In contrast, everything in Perec's summary seems designed to contain Bartleby. In Deleuze's essay, Bartleby is placed in an inter-textual network including figures like Musil, Thoreau, Henry James and Kleist. In contrast, Perec's summary is intent on making virtues of its economy and banality of description. In Deleuze's essay, Bartleby, having emerged as a form of *Homo tantum*, is situated in terms of great cosmic themes of democracy, exodus, and the literary and political 'messianism of the nineteenth century' (Deleuze 1998: 86). In contrast, Perec seems intent on distilling a story's essence by isolating it and reducing it to an object. To complete the contrast, what could be more striking than the fact that Perec makes no reference to 'the formula'? For Deleuze, the formula is something 'which every loving reader repeats in turn' (68); Perec, however, has treated of his avowedly 'favourite short story by Melville' (Perec 1965: 14–15) while omitting reference to it entirely.

It is not only Deleuze's reading that Perec's approach causes us to revisit. Going further, we should reconsider the influence of Deleuze's essay on subsequent readings of Bartleby. In Hardt and Negri's *Empire*, for example, Bartleby again emerges as a form of *Homo tantum*, and he is again situated in terms of grand political and historical themes. Working in a context opened up by Deleuze, Hardt and Negri read Bartleby as a figure of 'absolute refusal', now construing the formula as a negative moment in a movement with potentially more constructive socio-political effects. As they put it:

> [Bartleby's] refusal certainly is the beginning of a liberatory politics, but it is only a beginning … What we need is to create a new social body, which is a project that goes well beyond refusal … [W]e need … to construct a new mode of life and above all a new community. (Hardt and Negri 2001: 204)

Aiming at a community capable of resisting global capitalism in the form of 'Empire', this reading is more explicitly dialectical and programmatic

than that of Deleuze. Emerging in explicit contrast to it, we have Slavoj Žižek's reading, which holds that:

> Bartleby's attitude is not merely the first, preparatory, stage for the second, more 'constructive', work of forming a new alternative order; it is the very source and background of this order, its permanent foundation … [T]he very frantic and engaged activity of constructing a new order is sustained by an underlying 'I would prefer not to' which forever reverberates in it. (Žižek 2006: 382)

For Žižek, Bartleby's formula is a 'permanent foundation' which, contra Hardt and Negri, is never properly overcome, but which haunts any alternative political order whatsoever. What this reading importantly shares with that of Hardt and Negri, however, is a background context opened up by Deleuze that situates Bartleby as a form of *Homo tantum* of grand political and historical significance. In this respect, Žižek is in close proximity to another influential reading: Giorgio Agamben's account of Bartleby as a figure of 'potentiality', the experience of which, Agamben holds, 'is possible only if [it] is always also potential not to (do or think something)' (Agamben 1999: 250). As with Žižek, Agamben reads Bartleby in a less straightforwardly dialectical sense than Hardt and Negri. As with Žižek and Hardt and Negri both, however, his reading shares the context opened up Deleuze – again situating Bartleby as a form of *Homo tantum* of grand ontological, political and historical significance.

And herein lies the problem that the very banality of Perec's summary draws to attention. Has not this context become stifling, such that Bartleby now gets uncritically presupposed as a symbol for a kind of grand narrative refusal and resistance, causing other aspects of both his story and Deleuze's treatment of it to go unnoticed?[1] What is perhaps at the root of this problem is the eulogistic (if not downright eschatological and messianic) tone with which Deleuze concludes his essay: 'Bartleby is not the patient, but the doctor … the new Christ or … brother to us all' (Deleuze 1998: 90).[2] This tone has a lineage in French treatments of Bartleby dating back to at least Blanchot.[3] The danger, however, is that it stands, in spite of itself, to make Bartleby emerge reductively – as a hero (whether tragic or comic), whose actions are to be straightforwardly praised, mimicked or ignored, and whose formula reads like a soundbite or slogan.

Significantly, even accounts that dispute Deleuze's reading tend to compound this image. Jacques Rancière, for one, has claimed that Deleuze's account of Bartleby is too aestheticised to point toward any

meaningful form of 'political justice' (Rancière 2004: 164). Stronger still, and as we will shortly examine in depth, Alain Badiou has characterised Bartleby as a figure of 'betrayal', too intent on nihilistic refusal to exhibit the commitment necessary for political change (Badiou 2006: 422). Like the more sympathetic accounts identified above, however, these readings share in the tendency to make Bartleby emerge reductively. This is because, while they contest Bartleby's heroism, they do not dispute that this is the proper context in which to discuss his story.

To overcome this, this essay contextualises Deleuze's reading differently – as an attempt to move beyond the Sartrean framework of 'bad faith'. In her recent *L'Effet Bartleby*, Berkman suggests that Bartleby's significance pertains to a moment of French philosophy that has passed.[4] By contextualising Deleuze's essay as an attempt to overcome bad faith, this essay disputes this. It has several aims in doing so: to highlight the contemporary relevance of Deleuze's relation to Sartre and the extent to which bad faith comprises a restrictive and moralising threat; to highlight what conditions bad faith; and, above all, to argue that Bartleby's actions take on renewed political significance when viewed as a way of overcoming it. Respectively, these are the aims of sections two, three and four to follow.

II. 'Bad Faith': Its Nature and Its Relevance

Sartre's early period work sets up a famous dualism. Human beings, he holds, are composites of 'being' and 'nothingness'. On the one hand, one is a 'being' insofar as one is an 'object', 'thing' or 'in itself', situated within the world. On the other, insofar as one is a *human* being, one is also irreducible to this state: a 'nothingness', 'consciousness' or 'for itself'. In *Being and Nothingness*, Sartre construes human freedom in these terms. One is free, he holds, only insofar as one becomes conscious of the simultaneous 'being' *and* 'nothingness' of the human reality. This is because, for Sartre, such consciousness of one's irreducibility renders one capable of projects that change normative limits under which human beings are presupposed to 'be'.

Conversely, Sartre takes human beings to act in bad faith wherever this consciousness is denied. By this, he means that we are in bad faith wherever we view either ourselves or others as fully determined 'things' or as fully transcendent 'non-things', not responsible for the worldly consequences of our actions. To be in bad faith, then, is to recognise only the being *or* the nothingness of oneself or another, thereby denying

human freedom, and confirming existing normative limits on what it is to be (see Sartre 1943: 93–109).

The question is, what happens to Bartleby's formula when set against this framework? For Deleuze, 'I would prefer not to' is a statement that 'hollows out an ever expanding zone of indiscernibility or indetermination between some nonpreferred activities and a preferred activity' (Deleuze 1998: 71). This, for Deleuze, is the 'violently comical' power of the formula to disrupt language, beguiling those who expect Bartleby to have explicit preferences. Read in Sartrean terms, however, what else can Bartleby's statement be, except an expression of the psychic paralysis facing a character who denies human freedom, and who chooses not to choose? What, then, can the formula be on a Sartrean reading, if not an expression of bad faith's attempt to separate 'being' and 'nothingness', and to flee the responsibilities of 'being' entirely? And what, then, can Bartleby be, if not a figure of bad faith par excellence?

In his later *Critique of Dialectical Reason*, Sartre shifts away from the 'phenomenological ontology' of *Being and Nothingness* toward a form of materialism. One might therefore be tempted to view the questions just posed as pertaining to an out-of-date philosophy. That, however, would underestimate the extent to which dualistic thinking is fundamental for Sartre's philosophy more generally.[5] Furthermore, it would underestimate the nature of Sartre's influence on Deleuze, as well as the sense in which a return to Sartrean themes is observable in contemporary Continental philosophy.

Sartre is one of the great 'suppressed references' of Deleuze's philosophy. By this, I mean a figure that features in his work, but whose influence he often underplays.[6] Deleuze's philosophy contains other such figures (Hegel and Lacan, for example), but Sartre's status is attested in an especially contentious way: by the fact that Deleuze wrote extensively on Sartrean themes in his youth, only to later repudiate that work.[7] In his later philosophy, Deleuze's explicit references to Sartre are short, and tend to follow a pattern: having praised Sartre's acuity and influence, he gives reasons why Sartrean analyses fail to go far enough. This pattern is particularly evident in works from the mid to late 1960s, in the period where what is most distinctive in Deleuze's philosophy is beginning to emerge. It recurs in *Logic of Sense*, in *Difference and Repetition* and in Deleuze's 1967 essay on Michel Tournier, *Theory of the Other*.[8] It is not, moreover, contradicted by the more effusive tone of Deleuze's short article on Sartre from 1964: 'He was My Teacher'. Unlike the other works just cited, that piece is not concerned with developing Deleuze's

own philosophical position. Instead, it seeks to praise Sartre's stance as an inspiration and teacher. We might therefore say that it enacts half of Deleuze's usual strategy: praising Sartre's influence, but stopping short of highlighting perceived shortcomings in his philosophy.[9]

Significantly, Deleuze's 1964 article does highlight bad faith as a theme he found striking in Sartre.[10] After that, explicit references to Sartrean bad faith in Deleuze's work are more limited.[11] It would be a mistake, however, to discount it as something irrelevant to the development of Deleuze's thought. On the contrary, bad faith names the nexus for all that Deleuze is opposed to in Sartre and in the history of philosophy more generally: against Deleuze's philosophy of immanence, it affirms the transcendence of consciousness; against his affirmation of difference, it affirms the brute objective identity of the 'in itself'; against his affirmation of desire as positive excess in *Anti-Oedipus*, it affirms the negativity of the 'for itself' as the only means to bring about worldly change; and, against his attempt to 'have done with judgement', it is a viciously circular form of 'infinite judgement', since all attempts to overcome the dualism between being and nothingness will be susceptible to its accusation.

What gives these oppositions added pertinence today is that a return to Sartrean themes and tones can be detected in Continental philosophy.[12] To bring this squarely into focus in relation to Bartleby, consider the following from Badiou:

> There are no more than two possibilities regarding the becoming of a subject within a world … It is necessary to act, in one manner or the other. Certainly, one can refrain from acting. One could, like Bartleby, the employee in the eponymous story by Melville, 'prefer not to'. But then a truth will be sacrificed by its subject. Betrayal. (Badiou 2006: 422)

Witness just how Sartrean this is. Anecdotally, its themes of 'betrayal', 'choice' and 'action' figure heavily in Sartre's late period literary and philosophical output.[13] More significantly, however, the entire critique rests on the thought that Bartleby commits to *nothing*, not in the weak sense of 'being indecisive', but rather in the strongly Sartrean sense of *commitment to nothingness*.

In Badiou's philosophy, a subject is the bearer of a truth that goes unrecognised by the implicit normativity of its situation (or 'world' in the above terminology), until it changes this normativity through a sustained process of activity (a 'truth procedure') (Badiou 2005: 199–261). On Badiou's reading, Bartleby exemplifies a subject that sacrifices its truth through an act of betrayal. This is because Badiou reads Bartleby's

'preference not to' as a decision to reject normative demands placed upon him by the situations of his story (those of the workplace or prison, for example), without declaring fidelity to a truth that would be capable of changing them.

Recall that, on a Sartrean reading, Bartleby is in bad faith because he prefers 'nothingness' at the expense of 'being'. This critique is replicated exactly by Badiou. For Badiou, 'to be' is to be recognised or 'counted' as a being by the implicit normativity of a situation (to be included as a worker within the situation of the workplace, for example). This means that, for Badiou, 'not to be' is, to put it very schematically, not to be recognised within a situation. For Sartre, whatever is not recognised as a 'being' is 'nothingness'. We can therefore readily observe the sense in which Badiou's ontology is one of 'being' and 'nothingness'. Granted, his form of 'nothingness' is not the Sartrean nothingness of consciousness, but rather a nothingness which, he holds, only mathematics can indicate, and which he calls 'the void'.[14] Irrespective of this technical injunction, however, the point is simply that whatever is not recognised by the normativity of a situation is, on Badiou's reading, 'void' for it. Badiou's ontology is therefore assuredly underpinned by its own forms of 'being' and 'nothingness', irrespective of how much of an update these comprise on Sartre.

Whether in the language of Sartre's *Being and Nothingness* or that of Badiou's *Being and Event*, then, the critique of Bartleby is the same. On a Sartrean reading, Bartleby prefers nothingness at the expense of being, to which extent he is in bad faith. On Badiou's reading, Bartleby prefers disillusion in the nothingness of the 'void', over a commitment to change situations in which he is already counted (as a 'being'). What Badiou's reading of Bartleby offers, then, is confirmation of, and an update upon, the Sartrean critique. In the context of this essay, this does two important things. First, it prompts us to consider Bartleby's relation to bad faith in greater detail. Second, it shows that bad faith continues to operate as a background context for neo-Sartrean accounts of political action. In the following section, the first task will be pursued. After that, section four will build on this to consider the political significance of what it would mean to overcome bad faith.

III. Deleuze's Post-Phenomenological Approach: How Bartleby Overcomes Bad Faith

For a phenomenologist like the early Sartre, it is 'things themselves' (that is, 'phenomena') that prescribe the conditions for language,

and, provided it is employed methodically enough, language will be capable of neutrally redescribing these conditions. What the method of 'phenomenological ontology' seeks to show in *Being and Nothingness*, then, is that bad faith is a phenomenon pertaining to the nature of what it is to be. As post-phenomenological thinkers like Deleuze, Derrida and Foucault undertook to show, however, the inconsistency here is to presuppose that such structures of being, acting *prior to* language, can be neutrally redescribed *through* the structures of language. What marks post-phenomenological thought in the French tradition, then, is the claim that phenomenology is insufficiently critical, and that it underestimates the extent to which descriptions of reality are prescribed, not so much by 'things themselves', but by rules and norms inherent to language.[15]

In Deleuze's essay on Bartleby, this focus on language is reflected in what he calls a 'logic of presuppositions'. Here is how he outlines the concept:

> This is what [the attorney narrating Bartleby's story] glimpses with dread: all his hopes of bringing Bartleby back to reason are dashed because they rest on a *logic of presuppositions* according to which an employer 'expects' to be obeyed, or a kind friend listened to, whereas Bartleby has invented a new logic, a *logic of preference*, which is enough to undermine the presuppositions of language as a whole. (Deleuze 1998: 73; original emphasis)

By a 'logic of presuppositions', then, Deleuze means something closely akin to the 'dogmatic image of thought' analysed in Chapter 3 of *Difference and Repetition*: an implicit set of norms or 'postulates' conditioning given forms of expression and behaviour. In *Difference and Repetition*, he views the 'dogmatic image of thought' as a set of norms that has had damaging consequences for the history of philosophy.[16] In his Bartleby essay, he is aiming at something more situated with the concept of a 'logic of presuppositions': an account of how everyday situations like those of the workplace and of friendship are governed by their own limiting norms or 'postulates'.

What happens if we take this concept up and use it to re-examine Sartre's notion of bad faith? Well, a curious dialectic is observed: at first, bad faith appears to offer a way of resisting the logic of presuppositions underpinning any situation whatsoever, before then revealing itself to be a product of this logic.

Bad faith seems to offer a mode of resistance because it names the possibility of actors within a situation who mean other than they express. In *Being and Nothingness*, Sartre develops this in relation to

three famous situations: a woman who sees no future with her date, a waiter who acts too sincerely, and a subject evading questions on his sexuality. In each situation, Sartre holds, bad faith is exhibited because the subjects communicate other than they mean: the woman acts as if she sees a future with her date, the waiter knows all too well he is acting, and the evasive subject refuses to commit himself (Sartre 1943: 93–109).

The trap of bad faith, however, is to view such acts of withholding as forms of resistance. On the contrary, we can observe that they conform to the logics of presupposition involved in each case. This is because whoever is in bad faith seeks to communicate other than they mean, and because, in doing so, it is in accordance with what is presupposed of them that they act: of a date, it is presupposed it will be an enjoyable and reciprocal experience; of a waiter, it is presupposed he will be a genial host; of an interrogation, it is presupposed it will produce answers. Viewed from the standpoint of such norms, whatever actors involved in a situation might really mean, but withhold, is strictly irrelevant. Rather, what matters is whether or not they perform as they are presupposed to, and in each of the cases described by Sartre, this is what happens: the woman's date is led to see a future with her, the waiter's customers are satisfied, and the interrogator in the last case gets to interpret signs of evasion as signs of admission.

The paradox of bad faith, then, is that it always conforms to whatever logic of presuppositions it seeks to resist. This impotence does not, however, render bad faith irrelevant to how logics of presupposition function. On the contrary, it reveals it to be an integral product of this logic. This is because it is in the interests of a logic of presuppositions to eliminate the possibility of meaning other than it prescribes within a situation, and bad faith satisfies this condition twice: first, because it comprises no real alternative; second, because it indicates the failed search for an alternative, offered to actors who thought they could resist normalisation, but who must henceforth resign themselves to forms of expression and behaviour that are presupposed of them.

Turning back to the passage where Deleuze outlines the concept of a 'logic of presuppositions', we now face a further question: what distinguishes Bartleby's 'logic of preference' (as expressed by the formula) from the impotence of bad faith? Deleuze helps us to answer this through the following passage:

> Figures of life and knowledge, [Originals] know something inexpressible, live something unfathomable. They have nothing general about them, and are not particular – they escape knowledge, defy psychology. Even the words

> they utter surpass the general laws of language (presuppositions) … There is nothing particular or general about Bartleby: he is an Original. (Deleuze 1998: 83)

To overcome bad faith, one must show that it does not pertain to the nature of what it is to be, but is rather a product of how logics of presupposition presuppose beings to be. To do this, it is enough to show that the being of a being (its 'singularity' or 'difference in itself', in Deleuze's terms) is something irreducible to any logic of presuppositions whatsoever, and this is precisely what Deleuze is seeking to do in the above extract when describing Bartleby as an 'Original': to affirm Bartleby's singularity to be something in excess of the presupposed general and particular 'types' to which recognised forms of epistemology, psychology and logic (to cite only the above examples) might seek to reduce it.

This affirmation of singularity is what distinguishes Deleuze's philosophy from phenomenology. Under the terms of a method like Sartre's 'phenomenological ontology', bad faith must emerge as something pertaining to the nature of what it is to be (that is, to 'things themselves'). Against this, Deleuze recognises the inconsistency at work here (that phenomenology's search for a 'presuppositionless' account of 'things themselves' presupposes the descriptive neutrality of language), and affirms the gap opened up between being and language as the site for what he variously calls 'pure difference', 'singularity' or 'Originality'; that is, forms of being that remain irreducible to the logics of presupposition at work within language.

What distinguishes Bartleby's 'logic of preference' from bad faith, then, as Deleuze notes, is that Bartleby affirms his creative singularity by 'inventing' it. This inventiveness is sufficient to overcome bad faith because it runs counter to the impotence the latter prescribes. For Deleuze, the effects of this inventiveness are observable at every level of Bartleby's story: in, for example, the way 'I would prefer not to' challenges presuppositions on how grammar should function; in the way Bartleby challenges presuppositions on how employees and friends should act; and in the way Melville's text challenges presuppositions on how plot, character and metaphor should function in a story (Deleuze 1998: 68–70). In each case, Deleuze holds, a form of inventive and creative singularity operates that shows there to be more to being than logics of presupposition can capture. This is what Deleuze means when he says that Bartleby's 'logic of preference' is 'enough to undermine the presuppositions of language as a whole', and it is how Bartleby overcomes bad faith.

IV. Beyond Bad Faith and Bartleby: The Political Significance of Bartleby's Actions

Consider how the shift in perspective just argued for alters the predicament of bad faith. If, as in Sartre's account, bad faith pertains to the nature of what it is to be, then it is possible to suspect all beings of it, and impossible to overcome it. This is because all behaviours, gestures and actions will, simply by virtue of their being, forever be open to suspicion of it, including all acts intended to overcome it.[17] If, however, bad faith is a product of logics of presupposition, then, at worst, specific forms of bad faith are limited to specific situations of language, and, as we will argue, the potential to overcome it entirely is inaugurated.

There are therefore two steps toward overcoming bad faith, the first acting as a 'strategy of containment' against it, the second as total liberation from it. In this section, we will work through these steps in order.

If bad faith is produced by a language's logic of presuppositions, then it becomes possible to read it into any form of behaviour describable within the language. At first, this seems to mean that the threat of bad faith remains as prevalent as ever. This is because it still seems applicable to 'all that is', irrespective of whether this is meant in the ontological sense of 'all that has being', or in the logical sense of all that is describable within the limits of a particular language. The key point, however, is that, as is implied by the very notion of a language's particularity, there are a plurality of languages, each with their own limits (whether, for example, languages that are 'extinct', 'extant', 'possible', 'formal' or 'natural'), from which it follows that no one language in particular can definitively be said to account for all that is, or that is capable of being.

The first step toward overcoming bad faith, then, is to realise that particular languages produce forms of bad faith specific to them, and that the scope of these forms cannot be universal, because the languages from which they issue are themselves incapable of accounting for all that is. From here, the effects of bad faith can be contained by enquiring into just how 'particular' languages are. To develop this, consider remarks that Deleuze makes immediately prior to outlining the concept of a 'logic of presuppositions':

> A word always presupposes other words that can replace it, complete it, or form alternatives with it: it is on this condition that language is distributed in such a way as to designate things, states of things and actions, according to a set of objective, explicit conventions. But perhaps there are also other implicit and subjective conventions, other types of reference or presupposition. In

> speaking, I do not simply indicate things and actions; I also commit acts that assure a relation with the interlocutor, in keeping with our respective situations: I command, I interrogate, I promise, I ask, I emit 'speech acts.' ... It is this double system of reference that Bartleby ravages. (Deleuze 1998: 73)

This analysis is highly revealing. First, it corroborates the connection made earlier between the concept of a 'logic of presuppositions' and the 'dogmatic image of thought'. This is because, in both cases, Deleuze makes a distinction between 'objective' and 'subjective' presuppositions, and, in both cases, it is the latter set in which he is more interested – the implicit presuppositions or 'postulates' that act as conditions for communication within a situation. Wherever Deleuze discusses a 'logic of presuppositions' or 'dogmatic image', then, he is targeting this form of implicit presupposition (see Deleuze 2004a: 164–5; Deleuze and Guattari 2004a: 83–95). Second, this shows just how 'particular' languages are on Deleuze's analysis. For Deleuze, what marks the particularity of a language is less the set of 'objective, explicit conventions' according to which words are taken to designate, and more the implicit logic of presuppositions setting conditions for their exchange. Deleuze's conception of a language's particularity therefore goes much deeper than more common-sense notions of geographical or ethnic particularity, idiom or dialect account for. On the contrary, he takes it that there are as many languages as there are situations with logics of presupposition specific to them.[18]

To develop this, let us briefly turn to the story of Bartleby. As presented by Melville, 'Bartleby' is a story related retrospectively by a single narrator, an attorney looking back on Bartleby's employment in his New York law firm. The story begins by describing the period immediately prior to 'the advent of Bartleby' (Melville 1990: 4). Thereafter, it documents Bartleby's good beginnings as a copyist, before detailing the effects of his subsequent refusals to perform in terms of what is presupposed of him. There are four key situations involved in the story: the workplace, the prison, and the situations of charity and morality into which Bartleby's actions place him. It may seem strange to class these four situations together, given that the first two are more concrete or 'physical', and the latter two more abstract or 'metaphysical'. The reason for doing so, however, is that they each involve distinct logics of presupposition, to which the attorney ascribes, and to which Bartleby does not.

