as it presents itself that provides a starting point for its necessary phenomenological or even 'life-philosophical' radicalisation.

The central point of a post-Kantian critique maintains that no intensive magnitudes as such are ever involved in psychological facts: they are simply not quantifiable. Now, this thesis is easily misunderstood and at first glance it is not very instructive. First of all it disputes quite generally the scientifically fundamental interpretation of perceptions as actually being intensive contents of consciousness. No doubt Bergson and Cohen choose quite different critical strategies – and Deleuze takes from both, because they each make a contribution toward a positive definition of the concept of intensity – yet they both agree that 'intensities' present measurable magnitudes only when defined extensionally as (physically-physiologically or even behaviouristically) objectifiable facts. But while Bergson in the last analysis reduced all quantities to extensive quantities, Cohen not only held firm to the Kantian distinction between extensive and intensive magnitudes, but he expanded it for cognition-critical reasons by construing intensities as the physical counterpart of mathematical differentials. It is just this stretching of the second Kantian principle in order to make it the 'principle of reality' that allows Cohen to exceed the boundaries of the transcendental aesthetic and become attractive for Deleuze. Bergson, on the other hand, combines with his rejection of positivistic procedures in psychology an acceptance of the distinction between actual and virtual multiplicities, whereby the latter are then also quite compatible with intensities in the Deleuzian sense.

II. Through Hume to Pre-objective Intensities

Let us look again at the foundations of the empiricist theory of perception. We know that it is supposed to facilitate the realisation of a programme that founds and checks over all knowledge through reference to immediate experience. Hume introduces 'perception' as the generic term for facts of experience in general and distinguishes two types of perception according to their degree of intensity: impressions and ideas. Impressions for their part divide into impressions of sensation and impressions of reflection. In addition Hume emphasises that there are not only simple impressions, but also (from the simple ones) compound impressions and ideas. This addition is important because it complicates the dependency relationships of the two types of impression to one another. Hume's fundamental empiricist proposition, which is generally known as the copy-principle, frankly maintains 'that all our simple ideas in their first appearance are deriv'd from simple impressions, which are correspondent to them, and which they exactly represent'

(Hume 1978: 4). The prototype-copy relation can therefore only be established on the level of simple perceptions. This is fundamentally significant because the empiricist analysis of abstract ideas depends on being able to reduce ideas to impressions and can only elicit their truth content in this way. In this context we have the principle of difference as formulated by Hume, which states that 'whatever objects are different are distinguishable, and that whatever objects are distinguishable are separable by the thought and imagination' (Hume 1978: 18). Associations of ideas cannot combine the latter in such a way that they merge together or are made inseparable: precisely their 'independent separability' makes possible their empiricist justification in the first place.

It has often enough been pointed out that for Deleuze the atomistic premises of the theory of perception and the corresponding copy theory are not feasible and force us to look back at the distinction between phenomenological and naturalistic aspects of Hume's empiricism. The atomistic premises then give way to the central thesis to which Deleuze adheres, which says that sensual intensities are genetic elements that actualise themselves in extensity as an extensive magnitude. However, they are concealed by perceived qualities that ascribe themselves to some persistent object constituting itself within the same given framework (that is, in the corresponding space-time actualisation relations). Formulated in empiricist terminology, this thesis maintains that sense impressions are first to be understood as pre-individual sense data and only begin to stabilise themselves as associatively bundled and organised moments of perception in the order of visible objects. The postulated displacement within the empiricist field of concepts reveals itself only after a requisite appraisal in terms of immanent criteria.

Hume himself begins rather emphatically with the phenomenological relevance of the expression 'simple perceptions' as constituting building blocks of experience. In the much discredited chapter 'Of the ideas of space and time' in the *Treatise*, the atomistic presuppositions of perception theory are formulated by Hume in a particularly concise way, as Antony Flew has shown (1976: 257–69; see Hume 1978: 26–39). With the intention of rebutting the theorem on the infinite divisibility of space and time, Hume refers there to the kind of inseparable and extensionless perceptions underlying, in his opinion, all ideas of space and time.

> I first take the least idea I can form of a part of extension, and being certain that there is nothing more minute than this idea, I conclude, that whatever I discover by its means must be a real quality of extension. Then I repeat this

> idea once, twice, thrice, etc. and find the compound idea of extension, arising from its repetition, always to augment, and become double, triple, quadruple, etc. till at last it swells up to a considerable bulk, greater or smaller, in proportion as I repeat more or less the same idea. (Hume 1978: 29)

In his proof, Hume combines several arguments. First he relies on the universal admission 'that the capacity of the mind is limited' (Hume 1978: 26) and can never possess an adequate image of infinity. Second, he maintains 'that whatever is capable of being divided *in infinitum*, must consist of an infinite number of parts' (Hume 1978: 26). From these two premises it follows for him that the imagination is able to comprehend minimal ideas 'which cannot be diminish'd without a total annihilation' (Hume 1978: 27). Behind this thought, which draws a conclusion from the finite limitation of the imagination to the real structures of time and space, lie further assumptions on Hume's part. Thus time and space connections of perceptions must be put together out of single, unitary, and indivisible perceptions, since they otherwise couldn't exist. ' 'Tis evident, that existence in itself belongs only to unity … 'Tis therefore utterly absurd to suppose any number to exist, and yet deny the existence of unites [*sic*]' (Hume 1978: 30). In addition it is assumed that ideas are especially clear and evident if they are formed of correspondingly simple impressions and thus have at their disposal an immediately certain degree of reality. The postulate of correspondence between ideas and impressions asserts that that which is smaller than the smallest possible idea cannot be imagined and is therefore impossible.

Hume repeatedly says that ideas cannot be as small as you like, but reach a minimum that cannot be further subdivided. This thesis, which is here not an issue, is combined with another thesis concerned with the necessarily smallest impressions. Hume uses the ink spot experiment to illustrate what he understands to be simple impressions or *minima sensibilia*.

> Put a spot of ink upon paper, fix your eye upon that spot, and retire to such a distance, that at last you lose sight of it; 'tis plain, that the moment before it vanish'd the image or impression was perfectly indivisible. (Hume 1978: 27)

From this experiment we are supposed to understand that sensible impressions have a least magnitude that cannot be further minimised and therefore are indivisible. In Hume studies one speaks of extensionless points, because each extensive size is by definition assembled out of similar simple points. We can leave aside here the problems that arise when one tries to develop a concept of extension based on these points and their addition. It suffices for the moment to

interrogate the phenomenological evidence that Hume brings forth for his empiricist argument. In the last analysis the arrangement of the experiment is directed toward determining a limit to visibility, a limit that is normally invisible; this is where – more or less on the threshold of consciousness – the little, barely visible phenomena prove their irreducible atomic and discrete character. But now it seems that the intention to ground the 'logic' in a cognitively theoretical manner persistently influences Hume's descriptive analysis of the ink spot experience. The fundamental quest to uncover calculable basic units of a psychological nature compromises itself, since the description of the sense data understood in this way is unfortunately incompatible with the phenomenological facts. It isn't even necessary to harp on the multiple critiques of sense atomism from the perspective of Gestalt theory or phenomenology to argue against the assumptions Hume makes concerning the evidence of simple perceptions. In his replay of Hume's 'self-experiment', C. D. Broad summarises for the long haul the most important aspects of the way the perceptions are treated.

> At the earlier stages there certainly is a noticeable decrease in size, whilst the intensity of the blue colour and the definiteness of the outline do not alter appreciably. But, as I approach the limiting position, from which there ceases to be any appearance of the dot in my visual field, what I find most prominent is the growing faintness of the blue colour and the haziness of the outline. The appearance of the dot finally vanishes through becoming indistinguishable from that of the background immediately surrounding it. But, so long as I am sure that I am seeing the spot at all, I am fairly sure that the sense-datum which is its visual appearance is extended, and not literally punctiform. So I very much doubt whether there are punctiform visual sense data. The case for punctiform tactual sense data would seem to be still weaker. (Broad 1961: 166)

At issue here is the breaking up of Hume's atomistic position by looking more closely at the implicit and undifferenciated reference to both extensive and intensive magnitudes. On the one hand Hume gains mathematical points of sense out of a continuous minimisation of extension, whereas on the other hand they only exist as extensionless points because they have at their disposal a gradation of intensity. Clearly the spot, when it is no longer visible, loses both its spatially extended form and its more or less intensive colour. But does that mean it is a matter of equivalent magnitudes? Broad's observations show that the minimalising of extension and the weakening of intensity are not proportional to one another. That raises certain unforeseen questions. If there are simple perceptions, don't they have to operate with an intensive

magnitude that also cannot be further reduced in size? Don't elementary sense data require elementary intensities? Can we postulate elementary values with respect to intensive magnitudes? Is it at all possible to assign an intensive grade to perceptions as such? Or more generally, how should we understand the empiricist relationship between intensive and extensive magnitudes?

Hume's reliance on immediate experience and his fixation on the primordial structures of the experiential material, that is on 'clear and precise' perceptions that have to act as the base upon which all higher level ideas are grounded, leads him automatically to understand the individual 'sensual qualities' as indivisible homogenous parts which allow themselves to be assembled in the sense of discrete actual magnitudes. Hume's fundamental intention of grounding a science of human nature in accordance with the Newtonian (rather than the Leibnizian) model finds direct expression in his concept of experience insofar as the perceptual process is supposed to consist in 'a mere passive admission of the impressions thro' the organs of sensation' (Hume 1978, 73), which means that it manages for the moment without any mental activity or other synthetic process. These pure, passively received and unconnected impressions are completely individualised and clearly determined, as are the ideas that result from them, and therefore 'can never, but from our fault, contain any thing so dark and intricate' (Hume 1978: 72–3). As a result of his scientific-mechanistic objective, Hume raises himself above the phenomenological evidence that very small perceptual givens are merely blurred or hazily perceived or even that only such things are perceived to which attention has been drawn or that somehow have awakened interest. A small ink spot is normally not noticed at all, which means of course that the smallest perceptions are not normally available and thus also fail to be represented by ideas.

The anti-atomistic implications of the phenomenological interpretation that Broad puts forward with respect to Hume's experiments in perception become better appreciated when one recalls the concept of an intensive magnitude as developed by Kant. According to Kant, intensive quantities, as distinct from extensive ones, are characterised, after all, by not being measurable precisely because they don't have at their disposal any indivisible units that can be added to one another. They designate magnitudes that are constituted not in relation to one but to zero. That is why they can be infinitely and continuously diminished: at all times they involve ever smaller genetic moments that are not synthesised successively but – as Kant says – 'in an instant' (see Kant 1999: A167/B209–211). Intensive magnitudes can therefore

increase or decrease – and it is quite possible that it is exactly these self-differenciation processes that make them perceptible – but because they do not have a common denominator, these differences cannot be located on a constant, unchanging measurement foundation. Using this concept of intensity it is now possible to conceive of the gradation of affection (Husserl), so that inconspicuous perceptions cross the consciousness threshold at some specific point, namely at exactly the place where they (for example, the distant ink spot) become noticeable.

It follows that Hume makes his *minima sensibilia* dependent on perceptual conditions that – at least within the concrete contexts of daily life – are subject to permanent gradual modifications. Thus their unified and extensionless status no longer has any foundation. As Kant has shown, for any intensive magnitude it is a matter of a complex unit that does not consist of homogeneous parts which can be consecutively connected to one another. Even if a certain (variable) degree does define a minimum of visibility, nevertheless every quality of sensation implies an intensive and 'fluid' magnitude that 'doesn't run from the parts to the whole, that is to say, isn't an extensive magnitude', and results from the momentary synthetic apprehension of many (smaller) sensations (see Kant 1999: A167/B209ff.). According to Kant, sensations – in contrast to intuitions – are neither extended nor divisible: they can be arranged on a vertical scale of intensities which, although it has no general standard at its disposal, yet allows one to talk about intensive degrees that fall below any particular threshold whatever. The result is that a known sensation presents a complex unit constructed out of passive syntheses of imperceptible sense data. Not for nought does Kant call apprehension a synthesis. The givens of consciousness are in no way simple representations or bundles of simple representations, but noticeable phenomena lifted off an undifferenciated background, phenomena that result from the self-organisation of the field of experience. When these phenomena disappear, there is a continuous, not abrupt process of becoming invisible in which they become – as Broad described – indistinguishable from their background. Even though in the last analysis Kant subordinates the productive syntheses of the imagination as a whole to the activity of the understanding, we nevertheless owe to his discovery of the form of the inner sense the fact that the atomistic representation of the mere reception of simple givens can be rejected in favour of a transcendental consideration of the implicit syntheses of affection.

This is a good place to clear up a fundamental problem of empiricism with respect to the dispute about the Kantian objections to the premises

of the Humean theory of perception. It is the problem regarding the object-relationship of simple versus complex impressions and representations. Hume often presents simple perceptions as perceptions of objects: the empiricist sense criterion and the concept of association presume, according to Hume, already constituted objects as initial phenomena – at least in the actual practice of many of his arguments. On the other hand, he does not overlook the fact that pure incidents of experience have a 'pre-objective' nature, without, however, drawing from that the necessary consequences. Not without reason has Hume been called the 'spiritual precursor' of pointillism.

> The table before me is alone sufficient by its view to give me the idea of extension. This idea, then, is borrow'd from and represents some impression, which this moment appears to the senses. But my senses convey to me only the impressions of colour'd points, dispos'd in a certain manner. If the eye is sensible of any thing farther, I desire it may be pointed out to me. But if it be impossible to shew any thing farther we may conclude with certainty, that the idea of extension is nothing but a copy of these colour'd points, and of the manner of their appearance. (Hume 1978: 34)

Hume thus distinguishes single visual and tactile impressions from the combined total perception of an extended object. Accordingly, it seems that in the case of a perception intentionally directed at an object, we are concerned with a specifically organised association of sense data. Yet at this point Hume fails to give a precise determination of the organisation process relating to the object, nor does he consider radically enough the quasi-objective status of the sense data involved. Hume does not distinguish sharply enough between sense data and objects, nor between the object-constituting syntheses of pre-individual sense data and the resulting objects given to consciousness together with their empirical relations of association. Deleuze, in contrast, concentrates on the fact that the structure called 'conscious object' is predicated on genetic syntheses, so that he makes a cut between the intensive potential of virtual sense data and the extensive qualities that can be attributed to the objects of perception. The perception of an exterior physical object implies the (habituated) unification of visual and thought processes with respect to a persistently held identity terminus. Contrary to Kant and Husserl, Hume fails to appreciate the significance of the constituting syntheses in the case of the 'identity relation'. In his opinion the identity of constant and unchanging objects is immediately perceived, that is without the mediation of a corresponding act of thought, 'since (in the case of identity) the mind cannot go beyond what is immediately present

to the senses' (Hume 1978: 73). No doubt that Hume meticulously depicts the genesis of the belief in persistent and isolated things, yet he fails to grasp pre-objective sense data simultaneously as pre-conscious moments of perception.

The whole problem of Humean scepticism can now be better judged thanks to the insights we have gained. For example, Hume treats the representation of thing-constancy or of ego-identity as natural illusions which are brought forth by the imagination on the basis of many and diverse perceptions and their conventional relationships to one another. Under what conditions is this scepticism then to be considered radical or moderate, ruinous or pragmatically useful? As a matter of fact, the evaluation of the Humean 'doctrine of doubt' depends on the evaluation of the legitimacy of traditional epistemological validity claims. If Hume, for example, wanted to provide a foundation to the realistic assumptions of common sense then his philosophy falls apart in terms of its sceptical consequences. If on the other hand his critique of these assumptions is accepted and affirmed, then it is possible to develop out of it a defensible pragmatic scepticism that takes common sense to be a mutable form of opinion belonging to a historically determined imagination. When applied to the psychologism that can be found in Hume, this way of thinking means to say that the attempt to evaluate the 'laws of gravitation of the mental landscape' breaks down to the extent that no sure (causal relation depicting) cognition of facts is possible. This result is disastrous as long as one holds fast, with respect to the theoretical constitution of things, to the epistemologically foundational function of consciousness. All the same, Hume points two ways out of the mess. On the one hand, his determinations of human nature and its apparent conformity to natural laws motivate one to see the continuation of the empiricist project in a physiological or naturalistic 'psychology without soul'. On the other hand, the possibility presents itself of passing beyond an empiricist philosophy of consciousness with respect to its descriptive analyses of experience in the direction of a transcendental psychology that knows how to think the stream of consciousness rigorously as a virtual/continuous multiplicity.

Transcendental empiricism's great strength is the way it unfolds Humean scepticism in a productive way. The subtlety of the Humean experiential method, which appears above all in critical reflections on the concept of substance and causality, is given a new 'grounding' by Deleuze insofar as he undergirds transcendentally the atomistic theory of perception. It is of particular importance that small perceptions or sense data are not given (in isolation), but are understood as virtual

and intensive moments that are organised in transcendental syntheses. Only a complex unit comes to consciousness, a unit that results not from successive associations of simple sense data but from momentary syntheses of unconscious sensibilia. These passive syntheses correspond to self-differenciation processes in the field of experience that allow something to become noticeable or cancel it out. According to Deleuze it is not a matter of indifference if the noematic phenomenon (in the narrow sense) of a diffuse, not objectively localisable perception of colour is interpreted merely as the sensible quality of an identifiable object. Exclusive attention to actual and extensive givens implies disregard for precursory genetic syntheses and their characteristic relations of intensity. This disregard applies once again to difference in itself if it can only be conceptualised in a mediated form, starting with instances relieved of difference.

III. Second Overview

In his book *Nietzsche and Philosophy* (1962), Deleuze develops a theory of active and reactive forces on the basis of the doctrine of the will to power. In the fifth chapter of *Difference and Repetition* (1968), Deleuze again takes up what Nietzsche thought about the asymmetric relation of forces in order to give that relation an 'intensive' foundation. The two texts are bound together thanks to Nietzsche's interest in the conception of force in thermodynamics, which shows how and why, in scientific theories of energy, intensive magnitudes appear – and are determined – only in connection with already extended physical bodies. With this in mind, Deleuze exhibits, in *Difference and Repetition*, intensity as the ontological characteristic of individuation processes. These processes continuously explicate the virtual structures within actual givens, but they must be defined independently from the order of explication in the sense of an order of implication peculiar to intensity. Finally in his book *Leibniz and the Baroque* (1988), Deleuze develops a transcendental psychology of perception directly concerned with the differential and sub-representative relations of intensity underlying the processes of becoming presupposed by every objectively oriented perception.

IV. Nietzsche and the Intensive Differentials of Power

Deleuze starts the fifth chapter of *Difference and Repetition* by interpreting difference of intensity as a fundamental constitutive factor of consciousness and its phenomenological givens. 'Intensity – difference

of intensity – is the sufficient reason (ground) of all phenomena, the condition of that which appears' (Deleuze 1994: 222). From that it will be possible to derive the ontological primacy of the intensive over the extensive magnitudes founded therein. It is through the application of force or energy, the physical intensive magnitude par excellence, that extension in general can claim reality. Inspired by Nietzsche, Deleuze begins to conceptualise relations of forces or power as intensity relations. However, he doesn't succumb, any more than Nietzsche does, to the physicalist thinking that threatens to wipe out the essential difference between intensive and extensive magnitudes by way of good sense and common sense.

> This is what the will to power is: the genealogical element of force. The will to power is the element from which derive both the quantitative difference of related forces and the quality that devolves into each force in this relation. The will to power here reveals its nature as the principle of the synthesis of forces. (Deleuze 1983: 50)

With his interpretation of the will to power, Deleuze presents in 1962 the very first version of his transcendental empiricism. The crucial point is that the will to power is understood as the genetic and differential principle of force, that is as the universal motivating principle of becoming that explains the never-ending processes of change and interpretation of singular constellations of force. This endogenous and dynamic principle is responsible for the fluctuating relations that constantly take place between the little energetic moments of reality which organise themselves into variable units insofar as they affect one another, overcome one another or resist one another. The active forces that associate with one another construct physical relationships of intensity that predate consciousness and its reactive perspective. 'What makes the body superior to all reactions, particularly that reaction of the ego that is called consciousness, is the activity of necessarily unconscious forces' (Deleuze 1983: 41–2). Deleuze makes abundantly clear that Nietzsche defines quality, which corresponds to the quantity-differences in the configurations of quanta of forces, as affections. The will to power appears (à la Spinoza) as a capacity to affect and to be affected. The capacity for being affected is not necessarily a passivity (in the sense of suffering and receptivity) but an affectivity, a sensibility, a sensation' (Deleuze 1983: 62). The will manifests itself as 'differential sensibility' and in this way expresses the transcendental principle of intensity that is an essential characteristic of the 'higher empiricism' (*empirisme supérieur*).

Nietzsche developed his theory of the will to power and the eternal return on the basis of contemporaneous research in physics (see Zimmerli 1999: 266ff.). However, he does not actually adopt established knowledge from the exact sciences. Instead he transfers certain of their theorems into his philosophical reflections. Thus although his non-mechanical concept of force is compatible with the first law of thermodynamics, it turns against the second. Nietzsche's critique of science is expressed in exemplary fashion by his rejection of the teleological notion of entropy because, at least from Deleuze's perspective, that notion concentrates on the physicalist tendency to homogenise inequalities of energy differences by attributing to them a questionable, finalistic 'plan of transcendence'. For Deleuze the becoming – without beginning and without end – of forces affecting one another, which Nietzsche conceives under the title of eternal return of the same, is thought in the sense of a 'utopia' of pure immanence. Thus differences of quantity – for example, chaotic differences – cannot reach equilibrium any more than they can be resolved in extension. Even though Nietzsche wants to see 'the closest possible convergence of a world of becoming to that of a world of being' in the thought of a cyclical return of identical series, Deleuze can rightly cite Nietzsche in order to bring difference, as the transcendental principle of becoming, into play.

To speak with Deleuze, the quanta of force, that as elements of structure stand in differential relationship and that actualise themselves in differenciated forms, remain as virtual singularities behind their actual ways of appearing. The process of becoming is never brought to rest in its effects. The micrological relations of force persist in the background of the actual phenomena that are conditioned by them. Deleuze always presents his critique of the general idea that one has concerning the erosion of differences of intensity in the field of extended bodies and their qualitative determinations with a kind of 'deep-seated' Nietzschean undertone. For if, in energy studies, force is defined as a mixture of intensive and extensive factors, then that kind of force follows the tendency to de-differenciate intensive quantities in the field of homogeneous forms of extension. Forms of energy are therefore distributed in extension, just as extensions are qualified by forms of energy, as, for example, 'height and weight for gravitational energy, temperature and entropy for thermal energy' (Deleuze 1994: 223). From this, Deleuze concludes the following:

> In experience, *intensio* (intension) is inseparable from an *extensio* (extension) which relates it to the *extensum* (extensity). In these conditions, intensity

> itself is subordinated to the qualities which fill extensity. In short, we know intensity only as already developed within an extensity, and as covered over by qualities. (Deleuze 1994: 223)

This 'knowledge' leads Deleuze back to a transcendental illusion provoked by the way intensity is explicated, insofar as it tempts one to orient its description in terms of explicit results. Thermodynamics thus empowers good sense (*bon sens*), blessed as it is with the prescience to reduce differences by forging a path from what is more differenciated to what is less differenciated. Although good sense presupposes differences, it also prescribes how they are to be distributed, unified and thus negated in accordance with conditions reflecting sensible ideas of physical time and space. Good sense, 'like Plato's demiurge, ceaselessly and patiently transforms the unequal into the divisible' (Deleuze 1994: 224–5). In like manner, Deleuze characterises the most general content of thermodynamic principles by asserting that 'difference is the sufficient reason of change only to the extent that the change tends to negate difference' (Deleuze 1994: 223). Of course Deleuze doesn't deny that intensity as difference tries to explicate itself. But although it is deleted within extension and its physical or sensual qualities, he certainly denies that difference is thus abolished. For difference outstrips itself or loses its very nature insofar as it is explicated, but 'as intensity, difference remains implicated in itself, even as it is cancelled by being explicated outside itself' (Deleuze 1994: 228). It is intensity's implicative mode of being that preserves it in the face of its continuous transferal into the world of already constituted individual objects and, as Nietzsche puts it, protects Becoming's irrevocable inequality or disparity from 'immobilization, mummification, or mortification in Being'.

When Deleuze again and again speaks of forces and force relations – especially with respect to Nietzsche – then he is referring – in the jargon of *Anti-Oedipus* – to the 'differential coupling of streams of intensity that circulate on the body without organs'. But we can avoid the jargon, which has its own problems. For Deleuze is clearly stating that the field of intensity is coextensive with the field of individuation. Connecting with concepts developed by Hume, we can say that Deleuze in no way bases the logic of sensation on impressions of sense perception, but rather on the immediate impressions of self-perception. According to Deleuze, sensations (or forces) are affects that as such imply an individuating self-affection or folding of force on itself. The subject does not dissolve in the substanceless play of perceptions without reconstituting itself anew in what is sensible, hearable, visible or tasty.

As we have seen, for Deleuze it is not a matter of the destruction but rather of the immanent determination of the subject. For example, in the articles on 'literature and life' collected in *Critique and Clinique* Deleuze makes it clear that it only makes sense to talk about 'forces' where destabilising affects are present that in their particular self-reference give rise to subjectivation effects. Where Deleuze simplifies matter and talks about forces and intensities by alluding to Freud's *économie libidinale*, one could just as well substitute the phenomenological vocabulary of sensations and perceptions with respect to their individuational movements toward actualisation.

V. Deleuze and the Intensive Character of Time and Space

Deleuze's aspiration to radicalise Kant's critical philosophy in his book on Nietzsche turns out to be a leitmotiv of his philosophical enterprise as a whole – as Daniel W. Smith convincingly shows (Smith 1997: 5f.) – and is accomplished through the genetic-structural method of an immanent sense-determination of experience. In *Difference and Repetition* the names of Maimon and Cohen stand for the possibility of a post-Kantian transcendentalism, overhauling, thanks to Leibniz, the doctrine of time and space in terms of a theory of differentials. In the chapter on the asymmetric synthesis of the sensible Deleuze makes more concrete this vanquishing of Kantian dualism and its restrictive theory of cognition. Transcendental conditions are not regressively exposed possibilities of presupposed experience but genetic conditions of a developing experience that in the process of its actualisation determines itself in diverse ways. Difference in intensity does not at all mark an empirical relation between various facts that in each case already have an identity. Instead this difference characterises the way the given comes about in the first place. Difference is 'that by which the given is given as diverse' (Deleuze 1994: 222). The problematical structures of ideas define themselves within experience as differences of intensity in passive syntheses. For Deleuze the conditions of perception are thus contained within intensity as difference and cannot be established abstractly, before all experience as pure forms of intuition.

In the last section of the chapter on ideas in *Difference and Repetition* Deleuze explains that the immanent factors in the dramatisation of the idea are space-time dynamics: they embody as actualisation times and actualisation spaces the differential relations between ceaselessly and reciprocally determined elements of structure. To be sure, the processes of differenciation differ from their results: the processes themselves

(1) are simultaneously spatial and temporal and (2) are concealed by the actual qualities and extensities that they reveal. In addition to the latter two features of the (spatio-temporal) realisation of structure, there is also a third, since (3) 'every spatio-temporal dynamism is accompanied by the emergence of an elementary consciousness which ... is born on the threshold of the condensed singularities of the body or object whose consciousness it is' (Deleuze 1994: 220). Here there is no room to go into detail on consciousness. Instead we will move forward to the concrete processes of actualisation in the field of individuation and the intensity relations intrinsic to it. Actual extensive and qualitative series correspond indeed to the ideal elements of quantitability and qualitability. Even so, the conditions of their actualisation are still completely undetermined. We need to find out 'what carries out ... the element of potentiality in the idea' (Deleuze 1994: 221). And Deleuze quickly gives an answer. It must be a matter of spatial-temporal dramatisation, but one grounded in intensity and its relationships.

> Intensity is the determinant in the process of actualisation. It is intensity which dramatises. It is intensity which is immediately expressed in the basic spatio-temporal dynamisms and determines an 'indistinct' differential relation in the idea to incarnate itself in a distinct quality and a distinguished extensity. (Deleuze 1994: 245)

Deleuze draws a parallel between intensity's explication movement and the idea's differenciating movement. However, intensity can only then determine the structural conditions of actualisation if it can be defined independently of the differenciated or explicated results. That is possible, says Deleuze, because it has at its disposal an ontologically primary distinguished order of implication that is characterised by an idiosyncratic mode of processing. 'The essential process of intensive quantities is individuation' (Deleuze 1994: 246). Deleuze always calls the actualisation processes that can be described against the background of intensity relations individuation processes. They establish a field of communication or a system of signalising for heterogeneous series, so that the immanent structures of experience can get signs to flash and qualities to generate. In *Difference and Repetition* Deleuze proposes to treat thematically the reciprocal relations of the ideal synthesis of difference in the domain of individuation with its fields of intensity as passive spatio-temporal syntheses. In this way the fifth chapter builds a bridge between the fourth and the second chapter: the time-syntheses of 'repetition for itself' articulate the 'asymmetric syntheses' of the individuation processes that explicate the structurally determined

actualisation forms of 'ideas'. Thus it is no wonder that Deleuze in the fifth chapter focuses above all on the problem of space and places these investigations next to his analysis of time.

In connection with his reflections on the characteristic revelation-and-concealment structure of intensity, Deleuze asserts, 'that extensity does not account for the individuations which occur within it' (Deleuze 1994: 229). Here he follows the theoretical principle of individuality set down by Gilbert Simondon:

> Individuation does not only produce the individual. One ought not skip quickly over the step of individuation in order to arrive at that last reality that is the individual. One ought to try to know the ontogenesis in the entire development of that reality and get to know the individual in terms of individuation rather than individuation in terms of the individual. (See Simondon 1964: 4)

And in fact Deleuze, impressed as he seems to be by the work of Simondon, makes a lot of room for reflections on the biological genesis of the individual in the chapter on the asymmetric synthesis of the sensible. At first it is only a matter of ascertaining the origin of extensive magnitude from the intensive magnitude of original depth. 'Extensity as a whole comes from the depths' (Deleuze 1994: 229). Taking into account the paradox of symmetric objects, Deleuze makes problematic the presence of individuating factors in extensity: up and down, right and left, form and background. These factors lend depth to perception in the passively running organisation of the field of vision. In his discussions of the depth perspective that determines visibility, Deleuze has recourse, without saying so, to passages from the *Phenomenology of Perception* by Merleau-Ponty (see Merleau-Ponty 1981: 297–311). Following Merleau-Ponty to the letter, he shows that although in perception the 'third dimension' of depth may present a possible length or breadth, for example when the observer carries out an abstract measurement, it in fact becomes in this way part of extensity and loses its heterogeneity or its genetic potential (see Deleuze 1994: 229). Deleuze agrees with Merleau-Ponty that depth arises out of a 'primordial experience' which 'clearly belongs to perspective, not to things' (Merleau-Ponty 1981: 298–9). One could say that in the (binocular) 'seeing of depth' the perceiving subjectivity is made complicit, namely in the passive syntheses of disparate monocular images. From here it is but a short step for Deleuze to associate the original relation of perception to its background, its own depth, with

the coexistence of the pure past within the present. But on this point as well Merleau-Ponty anticipated him:

> Perception ratifies and renews in us a 'prehistory'. And that again is of the essence of time: there would be no present, that is to say, no sensible world with its thickness and inexhaustible richness, if perception . . . did not retain a past in the depth of the present, and did not contract that past into that depth. It fails at the moment to realize the synthesis of its object . . . because the unity of the object makes its appearance through the medium of time, and because time slips away as fast as it catches up with itself. (Merleau-Ponty 1981: 240)

As expected, Deleuze draws parallels between the syntheses of space and of time insofar as both of them, as actualisation forms of the idea, mark out concrete individuation conditions relative to experience. The perception of extensive individual objects implies depth, which precisely in its implicative mode of Being refers to intensity. As Deleuze declares, 'It is the power of diminution of the intensity experienced that provides a perception of depth' (Deleuze 1994: 230). The power of depth is proportionally grounded in the potentiality of the idea that it is capable of actualising (see Deleuze 1994: 244). That is why the sensible or physical qualities of persistent objects presuppose fields of intensity which they explicate – and in the course of explication cancel out. Which brings Deleuze to the question, how is it possible that intensity can be sensed independently of these constituted objects of experience? 'How could it be other than "sensed", since it is what gives to be sensed?' (Deleuze 1994: 230). With that, Deleuze arrives at the ontological aspect of the third syntheses of space and time regarding the transcendental exercise of powers or abilities: intensity, which can only be sensed – or depth, which can only be perceived. 'Depth and intensity are the same at the level of Being, but the same insofar as this is said of difference' (Deleuze 1994: 231).