Faced with Bartleby's actions, the distinct logics of presupposition at work in the story are forced to emerge through the attorney's discourse.

In the workplace, we therefore find that it is presupposed that there will be periods of drudgery and stress, and that, while labour will be alienated, employees are expected to be 'cheerful' about this.[19] In prison, while liberties will be restricted, it is presupposed that privileges can be bought.[20] In receipt of charity, it is presupposed that the recipient (Bartleby) will be grateful and beholding to others, and that the conscience of the benefactor (the attorney) will be gratified.[21] Finally, as a subject of morality, it is presupposed that Bartleby's actions will be open to the judgement of others.[22]

Now, Bartleby passes through each of these situations, and he 'prefers not to' have his labour alienated, 'not to' receive privileges in prison, 'not to' be in receipt of charity and 'not to' have his actions judged by others. According to the Sartreo-Badiouian critique, this means that Bartleby is in bad faith. If that is the case, then Bartleby's actions have no significance beyond condemning him to a miserable demise. According to our reading, however, Bartleby reveals bad faith to be a product of logics of presupposition. If that is the case, then Bartleby's actions have a double political significance: first, they force the implicit logics of presupposition at work within the story to make themselves explicit; second, by doing so, they show just how limited in scope these logics are.

Bartleby demonstrates that there are languages particular to the situations of the workplace and the prison, just as there are languages particular to the more abstract situations of charity and morality. These situations each involve logics of presupposition specific to them, and that make different normative demands. To this extent, they produce forms of bad faith restricted to them. If Bartleby refuses to copy within the situation of the workplace, then, this means that he can be held to be in bad faith in that situation at most, but not beyond it. Again, if Bartleby refuses charity, this means that he can be held to be in bad faith in that situation at most, but not beyond it. From here, the way to enact a strategy of containment against bad faith becomes clear: first, to make explicit what particular situations presuppose (to understand, for example, how 'an employer "expects" to be obeyed', or how liberties will be removed in prison); second, to detect the limits of the situation to which these presuppositions are applicable, since, if no one language in particular is capable of accounting for all that is, such limits must exist.

From here, the way toward total liberation from bad faith emerges. This is because, if specific forms of bad faith are restricted to particular situations, and one is outside of these limits, one cannot be accused of bad faith for behaving other than they prescribe.

What, however, does it mean to get 'outside' the limits of a situation? Well, it seems achievable in a straightforward sense: if one is physically outside a situation like the workplace or the prison, surely one cannot be accused of bad faith for acting contrary to normative demands holding sway there? Given the increasingly malleable situations of work and discipline within what Deleuze elsewhere calls our contemporary 'control societies', however, this becomes more problematic.

Drawing on Foucault, Deleuze outlined three forms of society in his 1990 essay, *Postscript on Control Societies*: early-modern 'sovereign societies'; 'disciplinary societies', which, he holds, operated between the eighteenth and early twentieth centuries; and 'control societies', which he takes to be characteristic of the contemporary world (Deleuze 1995b: 177–8). Contrasting the latter two forms, Deleuze notes that while disciplinary societies worked by closing people off within 'major sites of confinement' that each had their 'own laws' (the family, the school, the barracks, the factory or the prison, for example), control societies work through 'ultrarapid forms of apparently free floating control' that make use of new forms of communication and technology (Deleuze 1995a: 174).[23] Going further, Deleuze argues that, while people in disciplinary societies were moulded into 'individuals' and 'masses' by laws specific to the sites of confinement through which they passed, status in control societies is determined by 'passwords' and 'codes', the terms of which can, in principle, be revised at any moment (Deleuze 1995b: 181–2).

The difficulty here is that Bartleby's actions may seem to have only a dated political significance at most, related to a form of 'disciplinary society'. Granted, we might say, Bartleby does force the logics of presupposition operating in his story to become explicit and to announce their limits, but these are only laws specific to the sites of confinement of a vanished disciplinary society (the mid-nineteenth-century USA). On closer inspection, however, we find that this is not the case, and that Bartleby also has profound things to say about contemporary control societies, and about how we might overcome the bad faith that they produce.

To clarify, consider the following key difference that Deleuze notes between disciplinary and control societies:

> In disciplinary societies you were always starting all over again (as you went from school to barracks, from barracks to factory), while in control societies you never finish anything – business, training, and military service being coexisting metastable states of a single modulation. (Deleuze 1995b: 179)

Deleuze characterises the first form of judgement described here as one of 'apparent acquittal'. This, he holds, is felt by subjects in disciplinary societies as they move from one site of confinement to the next (from the school to the barracks, for example) – in-between sites, relief from what a situation presupposes of one is felt, but new forms of presupposition and judgement await in the next site. He describes the second form, characteristic of control societies, as one of 'endless postponement'. According to this form, the boundaries between old sites of confinement dissolve, such that one no longer knows when one has begun or finished anything (as, for example, the limits between the workplace and the home blur, and as schools are replaced by forms of continuous training) (Deleuze 1995b: 179).

There are two passages in Deleuze's Bartleby essay that relate profoundly to these forms of judgement. First, of the formula, Deleuze states that each time Bartleby employs it in response to a demand from the attorney, the latter 'has the vertiginous impression … that everything is starting over again from zero' (Deleuze 1998: 71). These words do not suggest that Bartleby's political significance is dated. What they suggest is that Bartleby is intimately aware of how the logic of 'apparent acquittal' works in disciplinary societies, because, through the formula, he is inflicting it upon the attorney. If this is the case, then what it suggests is that Bartleby has already superseded this logic in some sense, because, unlike the attorney, he knows how it works, and, unlike the attorney, he has not implicitly decided to be subject to it.

If this reading is too suggestive, it should be supported with a second passage from Deleuze's essay. Of Bartleby's refusal to leave the attorney's office, Deleuze states: 'Bartleby lives cloistered in the office and never goes out, but when the attorney suggests new occupations to him, he is not joking when he responds, "There is too much confinement …"' (Deleuze 1998: 88). One way of reading these words, a direct quotation from Melville's story, is as a form of localised subjective rejection: by pointing out that 'there is too much confinement', Bartleby is saying that he would prefer not to be subject to occupations suggested to him. Read like this, Bartleby's actions would, as per the Sartreo-Badiouian critique, seem to be a lonely exercise in bad faith, and that would seem to be the end of the matter. Another way of reading the statement, however, is as a diagnosis on the limits of a disciplinary society. What would count in this case is not the localised subjective stance of the character 'Bartleby' (whatever that might be), but rather the broader level of awareness demonstrated by the statement; and, read

like this, the statement appears aware indeed, implying what Deleuze would call a 'collective assemblage of enunciation'.

As developed in *Thousand Plateaus* and *Kafka*, Deleuze and Guattari's concept of the 'collective assemblage' overturns common-sense presuppositions on how language functions, and gives new political significance to seemingly isolated voices like Bartleby. According to the concept, a statement like 'there is too much confinement' is not the *ex nihilo* utterance of a lonely subject immured in bad faith. Rather, it is a diagnosis that enunciates an implicit collective awareness of the deeper logic at work within a society.[24] Read like this, Bartleby's statement is 'aware' in two highly significant ways. First, it comprehends the level of confinement that the logic of 'apparent acquittal' engenders within disciplinary societies. Second, by enunciating this, it points beyond this form of society, toward the future.

When developing the concept of the collective assemblage in relation to Kafka, Deleuze and Guattari state of his work that it is capable of rendering 'still unknown sounds that come from the near future … *diabolical powers that are knocking at the door*' (Deleuze and Guattari 2003: 41; original emphasis). Reading his essay on Bartleby in relation to his work on control societies, the extent to which Deleuze also takes this to be the case with Bartleby is clear. To demonstrate, consider a final passage on the move from disciplinary societies to control societies:

> Compared with the approaching forms of ceaseless control in open sites, we may come to see the harshest confinement as part of a wonderful happy past. The quest for 'universals of communication' ought to make us shudder … We've got to hijack speech. Creating has always been something different from communicating. The key thing may be to create … circuit breakers, so we can elude control. (Deleuze 1995b: 175)

Unpacking these words, it is clear that, if there is a character whose significance is 'dated' in the story of Bartleby, it is the attorney. This is because, faced with Bartleby's actions, he ultimately decides to remain subject to the logic of 'apparent acquittal' that they expose and supersede.[25] In this sense, he is a reactive subject, tethered to a form of a disciplinary society. In contrast, Bartleby's actions comprehend and control the logic operative in disciplinary societies, to which extent they move beyond it and contain premonitions of the future forms of 'ceaseless control' operating in control societies.

Bartleby's actions have an enduring political significance because they do not shirk this future. On the contrary, it is the attorney who retreats

toward a form of nostalgia that might just see 'the harshest confinement as part of a wonderful happy past'. In contrast, Bartleby's actions do not simply face up to future forms of control; rather, through the formula, they demonstrate how they might be resisted.

To draw this out, note that Bartleby's formula is an incisive example of the forms of creativity referenced in the latter half of the above extract: first, it shows how speech can be 'hijacked' (through invention within language); second, it shows how 'creating has always been something different from communicating' (by undoing communication's logics of presupposition); third, it shows how creativity can resist the quest for 'universals of communication' (by exposing just how limited logics of presupposition are in their scope). In each case, the formula demonstrates a profoundly contemporary sense of what it means to get 'outside' the limits of a situation: if control societies are replacing the logic of 'apparent acquittal' with one of 'endless postponement', then it is not sufficient to be outside the limits of a situation in the naive, physical sense referenced earlier; rather, what is required to 'elude control' are more nuanced and creative ways of diagnosing and subverting the limits of language.

According to the Sartreo-Badiouian critique, Bartleby is a lonely character immured in his bad faith. This, it holds, is because Bartleby does not embark upon an 'authentic' undertaking to change the norms of situations in which he is included. The problem is that this analysis is tied to a narrow understanding of 'character', and it presupposes bad faith itself to be an unchangeable form of normativity. What recommends Deleuze's essay, in contrast, is that it accesses the deeper political significance of Bartleby's actions by going beyond the limits of character, and by linking them to the collective assemblage that makes them possible. Thereby, it exposes bad faith to be something contingent on how logics of presupposition judge isolated 'characters' and 'subjects'. The profoundly liberating message of Deleuze's essay, then, is that, while it is *always possible* to read a character like Bartleby in terms of bad faith (Sartre and Badiou, for example, must do it because of the logics of presupposition underpinning their respective philosophies), it is *never necessary*.

By exposing bad faith as something profoundly unnecessary, Deleuze's essay shows how we might be liberated from it. This is not to say, however, that his reading is immune to critique. Problematically, its tendency towards eulogy has, as section one of this essay sought to demonstrate, led to a reductive image of Bartleby as a hero whose actions are to be praised, mimicked or, indeed, accused of bad faith.

To overcome this, we should be attentive to the fact that 'Bartleby's actions' are functions of what a text does to language. From here, a path beyond bad faith emerges: it involves being prepared to diagnose and resist logics of presupposition; it involves invention within language; it involves the creation of new characters and 'formulas'; it involves being prepared to learn and vary the languages in which one communicates; it involves being prepared to move beyond the impotence of bad faith; and, importantly, it involves being prepared to move beyond Bartleby. Such a move should not, however, pain us. 'Bartleby' is not a hero to be idolised or a traitor to be accused of bad faith, but rather a provocative diagnosis on societies past, present and future, one that challenges us to think deeply about how we might expose and critique the limits of their control.

Notes

1. Witness Žižek's uncritical use of the term 'Bartleby politics'. (Žižek 2008: 409). For signs of contemporary weariness with this reductive image of Bartleby, see Jean-Luc Nancy: 'everyone clings onto this "I would prefer not to", but it is precisely this that doesn't agree with me … My interpretation, if I must have one, would be that "I would prefer not to" signifies "I would prefer not to write his novel", signed H. Melville' (Nancy 2011: 179).
2. Berkman, for example, has characterised these words as symbolic of 'a messianism of the critical gesture' (Berkman 2011: 83).
3. See Blanchot 1986: 17; Blanchot 1995. Blanchot's earliest piece on Bartleby is from 1945. Berkman argues that, 'in many respects, Blanchot is the great, secret, initiator [of French accounts of Bartleby]. It is with he that … Deleuze dialogues in … "Bartleby; or, the Formula"' (Berkman 2011: 25–6). On Blanchot's general influence on the French reception of Bartleby, see Berkman 2011: 29–52.
4. 'The "Bartleby effect" is, without doubt, behind us … [Today], we are faced with … a new epoch of foundationalism that wants to have done with the troubling and undecidable powers of which [the] formula is the emblem' (Berkman 2011: 174–7).
5. The *Critique of Dialectical Reason*'s distinction between the 'practico-inert' and the individual's free praxis echoes the dualism between 'being' and 'nothingness'. This means that concerns expressed under the rubric of bad faith in *Being and Nothingness* get reworked in Sartre's later text through new concepts of 'pledging' and 'betrayal'. On this, see Sartre 1976: 318–20; Badiou 2008: 23–41. Deleuze, for his part, construed *The Critique of Dialectical Reason* as 'the necessary complement' of *Being and Nothingness* (Deleuze 2002b: 112).
6. Take two important themes: Sartre's concern in *Transcendence of the Ego* to seek a 'transcendental field without subject', and his concern in the *Critique of Dialectical Reason* for a Neo-Marxist theory of group formation. Khalfa identifies the first as a problem in relation to which 'Deleuze defines his own philosophy' from *Logic of Sense* to 'Immanence: A Life', and states of the second that 'the Marxism that [*Anti-Oedipus*] will claim to follow is Sartre's'. (Khalfa 2003: 72–4).These claims are accurate, but seem incommensurate with the level of explicit credit that *Logic of Sense* and *Anti-Oedipus* give Sartre – he receives

three short citations in the former (Deleuze 2004c: 112, 118, 120), two in the latter (Deleuze and Guattari 2004b: 30n., 278).

7. See, for example, Deleuze 2002a; Deleuze 2003; Deleuze 2007.
8. In *Logic of Sense*, Deleuze praises Sartre's acuity in searching for an 'impersonal transcendental field' that constitutes the subject, before condemning him for 'retain[ing] consciousness as a milieu' (Deleuze 2004c: 112, 118). In *Difference and Repetition* and the Tournier essay, Deleuze notes Sartre's richness on intersubjectivity before highlighting his failure to provide a proper account of the Other (see Deleuze 2004a: 77, 323; Deleuze 2004b: 346). For evidence of this pattern outwith the period identified here, see Deleuze 2005: 85; Deleuze and Guattari 2004b: 190.
9. The article cites Sartre as the thinker who 'taught the identity of thought and liberty'. The impulse for it was Sartre's decision, in October 1964, to refuse the Nobel Prize for literature. Deleuze praises this action insofar as it crystallises Sartre's 'revulsion at the idea of being institutionalised'. What is further noteworthy is that Deleuze is therefore praising Sartre for what other commentators perceived as an act of 'bad faith' (see Deleuze 2002b: 113).
10. 'It was the uniquely Sartrean that struck me . . . : his theory of bad faith' (Deleuze 2002b: 112).
11. Bad faith is, for example, cited in a course at the University of Paris VIII (see Deleuze 1983). These references are, however, more exegetical than critical.
12. This is evident in an anglophone context in the work of thinkers like Peter Hallward and Nina Power, and, in a different sense, in the debt owed to Sartre by thinkers like Arthur Danto and Charles Taylor. In a francophone context, it is evident, most obviously, in Badiou, as well as thinkers like Kacem, Tarby and Mavrakis. In a more populist sense, the proximity of Hessel's '*Idignez vous!*' to Sartrean themes is also noteworthy (see Hessel 2010).
13. For Badiou's analysis of these themes, see Badiou 2008: 23–41.
14. The void also functions, like Sartrean nothingness, as a source of change and new possibilities. In *Being and Nothingness*, change occurs through the capacity of a particular being (the 'human reality') to become conscious of its nothingness. In *Being and Event*, change occurs through the capacity of the void to be recognised within a situation, as an *event* that exposes the contingency of previously held norms on what it means to be (see Badiou 2005: 184–90).
15. 'Post-phenomenological' is used throughout this section in preference to 'post-structuralist'. I take the former term to be more instructive in determining the core theories of figures like Deleuze, Derrida and Foucault. For evidence of the shift from phenomenological description to the post-phenomenological critique of language, see, in particular, Foucault 1966; Derrida 1973; Descombes 1979; Deleuze and Guattari 2004a: 83–122.
16. 'The postulates need not be spoken: they function all the more effectively in silence . . . Together, they form the dogmatic image of thought. They crush thought under an image which is that of the Same and the Similar' (Deleuze 2004a: 207). For Deleuze's most developed account of the 'postulates' of linguistics, see Deleuze and Guattari 2004a: 83–122.
17. Bad faith leads to viciously circular paradoxes. It cannot be overcome through an opposed theory of authenticity (contra Sartre's suggestion in *Being and Nothingness* – see Sartre 1943: 111), nor by simply replacing the ontology that makes it possible (as occurs in Sartre's later move toward materialism, for example), nor by simply 'forgetting' bad faith as a metaphysical idol out of control, à la Nietzsche. This is because all such moves can be viewed as acts of bad faith toward the concept of bad faith!

18. "'I swear" is not the same when said in the family, at school, in a love affair, in a secret society, or in court: it is not the same thing, and neither is it the same statement' (Deleuze and Guattari 2004a: 91).
19. 'At first, Bartleby did an extraordinary quantity of writing. As if long famishing for something to copy, he seemed to gorge himself on my documents. There was no pause for digestion … I should have been quite delighted with his application, had he been cheerfully industrious. But he wrote on silently, palely, mechanically' (Melville 1990: 9).
20. This is something the character of the prison's 'grubman', emerging late in the story, makes clear:
    "'Your sarvant sir, your sarvant," said the grubman, making a low salutation behind his apron. "Hope you find it pleasant here, sir; nice grounds – cool apartments – hope you'll stay with us some time – try to make it agreeable. What will you have for dinner today?"
    "I prefer not to dine today," said Bartleby, turning away.' (Melville 1990: 32).
21. 'To befriend Bartleby, to humour him in his strange wilfulness, will cost me little or nothing, while I lay up in my soul what will eventually prove a sweet morsel for my conscience' (Melville 1990: 13).
22. Consider these remarks from the attorney to the character 'Nippers':
    "'What do you think of it, Nippers? Would I not be justified in immediately dismissing Bartleby?"
    "Excuse me, that is for you to decide, sir. I think his conduct quite unusual, and indeed, unjust, as regards … myself"' (Melville 1990: 14).
23. See also Stiegler on 'technologies de contrôle' (Stiegler 2006: 28).
24. 'There is no individual enunciation … [E]nunciation in itself implies collective assemblages. It then becomes clear that the statement is individuated, and enunciation subjectified, only to the extent that an impersonal collective assemblage requires it and determines it to be so' (Deleuze and Guattari 2004a: 88).
25. Deleuze sums up this decision as follows: 'the final words of the attorney's narrative will be, "Ah, Bartleby! Ah, humanity!" which does not indicate a connection, but rather an alternative in which he has had to choose the all-too-human law over Bartleby' (Deleuze 1998: 81).

Is A New Life Possible? Deleuze and the Lines

Luis de Miranda Translated by Marie-Céline Courilleault, revised by Colette de Castro and Luis de Miranda

Abstract

In his dialogues with Claire Parnet, Deleuze asserts that: 'Whether we are individuals or groups, we are made of lines' (Deleuze and Parnet 2007: 124). In *A Thousand Plateaus* (with Guattari), Deleuze calls these kinds of 'lifelines' or 'lines of flesh': break line (or segmental line, or molar line), crack line (or molecular line) and rupture line (also called line of flight) (Deleuze and Guattari 2004a: 22). We will explain the difference between these three lines and how they are related to the 'soul'. We will also explain how a singular individual or group can arise from the play of the lines. Eventually, we will introduce the concept of 'Creal' to develop the Deleuzian figure of the 'Anomal', the so(u)rcerer.

Keywords: crack line, molar line, molecular line, rupture, break, soul, difference, Hume, singular, Creal, impression, Anomal, subject

> Lightning, for example, distinguishes itself from the black sky but must also trail it behind, as though it were distinguishing itself from that which does not distinguish itself from it. (Deleuze 2004: 36)

I. Introduction: 'Whether we are individuals or groups, we are made up of lines'

What is it that makes us act? What is it that brings us from motion into space? Following what directions? What principles? The human life is often presented as a straight line, which has a start, a midpoint and an end. We picture ourselves evolving on this line with the feeling

Deleuze Studies 7.1 (2013): 106–152
DOI: 10.3366/dls.2013.0096
© Edinburgh University Press
www.euppublishing.com/dls

that we are not always the masters of our destinies and unsure as to which goal(s) to aim for. Is it meaningful to draw such a vectorisation of life when every living being, as soon as it sets itself free from certain indoctrinations, certain imperatives, so often feels that it is bursting with boundless energy or desire and that it is leaking out from every side, like an overflowing vase?

People talk about a life curve in terms of industrial items, but does the human experience – being so complex and metamorphic – truly follow a line? Can its essence be summed up in such a linear form, which would be but a form of abstraction deprived from any other link with the real life of the spiritual bodies than a symbolic or metaphoric one? 'Oh, the poverty of the imaginary and the symbolic, the real always being put off until tomorrow' (Deleuze and Parnet 2007: 51).

To say that souls follow lines seems to be a schematic abstraction. But it seems as though it were a concrete reality according to several excerpts in Gilles Deleuze's work; for instance, in the first chapter of *Difference and Repetition*, when, as he is taking a closer look at the distinction between the base of things and their surface, the philosopher writes: 'The rising ground is no longer below, it acquires autonomous existence; the form reflecting itself in this ground is no longer a form but an abstract line acting directly upon the soul' (Deleuze 2004: 37). Further in his writings, and particularly in his dialogues with Claire Parnet, Deleuze asserts quite simply that: 'Whether we are individuals or groups, we are made up of lines' (Deleuze and Parnet 2007: 124).

Individuation would thus follow one or several lines, like social life. How to understand – to accept? – that one of the simplest geometrical shapes could be used to describe souls? And how to describe this line, these lines and the dynamics that rule them? First of all, why does Deleuze emphasise the notion of soul in philosophy at the end of the twentieth century, while some cynical or embarrassed minds claimed it was part of the museum of theology?

We shall be more precise: Gilles Deleuze suggests that this line of life divides itself into three threads, or rather that there are three lines of life: 'The primary line of flight, of border or frontier, which is relativized in the second line, which allows itself be stopped or cut in the third' (Deleuze and Parnet 2007: 137). What is the meaning of this tripartite system and how does it work? And what is the meaning of terms like flight or cut? In *A Thousand Plateaus* Deleuze (with Guattari) calls these kinds of 'lifelines' or 'lines of flesh': 'break lines (or segmental lines, or molar lines), crack lines (or molecular lines) and rupture lines (also called lines of flight)' (Deleuze and Guattari 2004a: 221).

In the first place, the molar lines seem to be defined as binary and oppositional imperatives, segmenting, ordering, as forces of control and of social overcoding, of training, as a narrowing of the *élan vital* or a diversion from it. We shall notice at this point that this definition might remind us of the tendency Nietzsche called 'Apollonian' – the formalist containment. This orientation will be explored by reading *Nietzsche and Philosophy* by Deleuze.

As for the rupture lines, they seem to be chaotic lines of 'the steepest slope', of flight towards a disindividuated becoming, a force of impetuous attraction, the torrent of an over-full life (but not always a fool's life) bursting beyond the preservation necessity of the individual belonging to a species. Again, we will have to develop this first evocation and try to understand to what extent these two terms 'break' and 'rupture' can be opposed. We shall also notice that the rupture lines seem to evoke the concept of the Dionysian by Nietzsche – the excesses bursting from the centre of the earth, from the underground – an impression that we will explore.

Between these two lines, there is supposed to be a 'crack line', neither automating-castrating nor impulsive-anarchic, which according to Deleuze would fall and rise, like a yo-yo perhaps or a 'molecular flux of quanta'. This is a more supple line than the molar line, but Deleuze, in *Dialogues II*, maintains that it is not necessarily 'a more personal nor a more intimate one'. 'Micro-cracks are also collective. They run through societies and groups' (Deleuze and Parnet 2007: 124).

It is at this point that the main difficulty in our attempts to sort things out arises. Indeed, if the molar line is social, the rupture line infra individual, and the molecular line collective, where does the possibility of a singular individuation, of a subject's uniqueness stand? Where is the dynamic, the personality, which is generally supposed to tell individuals apart, in their identity, in their own becoming? What is it that leads a soul to express a distinct human self, a triumphing 'I', supposing that the individual identity is not a fiction out of reach? And what is it that Deleuze calls the 'fracture in the I' in *Difference and Repetition*?

It seems that the term 'crack' has been inspired, among others, by F. Scott Fitzgerald's short story *The Crack-up*. We shall state at once that it appears there is some dissonance between Deleuze's text and Fitzgerald's one. Deleuze seems to give a rather positive and active meaning to the notion of crack, whereas the vision offered by the American novelist is that of a depressive loss of vital flow, of impetus, an incapacity to embrace the fullness of existence. Fitzgerald depicts the fractured or cracked-up being as 'a person whose life makes other people's life seem

like death' (Fitzgerald 2009: 73–4) For Deleuze, the crack is healthier. But in fact, Deleuze and Fitzgerald are talking about the same line, for this one can be explored following the autumn or the spring, going down or up. On one side, the crack sets free; on the other side, it dries up. Or perhaps, does it set free by drying up the Real, like Deleuze said about Beckett? A line along which we believe we do not want anything anymore because we want everything.

In Fitzgerald's story, a woman replies to the narrator's lament:

> 'Instead of being so sorry for yourself, listen – she said. (She always says 'Listen,' because she thinks while she talks – *really* thinks.) So she said: 'Listen. Suppose this wasn't a crack in you – suppose it was a crack in the Grand Canyon.' 'The crack's in me,' I said heroically. 'Listen! The world only exists in your eyes – your conception of it. You can make it as big or as small as you want to. And you're trying to be a little puny individual. By God, if I ever cracked, I'd try to make the world crack with me. Listen! The world only exists through your apprehension of it, and so it's much better to say that it's not you that's cracked – it's the Grand Canyon' (Fitzgerald 2009: 73–4).

Grand Canyon or 'fractured I', what is the real driving dynamic of the human life if it is neither normativity nor anarchy?

Our examination of the tripartite conception of the lifeline will be advanced in four steps. We will first try to better understand the difference between the three lines – molar, rupture and molecular – and how they can be related to 'the soul'. In the second part, we will try to explain the interweaving, the structure of these three lines, their mutual influence, their permeation, which depends on the particular conception of the being and of the I as fractured. In the third part, we shall understand how a singular individual can arise (or not) from the play of the lines. Such a singular subject will appear as a contemplating, impressed and impressive soul, incarnated in a specific language, that is to say a figure not enclosed inside itself, not fractured. We will resume the hypothesis according to which the subject is longing for everything, in order to think a rising 'I', if it is possible. Finally, in the fourth part, once the role of the lifelines is clearer and the existence of a singular subject will seem possible in the form of a benevolent so(u)rcerer, someone who keeps bringing into being that which does not yet exist, it will be time to start a summary of what has been exposed before, reaching a full understanding of the way we move from the impression that comes first to the active subject.

II. Distinction of the Three Lines: Molar Lines, Rupture Lines, Molecular Lines

The Soul Draws Lines

'The rising ground is no longer the background, but acquires an autonomous existence; the form reflecting itself in this ground is no longer a form but an abstract line acting directly upon the soul' asserts Deleuze in *Difference and Repetition* (Deleuze 2004: 37) How can an abstract line operate directly upon the soul? To answer that question, we will have to understand what Deleuze means by 'soul' and, in order to do so, the reader is advised to listen to the class he gave at the Paris VIII university in 1986–7: *Leibniz: Soul and Damnation* (Deleuze 2003) before we examine here the first chapter of *Difference and Repetition*.

'What does this mean, the tissue of the soul?' wonders Deleuze while reading Leibniz. A swarm of small inclinations is the very component of the stuff of the soul. These inclinations fold the soul in all directions. This is not just a metaphor, this is the true nature of the Real: 'a swarm of differences, a pluralism of free wild or untamed differences . . .' (Deleuze 2004: 61) That is the essence of the soul: folds that form and unfold constantly in all senses; this is a '*pruritus*', a 'concern'. As if thousands of tiny springs were working in various directions, with elastic forces. The soul is a living, multiple being, an endless network simmering with differential micro-variations. The tissue of the soul, in a constant 'disparity', makes micro-folding, virtualised folds. How does this simmer, this swarm which has a tendency to fold, form lines?

'Towards which side will I fold my soul?' This is the question of the unconscious. The human self is what results from the production of a perception we have discerned, from a maximum of small perceptions: an inclination, a 'decisive fold', which forms a line of action. This decisive fold, this 'decisory' fold, is the trigger of action. The lifeline is formed by the association of decisory folds, which have led us here and there, to do or say this or that. We can already consider that if three complementary forces oppose each other – social break of training, rupture by coming back to the pure difference of disparity, individual crack of the 'neither-nor' (neither Apollo nor Dionysius) – we can end up with the formation of a kind of individuation, as unoriginal or not autonomous as it may seem at first glance, at this stage of our development.

In any case, the soul is not some steady scales upon which we might put weights. The true figure, the only possible diagram for the deliberation of the soul, according to Deleuze as he re-reads Leibniz, is a diagram of inflexion: there are only inflexions in the soul, inclinations

tracing folds of different sizes. These folds are the furrows of the action. The self is deliberative: it builds itself up in the virtual space and time we dedicate to the elaboration of a decisory fold, leading to a line of action in the real space. What is it that conveys to a movement a linear unity? It is the soul as a folder, which is the unity of the movement. 'Will I go to the pub or go to work?' The world drives us from a desire to a counter-desire, imaginings to actions.

But why does the soul draw lines rather than stay, for example, at a point? It is a matter of amplitude regarding the pendulum, a question of unfurling of the folded space and a matter of incarnation. The soul that lies at a point is not incarnated; it is, as such, asleep or damned. When a soul comes into the world, it is a body that unfolds. *To become spiritual is to unfold one's body*. All souls draw lines following various amplitudes, internal spaces of more or less broad folding – to the exclusion of 'the damned', which are the souls tending to be willing to reduce their amplitude to a mere point, a point of sheer hatred of the Everything ('I hate God!'). A completely unfolded soul, on the contrary, as we can deduce from what was just said, would be a sheer affirmation of everything.

At the basis of the Real, there is thus a pre-individual pruritus of endless differences. This background opens up in the space-time folding and unfolding itself, creating folds. At times, the sum of a certain amount of micro-folds forms a decisory fold, which is a line of action, a line of action of a defined amplitude: 'Whether we are individuals or groups, we are made of lines' (Deleuze and Parnet 2007: 124). Now let us take a closer look at the three kinds of lines Deleuze points out.

The Molar Line or Segmentary Line

'The first kind of line which forms us is segmentary, of rigid segmentarity' (Deleuze and Parnet 2007: 124). This fold is the archetypal social fold, the fold of convention, driven by the survival imperative. This is the line of classifying language, the line of prioritisation, of ordering, duty, false oppositions: 'family – profession; job – holidays; family – and then school – and then the army – and then the factory – and then retirement.' This is the line of the *they*: 'They tell us: now, you are not a baby anymore'[1] (14–17). This is a line that works collectively, a line of imprisonment in such and such a function or group, a line of training, a line setting in motion the wheels of the social code according to operational models enabling mass containment of the vital flows – necessarily reductive, forced and simplifying. These are

segments that, far from embracing the natural inclinations of the soul, its multidirectional pruritus and its joyful worry, castrate it or rather try to do so, lull it with the notion of obligation, the notion of necessary limitation of the individual name-surname inscribed in a historic era and in a given society.

The main binary segments make us suffer because the real individuation happens at a more subterranean, less clear-cut, less caricatured level. The main segments of disconnection, which literally take our breath away or shut off our desire in moments when freedom would like to follow another path, these moments of 'they' are oppositions and impositions working as emphatic imperatives: 'rich–poor, success–loss of success, health–sickness, love–love's drying-up, creativity–sterility' (Deleuze and Parnet 2007: 126). These are false opinions for, in reality, from the point of view of this opposition the rich as rich and the poor as poor cannot be told apart, they are in the same fold: they are both cut through by the money cut. Likewise the lover and the solitary person do not differ from each other as long as they are prisoners of a social and collective definition of their attachment-detachment.

A molar line depends on 'binary machines'. The machines of break are oppositional poles, heavily dialectical, regimenting the flow of inclinations, generating actions-reactions, orientating the folds of the soul without nuance.

> There are binary machines of social classes, of sexes (man–woman), of ages (child–adult), of races (black–white), of sectors (public–private), of subjectivations (ours–not ours) … These binary machines are all the more complex for cutting across each other, or colliding against each other, confronting each other and they cut us up in all senses. (Deleuze and Parnet 2007: 128)

These conflicted dichotomies do not create spaces of liberation but only new segments, new compartments, new false and too visible minorities; for example, the mixed-blood individual as third term of the white-black segment – as if to call oneself mixed-blood or anything else could free the individual from his or her problematical desire to find one's place in the world. In fact, it is always about controlling inclinations so as to impose rules more easily. The molar lines are social and therefore political. The segments that are cut imply 'devices of power', and we can draw an implicit parallel here with what Foucault called 'biopower'.

As many classifying devices, as many codes which drive the energies of the soul away from its creative or liberating (or auto-destructive) instinct, the segments determine a limited space in which the individual

human being must be penned, if possible, in a compound. Cut, he may still think he breathes, belongs, has a destiny, but in fact he is only penned in this big compound. The segments impose themselves with the relative complicity of the individual because they reassure him in view of the tormenting big vacuum and big chaos, and because they set up competitive networks that animate the ego and divert/pervert the soul. We know the importance of chaos in Deleuze's philosophy; for him this concept includes a positive reality – a play of differences, an 'ungrounding' – rather than a negative (groundlessness).

Each molar line corresponds to a territory in which a code can be applied at almost no cost. This behavioural code that obtains gratification without superhuman effort comforts human laziness in the idea that there must be something good in the exterior order, the hyper-normed society, that overcoding is the only way to organise a society. The molar lines are trends of automatisation of life, comfortable in appearance but in fact, behind the routine, despite the rules and the rewards, it is a form of apnoea: 'M. de Charlus collapses at Mme Verdurin's, because he has ventured beyond his own territory and his code no longer works' (Deleuze and Parnet 2007: 129).

The rules and the rewards of the segmental line regime are decreed by a 'State apparatus', that is to say a 'concrete assemblage', which effectuates the machine of overcoding in a society: 'An abstract machine organizes the prevailing statements and the established order of a society, the dominant languages and knowledge, the well-adjusted actions and feelings, the segments that win over the others' (Deleuze and Parnet 2007: 129).

To write a philosophical essay, for instance, means in a sense to obey a cutting organisation outline: the one of exposing analysis and of quotation of the corpus. In order not to be only cut and thus speechless, we ought to progressively tend to the fracture without lapsing into complete poetical rupture. We understand with this example that the soul draws lines: confronted with breaking forces and rupture forces, the line (we cannot help thinking about the written line) is a strategy of affirmation by vital focalisation, a concentration in deed, which does not turn into a point of hatred but goes forth towards the hope of an active singularity. Why a line, why a fracture, why a lightning? Because the dilatation or the blaze would be mortal if excessive, because willing to occupy all space at the same time would be equivalent to comparing ourselves to God.

We can notice that the molar line can evoke the plastic formatting that was called the Apollonian principle by Nietzsche, provided we identify

the collective order with the beautiful appearance, which is precisely the prevailing political speech. Deleuze quotes Nietzsche: 'Apollo overcomes the suffering of the individual by the radiant glorification of the eternity of the phenomenon' (Deleuze 2006: 11). The imaged artifice and the hyper-form are meant to make the suffering fade away: this reminds us of the prevailing contemporaneous cosmetics, which advocates for a shaping of bodies according to visible canonical models. Comply with the norm and you will be beautiful.

The Apollonian concept also gives us a description of the molar line that is not entirely negative: 'It would be too easy to say: "This is a bad line"'(Deleuze and Guattari 2004a: 216). It can save us from the death-drive into which can turn the rupture line.

We understand, in any case, how the cut lines work under the constraint of the imperative, of 'you have to'. We see very well how these lines can exert a formatting pressure on the multiplicity of differences that are boiling in the soul at each moment. What is it that is cut by the molar line? The molar line cuts the formation of a line of steep slope, which is the rupture line. The rupture line is somehow a rupture of the break and vice versa. But what is exactly this rupture line?

The Rupture Line or the Dancer's Soul

The rupture line may seem, at first sight, the opposite of the molar line. While one segments, the other crosses through the segments. While one organises, the other is a flow running through a line of irresistible trend. While one makes codes in a predictable world, the other builds chances out of impulses, unexpected decisory folds, energetic flows of tension bursting out. 'This line is simple, abstract and yet is the most complex of all, the most tortuous' Deleuze and Parnet 2007: 125). This is the overflowing of vital excess and this time it evokes the Dionysian principle by Nietzsche: 'Dionysus returns to primitive unity, he shatters the individual, drags him into the great shipwreck and absorbs him into original being.' Inside all of us there is more life than what is needed to draw straight lines. We leak out from every part and are unceasingly tempted to express our overabundance of being by letting out cries of joy, of madness or of fright. The rupture is sometimes here, sometimes there, sometimes elsewhere, flow of blood or loss of it.

We notice that the rupture is not opposed to the break of the molar line in a strict dialectical way. After Nietzsche, Deleuze pleads against too binary dialectical comprehensions of the Real. Instead of talking about a contradiction, we would rather speak about a differential

complicity of the two forces: the break like the rupture line tries to suppress the singularity of the subject in the first person, which is summoned by the crack line.

Finally, Deleuze compares the rupture with 'the dancer's soul' in the *Dialogues* with Claire Parnet, quoting *On the Marionette Theatre* by Heinrich von Kleist. It is not unimportant to stop a moment by this short text of 1810, reaching the climax of romanticism in that it advocates natural grace against semi-conscious reason. *On the Marionette Theatre* may also be one of the matrixes of Deleuze's conception of lines. Kleist mentions his meeting with a dancer from the city's opera house, in front of a marionette theatre. The dancer explains that the soul is the motive force of movement (*vis motrix*) and that the puppeteer does not set into motion the limbs but the point of gravity around which the limbs start to dance as if by magic: 'Each movement, writes Kleist, has its center of gravity; it is enough to direct it within the puppet. The limbs, which are only pendulums, then follow mechanically of their own accord, without further help' (Deleuze and Parnet 2007: 138).

Kleist adds that each time the puppet's centre of gravity is 'moved in a straight line, the limbs describe curves'. The line drawn by the centre of gravity is sometimes a straight one sometimes an incurved one, with a simple but 'exceedingly mysterious' appearance: 'It is none other than *the progression of the soul of the dancer*' (Deleuze and Parnet 2007: 138–40).

Man loses the dancer's grace because of the conscience he has of himself and because of the auto-reflexive act of comparing himself with others. Affectation is when the soul is 'anywhere other than the movement centre of gravity' (Deleuze and Parnet 2007: 140). The reflection of the self in others and vice versa is precisely the moment of the break, whereas the rupture is, in the best of cases, incarnated by the return of the soul to its centre of gravity. Kleist writes: 'We see that in the organic world, as refection grows dimmer and weaker, grace merges more brilliantly and decisively' (140).

But the puppet can break down. The rupture line is sometimes the line of grace, sometimes the line of a death-drive: 'It would be a mistake', advises Deleuze, 'to believe that it is enough to follow the line of flight or rupture.' For the rupture lines hold an extreme danger: 'That of turning into abolition, of destruction of others and of oneself. A passion for abolition. Just like music – why does it give us the urge to die?' (Deleuze and Parnet 2007: 140).

To sum up, the rupture line is the abyss in which what puts down roots is sometimes the grace of the living, sometimes the disappearing of

the individual: 'Not that it derives from the two others but it comes before them' (Deleuze and Parnet 2007: 140). This is the hazardous and eternally different ground everything originates from and comes back to. This is, Deleuze writes in *Nietzsche and Philosophy*, the South: once more – actually like dance, for 'To dance is to affirm becoming and the being of becoming' (Deleuze 2006: 161) – a Nietzschean theme: the Noon, the hour when the world is 'perfect', a 'well of eternity' according to Zarathustra. The South or the Noon is the moment when the soul reaches its maximal amplitude, when it reaches out to the infinite divine affirmation, in opposition, as we have seen before, to the point of negation in which the hatred for the Everything seen as a universal separation reaches the ego. Thus speaks Nietzsche through Zarathustra: 'How long and weary it becomes, my strange soul! . . . It stretches itself out, long – longer!' (161).

The Molecular Line or Real Lifeline

The crack line seems to somehow result from the tension of the other two lines. We could believe the following: the line of the human experience, 'lightning in the black sky', corresponds to a spatiotemporal molecular line, under the pressure of the other two lines, a pressure which we will have to apprehend as not exclusively dialectical. The molar lines exert pressure for the preservation of a hard-segmented world, with a homogeneous vocation in its organisation. The rupture lines are supposed to exert a chaotic force leading to exhilaration, drunkenness, intoxication (or to death), a gravity of the subterranean lava, a world of differential impulse. The crack line, the more human one (maybe the only truly human one) seems to be a creation of space-time, pressure upwards or downwards expelling the Apollonian monolithic blocks and limiting the Dionysian circular outflows, by lying in the world, in the rite, and in the language, although not entirely.

Because it is also a compromise, a fault of subsistence. These are, still, lines of segmentarity, although they are 'much more supple' (Deleuze and Parnet 2007: 124). 'They trace small modifications, they are winding, they sketch falls or jumps' (124). There is something touching, something existential, in the molecular line, because it seems to resist the cut line while still fearing it will sink into the rupture. 'A profession is a rigid segment, but also what happens beneath it, the connections, the attractions and repulsions which do not coincide with the segments, the form of madness which are secret but which nevertheless relate to the public authorities' (125). We may have the impression that

everything is all right, that we are well adjusted in society, that we have the permissions and the rewards we require and then 'a plate cracks': light is cast upon 'a lowered resistance limit or higher requirement level. We can no longer put up with what we previously put up with' (124).

The molar line establishes classifying links between 'pairs' whereas the molecular line is set into motion by 'particles escaping from these classes'. The links established by the molecular line are connections of 'doubles', generating a self-revelation, revealing that identity is not as steady as the frequency of the segments might suggest.

Fitzgerald seems to be, in 1935, a successful author blessed by Destiny. And then the editor in chief of the magazine *Esquire* visits him in Baltimore to ask him why he no longer writes articles or short stories. 'I cannot write anymore,' the author whispers. A short story will, however, be written in an attempt to explain this incapacity: *The Crack-up*, where Fitzgerald explains that when we are in the crack-up, life does not give in to intelligence and effort that easily. We can no longer be satisfied with social superficialities like celebrity. Fitzgerald then describes the crack as a form of vital incapacity, and this may seem contradictory to what Deleuze said about it. However, both do talk about the same thing, in the way that the crack line can be explored upwards and downwards, towards an augmentation of the rise or in the direction of the fall. The molecular line is precisely this human hesitation, this fold going from the paralysis of social inscription to the energy that splits constraints while respecting them partly. The crack line is the airlock of hesitation or of perseverance which makes the being emerge. Falling fracture, that is to say sinking and agony in the repetition of separation; rising fracture, that is to say creative repetition of the vital tension.

Here we clearly hear that the molecular line can be defined both as resulting from the rigidities of the molar line, and as the cracking due to the call of the rupture line. That is why we will have to attempt a more precise explanation of the way the three lines revolve around each other and interweave, with difference in their framework.

III. The Organisation of the Lines and the Difference

Against the Dialectic and the Abstractly Considered Symptoms

We could be tempted to see a kind of Hegelian dialectic in the interdependent play of the three lines. The molar line would be the thesis, the rupture line the antithesis and the molecular line the synthesis. That would be a partial interpretation of Deleuze's proposition.