Up until now we have found that the structure of intensity is such that its differences cancel out or explicate themselves in a system of extension without yet sublating themselves within the framework of this system or allowing themselves to be grasped in their nature. From this derives the ambivalent or double aspect of the produced quality-as-sign within the structurally determined milieu of individuation: 'It refers to an implicated order of constitutive differences, and tends to cancel out those differences in the extended order in which they are explicated' (Deleuze 1994: 228). The problem, whose key concepts are implication and explication, is further unfolded by Deleuze through his presentation of

three Nietzschian-Bergsonian features that 'deeply' characterise intensity (see Deleuze 1994: 232ff.). The first feature marks what cannot be cancelled in differences in quantity: the intensive magnitude envelops or interiorises an essential, irreducible inequality that can be homogenised but still insists within the depths of its homogenised manifestation. The second feature of intensity marks its 'profound' affirmation of difference, which only appears as negation in the domain of perfected extensities and qualities. 'Since intensity is already difference, it refers to a series of other differences that it affirms by affirming itself' (Deleuze 1994: 234). Deleuze wants to show that the negative is the inverse image of difference insofar as the negative figures of opposition and limitation are necessarily bound to differenciated forms of extension in actuality. For this purpose he examines the Platonic idea of an immanence of contrasting oppositions within a sensible quality. Large and small, thick and thin, hard and soft, etc., are for Plato 'challenging to reason' because they each only 'come to mind with their opposite'. Precisely the identity of oppositional characteristics, that is to say the coexistence of 'more' and 'less' as implied by sensible signs, points to the paradox of becoming, which according to Deleuze defines the constitutive character of intensity. Note the memorable passage, in the *Logic of Sense*, on growth taken from *Alice in Wonderland*:

> When I say, 'Alice becomes larger', I mean she becomes larger than she was. By the same token, however, she becomes smaller than she is now. Certainly, she is not bigger and smaller at the same time. She is larger now; she was smaller before. But it is at the same moment that one becomes larger than one was and smaller than one becomes. This is the simultaneity of a becoming whose characteristic is to elude the present. (Deleuze 1990: 1)

The paradox of becoming consists therefore in the simultaneity or 'identity' of two directions of sense. The present and its clear contours evaporate in the process of becoming, where past and future merge or are distributed in a new way. The intensity of becoming, that is the implication of counter-running lines of actualisation, differenciates itself by explicating itself concurrently in two directions. When Plato makes a distinction between problematic signs and problematic objects of recognition and moves his exposition of the former in the vicinity of the asymmetric paradox of intensity, he sees, according to Deleuze, intensive quantities 'only in qualities in the course of development – and for this reason, he assigns both contrariety and the being of the sensible to qualities' (Deleuze 1994: 236). In this way, however, he misses its third feature, which has to do with implication's form of being. For Deleuze,

intensity is not only implicated in quality, but it is primarily implicit in itself, that is, implicative and implicated. This implicative self-reference of intensity happens in differential and continuous syntheses which drive forward the actualisation processes of virtual manifolds and, as processes of individuation, make them concrete. The passive syntheses are presented by Deleuze as (spatial) syntheses of implicit multiplicities (intensive magnitudes) which stand opposite explicit multiplicities (extensive magnitudes). With that, he repeats and modifies on the plane of individuation – parallel to his treatment of temporal syntheses – the distinction between virtual and actual multiplicities. This is especially apparent in the concept of distance, which is introduced by Deleuze as the implicit magnitude and partial aspect of the third feature of depth-as-intensive-space (*spatium*). 'Within intensity, we call that which is really implicative and enveloping difference; and we call that which is really implicated or enveloped distance. Therefore intensity is neither divisible, like extensive quantity, nor indivisible, like quality' (Deleuze 1994: 237). The conclusive 'therefore' comes from the definition of distance, in reference to Leibniz, as a relatively indivisible and asymmetric relation that, in distinction to extensive lengths or stretches, is not put together out of discrete, homogeneous parts (see Deleuze 1994: 237f.).

Deleuze adopts and radicalises Kant's distinction between intensive and extensive magnitudes, exemplified by distances on the one hand and lengths on the oher hand as implicit and explicit multiplicities. Extensive quantities are defined as follows: 'by the relative determination of a unit (. . .); by the equivalence of the parts determined by the unit; by the consubstantiality of the parts with the whole which is divided' (Deleuze 1994: 237). It is a question of measurable multiplicities put together out of parts that are compatible, additive units of magnitude, all of the same order as the whole. The extensive quantities are divisible without essentially changing thereby. This is in contrast to intensive quantities which cannot be grasped in the context of a fiction of homogeneous space and time relations.

> An intensive quantity may be divided, but not without changing its nature. In a sense, it is therefore indivisible, but only because no part exists prior to the division and no part retains the same nature after division. (Deleuze 1994: 237)

The quantitative intensive unit implies only un-self-sustaining and heterogeneous partial moments that cannot be extracted as such from the whole: implied intensities as unit components would in the process change into implicit intensities as units. The Kantian determination of

the intensive unit of magnitude, which 'can only be represented through approximation to negation = 0' (Kant 1999: A168/B210), establishes between itself and zero a gap that can be infinitely and continuously made smaller, which argues against the possibility of its being defined in terms of its parts as units of measure. Deleuze will therefore suggest that two types of multiplicities be distinguished, 'those whose metric varies by division and those which carry the invariable principle of their metric' (Deleuze 1994: 238).

In *A Thousand Plateaus* this whole problem is discussed under the rubric smooth and striated spaces. A smooth space is a non-metric intensive space, 'one of distances, not of measures', whereas a striated space is an extensive space, with a closed, parcelled out or measured surface (Deleuze 1987: 479). Deleuze and Guattari present a series of different models – technological, mathematical, aesthetic and so on – which show the existence of both spaces in their interaction and in the factual interference phenomena of smooth and striated (de- and re-territorialisation). In the course of the discussion of the mathematical model and in the context of Riemann's substantive use of the manifold, they talk about Bergson's distinction between two multiplicities. And in fact Kant's reflections on the difference between intensive and extensive magnitudes are here reclaimed as well, in reference to the conceptual construction of a continuous, virtual manifold that opposes any explication or striation in terms of representational logic. However, this is not a question of an uncritical adoption of a traditional dogma. In *Difference and Repetition* Deleuze specifically refers to Cohen's 're-interpretation of Kantianism', which in his opinion 'attaches full value to the principle of intensive quantities' (Deleuze 1994: 231). The Marburger cognitive methodology is interesting for Deleuze because it connects the release from transcendental aesthetics with an orientation toward the fundamental propositions of pure understanding.

The decisive 'gap' in Kant's synthesis doctrine is for Cohen the fact that empirical intuitional material is pre-arranged for concepts. Kant awards a geometric extension to the pure forms of intuition 'and reserves intensive quantity for the matter which fills a given extensity to some degree or other' (Deleuze 1994: 231), whereas Deleuze, taking his cue from Cohen, attempts to derive space and time, as conditions of experience, out of the definition of the principle of intensity. For Cohen, it is a question, raised by the second Kantian fundamental principle when understood correctly, of a constructive precept that delivers reality as infinitesimal increments. Deleuze, for his part, understands what is here 'delivered', that is this spatial-temporal actualisation of ideal relations

of differential moments, as it is empirically intuited, to be of extensive magnitude. The genetic syntheses of space and time present a whole made up of 'virtual parts' that are not already given as (actual) parts in advance, nor can they be so represented.

> Space and time are not presented as they are represented... Space as pure intuition or *spatium* is an intensive quantity, and intensity as a transcendental principle is not merely the anticipation of perception but the source of a quadruple genesis: that of the *extensio* in the form of schema, that of extensity in the form of extensive magnitude, that of *qualitas* in the form of matter occupying extensity, and that of the *quale* in the form of designation of an object. (Deleuze 1994: 231)

Even though space and time cannot be reduced to concepts of the understanding, they nevertheless let themselves be integrated into the problematical field of the idea as transcendental conditions of experience – not at the outset related to extension but as 'subjacent conditions of real experience which are indistinguishable from intensity as such' (Deleuze 1994: 232).

Over against the extensive spatial relations that experience presupposes externally, there are intensive spatial relations that determine experience from within. This opposition results from the fact that for Deleuze there are also spaces in the sense of intensive magnitudes that cannot be divided up without each time changing essentially: these smooth spaces have no permanent points of reference, no constants and variables that could be assigned with respect to a stationary outside observer. On the contrary, these spaces are defined through continuous variations of their directions and points of orientation. They are not to be confused with a closed surface cut up into fixed point intervals, but correspond to open, unbounded, and multi-directional spaces on which nomads move about without sectioning them.

> Smooth space is filled by events or haecceities, far more than by formed and perceived things. It is a space of affects, more than one of properties. It is haptic rather than optical perception. Whereas in the striated space forms organize a matter, in the smooth space materials signal forces and serve as symptoms for them... Perception in it is based on symptoms and evaluations rather than measures... That is why smooth space is occupied by intensities... Striated space, on the contrary, is canopied by the sky as measure and by the measurable visual qualities deriving from it. (Deleuze 1987: 479)

The distribution of intensities on smooth space or on the 'plane of immanence' takes place 'nomadically' or according to the law of univocity, since it is not defined by any established transcendent

reference points: smooth space cannot be defined independently of the many events that subject its surface to a steady process of mutation or metamorphosis. 'It does not have a dimension higher than that which moves through it' (Deleuze 1987: 488) and tends to become identical with that which fills it. That is why no subjective perspectives exist on the space, but rather only local perspectives within the space, whose coordinates not only structure the particular patch, but also vary depending on the patch.

As we have seen, every relevant addition or subtraction from an intensive magnitude means its qualitative change. In this sense distances were only indirectly measurable: although they can be divided if one definition is implied in another, nevertheless they cannot be assigned a common measure. Seen in this way, intensities can be compared to one another and can be given a place in non-exact and discursive relationships of order. However, a smooth space comes about primarily by means of an 'accumulation of neighbourhoods' which stand externally in the vicinity of one another without implying one another. In this respect he takes his cue from the model of Riemannian space as amorphous and informal juxtapositions of heterogeneous parts that 'can be effected in an infinite number of ways' (Deleuze 1987: 485).

VI. Individuation as the Actualisation of Differentials

In spite of all that the implied multiplicities of intensity and the differential multiplicities of ideas have in common, we have held on to the fact that Deleuze wants to determine power relationships within the processes of individuation insofar as they dramatise the ideas or develop solutions for problems. In this way he sets a genetic field of passive syntheses into the middle of virtual and actual determinations of structure (differentiation-differenciation), a field that is primarily defined through the order of implication. Therefore the actualisation processes are to be described as processes of individuation and not in terms of their outcomes as processes of explication or differenciation.

> Individuation is the act by which intensity determines differential relations to become actualised, along the lines of differenciation and within the qualities and extensities it creates. (Deleuze 1994: 246)

Structures actualise themselves when their disparate and pre-individual elements are 'tensed up' or 'coupled up' with one another or transported in a 'communicative state', which means when they express and organise themselves in a field of individuation. The virtual structures are

differenciated from the relations of intensity that are being explicated. The latter make an effort to cancel themselves out in extension and cannot simply be separated – as *qualitas occulta* – from this movement. As we have seen, intensity does not actually explicate itself as such: it does not lose its differential status because it cancels itself only outside itself. It is of decisive importance for Deleuze that the intensive magnitudes cannot be derived from already constituted extensive or differenciated forms.

In this connection Deleuze falls into line with evolution-theoretical thoughts that allow individual differences to be localised in the field of individuation, that is beneath the larger taxonomic divisions. The universality of the individual, its organic classification on the model of the family tree, must accordingly rest on previous processes of individuation: in no way do individual differences merely fill out gaps in already structured systems where points of resemblance are differenciated by genus and species. 'It is the individual which is above the species, and precedes the species in principle' (Deleuze 1994: 250). Individuation must not be understood as propagation of specification. On the contrary, specification must result from the individuation. Deleuze bases his thoughts on von Baer's work, who situates embryonic epigenesis and the phenomena of organic de-differenciation in a constitutional milieu not defined by the criteria of representational concepts. 'The embryo is the individual as such directly caught up in the field of its individuation' (Deleuze 1994: 250). This constitutional or individuational field is generally defined in terms of sexual propagation, which expresses the 'evolutionary' principle of differenciating difference. Thus Deleuze again stresses that the differential relations only actualise themselves under the condition of individuation. 'What cannot be replaced is individuation itself' (Deleuze 1994: 258). Individuality cannot be separated from a virtual reservoir of pre-individual singularities which enable it to be drawn into unanticipated processes of becoming. The missing resemblance between ideas and their actualisation means, therefore, that only a genetic method can clear up the relations between the general and the particular, between the universal and the singular.

The field of individuation, which dramatises only undifferenciated differential relations – and presupposes nothing else, which is why it cannot be defined with concepts of explication or differenciation – therefore gives expression to ideas in terms of the order of implication. The intensities imply themselves reciprocally, so that each expresses the variable totality of differential relationships. However,

they express as implicational only some relations clearly, whereas they express as implied all relations confusedly. The intensive unity of the simultaneously clear-confused, which derives from the implicative nature of intensity differences, corresponds to the ideal unity of the simultaneously distinct-obscure. The clear-confused doesn't determine the idea, but rather the thinking of it, insofar as the latter expresses and works with an idea whose actualisation it determines: for indeed 'The thinker is the individual' (Deleuze 1994: 253).

At this point Deleuze returns to Leibniz, who shows every sign of having succeeded, on the basis of his theory of expression, in developing a logic of thinking that breaks with the Cartesian premise of a direct proportionality between 'clear' and 'distinct'.

> For despite the complexity and ambiguity of the texts, it does indeed seem at times that the expressed (the continuum of differential relations or the unconscious virtual Idea) should be in itself distinct and obscure: for example, all the drops of water in the sea like so many genetic elements with the differential relations, the variations in these relations and the distinctive points they comprise. In addition, it seems that the expresser (the perceiving, imagining or thinking individual) should be by nature clear and confused: for example our perception of the noise of the sea, which confusedly includes the whole and clearly expresses only certain relations or certain points by virtue of our bodies and a threshold of consciousness which they determine. (Deleuze 1994: 253)

The Idea is simultaneously distinct and obscure because it is virtually determined (differential) and actually undetermined (undifferenciated). It possesses virtual but not actual reality. The perception, on the other hand, is both clear and confused because it is actually determined (differenciated) and therefore implies virtual determinations that are not differenciated. The minute or molecular partial perceptions condense or intensify more or less in relation to our bodies and determine a threshold of differenciation across which they actualise themselves into a clearly defined perception. In this context there is also the distinction between seeing up close and seeing further away or between haptic and optic space. Whereas the smooth haptic space has no fixed points of orientation, no guidelines at its disposal which could be unified in some kind of visual model, the optic striated space is determined by distant vision and its conditions. In close vision and the undifferenciated perceptions belonging to it, the differential 'prototypical relations' of seeing are dramatically evident in the way they strive to make (something) visible. 'Cezanne spoke of the need to no longer see the

wheat field, to be too close to it, to lose oneself without landmarks in smooth space' (Deleuze 1987: 493).

In the book on *The Fold: Leibniz and the Baroque*, Deleuze pins down the perceptual implications of his differential empiricism in connection with the problem of intensity. Particularly cogent is the chapter 'Perception in the Folds'. There Deleuze develops a transcendental psychology of perception, whereby every simple and object-directed perception contains unconscious individualising differences that organise themselves into genetic processes. Starting from some of Leibniz's metaphysical thoughts, Deleuze remarks that every perceiving monad expresses an infinite world. Because of their finite constitution they are, however, restricted to express clearly only a small portion of that world. The world, which does not exist apart from its expressing monads, must nevertheless be implied by them in its totality. That is only possible – apart from the mentioned clear portion – in the form of confused perceptions. Deleuze combines at this point the metaphysical thought with a psychological one, also originating with Leibniz, which Deleuze extracts – to the extent necessary – from the metaphysically burdened context of 'world syntheses' as regulated by the principle of compossibility. Accordingly, a conscious (clear) perception is assembled out of infinitely many minute (confused) perceptions that are capable of producing it in its changeable state, more or less stabilising it, and then dissolving it. There are always micro-perceptions that do not integrate themselves into the present macro-perception but prepare for the next one.

> However abruptly I may flog my dog who eats his meal, the animal will have experienced the minute perceptions of my stealthy arrival on tiptoes, my hostile odor, and my lifting of the rod that subtend the conversion of pleasure into pain ... Tiny perceptions are as much the passage from one perception to another as they are components of each perception. (Deleuze 1993: 87)

The relation between the tiny and the large perceptions is a relation between the customary and the notable. It is thus not a question of a relation between parts and wholes, at the very least because the non-notable perceptions already have a collective character in their own right, even if they do not become conscious. A conscious perception can appear whenever at least two minute and confused perceptions determine one another or enter into a differential relationship so that they bring forth a novel singularity: for example, mixed yellow and blue colours constitute a perceptible green precisely when they alone (as two separate colours) are imperceptible. In the case of micro-perceptions,

when 'differentials of consciousness' blend with one another and in this manner unfold their genetic potential in a field of individuation, they are able to call into consciousness an objective quality for the very first time.

> For example, the sound of the sea: at least two waves must be minutely perceived as nascent and heterogeneous enough to become part of a relation that can allow the perception of a third, one that 'excels' over the others and comes to consciousness (implying that we are near the shoreline). (Deleuze 1993: 88)

Consciousness in the narrow sense is therefore not impervious. Rather, it must become pervious because it itself results from passive syntheses of unconscious or inconspicuous components of perception. More exactly, consciousness is determined by structural features of bodily affectivities, as well as from the number and properties of the filters with which the continuum of singularities belonging to radical experience are 'sieved', so that the important stuff is separated from the unimportant and the expected from the unexpected. Deleuze expresses this state of affairs succinctly as follows: 'All consciousness is a matter of threshold' (Deleuze 1993: 88). Which is to say that there are intensities below the threshold, 'smaller than the possible minimum ... of consciousness' (Deleuze 1993: 88) that only become conscious past a certain point, that is when they have so organised themselves that they cross the threshold or become conspicuous.

In summary, Deleuze, influenced by Kant and Cohen's intensive understanding of the Leibnizian differential, works past Hume's classical 'pointillism', picks up Nietzsche's intensive use of force and substitutes for the Kantian 'method of conditioning' an 'internal, subjective method of genesis'. Differential relations are what filter out certain of the available hallucinatory and hazy minute perceptions and concoct out of their reciprocal syntheses a conscious perception. From that it follows that two essential cognitive presuppositions of Kantian transcendentalism fall by the wayside: first, space and time do not have to act as an a priori basis for experience in the pure form of receptivity, and second, it is unnecessary to speculate about exterior objects that 'affect the mind in a certain way' (Kant 1999: A19/B33). The pure and empirical presuppositions of experience are instead integrated into the differential self-determination of experience: space and time can be grasped as variable actualisation forms of the differential relations among minute perceptions. The object itself is nothing that is empirically given, but rather the product of those relations in completely determined perceptions.

> Thus differential calculus is the psychic mechanism of perception, the automatism that at once and inseparably plunges into obscurity and determines clarity: a selection of minute, obscure perceptions and a perception that moves into clarity. (Deleuze 1993: 90)

The Idiocy of the Event: Between Antonin Artaud, Kathy Acker and Gilles Deleuze

Frida Beckman

Abstract

Exploring the evolution of the conceptual persona of the idiot from the philosophical idiot in Deleuze to the Russian idiot in Deleuze and Guattari, this article suggests that their use of the figure of Antonin Artaud as a model for an idiocy that is freed from the image of thought is problematic since Artaud in fact evinces a nostalgia for the capacity for thought. The article invites the writings of Kathy Acker and argues that Acker makes possible a more successful way of thinking of the event of thought beyond the Image and thereby a new conceptual persona of the post-Russian idiot.

Keywords: idiocy, image of thought, conceptual persona, Antonin Artaud, Kathy Acker, Gilles Deleuze

> There is thus something that is destroying my thinking,
> a something which does not prevent me from being
> what I might be, but which leaves me, if I may say so,
> in abeyance.
>
> (Antonin Artaud)

I. The Philosophical Idiot

> this is a table, this is an
> apple, this is the piece of wax,
> Good morning Theaetetus.
>
> (Deleuze 2004b: 171)

In Chapter 3 of *Difference and Repetition*, Gilles Deleuze asserts that the tradition of philosophy is based on a presupposed capacity and trajectory of being and thinking toward truth through good sense

and common sense.[1] The Cartesian *cogito*, for example, remains as a beginning of thought, not only because I am because I think but because in postulating such a claim I take the act of thinking as a given, as a universal premise that in itself need not be questioned. Cited from the source, Descartes' famous principle reads as follows:

> This truth, *I think, therefore I am*, was so certain and so assured that all the most extravagant suppositions brought forward by the sceptics were incapable of shaking it, I came to the conclusion that I could receive it without scruple as the first principle of the Philosophy for which I was seeking. (Descartes 2003: 23)

While Descartes' presuppositions regarding the self-evidence of the nature of thought have been challenged throughout the subsequent history of philosophy, Deleuze suggests that this tradition of critique, exemplified by, for example, Hegel's absolute spirit or Heidegger's pre-ontological Being, has nonetheless failed to escape an ultimate reference back to sensible being as the beginning of thought. To break with this 'beginning', this presumption that lingers as a problematic beginning of thought, thinking must break with this Image.

> The thought which is born in thought, the act of thinking which is neither given by innateness nor presupposed by reminiscence but engendered in its genitality, is a thought without image. But what is such a thought, and how does it operate in this world?(Deleuze 2004b: 207–8)

From here, Deleuze shows how the Cartesian self-evidence of thought places the philosopher as the idiot. Deleuze identifies this idiot in Descartes in terms of a belief in the common sense of man regardless of acquired knowledge.[2] As John Rajchman shows, Deleuze sees this idiot as an 'original figure' in Descartes (albeit anticipated by Nicolas of Cusa)[3] who differs from the Aristotelian rational animal in that he carries a natural capacity for thought independent of his political (in the Aristotelian sense) starting point (Rajchman 2000: 37). The idiot speaks French rather than Latin and forms his thoughts according to an untutored and perfectly common 'natural light'. The idiot takes the universal capacity to think for granted and the philosopher, Deleuze writes, 'takes the side of the idiot as though of a man without presuppositions' (Deleuze 2004b: 165). Like the idiot, the philosopher fails to recognise that his self-reflection is based on a very strong presupposition regarding his own natural capacity for thought. The idiot, in fact, naturalises these presuppositions of the Image of thought and conceals them as a pure element of common sense. This means that

the idiot serves as a basis rather than an escape from the dogmatic image of thought. In the overarching movement of Cartesian subjectivity, whereby thought returns to confirm the I as the basis of its own trajectory, the idiot steps in and allows thinking itself to remain an unthought category.

This paper seeks to address the figure of the idiot, not only as a neglected theme in Deleuze studies, but also in terms of the ways in which it could be reconfigured and used as a means to move beyond rather than predetermine the Image of thought. To enable this, it revisits one of the most established figures in the history of the writing of idiocy and madness, Antonin Artaud, and invites the work of a less obvious writer in such a context, American experimental novelist Kathy Acker. Moving from Deleuze's early conception of the idiot to the later one developed with Félix Guattari and from Artaud to Acker, this paper will suggest firstly that Deleuze and Guattari's use of the figure of Artaud is problematic and secondly that Acker renders possible a more appropriate and successful way of thinking of the event of thought beyond the Image.

II. The Russian Idiot

> Descartes goes mad in Russia? (Deleuze and Guattari 2003: 63)

As has been indicated above, the idiot initially appears in Deleuze's thought as a character who insists on his own capacity for thought. This is the 'private thinker' who trusts implicitly 'the innate forces that everyone possesses by right ("I think")' (Deleuze and Guattari 2003: 62); it is the philosophical idiot, the idiotic impersonator and perpetuator of the Image of thought. In *Difference and Repetition*, the critique of this Image and the idiot that upholds it is vehement. Indeed, the whole of philosophy is at stake. As long as philosophy relies on this moral, dogmatic and orthodox *pre-philosophical* Image, we are not really thinking. Deleuze even imagines a philosophy without presuppositions:

> Instead of being supported by the moral Image of thought, it would take as its point of departure a radical critique of this Image and the 'postulates' it implies. It would find its difference or its true beginning, not in agreement with the *pre-philosophical* Image but in a rigorous struggle against this image, which it would denounce as *non-philosophical*. (Deleuze 2004b: 167)

Later, in *What is Philosophy?*, the nature of this struggle has been somewhat transformed. Deleuze and Guattari make use of the freedom of the concept 'to change and take another meaning'. The concept is an event rather than an essence, they state, which means that a new

problem will require a modification of the concept (Deleuze and Guattari 2003: 21). A post-Second World War state of philosophy, as Gregg Lambert notes, means a modernity in which common sense ceases to be self-evident (Lambert 2002: 5). As a consequence, Deleuze and Guattari offer a new conceptual persona, an idiot that does not merely reject the possibility of a public, general knowledge, but also the possibility of his own capacity for thought (Deleuze and Guattari 2000: 70).[4] While the old idiot wanted to be able to judge what was comprehensible or rational, the new idiot that Deleuze and Guattari designate as the 'Russian' idiot, wants 'the lost, the incomprehensible, and the absurd to be restored to him' (Deleuze and Guattari 2003: 63).

This figure of the Russian idiot is foregrounded already in *Difference and Repetition*, for as Deleuze puts it in his chapter on the Image of thought: 'At the risk of playing the idiot, do so in the Russian manner' (Deleuze 2004b: 166). Basing his figure on works by Russian writers such as Dostoevsky and Gogol and their fascination with nihilism and the absurd, Deleuze suggests that this is a figure who does not recognise himself in the 'subjective presuppositions of a natural capacity for thought'. Rather than taking his thinking for granted, this Russian idiot fails to adjust to this supposed self-evidence of thought; as Deleuze puts it, he 'lacks the compass with which to make a circle' (Deleuze 2004b: 166).

Even if the Russian idiot is thus foregrounded in *Difference and Repetition*, its appearance has different implications in *What is Philosophy?* Here, Deleuze and Guattari seem to have given up on the project of escaping the Image of thought and try, rather, to develop concepts and conceptual persona that enable a negotiation of thinking. The 'radical critique' of and 'rigorous struggle against this image' that Deleuze calls for in *Difference and Repetition* has turned into a focus on a reconceptualisation of the relation between the concept and the problem it responds to and thereby to a more truly immanent principle. The philosophy 'without any kind of presuppositions' that Deleuze calls for has turned into a recursive generation of images of thought. As Deleuze and Guattari write: 'A concept like knowledge has meaning only in relation to an image of thought to which it refers and to a conceptual persona it needs; a different image and a different persona call for other concepts' (Deleuze and Guattari 2003: 81). This multiplication of images, then, becomes possible in *What is Philosophy?* because thought has become a plane of immanence. There is no thinking subject to be immanent to, in the Cartesian-Kantian-Husserlian style, but only thinking as a non-transcendent event. Because thought is not ascribed to

a subject but to a *thought event*, thinking could no longer be said to stem from a will to truth. Nietzsche, Deleuze and Guattari suggest, makes us see how thought is not a will to truth but rather a process of creation. But if there is no will to truth, they continue, 'this is because thought constitutes a simple "possibility" of thinking without yet defining a thinker "capable" of it and able to say "I" ' (Deleuze and Guattari 2003: 54–5). When thought precedes the thinker and occurs through the event, there is no longer any self-evident capacity to think. On such plane of immanence, Deleuze and Guattari suggest, thinking becomes an increasingly difficult process which lacks method and proceeds by 'uncoordinated leaps', like a dog (Deleuze and Guattari 2003: 55).

Artaud is posited as the Russian idiot par excellence, a conceptual persona that enables thought to leap and snarl and thereby to approach the thought without image, the point where, as Deleuze puts it in *Difference and Repetition*, it would seem as 'though thought could begin to think' (Deleuze 2004b: 168). Artaud, Deleuze and Guattari point out, says that the limitless plane of immanence inevitably engenders 'hallucinations, erroneous perceptions, bad feelings' (Deleuze and Guattari 2003: 49). The plane of immance thus becomes a way, maybe not to escape the Image of thought, but at least to lift thought from its basis in a self-evidently capable thinker.

For Deleuze and Guattari, Artaud is the schizophrenic who neglects to confirm the established limits of literature, common sense and the body. The schizophrenic is crucial to their project because he does not see the world in terms of fixed objects or entities but rather experiences it as a constant process of unpredictable production. Thereby schizophrenia becomes a way of breaking down idealistic categories of any kind, most centrally those of the body and thought. Recurring in Deleuze and Guattari's writing, then, Artaud is praised for his insistent and self-proclaimed incapacity to think. That Artaud sees thought as the event of a '*central breakdown*' and as proceeding 'solely by its own incapacity to take form' means that he opens for a possibility of creating a thought without Image (Deleuze 2004b: 417). In Deleuze, Lambert writes, the figure of Artaud is found at the very moment of rupture of the Image of thought, where the subject fails to externalise itself to make the Image part of the Whole and instead breaks apart at the prospect of this Image. At this point of rupture, thought 'does not accede to a form that belongs to a model of knowledge, or fall to the conditions of an action; rather, thought exposes its own image to an "outside" that hollows it out and returns it to an element of "formlessness"' (Lambert 2002: 127).

Artaud's literary and dramatic production seems to confirm and even flaunt his inability to think. His theatre conveys an uncertainty

in thought at the same time as it stands as an affirmation of what is lost, incomprehensible and absurd. His incantations and mumbles, cries and rhythms are not so much expressions of an inability to think and speak as they are expressions of a new form of thinking and speaking, one that is unhampered by the weight of rationality and language. The destruction of language frees the creativity of thought and enables a subjected 'deeper intellectuality' to happen.[5] Deleuze and Guattari pick up on Artaud's use of the figure of the mummy in his 'The Mummy Correspondence' but also recurring in poems such as 'La Momie attachée' and 'Invocation à la Momie'. In the former, Artaud compares his 'bloodless intellect' to that of the mummy in order to give God 'a glimpse of the void in which being born necessarily puts me' (Artaud 1968: 168). In *What is Philosophy?*, Deleuze and Guattari follow up on this in describing the idiot as 'a cataleptic thinker or "mummy" who discovers in thought an inability to think' (Deleuze and Guattari 2003: 70). This mummy links back to Artaud and cinema and the way he celebrated the potential power of cinema to disrupt and disassociate thought by 'un-linking' images of the Whole. In *Cinema 2. The Time Image*, Deleuze traces Artaud's use of the cinematic medium to reveal a powerlessness to think through the figure of the automaton, or *vigilambulist*, that stands as the impossibility of thinking in thought. The spiritual automaton in Artaud's scripts *32* and *Dix-Huit Secondes*, Deleuze argues, 'has become the Mummy, this dismantled, paralysed, petrified, frozen instance which testifies to "the impossibility if thinking that is thought"' (Deleuze 1989: 166). The mummy as the bloodless figure that both exists and does not is thus an important figure for Artaud as well as for Deleuze and Guattari in their search for the unthought in thought. What Deleuze and Guattari do not pick up on, however, is the close connection in Artaud between the word 'momie' (mummy), and 'môмo' which, Hayman notes, is slang for 'idiot' (Hayman 1977: 133). In Artaud, the 'void' in which he finds himself as a mummy is closely linked to his impotent intellect, his idiocy.

In *Artaud le Môмo*, Artaud uses surrealist nonsense to create his own language. As Hayman notes, Artaud has an ambition to create to 'create a language which did not depend on words that were not his' (Hayman 1977: 134). This means, Deleuze and Guattari in their turn suggest, that he makes thought snarl, squeak and stammer, 'which leads it to create, or to try' (Deleuze and Guattari 2003: 55). The loss of stable references of thought is extremely painful but also something more creative than those who 'fix landmarks in their minds', those who

> are masters of their own language, all those for whom words mean something, all those for whom there are currents of thought [...] and who have named these currents of thought I am thinking of their specific task and the mechanical creaking their minds give out at every gust of wind. (Artaud 1968: 75)

Unlike this 'trash' of 'those who still believe in orientation of the mind', Artaud celebrates and affirms his confusions. 'I truly lose myself in thought like in dreams', he writes, 'the way one returns to thought, suddenly. I am he who knows the inmost recesses of loss' (Artaud 1968: 74–5). This loss is the loss of the self-evidence of thought and Artaud thereby rejects the idiocy of philosophy and its presumption about the self-evident capacity to think. Returning to thought 'suddenly' means a production of thought that does not begin nor return to the innately capable thinker but that is produced in thought itself.

Despite his uncertainties and failures, Artaud's is an ambitious project that somehow continues to strive toward new possibilities for being and for thought; it is, as he states himself, a confrontation with 'the metaphysics I created for myself, in accordance with the void I carry within me' (Artaud 1968: 81). This means that although Artaud rejects the self-evidence of the thinking 'I', he nonetheless believes in the creativity of thought. But to reach this creativity, there must be an originality that only the idiot could provide because to reach real thinking one must slough off the 'masters of language' who 'orient thought'.

If we take a look at Artaud's private letters, however, we will see how Artaud struggles to find a way of justifying a thinking that seems to lack the will to truth that would justify it as subjective thought. '[I]s the substance of my thought so tangled', he writes in the first of his many letters to Jacques Rivière, 'and is its general beauty rendered so inactive by the impurities and uncertainties with which it is marred that it does not manage to exist *literally*? The entire problem of my thinking is involved. For me, it is no less than a matter of knowing whether or not I have the right to continue thinking, in verse or prose' (Artaud 1965: 8–9). Artaud's uncertainty about his own 'right' to continue thinking suggests a frustration, a sense of a capacity lost to him. Thought continually 'abandons' him, leaves him on the border of non-being. The poems he so insistently offers to Rivière are crucial to him because an existing uncertainty is still so much more reassuring than non-existence. Artaud, it seems, clearly mourns his professed inability to think, and he is also pursued by nostalgia; he is in search for a capacity lost, in 'constant pursuit of [his own] intellectual being' (Artaud 1965: 7). While Artaud

admittedly cannot posit thinking as a comforting proof of his being in the manner of Descartes, he is still, I would argue, in pursuit of this possibility. It is this pursuit, in fact, that constitutes the ingeniousness as well as the tragedy of his sense of mental dislocation.

Does not, then, the figure of Artaud in fact bring out some tensions rather than resolve Deleuze and Guattari's problem of freeing thought from its own image? As one who constantly doubts his capacity for thought, and who disrupts what may be called the self-complacency of thinking, we can see clearly why Deleuze and Guattari would place Artaud as a Russian rather than a philosophical idiot. At the same time, the fact that the perceptions on the plane of immanence can be described as 'erroneous' suggests that Deleuze and Guattari's conceptual persona of the Russian idiot nonetheless aspires to universal, or at least unequivocal, truth even as he fails to achieve it. Error, Deleuze writes in *Nietzsche and Philosophy*, is a concept whose persistence in philosophy illustrates the dogmatic image of thought. Everything opposed to the image functions to lure thought into error (Deleuze 2006: 98). As such, error is central to the classic Image of thought in that it comes to define that which is false in relation to the turning toward truth. While this should mean that error may provide a way of escaping the Image of thought, of demolishing the notion of truth at its basis, the relation to error must be as decisive as the relation to truth. To continue along Nietzschean lines, an error which is measured against truth must surely be indicative of a reactive force rather than the active force that throws us into thought. As Deleuze himself writes: 'Insofar as our thinking is controlled by reactive forces, insofar as it finds its sense in reactive forces, we must admit that we are not yet thinking' (2006: 100). Artaud's letters suggest that his failure of rationality does not do away with rationality and truth but compares itself with them. Not only does it invest these concepts with a sense of nostalgia; his recognition of his own lost capacity to think also keeps his thought in the grip of reactive forces and, as such, determined by certain coordinates.[6] Does this not, in fact, suggest a 'pre-Russian' rather than Russian idiot, an idiot that refers back to the dogmatic, even Cartesian plane by measuring his thought according to innateness and doubt?

III. Friendship, Ethics, and the Event of Thought

Artaud's letters to Rivière and the doubts they bring to light actualise the function of *friendship* in philosophy.[7] For thinking to be possible and for new concepts to be created Deleuze and Guattari reconfigure the

relation of friendship. The friend, they argue, reveals 'the Greek origin of philo-sophy' and the way in which philosophical communication and reflection 'violently force the friend into a relationship that is no longer a relationship with an other but one with an Entity, and Objectality [*Objectité*], an Essence – Plato's friend' (Deleuze and Guattari 2003: 3). Such friendship relies on common knowledge and on the self-evidence of thought and thereby blocks the possibility of creating new concepts, that is the possibility of thinking. Furthermore, it points to the inevitable ethics of the event. A philosophical thinking based on intersubjective idealism, or, rather, a stupefying dialectics, disables thinking through appropriation and domination of the Other that could unsettle the presuppositions that make up the Image of thought. The true event of thought relies on an ethics of true difference, 'to will the difference' of the friend that disrupts rather than negotiates your ability to think.

While the conceptual persona of the friend is not a person in the material, phenomenal sense in Deleuze and Guattari's reading, I will nonetheless stop for a moment to compare cursorily Artaud's exchanges with Rivière to an exchange between Acker and Avital Ronell.[8] At first glance, the exchange between Artaud and Rivière reveals the lack of common knowledge that philosophy presumes and thereby affirms Artaud's position as the Deleuzian Russian idiot who rejects the natural capacity for thought. Artaud anticipates Rivière's rejection of his work and even justifies it. 'You will say to me', he writes in a postscript, that 'in order to give an opinion on matters of this kind, another mental cohesion and another perceptiveness are required' (Artaud 1965: 12). Recognising his own failure he realises that 'it may be necessary to think further than I do, and perhaps otherwise. I am waiting only for my brain to change' (Artaud 1965: 12). But can the lack of 'proper' thinking really be a liberatory thought-event as long as it is measured exactly against the 'proper'? Is a thinking that is not only nostalgic, as I have already suggested, but also painfully aware of its submission as an 'Entity' to the domination of the old philosophical friendship really affirmative of its own difference?

This exchange suggests a very different ethical relation. In an article on Acker, Ronell characterises her exchanges with Acker by emphasising the 'co' in conversation. This is a politics of friendship that Ronell theorises in a discussion whose implications lie well beyond the scope of the present essay, but that indicate an ethics of 'being with' that complicates the origins of thought through the work of Martin Heidegger, Jean-Luc Nancy and Jacques Derrida. Arguably even more complex, however, is the ethics of the production of thought in Acker's

writing. Acker's texts, I would suggest, do not rely on the 'co' so much as the 'con' in conversation.[9] Acker strips philosophy and literature of their meaning by removing philosophical statements and narrative pieces from a meaningful context. She uses, or mis-uses or (ab)uses, thought, thereby undermining it as a meaning-making process. These *con*versations, then, imply a very different friendship than that which relies on common sense.

This con, it is important to note, is not a dishonesty within a moral system. Rather, it is a dishonesty that displaces this moral system. Or, more radically, it is a con that displaces the system of self-evident thought. 'The only way you can get the real self', Acker writes in *Great Expectations*, 'is to rip someone off [...]. You're a con man' (Acker 1982: 98). What is the nature of a friendship that steals rather than communicates? What are the ethical implications of such thought? Stealing, Deleuze has argued, is the very reverse of plagiarism or copying. Rather than the deadweight of imitation, stealing involves a becoming, a 'double-capture' or 'double-theft' that is always 'outside' or in between (Deleuze and Parnet 2002: 7). Stealing is a more radical move than plagiarism in that it produces something new out of the old. Indeed, Deleuze describes his collaborations with Guattari in these terms of the productivity of a 'theft of thoughts', of being 'between the twos'. 'I stole Félix, and I hope he did the same for me' (Deleuze and Parnet 2002: 17).[10]

In Acker's literary production, the act of stealing involves a radical mode of thought because thinking has become an act of immanent creation rather than one of nostalgic reproduction. Acker steals shamelessly from philosophical as well as literary discourse. She 'borrows' characters, fragments of stories and historical personages from the history of literature and philosophy. For example, she includes the writings of classical Roman poet Propertius and Pauline Réage's infamous *The Story of O* as well as quasi-fictionalised versions of real life critics such as Sylvère Lotringer and Susan Sontag. Furthermore, she transcribes lines from other novels and even 'steals' entire book titles, one novel being entitled *Great Expectations*, another *Don Quixote*. In the former, Pip from Charles Dickens' novel becomes a woman and a woman (possibly the same, who knows) is taken to Roissy to become O, Pauline Réage's masochistic protagonist.

This kind of tactic does not only challenge representation and meaning in literature; Acker's unabashed pilfering also challenges the nature of philosophy as a reflective mode of thinking. Acker's writing seemingly mirrors the thematisation of the thinking subject and the

possibility of the self-reflexive moment of subjectivity that haunts philosophical thinking. Her work seems apparently intelligent and reflective but this overtly intellectual self-reflexivity cannot be sustained. When classic philosophical claims are squeezed in between nameless subjects, incoherent narrative and stolen scenes of sexual violence, Acker undermines any moment that would enable a dialectical reflection, a mutual mirroring, between literature and philosophy and also, on a narrative level, between being and thought. While situating her characters in a patchwork of philosophical and literary discourse, these characters neither come to reflect philosophically on literary events nor do they reflect in a literary manner on philosophical events. Such a strategy would presume the possibility of knowing, of an autonomous vantage point, both epistemological and ontological. But there is no vantage point in Acker's texts and thereby thinking becomes neither a definition of being nor a mode of reflection. Acker's layering of literature and philosophy creates subjects without thoughts and thoughts without subjects. Her characters are portrayed as beyond a 'natural capacity for thought'. Thinking has a problem completing the circle of thought through which the characters could be portrayed as self-reflective subjects.

Acker's characters are denied a 'natural capacity for thought' in the way in which their identities are disrupted through their stolen roles and nature. Missing is also a logical literary narrative as well as a grammar through which we could determine the 'I' and a continuous self-reflexive consciousness that would make thought their 'own'. This means that the philosophical statements that are scattered through Acker's writing are not part of any coherent argument or thinking on behalf of the characters. Instead, they are ruthlessly mingled with a kind of incoherent splutter – 'I'm a … googoo' – short notes on sexual assault and pieces of appropriated narrative (Acker 1982: 21). In this way, the presence of philosophical thought does not serve to construct characters as philosophical subjects. In Acker's fiction, thought simply refuses to come back to itself and thereby to ground the being of her characters as constituted subjects. Thinking is no longer presented as subjective reflection. In fact, any attempt at self-reflection seems to take her characters even further from themselves. Thinking has two possible outcomes in these novels; it ends either in a stated impossibility of thinking or in the dissolution of the logic of thought and its relation to the subject. In *Empire of the Senseless* she writes: '[S]ince the I who desired and the eye who perceived had nothing to do with each other

and at the same time existed in the same body – mine: I was not possible' (Acker 1988: 33).

Acker's characters do not only lack the capacity for self-reflexivity, they also lack the immediate recognition through which thinking could proceed along the path of common sense. The common sense of the philosophical idiot functions as such because to him, thinking is obvious and does not therefore lead to the questioning of thought itself. Acker's writing violently opposes such self-evidence of thought. When Acker's characters are temporarily and defectively constituted through philosophical claims, they are constituted, not through thinking, nor through thinking about thinking, but through *someone else's* thinking about thinking. By extension, there is no possibility for thought to be truly self-reflexive – thought cannot return to prove the subjective capacity of the character to think, there are no such circles to be made. Instead, thought comes to be outside itself, beside itself. When Acker's characters are caught in a repetition of thoughts that cannot be identified as their own, they lose the possibility for coherent self-reflection.

Thus far, Acker's writing fits well as a thematisation of the Russian idiot that no longer takes for granted his own pre-existent capacity for thought. In its forceful mixture of challenging and frequently repulsive narrative fragments and its unforeseeable textual spaces Acker's work is distinctly similar to Artaud's. Like Artaud, Acker seems to resist representation in favour of a stuttering text in which characters ebb and flow without a delineable subjectivity. Acker too questions the self-evident nature of thought. Acker's writing, however, does not only reject reminiscence, it also rejects the nostalgia for the capacity to think that haunts both Artaud and the conceptual persona of Deleuze and Guattari's Russian idiot. In fact, Acker plays with and ridicules the Cartesian agent capable of improving himself through thinking. In her text, seemingly philosophical ponderings concerning the nature of being and thinking are mixed with incoherent writings on sadistic and masochistic relations. In this way, the 'instrumental stance' to one's desires, inclinations, tendencies, habits of thought and feeling is overtly ridiculed. Instead of producing coherent self-reflection, these philosophical scraps are juxtaposed to the most extreme forms of physical and unconstrained desires, inclinations and habits. We read: 'Stylistically: simultaneous contrasts, extravagancies, incoherences, half-formed misshapen thoughts, lousy spelling, what signifies what? What is the secret of this chaos? (Since there's no possibility, there's play. Elegance and completely filthy sex together)' (Acker 1982: 107). Thought, here, is exchanged for 'play'. Thinking, in Acker's writing, is

not so much a mode of reflection or knowledge as it is an event – an immanent possibility unrestrained by Cartesian cognition as well as by a nostalgia for it.

'Since the world has disappeared', Acker writes, efficiently doing away with the transcendent outside, 'rather than objects, there exists that smouldering within time where and when subject meets object' (Acker 1988: 38). And this is also how philosophy and literature meet in Acker's texts – through a smouldering within time where transcendent thought is impossible. It is, to return to Deleuze and Guattari, to will the difference; stealing becomes an event of thought in that it is unhampered by pretentions to any Image or Idea.

Acker's writings, it has been pointed out, are negotiations of the 'power relationships inherent in writing' (Mitchell and Parker 2005: 68). While this could be related to her infamous strategies of plagiarism, her strategies of layering of philosophical and literary discourses could be related to negotiating the power relationships inherent in thought. By inserting philosophical fragments in context without sense, she denies the friendship of philosophy, the totalising power of reason whereby thought could make sense of itself. The event of thought and its embodiments in philosophy and literature is the event of the con.

IV. Stealing Artaud: New Friendship, New Idiocy

But where is the thought that is without an I? What is the ethics of the thought-event that is beyond the individual subject? We have still not managed to determine what such an event of thought would be. (Indeed, if we did, would we not construct another image of thought?) Deleuze takes Artaud's concept of genitality as a possibility for thinking without an image. Genitality is a way of pointing to a creation rather than the innate capacity for thought. It is a way of escaping the idiocy of philosophy by replacing the Image of thought in which thinking already exists and can be judged with the birth of thought outside such preordained presuppositions. When Artaud says that he is 'innately genital' and that he must 'whip his innateness' in order to be, he is replacing the reproduction of an already existing quality (Image of thought) with the creation of thought through a violent becoming (thought without Image). Artaud is he who can think only if he obliterates the Image of thought and genitality violates this image because it threatens the reproduction of the already existing capacity of thinking that the Image of thought presumes. As Catherine Dale points out, Artaud can make innateness genital because he sees

it as an autonomous creation; thought is engendered in itself without presumptions (Dale 2002: 89). This process, the engendering of thinking in thought as Deleuze calls it, is about having the courage to confront the idiocy of philosophy, of facing the possibility of pain and madness as the event of thought. 'I truly lose myself in thought like in dreams', Artaud writes, 'the way one returns to thought, suddenly. I am he who knows the inmost recesses of loss' (Artaud 1965: 74–5).

In her novel *Pussy, King of the Pirates*, Acker invites, or rather steals, Artaud. She sets up an incoherent communication between Artaud and O, the protagonist, we recall, that Acker has stolen from Réage's novel.[11] Acker couples O's sexual concerns as a masochistic prostitute with the painful event of thought in Artaud.[12] In the novel, O has a difficulty with being beyond the hole that her name spells out because 'I couldn't walk away because inside the whorehouse I wasn't anybody. There was nobody to walk away' (Acker 1996: 9). O's statement is later followed up by one by (Acker's) Artaud who declares that 'Now I am Gérard de Nerval after he castrated himself because consciousness in the form of language is now pouring out of me and hurting me and so I can be with you. I shall own you O' (Acker 1996: 21). Both O and Artaud balance between genitality as becoming or disappearing, with the costs of the loss of self. But while O struggles to exist beyond the hole, Artaud needs to produce a gashing hole in order to reach consciousness and language. For Acker's Artaud, it seems, O becomes the very possibility for thought, his castration enabling his access to consciousness which, in turn, enables his possession of O. But who is O? O, in her masochistic surrender and complete abandon of integrity and self-hood is, many readings of Réage's novel have pointed out, an O, a void or a hole – a nothing. Is this then, the 'complete nothingness' from which Artaud snatches his 'shreds' of poetry? (Artaud 1965: 8). Acker places the O, the nothingness, as the beginning of thought – the aim for Artaud's nostalgic longing for 'owning' the capacity to think.

One might say, then, that Acker takes the cue of Artaud's/Deleuze's concept of genitality and brings it into the traditionally female position of non – access to language and consciousness, the O, or the impossibility of speaking and being so central in feminist studies. 'I can't help myself anymore I really can't I'm just a girl I didn't ask to be born a girl. When I think, I know totally realistically I'm an alien existant' (*sic*) (Acker 1982: 117). In Acker's hands, Artaud's creative idiocy opens a way to engage the female inaccessibility to thought toward a rebellious refusal to think. Acker chains the body to the text, O to Artaud and S/M to thought. Acker's stealing thus brings the inaccuracies and absences to thought, the

body that it has feared and the potential incapacity that it has ignored. Is O the possibility for a thinking that is 'neither given by innateness nor presupposed by reminiscence but engendered in its genitality' as Deleuze desires? Beginning with O means beginning from nothing, from a genital plane of immanence that disables the reminiscence at the basis of the image of thought from Socrates to Descartes.

Does this mean that we can consider Acker's fiction as an alternative configuration of idiocy, one that may be more active than the idiocies Deleuze and Guattari proffer? Considering Acker's writing in terms of idiocy may be perceived as provocative, not in the least because many feminist critics have pointed to Acker's writing as offering an important contribution to the possibility of thinking female subjectivity. As the many feminist readings of her work suggest, Acker can indeed be said to challenge the mastery of discourse through pastiche and mimicry and in this particular respect, her literary project can be discussed in relation to Luce Irigaray's philosophical one. Like Irigaray, she follows the critical approach(es) evinced both in postcolonial and feminist quarters that see mimesis as introducing a powerful disruptive force into the dominant discourse that it mimics. However, if this strategy opens for 'another articulation' as Brennan suggests, then this is an articulation that does not playfully repeat a masculine framework of thought but that violates it with its repetition. Acker constructs her characters through statements about the impossibility of identity, about moving so fast you become 'a perfect image: closed', about not being a name but a movement (Acker 1982: 44, 49 and 63 respectively), and many others that clearly echo the terminology and thought of what in her contemporary America was called poststructuralism. By tying philosophy and its presumptions regarding thinking closely to her characters while simultaneously subverting its morals, Acker creates a space that resists any transcendent logic that could determine the nature of thinking. Unlike Irigaray's repetition that works to bring out the feminine potential in the history of metaphysics, Acker's repetition, as Naomi Jacobs suggests, 'is original only in its omissions and inaccuracies, the absences surrounding its inclusions, the forgetfulness around its remembering' (Jacobs 1989: 53). In this sense, Acker's literary production invests Irigarayan mimicry with the problem of thinking, not just beyond a phallogocentric frame of thought, but thinking in itself.

It seems clear, then, that if thinking in Acker's work is idiotic, it is not so in the philosophical sense described in *Difference and Repetition*. Both her characters and the text itself lack the common sense that allows presuppositions regarding the nature of thinking. In other words,

she denies the self-evidence of thinking and knowing. In this sense, it coincides quite clearly with the struggle against the Image of thought that Deleuze calls for in *Difference and Repetition*, 'even at the cost of the greatest deconstructions and the greatest demoralizations' (Deleuze 2004b: 166). Acker's fiction renounces representation and the common sense that upholds the morality of the Image. As she writes in *Bodies of Work* 'The problem with expression is that it is too narrow a basis for writing, for it is pinned to knowledge, knowledge which is mainly rational. I trust neither my ability to know nor what I think I know' (Acker 1997: viii). As such, Acker has the courage of 'modestly denying what everybody is supposed to recognize' and at first glance her work would thereby seem to correspond to the other version of the idiot that Deleuze proposes, that is the Russian idiot (Deleuze 1004b: 165).

As I have suggested, however, the conceptual persona of the Russian idiot in *What is Philosophy?* is compromised by an unacknowledged, or at least untheorised, nostalgia in Artaud. Carla Harryman writes that in Artaud, Acker finds a mirror, a reflection of her own project for the unsettling of the Cartesian reign of unsullied, unbodied thought (Harryman 2004: 164). I would suggest, however, that while Acker certainly finds an ally in Artaud, she takes his ball and runs with it. Her destruction of thought is a way of giving up the project of authenticity altogether and affirming the non-originality of thought itself. The inability to think in Acker thus comes to have less to do with the possibility of thinking than with the inability to locate this thinking in a coherent 'I'. As a complex challenge to Descartes' proof for his own being through thinking, Acker lets O in *Pussy, King of the Pirates* state: 'I thought, where I am in this world which is no world, there's nobody' (Acker 1996: 57). There is no world, there is nobody in the world and thought hangs loose, unable to provide the reassuring 'therefore' that would allow thought to reconfirm the existence of 'I'. At stake in Acker's fiction is the occasion of thought itself, the being of thought without an I.

It seems, then, that Acker's writing of idiocy fits neither with the idiot as the figure of common sense, nor with the idiot as he who questions this capacity. It neither naturalises the capacity for thought nor mourns its loss. And yet, her writing repeatedly rejects the possibility of a complete circle of self-reflexivity that would allow her characters as well as her texts themselves to become capable of coherent thinking.

Acker simply refuses to create her fiction and her characters in accordance with a tradition that does not account for any movement outside the circle of self-reflexive thought. There is no stable relation

between inside and outside, no Cartesian consciousness through which the 'I' could be a reflection on the very fact of thinking. According to such a tradition of philosophy, Acker's characters simply are not thinking. Through the disjunctive mix of philosophy and literature, thinking becomes a doing, an action released from any fixed point. Scraps of philosophical discourse, bits of literary history, historical and fictional characters, fragments of sentences and narrative all stand to evince thought as an event unhampered by innate capacities as well as nostalgia for authenticity. Despite, or maybe because of, the pre-eminence of stolen material in Acker's texts, her writing resists a presupposed image or Idea according to which thinking could proceed.

If it is correct, as Deleuze argues through Nietzsche, that as long as our thinking follows the logic of the reactive forces of metaphysics, we are not thinking (Deleuze 2006: 101), and the possibility of thought demands a refusal of its self-evident nature, then the event of thought can only take place through an idiocy that is neither that at the heart of philosophy nor that of the Russian madman. This article has posited that the presumptions of the philosophical idiot are replaced in Deleuze and Guattari by a Russian idiot that does not quite manage to escape a classical, Greek, ethics of friendship as a means of evaluating and coordinating thought. At the same time, Deleuze cites Maurice Blanchot when he describes the event as 'the abyss of the present, the time without present with which I have no relation, toward which I am unable to project myself' (Deleuze 2004a: 172). In this abyss of the present, the event necessarily precludes the possibility of thinking within the coordinates of a presupposed image. The abyss of the present cannot sustain a friendship of common sense, of common coordinates. What Acker's writing points toward is a sense in which the event of thought must be idiotic in a manner that supersedes both innateness and nostalgia. If Acker's writing does indeed achieve this it does so by presenting what may be called a post-Russian form of idiocy. If it does so, it does so through the unveiling of what has been latent in Deleuze and Guattari all along, that is thinking as the creative and absolutely unrestrained idiocy of the event.

Notes

1. I would like to express my thanks to Dr Charlie Blake for crucial response to an early draft of this paper, to an anonymous reader for crucial response to a later draft and to Professor James Williams for helping me make sure that I got my Images and images right.

2. Descartes, as Deleuze and Guattari show, works with thought according to three personae, Eudoxus – the idiot, Polyander – the technician, and Epistemon – the public expert (*What is Philosophy?*, 2003: 221).
3. Nicholas de Cusa's wrote on the figure of the idiot in the fifteenth century and Deleuze and Guattari point toward him as the first to make the idiot into a conceptual persona (*What is Philosophy?*, 2003: 62).
4. 'The conceptual persona', Deleuze and Guattari write, 'is the becoming or the subject of philosophy, on a par with the philosopher, so that Nicholas of Cusa, or even Descartes, should have signed themselves "the idiot", just as Nietzsche signed himself "the Antichrist" or "Dionysus crucified" ' (Deleuze and Guattari 2003: 64).
5. Cited in Hayman (1977: 85).
6. This nostalgia and recognition of his lost capacity for thought also differentiates this Russian idiot from yet another idiot that appears in Deleuze's essay 'Plato and the Simulacrum'. This idiot, as Lambert notes, is more likely to be found in Shakespeare than in Dostoevsky and is characterised less by the naive innocence of the common man than by a 'will to stupidity' or even 'malicious cunning' that allows him to ignore his effect on the world (2002: 5).
7. The notion of friendship has been extensively theorised by philosophers from Aristotle to Derrida, the contemporary interest peaking, arguably, with the seminars called 'Politics of Friendship' in 1988–89 in France. My aim here, however, is not to make a (belated) contribution to these debates but rather to use the notion of friendship as a stepping stone toward a discussion of the ethics that qualify the event of thought in Artaud and Acker.
8. Ronell, incidentally, has spent quite a bit of time theorising the notion of stupidity. Her book *Stupidity* was published in 2002. She also writes about stupidity in relation to Acker in the essay 'Kathy goes to hell: on the irresolvable stupidity of Acker's death'.
9. Obviously, the prefix 'con' has its etymological base in 'com', that is 'with', an interesting point in itself in relation to Acker's strategy of incorporating others' work and the implications of such strategy on how we think about friendship.
10. For this more personal-philosophical aspect of Deleuze and friendship, see, for example, Charles Stivale's work on these relations including *Gilles Deleuze's ABC: The Folds of Friendship* (2007) and 'The folds of friendship: Derrida-Deleuze-Foucault' (2000).
11. This exchange between Artaud and O also appears in a slightly modified version as the essay 'The end of the world of white men' (Acker 1995).
12. Acker presents O as a prostitute – in Réage's novel she is not.

Violently Oscillating: Science, Repetition and Affective Transmutation in Fassbinder's *Berlin Alexanderplatz*

Elena del Río

Abstract

This essay looks at Fassbinder's *Berlin Alexanderplatz* to trace the film's transformation of a mechanistic scientific discourse into affective indeterminacy. Through patterns of repetition of a key event, the film considers its protagonist as a complex web of constantly shifting forces – a network of biological, social, political and semiotic flows coalescing in a body that exists in a state of perpetual oscillation between force and mutilation, ecstasy and pain. The role of physics and other materialist discourses in the film is thus not to fixate subjectivity, but rather to provide a passage into its affective transformations and the intense desubjectification that results.

Keywords: Fassbinder, Berlin Alexanderplatz, Deleuze and Guattari, science, repetition, affect

> Franz Biberkopf bends, and at last, like an element struck by certain rays, is transmuted into another element. (Alfred Döblin, *Berlin Alexanderplatz*)

Fassbinder's cinema is eminently affective in its zealous attempt to document the processes of transformation that bodies undergo as they pass from one state to another.[1] There is no denying that, to some extent, these affective transformations are attached to a particular human subjectivity. But, as *Berlin Alexanderplatz* (1980) quite eloquently shows, Fassbinder's films tend to surpass the level of personal consciousness or subjective intentionality, instead reconfiguring the body's powers of affection as self-determining material flows and processes. By taking full advantage of the capacities of cinema to visualise the virtual plane where affective transformations take place, *Alexanderplatz* intensifies the desubjectifying process to which

Alfred Döblin's novel already submits its protagonist Franz Biberkopf. The film positions its central character in the midst of a vortex of planes of composition and assemblages of enunciation that go from the imperceptible microlevel of physical, biological existence to the more readily perceptible levels of Weimar economics, politics and culture.

One may look at the city of Berlin in the film and at the representative of its human skin, Franz Biberkopf (Günter Lamprecht), as instances of a chaosmic matter that is governed in equal parts by chaos and order, chance and determination. *Alexanderplatz* intervenes into this chaosmic matter by paradoxically 'mak[ing] a machine that triumphs over [its own mechanistic organization (*sic*)]' (Lambert and Flaxman 2005: 118). The film functions as a performative machine that passes through mechanistic and deterministic rules (of narrative, of science, of psychology and ideology) in order to arrive at a sense of affective interiority beyond subjectivity. Rather than shunning mechanistic determination in the name of the higher human faculties of free will or endurance, *Alexanderplatz* makes its own the very scientific discourse that might potentially reduce the human event to a series of external, homogeneous and deterministic acts. But, in adopting a scientific discourse in some of its pivotal moments, I want to argue, *Alexanderplatz* makes a strategic use of science. The role of physics and other materialist discourses in the film is thus not to fixate or determine the subjectivity of its protagonist, Franz Biberkopf, but rather to provide a threshold or passage into his affective transformations and into the intense desubjectification resulting therein.

Against all logic, references to science in this film work in the direction of affective shock and not in the direction of instrumental reason. Perhaps because science is generally thought of as an epistemological domain of functions far removed from affections and sensations, its unaccountable presence during peak emotional moments generates the widest arc of affective resonance. In other words, the scientific will to exclude emotion paradoxically feeds into the irruptive and erratic power of emotion itself. Thus, despite the film's recurrent references to scientific laws and despite its involvement of a man's history with the idea of physical, accidental forces, *Alexanderplatz* considers these laws and forces as carriers of awe-inspiring mystery, and not as signs of crude, legible or fully determining causality. My interest in this film is therefore circumscribed to the unusual strategies it deploys as it transforms a quantifying scientific discourse (and the deterministic discourse of its narrative) into affective quality. Borrowing Deleuze and Guattari's terminology, I would say that *Alexanderplatz* transforms legal, state

science into a nomad or intensive science that follows the flows of matter and accommodates notions of relationality, affect, creativity and virtuality, thus displacing a deterministic model for one ruled by affective indeterminacy.

From the materialist perspective I am taking, Franz Biberkopf embodies a complex multiplicity of systems of intensities – what John Marks has described as a 'temporary coagulation in the flow of biomass, genes and … units of culture … mov[ing] through time' (Marks 2006: 13). This temporal, and temporary, confluence of biological, social, political and semiotic flows that is Franz presents itself to us as a forceful, imposing body, but also as a body that is used up, mutilated, battered and punished by the very forces that coalesce in his existence. Like all complex material systems, Franz displays both a long-standing behavioural pattern and a reserve of unpredictable potential. His strong tendency to act violently against the women he loves functions as an attractor and predictor of future behaviour, a force so firmly established that it guides a process toward an outcome even prior to its actualisation (DeLanda 2005: 83). Thus we see Franz's accidental murder of his lover Ida (Barbara Valentin) re-enacted six times throughout the film, never letting go of Franz in a definitive way.

James Williams' remarks on the ways in which repetition is invested with value are strongly evocative of the logic *Alexanderplatz* follows in choosing the event of Ida's killing as a privileged attractor in Franz's history:

> Seen as brute material processes, chains of repetitions are neutral with respect to value … [But] when events are selected, value impinges to introduce hierarchies … For Deleuze, [this value] is itself *a selection through sensations and these depend on past associations of ideas and sensations*. There is therefore a virtual, immaterial, trace of selections that runs through all the virtual past and this trace introduces value and selection into actual processes. *There is a virtual history of value that allows for determinations in the actual … A continuous relation … is presupposed by all actual events*. (Williams 2006: 110, emphasis added)

As in the process described by Williams, *Alexanderplatz* effects a hierarchical distribution of affective value across the series of events that constitute Franz's history, and such process of selection and distribution entails a certain direction or determination in that history. Furthermore, the notion of a 'virtual, immaterial, trace of selections' immediately displaces any hint of human intentionality or agency, suggesting instead that the process of selection of events results from the self-organising

tendencies of matter itself (in this case, the film as a self-regulated material assemblage of concepts, percepts and affects). As I will show in the following discussion, *Alexanderplatz* selects the event of Ida's murder as that which is capable of yielding the most prolific and productive connections with any other subsequent event. The film lays out Franz Biberkopf's history as a series of actual presents that can only be synthesised if seen in a continuous relation with the pure virtual past of Franz's killing of Ida.

But at the same time, the deterministic power of this repetitive event needs to be qualified. Given that the film starts with Franz leaving Tegel prison after serving time for his murder of Ida, this crucial event is never visualised in the present tense of its actualisation. Instead, being situated from the outset in the realm of the virtual, the event of the murder maintains its openness to quasi unlimited repetition and transformation in the mode of an eternal return. Thus, despite the event's function as a crucial attractor and predictor of Franz's future behaviour, its virtual status confers on it an outstanding capacity to grow connective ties with other events, thereby enabling its ongoing regeneration. As an event fundamentally unhinged from a stable ground, Ida's murder attests to Dorothea Olkowski's idea that attractors can be 'unstable … and allow for some unpredictability even while deterministically following established rules' (Olkowski 2007: 210). The film extends the permanent openness and oscillation of this event to Franz Biberkopf as well, who is never reduced to either a phallic dominant subject or a victim, or even to both of these positions at once. As I hope to demonstrate, even when dealing with repeated content, *Alexanderplatz* performs that content in a transversal fashion that never definitively circumscribes Franz within extrinsic social, ideological or moral coordinates (Genosko 2002: 202). Rather, in the course of the thirteen episodes and epilogue of *Alexanderplatz*, Franz comes to instantiate the 'essential complexity of elementary phenomena' (Bachelard 1985: 103). Like these phenomena, Franz remains absolutely exposed to the Open, in a state of constant oscillation and affection, having implicitly decided to live unshielded and unmoored.

I. The Encounter with Minna, or Pass-Words into the Garden of Eden

Franz's sexual encounter with Minna (Karin Baal), shortly after his release from Tegel prison, is powerfully connected to his killing of Ida. The moment is temporally uncertain, as it works as both a prelude and a

sequel to Franz's murder of Ida – a prelude to the film's first visualisation of the event, and a sequel to its invisible actualisation in the past. As I implied a moment ago, this scrambling of narrative linearity no doubt reinforces the priority the film gives to continuous affective virtuality over discrete linear temporalities. Franz's visit to Minna prefigures, and affectively motivates, our first visual access to Ida's murder. The scene opens and closes, hence is literally framed, with a portrait of Ida that Franz keeps in his room. Minna bears an uncanny resemblance to her sister Ida, and, as Franz seduces and rapes her in this scene, she very much stands for a kind of resurrected Ida who alone can restore Franz to his former sexual potency after years of guilt-induced impotence. Fassbinder shows Franz in this scene as inhabiting two divergent planes simultaneously: the symbolic/semiotic system of phallic, majoritarian subjectivity dependent upon the order-words of militarism, nationalism and dominance; and the molecular system of life at an elemental material level that dissolves the boundaries of subjective intentionality.

Soon after entering Minna's apartment, Franz's eyes lock into a realist painting of a military officer kneeling in front of the Kaiser and receiving a sword from him. Franz is literally positioned between the dark, emphatically defined contours of the painting's military bodies and ideals, and the softly illuminated, diffused close-ups of Minna anticipating the dissemination of identities that is to follow. Inspired by his vision of the painting, Franz launches into a song whose lyrics straightforwardly link sexual potency with military authority. The words 'The Kaiser relinquishes the sword; the Kaiser must return the sword to me' express a sexual ideal rooted in Oedipal principles that waver, all too predictably, between castration and dominance. This reading is reaffirmed by Franz's subsequent sexual assault on Minna. However, the scene simultaneously opens a powerful line of flight, the strength of which does not lie in opposing the order-words of nationalism, militarism or Oedipal sexuality. Rather, Fassbinder deflects what Deleuze calls the death-sentence of the order-word by 'hearing another word beneath it' (Deleuze and Guattari 1987: 110). This more resonant sound, which uncovers Franz's primal relation with the natural flows of life, emerges through a moving alchemy of images and words.