The philosopher repeatedly set himself apart from the dialectic in his works. Among others, in his *Nietzsche and Philosophy*, the concluding chapter is called 'Against the Dialectic'. 'The difference is more profound' than Hegel's conceptions judged too abstract and representative.

'On Hegel's interpretation, the death of Christ stands for superseded opposition, the reconciliation of finite and infinite, the unity of God and the individual, of changeless and particular' (Deleuze 2006: 148). Hegel seems to understand sensible diversity as an appearance, a game of the spirit. In doing so, he neglects the flesh of the world. He wants to look the negative straight in the eyes but remains in the spectacular face to face with the subject and object. His thesis, antithesis and synthesis, according to Deleuze, are only the symptoms of something which is at stake at a deeper level and which has to do with the difference rather than with the dialectic.

This is not the place to discuss injustice towards Hegel in this Nietzschean-inspired criticism. However, it appears clearly how the permutations of the dialectic can remain logical-abstract and can be used to raise capital concepts. Such superlative empty concepts were taken up by the 'New Philosophers' in the 1980s, with a lot less force and complexity than Hegel. Deleuze will precisely blame them for talking about Evil, Man, War without understanding their subtle ambiguities and their polyvalence. All of this proceeds from a willingness to fix the representation rather than to follow and to welcome the richness of the becoming:

> It is not surprising that the dialectic proceeds by opposition, development of the opposition or contradiction, solution of the contradiction. It is unaware of the real element from which forces, their qualities and their relations, derive; it only knows the inverted image of this element which is reflected in abstractly considered symptoms. (Deleuze 2006: 148)

What is subtle and supreme is the difference.

The critic regarding the dialectic is hard or even unfair since it is relegated to 'a fiction': 'To walk feet on the ceiling is not a thing that a dialectician can blame another for, this is the fundamentals of the dialectic itself' (Deleuze 2006: 149). What Deleuze reproaches Marx for in this hint, despite the admiration he had for him, is the same thing as before: not allowing himself the thought of a vital affirmation, an affirmation which would not be only theoretical or dependant on an abstract negation, but an affirmation of a living difference. What is this 'difference'?

The Difference or the Being of the Sensible

'Imagine', Deleuze says in *Difference and Repetition*,

> something which distinguishes itself – and yet that from which it distinguished itself does not distinguish itself from it. Lightning for example distinguishes itself from the black sky but must also trail it behind, as though it were distinguishing itself from that which does not distinguish itself from it. It is as if the ground rose to the surface without ceasing to be the ground. (Deleuze 2004: 36)

The difference is first envisioned as a 'monstrous' fight between what is undifferentiated and oneself. It is the moving of the being, its determination will in a continuous flow and metamorphosis, a movement Deleuze calls 'cruelty', reminding us of Nietzsche. This is the bottom that wants to rise up to the surface; it is a will to become a fold, a line, which is not a will to become a plastic form. This is the Dionysian that wants to appear without falling into the Apollonian trend. 'Difference is monstrous' (Deleuze 2004: 37): that is to say what tends to show itself (*monstro*, *monstrare* in Latin), to manifest itself without following the form, rather dissolving it, making its straight lines and its pillars waver.

On the other hand, if the difference does not reach out to the form, we could picture it as reaching out to functioning life. The difference would then be the impulse of the undifferentiated generating organs, that is to say interconnected networks of subcategories, bound by the rule of the biggest and the smallest. The difference would not be a continuous *monstration* but of big or small categories or sets; neither the diversity nor the otherness but the opposition of sizes able to fit the principles of identity, of opposition, of analogy, of resemblance, once they are in the field of representation.

But to enslave the difference to the exclusive requirements of organic representation would be veiling its 'orgiastic' element (Deleuze 2004: 52). For a long time thought tried to explain chaos, 'causing a little of Dionysius' blood to flow in the organic veins of Apollo' (Deleuze 2006: 149). Intoxication, quartering, fainting, decentring: these are the different stances that representation can never completely reach because representation on the contrary is centration. We could say that the difference is eternal space ('a non-extensive and non-qualified *spatium*' – Deleuze 2004: 33), fundamental chaos, pure roaring intensity. Most of the time humans only dwell in the surface space-time, a distorted space full of emptiness – excluding some psychotic minds maybe, or

some mystic people, some musicians, artists or other people who know how to merge with the otherness and the source, casting the ego down.

Difference is not an abstraction. It is the way of being of the sensible. It is, Deleuze says in *Difference and Repetition*, the world of the 'disparate' and of the emerging substrates. Now, we have already met this active disparity: Leibniz applies the idea to the ground of the soul. For Deleuze there is undoubtedly identity between the essence of the soul and the difference. The difference is infra-subjective, infra-individual, *infranimal* even, but it is also spiritual and animistic. What is then revealed is a set of differences 'which are neither in sub-stance nor in a subject: so many subterranean affirmations' (Deleuze 2004: 70).

We have to understand that the difference comes before the lines but it underlies them: the line of flight is leak, *ungrounding* towards the difference; the rupture line is forcing back, burial of the difference; and the crack line is manifestation of the difference through the relentless repetition or exhaustion of the breaking repetition. In their relation to the difference, these three lines can be considered as being just one.

Three Moments of a Same Line

'The primary line of flight, of border or frontier, which is relativized in the second line, which allows itself be stopped or cut in the third' (Deleuze and Parnet 2007: 137). We can consider, Deleuze says, that the primary line of flight, attracted by the Dionysian differential chaos, in order not to be cut, stopped by the Apollonian rigidities, will turn into a relative line, the molecular line. The fissure of the molecular line seems to be the human compromise between the whirl of the undifferentiated and the social mechanisms. What is the meaning of such a relativisation?

Let us first try to understand how these three moments of the line (or the three lines) are organised. First of all, the rupture line. If it is the line of the steepest slope, how can we explain its being highly dynamic and liberatory? How can we explain that it will not sink into the undifferentiated? Maybe because it does, but in the process, which is not a groundlessness but an *ungrounding*, it draws on an energy that makes it spring up again. The line of flight is once more taken in two directions, in the direction of a loss of destructive energy and in the direction of a springing up of the sensible.

How to understand that the molar line devitalises whereas it has been created by the institutions, that is to say by the humans? The direction of the molar line is also an edification: because of it, men dictate law

and rules that ensure the functioning of groups, keeping them alive over other groups. The molar line aims to be the vital line of a dominant group, whereas the rupture is the energy line of the divine, multiversal monster.

We understand the necessity of a third line better, a molecular line, more human, even if we could be satisfied with an oscillation and a conflict between the first two opposite lines: the Dionysian line of rupture and the Apollonian molar line. The molecular line is the line of relativisation with respect to the rupture line. It means that it is a line of connection: neither entirely submitted to automaton-like imperatives nor entirely submitted to the impulse of the undifferentiated. The molecular line seems to be the line of the 'I' inserted in the 'we'.

Here again, we are confronted by an obstacle. We have noticed earlier that Deleuze did not consider the molecular line as 'more intimate or personal'. And yet, everything leads us to think it is. The molecular line seems to be the line of affectivity, of the intimate self. But in fact, it is rather related to the 'fractured I', divided by self-reflection. Can we then conceive a molecular line, which would not be entirely intimate or entirely collective? What is it that Deleuze calls the 'fractured I'?

The Fractured I: 'I is an Other'

> We should be concerned with a precise moment within Kantianism, a furtive and explosive moment which is not even continued by Kant, much less by post-Kantianism – except, perhaps, by Hölderlin, in the experience and the idea of a 'categorical abduction'. For when Kant puts rational theology into question, *in the same stroke* he introduces a kind of disequilibrium, a fissure or crack, in the pure Self of the *I think*, an alienation in itself, theoretically insurmountable: the subject can henceforth represent its own spontaneity only as that of an Other, and in doing so invokes a mysterious coherence in the last instance, which excludes his own, that of the world and God. A cogito for a dissolved Self: the Self of the 'I think' includes in its essence a receptivity of intuition in relation to which 'I' is already another. It matters little that synthetic identity, and, following that, the morality of practical reason, restore the integrity of the self, of the world and of God, thereby preparing the way for post-Kantian syntheses. For a brief moment we enter into that schizophrenia in principle, which characterizes the highest power of thought and opens Being directly on to difference, despite all the mediations, all the reconciliations of the concept. (Deleuze 2004: 70)

Let us dwell for a moment on this idea of the fractured I. Everything arises, Deleuze says, from the difference between the Kantian cogito and the Cartesian cogito. *I think therefore I am*: there is nothing that can

lead us to think that the 'I' that thinks is the same as the 'I' that is, as Kant observes in *Critic of Pure Reason*. The thought existence may not be exactly the same as the life existence. For Deleuze, there is in effect a caesura between them. As soon as the I wants to apprehend being, it apprehends time: 'The form under which undetermined existence is determinable by the I think is that of time' (Deleuze 2004: 108).

What are the consequences of this swapping between being and time, between pure *spatium* and temporal conscience? First, it is due to the fact that my indeterminate existence can only be determined *in time*, as the existence of a phenomenon, of a phenomenal, passive or receptive subject *appearing in time*. Hence the distressing paradox: either my active self is another and the self I feel the closest with is pure contemplative passivity, or it is the other way round, but hardly ever both at the same time. To become aware of this is to fall into the crack mentioned by Fitzgerald, a downward fracture if we stick to this passive perception of the self.

That is depression: to adhere to a passive self, spectator of phenomena and representations, and to feel sad about a fundamental lack of authentic initiative. 'It is as though the I were fissured from one end to the other: cracked by the pure and empty form of time', Deleuze repeats (Deleuze 2004: 108). Reflexivity makes us double. This double I is the fracture.

Deleuze tells us that Hölderlin discovers after Kant the emptiness of time backed with the sustained fracture in the I. In this form of time, Hölderlin saw the death-drive. What does this mean?

Let us read the lecture Deleuze gave about Kant in Vincennes (Deleuze 1978). As long as time is cyclical, death does not really occur, it is outside the limits of life, life is only seen as a replacement game in which, sooner or later, Destiny makes up for the injustices here or there. But as soon as time becomes a straight line, as soon as it 'un-curves', as it is 'out of joint' (which, according to Hölderlin, is illustrated first by Sophocles's *Oedipus* then by Shakespeare in *Hamlet*), conscience then becomes sad and vacillates.

> Oedipus is in perpetual suspension, he will travel his straight line of time. In other words, he is traversed by a straight line which drags him along. Towards what? Nothing. Heidegger will be able to say later that it's towards death. He will draw from the straight line the idea, which is not wholly un-Kantian, of a sort of being-towards-death. (Deleuze 1978)

There is a caesura in the linear un-curved time and this caesura is a 'zero-instant' a 'pure present' of self-reflection. There is a before and an after

and so, according to the Nietzschean formula, the possibility of a will of revenge, of resentment. In short, the self creates the linear time and finds itself in a quandary, wanting to be at the centre of life.

Deleuze quotes a text by Hölderlin:

> At the extreme limit of the rift nothing in fact remains except the conditions of time and space. At this limit man forgets himself because he is wholly inside the moment. God forgets because he is nothing but time. And there is infidelity on both sides … (Deleuze 1978)

That is the modern condition of the I and the double turning-away: a God that would no longer be anything but empty time, a man that would no longer be anything but a caesura in time, an oblivion, a negation by self-extraction of the vital being and of difference. Everything happens, Deleuze says, as if thought has its enemy within.

We understand the molecular or crack line better now. The fissure arises at the moment when we shift our perception of life as friendly, to life as hostile or indifferent. As long as Nature informs us and organises destinies in a cyclical way, the self can only celebrate life: this is the time of the sweet *amor fati* and of the oceanic feeling. As soon as a self arises, setting its being from the world, suspicion towards life arises together with powerlessness and ego poverty. For to doubt life only centres ego on a spectator's passivity while life goes on, but without him. We cannot say that life is indifferent a priori but we can say that it is a posteriori indifferent to the self-reflective cogito. That is why the ego judging life with contempt judges only itself in reality and condemns itself to suffering and paralysis.

The fracture comes from the caesura, that is to say from the ego that wants to coincide with the being in a central position, whereas the centralised ego is precisely what prevents us from coinciding with being. Lack of being, loss of being, that is the name of the modern ego and from there it seeks revenge on the being which has supposedly abandoned it (whereas it is the ego that abandoned the being favouring separation instead of union). Its desire turns into infidelity. Self against the indifferent life: a tragedy leaving the self more on its own each time. Not alone against all, but like all.

Because if the fractured I is frequent, the singular I is rare. Now we have set the theoretic fundamental bases of what Deleuze calls lifeline, it is time we tried to think subjectivity in its singularity. Is a singular and free life still possible today, when the self essentially appeared as reactive, sullied by pathos and loss of being?

IV. Is A Singular Lifeline Possible?

It is admitted that the sap of being is becoming. But what is the basis of the human subject, how can he reach a singular individuality? The singular becoming, since it is enclosed in the original difference (also called 'monster' by Deleuze) by the rupture line or line of flight, is first the anchor chain linking the surface to the depth. Difference is a non-representative process, which is involuntary, unsubjective, impersonal and infra-individual.

We are made up of more or less curved lines: rupture lines – the call for the Dionysian; molar lines – the social imperatives; molecular lines – the ascending or descending compromise between these two opposite tendencies. A curved line implies an inflection point. A singular point is opposed to an ordinary point in the line, not because it is determinate by a form or the development of a form, but because it determines the change of inflection of a line. The lines' inflection point is always determined, as we will analyse below in Deleuze's text about Hume, by an impression, a sensation summoning both imagination and affective domain.

We have to seize each singularity, first as an emergence of difference, which is a canvas of multiple impressions making up the world's soul. An impression can never be localised and is never still, because it is in progress. An assemblage is formed when an abstract line is drawn between two impression points. Polarities between impressional micro-events are what set into motion the play of the molar line, rupture line and molecular line. The impression is first singular and we quickly pull it back because of cutting prejudices. Does that mean that the individual can never be singular but always a hybrid between the singular and the same?

For a subjective singularity to arise, as we will see, we have to take on the complicity of difference, this vital and infranimal flux, between the banks of novation and void, and to take on a relentless fight against repetition in the first person. There are two kinds of repetition in the first person: the social daily routine, which de-singularises, and the continuous resistance to death, which is the muffled voice of vital spontaneity, from which the ego is set apart by the cogito.

The Repetition of Union and Separation

The egotistical repetition of the social individual is alienating, separating, symbolical and lethal. So the sensible, vital repetition of the eternal

return of a disparate union, of the attention to the impressions, will be competing with ego in the first place.

'Repetition changes nothing in the object repeated, but does change something in the mind which contemplates it', Deleuze says, after Hume (Deleuze 2004: 90). Imagination is defined as a power of contracting impressions. But repetition of habits is a somnolence of the imagination; whenever A appears, I expect the appearance of B. There are active contractions and passive contractions.

The passive contractions are the sleep-walker daily routine; they are not creative. The active contractions, more difficult, nourish themselves in the flesh of impressions. Passive contractions are an egotistical mechanism operating in time, in the present experienced by the I fractured by the cogito that sets it apart from the living. The impressional contraction takes place in pure original space, which is already at the surface. It is in this prejudiced social present that time spreads. A passive synthesis happens: 'Time is subjective but in relation to the subjectivity of a passive subject' (Deleuze 2004: 90). As for space, it is pure becoming, the creation of worlds perpetuates within it. A singular subject will have to draw new forces from the pure differential *spatium*, which is the flesh of the world, and will have to set itself free from time.

Deleuze evokes the Essay on the Immediate Data of Consciousness by Bergson:

> Four o'clock strikes ... However, quite apart from any memory or distinct calculation, we contract these into an internal qualitative impression in this living present or *passive synthesis* which is duration. Then we restore them in an auxiliary space, a derived time in which we can reproduce them, reflect (on) them, or count them like so many quantifiable external-impressions. (Deleuze 2004: 92)

Bergson's mistake here is to talk about passive synthesis. The impressional contraction, according to Deleuze – whose trust for Hume is higher than for Bergson – is, on the contrary, active. It does indeed happen outside of time, in a living and continuous duration, but the time of restitution in an auxiliary space, the *partes extra partes* space, is not a derived time, it is the only time, the time of the cogito, the social time, and the 'external-impressions' are already nothing other than judgement, quantity and representation.

The repetition of the living, which is repetition of the dissimilar, draws lines in the soul: the contraction designates the active elements that will form these lines, the sensitive contraction points. How can we extract qualities from these points? How do we create a reality from

these contraction points? Because all the souls and the elements in the world are united by a 'primary sensibility that we are' (Deleuze 2004: 92). This primary sensibility is the very difference, as a living sensibility, the impulse to contract, the *monstrating* impression, as infra-organic. The contemplative soul is a pruritus questioning the eternal return of disparity.

We are made of thousands of habits and prejudices: they form the basic domain of the passive and secondary syntheses at the surface. The articulation of thought takes place within the I fractured by the cogito, and this caesura from life accounts for the habits of the I often being 'bad habits' from the point of view of life. The only good mental habit of the I, probably impossible to keep, would be to strive not to repeat in the first person, but to let life be repeated in the I. I stand outside the becoming as ego but I am partly inside as being. The repetition in the first person is the means through which difference is spoiled in representation. To give back its freedom of speech to difference, that is the goal of the individuality willing to find again its axis, that is to say the best way for difference to animate it and to instil a destiny. In order to do so, there are two ways, both ultimately improbable so long as they are distinct: the relentless auto-disciplinary repetition of genius, aiming at a return to grace through overdetermination to the limit of consciousness, and the stance of the self in a not-to-repeat-in-the-first-person.

To Bring into Existence that which Does Not Yet Exist

In order to be the expression of a real truth, the I needs to draw from the differential unconscious, in the creative basis of being. The lightning will be (c)real, completely alive, only if it is the expression of the base of the night. The only way for the I to become singular, that is to say to spread out and to manifest the active synthesis of the multiplicities that run through it, is to be willing to bring into existence that which does not exist. An I which would let itself be driven by the cutting repetitions ends up falling into the void of its fracture and goes downwards, wrongly clinging on to the repetitive molar lines in its struggle: 'You have to start your social routine again' (Deleuze 2004: 93). To climb back up the fissure, the exercise is to let the ground rise from a monstrous explosion, to repeat life. That is what we will call a hyper-stasis.

For the eruption of difference not to be anarchical without creating a rising linear form then a will, an axis is needed, defined as to bring into being that which does not yet exist, to 'bring into existence something you will not take from what already exists' (Deleuze 1983).

Hereafter is what Deleuze says in a lecture in Vincennes:

> Because the modern world is tumult and chaos, the task of the modern man is to get out of tumult and chaos. How? Building up a spiritual life of one's own – see, it is the contrary of the modern dialectic, of the Hegelian dialectic – building up a spiritual life of one's own, that is to say a spiritual life which does not owe anything to what is existing, but you have to bring it into being, it is your task to bring into being something that you will not take from what exists. (Deleuze 1983)

This is the condition of becoming a figure that is not self-centred, the condition not to remain in the possible of representation: not willing to get out of oneself, because it is impossible, but 'to make the difference': 'We must therefore say that difference is made' (Deleuze 2004: 36). And we will add that difference must be told.

An individual who does not try to let the difference be made by himself or through himself does not reach singularity. Again, Deleuze's inspiration comes from Nietzsche: 'For the speculative element of negation opposition or contradiction, Nietzsche substitutes the practical element of difference' (Deleuze 2006: 8). What a goodwill wants is to affirm difference, which is not a difference of the ego. There is an enjoyment in the difference which is inhabited, which is a kinship of destinies with being. We ought to understand that this difference is not hierarchical according to the rules of the social molar line, it does not imply competition in the manipulation of the beings, it is an axial stance welcoming the becoming, this infra-natural fundamental monstrosity, the subterranean lava that runs in-between what we will define as novation and void.

There is not any singularity which is not backed up with the rupture line or which is satisfied with escaping, since perpetual flight is impossible. The individual can become singular, that is to say rising fracture, if he takes into account the three lines: the molar line, the rupture line and the molecular line. That is why there is only one line, as Deleuze suggested. And this line is a rising or falling flux with a zigzag course sometimes bursting egotist plugs, colliding here with a break, there with a relapse.

It is not only through work of the thought that difference is made singularly, because thought is not able to tell the difference between the possible and the real. In order to be singular, singularity has to let the real be expressed and told through the body, the senses. But the real that shows up is difference coupled with the possibles of thought and egotist breaks. This is an unceasing Sisyphean movement, and the individual

who would think he had arrived would fall back out of the scheme and would be an object again.

The application of bringing-into-existence-that-which-does-not-yet-exist is not a job you finish once and for all but a perpetual, endless effort, which may fall back into the break or the separation at any moment. Every minute the world becomes object and every minute the will recreates the subject. But can the subject and the object ever be separated from each other, can we cut a bolt of lightning into two, or say that on one side of the lightning the night is not the same night as on the other side?

I am standing in a place, surrounded by people. I am requested to have an identity, that is to say I am asked to choose my line of conduct. Will I show an identity belonging to the molar line, for instance a grade or a title? Will I show an identity belonging to the rupture line, that is to say burst out shouting, laughing insanely or speak 'incoherently'? Will I show my fracture, that is to say make a small complaint, as if it were incidental, or give a metaphorical answer beside the point? Each time I make an attempt to show my presence through a line of conduct, I am making an object of myself, I am mimicking the living experience.

But then we will ask where the problem stands. Is it not 'enough' to be willing to bring into being that which does not yet exist, to tense oneself up in order to welcome difference, in order to become a self rather than a petty ego? Nothing is enough, first because singularity asks for a daily bravery, then because the problem of the I is that it expresses a local point of view. In the best of cases, the subject wishes it could express all the points of view at the same time but it would be a fall into rupture and madness, and still without succeeding in being totally multiple.

The fractured I is defined by temporality and thus it can never fully express the pure *spatium* of difference. It can only, in the temporal succession, say: I + I + I + I (or else non-I + non-I + non-I . . .) and can never completely be a continuous flux for itself. To bring difference into existence is not that easy, because the human individuality is a cogito which is, each minute, an affirmation threatened by doubt or oblivion.