The crucial part of the scene begins with a shot compositionally divided in half along the horizontal axis formed by a fish tank elevated from the floor. In the upper half, we see the fish in the tank, while the lower half frames Franz and Minna's bodies on the floor. While Franz forces himself upon Minna, Fassbinder's voice-over tells a story of an old divorce case concerning a captain and

his wife's infidelity with another captain. This story tangentially pertains to the scene's associations of military authority with masculine sexuality, but its relative indeterminacy marks the first step toward the line of flight that intensifies as the rape proceeds. Defacialised close-ups[2] of Franz expressing infinitesimal variations of sexual ecstasy are punctuated by melancholy, almost religious sounding, violin chords and by Lamprecht's voice-over announcing his exit from prison and his entrance into 'the Garden of Eden, with dazzling fireworks'. In the next shot, the fish are moving in a liquid space with no visible boundaries or frames. The left upper corner of this liquidity is brightly lit as if by the light of the sun. The green of plants, the orange of the fish and the purple of the background reverberate with Franz's declared state of *jouissance*, which Fassbinder's voice-over also expresses: 'No house. No gravity, centrifugal force. Gone, sunk down, extinguished. The red diffraction of solar radiation, the kinetic theory of gases, the transformation of heat into energy, the electrical oscillations, induction phenomena, the density of metals, of fluids, of non-metallic solids'. These words, quoted verbatim from the novel, are perhaps the film's first avowed expression of its commitment to the idea of an impersonal, material consciousness that encompasses, yet surpasses, the Döblin-Fassbinder creative continuum. The metamorphosis the scene has undergone by this point recalls Deleuze and Guattari's words in *A Thousand Plateaus*: 'We witness a transformation of substances and a dissolution of forms, a passage to the limit or flight from contours in favor of fluid forces, flows, air, light, and matter, such that a body or a word does not end at a precise point' (Deleuze and Guattari 1987: 109).

The emotionless and measured tone of Fassbinder's voice, the content of his words and the deframing of the images – all contribute to changing the order-words conspiring to organise the scene into what Deleuze calls 'pass-words', 'words as components of passage' (Deleuze and Guattari 1987: 110), as they transform the stale organisation of majoritarian identity and Oedipal sexuality into creative chaos and moral judgement into affective paralysis and shock. The escape from physical gravity alluded to by the words ushers us into pure celerity without measure or extension – a corporeality so intense that it tips over into incorporeality as it reaches its limit. Legal science mutates into eccentric science by putting gravity in contact with affective speed (Deleuze and Guattari 1987: 373). The fluidity/liquidity that takes over the last moments of the rape scene does not cause the rape to become any less shocking. If anything, the slowing down of time and the literal decrease of gravitational weight in the bodies increase the shock we receive by virtue

of the unlikely performance of rape these elements produce – a surprising conjunction of masculine force and its extreme deformation.[3] Despite Franz's cognitive experience of the event as a joyous repossession of the sword of his masculinity, the film invokes a larger reality – one that subsumes the boundaries of Franz's individual subjectivity within the immanent flows of matter that compose his existence.

II. An Event That is Manifold: Now and Then Franz Kills Ida

Immediately after the close-up of Ida's portrait at the conclusion of Franz's encounter with Minna, we are thrown into the first re-enactment of Franz's murder of Ida. This is the first in a series of repetitions throughout the film, each of which is uniquely matched to a different voice-over text to bring forth in a stretching out of time the manifold singularities of the single event the film identifies as Ida's murder. Accordingly, each time the event is re-enacted, the subjectless consciousness carried over by the voice transects the event with a different plane: of physical laws, of bodily force and labour force, of historical and political events, of Biblical narrative, of bits and pieces of news of the day, and so on. The voice-over thus performs the function of transversality with regard to Franz Biberkopf's story, in the sense that it summons radically heterogeneous domains with the aim of preserving the event's complexity and flexibility. These are not the repetitions of a personal unconscious compulsively drawn to revisit a traumatic event in a static, unproductive fashion. Instead, the multiple repetitions are performed by a cinematic brain that is auto-possessed and auto-affected as a proto-subjectivity of material and living assemblages.

The first re-enactment of the murder is the only one to feature a direct verbal description of the act. While in the image-track we see Franz first quarrelling with Ida and then beating up her body in various positions to the point of death, Fassbinder's voice-over provides a medical dissection of Ida's damaged body parts, and a moment-by-moment account of the forces mobilised by Franz's body and received by Ida's. In the final portion, the voice-over invokes the Newtonian model of classical physics:

> What … happened to the woman's rib cage … has to do with the laws of rigidity and elasticity, impact and resistance. Without a knowledge of these laws, the case cannot be understood. The following formula may be applied: Newton's first law says that a body remains in a state of rest unless acted upon by an external force, open parentheses, which applies to Ida's ribs, close parentheses. Newton's second law says that the change of momentum is

> proportional to the force and is in the same direction, open parentheses, the effective force being Franz, of his arm and fist and the contents thereof, close parentheses.

From a purely scientific standpoint, such a clinical account of the event perfectly fits the model of classical or Newtonian mechanics as described by Arkady Plotnitsky:

> [Classical mechanics] accounts for its objects and their behaviour on the basis of physical concepts, such as 'position' and 'momentum', and measurable quantities corresponding to them. Classical mechanics is thus, ontologically, *realist*... [and] *causal* ... [and] epistemologically, *deterministic* insofar as our knowledge of the state of a classical system at any point ... allows us to know, again ... its state at any other point. (Plotnitsky 2006: 44–5)

As Döblin aptly notes in his novel, 'there is no unknown quantity' (Döblin [1929] 1968: 124) with respect to the physical forces involved in Franz's act and the laws that govern their effects. Döblin's interest in foregrounding the quantitative dimension of the event is expressed in the physics equation he provides, which the film also displays on a starkly white background at the end of Ida's killing. This equation, like the voice-over text itself, epitomises the scientific attempt to describe and predict the behaviour of systems by creating functions capable of actualising the virtual (Deleuze and Guattari 1994: 118).

It is clear that the mechanistic account of Ida's murder infuses a high degree of impersonality into the behavioural dynamics between Franz and Ida. While impersonality is instrumental in avoiding the inertia of psychologising and moralising evaluations of this event, it also comes at the price of stripping the body's gestures, acts and expressions of interiority. In other words, as Olkowski notes with respect to the limits of Newtonian dynamical systems, 'Intentions are converted into the objective movements of the nervous mechanism, sensory experience becomes a quality traceable from nerve endings to nerve centers, as the body is transformed into an object, a machine among machines' (Olkowski 2007: 211). The lack of interiority that Olkowski ascribes to scientific descriptions of dynamical systems is in fact echoed by Thomas Steinfeld's comments on *Alexanderplatz* when he says that '[Franz Biberkopf's] "ego" is always present ... on every page of the novel [and every scene of the film], yet it never forms a consistent interior' (Steinfeld 2007: 57). Given this stripping of subjective interiority, the question *Alexanderplatz* implicitly poses, and, I believe, affirmatively answers, is whether it is possible to preserve interiority while doing away with subjectivity as one adopts mechanistic accounts of human

existence. The impending task then is to examine the means by which the film still manages to produce an overwhelming, at times even stifling, sense of interiority. How does *Alexanderplatz* surpass the model of classical dynamics/physics and its homogeneous, external and deterministic version of events? How does it arrive at its own conceptual and aesthetic version of quantum field theory or chaos theory in order to express film events as heterogeneous, internal and absolutely new? In other words, if consciousness disappears in an individuated human sense, can it perhaps re-emerge in an altered form, that is as a primary form of consciousness that surveys itself and is no longer dependent on an ego-logical subjectivity? (Bains 2002: 112).

As always already cognisant of the outcome of the violence that unfolds before our eyes, the voice-over during the first re-enactment of Ida's murder seems initially to have an anticipatory function, a certain epistemological capacity to survey and determine the course of action. This claim to cognition also appears to be reinforced by the legalistic content of the speech – its emphasis on court records and especially on Newton's physical laws clearly examples of a scientific discourse that is reductive and extensive rather than expressive and intensive. But despite appearances to the contrary, the intervention of science here is not destined to have autonomous power, but to follow the flow of matter. In ways that I will momentarily discuss, the juncture of moving images and words brings together in the closest, hence most affecting, way the deterministic laws of physics and the absolute openness of the situation, that which has always already transpired in the past and its eternal prolongation into the future as a spilling of chaotic creativity.[4]

Although the voice-over describes the action concurrently unfolding in the images, its function is anything but redundant. By providing a painstakingly detailed account of the forces unleashed by Franz's body and applied to Ida's, the voice-over discloses a physical dimension of the event that remains below the threshold of visibility. As I already indicated, the text underscores the invisible materialism of the event by reference to physical laws that remove the action away from ego-logical agency. Instead, these impersonal physical laws recast the event as a matter in flux that works independently of human consciousness and possesses its own self-measuring and self-determining capacities. Döblin's training as a physician must no doubt have played a part in his choice of words here, as in many other instances in the novel/film that make a substantial use of medical discourse. But the transformation of this scientific discourse into affectively inflected materialism, the capacity of these quantifying words to become intense,

is in excess of the model of gravitational forces described by the voice-over alone.

The alchemy of image and word produced by the film injects a qualitative affective leap into the written narrative of Franz Biberkopf. Relative to the novel, the film has at its disposal a greater number of means to devise a structure that 'allow[s] us to grasp change from the inside rather than the outside' (Olkowski 2007: 206). This enhanced capacity of film is an effect of the shift not only from a written text to a visual and multi-sensorial one, but it is also an effect of the shift from written narration to one recurrently delivered by Fassbinder's voice. Images and words enter in a relation of mutual affection and enhancement beyond simple analogy or mimesis. Affective interiority is triggered on multiple levels simultaneously and along their various concatenations and intersections. The spoken word itself consists of two interrelated facets: a material trace or pure physis of sound, and a semiotic/semantic content. In the former instance, Fassbinder's voice-over running commentary is a catalyst for a kind of interiority that we feel and absorb below the threshold of consciousness. On the other hand, the very content of the words in this scene reinforces the material properties of the voice by referring to material processes. The culmination of these series of material assemblages is achieved in their intersection with the image, which truly liberates matter's capacity to set its own 'energetic materiality in movement' (Marks 2006: 5).

The repetitions of Ida's murder plunge us into a temporal hole of affective intensity. Affect emerges from the tension between (the spoken) cold factual details and (the visible/audible) hair-raising violence; but it is also heightened by a twofold mechanism that empties out the image of its narrative content while saturating it with a temporality that is as dense and visible as bodies. This is the temporality that film-maker Tom Tykwer identifies in *Alexanderplatz* when he says that, 'The film ... stretches [the story] ... and spins it out into time, expands it ... to such a degree that interim spaces are torn open in this drawn-out time ... until time itself seems no longer expansible' (Tykwer 2007: 22). Certain cinematic inflections of the image are key to the film's materialisation of time. A few close up shots of Ida during the murder scene, for example, reveal a slowing down and a thickening of time that enhance the ethereal fogginess of the image. At one point in particular, after Franz hits Ida's side with the cream whip, we see a close up of her face, suffused with pain and disbelief, looking up towards Franz. As her mouth opens and blood streams from it, Ida seems to articulate a word or two, but her

gesture is impossibly slowed down and her words remain inaudible. In this hole in time, the focus becomes uncertain, the lighting liquid. The visceral paralysis that takes hold of the image in such moments matches the kind of suspended emotional state that Brian Massumi describes as 'a temporal sink … not exactly passivity, [but a state] filled with … vibratory motion, resonation' (Massumi 2002: 26). In its intensely slow movements, Ida's close-up takes on a peculiar affective speed – the kind of speed in which bodies are caught up when they deviate from their gravitational centre.

When taken all together, as a synthesis of the virtual pasts and the actual presents, the six repetitions of Ida's murder in *Alexanderplatz* insistently manifest the wavering of Franz Biberkopf between dynamism and determinism. That is, although the event as outcome is set and the rules of its narrative scaffolding are given even prior to its first visualisation, the particular movements and interactions of the particles entering into each re-enactment are fully contingent and unpredictable. Each of these repetitive instances thus animates a different affective choreography, depending on the myriad sensations and affections that emerge in the interface between the almost identical images of the murder and the consistently new words spoken by Fassbinder's voice. Although we may come to know the sequence of the movements and gestures that transpire between Franz and Ida rather exhaustively and intimately, we can never predict the kind of world each new intersecting network will be able to fashion.

III. The Whole Man, the Amputee and the Slaughtered Animal

In order to tackle the question of 'what Franz Biberkopf's body can do', *Alexanderplatz* experiments with the possibility of extending Franz's body into a virtual series of bodily states. The third re-enactment of Ida's murder in the film's eighth episode brings forth the unstable conjugation of power and vulnerability that is Franz's body, in fact weaving together this most productive of events in Franz's history with the two contiguous figures of physicality in pain that are central to the film: the crippled human and the slaughtered animal. In this instance, the transversal qualities of the voice-over further widen the event of Ida's murder by spinning a series of discontinuous, yet uninterrupted, narratives revolving around the idea of bodily force and its impairment. Physical amputation or diminution thus figures prominently here, first in a story that features Franz himself, as an amputee, observing a horse that has fallen into a pit, where it trembles, whinnies and thrashes furiously

with its legs. Fassbinder's voice-over informs us that, as 'Franz jumps down into the pit … and helps push the horse forward, everyone is amazed at what Franz can do with one arm'.[5] Multiple lines of resonance fan out in several directions at once. First, the words in the story resonate against the violent visual interaction of Franz and Ida. The horse in the pit that trembles, whinnies and thrashes furiously with its legs is both Franz, even as he thrashes furiously against Ida, and Ida herself as she is subdued and killed by Franz. Second, in a temporal tour de force, the resonance between words and images brings all temporalities out of linearity and into an affective knot of simultaneity, for the Franz-become-horse in the story is already an amputee, while the images of the murder show Franz as physically whole. Logically, we know that Franz's amputation will be actualised long after Ida's death, but, following the impersonal process of selection described earlier, the film chooses virtual resonance over actual, chronological linearity, between different states of the body in time, as well as between the concepts of ability and inability, physical force and physical impairment.

As expressed in the statement 'everyone is amazed at what Franz can do with one arm', force and disability are conjugated here as (virtual) coexistent compossibilities, rather than (actual) oppositional states of affairs. According to Williams, the field of the virtual, which produces the new, can 'change only as continuous, that is, in terms of relations of distinctness and obscurity, rather than in terms of relations of opposition and identity' (Williams 2006: 112). In the domain of the virtual, being a whole man, an amputee, and very importantly in *Alexanderplatz*, an animal in pain or a slaughtered animal, are not three successive moments in chronological time, but three continuous states of the body/soul,[6] three modalities of affective intensity in a scale from the least intense exteriority/optimal limit (Franz as a whole man) to the most intense interiority/pessimal threshold (Franz as a slaughtered animal). Thus the film is free to conjugate these various virtual powers irrespective of the actual state of affairs Franz may be involved in at any single point in time, spinning multiple configurations of actuality and virtuality (For example, in this instance in episode eight, Franz is already an amputee while remembering killing Ida as a whole man, while a voice-over describes him simultaneously as an amputee and a becoming-horse-in-pain; yet, in another instance in episode six, Franz is a whole man who dreams he is a horse pulling a vegetable cart in the cold of the night; the horse/Franz then dies and transmutes into a bird only to be bitten by a snake he identifies with Reinhold [Gottfried John].)

As part of its ongoing emphasis on Franz Biberkopf's participation in a series of physical/material processes, *Alexanderplatz* displays a gallery of becomings-animal that further intensify the desubjectification of its protagonist. The transversal quality of molecularity involved in becoming removes the human body from its 'natural' (in the sense of 'programmed') functions in order to participate in an 'unnatural' (in the sense of 'non-anthropomorphic' or 'transversal') nuptial or relation. Thus, throughout *Alexanderplatz*, the human body and the animal body intersect each other on a continuous plane of physicality and affection. In the story Fassbinder reads over the third repetition of Ida's murder, Franz is not just an observer of the horse's pain. Rather, the proximity between Franz and the horse constitutes a machinic assemblage of bodies that does not withstand anthropomorphic hierarchies or territories. As in Deleuze's example of Hofmannsthal's becoming-rat,[7] it is not a question of '*a feeling of pity* … still less an identification' between human and animal. Rather, it is a question of Franz and the horse being traversed by a single composition of speeds and affects, so that 'Being expresses them both in a single meaning in a language that is no longer that of words, in a matter that is no longer that of forms, in an affectability that is no longer that of subjects' (Deleuze and Guattari 1987: 258).

An illuminating instance of machinic conflations of bodies as exchanges of affective forces beyond linear chronology can be found in episode thirteen when Franz, upon hearing the news of Reinhold's killing of his girlfriend Mieze (Barbara Sukowa) in the woods of Freienwalde, takes the canary Mieze had bought for him out of its cage and crushes it in his strong hand. Here, Franz, the animal brought again and again to the abattoir by Reinhold, becomes the agent of death/Grim Reaper for the helpless bird. The bird is Mieze,[8] killed once more by Franz/Reinhold. But, in resonance with Franz's dream in episode six just mentioned, the bird is also Franz, seduced, suffocated and bitten by the snake Reinhold.

The complex affective circulation between Franz and Reinhold throughout *Alexanderplatz* deserves more attention than I can devote to it here. Suffice it to say that Franz is the vivid example of the 'becoming-animal essential to masochism' (Deleuze and Guattari 1987: 155) – his masochistic position with respect to Reinhold inseparable from his becoming-amputee and his becoming-slaughtered-animal. As is made abundantly clear by Franz's irrational yielding to the increasingly irrational demands placed on him by Reinhold, Franz is 'kept in continual expectancy of [Reinhold's] actions and orders, and … little by little all opposition is replaced by a fusion of [Franz's] person

with [his master's]' (Deleuze and Guattari 1987: 156). As I implied a moment ago, as Franz strangles the canary/Mieze a second time, he finally embraces the continuous, undifferentiated stream of violence that traverses both his and Reinhold's actions, in a sense participating at that moment in the same affects and speeds that compose Reinhold (an idea exactly captured in the title of this section as outlined in the Criterion DVD edition: 'Me and Reinhold ... and murder').

The story of Franz's becoming-horse-in-pain resonates with a recurrent line of thought in Fassbinder's work: man becoming-animal-at-the-slaughterhouse, an image at the heart of his previous film *In A Year of Thirteen Moons* (1978).[9] *Alexanderplatz* reaffirms what was already clear in *Thirteen Moons*, namely that, far more important than a visual analogy between the dismembered bodies of cattle and the human body, is the way in which the latter is endowed with the relations of speed and slowness of the slaughtered animal. If in *Thirteen Moons*, the voice of Erwin-Elvira (Volker Spengler) becomes a major transducer of the affects and speeds of the body-in-pain, in *Alexanderplatz*, this function is taken up primarily by Fassbinder's own voice, and even, in one particular instance, by the physical presence of his body on screen. The three instances in *Alexanderplatz* that most poignantly draw on the image of the slaughtered animal are all indicative of Fassbinder's own desire to involve himself in Franz's 'unnatural participation' in other bodies-in-pain, hence creating an interiority that no longer belongs to any individuated body or subject. Thus, in episode four, we are shown a series of documentary stills of cattle at an abattoir while Fassbinder in great detail recounts the drama of a bull facing his death at the hand of the drover. When Ida's killing is re-enacted in episode nine, Fassbinder's voice tells the Biblical story of Abraham, asked by God to prove his faith by showing his willingness to slaughter his own son Isaac. The repetition of the image of the slaughtered animal in the epilogue matches the more hallucinatory quality of this latter part of the film: here, Fassbinder's voice is replaced by his own visible body standing by the angels Sarug and Terah, all three of them witnesses to the final slaughtering of Franz and Mieze's bodies in the human abattoir. In this instance, the explanatory function of the voice is displaced by the odd juxtaposition of the angels' matter-of-fact description of the event ('swing, swing, hack, hack') with the music of Wagner's *Tristan and Iseult* and Mieze/Sukowa's frightful uninterrupted screaming. With all such material/physical interventions in his film, Fassbinder largely departs from the classical authorial position; that is, one hears in his voice, or even senses in his physical presence, a

desire to become imperceptible by dissolving his subjectivity within the continuous affective flow of bodies in the film.

As Fassbinder's voice explains over the slaughterhouse stills in episode four, 'Stockyard, slaughterhouse, and market form an indivisible economic unit'. The slaughterhouse image thus weaves together the most intensive/molecular affective series and the most extensive/molar discursive transformation of the body. As Thomas Elsaesser has pointed out, throughout *Alexanderplatz*, the idea of physical force as pure matter is contiguous with the idea of labour force as quantifiable/commodifiable physicality within a system of capitalist economic exchange (Elsaesser 1996: 235). During the third re-enactment of Ida's murder discussed above, the voice-over commentary places a great deal of weight on the issue of how a disabled man's alienated relation to the labour market drives him to make his living by engaging in morally dubious activities. From the story of the paralysed man who trundles his cart forward with his arms through the city selling postcards with sensationalist tales, to the dialogue that first questions and then sanctions the idea of a crippled man working as his wife's pimp, this whole string of narratives reflects Franz's situation for most of the film as a cripple and a pimp. Thus Franz is situated within a discursive assemblage that pursues its inquiry into the notion of force by weaving together 'semiotic, material, and social flows simultaneously' (Deleuze and Guattari 1987: 23).

The entire sequence of narratives spoken by the voice-over in this scene shows a powerful link between physics and sociology – the assemblage of physical forces a body crystallises and mobilises, and the ways in which those forces are managed or accounted for by the labour structures and institutions of a given capitalist economy/society, whether they be measured and put to use or disregarded as useless. Even if a bit decontextualised in historical terms, Deleuze and Guattari's observation that 'the wage regime [of the nineteenth century] had as its correlate a mechanics of force' (Deleuze and Guattari 1987: 490) is rather relevant to the interacting dynamics of physical force and socio-economic force played out in *Alexanderplatz*. An enormous unevenness thus exists between Franz's formidable physical force and the unwillingness, or rather inability, of the labour market to set this force in motion as anything but a commodified quantity. It is not that the socio-economic conditions of Weimar Germany strip Franz of his force, but rather that, to some extent, they force him to channel that force into extremely violent expressions. In fact, the film never looks upon Franz as a victim altogether deprived of force, but rather as a network of constantly shifting forces. That is why this scene in particular

does not spin force and disability as two oppositional values, but as differing degrees/intensities in a single conceptual web.[10]

IV. From Heaven to Hell in the Blink of an Eye: The Diabolical Interval

In *Alexanderplatz*, the assemblage Franz-Mieze may be seen as both an *original production* of new possibilities and a *dead-end production* of the fear of repetition of the assemblage Franz-Ida. But, I would argue that, in staging the alliance between Franz and Mieze, the film's meticulous affective choreography inflicts a final blow on the notion of repetition as predictable determination. For, while we are led to believe, not without reason, that the event of Ida's murder has a powerful enough hold on Franz's history so as to deterministically taint and destroy his relationship with Mieze, the manner in which Franz and Mieze interact at the level of each singular encounter (and even the manner in which their alliance eventually decomposes) is ultimately more forcefully indebted to the idea that 'the structure and functioning of complex systems remains somewhat unknowable and unpredictable' (Marks 2006: 10).

Tykwer has perceptively pointed out the disconcerting effects of the twists and turns of mood in *Alexanderplatz*, 'the accidentalness with which vehement rage can suddenly turn into bloody madness' (Tykwer 2007: 28). The scenes between Franz and Mieze redouble the accidental undertones of human behaviour already at work in the scene of Ida's murder, as they widen the gulf that separates the states the body traverses, instantly transforming the tenderest, most innocent expressions of love into the cruellest expressions of wrath and hysteria. But, underneath this impression of accidental changes of mood lies a whole method that Fassbinder seems to adopt for tracing and documenting human behaviour – a method that is radically at odds with the realist, psychologising tendencies of classical narrative. For while classical realist cinema is only attentive to the visible level of actual expressions and actions with which it identifies the whole of the real, *Alexanderplatz* weaves a far more complex layering of realities. Leaving aside the layers of the possible and the potential,[11] which would take us away from the specifics of a scene, let us just consider the layers of the actual and the virtual and their intricate intertwining as a particular scene unfolds. To this end, I will briefly examine one of the most emotionally nuanced of exchanges between Franz and Mieze. This scene in episode ten takes place in their apartment on the morning after

Franz has come home deliriously drunk and Mieze has made her pact with Eva (Hanna Schygulla) regarding her having a child by Franz. In this scene alone, Franz and Mieze undergo three consecutive series of tense quarrels and tender reconciliations, thus expressing a high degree of affective oscillation and volatility.

The scene begins with Mieze standing by the window a few feet apart from Franz who sits at the table. Obstinately silent at first, Mieze takes her time to voice her displeasure with the kind of men Franz befriends and the left-wing political meetings he attends. Upon Mieze's demand of a promise of change, Franz bangs his hand on the table with a violent blow, but then he gets up to feed the canary and, in a much lighter, kinder tone, informs Mieze of his utter indifference to politics. Mieze is overjoyed, approaches Franz and hugs him, but a few moments later, she resumes her place by the window, a move which Franz rightly perceives as indicative of further worries on her mind. With the two of them in their initial positions again, Mieze declares she has met a guy who wants something more permanent, 'like Eva's wealthy gentleman friend'. Gnawed by jealousy and self-doubt, Franz smashes a saucer on the floor with all the strength of his one arm. Mieze then engages in one of her hysterical demonstrations of singular devotion to Franz, kneeling on the floor by him while denying his accusations. Franz believes her and they kiss. Mieze then discloses the core issue of her concern, namely that Eva, in response to Mieze's pleas, has agreed to have a child by Franz. At this point, the height of Mieze's happiness, Franz, thinking that Mieze wants to get rid of him, collapses on his knees over a chair and begins to sob and scream, while he delivers a chilling monologue that features himself in the place of the animal led to slaughter. Mieze pleads with him to stop and, with her head down, she covers both her ears while he continues to scream at her. In an unexpectedly composed tone of voice, Mieze finally makes herself heard, puts Franz's fears of being abandoned to rest and declares her love for him once more. Mieze looks at Franz with her radiant, child-like smile, and Franz's remaining resistance melts away. They kiss again and she rushes out.

In realist cinema, emotional expression does not take into account the continuous trail of affective transformations in the virtual, hence emotions seem to appear out of, and to disappear back into, nothingness. To avoid the threat of incoherence, extreme emotional changes within a classical scene need to be exhaustively accounted for and sewn back together into linear coherence. Usually, the emotional rift is repaired through causality – by adding an explanation through dialogue or by pointing out a narrative connection through editing or camera work.

By contrast, Fassbinder's cinema shows the pure continuity of states in the virtual, which obviates the need for rationalisations of extreme changes from one state to another. And, even when, as in the scene above, (Franz's) questions are rather logically followed by (Mieze's) answers, the affective accent falls entirely elsewhere. Here, bodies and their emotional expressions are caught up in what Deleuze and Guattari call a state of 'continuous variation' (Deleuze and Guattari 1987: 108):

> The smallest interval is always diabolical: the master of metamorphoses is opposed to the invariant hieratic king. It is as though an intense matter or a continuum of variation were freed. The idea of the smallest interval does not apply to figures of the same nature; it implies at least a curve and a straight line, a circle and a tangent. (Deleuze and Guattari 1987: 109)

Thus, as the scene described shows, the greater the distance between two contiguous emotional states, the smaller the interval, hence the more diabolical the intensity of the passage from one state to the other.

Under the kind of magnified lens that Fassbinder applies to the behaviour of bodies, the most minute of inflections in gesture or movement becomes perceptible right at the interval, the point of passage from the virtual to the actual. In other words, the barely perceptible moment-to-moment changes in bodily posture (from standing or sitting to kneeling), gesture (from small to large or hysterical) or voice (from neutral speech to loud laughter, yelling, sobbing, and so on) compose a continuous topology that allows us to visualise the very movement of the actual's appearing – the passage from virtual affects to actual gestures and actions. This intricate choreography of the visible whereby the actual emerges only to recede back again into inactuality/virtuality (Massumi 2002: 136) (not nothingness) endows the human event with a complexity that can never be grasped merely by treating bodies as external, visible signs of fully disclosed and rationalised behaviour. As Marks puts it, 'the identity of an actualized [*sic*] object or event can never fully account for that object or event' (Marks 2006: 3). Such extension of the actual into the virtual acts, at the level of the film's perceptions, sensations and affections, as a powerful mechanism for generating a sense of non-subjective interiority.

If, on a visible, actual plane, the shifts of mood between Franz and Mieze appear disconcerting, random or unjustified, on the level of the virtual they are part of a 'continuous topological transformation' (Massumi 2002: 184) that always already contains the most disparate of emotional states. The film intervenes into this virtual plane by selecting and choreographing these various affects, acting in conjunction with the

dynamic reserve of surprise that is nature itself (Massumi 2002: 236) with the aim of producing the most surprising, least deterministic of configurations and trajectories. It is thus not a matter of considering the whole process determined in advance, insofar as the affects are already real on a virtual plane, but a matter of *which affects* will be actualised and of *what compositions with other affects* they will enter into. Will Franz at a particular point react to Mieze with violence or with kindness? Will the past assemblage Franz-Ida be actualised again, or will something else emerge instead?

The film does take account of the possibility of repetition with the phantasmagoric insertion of a travelling shot of two decapitated mannequins at the start of a scene in episode ten when Mieze decides to get drunk with Franz. As the hand-held camera travels over the mannequins, also tracing the movement of a spider that crawls over one of the bodies from foot to head, Fassbinder's voice reads a text that transposes Ida's murder onto Mieze: 'In his thoughts he was holding a small wooden instrument, and he struck Mieze a blow with it from above, hit her in the chest once, twice, and smashed her ribs. Hospital, cemetery, Tegel Prison'. But, as we see in the film, rather than simply repeating the Franz-Ida assemblage, the end of the Franz-Mieze alliance exponentially enlarges the scope of the former event with its far more complex, devastating resolution. Thus, relative to Franz's murder of Ida, the murder of Mieze at the hands of Reinhold intensifies Franz's individuated violence with its extension into the assemblage Franz-Reinhold (which is ultimately at stake in actualising Mieze's death);[12] as well, the second murder in the film widens the affective resonance of the Franz-Ida murder event with the far more disparate affective dispositions between cold, lethal Reinhold and trustful, loving Mieze.

As we clearly see in the emotionally overwrought scene discussed above, Franz and Mieze each bring a particular set of affects into their alliance: in the case of Franz, a culturally inspired fear of a loss of masculinity combined with a paradoxical masochistic willingness to submit to Reinhold's humiliation and abuse; in the case of Mieze, a child-like trust incapable of discriminating between serpents and doves. As Deleuze and Guattari remark in the above quoted passage, 'the idea of the smallest interval [and its diabolical intensity] does not apply to figures of the same nature' (Deleuze and Guattari 1987: 109) but to those that relate through a profound disparity. Indeed, such is the case with the volatile affective alchemy produced by the Franz-Mieze assemblage. For, if Franz and Mieze are on the one hand joined by a fundamental belief in the goodness of the human other, they are also situated at irreconcilable

extremes, particularly with respect to the cultural codes and demands of their gender positionings. Thus all exchanges between Franz and Mieze in the film show that:

> Every union is undone by its own discordant productions; for every connection, a disjunctive synthesis emerges to separate each event both from its sense and from other events, destroying codes, pushing ahead of itself the detritus of life, actualizing [sic] it as pure value, the value of savagery, tyranny or capital. (Olkowski 2006: 171)

Olkowski pairs off this force of separation and discordance with nature's intrinsically violent task 'to disconnect what has been connected, to keep separate, to tear apart what otherwise might be related' (Olkowski 2006: 169). *Alexanderplatz* is overtly cognisant of such a destructive force, as apparent from the film's continuous references to death as 'a Reaper with the power of almighty God'. The words Fassbinder speaks in a voice-over during the last moments leading to Reinhold's murder of Mieze are in fact strongly evocative of this force: 'Let no one come to stop anything here, or there will be a rupture such as no hurricane or rockfall can hinder. It is a cannonball, a mine flying through the air, smashing through anything in its path, thrusting it aside. On it goes, farther and farther'. From this standpoint, man's violent acts are but a residual effect of 'the divine power to break apart anything that has been connected' (Olkowski 2006: 169). Looking at Franz Biberkopf as a residuum of nature's violent axiomatic certainly allows us to avoid a moralistic judgement of Franz's acts and to reconsider these acts in a more dispassionate light. But I wish to go further and suggest that, while the film shows a lucid awareness that the violent axiomatic can neither be mitigated nor redeemed, it is at the same time capable of inscribing another force that runs parallel to, and can be felt beneath, such destructive imperative. This, I would argue, Fassbinder accomplishes in his film by creating an open-ended, perpetually moving machine, in the words of Ronald Bogue, 'an image … intense enough that it *lives its own life*' (Bogue 2006: 218).

Alexanderplatz makes available to our perception a common matter that synthesises all intensities (Deleuze and Guattari 1987: 109) – from the biological and physicochemical to the aesthetic, linguistic, semiotic and political. To escape the 'death sentence' that might have ensued had the film offered a psychological simplification or a moral judgement of Franz, Fassbinder submits all systems that compose Franz Biberkopf's existence to a continuous affective synthesiser. It is by no means a question of lining the gestures of a phallic, sadistic masculinity with

an aesthetic exuberance that would obliterate the ethical implications of its violent acts. Rather, it is through the material, virtual continuity that synthesises a sadistic male force and the deterritorialising forces that tear away at the illusion of its coherence that the film harnesses its most radical ethical impulses. Indeed, the uncovering of such illusion and the acknowledgement of the claim to consciousness of vital, impersonal forces unfold in *Alexanderplatz* as indispensable components in Fassbinder's passionate wager for a new ethics of subjectivity.

Alexanderplatz may be considered a scientific experiment on human existence – an experiment where life unfolds according to laws quite other than those of classical physics/mechanics. In its staging of Franz Biberkopf's harsh, yet eventful, existence,[13] the film blatantly rejects the inherently soothing rules of realism, causality and determinism. Instead, *Alexanderplatz*, more faithful to the spirit of Döblin's novel in this respect than the novel itself could be, traces the trajectory of a man who is absolutely open to affection, and who breathes life's risks beyond any possibility of protection or promise of salvation. Franz Biberkopf appears as the ultimate oscillator,[14] the abolisher of all prediction, in a film that knows there is no secure haven outside this life, and no armour that can protect us against its forces.

Notes

1. In *Deleuze and the Cinemas of Performance: Powers of Affection* (2008) I have analysed these affective processes in two other Fassbinder films: *The Marriage of Maria Braun* (1978) and *The Bitter Tears of Petra von Kant* (1972).
2. The treatment of Franz's face at this point recalls Deleuze and Guattari's comments: '[W]hen the face is effaced, when the faciality traits disappear … we have entered another regime, other zones infinitely muter and more imperceptible where subterranean becomings-animal occur, becomings-molecular, nocturnal deterritorializations [sic] overspilling the limits of the signifying system' (Deleuze and Guattari 1987: 115).
3. The slowing down of time common to many moments in *Alexanderplatz* recalls Dorothea Olkowski's notion that 'some slow-down [is] essential to the intuition of sensibility' (Olkowski 2007: 7). This view is echoed by Gregg Lambert and Gregory Flaxman when they write of cinema as a techno-scientific art 'made up by the relative speeds it uses to slow down chaos in order to "capture" movement' (Lambert and Flaxman 2005: 119).
4. The passage in *Alexanderplatz* from classical/Newtonian mechanics to an affectively-inflected mechanics runs parallel to a conversion of a phenomenological notion of embodiment (where bodies retain their gravitational weight) into a Deleuzian incorporeal materialism (where bodies are set loose from a gravitational centre/anchor).
5. Note the similar wording Deleuze and Guattari use in reference to Little Hans' affective horse when describing the all-too-common incident in the early decades of the twentieth century of a horse falling in the street: 'These affects circulate

and are transformed within the assemblage: *what a horse "can do."* They indeed have an optimal limit at the summit of horse-power, but also a pessimal threshold: a horse falls down in the street! It can't get back on its feet with that heavy load on its back, and the excessive whipping; a horse is going to die! – this was an ordinary sight in those days (Nietzsche, Dostoyevsky, Nijinsky lamented it)' (Deleuze and Guattari 1987: 257, emphasis added). In the voice-over story in *Alexanderplatz*, the impaired condition of the horse is contrasted with the 'unnatural' conjugation of ability and disability displayed by Franz: 'Everyone is amazed at *what Franz can do* with one arm'.

6. Spinoza's idea of a parallelism between body and soul seems to be present throughout *Alexanderplatz*, in the way it perceives the augmentation or diminution of force/power in the former to result in a correlative augmentation or diminution of force/power in the latter. Such parallelism runs counter to the Christian tradition where body and soul strive for ascendancy over each other in a relation of mutual exclusion/opposition (that is, indulgence in bodily pleasures deprives the soul of strength and vice versa).
7. *Alexanderplatz* also features Franz Biberkopf's becoming-rat in a moment in its epilogue that shows Franz straight-jacketed and on all fours drinking from a plate on the floor and surrounded by dozens of rats in a dimly lit room.
8. Several details in the film signal to the becoming-bird of Mieze: not only her act of bringing the canary into the apartment, but also her cooing like a bird when in the woods with Franz; after her death, in the epilogue, countless bird cages are hanging from the trees in the woods where she was strangled by Reinhold.
9. Thus, for example, the scene at the slaughterhouse in *In a Year of Thirteen Moons* when Erwin/Elvira (Volker Spengler) relates the story of his past to Red Zora (Ingrid Caven) is not just an autobiographical narrative, but the moment when the film produces the machinic assemblage of Erwin/Elvira-becoming-slaughtered-animal. Thomas Elsaesser has identified the desubjectification that takes place in this scene in *Thirteen Moons* as a shift from expression to excorporation, noting that this scene does not follow a classical melodramatic paradigm of repression/expression. Through a process of excorporation, Elsaesser claims, Erwin-Elvira's pain is separated from his individual body and disseminated into the body of the film (Elsaesser 1996: 213). But, as I argue in *Deleuze and the Cinemas of Performance* (2008), if we follow a non-subjective model of expression such as Spinoza-Deleuze's, we can still speak of the film as an abstract assemblage of sound effects, light, music and ambient noise expressing a pain that goes beyond any individual experience. *Thirteen Moons* achieves the exchange of speeds and affects between human and animal by weaving its tracking shots of carcasses and its background melancholy music together with the rising affective speed of Erwin-Elvira/Spengler's voice.
10. The concept of a mechanics of force is in fact evoked during the opening credits of every episode of *Alexanderplatz* with a montage of images that juxtaposes still bodies and moving machines. The constant moving image of the wheels and steam of a locomotive is superimposed over a succession of twenty-eight still archival images. As one of the anonymous readers of this essay remarked, 'One has the impression of violent, churning forces just beneath the surface of people living in Berlin', while they themselves remain quite unaware of the source of what plagues them. The juxtaposition of stillness and mobility at the beginning of each episode perfectly captures Franz's predicament, caught in a mechanised industrial economic system that attempts to supplant his own formidable physical strength and to render him static and useless.
11. To the actual and the virtual, Massumi adds the possible and the potential. It is at 'the point of intersection of the possible, the potential, and the virtual',

he argues, that the actual occurs. 'The actual is the effect of their momentous meeting, mixing, and re-separation' (Massumi 2002: 136).

12. Every time we see Franz and Mieze together in the film, the snake-like presence of Reinhold is lurking nearby. This is most directly implied in the scene where, egged on by Franz himself, Reinhold hides under Franz and Mieze's bedcovers to witness what turns out to be Franz's most emasculating experience – not coincidentally, the most violent interaction between Franz and Mieze, and the closest to a literal repetition of Franz's murder of Ida.
13. My characterisation of Franz Biberkopf's life as 'eventful' is supported by Fassbinder's unsentimental description of Franz as possessing a '[highly] differentiated subconscious, combined with an almost unbelievable imagination and capacity for suffering' (Fassbinder 2007: 48).
14. The idea of 'oscillation' very much reflects the way I see Franz Biberkopf. The first part of the title of this essay, 'Violently Oscillating', comes from a passage in Olkowski: 'What matters is not what an individual *consciousness* can do, but what *does*, what *gives*, what provokes thought and what is thought in a continuous process driven by the dark precursor, the violent axiomatic in which every connection is violently disjoined, the conjoined, violently oscillating' (Olkowski 2006: 170).

If Not Here, Then Where? On the Location and Individuation of Events in Badiou and Deleuze

James Williams

Abstract

This paper sets out a series of critical contrasts between Alain Badiou and Gilles Deleuze's philosophies of the event. It does so in the context of some likely objections to their positions from a broadly analytic position. These objections concern problems of individuation and location in space-time. The paper also explains Deleuze and Badiou's views on the event through a literary application on a short story by John Cheever. In conclusion it is argued that both thinkers have good answers to the objections, but that they diverge on the ontological commitments of their definitions of the event.

Keywords: Badiou, Deleuze, event, political, ontology, individuation

I. Introduction: a Counter-balance to Badiou's Reading of Deleuze's 'Event'

In his latest major work, *Logiques des mondes*, Alain Badiou adds a series of distinctions and clarifications to his already extensive engagement with Gilles Deleuze's thought.[1] This addendum focuses on an interpretation of Deleuze's philosophy of the event as set out in his *The Logic of Sense*; it then sets out a list of differences between Badiou's philosophy of the event and Deleuze's.[2] Two points need to be stressed about Badiou's interpretation. First, it is limited in its form, since like many of the notes on other philosophers in Badiou's works, the main goal is to clarify his own position and distinguish it from perceived flaws in another. Of course, this is not necessarily a failing and certainly does not lead inevitably to a mistaken reading. However, it does skew that reading towards Badiou's concerns and towards the places where he

sees important differences between his philosophy and others. Second, the form of the interpretation is designed to fit the wider structure and terminology of Badiou's argument rather than operate a more immanent critique of another position. Thus, for instance, Badiou imposes external concepts in his readings in order to bolster his critical distinctions and to demonstrate the reach and relevance of the conceptual framework he is deploying in his wider philosophical argument.

Badiou's interpretation of *The Logic of Sense* turns on two conceptual shifts and one interpretative claim at odds with the form and concepts of Deleuze's book. First, the event is treated in terms of 'the One'.[3] This is a problematic shift from Deleuze's multiplication of terms for the event where the term 'Event' is distinguished from events and where 'one great Event' is connected to actual events and to events in sense and to what Deleuze calls surface through processes of static and dynamic geneses.[4] Where Badiou capitalises the 'One', Deleuze capitalises 'Event' and his point is that, in a counter-actualisation or replaying of any event, all events *communicate* in one Event where communication is not in terms of set meanings but in terms of processes.[5] Events set each other in motion with no limits in principle; they therefore communicate in one great Event constituted by this multiple, mobile and ever-changing series of relations. It can therefore be argued that this latter Event should not be thought of as the 'One' but rather as a multiple that cannot be represented as a unity or identity; the Event is in the communication of all events rather than in their collection or as their essence. This Event is presented as a process of communication and multiple disjunctions by Deleuze, for instance in his study of games in *The Logic of Sense*: 'Each event is adequate to the entire Aiôn, each event communicates with all others; they form a single and same Event, event of the Aiôn where they have an eternal truth'.[6]

Note how Deleuze avoids any statement such that the events *are* the Event, or that Event *is* the same, or that the final *meaning* of events is in the Event. Instead, he stresses adequacy, communication and forming. Adequacy is taken from his major work on Spinoza where that concept and the concept of inadequacy play a central role in Deleuze's account of expression.[7] Thus Badiou can be questioned in his identification of the Event with the One since for Deleuze the adequacy of events to the Event is not representative or designating but expressive and explanatory, where to explain is to envelope the other idea, that is, in strict Spinozist terms, to express the cause in the effect.[8] This expression is necessary and never a matter of identity or inclusion. It is the only way we come to know the cause and, since it is neither representational

nor designating, it is not a matter of meaning or signification. Badiou is therefore moving away from a strict Deleuzian usage when he interprets sense in theological and hermeneutic terms.

The following imposition of a theological model of the One onto Deleuze's account misunderstands or ignores Deleuze's reading of Spinoza and misses the necessary multiplicity implied by the multiple ways in which events are folded and unfolded in the Event:

> If in fact sense has an eternal truth, then God exists for never having been anything other than the truth of sense. Deleuze's idea of the event should have convinced him to follow Spinoza, who he calls the 'Christ' of philosophers, all the way and to name 'God' the unique event in which all becomings are diffracted.[9]

When Deleuze says that the Event is the truth of events this does not mean that events find their highest truth as meaning in some identifiable One, but rather that the truth of events lies in their communication with one another as ever-changing multiple series *that can never be reduced to the One* since this would interrupt the truth of the ongoing becomings, disjunctions, expressions, foldings and unfoldings. Again, the concept of God is imposed on Deleuze's work by Badiou through a very quick and perfunctory move via Spinoza. This move takes no account whatsoever of the intricacy of Deleuze's interpretation of Spinoza's concept of God again formulated in terms of expression and communication[10] or of Deleuze's long discussion of divine names in *Spinoza and the Problem of Expression*[11] or indeed of the pointed humour when Deleuze and Guattari call Spinoza the Christ of philosophers, a passage again misquoted by Badiou since Badiou's rendering is '*le Christ de la philosophie*'[12] (the Christ of philosophy) when the original is '*le Christ des philosophes*' (the Christ of philosophers).[13] The difference in prepositions is crucial since, notwithstanding the humorous provocation, Deleuze and Guattari's point is that Spinoza's construction of the plane of immanence of all other planes is a once only occurrence, like Christ, since it is a paradoxical construction (as the inside and the outside of thought) presupposed in all others. As such, all other philosophers are apostles to Spinoza's Christ but this in no way commits Deleuze and Guattari to any dogmatic conception of God as the One or as the truth of meaning (a misreading of Deleuze's sense). Instead, it commits them to the notion that the Spinozist plane of immanence of planes of immanence because it is the most pure, that is one that does not impose meaning or truth but

rather allows for the generation of new senses, planes and events with the 'least illusions, bad feelings and mistaken perceptions'.[14]

Second, Deleuze's approach is reduced to a fourfold axiomatic of the event, something that might be plausible in terms of the later work with Guattari but that does not fit the differential processes set out in *The Logic of Sense* which owe much more to structuralism, to Lacan, to Lautman and to philosophical structures developed in *Difference and Repetition* than to the later axiomatic. Badiou takes truncated passages from *The Logic of Sense* then sets them in quotation marks and numbers them as axioms. However, these passages are never indicated as axioms by Deleuze. They are often part of longer sentences and arguments. The extraction of these passages sits very uneasily with the serial form of Deleuze's book and of his argument on the interlocked and event-like quality of series. Finally, Badiou reads Deleuze as close to the twentieth-century linguistic turn in his use of the concept of sense, when it might be argued that the concept of sense is exactly designed to resist and move away from the linguistic turn and to extend a philosophical treatment of language away from the tripartite distinction of denotation, signification and manifestation by adding a concept of sense that is inseparable from another concept (surface) and which operates to open up paradoxes in the philosophy of language such that any linguistic turn will be seen as inadequate both with respect to the problems that lead to it and with respect to bodily, ideal and surface events, as well as the surface intensities accompanying them. Badiou claims the following:

> From the very beginning of his book, [Deleuze] forges what is for me a chimera, an inconsistent portmanteau [*mot valise*]: the 'sense-event'. This, moreover, makes him communicate much more than he desired with the linguistic turn and the great contemporary sophistry. Since, to claim that the event is of the register of sense is to topple it fully into language. (Badiou 2006: 408)

But what if the point is to topple language into the event rather than the event into language? What about the extensive treatment in *The Logic of Sense* of portmanteau words as inconsistent yet structurally functional in Carroll's works and the associated explanation of this functionality through the concept of the event as moving beyond the traditional linguistic definition of sense as meaning or signification?[15] What of Deleuze's extensive study of the circle of language set in motion by his new concept of sense associated with intensity rather than set linguistic structures?[16] What of the distinction that has to be drawn between signification and sense in *The Logic of Sense*, for

instance in Deleuze's reading of Benveniste?[17] In short, though Badiou's interpretation of Deleuze is without doubt of interest and value for the elucidation of Badiou's work, it cannot be taken as the last word either on Deleuze's philosophy of the event or of its relative worth with respect to Badiou's position. It is simply too much of a reduction, too textually selective and limited, too far removed from Deleuze's idiom and, from an interpretative point of view, too lacking in self-critique in the imposition of an unsympathetic conceptual schema without questions concerning the possible costs of such an approach.

Two options open up given these doubts about Badiou's reading of Deleuze on the event and about his interpretation of their differences. We could go through a detailed analysis of that interpretation to show its limits. I have already sketched the direction this move would take, but it would be insufficient with respect to a wider question that I take to be more important, that is where to situate and how to evaluate the different positions on the event in Deleuze and Badiou in the context of the turn to the event in recent continental and analytic philosophy.[18] In order to respond to this question I want to set out a thesis on the broad similarities and differences between Badiou and Deleuze's positions in order to then proceed to a study of what is a stake in those connections and divergences.[19] These theses have been deliberately set in as neutral manner as possible, that is in the most accessible general language about the event. Here are the points that I wish to show that Deleuze and Badiou share:

1. The event does not have a well-defined spatio-temporal location.
2. The event does not happen to things or to persons, but rather happens through them.
3. Events are politically and ethically of the highest significance.
4. Relations between events are not causal.
5. The concept of genesis is central to the concept of the event.

The divergences between the two thinkers stem from the following oppositions (again stated very generally):

1. Events are either rare or ubiquitous.[20]
2. Events have no well-defined spatio-temporal location because they cannot be recognised from within a given established state or because they are infinitely extended and ongoing processes.
3. The event has an important relation to truth, or the event is prior to any philosophical conception of truth.

4. Logical and subject-led sets of actions posit and then follow on from an event, or there can be no valid logical following on from an event.
5. Events organise and give order to political and ethical behaviour, or events are occasions for experimentation and creative transformation in political and ethical action.[21]
6. Relations between events are a matter of logical implications punctuated by free decisions, or relations between events are a matter of many different kinds of interdependent determinations.[22]

Badiou's position maps onto the first set of options, Deleuze's onto the second. The aim of this article is to explain these oppositions in the context of some of the shared features, not in order to finally take sides with Deleuze or with Badiou, but rather to allow a stronger understanding of their differences and a sense of the value of their novel philosophies of the event. Possible responses to a severe objection to both positions underlie this explanation. The objection is a familiar one in philosophies of the event[23] but it takes on a particularly difficult form once the spatio-temporal location of the event is denied:[24] how are events individuated if they cannot be located in a shared space-time? This discussion of the problem of individuation, taken from analytic philosophy but with deep roots in Leibniz and hence with strong connections to Badiou and to Deleuze,[25] might appear to be easily refuted for both of them through the argument that of course both thinkers speak of events located in particular spaces (Paris, say) and at particular times (1917, say). This misses the point that for there to be a successful individuation in space-time it has to be unique and homogeneous: one space-time for all events, even if positions within it are relative.[26] It is this uniqueness and homogeneity that Badiou and Deleuze deny through the claim that we have different spaces and times for different events. The problem is that if this is the case, how do we know that the events are different, that is according to what principle do we distinguish those spaces and times without establishing a new unique space-time to make the distinction?

II. Definitions of the Event

Badiou suggests that an event is a rare occurrence that cannot be recognised within a given state of affairs. It can, however, be named by subjects as that which cannot be recognised. Subsequently, a fidelity to

the event can be constructed according to a well-ordered series of faithful acts implied by that first naming and driven by the hitherto unrecognised truth that it brings to light.[27] This fidelity follows a subsequent series of points where new decisions have to be made with respect to the event in relation to the situations that resist its recognition.[28] For example, political actors can group together to name an injustice within a system incapable of seeing it as an injustice. They can then embark on a suite of actions designed to construct a new situation free of the injustice and organised by its form and its agonistic relation to the old situation. This construction will encounter different turning points where novel decisions have to be made, for example in terms of how to militate for the truth in the face of reaction from those in favour of the established situation. Thus the effort to name and describe a form of suffering endured by some human beings but not seen as possible in a wider society (to the extent that they might not be seen as belonging to the class of human beings) could lead to the formation of a political grouping determined to militate in the name of that wrong. This militant activity would then continue until society was changed to the point where the suffering and our duty towards it become manifest, though still not from the point of view of the former state.

So the event has no place, in the sense that it cannot be recognised at a given time by a wider state that militants act against through their naming and fidelity to the event.[29] The trace of the event emerges during a construction that follows a naming and unfolds according to a necessarily ambiguous rationale – one that sets up an antagonism between a new construction and a prior but continuing state that is inconsistent with it. The logical difficulties generated by this ambiguity run parallel to the activists' political difficulty of having to bridge between incompatible systems; they militate for a new state within an old one. Badiou's Maoism provides him with many interesting examples and cautionary tales on the risks and difficulties of this bridging. Recently, in *Logiques des mondes*, he has given accounts of Mao's strategy for separating the Red Army from wider society while bringing elements of that society into the army.[30] In the same book he provides analyses of different Spartacist movements explaining their failures and successes on the ground of categories of subject defined according to their fidelity to the event and to a shared truth where freedom is posited on political equality.[31] In all these cases, the struggle refers back to an event that it also constructs. For instance, the new event of a crime against humanity emerges with the definition of this novel form of crime, with historical work situating it, and with political work that changes legal and social

frameworks so that they incorporate the new crime; all this activity is not performed by individual human subjects but is rather understood better as the work of a collective political subject or grouping. Badiou carries forward the lost militancy of twentieth-century revolutionary politics, yet tries to adapt it to a more multiple and flexible view of reality.[32] This explains why the non-location of the event and its relation to truth and to a series of points of decision is so important to him, since it avoids a monolithic politics, yet retains militancy and effective structures of order, priority, relation to truth and claims about reality. New events can always be named and there is no essential (say, proletarian or liberal democratic) state free of falsehood.[33] Truth emerges in the naming and militant fidelity; for instance, in the way the wrong of slavery became an accessible and shared truth through the efforts of abolitionists over more than a century.[34] This appeal to a truth is important because it avoids any relativism, because Badiou restricts truths to a few 'eternal' propositions, such as 'all men are equal'. These are only appropriate to specific fields and only appear in what he calls a truth procedure, or the connection of an event in a state through the actions of subjects set in an organised political body fighting for a novel maxim (of equality for the political truth).[35]

Deleuze's view of events lacks the binary oppositions found in Badiou's model. Badiou opposes the state where an event cannot be recognised to the fidelity and militant actions that follow the naming of such an event. This means that his ontology is itself binary. We either have a well-ordered and consistent structure that admits of no events, or we have a line of militant moves from point to point that are generated by a named event and a corresponding truth that can never appear as such ('all men are in fact equal'), even within the new structure that emerges with the militants and that will eventually disappear with them. There is therefore always a series of radical oppositions at work in his philosophy, such as the pure philosophical one of event and state or the derived political ones of reactionary and militant.[36] Thus for Badiou either a thing has its place within a state or it follows from an event that can never be shown as such within that state. In *Logiques des mondes* this place is determined according to a transcendental logic assigning degrees of appearance in a world to any phenomenon (roughly this can be understood as degrees of importance derived from the number of active relations a thing holds to others).[37] That such degrees can always be assigned is deduced by Badiou following a use of mathematical category theory – broadly a theory of simple relations applicable across many or perhaps all mathematical fields – which he calls his 'grand

transcendental logic'.[38] This use of category theory to establish the necessity of degrees and the consistency of a world can seem highly abstract but Badiou provides illuminating examples of how it works in practice, for instance when he assigns different degrees of appearance to different groups and individuals in the preparation for a demonstration on the *Place de la République* in Paris. A timid postal unionist on the fringes has a lesser degree than a leading agitator from an anarchist group, for example.[39] A world is constituted by a set of phenomena, or things that can appear in that world that can be traced according to a logic that assigns a degree of appearance to them, itself determined according to the type of relation that determines the world (political action, in the case of the demonstration, or military effect, in the case of a battle). The whole point about an event is that it cannot be assigned such a degree and it cannot therefore be a phenomenon or appear in the world. The event, when named, is therefore a challenge to the logic of the world and that challenge then goes through a series of tense points where the logic of appearance keeps raising problems for the new line that follows on from the naming of the event. A novel political action sees itself compromised when it has to make a choice with respect to things it is ambivalent about (the definition of admissible violence in the world, for instance). It is then caught by the logic of appearance of a world. At least in his writing, Badiou often takes the radical and extreme view with respect to such compromises because to yield to them is to fall back into the logic of a world and hence to betray the event. His writing on violence and what he calls cruelty is therefore often rather shocking[40] and Badiou's taste for ferocious commitment to political action is one of the undercurrents in the debate with Deleuze on the event. There is a misgiving that action can be at any cost for Badiou, if cost is set by a world inconsistent with the militant's truth and event.

For Deleuze, an event is a real process in different kinds of realm – virtual and actual – that together constitute a complete reality. An event is therefore something that runs through real series of Ideas and through actual things. It runs through them not in terms of break-like changes in actual and ideal relations, but in terms of changes in degrees of intensity in their relations carried by the movement of placeless occupants along empty places in different series, for instance when a question runs along a series of different possible answers illuminating them differently when each in turn is seen as the right one. The empty places determine a lack in actual series and an excess in virtual ones and intensity can be seen as a wave-like effect running through both series as they interact.[41] If we concentrate just on a series at a particular

point it can seem that there are still breaks in Deleuze's model, but this would be to miss the variations in intensity carried by movements along series. So an event is an actual relation, such as 'this fell from here to there', but it is also an ideal or virtual change, such as 'the fall changed the relations between these Ideas in this way', and the event is also a change in the intensity or significance of such ideas in relation to actual things, such as the rises in different intensities expressed in the phrase 'this Idea began to dominate after the fall'. In Deleuze's technical language from *The Logic of Sense* the event is therefore something that occurs along series in the depth of (actual) bodies, along series in the height of (ideal) sense and it is on the (intense) surface connecting the two realms.[42] In the terminology from his *Difference and Repetition*, an event is actual and virtual and a change in intensity. As a process whereby the actual is determined by an ideal change, it is a 'differenciation'. As a process where virtual ideas are determined by an actual change it is a 'differentiation'. All of these processes of determination are a matter of changes in degrees of intensity as individuals emerge according to particular dramatic enactments of prior events.[43] Deleuze therefore sees reality as a manifold of communicating processes which can be described in terms of multiple distinct series within separate realms, but only temporarily and incompletely. An event for Deleuze is therefore any significant change within a process, where the emphasis is on significance and on a limitless extension of this change through all other series and, in principle, through the whole of reality.[44] In his famous discussion of the A and B series of time McTaggart sums up this interconnection of events in relation to change or process through the following evocative example, capturing the difficulty of what Deleuze wants to sign us up to:

> And if anything changes, then all other things change with it. For its change must change some of their relations to it, and so their relational qualities. The fall of a sand-castle on the English coast changes the nature of the Great Pyramid.[45]

In his work on the event, Deleuze also uses the example of the great pyramid to illustrate this connection over great distances in time and space through a reference to Napoleon's famous statement: 'Soldiers, from the height of these pyramids forty centuries look down upon you',[46] and to Whitehead's discussion of the event as process in *The Concept of Nature*.[47] Thus, for instance, a rise in anger around a slave ship massacre is at the fulcrum of an event involving all series of events, to the point where the event is not located in any

particular crime or witnessing but rather as contrast running through all series as the change in intensity of the anger alters the whole of reality.[48]

It is important to stress that for Deleuze such events are not primarily meaningful in a linguistic sense, but rather that significance indicates a change in degree, such as a rise in outrage for example, as a prior condition for a change in meaningfulness and a change in its relation to things we can refer to in the world.[49] The opposition to Badiou's twofold antagonisms rests on these limitless and multiple processes determined by turning points in degrees, because any absolute 'two', such as state and event, shown by Badiou[50] is for Deleuze a complex many which can appear as two or more, but only fleetingly and incompletely.[51] It is beyond the scope of this study of the event in the two thinkers, but there is more at stake in this definition of the many than any simple opposition could capture; this is because both philosophers can lay claim to a special use of the terms multiple and multiplicity. Put somewhat simply, Badiou's 'multiple' does not include the event as such. It is rather the evental site in a situation where the event can be named[52] whereas Deleuze's multiplicity, for instance as found in the concept of the rhizome, is event through and through, and thereby resistant to any sense of a countable multiple.[53]

Badiou concentrates on forced shifts between objective states made possible by the positing of the event. Deleuze, on the hand, never allows for a settled objective state, which for him is always an illusory cover over ongoing event-driven processes. This point can be generalised to explain his position further. For him, any representation of an event is a false abstraction away from its role in wider series of processes; for instance, the event of slavery is still rumbling away now and was being prepared for in the ancient world, so to isolate it in any given time-slice will always be an incomplete representation of it.[54] As discussed in the introduction to this article, in *The Logic of Sense* the basis for this claim about the interconnection of all events lies partly in the remark that all events communicate and therefore become one great 'Event', or put otherwise, it is that no boundary around any given event or game is legitimate because events outside those boundaries can change the sense of the event or what winning means within any given game.[55] These oppositions allow us to understand the violence and fervour of the debate around the event in Badiou's work on Deleuze, since his militants appear to be cancelled out by a lack of distinctness in Deleuze's model, which therefore appears reactionary and insipid when compared to militant action for a truth.[56]

III. Badiou and Deleuze Events in Cheever's 'The Trouble of Marcie Flint'

These debates and oppositions on the existence and nature of events have a long and complex history in analytic and continental philosophy since the 1960s and, to a lesser extent, before then. The two traditions sometimes overlap in terms of problems if not method, for example in arguments around the distinction to be drawn between processes and facts which occur in Deleuze and Whitehead, but are also discussed in analytic philosophies of the event.[57] There is therefore no single 'analytic' or 'continental' philosophy of the event.[58] Given the complexity and lack of clear definition in this historical background, I will give a second, more practical approach to the event through a literary example. This literary angle provides a simplified approach to everyday events, through the imposition of narrative boundaries and selections in characterisation, yet a more contextual one than encountered in abstract philosophical examples such as 'the spilling of a cup of coffee'.[59] I will therefore look at a number of interconnected events drawn from a short story by American novelist John Cheever (1912–82).[60] and show how they illuminate further the differences between Deleuze and Badiou. This is because Cheever's short stories revolve around significant events and chart their effects through series of characters. Cheever plays on matters of perspective and perception, yet also relies on events as central organising and disorganising factors within human lives. His fiction is a useful hinge between different types of approach to the event, since his stories combine ethical and political import with existential and thematic complexity and with carefully described and located everyday events. This also means that the commonsensical and the ordinary in language and life are combined with deep effects and rich contexts.

'The Trouble of Marcie Flint' is situated about half-way through the influential chronological collection of Cheever's stories *Collected Stories*.[61] It is an interesting but also potentially a problematic story about events because, like many of Cheever's stories, it is constructed around a reversal. This is not a grand *coup de théâtre*, but a more discrete play on patterns in characters and in acts, where patterns are revoked when different and often uncomfortable truths and events come to light. Cheever's event-driven turnarounds are reminders of the base and frequently unjust human propensities to jump to impose set patterns, to judge others on scant evidence and to operate with set moral categories bearing little relation to a more complicated underlying reality. The reversals described in the stories, many of which first

appeared in *The New Yorker*, therefore have a socially reforming tenor, providing a gentle but nonetheless effective critique of the negative role of conservative social structures and judgements in relation to lives as they are actually lived rather than as they are perceived through a moral lens. The difficulty of sensitive and realistic practice is contrasted with the certainty and brutality of judgement according to values external to given situations. Fiction here need not be viewed as real for it to be able to trigger awareness that reality and modes of judgement are out of kilter. The lesson is about how we judge and about the potential life has for fine-grained complexity rather than about this or that real event. Cheever's stories are an experiment on the effect of events on malleable structures rather than a straightforwardly informative account. For a discussion about recent philosophies of the event, the stories therefore have the further merit of combining precise moral and political scope with manageable accounts of everyday events, as opposed, on the one hand, to descriptions of events in a moral and political void, and on the other hand, to grand sweeping events such as wars or revolutions which seem to call for a closer study of their subcomponents.

Cheever likes simple and spare titles that accurately capture the main topic of his story: a place, a person or a state of affairs, all very briefly depicted or named. The titles are descriptive yet keep a little in reserve in terms of the deep point of concern.[62] This prompts readers to search for the lesson and, if they are aficionados, they know to look for an event twisting the story to an unexpected yet revealing outcome. Marcie Flint's trouble initially seems to lie with her husband, who opens the story with a self-indulgent account of a mid-life crisis involving an Atlantic crossing and an idyllic illusion of a new life in Turin sipping wine on the Superga. The main event is then, at first sight, unfaithfulness with the effects on wife and children as sub-events caused by the crisis. The location of these events is outside Marcie, in her husband's spirit, mind and body, then in her own and those of her children. However, the trouble with Marcie turns out to be more convoluted. It lies with her own betrayal, not only a sexual infidelity but one breaking with her social and moral position in a tightly-knit upper-middle-class commuter village. The crossing of a social boundary is all the more shocking, from the point of view of her class, as it not only involves consorting with a lower-middle-class man, but one she has warmed to because of his humanity and vulnerability. The story therefore shifts with Cheever's extraordinary economy of style from a commonplace account of the morals of married life to broader comment on class boundaries and the cruelties necessary to maintain them against social and political change. The tryst starts because the man speaks in favour of a public library in Marcie's village; something

it has 'no need for' since, from a privileged point of view, everyone who ought to have a library has a private one, and anyone who does not have a library has no place in the village. Underlying this complacent judgement and double-bind there is the fear that with the lower middle classes come crime associated with poverty and lack of moral standards. Below that we then find the even more unavowable evidence that social distinction is neither as permanent nor well-founded as those on top feign to believe. Marcie's troubles therefore run deep and resist cures with greater tenacity than her husband's, whose second trip to Turin leads to an exorcism of his jealousy and a renewed determination to live happily with Marcie and their children.

Though each of the story's events has internal coherence in terms of factual accounts, they are ambiguous in their external relations. We can be sure of Charles and Marcie's locations and position in time when he is writing a diary on board a Europe-bound ship and when she shows her first kindness to an outsider maliciously repelled by her neighbours. We can, however, make serious mistakes in their causal relations. It turns out that the return to Turin and the diary's self-involved reverie are not the result of a tawdry and ignoble midlife crisis but rather of a much harder to judge wrong, another's unfaithfulness with more complicated roots and broad causal and social contexts. This complexity is reflected in the key event of the story and its relation to another event acting as a catalyst. Marcie's troubles stem from a profound guilt, expressed as an unbearable fear of punishment through an assault on the well-being of her family. This symptom is so strong that Marcie demands a divorce, not as revenge on her husband, or as an attempt to escape the marriage, but as a desperate attempt to save her children from fateful punishment. The catalyst is the accidental poisoning of the children, where guilt lies, if anywhere at all, with the husband who thoughtlessly leaves the poison within reach, because he is indeed at the outset of a crisis of misplaced self-regard.

Why though would any of this be ambiguous by the time we unravel the many turns of the story and arrive at its main declaration? When Marcie confesses, a clear chain of causes ought to emerge and the reader's perception of indistinct or contradictory causal lines should be traceable. This in turn will allow us to re-establish spatial and timely locations for all the events:

> 'I want a divorce. I can't bear living like this any more. I can't bear it. Every time they have a head cold, every time they are late from school, whenever anything bad happens, I think it's retribution. I can't stand it.'

'Retribution from what'?
'While you were away, I made a mess of things'.
'What do you mean'?
'With somebody.'[63]

After this declaration we know why Marcie's husband left for Turin a second time. We know why there is talk of a divorce. We have information and a causal chain to base judgements on, such as who is at fault. We can also describe which social and sexual conditions we might take into account in arriving at such judgements. Why then should we claim that the events have no spatio-temporal location and do not entertain causal relations to one another?

The first step, in explaining Deleuze and Badiou's resistance to these questions on the location and causal nature of events, lies in changing that initial set of questions and the order of priority of subsequent ones. They are not just asking 'What happened?' but also 'What are the conditions for action after the event?', 'How is the event novel?' and 'How can we best respond to that novelty?' Moreover, they are claiming that an unambiguous account of what happened is neither one of those conditions, nor even answerable when we understand them and their relation to subsequent actions. The conditions for significant political and ethical action therefore become prior conditions for answering questions about the nature of events. Significance here is all important, since neither philosopher is committed to the claim that we cannot describe factual situations and causal relations between actual things. Instead, both claim that there is a relation to these situations that is in excess of them, in the sense of not obeying rules concerning its form and in terms of demonstrating incompleteness in objective spatio-temporal accounts of events (physical or mental).