To bring difference into being is the pure repetition of the *I am not repeating*, an effort understood as Maine de Biran's definition of it:

> Effort necessarily entails the perception of a relationship between the being who moves, or wishes to move, and any obstacle whatsoever which is opposed to its movement. Without a subject or a will that determines the movement, without a resisting term, there is no effort and without effort, no knowledge, no perception of any sort. (Derrida 2005: 152)

At this point we could wonder whether this effort is worth making. To become a singularity, to act up to a difference: for what? Could we not stick to following the binary molar lines and conform ourselves to being an automaton rewarded by the system? But this is an impossible fiction: sooner or later the caesura will reassert itself, sooner or later extreme need shows up, sooner or later the ground claims its due. It seems that we can only rise up or fall down the molecular line: the yo-yo of the subject.

Shall we then, to avoid the falling crack, merge with the sensation of our impressions? Shall we tell ourselves that the aim of a human existence is to experience as many impressions as possible and give up on the individual singularity beyond the sensible? That is a serious proposal. Is not the willingness to express a discursive singularity, which is shown to others, already a fall into the molar line? Does it matter that the others recognise my point of view as healthy, new, worthy of admiration, if what I feel is already so rich and multiple, if, being opened to the senses, I am already in the difference, with no need to express it? Why should we not content ourselves with being a contemplative soul to become a ful(ly-)filled subject?

Contemplation as Self Fulfilment

Is there a similarity between *bringing into existence what does not yet exist* and contemplation? Are we not already in the molar line when we *want* to be a difference? Effort: does it prevent us from achieving the amplitude of our soul? Let us read the third Ennead of Plotinus with Deleuze's lecture in Vincennes (Deleuze 1987).

According to Deleuze, Plotinus says: every single thing rejoices, every single thing rejoices of itself, and it rejoices of itself because it contemplates the other one it is made up of. 'Every single thing is a contemplation and from this derives its joy' (Deleuze 1987). Joy is ful(ly-)filled contemplation. It rejoices of itself as contemplation is ful(ly-)filled. Contemplating the other that it is made up of, it fulfils itself and fills itself up. Not only animals, not only souls but also you and I are self-fulfilled contemplations filled of themselves.

> We are little joys. But we no longer know it! Feel that these are the words of salvation for philosophy. This is the philosopher's creed and this does not mean: I am happy. What stupidities have been said about Leibniz's optimism; this does not mean everything is fine! When somebody tells you, like Plotinus: be joyous, this does not mean, come on folks, everything is fine,

> be joyful, contemplate and fill yourselves up, fulfill yourselves with what you contemplate. (Deleuze 1987)

What Plotinus says is that we are of a contemplative nature. 'Not only you and I, your souls are contemplations but animals are also contemplations, plants are also contemplations, and the rocks themselves are also contemplations. There is a *self-enjoyment* of the rock' (Deleuze 1987). Just by contemplating, the rock is filled up and fulfilled with what it contemplates. It is thus '*self-enjoyment*'.

It means that each being, at its own level, looks back to that which preceded it. That is what contemplation is, according to Deleuze: a 'conversion'. This is the soul's conversion or a thing's conversion into that which it derives from. Looking back to that which precedes it, the soul contemplates. By contemplating, it fills up and fulfils. But it does not fill itself from the other without first filling itself. 'It becomes a joy by itself looking back to that which it derives from. The *self-enjoyment*, the self rejoicing is the correlate of the contemplation of principles' (Deleuze 1987). Every single thing is a contemplation of that which it derives from, which is life becoming difference, flesh of endless disparity.

What is it that the rock contemplates? Its own parts. The rock contemplates the silicon, the carbon, the micro-elements from which it derives. The wheat is contemplation of the elements from which it derives and which it takes from the earth. 'And that it takes from the earth according to its own form and in accordance with the demands of its own form, that is to say, according to its *feeling*' (Deleuze 1987). The demands of its form are the *feeling*. The individuation proceeds from what is felt, but what is actively felt.

Every single thing is contemplation of its own 'requisites', unconscious contemplation of its own conditions of existence, that is to say its requisites.

> Is there anything more contemplating than a cow? It seems to have a blank look, but not at all. It is true that there are animals that are not contemplative in the least but this is the lowest level of animals, for example cats and dogs, they hardly ever contemplate. That is why they experience little joy. They are bitter animals, they do not contemplate anything. They echo the damned exactly, we will again see that the damned do not contemplate anything, as we have seen. (Deleuze 1987)

Going over Leibniz, Deleuze determined that the damned stands at the point of hatred for God, for the Everything. The amplitude of his soul is really small and he is not trying to expand it. The damned, hateful cogito, pure point of critic, is separated from the contemplation of the

elements. 'The status of the damned is to be pure vomiting. They do not have prehensions other than negative. They do not have prehensions other than negative and expulsive, as they are pure vomiting' (Deleuze 1987).

Is contemplation passivity? No, and to understand this we could be tempted to use, as Deleuze says, the word 'envision' with the meaning of a verb (*envisager*). The subject operates the prehension of its own requisites. It envisions, imagines its own requisites rather than contemplating them. But eventually Deleuze uses instead the term of 'contraction'.

> If I say that an organism contracts the elements that are needed by it, I say that your organism is a contraction of water, oxygen, carbon and salt etc. and it seems to me it becomes extremely clear. If I say that the rock is a contraction of silicon and I don't know what else, it becomes extremely clear. (Deleuze 1987)

To contemplate is always to contract impressions, contract data. Contracting data, I fill myself up with the joy to be myself: to let the vital points arise. To atomise the Real to reconstitute it after one's own image.

To contemplate is to envision the formation of lifelines in the fabric of the soul and to facilitate the game of the folds by standing up for *I don't repeat*, as much as possible. It is to pay attention to its folds, to feel them, to project them. There is no contradiction between bringing into being that which does not yet exist and contraction, since it is the very basis of it. Singularity shall not be looked for in an egotist subject. The subject of *bringing into existence that which does not yet exist* is the 'successful schizophrenic', the one who does not dramatise his scattered state, but rejoices in it without getting stuck in it, insofar as it cannot cling on to a trained ego, insofar as it follows the line of flight thanks to his ego's bursting.

What is this *metaschizophrenic*? An interior elegance, a tightrope-walker's soul strolling onto the thread of impressions. The model of schizophrenic singularity is a walk of the sensible and not 'a lie on the analyst's couch' (Deleuze and Guattari 2004b: xix). A walk on what path? On the folds of the disparate soul, 'in the midst of nature':

> He thought that it must be endless bliss to be in contact with the profound life of every form, to have a soul for racks, metals, water and plants, to take into himself, as in a dream, every element of nature like flowers that breathe with the waxing and waning of the moon. (Deleuze and Guattari 2004b: 2)

Nature is not experienced as nature-object but as a process of creative production. There is no longer man, nature, subject or object but process producing one in the other and producing machines of production: 'the self and the non-self, outside and inside no longer have any meaning whatsoever' (Deleuze 1987). Everything is production, production of production, desiring production. The *metaschizophrenic*, this *crealist*, we shall say, is the one who draws his points of view on the tightrope of the desiring-production of the folds of the soul, whose repetition is a *not-to-repeat-in-the-first-person* modifying the Real.

The lifelines opening up to a singularity are undoubtedly backed up by desire.

Desire: Miraculate, Enchanted Surface

The line machine is constantly supplied by desire. Machines are essentially desiring-machines, eager to see several points coupled. Only the point of hatred for the Everything remains on its own. All the other points are passionate about drawing lines, they have a constant appetite to fold, to unfold and start folding again. 'Desire constantly couples continuous flows and partial objects that are by nature fragmentary and fragmented. Desire causes the current to flow, itself flows in turn and breaks the flow' (Deleuze and Guattari 2004b: 6).

We clearly see that production is at stake in the three lines. Desire makes things flow, this is the rupture line. Desire flows, this is the molecular line. Desire seizes up, this is the molar line. Here we understand very minutely how the three lines only form one line, the line of universal production. But Deleuze reminds us that we shall not picture it as forming a pre-established harmony. Desiring machines only function by breaking down all the time: creative or destructive conflict over social habits and subterranean repetitions of difference.

Universal desire is constantly bringing into existence that which does not yet exist and contemplating this production. This is the impression's will to become lines and *spatium*. This point is the opposite of hatred for the Everything. Desire is love for the realm of the Everything, will of full amplitude of the soul, call to create and run through all the area of the *spatium*, which is the living and disparate flesh of the world.

Universal production implies of course, at its extremity, a point of un-productivity, a point of void, a point of nothingness or abstract unity. Is the point of un-productivity the point of hatred for the Everything, the point of the damned? No, on the fringe of un-productivity stands the 'body without organs', blank face of novation, reverse of the *spatium*.

'The body without organs is not God, quite the contrary, but the energy that sweeps through it is divine, when it attracts to itself the entire process of production and serves as its miraculate, enchanted surface' (Deleuze and Guattari 2004b: 14)

Desiring-production is consumption and consummation, voluptuousness. It is not so for an ego but for a creative subject. The self is nothing but what remains of the disjunction, the shadow of the fold in the past: 'So that's what it was!' The ego is reactive. We can even wonder if the ego is not the fatigue of the Real. That would be a way to define the ego: the moment of fatigue in production, the point which means stop. The ego coincides with the damned. The damned is the ego as hatred for universal production and desire for it to stop so that we can breathe a little or that we can finally sleep properly. But it never stops, production never stops and that is why the ego sometimes goes through bitterness, regret, falling fracture. A singular subject, in the process of becoming, in rising fracture, is consequently the subject that overcomes its ego, that wraps up its tiredness point of the Real, becoming creator of the Real. My ego has to remain but a reduced pragmatic point, which does not sum me up. I am not inside of my ego but I wrap it up as I become within the *Creal*.

The ego is the nihilist point, which is willing everything to stop or to be one. But how can we conceive that such a point should spring up in the midst of universal desire? Because to want nothing is still to want something. This is what characterises the damned: his bored irritation, his bitterness comes from the fact that he cannot give up desire. Desire is always there, even if it is desire for nothing. Desire constantly produces Real, and as a reactive ego it sometimes produces negation, hence the fractured I as reactivity: 'desiring-machines produce antiproduction all by themselves' (Deleuze and Guattari 2004b: 34).

What is the desiring-machine? A system of template breaks, hot ruptures and waving, yo-yo fractures, a perpetual becoming. Desire implies that there is not strictly speaking a singular subject but only a constant process of singular becoming.

Desire is a contemplating 'becoming-animal', a becoming-molecular, a 'swarm', a 'pack', a circulation of affections, an alternative current upsetting significant projects like personal feelings and it constitutes extra-human sexuality, an 'irresistible deterritorialisation'.

What is this 'becoming-animal'? The point is not to be an animal or to imitate it but to guarantee desire the possibility of its production. 'Becoming produces nothing other than itself' (Deleuze and Guattari 2004b: 262). The subject is nothing other than the temporal and temporary character of multiple becoming considered by

a consciousness. Becoming is a 'rhizome', a radical tissue of multiple arborescence. The singularity of desire is to be 'multiplicity', 'axial', a vertical collective but immanent 'peopling'. 'I am legion', a legion which spreads by 'contagion', that is to say 'assemblages' of points and lines.

But should we not be surprised to see that the *I* shows up, above all in a 'So, that's what it was!'? Should we not see a problem in the fact that the I will first be memory of the past rather than a prehension means of the Real? Should we not ask ourselves in even more detail according to which conditions the I can become active?

The Anomal or the Subject as So(u)rcerer

Desire is certainly 'pack and contagion of the pack', but Deleuze and Guattari observe clearly in *Thousand Plateaus* that 'wherever there is multiplicity, you will also find an exceptional individual, and it is with that individual that an alliance must be made to become-animal' (Deleuze and Guattari 2004a: 268). Desire thus implies exceptional polarities. How to define them? They are the 'leader of the pack', the 'master of the pack', above all the 'Anomal' among the animals. Anomal has a meaning that differs from abnormal. Ab-normal (Latin adjective), Deleuze says, defines that which does not have rules or goes against the rule, whereas 'a-nomaly' (Greek substantive without adjective in English) designates 'the inequal, the rough, the cutting edge of deterritorialisation'. The Anomal is a position in space or a set of positions in relation to a multiplicity.

What is the nature of the anomal? The anomal is not an exceptional domestic individual but nor is it a bearer of species that would possess its specific or generic specificities in the purest form, unique model or specimen, typical perfection incarnated, eminent outcome of a series or pedestal of a completely harmonious correspondence.

The anomal is a 'phenomenon of bordering'. Each multiplicity is bordered by a wrapping line that is its anomaly. When it is incarnated, this anomaly takes the shape of the 'so(u)rcerer', that is to say the one who knows how to invoke the powers of the vital source and to give them a name. Would he then be the incarnation of the free subject, this sorcerer, this so(u)rcerer, this 'Outsider'?

If the active subject is the Anomal, it is the boundary between two groups of flows, between two packs, between two tendencies. What does it mean to say that the subject is boundary? First, that he exists only as a limit, that is to say he does not have any intrinsic materiality. The subject is a membrane that can vibrate, this is the limit of the organ. It justifies

what animates it from the inside, it makes it show up but it does not define itself by it. It is a wrapping line. Is this line a line other than the three lines, molar, rupture, molecular?

Deleuze and Guattari write that the Anomal is the alliance necessary for becoming but it conducts the becoming transformations or the moments of multiplicity always further on the line of flight. Therefore, the sound subject is the line of flight as an organic envelope of a vital production, and in this respect we understand that it is never in any other form than becoming. The subject is an 'experiment'. We find again the *bringing into existence that which does not yet exist*.

Deleuze calls the moments of this becoming subject *haecceities*, that is to say degrees, intensities. But can these intensities of individuation define an active human? On the contrary, should we not remember that because of his intrinsic temporal fracture, the so(u)rcerer can never say I? Or, the other way round, that man, as an individual, can never be fully active?

This question brings us back to *Nietzsche and Philosophy* by Deleuze. Is man essentially reactive? Nietzsche presents the triumph of the reactive forces as something essential in man and in the history of man.

> *Ressentiment*, bad conscience and nihilism are not psychological traits but the foundation of humanity in man. Nihilism is the a priori concept of universal history; that is why defeating nihilism, freeing the thought of bad conscience and *ressentiment* means to overcome man, to destroy man, even the best one. (Deleuze 2004: 157)

It is in his essence that man is said to be 'skin disease of the Earth'.

To the question 'Is man essentially reactive?', Deleuze says that we have to answer 'yes' for man as a result but 'no' for man as becoming of forces. Man can be active as a medium, as a vector, but to be essentially active he has to be capable of affirming. To be able to affirm, the subject has to get out of its cogito ego cutting it off from its spontaneity, that is to say to open the doors of difference.

However, one might have the impression that sometimes the subject affirms the I and from then on denies its differential spontaneity, sometimes serves as a channel for difference and speaks like a poet, that is to say without identification to an ego ('I is an Other', as Rimbaud wrote). Can we conceive a subject who at the same time affirms itself as an I and expresses the difference, this 'eternal return of that which makes dissimilar' (Deleuze 2004: 374)? Yes, provided that its self shall not be reduced to an ego, provided that the I shall be a self that includes the ego reduced to the point of reverse of hatred for Everything. The so(u)rcerer

does not speak in the first person as an ego, but in the name of the spirits and the fleshes, in the dancing uttering of the trance of being.

The anomal subject, the leader of the pack, is as spontaneous as can be:

> As a result, the spontaneity of which I'm conscious in the *I think* cannot be understood as an attribute of a substantial and spontaneous being, but only as the affection of a passive self, which experiences its own thought – its own intelligence that by virtue of which it can say *I* – being exercised in it and upon it but not by it. (Deleuze 2004: 108)

The singularity of the subject seems possible as a so(u)rcerer, the one who desires the Everything and who lives from it, through whom the destinal becoming expresses itself. As we will see it in the conclusion, the so(u)rcerer acts remembering three axes: hyper-stasis, untimeliness and crealism.

Yet we have to better understand to what extent lifelines constitute intensity links, plateaus between the primary impressions and the subject.

V. From the Impression to the Subject

At the heart of Deleuze's philosophy stands the first text he published, *Empiricism and Subjectivity*, and the notion of impression as original monad. The impression, as we have started to see, is the vital principle, the *vis motrix* of becoming. A complete reading of this text on Hume, in the light of the text we have examined, is necessary.

Deleuze first states that Hume's project entails the 'substitution of a psychology of the mind by a psychology of the mind's affections' (Deleuze 2001: 22). Only a psychology of affections can constitute the true science of man. At the origin, there is not only the spiritual but the passionate, and the social itself is originally passionate. In order to exist, spirit has to be affected. When we wonder how the spirit becomes a subject, we have to wonder how an impression becomes spiritual.

Imagination, as a singularisation of impressions, expands from space, from a place, the original *spatium* of difference. 'The production of an idea by the imagination is only the reproduction of an impression in the imagination' (Deleuze 2001: 23). This activity is 'whimsical and delirious'. Being the bond of ideas, it moves through the universe, 'engendering fire dragons, winged horses, and monstrous giants' (23). The depth of the mind is indeed 'delirium' or – the same thing

from another point of view – change, randomness, indifference of the difference.

Deleuze observes that Hume's philosophy is a sharp criticism of representation. Spirit is not reason, but it is reason which is an affection of spirit through the play of habit, of repetition. 'Reason is a kind of feeling' (Deleuze 2001: 30). As the method of true philosophy goes from the lack of an idea to the presence of an impression, likewise, the theory of reason goes from a scepticism of reason to a positivism of feeling, which includes *in fine* reason as a reflection of feeling in the defined spirit, the subject. In this respect, Hume is not at all sceptic. He believes in impressions. Impressions of reflection, contemplations are the origin of spirit.

An impression expands, from points to folds, reflecting itself, that is to say trying itself: 'The passions are reflected; but where and in what? They are reflected in the imagination' (Deleuze 2001: 56). In the reflection that arises from the original contraction of the impression, 'the passions imagine themselves and the imagination becomes passionate' (57). The formation of lifelines is the passion of the imagination.

We see once more the conflict between the molar line and the rupture line as far as imagination is concerned. Insofar as the principle of morals and of passion affects the spirit, the spirit is no longer a fancy, a pure creativity of impressions: it fixes itself and tends to turn into human nature, a fracture. But insofar as the spirit also reflects the affections which try to fix it, it remains a fancy, capable of transformation, 'for at least something within the affections escapes all reflection' (Deleuze 2001: 59). That which cannot let itself be reflected without contradiction is precisely that which defines the real exercise of affections, the relevance of limits, the action through which they fix the spirit under such and such a form. Reflecting the form of its own fixation, imagination sets them free and set itself free from them, expands them endlessly. That is the play of desiring-machines: the breaks lead to leaks, the leaks join the fractures. The greatness of man is that it does not stop at the break, that he considers the break not like something real but as an impression of break, and from then on the creative machine can start working again. Alienation will never be total, as long as man will not forget its impressed/impressing ground, its capacity to untangle the Real, to catch its breath in the heart of a barren nothingness. Imagination 'makes the limit an object of the fancy, it plays with the limit by presenting the accidental as essential, and separates power from its actual exercise' (59).

There is a belief, deep inside the human brain, which is animated by this indestructible faith: there will always be a new exception that might

change the rule. This firm belief that rule is not as solid as a rock derives from the being, from the difference. The human being is profoundly revolutionary because the being is profoundly disparate: 'The power of imagination is to imagine power' (Deleuze 2001: 59). Illusion restrains, but it saves as well as a creative principle. There is a 'union of the most frivolous and the most serious' (60).

This union of the most frivolous and the most serious is subterranean. At the surface, the naturalised images and the prejudiced words draw us back from our participation in the difference, break the emergence of the impression almost from the start: unceasing play of the impressions that form at the surface of the soul, and of the lines that break or distort them.

We find a pathetic evocation of this tragedy under the hand of Georges Bataille, in *Inner Experience*, a text contemporary with Deleuze's book about Hume:

> There subsists in us a silent, elusive, ungraspable part. In the region of words, of discourse, this part is neglected. Thus, it usually escapes us. We can only attain it or have it at our disposal on certain terms. They are the vague inner movements, which depend on no object and have no intent – states which, similar to others linked to the purity of the sky, to the fragrance of a room, are not warranted by anything definable. (Bataille 1988: 14)

Bataille continues:

> If we live under the law of language without contesting it, these states are within us as if they didn't exist. But if we run up against this law, we can in passing, fix our awareness upon one of them and, quieting discourse within us, linger over the surprise which it provides us. It is better then to shut oneself in, make as if it were night, remain in this suspended silence wherein we come unexpectedly upon the sleep of a child. (Bataille 1988: 15)

This child, this surprise, which somehow reminds us of the Nietzschean motif of found again creativity, is listening to the impression. This creativity happens thanks to the everlasting effort of the so(u)rcerer against the molar lines, against the principles of the same.

The I is half deprived but in the silence of the night it can be in contact again with its freedom of expression. We find in the text by Deleuze about Hume this intuition of the self as a fractured synthesis which will be developed in *Difference and Repetition*:

> We saw that origin and affection could not be combined within the self because, at this level, there subsists a great difference between principles and fancy. That which constitutes now the self is the synthesis of the affection and

> its reflection, the synthesis of an affection which fixes the imagination and of an imagination which reflects the affection. (Deleuze 2001: 64)

We can admire here the coherence of Deleuze's evolution, quoting once more these lines from 1968 about the pure I of the *I think*:

> The subject can henceforth represent its own spontaneity only as that of an Other, and in so doing invoke a mysterious coherence in the last instance which excludes his own – namely, that of the world and God. A cogito for a dissolved Self: the Self of the 'I think' includes in its essence a receptivity of intuition in relation to which *I* is already an other. (Deleuze 2004: 70)

I is an other because the overflowing line of flight and the simplifying cut line run through it. Schematisation is the defining principle of the parts among the tissue of vague impressions. This is the Apollonian principle confronted with the Dionysian principle.

We can wonder at this point how the molar line was born, if it abuses life so much. First hypothesis: there is an original molar line that is established from the moment the animal becomes aware of being mortal. The genesis of the break would then have to do with the death consciousness. 'Gaping desire', but death is a gap, a comparison and so a schematisation of the same, a comeback of the reflection on the lost territory and a naturalisation, a fetishism of this absent territory, as if it were the same for everybody, as if it were impossible to talk about death in multiple.

Second hypothesis of the territorialisation of differential impressions: habit. As we have seen, repetition is what restricts, being the neurotic criss-crossing of the same fold, but also what sets free, being a resistance, bringing into being that which does not yet exist. For there is a habit of doing and a habit of not doing, which is persisting refusal to be (un)done, to be cut. And it is above all the latter that sets the impressions free:

> Repetition becomes a progression when we no longer see it in relation to the objects repeated because it changes, discovers and produces nothing. It becomes a production as soon as we see it from the point of view of the mind which contemplates it, for it produces a new impression in it … (Deleuze 2001: 68)

To summarise, we can say that, from the subject's point of view, the molar line is the acceptance of a habit imposed from the exterior, whereas the walk along the line of rising fracture is the resistance of a habit to listen from within. In other words, the molar line is brought to life as soon as a world of external objects is fixed by the cogito.

This world of external objects will divert the desire for difference and orientate it towards the same of rigid protocols and social rewards.

The rupture line is the dissolution of the subject–object dichotomy created by the desperate will to find enjoyment in objects rather than in vital impressions. As an ego, I am indigence separated from becoming. As a self, a so(u)rcerer, I open myself up to the eloquence of living, to its suggestiveness, all the more as I no longer try to transpose my aim of enjoyment to an object. In this respect, we can talk about asceticism in the accession to original joy. The anomal is not to hunger for objects but to be steadfast in letting creative impressions rise. To that extent the I as an ego does not live entirely and is lacerated by death: this death is the wish for what we believe we do not have, that is to say the illness of the imagination denying itself by espousing the simplification of breaks.

Rousseauist drama of the human: to live together, one has to create norms, and these norms, becoming fixed, make him unhappy. Subordination to the State and social production machine: as long as this subordination is painful (even afterwards) then it is the sign that the current social system is lethal and that the verb of life is resisting the prevailing biopolitical speech. The external habit is not the inner experience: 'The unity of experience and habit is not given' (Deleuze 2001: 69). When both are identical then we will be able to say that society is life.

Meanwhile, 'by itself, habit can feign or invoke a false experience, and bring about belief through "a repetition" which is not derived from experience' (Deleuze 2001: 69). The repetition of the same that does not derive from experience is the molar line. As for the line of flight, it is the repetition of difference deriving from experience. What about the molecular crack-up line? Line of the biographical real life, oscillating, stumbling, between life and death, between, on the one hand self-training separated from the vital flows and object-orientated and, on the other hand, liberation of a subject through the ascetic fulfilment of letting the *Creal* emerge in the form of flesh.

Of course, as we have seen, the molar line should not be considered as absolute evil and the rupture line as divine good. In any case, we are standing, whether we want it or not, beyond good and evil, rather on the side of an interdependent relation between life and death, between the individual and the group. The lines are balances and unbalances of becoming. We can only hope that they interweave to form a rising spiral, in which the freed subject would jump from line to line, as much for saving its skin, and its senses, as for remaining in differential creativity

and active contemplation of disparity within the self. It is a trick of the subject, in the agencies it establishes, in the rhizomes it weaves jumping from line to line, but also an ascetic task and a brave confrontation with the errands of the ego. There is no axis of the world outside the subject (but a group can be a subject, an integrity); there is no subject without axis. What is this axis? A self-defined filter to fight resentment.

The subject becomes absolute and sets itself free from the ego when it makes the sap of the pure vital *spatium* rise from within, thanks to a spiralisation, which is an accomplice of the three lifelines. Hence this alternative: on the side of the cutting and cut ego, we have 'the earth girded, encompassed, overcoded, conjugated as the object of a mortuary and suicidal organization surrounding it from every part'. On the so(u)rcerer's side we wake up 'the earth consolidated, connected with the Cosmos, brought into the Cosmos following lines of creation that cut across it as so many becomings (Nietzsche's expression: Let the earth become lightness)' (Deleuze and Guattari 2004b: 510).

Impression is the absolute movement. Impressions are the tissue of the soul and in their bosom, every single second, the destiny of the subject is at stake. We shall remember Deleuze's lecture about Leibniz and the soul: 'Will I go to work or to the tavern?' (Deleuze 2003). According to the impression that I am and that I let materialise in image and in deed, I will fold myself in one direction or another. Between the starting point of a line, the impression, and the finishing point, the fold, there is a micro-destinal series. 'What would have happened if I had not been to the tavern?' Deleuze asks. 'Then it would be another me' (Deleuze 2003).

To that extent, our actions judge us. The way we allow ourselves to identify the impressions from the start, as good or bad – we often speak in everyday language about 'first impressions' – determines in part our destiny or our capacity to resist dominations.

Reading Hume, we find striking equivalence between the three critic states of spirit and the three lines. 'Indifference and imaginativeness are the situation peculiar to spirit, without regard for the external principles that fix it by associating ideas' (Deleuze 2001: 86): this is the rupture line.

'Madness is the contradiction within the mind between these principles that affect it and fiction that he sets as a principle' (Deleuze 2001: 86): it is in the worst of cases the molar line and in the best of cases the so(u)rcerer's axial asceticism.

'This system is a delirium. When fiction becomes a principle, reflection goes on reflecting, but it can no longer correct. It is thus thrown into

delirious compromises' (Deleuze 2001: 86): it is in the rising molecular line (synchronicities, crealism) or falling one (incidents, depression).

Indifference, imaginativeness, madness and delirium: that is a really accurate picture of human experience. That is why the slightest extravagance, the slightest distraction is still to confide in its first impressions, without immediately denaturing them in prejudice, which is a true asceticism, that is to say a training to refer to life rather than to death.

The question of the third part in our presentation comes back to the foreground under this form: 'How the subject, or that which goes beyond the given can arise from within the given?' 'Undoubtedly, that which transcends the given is also given' but in another way: 'As we believe and invent, we turn the given itself into a nature' (Deleuze 2001: 86). The given is not given to a subject, the subject forms itself in the given while forming it: that is what we call crealism.

But what is the given? It is, according to Deleuze's interpretation of Hume the 'flux of the sensible, a collection of impressions and images, a set of perceptions. It is all that shows up, the being equivalent to the appearance, movement, change without identity or law' (Deleuze 2001: 86). This experience of a collection, a bustling succession of distinct perceptions, is the very basis of empiricism as being distinct, independent, different: 'Every discernible perception is a difference' (86). Here we find the announcement of the principle of difference, the monster that enables to show up. Experience is always experience of difference. The subject then forms ideas, which in the best of cases are not the representations of an object but of an impression.

To talk about a subject and no longer only about impressions is to talk about a duration, about an axial ritual, about a *praxis*. The active repetition is the subject's constitutional root and the subject is at its root a synthesis of present and past looking forward the future. The synthesis consists of establishing the past as an a priori law for the future, with the inherent factor of disappointment: 'Each man expects to conserve what he already possesses. The principle of frustrated anticipation will play the role of contradiction in the logic of property, that is, the role of a principle of synthetic contradiction' (Deleuze 2001: 86). To a certain extent, time is disappointment whereas space is hope, impulse. The experience of difference displays an a-temporal multiplicity, whereas the experience of repetition creates temporality. That determines a play between reason and imagination and as a result some impressions become brighter. The brightest impressions, allowed by a voluntary filtering of the connections between perceptions, are the present of the subject, both body and mind.

The subject forms from a given that it filters and shapes. The given is the impressions generating associations and passions. Imagination is the faculty to animate impressions: 'According to Hume, the imagination becomes a faculty insofar as a law of the reproduction of representations or a synthesis of reproduction is constituted as the result of principles' (Deleuze 2001: 110). But as was demonstrated by Kant's interpretation of Hume, if the given was not itself primarily submitted to principles of the same nature as those regulating the link of representations for an empiric subject, the subject could never know this agreement, except by chance, and would not have the opportunity to link its representations according to the laws that would however be at its disposal.

But are impressions ontologically prior to imagination, or does a transcendental position exist which operates the synthesis of impressions into images? In other words, in reference to our first chapter about the soul and Leibniz: is the virtuality of the fold prior to the pruritus of the animistic original tissue? Should there not be, together with the pure *spatium* of difference, a transcendental principle tending to turn the points of disparity into lines? The alternative is simple: either lines are formed by chance (even if imagination then projects necessity onto them), or their realisation is inscribed as a necessity of the sieve-subject.

Another way to raise this problem is: are impressions equivalent to each other or are there affinities between them, which would favour such or such orientation in the formation of the lifelines, starting with the points of impression? Hume resorts to a musical metaphor in his *Treatise of Human Nature*:

> Now if we consider the human mind, we shall find, that with regard to the passions, 'tis not of the nature of a wind-instrument of music, which in running over all the notes immediately loses the sound after the breath ceases; but rather resembles a string-instrument, where after each stroke, the vibrations still retain some sound, which gradually and insensibly decays. (Hume 2000: 188)

We have to start from the pure impression, Deleuze says. Some principles affect the mind, such as impressions of reflection. Subjectivity is the impression of reflection and this impression itself derives from some impressions of sensations: 'But it is precisely this proceeding or this process that the impressions of sensation are incapable of explaining: they cannot even explain why in the collection, they themselves are elected among others and instead of others' (Deleuze, 2001: 113). The notes of music do not know how they will form a melody together.

So Hume says that there are some 'principles' orientating what shows up. These principles have a double selective and constituting role. But according to which necessity is the principle of the subject formed?

We could first think about the principle of pleasure. Imagination would follow the impressions, whose association generates the greatest pleasure in the body. But this idea does not resolve anything because we would still have to explain why pleasure would choose a certain order, a certain harmony, rather than cacophony.

The hypothesis of a selectivity of impressions presiding over the formation of the lines of imagination and action is the true culmination of our description of the lines. We can think that Deleuze is not always very clear about the principles of linearisation, about the way in which the monster shows in this way rather than in this other one. The constitution of lines would remain but a mechanism stained with shadows if we reject the idea of a pre-established harmony, *more geometrico*, of an affinity between some points orientating the formation of lines. Otherwise, we could imagine that points would remain points and would never form lines.

Another way to see things is to say that points cannot form lines except intentionally. For Hume, the subject 'hates pain' and looks for pleasure. 'Making of pleasure a purpose, the principles of passions give to action its principle' (Deleuze 2001: 113). But a principle of immediate pleasure, once more, would not account for the coherent channelling of forms.

Hume suggests then that there are 'useful' tendencies and others that are 'baneful'. But that the original imaginativeness should locally orientate towards the useful, that is to say towards the safe opening up of a subject, could seem like an entropic view.

The idea of 'vivacity' of some impression is more satisfying in that it combines pleasure, effort and utility, and goes beyond them. Hume writes: 'There is also a resemblance between the image and the object we infer; which strengthens the relation, and conveys the vivacity of the impression to the related idea with an easier and more natural movement' (Deleuze 2001: 113). If the subject's will of creation is orientated following the principle of vivacity, this means that lines are formed following points of greatest intensity, and it allows the introduction of a finality which is also physiological. The subject is formed in the given from the principle of greatest vivacity. Sometimes the molar line attracts the body because of the greatest vivacity that instinct feels, sometimes it is the rupture line or the molecular line.

Hume writes about a 'general interest' as the impact in the imagination of the particular interest, as the movement of a passion overcoming its partiality. This unity of a subject functioning as a whole in relation with other subjects, Deleuze, reading Hume, calls 'intentional finality'. The mind is 'resonance and vivacity': the mind becomes subject 'when it calls on its vivacity so that a part of itself, whose character it is (impression), conveys it to another part of itself (idea), and secondly, when all its parts put together resonate producing something new' (Deleuze 2001: 113). In the given, Deleuze says as early as 1953, we establish relations, we form totalities, swept away by the impulse to produce 'something new'.

Here is the confirmation we were looking for. This idea by Deleuze, inspired by Bergson, presented at the end of *Empiricism and Subjectivity*, seems to be *in fine* the only one that accounts for the dynamic of formation of the lifelines: the tendency to create novelty. From then on, we have to say: in the depth of being, there is certainly difference, disparity, but there is also desire for novelty. That is the principle of desiring-machines: to create vivacious novelty.

This hypothesis implies that death is as real as the same, contrary to novelty. From then on life is a fight against the same. Fleeing from the same as death or as void would be at the origin of difference. The term 'void' is even preferred to the term 'death'. Deleuze sees difference as multiple; likewise, to avoid a philosophy of the one we have to see the void fled by the desire for novelty as a void beyond (or below) the one and the multiple. Now, is it not that which characterises void not to be one? If the void was one, it would become being again. Here we have to take into consideration the notion of vacuity in Buddhist philosophy. Vacuity, void are nothing other than the reverse of difference.

We understand better, now, the formation of the lifelines. They are formed by the tension between void and desire for novelty. We have to imagine that the original monster, life, is not a homogeneous space but a space containing void. What is void then? It is non-existent intensity, zero vivacity.

From then on, life draws lines between maximal intensity and zero intensity, without it being necessary moreover to assert these limits as real: we can indeed imagine that life is accounted for by the fact that maximal intensity and zero intensity are both impossible. Hence becoming as scattering between two original fantasies.

Void and novelty: is it a new dualism or the synthesis of dualisms in the being-becoming? 'Arrive at the magic formula we all seek – PLURALISM = MONISM – via all the dualisms that are the

enemy, an entirely necessary enemy, the furniture we are forever rearranging' (Deleuze and Guattari 2004: 23). There is no beginning or end, no void at the start or maximal intensity in the end, but 'always a middle point', through which life grows and overflows.

With respect to the consistency of lines, the one is always deducted, Deleuze says. Multiplicity varies its dimensions, affected by the passion for change of nature and for metamorphosis. The play of lines, the rhizome, is not formed according to a principle of reproduction but of creation. Taken as a whole, the being is pure creation, but taken as individualities, the being temporarily turns into empty shapes constituted by desire, like dead skin. A cathedral is in a way a dead skin once its construction is finished. The centration of its project has been brought to its end. But the end of life is not centration, insofar as it is inhabited by an a-centred non-hierarchical and non-significant systematic: a circulation of states in which the important term is the circulation and not the state. The state is that which life rejects. This is applicable, in political theory, to the State with a capital letter and its molar lines.

The building up of the cathedral, as long as it is not finished, is a 'plateau' of intensity. But a plateau is always followed by another plateau, once the thing is formed. Singularity is the creative intensity, not the objectivised work or its outline. The path is the middle point of life.

> The middle is by no means an average; on the contrary, it is where things pick up speed. *Between* things does not designate a localizable relation going from one thing to the other and back again, but a perpendicular direction, a transversal movement that sweeps one *and* the other way, a stream without beginning or end that undermines its banks and picks up speed in the middle. (Deleuze and Guattari, 2004: 28)

Novation and void: the two unreachable banks in-between which life flows.

VI. Conclusion: How Is a New Life Possible?

We will leave Deleuze aside for a while to make a short detour to a poetic sea, casting the anchor in the lands of Rainer Maria Rilke's words in the *Duino Elegies*. Thus we will first define the tendency to be slow off the mark not only as the *ressentiment* of the one who, being subject of an experience, subjected to the past, only becomes aware of things as a 'So that's what it was – it could have been better', but also as the movement

of the one who, in the impossibility to fix itself either in the sea or on earth is in a perpetual nomadic stopover.

'Who has turned us around so that, whatever we do, we bear the attitude of one who is departing?', the Eighth Elegy asks (Rilke 2000: 51). Man feels himself orientated towards one direction rather than another, facing something rather than something else, partial being, being with a standpoint and as a consequence simultaneously of light and blindness. The impression given by this question is a non-coincidence with action, a separation from the living world. We are positioned so locally delimited and we do not occupy the whole space, we leave one state in favour of another, we stop over once and again. The idea of being turned implies that there would be a way to go on, no longer as someone who is departing, but as someone who is coming, or in any case someone who goes on while staying at the same time, someone who is both going away and standing at his starting point.

Now, what is going away without departing? To spread. That, as we have seen, is what Leibniz calls the amplitude of the soul. In order to spread while spreading out an action, there must be dilatation so there is a centre even if it is moving. Now, what seems to be the meaning of the question in the Eighth Elegy is that the human being is constantly mobile, a point of disaffection upon which we have no hold. Who has never experienced telling something which seems important to us to a person who is drifting away in an exasperating manner, not focusing on what has just been said (maybe precisely because the person feels an intention of importance in the other person)? A shore is offered but we have already departed, preferring the uncertainty of the sea to the revelation offered, in which we will not confide. But the tendency to be slow off the mark will imply that the person will think it over later, in the last stopover, since a stopover is always defined by the past and forthcoming stopovers.

The Fourth Elegy says: 'The migrant birds can tell the seasons ... We kept ignorant and left behind, must force ourselves belatedly upon a wind and come down hard on some uncaring pond' (Rilke 2000: 23). Were it a vital intuition within us, were it something like a projective instinct of life, which would throw us towards a greater vitality in the future, then we would maybe live in the present, in accordance with the present time. But we are ignorant as to what our present actions will become in the future whereas the migrant bird knows that its migration leads it towards the watering place and better weather. The bird confides blindly in its migration, its movement is orientated, and moreover, it does not lose its original standpoint since it will come back there.

The migrant bird spreads up its soul, from its starting point to its finishing point. Man, lacking information, lacking in appearance the projective instinct of life, moves losing sight of his starting point: stopping over but no longer knowing from where he departed, why he departed and where he is going.

'Oh Trees of Life: how shall we know your Winter?' the Fourth Elegy also asks (Rilke 2000: 23). We are not trees of life because as we move we lose our roots, we do not know how to preserve life in winter, we rather flee than endure, by lack of forbearance. Forbearance only, only the extension of the soul would enable us to go through winter, since other points of the soul would be in summer.

'We set all in order. All falls apart. We order it once more and fall, collapse, disintegrate ourselves', the Eighth Elegy asserts (Rilke 2000: 52). That also is the tendency to be slow off the mark, a will to archive the past by retrospective. If I had said this, that would have happened. Cause and effect as a way to classify life projected in the past. We often function on the same pattern; this is not a singularity that classifies but a busy collective form: 'We classify.' Sometimes objects fall, sometimes the ego falls. A confrontation cutting the vital flux, so destroying it. As long as I am classifying, I am a cogito facing objects that I classify. I put the world in order, I look after it like a 'master and possessor'. But the world is not material so it gives the impression that it is collapsing to the sense of ordering. And if we succeed in regimenting the world as an object we then lose contact with our singularity, we are scattered in pieces like a broken mirror, since the subject no longer reflects itself but as an object.

The world as a perpetual collapse is the world of the 'spectator', 'turned towards the Everything'. 'As if in panic fear they flitter through that sky … afraid of flight itself: swift as a flaw runs through a cup' the Eighth Elegy also says (Rilke 2000: 52). We want to be a bowl containing everything, thanks to retention, thanks to the thirsty concentration, forgetting that the world is the open. We want to shut the open in our subjective cup out of fear to disappear and from then on, as the result of pressure, a crack falls and we become this crack. *Ressentiment* of the 'bat', afraid of dying but equally afraid to live in the daylight, in the diurnal openness.

How can we be not only the traveller fleeing from one end to the other, always bidding farewell? How to be at the same time the earth, the sea, the stopover, the boat and the sailor? Spreading one's soul.

Leibniz said: to have an ample soul. Deleuze's lecture about Leibniz, as we saw, distinguishes the damned, whose soul stands at the point of

hatred for everything, from the free man, whose soul fills an amplitude tending to a physical living and sensitive infinite, not only abstract, and whose acts and thoughts try constantly to fill this amplitude. It is no use adding that, most of the time, without effort, we are all damned rather than angels. We would have to be both, point and extension of the surface of the soul: 'Angel and Puppet: now – at last – a *play*! Now all can fuse together, all that we divide by merely being here', the Fourth Elegy says (Rilke 2000: 23).

But angels and puppets form fugacious dances. We are soon again like writers in perpetual gestation, living in the excuse rather than in the verb. And why? Because the tendency to be slow off the mark, the sense of travel craving more novelty, is always titillated by the idea that it would be better elsewhere, magnetised by the idea of the absolute stopover. This dream of the 'pure *space* before us – all its flowers opening endlessly', in the Eighth Elegy (Rilke 2000: 52), leads us from a harbour to another harbour as fishes going after the bait. We covet, we want to *have* the being, and that is how we make it fall apart. We see our paradise lost as a world to come back to, as a place, as a located object and not as 'that nowhere, free from negatives, unsupervised and pure; the place which we might breathe and know unendingly, and never crave' (52).

Envy and the envious person want to locate the being for a private show, which could be enjoyed as something we have, and they are always lying in wait. The comedy of man: this lying in wait is so intense that the hyper-spectator no longer sees anything, does not allow an impression that could bloom into a flower to linger. A stopover blots out another, an expectancy drives out another and I do not live anything, and I do not see anything and everything is always finished when it had hardly begun. 'This is what fate means: to be opposite, and to be that and nothing else, opposite, forever' the Eighth Elegy says (Rilke 2000: 52).

Will love save us? It is very unlikely according to Rilke: 'When you lift yourselves up to each other's mouth and your lips join, drink against drink: oh how strangely each drinker seeps away from his action' the Second Elegy says (Rilke 2000: 13). In the love relationship, we do not escape lying in wait, the show of ourselves, and from then on we are beyond the grace of a kiss. Ego *against* ego rather than losing and giving up on the ego. Avidity and impatience, attempt to locate enjoyment spatio-temporally rather than extension and dilatation of the soul: 'Do not think I woo thee, angel! Should I do so, you would not be moved, so full of conflict is my cry. Against such utter counter force you cannot prevail' the poet laments in the Seventh Elegy (45). Passion for travelling,

passion for the contraction in the place it gets off. Maybe we like nothing more than being alone to the extent that we lose ourselves and never find ourselves, pushing back the torrent of life.

Maybe the tendency to be slow off the mark is nothing else than a love for death because 'Close to dying we need see death no more and can, perhaps, look outwards with a gaze as wide as the gaze of animals. Lovers, were it not for that other one whose presence blocks their sight, might come to it, amazed', according to the Eighth Elegy (Rilke 2000: 47). We believe we run after death as innocently a being sleeping alive, but in fact we run with avidity after the enjoyment to *have*, the dream to have Everything which makes us push something back as a thing and not as an emerging seed. Alas, we cannot *have* Everything. We can only *become* Everything through an extension of our soul in all directions, past included. But this past frightens us since we were not spread in it but only ephemeral spirals run through by destiny. We have to accept to be an other.

As we suggested, a soul spreading out implies an origin by creation of a centre, even a moving one. Every moment, the soul spreading out its amplitude has a centre. What is this centre? Nothing other than the will not to lose oneself and to be oneself. We are not afraid of death, because we do not know it and, deep inside, we hope too much. We are afraid of not knowing who we are, of having several personalities (different contractions of the soul) and as a consequence several possibilities and several impossibilities. We are afraid to be lost in the sea or to wander on earth, that is why we keep on following the tendency to be slow off the mark, as an in-between flitting about with little life.