For Badiou, as we have seen, a significant response to an event involves advocating and following a truth that is incompatible with a state of affairs (something he calls a world in his latest writings and a state in the earlier ones). When an event is named and related to this truth a new world begins to take shape as we follow a suite of ordered steps punctuated by decisions regulated by our fidelity to the event and to the truth, yet that event cannot be shown in the original world. Thus, in the Cheever story, the truth standing outside its world could be 'The sexes are politically and socially equal'. We can see why this truth has no place in the facts of Marcie's story, but for Badiou what matters is that active subjects can begin to trace a new event within that story, thereby moving towards a world that does have a place for the truth.

For instance, the mutual lack of comprehension between lovers and the injustices of the story turn on the lack of equality, which itself feeds into Marcie's guilt and her husband's self-satisfaction and complacency. The hatred of other classes and the deep shame and fear of punishment following relations across classes are also inflated by this lack of equality. The event in relation to the truth is then nowhere in the story; there is no equality of the sexes in any of its facts. Yet the event can be named and its negative and positive traces can be followed through Cheever's account, both in the world that resists truth and in the glimmers of a world that is consistent with it. For example, if we introduce the notion of equality, the depth of Marcie's reaction and its strange context in fateful retribution can be explained according to a tension between a justified desire and its unjust prohibition. Marcie's infidelity would then become a point of tension and a decision that, together, constitute a trace in the construction of a state true to the emergence of the event of equality, one that does eventually begin to be constructed a decade or so later.

It is important to note that, in Badiou's philosophy, ambiguity is not a matter of the interpretation of events, of different subjective views, but rather the result of the introduction of what Badiou calls a truth and the actions of subjects into a world that is ambiguous because of its capacity to change. A truth is then not an accurate correspondence to a state of affairs or the result of coherent logical argument but rather a shared conviction that sets subjects in motion despite the fact that it does not correspond to a state of affairs or follow from a logical argument and agreed premises. Truths stand outside worlds and have to be forced upon them. They can be played out in different worlds and in different ways, but always as the result of the naming of an event and the activities of subjects on bodies in worlds. This capacity for change depends upon events that cannot be represented in the world but instead only named and worked faithfully in relation to, as political subjects work to alter the original one. In other words, ambiguity is built into ontology through the nature of events and worlds (hence the title of Badiou's most important work, *Being and Event*). The following passage, from *Logiques des mondes*, gives Badiou's succinct account of the event and world structure:

> We begin with the underlying ontological components: world and event, the second introduces a rupture in the presentational logic of the first. The subjective form is then assigned to a localisation in being that is ambiguous. On the one side, the subject is but a set of elements of the world, and therefore an object of the scene where the world presents its multiplicities; on the other

> side, the subject orientates that object, in terms of the effects it can produce, in a direction that comes from an event. The subject can therefore be called the unique known form of thinkable 'compromise' between the phenomenal persistence of the world and its evenemental [*événementiel*] reshaping.[64]

A world has a logic governing what can and cannot be presented in it, for instance in terms of impossible objects in a given presentation, such as the free slave under the ownership of another or the equal sex in a patriarchal society. Subjects though can introduce a truth into the world that forces such a contradiction upon a world, 'No human is a slave' or 'The sexes are equal'. This means that the subjects must bridge between the world they belong to, or are a set of presented elements of, and the world they move towards, one determined by the event that cannot be presented in the first, yet one that directs the actions of the subjects designed to bring about the second; hence the ambiguous position of all political subjects, in the strong sense appealed to by Badiou. The ambiguity is not between interpretations but within the forms of subjective activity and existence. Thus, in terms of Marcie Flint's trouble, the reader as political subject recognises the fatefulness of Marcie's situation and the impossibility of presenting her equality and sexual freedom, as well as her hopes for political equality. Thereby the reader belongs to that world and is caught in its presentational logic. On the other hand, though, the reader can also work towards another possible world governed by a new truth, one where an event that cannot be localised in Cheever's story determines new presentations and possibilities. It is this latter world that the subject militates for.

Where Badiou's event requires subjects to 'force it' onto a state that cannot recognise it, Deleuze's view is that a state is undergoing events, introducing novelty and stress into it, at all times and in all parts where there is a change in intensity in the state. For example, in Cheever's story the increases and decreases in sadness, fear, hope, bemusement, desire and hate are all signs that events are running through the characters of the story. As such, these events could resemble more closely what we commonly understand as events: things that happen to us. This is not Deleuze's main point, though. Instead, the changes in intensity associated with events occur within series of repeated patterns. A change of intensity is a change within the pattern that alters its relations. Moreover, these patterns are actual and ideal, that is they occur in identifiable actual series and in ideal ones. For instance, Marcie's infidelity begins when a predictable and often repeated series of village meetings designed to keep outsiders at a distance is interrupted by a plea

from the man she will eventually commit adultery with. The intercession by the outsider is a source of violent emotional reactions in the village committee. These reactions push her more firmly towards the stranger. The reason an event cannot be located in space and time is that it occurs *throughout* actual and virtual series, back and forward in time, such that the event does not happen 'here' and 'now' but rather through all series at different degrees of intensity. Marcie's actions do not make sense when taken simply with one committee meeting and boorish behaviour by her neighbours. Her rebellion is the result of repeated exclusions and cruelties. Similarly, the distress felt by Marcie after the poisoning of her children runs back and forward through all the series that make up her life, not only in terms of physical aspects but also in terms of ideal ones. The significance of those events changes; Deleuze calls this their sense. For instance, on the ideal plane, the affair becomes a deep wrong worthy of the most terrible punishment and her marriage becomes insufferable. On the actual plane, she cannot physically bear the guilt and apparently robust feelings of sensual pleasure and everyday ease disappear. The event then is an intensive transformer running through lives, altering their values and the arrangements of priority between ideas and physical things. This explains why it is wrong to say that the event 'happens to someone'. It is rather that its happens through them and intersects with many other series that happen through others.

Two strange and counter-intuitive features of Deleuze's account allow for a better understanding of it – if not an agreement. Both can be explained in terms of surprising claims about reality. Given that changes in intensity are the signs and focal points of events, defined as alterations in relations running through series, it seems that reality must be seen as many interleaved and communicating series, each determined by intense events. Reality then becomes multiple, something like a set of interconnected worlds, each determined by its events, but then also determined by the resonance of those events with other worlds. The term 'world' is not Deleuze's and it would be better to talk in terms of individuations. Thus Cheever's story would have an individuation running through Marcie and her intensities, another running through Charles; these would interfere with one another but not be reducible to one series of events. This explains the ubiquity of events for Deleuze: there is an event wherever there is a change in intensity accompanying novel effects along actual and ideal series. This contrasts with the rarity of events in Badiou's account due to their dependence on the actions of subjects. For the former, events happen and then have to be replayed and worked with, for instance in the way Marcie calls for a divorce in

reaction to her fear of retribution. For the latter, events emerge when subjects construct a world conforming to events and truths. It is easier to see why Badiou's events are not caught in causal chains because the free intervention of subjects is an attempt to disrupt causal and logical chains (primarily logical ones). However, in Deleuze's case, if events are disruptions or alterations running along series, why aren't they causal and how can it make sense to speak of effects along all series forward and back in time?

The answer to this question comes out of a complicated and at first sight outlandish metaphysical structure constructed by Deleuze in his book *The Logic of Sense*.[65] Reality is not only actual series, but rather relations of reciprocal determinations between actual and ideal series through a medium they share, the surface of changing intensities.[66] So the real is the actual, the ideal (also called the virtual) and surface. Actual events occur as depth, an increase in intensity around a physical wound, say.[67] Ideal events occur as the change between series of infinitives, an increase in intensity in 'to suffer' in its relation with other infinitives.[68] Intensities therefore connect actual series to ideal ones, but without reducing them to one another and without allowing for shared laws.[69] The way intensity changes actual series and virtual ones is completely different: in the former actual things are altered 'in depth', but in the latter only the relations between infinitives change and not the infinitives themselves.[70] If we return to Cheever's story, Marcie's trouble has three components, each of which is incomplete without the other. There is her physical wound: the agony she feels waiting for retribution for her betrayal. There is the ideal alteration in what Deleuze would call sense, for instance the relation between 'to love' and 'to fear' becomes stronger. And there is the change in surface intensity relating the actual and ideal realms. The occurrence of this intensity changes the relation of sense to her body; the significance of her actions and actual relationships changes forward and back in time (for example, in the judgements 'I should not have done that' or 'This is retribution'). The potential for ideas and infinitives to be expressed in different ways is also changed forward and back in time, for instance, because the close relation of 'to love' and 'to fear' makes it much harder to continue in her marriage and because earlier relations of 'to love' and 'to fear' are now connected to their changed relation in the present. That is why I have described the event as an intensive transformer running through actual and virtual series: the change in intensity is a change in significance forward and back in time. No series is left untouched by it and no partial series, that is one taken as merely actual or merely ideal, is complete without this

appeal to significance which itself only continues to appear when it is transformed by new events that our actions contribute to. The setting of event into series allows them to counter and transform one another. It is the basis for Deleuze's most important moral and political term 'counter-actualisation'. In counter-actualisation an event is doubled back on, countered or replayed, so that its actual wound is diminished, while the intensity of the event's ideal connections is maximised: 'We only grasp the eternal significance of the event when the event is inscribed in the flesh; but each time we must double this painful actualisation with a counter-actualisation that limits it, plays with it and transfigures it'.[71]

IV. Conclusion

It is now possible to return to the similarities and oppositions set out at the beginning of this paper and to the aim of offering a counterbalance to Badiou's reading of Deleuze's work on the event. For Badiou and for Deleuze we can speak of an event despite its lack of spatio-temporal location because we have signs of the event. These signs can be found in the actions of subjects, in traces of the event, in actual turning points with respect to intensities (changes in the intensity of a sensation around an event) and in effects that run through patterns in structures. Events are first individuated through these signs, but then also, for Badiou, according to the worlds they move from and into, and for Deleuze, according to the processes that emerge with an intense event. For both philosophers, the familiar problem of individuation of events is reversed.[72] Real individuation is achieved through events and only through events. This individuation can only occur through events because they account for changes between worlds and for the actions of subjects (Badiou), or because events are the source of significance in any world (Deleuze). Without events we lose political action in the grand sense of revolutionary action, and we lose existential significance, that is the reason why we value one thing more than another, or more precisely the reason why we move in one way rather than another. The identity conditions for events could then be given the following form for each philosopher. Two events would be identical for Badiou if they were followed by the same line of subjective actions and if they were the trace of the same truth, despite the fact that neither the truth nor the event could be located. Two events would be identical for Deleuze if they were accompanied by the same degrees of intensity of ideas and of significance in actual events, in short if the events were accompanied by the same

signs. However, the broader point is more paradoxical for both thinkers. It is that there is a circle in these identity conditions, since the actions of subjects and the signs depend on events for their identity conditions (the actions are only the same if they are faithful to the same event; the signs are only the same if they express the same event). Of course, if identity conditions are viewed as essential for a theory of events, then this paradoxically circular position appears to be disastrous – a vicious circle rather than a paradox. One reason why it might not be is that Deleuze and Badiou allow for identity conditions only for some kinds of entities (appearances for Badiou, actual things for Deleuze). It is just that they do not think that such conditions are satisfactory if they are taken as conditions for any kind of entity, in particular events.

The greatest differences between Deleuze and Badiou's positions stem from answers to the critical questions regarding the causal interaction of events and their resistance to fact-based analysis. For Badiou, events have no causal relation, first because they depend on the free actions of subjects (shown through his insistence on the importance of fidelity to the event), and second, because events belong to different worlds with different logical structures. For Deleuze, events occur across different realms that condition one another but do not have causal relations to one another; this is rendered as an asymmetrical determination of the actual and the virtual, or in more traditional terms, of actual and ideal planes. Ideas condition the significance of the actual side of events; they determine why things matter and how we respond to them. Actual events determine ideas by highlighting their relations and bringing some of those relations to the fore while relegating others to the background. However, neither of these relations of determination has the law-like reliability of causality. Though both philosophers admit to facts, for instance, in the judgement that 'A caused B' neither thinks that any such fact is sufficient on its own, because such facts are always open to being cancelled when taken within the ambit of a novel event where the fact changes in its significance (Deleuze) or in its logical relations (Badiou). Different worlds constructed by our political actions alter Marcie Flint's guilt, or different intense events change the relation of that guilt to the set of other occurrences around it, where some come to the fore and others recede. In short, contemporary French philosophy is caught in a debate around the question of why events matter and how they set us in motion. The answers given to these questions remove events from any simple analysis in terms of causal relations, identity conditions or linguistic meanings. They also give events the final say over matters of fact.

Notes

1. Badiou (2006: 404–10).
2. Other reference points for the encounter of Deleuze and Badiou are in the latter's book on Deleuze (Badiou 1997). Badiou is given as an example in a discussion of events in relation to concepts and to functions in Deleuze and Guattari's *Qu'est-ce que la philosophie?* (1991: 143–4). Badiou also wrote an important review of Deleuze's *Le pli: Leibniz et le baroque*. The question 'What is an event?' is the title of one of the chapters of Deleuze's book on Leibniz *Le pli: Leibniz et le baroque* (1988: 80–103). There is also a shorter discussion of Deleuze by Badiou 'One, multiple, multiplicities' in the collection *Theoretical Writings* (Badiou 2004: 67–80). For an excellent study of Badiou's and Deleuze's philosophies of the event in relation to language see Jean-Jacques Lecercle's *Deleuze and Language* (2002: 108–18).
3. Badiou (2006: 404).
4. Deleuze (1969: 217). For a detailed account of this intricate multiplicity in the event in relation to genesis, see Véronique Bergen's *L'ontologie de Gilles Deleuze* (2001: 109–17). See also John Marks' *Vitalism and Multiplicity* (1998: 38–42).
5. Deleuze (1969: 179).
6. Deleuze (1969: 80–1).
7. Deleuze (1968b: 114–39). For a discussion of the importance of the concept of adequacy and of its roots in Spinoza, see Ian Buchanan's *Deleuzism: A Metacommentary* (2000: 6, 30–3): 'How we attain adequate ideas, which is to say, how we overcome whatever obstacles stand between us and a secure knowledge of causes, is clearly enough the crucial question' (2000: 31).
8. Deleuze (1968b: 118–19).
9. Badiou (2006: 409).
10. See Deleuze (1968b: 112).
11. Deleuze (1968b: 44–58).
12. Badiou (2006: 409).
13. Deleuze and Guattari (1991: 59).
14. Deleuze and Guattari (1991: 59). For a further development of these points on Christ and Spinoza, also in relation to Lenin, see Slavoj Žižek (2009): 'What if Christ is an Event in the Deleuzian sense – an occurrence of pure individuality without proper causal power?' (I thank Ian Buchanan for this helpful reference.)
15. Deleuze (1969: 84–5).
16. Deleuze (1969: 27).
17. Deleuze (1969: 25–6).
18. Thus work on the event is not restricted to Deleuze and Badiou. It is also an important concept in Lyotard's *Discours, figure* and *Le différend* (see Bennington 1988: 75–6, 106–10) and throughout Derrida's work since the early 'Signature, événement, contexte' (Derrida 1972: 365–90). I will also be referring to the extensive research on the event in recent analytic philosophy (see Varzi and Casati, 1996 and 1997).
19. In terms of the aims and content of this article, I am very grateful to the two anonymous readers of an earlier version for their helpful suggestions, notably to extend my engagement with Badiou's *Logiques des mondes* and refine my reading of the event in *The Logic of Sense*.
20. This point is made by Justin Clemens and Oliver Feltham in their recent paper on Deleuze and Badiou on the event (Clemens and Feltham 2007: 23–4). In the conclusion to their paper Feltham and Clemens argue for a possible rapprochement of Deleuze and Badiou on the event: 'But if Badiou's rare

and punctual event is rendered equivalent to the coming into being of a new situation, then aren't we uncomfortably close to Deleuze's conception of any state of affairs being also a host of events, or to what we termed above in our exegesis of Deleuze: "the continuing 'eventing' of the event"'? (Clemens and Feltham 2007: 24). This paper resists such fusions of Deleuze and Badiou. Though I am in sympathy with some of the points Clemens and Feltham make against comparative work on philosophers, I believe that it is important not to lose differences that condition the form of ethics and politics grounded on metaphysical distinctions.

21. These critical points for Badiou and against Deleuze have been made by Hallward for the political argument (2006: 159–64) and by Reynolds for the ethical one (2007: 151–7).
22. I have omitted an opposition with respect to Badiou and Deleuze's approaches to mathematics from this list as it is only indirectly connected to the differences with respect to events. However, the opposition is nonetheless very important and for a extended discussion of it followed by a trenchant summary see Smith (2004: 93).
23. The seminal text on the problem of the individuation of events is Davidson (2001b): 'What we want, rather, is a statement of necessary and sufficient conditions for identity of events [. . .]' (Davidson 2001b: 172).
24. Jaegwon Kim, for instance, uses the time component of an event to give identity criteria (Kim 1996: 119). This option is not open to Deleuze or to Badiou. For an idea of the controversy and counter-intuitive position implied by this denial that events take place at a particular time see P. M. S. Hacker's gloss on the more accessible view of events as related to time: 'Events, unlike objects, are directly related to time. They occur before, after, or simultaneously with other events' (Hacker 1996: 445). Badiou and Deleuze claim that an essential property of events is to lie outside time or as a prior condition for it, such that we cannot say that an event occurs before another without missing something essential about those events.
25. Badiou (1988: 349–60); Deleuze (1988: *passim*).
26. For an illuminating discussion of Deleuze and Guattari and the problem of actual events, see Lampert (2006: 114–42).
27. The strongest account of the way the event is outside a situation which itself includes the 'evental' site where the event is named but does not occur as such is described, in terms of set theory, in Badiou's *L'Être et l'événement* (see, for instance, Badiou 1988: 197).
28. Badiou (1988: 257).
29. Badiou (1988: 203).
30. Badiou (2006: 515–25).
31. Badiou (2006: 72–80).
32. This militancy can be traced back to Badiou's early Maoism and remains central to his politics and philosophy as set out, for example, in his recent *Le siècle*. See Badiou (2005c: 91–5) and Badiou (2006: 29–35, 515–25). For an up-to-date review of his philosophical and political careers see his recent introduction to the re-edition of his earliest book of philosophy *Le concept de modèle* (Badiou 2005a: 1–37).
33. The denial that there are events necessarily outside the grasp of modern capitalist democracies is at the heart of Badiou's critique of 'materialist democracy', that is of individualist, wealth-seeking and, at least in his view, essentially selfish and reactive liberal democracies. This criticism is itself a development of his early Maoism but is put in more technical terms in *Logiques des mondes* (Badiou 2006: 531–7) and more aesthetic ones in *Le siècle* (Badiou 2005c: 247).

34. Thinkers influenced by Badiou often share political concerns with him, notably around racism and slavery. See, for example, Peter Hallward's work on Haiti 'Haitian Inspiration: Notes on the Bicentenary of Haiti's Independence' (2004) and his interview with Jean-Bertrand Aristide in the *London Review of Books*, 22 February 2007. It is also important to note that Badiou is one of the few French intellectuals to continue in the role of the *philosophe engagé*, for instance in his critical book on Nicolas Sarkozy (Badiou 2007) or his militant action for the *sans papiers* (immigrants without valid documents; see Badiou 2005b).
35. Badiou (2006: 77–8). For a helpful discussion of truth in relation to events in Badiou and Deleuze see Bell (2009: 35).
36. See Badiou (2006: 62–6).
37. Badiou (2006: 146–50).
38. Badiou (2006: 313–37).
39. Badiou (2006: 211–16).
40. Badiou's discussion of the cruelties of the twentieth century in Badiou (2005c: 178–9). For a good study of the political in Deleuze see Patton (2000).
41. Deleuze (1969: 65).
42. Deleuze (1969: 172–3, 178–9).
43. Deleuze (1968a: 323).
44. Deleuze's most extended work on the event comes in his 1969 book *Logique du sens*, but it continues through to late works such as his book on Leibniz *Le pli: Leibniz et le baroque* with a chapter on the event in Whitehead and Leibniz.
45. McTaggart (1993: 23–34, esp. 24).
46. Deleuze (1987).
47. Whitehead (2004: 77). Bell (2006: 193–4) gives a good discussion of the relation of Deleuze to Whitehead on the event.
48. See J. M. W. Turner's *The Slave Ship* as discussed in Simon Schama's recent *Power of Art* series on the BBC (2006) and his article on Turner in 'The Patriot: Turner and the Drama of History', *The New Yorker*, 24 September 2007.
49. Deleuze (1969: 34).
50. I am using 'two' loosely here to indicate a binary opposition. Badiou has related but more technical uses of the term in his set theory (Badiou 1988: 227) and his definition of the eternal truth of love (Badiou 2006: 40).
51. The concept of 'two' in Badiou should not be confused with a numbering of units, but rather as the manifestation of a radical difference, to the point where his *L'Être et l'événement* involves the claim that 'two' is not itself an identity. This then leads into an equally radical view of the antagonism of political groupings whose differences cannot be subsumed (a point made repeatedly in *Le siècle*). In his book on Deleuze, *Deleuze: La clameur de l'être*, Badiou denies that Deleuze is a philosopher of the multiple and instead classifies him as a philosopher of 'the One'.
52. Badiou (1988: 195).
53. Deleuze and Guattari (1980: 31).
54. Events therefore have begun and continue to reverberate long before and long after their actual expression or effectuation. One of the ways in which Deleuze explains this is through the idea that events raise problems that go beyond them and that resist closing solutions in our response to given events (Deleuze 1969: 70).
55. Deleuze (1969: 77–80).
56. In *Logiques des mondes*, Badiou is highly critical of what he sees as reactionary politics with respect to the event (Badiou 2006: 62–7) and his interpretation of Deleuze on events would classify him as reactionary, in particular where Badiou finds either a diversionary commitment to inexistent multitudes or a new

religiosity in Deleuze's philosophy of events (Badiou 2006: 408–9). For a reading that raises religious themes such as 'spirit' and 'transcendence' in Deleuze see Goodchild (1996: 162–9).
57. Parsons (1996: 235).
58. Varzi and Casati (1997: 1–6).
59. I do not mean to imply that there is something particularly egregious about the selection of such relatively simple examples. It is rather that the 'spilling' taken by Davidson is hard to connect to the more overtly political and aesthetic examples and stakes considered by Badiou and by Deleuze (Davidson 200la: 43–5).
60. For a good biography of Cheever see Donaldson (2002).
61. Cheever (1990: 375–90).
62. Famous Cheever titles with this gnomic simplicity include 'The Swimmer' and 'The Sorrows of Gin' both in Cheever (1990).
63. Cheever (1990: 387).
64. Badiou (2006: 89).
65. Deleuze (1969: 205). See Williams (2008: 28–76) for a full discussion of this metaphysics in relation to the event and to language.
66. See Williams (2003: 186–7) for a more full discussion of reciprocal determination.
67. Deleuze (1969: 174).
68. See Colebrook (2002: 110–11) for a helpful discussion of infinitives and events in Deleuze.
69. Deleuze (1969: 37).
70. Deleuze (1969: 46).
71. Deleuze (1969: 188).
72. See Davidson (2001b: 163).

Speranza, the Wandering Island

Ronald Bogue

Abstract

Michel Tournier's novel *Friday* is the subject of an important essay of Deleuze's, in which he presents the concept of the 'a priori Other'. Alice Jardine and Peter Hallward have offered critiques of Deleuze via readings of this essay, but neither takes into consideration the full significance of Tournier's novel or Deleuze's commentary. Jardine and Hallward provide divergent and only partial perspectives on Deleuze. If there are several Deleuzes, each defined by a critical point of view, there is also a single Deleuzian problem that informs the Tournier essay and Deleuze's thought as a whole.

Keywords: Tournier, a priori Other, perversion, the possible, perspectivism, becoming

At the end of Michel Tournier's *Friday: Or the Limbo of the Pacific*, the subject of an essay of Deleuze's included in the appendix of *The Logic of Sense*, Robinson Crusoe decides to stay on the island of Speranza, despite the fact that a ship has at long last landed on his desert island and offered to rescue him. Twenty-eight years earlier, Robinson had been shipwrecked on the island, which he initially named the Island of Desolation. For the first several months of his stay, he desperately and fruitlessly laboured to build a boat for his escape. After failing, he resorted to submerging himself for hours in a swamp he called 'the mire', where he began to lose his mind, seeing at one point a vision of his sister Lucy, who died as a child. To save his sanity, he instituted an administrative rationality for himself, raising crops, gathering goat herds, building a shelter, writing an island charter, constructing a water clock, recording dates, keeping a diary, and so on. He mapped the island and renamed it Speranza, the island of hope, noting that its shape resembled that of a headless woman. He pursued a kind of hyper-capitalism, concluding ultimately that accumulation was the sole good and that consumption was evil. Yet he sensed that beyond the

administered island lay 'another Speranza'. He came closer to that Speranza when he bathed his naked body in milk and slipped into a womb-like cavern, discovering a foetal warmth that reminded him of the rising bread his mother had kneaded when he was a child. Eventually he came to embrace the feminine Speranza as his wife. He began copulating with the earth, burrowing his erect penis in the ground and inseminating the soil, his semen mysteriously producing mandrake flowers which he regarded as his daughters.

Then someone else arrived. Neighbouring Aracauna Indian tribes used the island for sacrificial rites, and one day Robinson witnessed a would-be victim escape his torturers. Robinson fired his rifle, caused the torturers to flee and saved the escapee, whom he subsequently named Friday. Robinson initially regarded Friday as a savage and considered it his duty to civilise the fifteen-year-old. Friday, however, was a recalcitrant subject, who exasperated Robinson to such an extent that he began to adopt the habits of a tyrannical slave driver. But Robinson was also becoming weary of the strict order of his island regime, and he sensed beneath the savage Aracauna 'another Friday'. So when Friday inadvertently ignited Robinson's stored powder kegs and blew Robinson's settlement apart, it was with a secret relief that he left that administrative order and entered a nomadic existence with Friday. He learned from Friday, who seemed an aerial spirit. The terrestrial Robinson, under the guidance of the aerial Friday, came to discover a new Robinson, a solar spirit who inhabited the island with an animal immediacy and experienced each day as the eternal return of a new present. Not surprisingly, when the *Whitebird* landed and Robinson began talking with the crew, he had misgivings about leaving the island and returning to the civilisation he now saw as alien. He decided to stay and continue his existence with Friday. Yet as the *Whitebird* departed, he discovered that Friday had departed as well, and in near despair he faced the prospect of dwelling alone on the island forever. He then heard a voice and found that a twelve-year-old cabin boy had jumped ship to avoid the constant beatings he had been subjected to. With equanimity restored by the promise of the boy's companionship, Robinson 'drew a deep breath, filled with a sense of utter contentment, and his chest swelled like a breastplate of brass' (Tournier 1969: 234).

In an early assessment of Deleuze's relevance for feminism, Alice Jardine treats Tournier's plot as a figure for the dangers of Deleuze's approach to sexuality, gender and power relations. She is especially wary of the concept of 'becoming woman', which she regards as strategically disadvantageous and suspiciously similar to recalcitrant male attitudes

towards women. All becomings pass through a becoming woman, she observes, but they all end in a becoming imperceptible – that is, in the erasure of women. She duly notes the alliance of Robinson's sister Lucy with the mire, Robinson's maternal affection for Speranza and his eventual embrace of the island as his bride. But with the appearance of Friday and the explosion of the fortress settlement, Robinson goes beyond Speranza. She disappears, and in an enactment of the primal male fantasy of a world without women, Robinson is miraculously presented with offspring in the form of the cabin boy, a child born for Robinson without the intermediary of a mother. For Jardine, Tournier's *Friday* aptly illustrates the subterranean motif of Deleuze's approach to gender: Speranza, the limbo of the Pacific, represents woman in limbo, and Deleuze's others, she concludes, eventually prove to be his brothers, not his sisters.

In Peter Hallward's recent book *Out of This World* (2006), Tournier's novel assumes a markedly different function. Hallward couples his remarks about Deleuze's essay on *Friday* with an extended meditation on Deleuze's early unpublished essay, 'Causes and Reasons of Desert Islands', emphasising the motif of a 'world without others' in the two essays. In the early essay from the 1950s, Deleuze treats the island as a figure of absolute origin and creativity. Under certain circumstances, the island remains 'deserted and unpeopled', no matter how many people may occupy it, for the island has become 'only the dream of humans, and humans, the pure consciousness of the island' (Deleuze 2004: 10). In the moment of its desertion, the island gives rise to 'uncommon humans, absolutely separate, absolute creators, in short, an Idea of humanity, a prototype, a man who would almost be a god [...] a pure Artist, a consciousness of Earth and Ocean' (Deleuze 2004: 11). In the light of this vision of the island as a pure creative consciousness untroubled by others, Hallward reads Deleuze's analysis of the 'a priori Other' presented in *Friday*. Hallward concludes that for Deleuze, the only meaningful form of creative thought entails 'the sacrifice of that most precious sacred cow of contemporary philosophy – *the other*'; hence, Hallward argues, 'a liberating return to the immediate and the impersonal will requires elimination of the other' (Hallward 2006: 92). Hallward treats this movement beyond the other as a symptom of Deleuze's weakness as a political philosopher. Hallward concludes that 'there is no place in Deleuze's philosophy for any notion of change, time or history that is mediated by actuality'. Deleuze is 'indifferent to the politics of this world', to 'mechanisms of exploitation and domination', "conflicts and contradictions' and to 'relations of conflict

or solidarity, i.e. relations that are genuinely *between* rather than external to individuals, classes, or principles' (Hallward 2006: 162), and primarily because his model of thought and creation is that of a world without others.

Jardine's reading of Deleuze and Tournier is understandable, and her objections spring less from the interpretation than the practical application of Deleuze's thought. Her presentation of becoming-woman is reasonable enough – she simply questions the strategic political value of the concept. She does tend to intermix Deleuze and Tournier, as, for example, when she attributes to Deleuze a reading of the characters in terms of earth, air and sun, whereas that association is inscribed directly in the novel, and Tournier himself says explicitly in a prose commentary, 'Earth + Air = Sun' is the same as 'terrestrial Robinson + Friday = solar Robinson' (Tournier 1988: 195; translation modified). Such manoeuvres, of course, allow her to imply that all aspects of the novel reflect Deleuze's attitudes, including the closing scene of Robinson with the cabin boy, when in fact Deleuze never mentions that plot detail. Perhaps she is correct that the novel's final section focuses on a brotherhood of Robinson and Friday, but we should note that Tournier briefly feminises Robinson when Robinson says of his 'elemental' sexuality, 'If this is to be translated into human language, I must consider myself feminine and the bride of the sky' (Tournier 1969: 212). Granted, this feminisation is only provisional, since Robinson adds that such 'anthropomorphism is meaningless', for 'the truth is that at the height to which Friday and I have soared, difference of sex is left behind' (Tournier 1969: 212).

Hallward's reading is more tangential than Jardine's, though oriented as well toward practical political concerns. Deleuze's explication of Robinson's disorienting experience of living in a world without others – something, we should note, Robinson undergoes only until Friday's arrival – asserts that an a priori Other structures commonsense reality before the appearance of subject or object, assigning them positions within the realm of the possible and orienting them in a chronological time. That a priori Other functions in roughly the same way as the agencies of common sense and good sense in *Difference and Repetition*, or, even more roughly, as the sensory-motor schema of hodological space in the cinema books. But as Boundas has pointed out, Hallward entirely ignores the 'otherwise other' Deleuze sees as emergent in Tournier's novel. Far from rejecting the Other entirely, Deleuze denounces only the Other as structure of limiting possibility, leaving room for an alternative world of 'otherwise others'. And such

a conception is not simply hypothetical or imposed on Tournier's text. Tournier says repeatedly that Robinson sensed beneath Speranza and Friday 'another Speranza', 'another Friday', and the relationship of two individuals as 'otherwise others' is directly presented in the interactions of Robinson and Friday in the novel's final section.

Neither Jardine nor Hallward do justice to the complexity of Deleuze's essay, which is a remarkable piece of literary criticism as well as a subtle set of variations on familiar Deleuzian themes. One might say that Deleuze adopts both Jardine's focus on the problematics of psychosexual desire and Hallward's concentration on the phenomenological, epistemological and ethical implications of the Other. The term common to these two concerns is 'perversion'. The a priori Other is a transcendental structure that organises space according to Cartesian coordinates and a Newtonian, Laplacean causality. The emergence of subject and object within this regulated space in turn gives rise to an organised sequential time of past, present and future. But most important, the a priori Other structures desire: 'In all these respects', says Deleuze, 'my desire passes through Others, and through Others it receives an object. [. . .] It is always Others who relate my desire to an object' (Deleuze 1990: 306). When Robinson enters a world without others, his desire loses its object – it turns away from its normative object, 'per-verts', and becomes first telluric, then vegetable and finally solar. In that turning aside, that 'per-version', Robinson discovers a different space, a new temporality and a social relation that is 'otherwise other'. 'What is essential', says Deleuze, 'is that Friday does not function at all like a rediscovered Other. [. . .] Not an Other, but something wholly other than the Other' (Deleuze 1990: 316–17).

At this point, it is worth considering Tournier's own reading of his novel, since his views point to elements of the novel that supplement Deleuze's interpretation and that Deleuze could assume his audience would already be aware of. In his autobiographical book *The Wind Spirit*, Tournier argues that myth is central to human culture. 'Man rises above animality only by grace of mythology. Man is nothing but a mythological animal. He only becomes man – he acquires a human being's sexuality and heart and imagination – only by virtue of the murmur of stories and kaleidoscope of images that surround him in the cradle and accompany him all the way to the grave' (Tournier 1988: 158–9). Myth is 'a fundamental story' (Tournier 1988: 156), '*a story that everybody already knows*' (Tournier 1988: 157). An allegory, by contrast, is 'a dead myth', and 'the writer's function is to prevent myths from becoming allegories' (Tournier 1988: 160). (We might note

that Deleuze, in his early essay on desert islands, says 'Literature is the attempt to interpret, in an ingenious way, the myths we no longer understand, at the moment we no longer understand them, since we no longer know how to dream them or reproduce them' (Deleuze 2004: 12).) For Tournier, Defoe's *Robinson Crusoe* is a myth in danger of becoming an allegory. Tournier revivifies the Crusoe myth in part by rendering it in the elemental terms of earth, air and sun, in part by uncovering the psychological dynamics of isolation buried by Defoe, and in part by envisioning a world outside the conventional real. The meeting of Robinson and Friday, says Tournier, represents not 'the marriage of two civilizations', but 'the elimination of every last vestige of civilization in a man subjected to the corrosive effect of an inhuman solitude: the very roots of his life and being are laid bare, and he must then create from nothing a new world, groping in the dark, feeling his way toward discovery, clarity and ecstasy' (Tournier 1988: 190–1).

Tournier also imbues the novel with a mythical-philosophical structure, whereby, as Tournier observes, 'the three stages of Robinson's evolution are related to the three types of knowledge described by Spinoza in the *Ethics*' (Tournier 1988: 196). Robinson submerged in the swampy mire corresponds to Spinoza's first form of knowledge that operates through 'the senses and emotions'. Robinson's administered island aligns with Spinoza's second form of knowledge, that of 'science and technology', a rational knowledge 'but superficial, mediated, and for the most part utilitarian'. Finally, Robinson's solar ecstasies represent Spinoza's third form of knowledge, that of 'an intuition of the essence of the absolute' (Tournier 1988: 196). But most important in his resurrection of the Crusoe myth is Tournier's focus on Friday. In *The Spirit Wind* Tournier reflects on his years of study at the Musée de l'Homme and the condescension with which Defoe treats Friday. That exposure to traditional cultures' wisdom and that awareness of Western racism, says Tournier, led him to vow that in his novel the cultural Other would not be dismissed or reduced to a distorted reflection of the West. Hence, part of Tournier's mission is, first, to reconfigure Defoe's mythical presentation of Crusoe as *homo economicus* and lay bare the logic of capitalism and colonialism in the first section of the novel, and then to counter Western racism and infantilising primitivism in the novel's closing section. In the novel's middle section, we might note, Tournier provides an analysis and critique of the eros of exoticism through his exploration of Robinson's libidinal engagement with Speranza. One can see, then, that in Tournier's mythic project there is a political dimension. His treatment of capitalism, colonialism,

exoticism and primitivism engages historical forces that continue to play through the present world. It is for this reason that Tournier remarks, 'I wanted to dedicate my book to all of France's immigrant workers, to those silent masses of Fridays shipped to Europe from the third world – some three million Algerians, Moroccans, Tunisians, Senegalese, and Portuguese on whom our society depends and whom we never see or hear, who have no right to vote, no trade union, and no spokesperson' (Tournier 1988: 197).

It is startling to note the degree to which Tournier's characterisation of his novel conforms to the Deleuzian notion of fabulation, which Deleuze only began to articulate in *Cinema 2*, *What Is Philosophy?* and *Essays Critical and Clinical*. The engagement with historically situated assemblages of power, the detection of the diabolical forces of the future, the hallucinatory invocation of the names of history, the mythic 'legending *in flagrante delicto*', the exploration of the floating time of the event, the invention of a new earth and a new people to come – all are present in Tournier's description of *Friday*.[1] Hallward's charge of a lack of engagement with the divisions, conflicts and inequalities of the socio-historical world certainly cannot be sustained against Tournier's fiction. A reader once asked him why he had not dedicated *Friday* to Defoe, and Tournier admits that 'the thought never even occurred to me, for it seemed obvious that every page of the book paid tribute to its English model' (Tournier 1988: 197). One might argue similarly that Deleuze need hardly mention in his essay on *Friday* that Tournier is reworking the Crusoe myth, that he is touching on central issues in the rise of capitalism and colonialism, and that he is countering European racism in his depiction of Friday. Such things are so obvious that they go without saying, and it would be odd were Deleuze deliberately labouring against the basic thrust of the novel and arguing that the work's theme and his own point is that one must eliminate the Other, escape historical contingency and move somewhere 'out of this world'.

If Tournier's novel resists assimilation within Hallward's scheme, does it lend easier accommodation to Jardine's treatment? Perhaps, but there is one alternative reading that might at least problematise a feminist interpretation of the novel. Tournier is a gay man, and though he does not thematise sexual orientation and concerns explicitly coded as 'gay' in the novel, one might ask, what would the work look like, not from the perspective of feminism, but from that of gay studies? Would the handling of the feminine and concentration on males seem as symptomatic of the sexism of dominant, heterosexual norms? Or would the exploration of the psychology of perversion suggest an openness

to alternative conceptions of sexuality available to men and women? Jardine argues that the cabin boy who remains with Robinson is a son procreated without the aid of a mother, but might the twelve-year-old (and the fifteen-year-old Friday for that matter) be seen as an ephebe, an older man's ideal lover (albeit of a Platonic kind)?[2] Is it possible that Tournier is slyly winking at the reader as he brings the tale to its conclusion?

Tournier was one of Deleuze's oldest friends, a close companion during their years as philosophy students at the Sorbonne and in later years as well. As Stivale has recently shown us, friendship has always been an important component of Deleuze's thought and values, and no other individual as close to Deleuze as Tournier, save perhaps François Châtelet, has been the subject of Deleuze's writing. All creators need intercessors, and Tournier in this essay is an especially intimate intercessor, which raises the question of the status of Deleuze's essay. In his works on Spinoza, Leibniz, Hume, Bergson and Nietzsche, it is not always clear when Deleuze is explicating the philosopher and when he is presenting his own views, and separating Deleuze from Tournier is especially difficult in this case. The essay is a generous offer of friendship, and a contribution to a collective thought about the Robinson Crusoe myth. As such, it certainly cannot be taken as an antithetical negation of the fundamental texture and spirit of the novel.

So, how might we situate this case of Tournier, Deleuze, Jardine and Hallward in relation to the question of whether there is one or several Deleuzes? Obviously, the issue may be approached in two broad ways, one in terms of interpretation, the other in terms of the object of interpretation. If we adopt a hermeneutical perspective, we may say that the Deleuzian text does not exist outside its activation by readers, and each reader will necessarily engage the text in a slightly different fashion. Hence, we would find as many Deleuzes as there are readers. It might be argued that this is a very un-Deleuzian approach, and though I would question Hallward's assertion that Deleuze is not an anti-foundational thinker (Hallward 2006: 134), I would agree that he is no proponent of the unrestrained free play of the signifier. Levi Bryant is right, I think, that even Nietzschean perspectivism, as it is commonly construed, is not really Deleuze's, but I would insist that the Leibnizian perspectivism of the clear and the obscure, which Bryant does attribute to Deleuze, entails a necessary differentiation of degrees of chiaroscuro in each monad, and hence a qualified support of a perspectival hermeneutics. According to this view, Jardine's Deleuze and Hallward's Deleuze are incommensurable, and necessarily so.

More interesting, however, is the issue of whether the object itself, Deleuze's thought, is single or multiple. Should we clearly demarcate Deleuze from the other philosophers he examines, Deleuze from Deleuze-Guattari, early Deleuze from late Deleuze? Raymond Bellour and François Ewald put the question directly to Deleuze in a 1988 interview: 'Should we take your work as a whole, as unitary? Or do you see in it, rather, breaks, transformations?' (Deleuze 1995: 135). Bellour and Ewald then propose a division of Deleuze's work into an early treatment of other philosophers, a middle phase of his own philosophy, including *Difference and Repetition*, *The Logic of Sense* and both parts of *Capitalism and Schizophrenia*, and a final return to more traditional philosophical topics in the books on Bacon, cinema and Leibniz. Deleuze responds, 'Three periods, not bad going' (Deleuze 1995: 135), then considers in sequence the three phases of his work, never really addressing the question of whether his work is single or multiple, but suggesting, ultimately, that throughout his career he has never ceased to invent concepts, and hence to do philosophy.

In the Tournier essay, one might discern evidence of a shift in Deleuze's work, specifically in his approach to the possible, which is regarded here as essentially negative and limiting, whereas in Deleuze's later works the possible occupies a positive role, as in his reference to the invention of possibilities of life as a goal of philosophy and the arts. One thinks specifically of Deleuze's citation of Kierkegaard in the Tournier essay. Like a spectator overcome by the heat of a crowded theatre, crying out, 'Water! Water!', so a bourgeois gentleman suddenly rushes to the window and exclaims, 'The possible! The possible! or I shall suffocate' (Deleuze 1990: 318). Deleuze asserts that Kierkegaard is 'only invoking the a priori Other' (Deleuze 1990: 318). Yet in *Cinema 1* (Deleuze 1986: 240) and *What Is Philosophy?* (Deleuze and Guattari 1994: 177), Deleuze cites the same remark and glosses it as a quest for possibilities beyond the actual, that is, outside the structure of the a priori Other. The contrast, however, is more apparent than real. The possible has two senses, the first of which is that which is practicable, feasible, predictable, a sense picked up in Bismarck's quip that politics is the art of the possible. But a second sense is that of alternatives beyond expectations, new conceptions and approaches outside conventions, a sense epitomised in the Pauline dictum, so important to Kierkegaard in *Fear and Trembling*, that with God all things are possible. From as early as Deleuze's book on Nietzsche, through *Difference and Repetition* and into *Essays Criticial and Clinical*, the latter sense of the possible may be found, and if Deleuze concentrates on the former sense in the Tournier

essay, it is to echo Bergson's critique of the possible as opposed to the virtual, rather than to discount the sense of the possible as the sphere of invention and creation.[3] This seeming difference in the articulation of the possible I see as symptomatic of the dangers inherent in the temptation to divide, periodise and segment Deleuze's thought. All too often, what appears to be a shift in position is actually merely a retooling of vocabulary. In my view, at a basic level there is a singular focus throughout his work. Granted, Deleuze is a philosopher of assemblages, planes of consistency, qualitative multiplicities, the one as an additional part existing alongside machines, the open whole, and so on. Yet I would argue that a single problem occupies Deleuze from start to finish – that of difference and its expressive individuation. A problem, of course, is not a fixed, stable entity, but a trajectory, a line of continuous variation, a modulation of a transmission frequency, a metastable locus of ongoing disparation, what Bryant has aptly called 'a durational tendency-subject', 'a sort of thread, flow, distension or "smear"' (Bryant 2008: 217). Yet that problem remains singular, if not single.

So are there several Deleuzes? Yes, and certainly so from the hermeneutical perspective. Is there one Deleuze? Yes, at least from the vantage of the continuing explication of a singular problem. Could it be otherwise? Yes, but from the position of the otherwise other – that is, it could be 'otherwise otherwise'. In *A Thousand Plateaus*, Deleuze and Guattari say that they aim to 'arrive at the magic formula we all seek – PLURALISM = MONISM' (Deleuze and Guattari 1987: 20). Perhaps our aim as well should be the magic formula, 'SEVERAL DELEUZES = ONE DELEUZE'.

Notes

1. For a detailed account of Deleuze's concept of fabulation, see Bogue (2006).
2. In the short story 'The Taciturn Lovers', Tournier briefly alludes to the sexual status of the cabin boy on board ships. In the story, an older man recalls having gone to sea as a cabin boy at the age of thirteen. 'But for a ship's boy on a deep-sea fishing boat, it was hell. As the Larousse dictionary of the time coolly wrote at the entry for "scapegoat": "the ship's boy was the crew's scapegoat". He was exploited, trampled underfoot, beaten and sodomized' (Tournier 1991: 5–6).
3. I treat this motif of 'the possible' at greater length in Bogue (2007).

Review Essay

Taking Deleuze into the Field: Machinic Ethnography for the Social Sciences

Mark Bonta

Julia Mahler (2008) *Lived Temporalities: Exploring Duration in Guatemala. Empirical and Theoretical Studies*. Bielefeld: Transcript Verlag.

Arun Saldanha (2007) *Psychedelic White: Goa Trance and the Viscosity of Race*. Minneapolis and London: University of Minnesota Press.

The social sciences need Deleuze and Guattari whether we know it or not. We need them with us in the field. In my discipline (geography), we have a disturbing tendency to attempt to fold the 'latest' Continental theorists into series of speculative journal articles where we discuss how and why they should be used, and why they are an improvement on the theorists we were using five years ago. Enough articles like these and we then claim we have 'done' Deleuze, or whomever, and it's on to the next hot thinker. But the social sciences, dominated still by traditional (by which I mean pre- and anti-poststructuralist) approaches, are orphan stepchildren in the process whereby theory moves from the Continent to English translation, into the humanities and from there leaks and creeps into the social sciences. Sometimes decades late. And even when there is notable contagion, at least in the US, it is generally contained locally, within a few odd departments. Some do make it through, of course: Foucault, for example, seems to be gradually tunnelling his way toward the 'mainstream' and can occasionally be seen in the company of others of his kind. Mention of Deleuze and Guattari, however, like Derrida, still elicits uncomfortable squirming and awkward silences in 'respectable' social scientific circles.

Where social scientists, particularly anthropologists, are engaged in critical and deconstructive endeavours, there has been for some time

a close engagement with Continental theory. The challenge before Deleuzians is to show that works like *A Thousand Plateaus* (1986) can also guide and inform field-based research, in which all of us – sociologists, anthropologists, geographers, psychologists, criminologists, historians, economists and political scientists – are engaged, either directly or indirectly. Protevi and I (2004; see also Bonta 2001) have argued that Deleuze and Guattari's 'geophilosophy', read as complexity theory, can indeed provide substantial ontological scaffolding for the social sciences (though geography is a bit of an odd case because it is part-physical science) via an emphasis on the creative, self-organising, and rhizomatic characteristics of the social world. And now a rich, book-length literature is emerging along these lines, and this will make all the difference.

To take the example of geography again, in the 1990s, Deleuze and Guattari were primarily understood as proponents of 'nomadology' and most of the rest of what they had to say was politely ignored or misunderstood as clever wordplay and metaphor. But the Deleuze onslaught has continued, of course, and the publication of *Deleuze and Space* (Buchanan and Lambert 2005) and a scattering of other works (e.g. Byerley 2005; Halsey 2006), along with the healthy growth of Deleuze studies in general, came to inspire two doctoral students in the social sciences to plow into the heart of his oeuvre and put him to work for three very distinct field studies. Arun Saldanha, a geographer, uses Deleuze and Guattari's machinic approach in *Psychedelic White: Goa Trance and the Viscosity of Race* to devise a new theory of whiteness and race; Julia Mahler employs a blend of anthropology and psychoanalysis in an ethnographical study of highland Guatemala, *Lived Temporalities: Exploring Duration in Guatemala*, informed primarily by Deleuze and Bergson.

The creation of this new literature is enormously gratifying to me, because it is one thing to advocate that social scientists use Deleuze, but another thing entirely to be among the first to make the leap and demonstrate – I believe successfully in these two cases – that they are not just to be cited among others (to please a committee, perhaps) but rather should be considered as powerful allies in our social scientific endeavour to disentangle the human world, its conceptual categories and its relationships to space and time. Throughout this essay, I shall be attempting to show how these two authors contribute to this breakthrough – how their own experimentation, through being largely faithful to the machinic, materialist Deleuze, gets us past the logjam of antinomies that plague our disciplines. These two obviously took

Deleuze into the field with them, on Guatemalan buses and to the beach at Anjuna. That's a comforting thought.

I would like to get the bad news out of the way first, and the first bit is simply about the clutter. On one hand, both studies, through the nature of what they are doing, perforce spill a lot of ink on making sense of Deleuze to a wider academic public. This is necessary and can be gratifying to see; as in all ethnography it can detract from the narrative, but here it is entirely understandable that Deleuze (as always) has to be explained from the beginning. On the other hand, both are also re-writing doctoral theses, so there are obvious problems with the retention of scaffolding. Mahler's book is the most troublesome in this sense, as at times poor translation from German is exacerbated by an annoying tendency to wedge the ethnographical narratives – every chapter – between theoretical foreplay and post-event analysis. Saldanha is more successful here, as his rather amazing writing prowess gets him through some sticky parts, particularly toward the end of the book where he has a somewhat viscous exit strategy: after revealing his machinic theory of race, he then returns to the parties of Anjuna and wants to try to settle what should be done there, ending with some comments about beggars that I found a little odd, even offensive. I could feel the ghosts of his doctoral committee peering over my shoulder.

Happily, these turn out to be mostly editorial issues, and both texts are redeemed so that the reader doesn't feel that the only reason to wade deeper is for the love of Deleuze and certain curiosity about whether they 'get it right' (to a large extent, I feel they do). Saldanha's work is a page-turner: hippie enclaves are something geographers who have travelled can't fail to have noticed and wondered about (and perhaps participated in). There is a certain appeal to a text written by a researcher who uses foul language and admits to having dropped acid at all-night raves that only get 'pure' after sunrise. The whole premise is unremittingly cool, and it pulls you along (I could hardly put it down – how often does *that* get said?). Mahler's study was at first almost the opposite for me, particularly because she's writing about a part of the world that I know well. But once I got accustomed to the odd English, the theoretical excesses and the poorly informed discussion of 'Ancient Maya' (29–34), I found that the ethnographical narrative was superb. Her micropolitical descriptions of everyday life in Quiche Maya households, markets and buses rang true – embarrassingly enough, they sound better and more like what one really experiences than too many of the works in the voluminous geographical and anthropological literature that she almost unfailingly ignores. Thus I came to admire her refreshing, outsider

approach to one of the most social-science-saturated landscapes on the planet.

Now, on to the flesh. In *Psychedelic White*, Saldanha applies his 'nonessentialist, nonmechanistic, and emergentist materialism' (27) to an ethnography of place, and seeks thereby to foreground a novel ontology of race. His guiding concepts – virtuality, embodiment, face and location, for example – are heavily tinged with Deleuze and Guattari (Levinas, Massey, Goffman and others also make appearances), but he creates 'viscosity', which he defines as 'pertain[ing] to two dimensions of a collective of bodies: its sticking together, and its relative impermeability' (7). In this case, his study highlights again and again the way that whiteness is performed in certain locations through 'viscous' practices that help stick like bodies to like – a process of sorting and sifting a certain sediment, particles that stick together and create a pack of whites, an island of whiteness in a sea of others, connected to other white islands through time and space, island arcs across Asia and the world, lines of flight traceable to bourgeois discontent with Whiteness in the West and becoming-West (the latter: others who, by virtue of practices and qualities that make up for their unwhite skin tones, get accepted). Ironically. In short, Saldanha's very defensible idea is that hippies and their ilk, and their descendants, the ravers of Goa circa 2000 CE, never escaped what they rejected in the West. In their searches for authenticity and the Other, they nevertheless did not become-other and disappear into the warp. Rather, they clustered together in certain apparently non-Western exotic locales: Kathmandu, Marrakesh, Bali, Goa and so forth, creating their own worlds riven with microfascistic tendencies.

Saldanha rejects discursive theories of whiteness and particularly the type of social constructionism that permeates white studies. He wants his whiteness to be gritty and to depend on what happens in Goa – what really happens – though at the expense of non-whites, who often come across as little more than caricatures: beggars, Indian tourists and 'locals' in general. This is perhaps the only real disappointment in the content, but it is likely the price of empathising with a highly exclusivist spatial identity; participant-observation takes its toll. He hopes, through the study, to arrive at 'not an abolishing of the idea of race, but its critical reappropriation so as to combat racism more effectively' (9). Race, to him, is 'a heterogeneous process of differentiation involving the materiality of bodies and spaces', and 'racial difference emerges when bodies with certain characteristics become viscous through the ways they connect to their physical and social environment' (9). Race is to be understood as a machinic assemblage; categories of race emerge

from the sifting and sorting practices of lightly hierarchised rhizomatic communities forever tapping into a far-from-unlimited realm of virtual possibility.

'Psychedelic whiteness' (Chapter 1) is a skilful geohistory of the West's discontents, a century and more of mystics turning from the Rational to the East, and homing in on India (Chapter 3). Said upside-down. Goa, part-India and part-world, apparently unrooted, 'the place where people go to run away from India' (words of an informant, thirty five), becomes the setting for a decades-long party sucking in the wretched refuse of the West, a place for creativity, individuality, spirituality and simplicity, as an informant would have it. Trance dancing is simply the latest expression of how it goes to be white there. Reality is hybrid and nonconformist if you're one of Us, like/unlike the author, 'half-Indian, half-Belgian, definitely not white' (45). A core evolves: the 'Goa Freaks' (Chapter 4), a specific identity, little suns of non-conformity, epitomes of cool, black holes sucking in more peripheral bodies, their lines of flight become microfascistic. Saldanha spends many chapters explaining the mechanics of how this happens: through drug taking (Chapter 5), trance-dancing (Chapter 6), travellers' 'war stories' and the siege mentality of being a xenophobic backpacker on the cheap in the non-West (Chapter 7), the visual economy of dress, body modification, motorcycle riding (Chapter 8). The description rarely lags, and is accompanied by helpful sketch maps and photos that plot the micro-geography of clubs and outdoor raves, where he applies the white wall/black hole system to the face-sorting constantly going on, allocating bodies to specific places and times and reserving the sunlit hours of the morning for the whites: a 'combination of visibility, intoxication, outlandish music, a peculiar sociability, and an exoticist attitude toward the tropical sun … keeps outsiders out' (127); thus, 'subculturally pure … comes to mean racially pure' (131).

Later chapters move from the exclusive and 'cool' spaces, where highly specific sorting takes place, to more heterogeneous situations, particularly those involving markets, the law and the 'Third World' in general. Highly racist behaviour is to be expected; the author's tentative solution is via Levinasian ethics, e.g. 'being friendly to poor Indians' (176) as a place to start. This seems very lukewarm to me, and unnecessary as I don't think such a 'machinic geography of phenotype' (Chapter 16) requires any sort of transcendent ethics whatsoever. Oddly enough, he claims to not want to deal with Deluze and Guattari's 'anarchic' and 'avante-garde' tendencies (210), yet these very tendencies are what would allow us to understand the pervasiveness of racialist

overcoding and the striations not only of Worldwide Whiteness and the molar but also the molecular when it folds in upon itself. The 'nouvelle terre' could emerge not only after recognition that The [White] Man's got us down, but also as we ourselves do not succumb to viscosity at the expense of unbecoming-local.

Julia Mahler's *Lived Temporalities* is an important book in a wholly different sense. She is a trespasser in the social sciences, and we need more of those: inventive even when reifying, unafraid and jumping across to the 'Other' as if she were one. In a sense, she does what Saldanha cannot, ignoring the tourists and getting in deep with Guatemalans. For the sake of space I shall spend little time on her theoretical discussions, which are as heavily engaged with Bergson as with Deleuze. I can't say that I agree that 'Deleuze's entire work is vitalist' (49) but I am more interested here in getting across the authenticity of her portrayals of lived time in the Guatemalan highlands. I think many Deleuzians would have much to argue with in this text; in the Preface, for example, she argues that one can inhabit the event even while claiming that the Deleuzian event is narcissistic, without an other as other; she uses Jessica Benjamin's interrelational theory to attempt to get past this. She sees the Deleuzian actual as enemy to the virtual, whereas I see this relationship as endlessly productive lemniscate. I am relatively certain we would not agree.

She explores 'passive time' à la *Difference and Repetition* (Deleuze 2004) in Chapter 2, and this is where I begin to be convinced that Mahler and I have inhabited the same Deleuzian Central America. Section 2.2.1.1 'Chopping Firewood' (73), for example: 'Firewood produces an atmosphere of time passively unfolding in all its weight, full time. The atmosphere gets produced through signs that signal the co-existence of the non-abbreviated and non-mediated temporalities of nature and the non-abbreviated and non-mediated temporalities of people.' She demonstrates how this works through thick ethnographic description, and sets the pattern for the entire work. Next: tending the fire, temporalities of water, cleaning clothes, washing the body, temporalities of sweetcorn, temporalities of saints, and so on. Guatemalans, she tries to show, 'tend to live among so much passive time, but [don't] appreciate it particularly' (107) in the sense that the way that they inhabit the event seems so normal that they do not detect it, while she, the European, is struck by every nuance. What she is doing, it turns out, is empathising with the distinct temporalities of the so-called 'Third World', with a decidely unhippylike delight in everything that is strange. She unfolds herself onto and into Guatemalan space-time

without the need for critical distance – she tells us what she's thinking all the way along, and eventually we get the point. Chapter 3 explores immanence and territorialisation via the passive self and the market; Chapter 4 delves into the unpleasant as a way of reaffirming life (via war, excreta, chicken-killing and trash, for example); Chapter 5, via engaging accounts of riding on buses, unravels the time of the event, contrasting Chronos with Aion. Theoretical differences aside, I would like to say that Mahler gets closer to what is true in the social world of the highlands (and this has wide applicability across the Central American cultural region) through her painstaking approach than most others have. The rhythms and refrains of life, constructing the interwoven space-times in endlessly creative ways, *are* Guatemala – hers is the complement to Saldanha's account, as if the latter had abandoned the freaks and explored what it meant to be Indian. Both accounts are brimming over with Deleuze and enough practical application of concepts to keep us busy in the field for the time being.

It might go something like this. Doing ethnography is a way of letting the world wash over us, taking note of what's going on, and making sense of it all through the construction of narratives without doing violence to the interwoven complexity of the forces at work out there. We take Deleuze into the field, we're crammed into a bus somewhere, how in the hell is any of this supposed to make sense? Where's the ritornello? The pineapple plantations whizzing by appear to be striated, but there's so much dust coming in the window that the thought of 'faciality' actually being something you could apply to what's going on around you before you get back to some sterile quiet space somewhere (where it's relatively easy to do so, ex post facto) is nauseatingly laughable. You throw up your hands – it takes years to get on top of the 'basic data', to become proficient in the languages and landscapes. Why not just paste theory on afterwards? If you go out looking to reinforce the theory that's in your head, good luck – you'll likely find what you were looking for (or perhaps never complete the study). Deleuze is hinting at ways to figure out how the full corporeality of the world works while we're in the world, not just providing us with endless new ways to interpret the meanings of signs from a safe distance. But Deleuze, like many honest philosophers, was, as we say, 'not exactly a field person'. Try writing *your* doctoral thesis as a set of interconnected plateaus with a fair number of invented concepts and foul language. Power/knowledge: the censo/u/reship is not to be taken lightly. Bottom line: Mahler and Saldanha, and others, are opening the door, preparing the way, paving over the rut for the rest. I would hope that at

some point, Deleuze becomes imperceptible – a veritable Descartes, but a better coordinate system for the social.

3rd International *Deleuze Studies* Conference

Connect, Continue, Create

Deleuze and Nomadic Methodologies

Amsterdam 12–14 July 2010

ASCA/CFH
Amsterdam School of Cultural Analysis with the Centre for the Humanities at Utrecht University

'Philosophy needs a nonphilosophy that comprehends it; it needs a nonphilosophical comprehension just as art needs nonart and science needs nonscience', Deleuze and Guattari argue in *What is Philosophy?* The third annual International *Deleuze Studies* Conference will address the relevance of nomadic thought for contemporary scientific, critical and artistic practices. More specifically, it will explore the fast-growing new interconnections among the three domains of art, science and philosophy, by mapping out and exploring the complex ways in which transdisciplinary encounters can be engendered. Combining critique with creation, the conference will focus on issues of methodology by positioning Deleuze's philosophical work as the missing link among different domains of scientific enquiry and philosophical and artistic practice today. Central questions are: What are the different ways of interference among these different areas? What kind of methodological implications do their dynamic encounters entail? What are the limits of transdisciplinary connections, relations and fields? What kind of research is art practice? In a world that is increasingly technologically linked and globally mediated, how can scientific disciplines connect in distinctive and productive ways, both among themselves and with practices located in the world of art and thought? The conference rests on the assumption that rhizomatic growth and interrelations are unpredictable but this does not mean that they proceed randomly. Connections may be broken but will always continue to grow in other directions and create new encounters, new thoughts and new affects. Accounting for the unexpected patterns of both sustainable

and unsustainable interconnections is one of the challenges of nomadic methodology. **Parallel** to the conference several **art events** and **film screenings** will take place in Amsterdam, Utrecht and Eindhoven.

Conference Organisers: Prof. Patricia Pisters, University of Amsterdam; Prof. Rosi Braidotti, University of Utrecht. For information asca@uva.nl. See also the conference link at www.hum.uva.nl/asca.

Deleuze Camp

Preceding the conference students can participate in the Deleuze camp **Mille Gilles** which will take place on **5–9 July 2010** in Amsterdam. In intensive sessions participants will read texts by Deleuze and Deleuze scholars with the help of experienced scholars from different fields. The Deleuze camp also includes a student forum in which participants can launch their own ideas and questions. Places are limited. Please address your application to Amir Vodka: avodka@gmail.com

Introduction to Félix Guattari's 'Project for a Film *by* Kafka'

Gary Genosko Lakehead University

> *CONTROLLER*: *All who are here today must remember that we are gathered in a ritual to approach what is called Kafka through Kafka, by Kafka, with Kafka.*
> *THREE*: *Whatever Kafka means. (She speaks, dreamily.)*
> *TWO*: *Kafka? Someone said Kafka . . . Kafka? (A sudden cry.)*
> *THREE*: *What is Kafka?*
> *CONTROLLER. (Moving toward THREE, threatening her with the knife). We are joined in a struggle against incomprehensible odds. We must all enter the ceremony.* (Shein 1975: 23)

Franz Kafka's 'oeuvre', Guattari thought, was falsely manufactured after the fact as a 'corpus' and a 'work'. Instead, Guattari found it full with failure, fragmentation, and minoritarian tendencies: deterritorialisations, anOedipal becomings, collective assemblages of enunciation that loosened statements from subjects, and literary machines of all sorts: rhizomatic letters, stories of animal becomings, unfinished and interminable novels. Failures at formalisation link writing with becoming, and make it possible to see the singular transversal lines crossing language and literature, but also exiting these, too, along intensities running across institutions, professions, and social movements.

There is, of course, the 'Kafka book' co-written with Deleuze (Deleuze and Guattari 1986), but that is not all, even if it should be enough for anyone. There are many notes for unrealised projects, out of which this translation has been created. Guattari was fascinated with Kafka's dreams; he collected and numbered them (in *Soixante-cinq rêves de Franz Kafka*, 2007), commenting that they 'engage the most diverse and heterogeneous semiotic means: those of theatre, dance,

cinema, music, plastic forms, and once again, to be sure, writing!' (Guattari 2007: 29). Moreover, these dreams are 'open, machinic indices' conjoining Kafka and Guattari, literary and schizoanalytic machines, and open in the sense of 'how they have fertilized and broken such and such semiotic or behavioral chains' (Guattari 2006: 405). A machinic dream interpretation follows the deterritorialising line and its messy nonsense, fuck ups, brutality, and sputtering flows of particle-signs. But the collective assemblage that is Guattari's Kafka also includes his 'first schizo' patient, who he had copy out *The Castle*, and the tape recorder Guattari used to play back sessions since this patient liked to listen to his own voice (Guattari 2006: 146). And then, many decades later, the internet comes along, and its Kafka potentiality is staggering – what better medium than one that enables two or three enthusiasts to communicate about Kafka's dreams by means of keyboard and screen, Guattari remarked (Guattari 1985: 11). Schizo processual chain: Guattari, R.A. (patient), Kafka, journals, writing, copying, tape recorder, e-mail . . .

François Dosse reminds us of another Guattari: an inventive curator of multimedia exhibitions, a 'Kafka event' on the occasion of the 100th anniversary of his birth, mounted in the summer and fall of 1984 at the Centre Pompidou in Paris (Dosse 2007: 294 ff). Kafka event: dream texts, dream theatre courtesy of Philippe Adrien, seminars, dream cinema (by François Pain). It may be said without exaggeration that Guattari never stopped working on Kafka who was, after all, his favourite author (Guattari 2006: 146). He even wanted to tour the exhibition to Japan.

The semiotic at issue here is cinema. To the existing relation of Kafka and minoritarian becoming in a literary key, Guattari adds cinema. For Guattari, minor cinema precipitates becomings minor (practical enrichments of schizo desire) in the mass, just the sort of people he wanted to reach with 'Le Siècle de Kafka'. And to become minor is not to be in a minority or the representative of a minority, or even to formally acquire the characteristics or status of a minority through some affiliation. It is not a question of mimesis or membership, but of how to produce becomings that might summon a people with whom cinema connects. The fundamental theoretical problem here lies at the heart of what it means to summon a new people without teleological or messianic politics. And on television, no less! What Guattari thought he needed to accomplish was to make a film that would find some funding through the production of television shows, perhaps culminating in a 'cultural series'. Television was a choice medium in Guattari's search

for a potential public, a public yet to come, with which he attempted to connect through minor Kafka becomings, engaging sensibilities not yet fully entangled in dominant normative modelisations. In short, an anOedipal, anti-axiomatic Kafka assemblage; a Kafka not closed off by editors and translators; a molecular Kafka beyond representation (not 'about' Kafka but 'by' Kafka through Guattari's production group); independent Kafka affects that connect across existing strata, blending with real material fluxes, intervening in and resisting stolid representations, enriching flight paths of singularisation, right at the heart of repetition (that is, 'the threshold of deterritorialization' in Titorelli's 'companion' canvases in *The Trial*; see Guattari 1984a: 258; Kafka 1968: 163).