To be at the same time the earth, the sea and the sailor: that is the salvation of the soul spreading into the openness, Deleuze says. That is the rising fracture: 'And we, who think of happiness ascending, would with consternation know the rapture that almost overwhelms us, when happiness falls', the Tenth Elegy says (Rilke 2000: 65).

Spinoza suggested that we are far from knowing what a body is capable of doing, the joy a body is capable of. It seems that humanity has not yet explored the whole expanse of its soul, weighed down by lament or complaining. We are still elegiac. We *think* happiness instead of living it. We are no longer faithful to the earth, Nietzsche would say, that is why the fruits of happiness escape us falling next to our little grateful hands.

We still have a thought of lack, hence the elegy spirit. Maybe we can never go beyond. We may always be staircases, mobile points going from one harbour to another, looking for the absolute and (already)

missed haven. Life may give us time to spread out our soul but there is envy looking after the elastic and contracting the soul into will to have.

The Second Elegy says: 'If only we too could discover a pure, contained human place, a strip of fruitful land of our own, between river and stone! For our own heart exceeds us, even as theirs did' (Rilke 2000: 23). So hope is allowed. For our heart exceeds us, like the heart of gods. And our heart encourages us to become a subject, a hero, a so(u)rcerer, a living axis. To become such, three coordinates are to be held firm:

1. Hypo-stasiate our *will-to-bring-into-existence-that-which-does-not-yet-exist* in a conscious and felt repetition.
2. To keep being untimely by refusing the normative temporality of the breaks.
3. Never give in to the fatalism of believing that the real is fixed. *The world is my creation.*

Revolution in time, becoming another, human transmutation, setting oneself free from the furrows of labour: can we conceive a more solemn, more triumphant, a happier subject? A dialectic whose sparks create the world. Can we conceive a better subject for passion?

It is a fact that there is a whole discourse of revolution, which is a manifestation of laziness, a distressed snobbery, an obscene timidity. But the repetition of the will to be different, even under the minimal form that the critic in society is, is a way to be on the watch. A necessary way, probably but definitely insufficient. There are watchwords with which we fall asleep, enthusiasms that are too intoxicating whereas the becoming other is always an adventure.

'Chaosmos' of lines to endure, in which to inscribe oneself, to write. New life is our passion. We give birth to worlds trying to hold onto the impossible, walking on towards a woman of manifest interior elegance, walking a step away from our falling apart, raising our voice next to (self-)destructing persons, refusing that our retinas be dazzled by mimetic persistences.

Once upon a time the meeting between a rupture and a systematic, an unconsciousness and a rhythm, fire and ice.

Rising fracture. Lightning.

A friction accompanied by a look at the black sky, where stars draw the lines of the destiny we inscribe in them.

Notes

1. *They* is a limited way of translating the French *on*, a general and unsingular version of *we*.

Book Reviews

Christian Kerslake (2009) *Immanence and the Vertigo of Philosophy: From Kant to Deleuze*, Edinburgh: Edinburgh University Press.

In *What is Philosophy?* Deleuze and Guattari define philosophy as the creation of concepts on a plane of immanence. Yet the more they expound on what the plane of immanence is, claiming that it is the absolute ground or prephilosophical presupposition of philosophy, the more abstruse it becomes. Aptly, they write: 'We head for the horizon, on the plane of immanence, and we return with bloodshot eyes' (Deleuze and Guattari 1994: 41). Immanence is consistently present and problematic in Deleuze's work, and Christian Kerslake speculates that 'perhaps it is *the* problem inspiring [Deleuze's] work' (2). What is implied is that determining what Deleuze means by 'immanence' is the key to understanding his philosophical project. This is the difficult task assumed by Kerslake in *Immanence and the Vertigo of Philosophy: From Kant to Deleuze*.

Kerslake begins by offering a preliminary definition of immanence: 'formally', a philosophy is immanent if it does not appeal to any terms or relations outside of itself; 'ontologically', it means that thought is adequate to the expression of being (2). Polemically, Kerslake positions himself against recent studies that have presented Deleuze as a non-critical metaphysician, and he asserts that the book's aim is to emphasise, unequivocally, that Deleuze is the 'latest flowering' of the post-Kantian tradition (5). Although he offers this work as a 'sourcebook of ideas and arguments' (vii), there is a very clear unifying and coherent argument: it is only within a Kantian and post-Kantian context that Deleuze's struggle with the problem of immanence can be properly understood. He identifies immanence with the post-Kantian idea of immanent critique: that is, a critique in which reason criticises itself and thereby accounts for its own method and genesis. The problem of immanence is therefore formulated as the problem of metacritique.

Deleuze Studies 7.1 (2013): 153–156

www.euppublishing.com/dls

However, it is a gross simplification to reduce a book to its polemical edge, and Kerslake's aim is far more complex and captivating. To understand Deleuze's reading of Kant, Kerslake does not primarily engage with Deleuze's explicit treatment of Kant and the German idealists, nor does he situate Deleuze's post-Kantianism against Hegel's. Instead, he carries out what he describes as a 're-excavation' of Kant's critical philosophy to show how Deleuze '*repeats* the first convulsions of the critical project' (10). Accordingly, three of the book's four chapters are a studied dissection of the origins of Kant's critical philosophy, paying close attention to the tensions and problems guiding Kant's formulation; the fourth chapter shows how Deleuze responds to these problems.

In an extended Introduction, Kerslake grounds his arguments on Deleuze's lectures series *Qu'est-ce que fonder?*, which were delivered in 1956. What is so advantageous about these lectures is that Deleuze engages directly with methodological issues of critique and the problem of self-grounding in philosophy; more significantly, Kerslake argues: 'Everything in *Difference and Repetition* is present *in nuce* in "What is Grounding?", and just needs unfolding' (21). This is an interesting speculation, though it rather raises the question of why Deleuze took over a decade to simply unfold it. Kerslake claims further that 'Deleuze's style in the lectures appears to be a hitherto unknown dialect of Heideggerese; but that may be due to the state of the lecture notes' (43, n. 18). What is of some concern is that this acknowledgement is the only note of caution Kerslake sounds regarding the credibility of the notes, for these lecture notes are not Deleuze's own but were made by a student, and their accuracy has not been determined.

The rest of the book elaborates at great length the arguments that Deleuze, in these lectures, 'traversed with lightning speed' (9). Chapter 1 establishes a consistency in Kant's pre-critical and critical writings with regard to his awareness of metacritical issues. Kerslake identifies three historical stages in Kant's struggle to define systematically the relation between critique and metaphysics as he attempts to develop his critical project in terms of the relation between critique and teleology. Chapter 1 ends with two sections on Deleuze: the first on Deleuze's reading of the relation between the three critiques in *Kant's Critical Philosophy*; the second on the development of his transcendental empiricism, which Kerslake identifies as being rooted in the third stage of Kant's struggle. Chapter 2 expands on the assertion of consistency established in chapter 1 by locating the origins of critical philosophy in Kant's 'pre-critical' writings (a term Kerslake dislikes) in dogmatic metaphysics.

In a close and interesting reading of the history of the ontological argument, Kerslake pursues the relation between the logical and the real as it is developed through Spinoza, Leibniz and Kant, and details the critical turn in Kant's philosophy as it arises in response to Leibniz's rationalism.

Kant's break from Leibnizianism is developed further in chapter 3, which explores Kant's theory of cognition. In his pre-critical writings, Kant engages with the problematic notion of the object, which Kant refers to as 'object $=x$', and which is to have significant consequences as it is retained in his critical writings. Kerslake's argument centres on the Transcendental Deduction in the first edition of the *Critique of Pure Reason*; he argues that this Deduction is only fully appreciated in the light of Kant's work on Ideas in the Transcendental Dialectic, which he persuasively argues has the features of a transcendental deduction. He argues that the deductions in the Analytic should be understood as being subordinated to this *third* deduction, and it is the internal connection between all three that gives the *Critique* its consistency as a whole.

But why is immanence 'the very vertigo of philosophy'? (2). Kerslake addresses this question in the fourth and final chapter. Two different meanings of immanence are identified in Deleuze's thought: the first conception of immanence is that which is explored through most of the book and concerns the systematic and metacritical problem of self-grounding; the second conception, which appears in Deleuze's later works, is that of a prephilosophical and pre-reflexive thought. The task of this chapter is to determine whether or not these two conceptions can be reconciled, thus demonstrating a consistency in Deleuze's thought. Kerslake achieves this by identifying three vertigos in the notion of immanence: the first is the vertigo encountered in any instance of ungrounding, which is necessarily included in self-grounding; the second, with which the book is largely concerned, is the attempt to attain metacritical consistency; but it is the third that is 'the specifically Deleuzian one, where the question is asked what living in a *plan* (or in English, "plane") of immanence would in any case be *like*' (265).

Immanence and the Vertigo of Philosophy is an ambitious work and the breadth of Kerslake's analysis is very impressive. Although he traverses 'in slow motion' the ground covered in the 1956 lectures, his project might have benefited by moving at an even slower pace that shifted more weight onto the context within which his often dense arguments are expounded. Kerslake assumes a lot of the reader, including a solid understanding of a wide range of texts, some of which are lesser known; although each chapter is equipped with

extensive footnotes that help elaborate ideas, further explication and clarification would have made his insights more accessible. That said, this is an invaluable contribution to a growing body of literature on Deleuze's post-Kantianism, and these are insights worth pursuing further. Presumably, the reason Kerslake describes this as a 'sourcebook of ideas' is because, although he has analysed the historical roots of Deleuze's post-Kantianism, its value will ultimately be borne out by future works that complement the project Kerslake has carried out here by examining how these historical roots are played out in each of Deleuze's texts. This, too, would be a very worthwhile project.

Editorial Introduction: For a Transdisciplinary Practice of Thought

Guillaume Collett University of Kent
Masayoshi Kosugi and Chryssa Sdrolia Goldsmiths, University of London

All the articles presented in this issue have their origin in the conference 'Deleuze, Philosophy, Transdisciplinarity', which took place in London in February 2012 and which the present editors organised. The key question that the conference sought to address and around which the present issue revolves is the following: How are we to understand philosophy's relation to the various thought processes and practices of other disciplines in the work of Gilles Deleuze? The necessity of asking this question is to be found in a difficulty we perceive to exist in the tendency for an interdisciplinary mode of knowledge production. As the desire to bring together a multitude of different research fields grows, particularly in the humanities, it has also become harder to compare and conjoin them without a certain perplexity arising as to how the different protocols and traditions of thought are to intersect.

Our turn to Deleuze is precisely motivated by his distinctive take on the problem, which we will here articulate as 'transdisciplinarity'.[1] We take our cue from the blurb of the French edition of *What Is Philosophy?*, which reads: 'Philosophy is not interdisciplinary'.[2] This might be taken to harbour a tension. After all, it is known that Deleuze had long insisted on the essential relation between philosophy and other disciplines. His work has been explicitly and on numerous occasions praised for having advocated the necessity of breaking through traditional disciplinary boundaries and can be rightly described as one of the boldest instances of Continental philosophy. As Isabelle Stengers notes, Deleuze's thought has been associated with 'the affirmation

Deleuze Studies 7.2 (2013): 157–168

of productive connections, the creation of deterritorialising processes escaping fixed identities, transgressing the power of exclusive disjunction that is the either/or alternatives, such as, for instance, doing either science or philosophy' (Stengers 2005: 151). The same can be said of Deleuze's engagement with other traditions. Besides the sciences, from *Difference and Repetition* ([1968] 1994) to *A Thousand Plateaus* ([1980] 1988) and *Cinema 1* and *2* ([1983] 1986; [1985] 1989), philosophy is actively shown to thrive on a multitude of connections with the arts, technology and the social sciences. Indeed, we may identify a strong *centrifugal* movement in his writings – intensified in some ways after his collaboration with Félix Guattari – by which philosophy is audaciously extended towards other disciplines. Expressed and practised as a logic of the 'and', this transversal way of thinking emerges as a choice, as a particular ethic of doing philosophy, and its stakes are laid out clearly: contrary to an image of thought as disinterested 'contemplation' that would close up on itself to induce a return to pre-established canons, for Deleuze philosophy must open itself up to other practices of knowledge production. Such an opening is not only possible but also necessary if philosophy is to be divested of a false and detrimental aura of contemplative universality and mastery over other modes of thought.

Yet at the same time that this opening is affirmed and consciously practised against the pitfalls of mere 'contemplation', in his late work with Guattari, Deleuze's philosophy appears to be defined by a *centripetal* and self-restricting movement, which delimits and breaks connections. Compared with the profusion of adventurous links animating previous works, *What is Philosophy?* might be taken to promote a surprisingly conservative picture, with philosophy trying to establish itself and its own methods in contradistinction to what it is not. In the book, philosophy, science and art are indeed considered apart from one another, each shown to create through its own mode, to have its own outside (non-philosophy, non-science, non-art) and to correspond to different disciplinary planes of immanence, reference and composition, respectively. 'The three planes, along with their elements, are irreducible' (Deleuze and Guattari [1991] 1994: 216). Philosophy produces concepts; science produces functions; art produces affects and percepts. And if they can be said to 'interfere' (Deleuze and Guattari [1991] 1994: 216–18) with each other, this interference proceeds through their individual means: out of a function or an affect and percept, philosophy can make a concept; out of an affect and percept or a concept, science can make a function; out of a concept or a function,

art can make an affect and percept. The point is repeated in the American preface to *Difference and Repetition* written in 1994, only three years after the publication of *What Is Philosophy?*:

> A philosophical concept can never be confused with a scientific function or an artistic construction, but finds itself in affinity with these in this or that domain of science or style of art. The scientific or artistic content of a philosophy may be very elementary, since it is not obliged to advance art or science, but it can advance itself only by forming properly philosophical concepts from a given function or construction. (Deleuze [1968] 1994: xvi)

As Deleuze himself asserts in this particular instance, when he strays into mathematical and biological territory to make concepts out of the functions of 'differen*t*iation' and 'differen*c*iation', the movement that enables him to connect with those practices abides by certain disciplinary protocols, restrictions and rules. The differences between disciplines are not to be ignored.

Is there a contradiction between the two movements? Are we presented, as Alain Badiou indicates, with an imperative to choose, as it were, between two Deleuzes, one 'radical', the other 'temperate' (Badiou [1997] 2000: 9)? More specifically to our problematic, are we faced with the impossibility of the cross-fertilisation of disciplines and with the surreptitious re-establishment of boundaries? Deleuze hints at the answer as early as 1972 in an interview with Catherine Backès-Clément: 'I'm interested in the way a page of writing flies off in all directions and at the same time closes right up on itself like an egg' (Deleuze [1990] 1995: 14). We can see from this quotation that the situation is more complex than the one implied by our previously staged dualism between a promiscuous and a classical way of philosophising. The centrifugal and centripetal movements cannot be taken to cancel out one another, nor can they be said to have emerged at different points in Deleuze's career. On the contrary, it becomes clear that they have always been complementary, the two components of a single movement, with each component articulated sometimes with more, sometimes with less emphasis. One finds this in *Difference and Repetition*, where the practice of transcendental empiricism frees the transcendental from the a priori and the conditions of possible experience, reconstituting it on the back of a disciplinary pluralism spanning the arts and sciences. The latter are now un/grounded in a problematic transcendental field no longer reducible to philosophy itself. But is this also the case in *What is Philosophy?* The question must be answered positively. For at the end of the book, the separation of

disciplines is simultaneously co-articulated with the appeal to a point of divergence that is nevertheless common to all of them. This is the brain, the '*junction* – not the unity – *of the three planes*', which, being a determinate cluster of neighbourhoods, a 'complex both of horizontal connections and of vertical integrations reacting on one another', is the condition of transdisciplinarity itself (Deleuze and Guattari [1991] 1994: 208). It is at this level that the disciplines are treated non-hierarchically. The brain reveals, or rather, it practises, a subtle art of 'interferences' that can proceed extrinsically, intrinsically or in a non-localisable way. Accordingly, there can be connections proceeding unilaterally and through individual means; or connections that slip from one plane to another and that cannot be safely claimed by either; or connections that pertain to each discipline's relation to its own outside. But there is another level of equality; for through the brain, the planes of immanence, composition and reference are also plunged into chaos where they are finally confronted with the impossibility of their distinction: 'concepts, sensations, and functions become undecidable, at the same time as philosophy, art and science become indiscernible, as if they shared the same shadow that extends itself across their different nature and constantly accompanies them' (218). If *What Is Philosophy?* puts forth a unique take on transdisciplinarity, it is because it advocates a relation between disciplines that is more than a simple separation.

From this perspective, the 'separation' of philosophy, art and science is not a prescription, a parting of the ways or a comment on the impossibility of a cross-fertilisation of disciplines. Above all, it is a cautionary gesture. For the path to creative connections is strewn with the dangers of 'communication' manifested as the tendency of theorising discourses to assume the voice of 'common sense' in order to dictate to others how they should know what they know. We may stage an imaginary dialogue between Foucault and Deleuze at this point:

> But, then, what is philosophy today – philosophical activity, I mean – if it is not the critical work that thought brings to bear on itself? In what does it consist, if not in the endeavour to know how and to what extent it might be possible to think differently, instead of legitimating what is already known? There is always something ludicrous in philosophical discourse when it tries, from the outside, to dictate to others, to tell them where their truth is and how to find it, or when it works up a case against them in the language of naïve positivity. But it is entitled to explore what might be changed, in its own thought, through the practice of a knowledge that is foreign to it. The 'essay' – which should be understood as the assay or test by which, in

> the game of truth, one undergoes changes, and not just as the simplistic appropriation of others for the purpose of communication – is the living substance of philosophy, at least if we assume that philosophy is still what it was in times past, i.e. an 'ascesis,' askesis, an exercise of oneself in the activity of thought. (Foucault [1984] 1985: 8–9)

> For many people, philosophy is something which is not 'made', but is pre-existent, ready-made in a prefabricated sky. However, philosophical theory is itself a practice, just as much as its object. It is no more abstract than its object. It is a practice of concepts, and it must be judged in the light of the other practices with which it interferes. (Deleuze [1985] 1989: 280)

The second quote can be taken as a reply to the first, since Deleuze indeed read an extract from *The Use of Pleasure* as his eulogy for Foucault. Published the following year, *Cinema 2* expresses precisely that mode of thinking which Foucault describes. Deleuze presents us with a philosophy that lives by interfering with, and simultaneously rendering itself sensitive to, something 'foreign' – to a cinematic, scientific or other way of thinking – which it cannot claim for its own but which enables philosophy to evolve as a practice of concepts. It is at this level of philosophy as practice that the apparent contradiction between the two movements we staged and the ambivalence of *What is Philosophy?* need to be thought: *qua* distinct 'modes of Ideation', disciplines are all *practices*, each no more or less abstract than the other. The point is not for philosophy to stop looking outside itself for inspiration or to lay claim to superiority over other disciplines. The point is that the practice of transdisciplinarity needs to proceed with care. If, returning to *A Thousand Plateaus*, Deleuze and Guattari tell us that the plane of consistency is always 'constructed [. . .], in very different social formations through very different assemblages (perverse, artistic, scientific, mystical, political)', the question nevertheless remains one of caution: 'whether the pieces can fit together, and at what price' (Deleuze and Guattari [1980] 1988: 157). For the stakes are never purely theoretical but always also practical. In *A Thousand Plateaus*, the construction of the plane of consistency always involves the assembling of flows of desire, the practical implications of which are extended into Deleuze's last published work where 'pure immanence' is twinned with an impersonal practice, 'A LIFE' (Deleuze [1995] 2001: 27).

It is at this crossroads of practices of thought that the political value of a transdisciplinary practice of interference becomes manifest. That the three disciplines can 'interbreed' but claim the offspring respecting the conceptual, functional or affective-perceptive method of conception

is not a limitation but a warning against the relativistic application of concepts across fields. Interference, the practice of transversing boundaries, needs to proceed with care. Of course, as we have seen above, we are not speaking of a method that functions as a final end or as a programmatic perspective given once and for all. A discipline may create something unexpected, if, as we saw, the interference proceeds subtly. The only requirement, then, is that the connection between disciplines be constantly reinvented, respecting their distinct specificities while being able to induce the new without claiming mastery or assuming power over one another. Above all, what is at stake is an understanding of transdisciplinarity as a practice capable of bypassing the facile opposition between contemplation and action, theory and praxis.[3]

*

All articles contained in this issue may be considered to express this single centrifugal–centripetal movement in terms of the problematic of transdisciplinarity as practice. In doing so, they aspire to shed light on a crucial aspect of Deleuze's practice of concepts as the condition for the articulation of a philosophy that will be 'no more abstract than its object' (Deleuze [1985] 1989: 280) but, strictly speaking, a practical or ethico-aesthetic experiment, to use a Guattarian notion, always in the process of reconfiguring itself.

In 'Deleuze Challenges Kolmogorov on a Calculus of Problems', Jean-Claude Dumoncel reveals the character of Deleuze's philosophy as a 'practice of problems' by reviving the latter's encounter with mathematical intuitionism on the contested territory of the Leibnizian *Calculemus*. The article proceeds by tackling Deleuze's transformation of logico-mathematical structures as conducive to the very conceptualisation of the 'problem' in properly metaphysical terms. Beginning with a review of Kolmogorov's constructive logic, Dumoncel discusses the implications of the Deleuzian decision to liberate the principle of the excluded middle from the epistemological focus of the standard propositional calculus and restore it into an ontological '*law of being and becoming*'. At stake in this act is the articulation of the relation between the calculus of problems and propositional calculus as a nuanced but non-hierarchical relation of 'discriminating power'. According to this power, Dumoncel argues, the calculus of problems emerges as being able to '[detect] *differences* in the propositional calculus'. But this can only happen 'on condition that [the calculus of problems] is (morphologically) *identical* to [propositional

calculus]'. Paradoxically, it is precisely '*because* the symbolic formulas of the calculus of problems, literally taken, are *indiscernible* from the corresponding formulas in the propositional calculus' that difference can be detected by the repetition of the logical rules of the excluded middle on a metaphysical level. With this premise, the article goes on to plot a meticulous trail of conceptual connections, including the role of Leibnizian *themes*, Peircean *rhemes*, Hilbert's *Aristide* and Spinoza's parallelism at work in the metaphysicalisation of the propositional calculus into a calculus of problems. Principal among the latter is the subtle interference between philosophy and mathematics as exemplified by the encounter between Deleuze and Lautman. Deleuze is shown to engage with a Lautmanian dialectics in order to reveal the Idea as the extra-propositional and extra-philosophical plane that is differently actualised in logic, mathematics and philosophy but remains irreducible to them. The result of this second connection is brought to bear upon the nature of philosophical thought as one that, through a calculus of problems, takes for its object the very practice of concept creation as fundamentally transdisciplinary.