Guattari believed that Kafka was nothing less than the future, but in addition to the sense of a people to come just evoked: 'Kafka is not, as some have said, a nineteenth-century writer imprisoned in family conflicts. He is a twenty-first century writer describing the earliest stages of a problem whose implications we are barely beginning to grasp today' (Guattari 1984a: 259). Qua bureaucrat, Kafka struggled against the perverse satisfactions of bureaucracy – its micro-fascisms that trap power in static forms, procedures, protocols, and hierarchies, alienating those encountering it.

But Kafka's relation to bureaucracy has been misunderstood, Guattari insisted. His vision was not sombre and sad, but full of humour, and insight into the perversions of bureaucracy. Indeed, recalling a comment in *A Thousand Plateaus*:

> if Kafka is the greatest theorist of bureaucracy, it is because he shows how … the barriers between offices cease to be 'a definite dividing line' and are immersed in a molecular medium that dissolves them and simultaneously makes the office manager proliferate microfigures impossible to recognize or identify, discernible only when they are centralizable. (Deleuze and Guattari 1987: 214)

The perverse mixing of transversal communication between compartments, workstations, boxes on forms, with the boss at the top corner office, and company crest at the top centre of the page, is in the Kafka assemblage. The 'great paranoid bureaucratic machine' and the 'little schizo machine' are in the same assemblage (Deleuze and Guattari 1987: 34).

Guattari worked with Yasha David on the Kafka exhibition. Here and there he mentions this collaboration, sometimes referring to it as a joint project, at other times suggesting he had 'entrusted' the running of the

event to David (Guattari 1996: 235; Guattari 1984b: 1). Whatever the case may have been, Guattari also notes in every instance the trouble he experienced with the arts bureaucracy at the Centre Pompidou: 'Those in charge at the Pompidou Centre made it so difficult that, on several occasions, we thought we would have to abandon the project' (Guattari 1996: 235). So Guattari, in a very Kafkaesque manner, plugged into a bureaucratic machine, in organising the centenary celebrations of Kafka's birth.

Project for a film *by* Kafka? Yes, Guattari's emphasis is deceptively simple. The affects with which Kafka wrote may live in film made for television because they are independent and survive their author, remaining available for 'non-human becomings' of readers to come: 'artists are presenters of affects, the inventors and creators of affects. They not only create them in their work, they give them to us and make us become with them' (Deleuze and Guattari 1994: 173, 175).

Finally, it has to date been hard enough to think of Guattari as a film theorist (Genosko 2009), let alone as a filmmaker. Perhaps this fragmentary outline, which is not the only evidence we have, is most important for the role it may play in helping readers of Guattari to overcome existing difficulties, think of minor cinema, and join the Kafka assemblage.

Project for a Film *by* Kafka[1]

Félix Guattari

Abstract

This short document, appearing for the first time in English translation, concerns the prospects of a made-for-television cultural mini-series inspired by select episodes in Kafka's works. A window is opened onto Guattari's curatorial ambitions, cinematic projects, and theory of minor cinema, bringing into focus how he translated theoretical preoccupations into the cultural sector with reference to diverse semiotic media.

Keywords: Félix Guattari, Franz Kafka, film and television, workshop, exhibition, script

[1. DRAFT]

The Kafka draft may be divided into three large sections:

1. A video workshop, consisting of six important sessions staggered every two months, that brings together material for a script;
2. The writing of the actual script by a small team;
3. The film's production.

We are, of course, particularly interested in phase 1. It consists of two aspects: the study of a film project on Kafka and the more general study of the method of developing scripts, in terms of a critical analysis of actual cinematic practices.

We will then be faced with three distinct financing problems, phase 1 probably being taken care of by different television stations in view of producing a 'cultural series', and phases 2 and 3 being handled by producers.

Kafka's work and life seem to lend themselves especially to this type of project; indeed, it would not seem proper to expect that a scriptwriter should monopolize all the dimensions likely to go into the film (on the levels of design, music, sound, gesture, etc.).

It is worth remembering that Kafka's work has itself been largely reconstructed, superficially, by Max Brod, on the basis of material pulled from texts Kafka wanted to burn. This work, to borrow Umberto Eco's expression, is essentially 'open'. But the literary machine made of it a closed work: it manufactured books like *The Castle* or *The Trial* out of sketches; it made choices, and a Dutch researcher, Herman Uyttersprot, was able to demonstrate how the order of chapters as fixed by Kafka himself had not been respected. In fact, novels were produced that absolutely do not correspond to that which we can reconstitute from Kafka's project (Max Brod managed to find a sort of religious conclusion to *The Trial*, whereas it was actually the chapters on the very rich character of Titorelli, open to all the azimuths of art and sexuality, that make up the natural continuity of the novel). We have tried to show that the subject of Kafka's death is in fact a short story that could fit perfectly at the beginning of the book. Even a novel like *Amerika*, which seems to be the most constructed, is unfinished. If we take a closer look at Kafka's work, we notice that numerous appended notes, which in present editions have been placed outside of the text, have in fact as much importance as the text itself. We cannot say that Kafka would not have modified the works as we now know them on the basis of these sometimes microscopic notes. In fact, I believe we are in no position to distinguish, in Kafka's work, what constitutes short stories, novels, the diary, the correspondence, etc. Because of the very fact that Kafka had an extremely rigorous literary ideal – Flaubertian, Kleistian – he left us with a work of failure, according to him, a fragmented work. He only acknowledged the validity of certain short stories like *The Verdict* or *The Metamorphosis* and, for the most part, he renounced his work. But on the other hand, implicitly, he acknowledges it: certain comments show us that what interests him are very small sentences, very small sequences. For example, he explains that what interests him in cinema is not the whole of the film, but a comment, a retort, and this sometimes even in very bad films.

If we want to respect what seems to be the profound inspiration of Kafkaism, we must endeavour to capture the molecular elements of the work and to deal with them in all possible matters of expression. What interested Kafka, and what should interest us in cinema, are not characters, plots, but systems of intensity, gestures, reflections, looks – for example a face behind a window, attitudes, sensations, changes in gravity, in space and time coordinates, and the dilations or retractions of all perceptual semiotics... For too long, Kafka has been described as a literary hack of the nineteenth century; in fact, his

approach to unconscious social processes places him perhaps on the level of the twenty-first century, on the level of what could be twenty-first-century cinema.

The (inordinate) ambition of our project would then be not to make a film about Kafka's work, or a film on Kafka, but a film *by* Kafka; let Kafka's machine live within the coordinates of cinema, work within the oeuvre. It appears to me that only a group, bringing together people with different points of view and setting out from systems of specific singularities, will be able to contribute in ways that make the themes, and the significations that tend to impose themselves, explode. We could start with sequences like the ones with characters who, heads bowed, beards crushed to their chests, curl themselves up; or those that stand up in one shot, that put their heads through the ceiling; these animal heads that burst in through a window or through a wall; the diverse becomings-animal; the fact that a little detail starts blooming and transforms the whole landscape (I am thinking specifically about this cathedral scene, when K. notices a detail on a relief and, after this, the novel seems to turn in a new direction).

We would therefore in no way have to seek to identify a work or flesh out one type of character. Indeed, it is not the same K. character that traverses the various works or even each of them. If we read the text carefully, in *The Castle*, when K. arrives at the outskirts of the village, we realise that a certain number of his characteristics disappear in the rest of the novel: at the outset, he appears to be a married man, a sort of sales representative, a little bit like Kafka himself was for an insurance company; then the character takes shape, acquires a certain authority, bends in different directions. With the K. of *The Trial*, we are dealing, at the beginning, with an extremely ambitious, proud character linked to the bigwigs of the bank – we have to remember that Kafka himself was not a low-level bureaucrat but an important civil servant, much appreciated by his superiors. Along the way, K. loses some of his rigidity and, at the same time, takes on a kind of authority . . . There is no uncertainty here, in fact there are clues to find, lines of desire to discover in *The Castle* as well as in *The Trial*, or in the short stories. One of these directions, that could be explored from the outset but just as easily abandoned along the way, is a certain type of *jouissance*, what we have called 'bureaucratic *jouissance*', that is established through the power relations of the bureaucrat who 'holds' his employees, who 'caresses' his folders, and who argues about them to the point of losing sight of them. This should lead us to turn away from making a film noir, a sad film; Kafka's work is essentially humorous, violent and cheerful.

The workshop of phase 1 might then consist in bringing together a certain number of people working on Kafka's oeuvre from their own perspective, capturing in their own way these lines of desire. Some will retain such themes as the window, or the woman in black with her silk shawl around the head, whom we find in the entire work; or even the small dog, a kind of little monster that pursues you in the night, etc.

Bringing these themes to light will give rise to suggestions concerning composition, editing and semiotisation. We can imagine that actors such as Jean-Pierre Léaud would seek to portray such and such a gesture, such and such an attitude; whereas a set designer would sketch the stage setting, etc. The interval between sessions should allow a minimal video summary [of one session] to be presented in the following session, which does not at all mean that from one session to the next choices or the slightest organization of work should be made. Indeed, during this phase, we should remain within the same exploratory perspective; nothing will prevent us from contradicting ourselves from one session to the next. I clearly imagine the presentation I could make, at one of the sessions, about certain Sologne farms as the setting of the new *Defence of a farm*, but, just as well, on another occasion, I could suggest a wholly abstract setting. The polyvocality of the collective inspiration should not in the least reduce each intuition to a consensus; it is in this sense that the fragmentation of Kafka's work should be protected. Perhaps in this way we could bring to light certain dimensions that are generally crushed in the typical working of cinema. This concerns the work of the screenwriter as well as that of the musician, the set designers; indeed, even the decorators, the lighting, sound, and make-up artists, etc. Maybe each of them would be able to tip the balance of opinion and seize upon a trait especially appropriate for highlighting a particular system of intensities.

At the end of this year of work, twelve to twenty hours of video, summarizing the totality of the work, would serve as the basic material for two types of activity:

1. the production of a script by a team in charge of phase 2 (which would not necessarily be dominated by film professionals, but depend on negotiations with the producers);
2. a series of TV shows, with the aim of absorbing costs, and that might result in a cultural series. But it should be understood from the get go that at no point should the workshop be impelled by the video team towards 'making a show'. The video team will have to submit a report, and participate in the rest of the work, without

imposing its point of view, which would be that of the presentation to television viewers.

The possibility that a part of this material accumulated in phase 1 be used in phase 3 in making the film implies that the work must be made with quality video (probably 2 inch tape).

About phase 3, about the film itself, I will not say anything else except that, ultimately, the producer will be asked to take limited risks. In fact, phase 1's workshop should be mainly financed by TV stations, and the producer will be asked to finance part of phase 2, that is to say, the part of the work of the professional team participating in the workshop.

[2.] COMPLEMENTARY NOTES

The whole film takes place along a wall:

- wall of the farm at K.'s arrival;
- wall across which runs a beam of light, indicated by the woman who writes in the night and whom children join;
- wall of the inn through which Frieda indicates Klamm sleeping;[2]
- wall along which two children run and 'catch' little Hans;
- wall of the farm, this time seen from the inside and that will open to let the official procession pass . . .

During the first half of the film, the wall, seen from the outside, conceals a mystery and lets K. sense the existence of the castle. During the second part, after having cleared the wall in the children's dramatic scene, we discover that the castle is not mysterious at all, that everything that takes place there is the result of typical behaviours, gesticulations and bureaucratic rituals.

This wall's *plastic* and *musical* unity should cross the entire film, different scenes somehow detaching themselves from it. This way, intermediate scenes depicting, for example, a gliding motion along the wall, or else an immobile face-to-face revealing the almost imperceptible modifications at work within it (a little like in Henri Michaux's film on drugs), would be of great importance, especially from the musical perspective, thus bringing out a common thread through the same kind of blend of sounds, noises and words these scenes would showcase.

The wall is synonymous with the absence of the face and the absence of the eyes. I thought under these conditions, an alternative to the wall could be suggested in the form of a face, always the same, in extreme

close-up, speaking very loudly and therefore integrated into this music-noises-words complex previously put forward. As the camera gradually gets closer to this face, we cease to distinguish its traits and seamlessly pass to the wall.

Thus, during certain climactic moments of the film, this complex would suddenly reappear. A whole paranoid and bureaucratic discourse will need to be brought into focus, flowing rapidly yet in a deep voice, linked to images that are perhaps being inscribed onto the face itself – images of streets, cities, corridors, offices, etc.

I also thought that at a certain point, perhaps this face might be composed of about forty videos showing the same urban images, in a sort of ballet of changing figures, with systems of gliding lines, symmetries, dissymmetries, rhythms, and images that skip, etc.

The very first image of the film could issue from such a distorted face: in this way, that which had been initially proposed regarding the linking together of wind, music, words and noise, would be presented in a different order, the horizon of the wall appearing in the greatest silence, after all the noisy images had dissipated from the face.

[3. SCRIPT OF THE] FIRST PART

Elements for the first segment:

A cart in the night. Phosphorescent horse – somewhat purple – slippery, slimy image. (I am thinking about the image of the dog at the end of *Los Olvidados*.[3])

Tremendous acceleration: the cart crashes into the wall towards which it charges. Exploded head.

(Reference: the short story *A Country Doctor*.)

Elements of the final break (a few seconds):

- the young man from *The Verdict* steps over the parapet of the bridge;
- in the distance, a hand signal through a window, a few seconds before K.'s execution in *The Trial*.

Elements for the second segment:
Same movement of the cart.

But at the moment where the acceleration becomes unbearable: abrupt stop. (Like in the text I lent you.) The peasant characters are almost midgets; they are dressed in cowls, a little medievalistic, which gives

them a comical silhouette. Each keeps their distance. (A kind of formal ballet, Jancsó style.[4])

For a few seconds.

Final scene, inside of the farmyard: the same characters, in a slightly blurred background (I don't know what there will be in the foreground), cross the field at full speed. (In reality, this will consist of silhouettes mounted on rails).

- Woman's face, rings under her eyes; she has cried a lot. Slow, careful conversation in a foreign language. Sudden, authoritarian interruption, in the manner of: 'I will take care of all of this; I will take back control of everything.'
- Very quick image of the scene of the dance's eruption.

For the third segment:

The cart, slowly, along the wall; summer afternoon; vegetation.

The young boy's legs, sitting on the wall.

K. enters the farm. Fixed silhouette – in the background – of one of these comical characters.

K. walks into the room where two old men are eating their soup. The scene continues with children; until the client bursts in.

But then, the link is made with the licentious civil servant from the end of the film who pursues a young girl. (The violin scene, etc.)

(Ridiculous orchestra parade, etc.)

For the fourth segment:

Two old men get up. They direct the cart in. They lead K. through the barn towards a door. Steam; scene of the tub; of laundry. Children's legs climbing down a ladder. Sketch of the wall scene.

[4. CUTTING OF THE FIRST PART]

Break 1

[Description of the first shot:] 1 a

[Image 1:]

Sequence shot: A greyish white wall seen from the front with, in double exposure (or an altogether different device to be determined, for example, by intercalated images), a face in extreme close-up, but that we can barely make out.

As the camera imperceptibly approaches the wall (or zooms in), the face loses its contour, only the fixed eyes and a talking mouth still vaguely appear.

[Sound 1:]

A rapidly flowing speech, while remaining in a low tone, or progressively, transforms itself into muffled music. This music, an arrhythmic sonorous mass, transforms itself very progressively into the whistling of the wind which in turn will extinguish in reaching a perfect silence.

We will only understand the text intermittently, given that, step by step, the same voice will be superimposed on itself and sometimes this superimposition will triple or quadruple in fits and starts. The source texts will be extracted from the reports of the Moscow trials, for example, Karl Rudels' last statement:[5]

> *The presiding judge: 'Defendant Rudels, you have the floor for your last statement.'*
>
> *Rudels: 'Citizen Judges, after I have confessed to the crime of treason to the country there can be no question of a speech in defence. There are no arguments by which a grown man in full possession of his senses could defend treason to his country. Neither can I plead extenuating circumstances… And when I hear that the people in this dock are mere bandits and spies, I object to it. I do not object to it with the purpose of defending myself; because since I have confessed to treason to the country it makes little difference from my point of view, from a human point of view that I committed treason in conspiracy with generals, I have not that professional pride which permits one to commit treachery in conjunction with generals, but not to commit treachery in conjunction with agents… If you are dealing with mere criminals and spies, on what can you base your conviction that what we have said is the truth, the firm truth?… And that is why I contest the assertion that those who sit here in this dock are criminals who have lost all human shape. I am fighting not for my honour, which I have lost; I am fighting for the recognition of the truth of the testimony I have given, the truth in the eyes not of this court, not of the Public Prosecutor and the judges, who know us stripped of the soul, but of the far wider circle of people who have known me for thirty years and who cannot understand how I have sunk so low.' (Excerpt from: Report of court proceedings in the case of the anti-soviet Trotskyite centre, heard before the Military collegium of the Supreme court of the USSR, Moscow, 23–30 January 1937, English Edition, 1937, page 541 ff.)*

[Description of the second shot:] 1b
[Image 2:]

With fade-in dissolve or any other device, we pass, without any resolution of continuity, without any rupture of luminous intensity, 'through the wall'.

Little by little a horizontal line appears. It seems that we are in a field and that we are advancing, facing a wall that is still very far away. This wall crosses the shot horizontally and cuts it through and through in the middle.

Blunt jerk of the camera and return to the fixed shot.

Again, a 'clumsy' jerk and a soft oscillation: we are in a cart pulled by a mule – up to this point, we had not yet seen the mule.

We see, in the foreground, an arm dressed in a thick peasant cloth (on the right side of the shot).

A hand wearing a ring quickly crosses the shot.

Camera pulls back: we see:

- the mule (bird's eye view);
- on the occasion of a chaos [*sic*], two characters, seen from the back: a peasant and K. dressed in black.

[Sound 2]:

From the sonorous mass, sounds of the mule's steps and the cart's grinding gradually emerge.

[Description of the third shot:] 1c
[Image 3:]
Cutting speeds up.
Shots in quick succession.

- Establishing shot of the cart.
- Close-up of the mule's eyes (no blinkers).
- Close-up of hands.
- Close-up of a paper that sticks out of the peasant's pocket.
- Shot facing the wall that comes closer but sways because of the cart's movements.
- In passing, we catch, but very quickly, without really distinguishing what it is: three fixed heads above the wall.

[Nothing is noted regarding sound 3]

[Description of the fourth shot:] 1d

[Image 4:]

Little by little the cart's motions centre on the three heads above the wall. The middle one is placed a little higher than the other two. It sports a long red beard.

Through sudden jerks, shots displaying the same stationary cart, and the two characters – K. and the peasant – gesticulating nervously, are inserted within the preceding sequence. We understand that the peasant refuses to go further: he is scared.

[Nothing is noted regarding sound 4]

Break 2[6]

[Image 5:]

Suddenly the film becomes white, swept by the film stock that seems cut. Little by little we realise that this is not a technical incident because

1) some numbers appear,
2) in – *very light* – double exposure, the three heads reappear.

[Sound 5:]

Sounds of the projector in which the film stock is cut.

[Image 6:]

Sudden obscurity: long shot sequence to the right, the wall and K. seen from the back (about twenty metres away). He advances towards a dark tree. He turns his head occasionally towards the wall as if he were trying to find the three heads. He approaches another peasant who is stopped by the side of the road, slightly in front of the tree.

Close-up shot: K. calls out to the peasant

[Sound 6:]

> K.: 'Who was the guy we could see a short while ago on top of the wall?'
> – No answer.
> K.: 'Excuse me sir, is there not an inn around here?'
> – No answer.
> K.: 'Sir, I am speaking to you!'
> The peasant: 'Yeah, so what?'
> K.: 'Is there an inn?'
> The peasant: 'An inn.'
> K.: 'Sir, I beg of you, I would like to find an inn for the night.'
> The peasant: 'What are you doing here?'

[Image 7:]

The peasant points in the direction from which K. came. He turns around without answering K. and goes away towards the tree.

[Sound 7:]

K. (disconcerted): 'But, listen, I have things to do.'
The peasant: 'He has things to do!'
The peasant: 'After all, I don't care! Go there if you want, you will see . . . '
K.: 'Sir . . . '

[Image 8:]

K. goes in the direction indicated; he takes a piss a way along the wall.

[Nothing is noted regarding sound 8]

Break

[Image 9:]

For a second, Frieda's image appears as she props herself up on her elbow, at the point when Klamm knocks on the door.

We hear the peasant speaking to a woman. We see that a woman had stayed in the shade, in the tree, spying on them.

[Sound 9:]

The woman: 'But what are you doing with this pig?'

Notes

1. [Note added by French editor Stéphane Nadaud:] In the 1980s, Guattari was planning to produce a film based on Kafka's oeuvre. Many rough drafts and work projects are deposited in the Fonds Guattari (IMEC: Institut Mémoires de l'Édition Contemporaine). Here, we put forward four previously unpublished texts which are sufficiently complete to be published (the additions to make the text coherent, which appear in brackets, are our own, as is the title of the piece). The first text, the 'draft', exposes the feasibility of the project: likely written for eventual financiers, it sets out the project's extremely elaborate structure. The second is a 'complementary note' that already envisions what the film could be. Guattari, in his many rough drafts, puts forward a fastidious cutting of the film into many parts, each composed of many segments the assembly of which is almost impossible to follow. The third text proposes a script of the first part of the film (divided in four of these segments). The fourth text is the shooting script

of the first part (cut according to *image* and *sound* side by side in two columns that we convey here by putting them in brackets).
2. Frieda and Klamm are characters in *The Castle*.
3. The French title of Luis Buñuel's film is *Pitié pour eux* (1950) [The English title is *The Forgotten Ones*].
4. Guattari is discussing the Hungarian filmmaker Miklós Jancsó. He follows a schema representing K running along the wall with, at the level of the wall, '*three barely seen silhouettes [of] soldiers from the ending*'.
5. [Translator's note:] Guattari takes this dialogue from: Piatakov, Georgii Leonidovich. Report of court proceedings in the case of the anti-soviet Trotskyite centre, heard before the Military collegium of the Supreme court of the USSR, Moscow, 23–30 January 1937, in re: Y. L. Pyatakov, K. B. Radek, G. Y. Sokolnikov, L. P. Serebryakov, N. I. Muralov, Y. A. Livshitz, Y. N. Drobnis, M. S. Boguslavsky, I. A. Knyazev, S. A. Rataichak, B. O. Norkin, A. A. Shestov, M. S. Stroilov, Y. D. Turok, I. Y. Hrasche, G. E. Pushin, V. V. Arnold, accused of treason against the country, espionage, acts of diversion, wrecking activities and the preparation of terrorist acts, i.e., of crimes covered by articles 58(1a), 58(8), 58(9) and 58(11) of the Criminal Code of the RSFSR. Verbatim report. Moscow: People's Commissariat of Justice of the USSR, 1937. The text Guattari attributes to Karl Rudels is actually pronounced by Karl Radek.
6. From this point on, Guattari does not cut his scenes. We have reconstructed the sequence.

Lessons to Live (2): Deleuze

for C. B.[1]

Zsuzsa Baross Trent University

Abstract

Part of a series on the question of what is the good life, the essay is structured as a montage. Part 1 contests the received notion that death is exterior to the work of Deleuze. To this end, it gathers together a telegraphic collection of examples – 'corpses' in his corpus – that invariably show up whenever the question is raised. Part 2 attempts a Deleuzian move: it puts death to work. If death is not nothing, it argues, it must be productive of something absolutely new. Drawing upon Blanchot's seminal essay, 'The Two Versions of the Imaginary', it makes the case that this creation is the cadaver: the first time-image.

Keywords: Deleuze, Blanchot, Godard, time-image, cadaver-image, resemblance, repetition, imaginary

PART I

Resistances

The first thoughts on the subject of this essay organised themselves around a provocation arriving from a colleague or rather – as he himself may prefer a title that invokes the presence of an *inoperative community* – a 'literary friend'. Upon reading my reflections on Derrida's last lesson on learning to live (Baross 2008) – 'only from an other and by death' (Derrida 1994: xviii) – this ardent student of Deleuze exclaimed (or so I imagine, since our communications were electronic): 'but why speak of life starting from death!'

It is, however, not in defence of Derrida that I begin to write, to replay otherwise the *différend* Deleuze/Derrida or to confirm – against his not undeserved reputation of a thinker *in* mourning – his 'yes' to life, until the last *instant*. It is rather the defence, if not the praise, of death that motivates me. The ambition – indeed folly, for the task is far too

great and not only because of the constraints of an essay – is to show death to be *something* (following Bergson's celebrated formula 'time is something'), to extract it from the radical exteriority imposed on it by a calculated *philosophical* indifference, in whose long history Deleuze's is only one among many illustrious names.

Resistance to Deleuze, however, requires a certain measure of faithfulness to Deleuze, such is the power of his work. It demands fidelity at least to what Badiou considers one of its 'major motifs': 'il faut se lever contre le négatif' (Badiou 2008: 110). I will embrace this injunction against the negative, even as I appear to move against the grain of Deleuze's work and inscribe death in the order of life and creation. Not in order to restore to it the force (*pulsion*) of a negative principle at work on the reverse side of life, or to replenish its negative idea (Nothing) with *signifiance*, but rather to render justice to its power (*puissance*) of creation. The power to introduce something absolutely new in the world, something that is proper to death and death alone. This *something*, as we will see, is worthy of the great reputation of its creator. Unexpected, counter-intuitive, unthinkable by any direct route – which is why I name it provisionally and ahead of time in my narrative by way of a hypothesis: it is the image, or better still, the first Image.

I begin, however, with a counter provocation. My first reactive impulse to my interlocutor's irreverence for death is to send off a heterogeneous collection of corpses in Deleuze's corpus – a macabre enterprise, I know – that invariably turn up whenever the positive principle of life and the future is at stake: What is an adequate life? How to live the accidents of one's life – disease, war, misfortune, and yes, the *mortal* wound – precisely not as accidents?

Space permits only a few questions and a handful of examples from my strange collection:

♦ 'Bébé écrasé': the grotesque image is introduced in the Spinoza lectures as a telegraphic reference to premature death and the extreme case of a life being extinguished right away; it arrives at the precise moment when the question of the good life is raised: 'what is that curious benediction that one can give oneself, which is different from being content with oneself?' (Deleuze 2001a). Significantly, the damaged corpse of an infant is offered up as an icon not of innocence (salvation) but, on the contrary, of an existence absolutely without benediction, condemned to mortality in all its parts. A merciless ethical lesson regarding life may be extrapolated from this cruel image: it concerns not immortality but eternity, which is not a question of age. The child-body signifies a life – at any age – that failed to actualise its essence, the singular degree of *puissance* it is. (I should hasten to add, however, that in the last published text – to which I will return and where

life at the other extremity, on the death bed, is considered – it is precisely 'small children [who] through all their suffering and weaknesses are infused with an immanent life that is pure power and even bliss' [Deleuze 2001b: 30]).

♦ Of a voluntary death – whose example, I admit, constitutes a forcing – perhaps I only imagine to have read in Deleuze: someone, the author of *The Waves*, or maybe one of her characters who enters the town 'like a knife through everything' (Deleuze and Guattari 1994: 169) (although not the poet [Celan], who hurls himself against death and whose verse [breath/*Atem*] is hard as *Crystal* – and I will have to speak more of crystals), gently slips into death, as if into a wave. It is impossible to pause here long enough to consider the profound pedagogy that conjugates with this image: an understanding of life 'as a complex relation between differential velocities … a composition of speeds and slowness', a *sagesse* of living that is the wisdom of composition. 'It is by speeds and slowness [*lenteurs*] that one slips in among things, that one conjugates with something else' (Deleuze 1981b: 165–6). Before learning to swim, the child cries out: 'maman, la vague m'a battu'. Later, he slips in between the waves ('Formidable!'). One crashes (bad composition) – or swims, or surfs, or glides. If death may be conceived as a force ('it is something stronger than me that will kill me'), one could also decide to slip into it as if into a wave, choose to compose with it without fear, panic, agony or despair, and not 'rage, rage against the dying of the light' (Dylan Thomas). For 'the fear that sings its head off in the dark' – this is not Deleuze's but Bataille's lesson, though their kinship is often overlooked – 'the rage and the vomiting are so many evasions' (Bataille 1992: 50).

(At the threshold of this massive problematic, which I cannot cross here, one question nonetheless insists on being recognised: how to discriminate between suicide, voluntary death, and the life-negating 'aller au devant de la mort' that Deleuze denounces as the summit of an inauthentic life? For obvious reasons, we must leave open the possibility of a voluntary death that is an affirmation of life: a 'death willed against all death', of which Deleuze himself writes in *The Logic of Sense*, or a 'good death' that Blanchot – whom Deleuze reads closely on this very point – defines as 'with regard to the living' [Deleuze 1990: 149]. Still, it would appear that the Spinoza Deleuze ventriloquises in these lectures, or the Deleuze who is the ventriloquist behind the portrait of the philosopher he paints, categorically disallows every intimacy, every interiorisation of death. The language could not be stronger: 'I deny the beauty', he says, of any writing that would lead to the exaltation of death. Whatever the beauty, it is an 'offense to thought', 'an offense to life', 'an offense to everything lived … It is I say the enemy' [Deleuze 2001a].

It takes an unexpected intervention from the audience – significantly, it introduces *durée*, that is, finitude – to breach this categorical exclusion, to

force an admission [inclusion]: that of a 'profound sentiment of existence', an apprehension or calculation that comes 'from the depth of existence' – of the time that remains. At the threshold, where one senses that there is not much time left to live, where one touches the limit [and Derrida's last lesson also privileges this boundary], questions of a different order impose themselves on the living: 'how to make preparations?' how to 'arrange one's affairs', without panic or anxiety?

'Aih, c'est intéressant, ça': the sound recording captures the familiar cadence of this untranscribable 'aih'. Yet, the effect of this replay [repetition] could not be more uncanny, more untimely today [we know that Deleuze burnt his papers before the act]. The pensive, quiet aside, which appears to address no one, not only arrives in the living voice of someone dead, but posthumously. It redoubles over itself, is overprinted, as if by a film or virtual image, with the memory of the future, which future it predicts, or rather, subverting every chrono-logy, repeats before it would or could have taken place.)

♦ One momentous leap into death comes in *Difference and Repetition*: an Empedokles, a Hamlet, 'throw[s] time out of joint, make[s] the sun explode, throw[s himself] into the volcano, kill[s] God or the father' (Deleuze 1994: 89). (The exalted language corresponds with a magnificent image of Godard, who himself repeats Olivier's Hamlet by purely cinematic means: rather than falling, Godard's prince soars in an Ikarus flight that metamorphoses into that of a bird filmed high against the open sky [Godard 2007]). Although fictional/mythical, the event, in the most rigorous sense of this term, is at the very heart of the corpus. The hero's becoming equal to the act performs the crucial third repetition, the repetition that breaches the future – that is, opens a caesura in time so as to make a future that deserves the name appear: one that leaps away from the past. Exceptionally for Deleuze, who has no taste for the tragic, the death of the hero here necessarily submits to the logic of sacrifice. The future appears at the cost (sacrifice) of the life of the 'actor', who is excluded from it, whose self is smashed into pieces, 'as though the bearer of this new world were carried away and dispersed by the shock of the multiplicity to which it gives birth' (Deleuze 1994: 89–90).

♦ Another leap is historical, actual. In a terrifying fall that is the opposite of composition or slipping into waves, the philosopher's body crashes violently onto the hard surface of the sidewalk below. (How) are we to avert our eyes from this bloody spectacle – avoid, that is, inscribing it on the interior of his corpus as a sending, perhaps the philosopher's last – precisely with regard to life? (As Derrida taught us, the body is always implicated in testimony.) Bequeathed to us is not material work to guard but an obligation, a task that by necessity befalls those who come after – namely, to let the work test, to 'taste' this last mute *geste* of the body, to let the corpus decide whether to expel it, violently, or incorporate it as the last 'word' *of* a life, judging itself.[2]

♦ My final example, from one of Deleuze's last published texts, is often cited: 'a disreputable man is found … as he lies dying' (Deleuze 2001b: 28). Turning from the threshold to the threshold, the writing of Deleuze meets here, doubly, Derrida's condition of rightfully teaching a lesson on life ('from the other at the edge of life' [Derrida 1994: xviii]. The rest is speculation). A hymn and prayer to life, Deleuze's last writing nourishes itself by its double proximity to the extreme limit situation. From the threshold of a life, it watches over the limit of another, over a deathbed where an 'individual life confronts universal death' (Deleuze 2001b: 29); it watches, not as a 'pleureuse' would, with her eyes veiled by tears for the departed (and Deleuze, we know, confesses a passion for this vocation), but as a keen observer. (I cannot digress here as I would like to, to read this passage closely together with several other texts, including two magnificent accounts of a confrontation between death and a life by Duras: in one, she watches, for fifteen long minutes, 'on the wall, near me', a common fly's agonising combat with death [Duras 1998: 21]; in the other, her war diaries, she records a similar confrontation, lasting for weeks, by Robert Antelme, or rather, the vegetable-earth body that returns from the camps [Duras: 1986].) Vigilant, Deleuze seeks out – in the narrowest of regions, between 'his life and his death' – not the 'instant' that is 'his' alone but, rather, that which is denuded of every trace of subjectivity: 'a moment that is only that of a life playing with death' (Deleuze 2001b: 28). The result is something unexpected, a double benediction: in the confrontation, the dying attains a sort of beatitude, whereas we, the living, intuit what Derrida would call 'more than life' – a pure event, freed from the accidents of internal and external life – a 'homo tantum'. (Once again, I can only signal in the direction of the field of a massive problematic that opens up here, whose indices could be the figures of the 'homo sacer', or the *Muselmann*, or Robert Antelme. Each leads to the same question: how to think the non-relation between what Benjamin calls 'blosse Leben', also nothing but life, and the reality of this concept 'homo tantum'? What must be maintained in 'a life' that is nothing more than life for it to attain still a sort of 'beatitude'? In other words, what aspectus of life is nihilated when a singular life confronts not 'his' death but a steel-gaze under the insignia of a *Totenkopf*?[3] Deleuze's meditation on Nietzsche's life at the end may be instructive to think precisely this difference: what life deserves the name, to be lived?