Daniela Voss's article 'Deleuze's Third Synthesis of Time' focuses on Deleuze's theory of time and especially the enigmatic character of the so-called 'third synthesis' by drawing attention to a series of extrinsically interfering philosophical, dramaturgical and mathematical lines that inform it. In the article, the dynamics of the conceptualisation of the static synthesis of the future is seen as driven by the notion of the 'cut'. Working her way through detailed readings of Kant's pure form of time, Hölderlin's 'caesura' and Dedekind's theory of continuity, Voss's thesis is that Deleuze's interest in the 'cut' is threefold: the 'cut' allows a static and purely ideal definition of continuity; it induces a break from empirical definitions of time as flow; and it permits the distribution of past and future affairs in a linear yet non-identical way. The three strands are then intercepted and bent through a Nietzschean lens. With the aid of the concept of the eternal return and its (Klossowskian) demand that whatever returns return as different and new, as simulacrum, Deleuze is then shown to achieve nothing less than a novel theory of the subject as non-identical to itself and multiple, always in the process of becoming. Deleuze's third synthesis of time presents us 'not simply an a priori subjective form, but an a priori and a-subjective static synthesis of a multiplicity of temporal series', immanent to the process of de/subjectivation. Yet the 'cut' here is not described as a means to articulate or simply 'contemplate' the possibility of an a-subjective a priori. As Voss argues, the 'cut' is first and foremost the

means with which to engage with the untimely a-subjective field as a practice of thought, which immanently refashions Deleuze himself *as* political subject *in* the present and qualifies his way of philosophising as one of 'cutting theories together'. In fact, the article concludes, this is where the proper meaning of 'thought as heterogenesis' is to be found. By interfering with other modes of Ideation, such as mathematics and drama, Deleuze is able to invoke a 'becoming-other' of the subject that is first and foremost a logic of transdisciplinarity where thought exercises and expresses itself in heterogeneity.

Éric Alliez's article 'Ontology of the Diagram and Biopolitics of Philosophy: A Research Programme on Transdisciplinarity', uses the diagram to both develop a genealogy of and critically engage with Deleuze's and Deleuze and Guattari's practices of transdisciplinarity, culminating in an equally biopolitical and artistic critique of philosophy. The article examines how under the influence of Guattari, Deleuze extracts from Foucault in the mid-1970s a 'revolutionary diagram from which are derived both a new way of doing and a new way of speaking'. This is fleshed out in *A Thousand Plateaus* in terms of a constructivism of desire. Alliez's key proposition in the first part of his article is that the 'political plane of consistency' of the diagram – its complete immanence to the socio-political field and thus its capacity to construct it – must always be 'explicat[ed] and complicat[ed]' as '*Art and politics*'. The lines of flight or points of mutation lying between or prior to formed strata (or structures) excavated by Deleuze and Guattari's new practice of the diagram are also always, for Alliez, sensible signs open to artistic experimentation and creation. Thus, art is never 'an end in itself' but always a biopolitical practice (the construction of vital flows of desire). To explain how this in turn leads to a biopolitical critique of philosophy, the second part of the article charts the historical development of the Deleuzian and Guattarian concept of diagram out of Deleuze's transcendental empiricism and engagement with structuralism in the 1960s. While structuralism sought to establish a transdisciplinary conception of structure capable of opposing the 'theoretical primacy of philosophy', Alliez considers that Deleuze's key innovation in 'How Do We Recognise Structuralism?' was to fold structuralism *back* onto philosophy. This folding gives way to a 'new transcendental philosophy' literally turned inside-out by its internal reliance on other disciplines and practices for its ideational and sensible content. Alliez shows that it was thanks to Guattari that Deleuze could fully break with structuralism and realise its transdisciplinary outlook, by identifying the idealising

'operational closure' or 'disciplinary regulation' of structure with the internal limits of the capitalist system they sought to critique. The anti-structuralist outside of capital (and State philosophy) is therefore understandable, for Alliez, as both 'the politics of thought and politics inside thought' and '*Art after Philosophy*'.

For Deleuze, along with Guattari, politics as such is not categorically singled out as an autonomous mode of 'Ideation' like those of philosophy, science and art, respectively. Rather, politics assigns itself the form of transversal 'collective creations' or 'becomings', which cross disciplinary territorialities and hence cannot be localised in specific regions or groups of activities. Then what are the precise nature and the end of such politics? In 'Who Are Our Nomads Today?: Deleuze's Political Ontology and the Revolutionary Problematic', Craig Lundy seeks to explore and clarify these questions by elaborating upon another question posed as a political imperative by Deleuze in 1972, 'we must ask: who are our nomads today?' (Deleuze 2004: 260). For Lundy, this question demands that we turn to the ontological basis behind the conceptual distinction between the State and the nomad, as well as to Deleuze and Guattari's seemingly dualistic deployments of terms such as smooth/striated, as presented in *A Thousand Plateaus*. The view he offers is that such dualisms are ultimately rooted in Deleuze's long-sustained engagements with Henri Bergson's distinction between two types of multiplicities (of degree and of kind) and this distinction in fact serves as the ontological foundation of their political philosophy *tout court*. The lesson for politics he draws from the Bergsonian distinction allows him to reconfigure the seemingly dualistic definition of the nomad so that it is not dualistically opposed to the State. Rather, the nomad is defined in terms of a topological triad that supposes the 'second force of nomadism' placed in-between two kinds of multiplicities here transposed onto the polarity of State/nomad, a polarity that is initially established in an absolute manner. There are thus two nomads: the nomad conceived vis-à-vis the State and the nomad in-between the State and the nomad. The answer to the first question, 'who are today's nomads?' is thus answered behind our backs, for asking the question itself is part of philosophy as practice of thought.

In "'What Is Called Thinking?": When Deleuze Walks Along Heideggerian Paths', Benoît Dillet explores the complex relation between Deleuze and Heidegger in their respective formulations of 'thinking' as a political problem. While it is well known that Deleuze explicitly distanced himself from Heidegger's 'ontological Difference'

in *Difference and Repetition*, Dillet argues that there is a more profound affinity between them with respect to their common thesis on thinking as a political problem. Dillet points out that when Deleuze repeatedly writes 'we are not yet thinking', he is referring to the same pronouncement made by Heidegger, and to the specific ways in which the latter called for an understanding of what thinking involves in his 1951–2 lectures entitled 'What Is Called Thinking?'. Dillet, drawing on Zourabichvili's take on Deleuze's political thought, argues that Deleuze's conception of thinking as an involuntary practice comes close to Heidegger's conception of thinking as 'releasement', which requires an unwillingness that simultaneously points to and withdraws from what calls for thinking. However, on the question regarding who, or better which discipline, has access to thought, the two thinkers are considered by Dillet to differ sharply. While for Heidegger, '[a]ll sciences are grounded in philosophy, but not *vice versa*', Deleuze, on the other hand, grants all disciplines full rights and power to ground themselves and to reflect upon their own 'supra-historical' foundations without relying on philosophy to do so. In short, while Heidegger draws a hierarchical picture of 'thinking' with philosophy sitting on top of all sciences, Deleuze 'democratises' thinking and sees it as equally capable of being accessed by all disciplines, albeit in their own particular ways. This openness of thought to disciplines other than philosophy is exemplified by Deleuze's work on cinema. Far from requiring philosophy to think on behalf of it, cinema is fully capable of thought in its own right, and it resists stupidity just as much as philosophy and science do.

Notes

1. We borrow the term 'transdisciplinarity' from the research programme currently underway in the Centre for Research in Modern European Philosophy at Kingston University, London, and which Éric Alliez has recently articulated from a Deleuzian and Guattarian angle in such texts as 'Rhizome (With no return)' (2011), further developed in his contribution to this issue.
2. 'La philosophie n'est ni contemplation, ni réflexion ni communication. Elle est l'activité qui crée les concepts. Comment se distingue-t-elle de ses rivales, qui prétendent nous fournir en concepts (comme le marketing aujourd'hui)? La philosophie doit nous dire quelle est la nature créative du concept, et quels en sont les concomitants: la pure immanence, le plan d'immanence, et les personnages conceptuels.

   Par là, la philosophie se distingue de la science et de la logique. Celles-ci n'opèrent pas par concepts, mais par fonctions, sur un plan de référence et avec des observateurs partiels. L'art opère par percepts et affects, sur un plan de composition avec des figures esthétiques. La philosophie n'est pas interdisciplinaire, elle est elle-même une discipline entière qui entre en résonance

avec la science et avec l'art, comme ceux-ci avec elle; trouver le concept d'une fonction, etc.

C'est que les trois plans sont les trois manières dont le cerveau recoupe le chaos, et l'affronte. Ce sont les chaoïdes. La pensée ne se constitue que dans ce rapport où elle risque toujours de sombrer' (Deleuze and Guattari [1991] 1994: back cover).

We owe special thanks to Marjorie Gracieuse for drawing our attention to this passage in her paper 'Immanence as Differential Material of Human Practices: on the distinction between Transdisciplinarity and Interdisciplinarity', presented at the conference.

3. This is the 'creative act' itself, which, as Deleuze puts it in his lecture from 1987, involves the construction of different modes of ideation:

'No one has an idea in general. An idea – like the one who has the idea – is already dedicated to a particular field. Sometimes it is an idea in painting, or an idea in an novel, or an idea in philosophy or an idea in science [. . .] Ideas have to be treated like potentials already *engaged* in one mode of expression or another' (Deleuze [2001] 2007: 317; original emphasis).

How can we visualise such a practice of thought? We may borrow here Jean-Claude Dumoncel's image: disciplines are paths of thought that travel in caravans, and Ideas are the 'caravanserais' where disciplines can enter from the various gateways and intersect 'independently of their specific technicalities' (Dumoncel 2009: 83; our translation):

'Les Idées, au sens deleuzien, sont donc des caravansérails de la pratique et de la pensée où peuvent se croiser les disciplines les plus diverses, indépendamment de leurs technicités spécifiques.'

Deleuze Challenges Kolmogorov on a Calculus of Problems

Jean-Claude Dumoncel University of Caen

Abstract[1]

In 1932 Kolmogorov created a calculus of problems. This calculus became known to Deleuze through a 1945 paper by Paulette Destouches-Février. In it, he ultimately recognised a deepening of mathematical intuitionism. However, from the beginning, he proceeded to show its limits through a return to the Leibnizian project of *Calculemus* taken in its metaphysical stance. In the carrying out of this project, which is illustrated through a paradigm borrowed from Spinoza, the formal parallelism between problems, Leibnizian themes and Peircean rhemes provides the key idea. By relying on this parallelism and by spreading the dialectic defined by Lautman with its 'logical drama' onto a Platonic perspective, we will attempt to obtain Deleuze's full calculus of problems. In investigating how the same Idea may be in mathematics and in philosophy, we will proceed to show how this calculus of problems qualifies not only as a paradigm of the Idea but also as the apex of transdiciplinarity.[2]

Keywords: calculus, Deleuze, problems, rhemes, transcendentals,

I. Introduction

Transdisciplinarity has two conceptual neighbours or challengers in neighbourhood: pluridisciplinarity and interdisciplinarity. Pluridisciplinarity reaches its apex in anthropology: a man falling from a cliff is a point for mathematics, a body for physics, an organism for biology, perhaps a candidate for suicide for sociology. Interdisciplinarity, if it

Deleuze Studies 7.2 (2013): 169–193

www.euppublishing.com/dls

exists, is constantly in danger of falling prey to fashion. In a congress of mathematicians, physicists and epigraphists, the first condition of 'interdisciplinarity' is that mathematicians make mathematics, physicists physics and epigraphists epigraphy; but the second condition is that each also says something in the disciplines about which he or she is supposed to have a lot to learn. In this sense, 'interdisciplinarity' can be said to have as many advantages as squaring the circle does. And so the suspicion is born that mathematicians, physicists and epigraphists go to interdisciplinary jamborees in the rare periods when they really have nothing particular to say in mathematics, physics or epigraphy, respectively.

But what about this *tertium datur* between the Necessary and the Impossible that is transdisciplinarity? It is fairly easy to notice that the whole universe of pluridisciplinarity and interdisciplinarity turns in the circle of Comte's classification of the sciences: mathematics, physics, biology, sociology (and other social sciences). In other words, pluridisciplinarity and interdisciplinarity are by-products of positivism. Since universities, still bearing the vestiges of their medieval mothers, currently include a department of philosophy on a par with the faculties of theology, medicine and law, philosophers are also invited by force or politeness in the interdisciplinary jamborees. But the status of their discourse remains a mystery for all the participants, including themselves.

In the Deleuzian doctrine of Thought, however, we do have a concept for transdisciplinarity. This is the concept of the Idea, taken in the sense that the same Idea may be, for example, an Idea in mathematics, in cinema and in philosophy. In relation, then, to the positivist encyclopaedia, which circumscribes the whole territory of interdisciplinarity as well as pluridisciplinarity, we notice that Deleuze exceeds this Procrustean bed at least in two ways. First, philosophy acquires, in addition to its *de facto* status inherited from the medieval university, a *de jure* status reminiscent of its role in Plato's Academy or Aristotle's Lyceum. Second, the extension of Ideas is not confined to sciences (even *sensu lato*) but includes arts, such as cinema. Starting with this freed space of the Idea, we will focus on the couple philosophy–mathematics. With regard to this couple, the relation of Deleuze to Kolmogorov and the latter's calculus of problems offers more than a paradigm: rather, it opens a royal path, which, incidentally, also encounters the main difficulties surrounding what we will call the problem predicament.

Deleuze's assessment of the calculus of problems in symbolic logic is contained in two sentences that must be quoted in reverse chronological order:

> The 'intuitionist' school (Brouwer, Heyting, Griss, Bouligand, etc.) is of great importance in mathematics, not because it asserted the irreducible rights of intuition, or even because it elaborated a very novel constructivism, but because it developed a conception of *problems*, and of a *calculus of problems* that intrinsically rivals axiomatics and proceeds by other rules (notably with regard to the excluded middle). (Deleuze and Guattari [1980] 1987: 570)

> The calculus of problems as it is defined – notably by Kolmogoroff – still remains traced from a calculus of propositions, in 'isomorphism' with it. (Deleuze [1968] 1994: 322)[3]

The question faced in these two sentences is precisely indicative of the problem predicament. The first sentence contains the Deleuzian synopsis of mathematical intuitionism, which is better, as we shall see, than its counterparts in standard companions on the foundations of mathematics.[4] The second sentence is the Deleuzian challenge to Kolmogorov on the calculus of problems.[5] Yet there is a crucial connection between the two: the 'etc.' following the names of Brouwer and Heyting in the first sentence must be taken to refer primarily to Kolmogorov in the second. For, as it is well known, the calculus of problems, which according to Deleuze is the highpoint of mathematical intuitionism, had been created by Kolmogorov in 1932. This entails that the first sentence, which appears in *A Thousand Plateaus* in 1980, is an important correction of the position taken in 1968 in *Difference and Repetition*. In the latter, the calculus of Kolmogorov was simply seen as illustrating a 'false conception of the category of problem'; accordingly, its value was dismissed (Deleuze [1968] 1994: 322). In *A Thousand Plateaus*, however, the calculus of problems has reached the level of 'great mathematical importance'. As we shall see, this does not mean that the critical assessment is wholly withdrawn. In fact, the main reason behind Deleuze's enduring critical stance is his endorsement of the most celebrated among the Leibnizian 'dreams', that is, 'the great logical dream of a problem calculus'. For the *locus classicus* of this dream is the paragraph where Leibniz precisely anticipates the effect of his 'philosophical grammar' on Philosophy as a whole:

> Then, between two philosophers, there will be no more need of discussions longer than between mathematicians, since it will suffice that they seize their

> pen, that they sit at their computing table (appealing to a friend if they wish) and that they say to each other: 'Let us calculate' [*Calculemus*]. (Leibniz [1687] 1978: 200)[6]

Regarding our question, then, in *Difference and Repetition*, Deleuze essentially draws on two tenets:[7] on the one hand, he endorses 'the great logical dream of a combinatory or calculus of problems' he ascribes to Leibniz (Deleuze [1968] 1994: 157);[8] on the other, he says about Carnot's *Reflections on the Metaphysics of the Infinitesimal Calculus* that '[by] invoking the notions of "problem" and "problem conditions" ... Carnot opened up for metaphysics a path which went beyond the frame of his own theory' (177). So that with regard to what we have called the problem predicament, the whole Deleuzian doctrine may be described as outlining a metaphysical calculus of problems. As we shall see, this view is maintained until *What Is Philosophy?* and it is precisely what subtends the definition of a properly Deleuzian dialectics. For according to Deleuze, 'Dialectic is the art of problems and questions, the combinatory or calculus of problems as such' (157). And in this dialectics, the metaphysical calculus of problems is the spearhead, and the theory of problems is more specifically called 'problematics'.[9]

Based on the above, our whole exposition will have two main, though unequal, parts. In the first part, which is relatively brief, we shall explain the Kolmogorov calculus and its discussion by Deleuze. In the second part, relying on scattered data in Deleuze, we shall disclose, through their systematisation, his full metaphysical calculus of problems.

II. The Kolmogorov Calculus of Problems

We have a double reason to expound upon and discuss the calculus of Kolmogorov. We must understand why Deleuze arrived at a positive assessment of it; and we must also find in it the target of his lasting critic on the problem predicament, explaining why the very same calculus falls short of the 'great logical dream'.

In order to appraise the Deleuzian judgement in its two pronouncements, we may condense the Kolmogorov calculus of problems in the four following definitions:

1. $A \wedge B$ is the problem of solving problem A *and* problem B.
2. $A \vee B$ is the problem of solving *at least* one of problems A *or* B.
3. $A \rightarrow B$ is the problem of reducing a solution of problem B to a solution of problem A (conditional problem).

4. ¬ *A* is the problem: assuming a solution of problem *A* exists, deduce a contradiction.

Based on the logic so defined, we shall try to answer two questions: first, what is the 'great importance in mathematics' of this calculus 'notably with regard to the excluded middle'? Second, why does it nonetheless miss, according to Deleuze, the true 'conception of the category of problem'?

According to the standard story, as concerns the calculus of problems Kolmogorov is credited with having provided the 'semantics' of intuitionist logic. This is not false, but when Deleuze asserts that the calculus of problems 'intrinsically rivals axiomatics and proceeds by other rules (notably with regard to the excluded middle)' (Deleuze and Guattari [1980] 1987: 570), he is pointing to a much more important performance. As we shall see, the main contribution of Kolmogorov to intuitionist logic is a real foundation of this deviant logic in his calculus of problems. Taken in this perspective, 'intuitionist' logic is better called 'constructive' logic.

In order to see this point more clearly, it should suffice to deepen the comparison between two of the best-known laws in formal logic, here presented in a Kolmogorov dress. We mean the *tertium non datur* (or principle of 'the excluded middle')

$$A \vee \neg A$$

and the *modus ponens*

$$(A \wedge (A \rightarrow B)) \rightarrow B.$$

Between these two laws, the universal validity of the *tertium non datur* was notoriously questioned by Brouwer; and the first contribution of Kolmogorov to intuitionist logic is in his 1925 paper 'On the Principle of Excluded Middle'. Indeed, in the seemingly homogeneous web of the propositional calculus where these laws are selected, the Kolmogorov calculus of problems will reveal an unsuspected break.

Suppose the problem $A \wedge (A \rightarrow B)$ has a solution. This means that we have a solution to problem A and a solution to problem $A \rightarrow B$. But a solution of problem $A \rightarrow B$ means that the solution of problem B may be reduced to a solution of problem A. And, by hypothesis, we have a solution of problem A. So we have also a solution of problem B. All this means that the solution of problem B may be reduced to a solution of problem $A \wedge (A \rightarrow B)$ – that is, the exact case of $(A \wedge (A \rightarrow B)) \rightarrow B$. In other words, the *modus ponens* works in the calculus of problems

exactly like it does in the standard propositional calculus. But with the *tertium non datur*, it is a different ball game! Because here we hit at the difference between

$$A \vee \neg A$$

and the crude

$$p \vee \neg p.$$

The classical $p \vee \neg p$, for its part, means only that in any couple $\langle p, \neg p \rangle$ of contradictory propositions one at least is true. But with $A \vee \neg A$, it is quite another story because in this case we have either a solution of problem A or a solution of problem $\neg A$. And having a solution to any problem is an epistemic endorsement. Thus, the *tertium non datur* which, in a calculus of truth functions is a valid law, reveals itself to be subject to an 'impeachment' when the calculus of problems enters the landscape.[10]

Let us illustrate the above point with a celebrated example revisited by Deleuze: 'Will there be a naval battle tomorrow?' (Deleuze [1985] 1989: 130). This is a problem. As Aristotle says, 'it is necessary that there will be a sea-battle tomorrow or not' (Aristotle, qtd in Anscombe 1956).[11] This gives us an illustration of $p \vee \neg p$. But $A \vee \neg A$ is the problem of solving *at least* one of problems A *or* $\neg A$, where $\neg A$ is the problem: assuming a solution of problem A exists, deduce a contradiction. So that in this case $A \vee \neg A$ is the problem of having either a demonstrably true prognostic of a sea-battle tomorrow or a *reductio ad absurdum* of such a prognostic. We sublunar mortals are far off this epistemic performance. In other words, we may say that in the practice of problems, the transmission of obtained solutions along the channel of implication can conduce to the detachment of a solution according to the step of the *modus ponens*, but that on the fork of a disjunction there is no adjudication of solutions isomorphic to a *tertium non datur* (this alternative adjudication being confined to the truth values).

The difference between the respective destinies of the *modus ponens* and the *tertium non datur*, when the calculus of problems makes the difference, is of a huge significance. It means that formal logic, on the level of the propositional calculus, is crossed by an essential heterogeneity. The *modus ponens* is paradigmatic of the logical principles as laws of thought. With the *tertium non datur* we are on another territory. As the sea-battle predicament shows, the *tertium non datur* is a law of being and becoming. The calculus of problems reveals the objective difference between the two kinds of laws by epistemological criteria. And when the epistemological considerations are predominant,

as in mathematical intuitionism, the verdict of the epistemological criteria is promoted to the status of a logical touchstone: so much so that the principle of excluded middle is rejected as a logical rule.

In all this, as it will be obvious by now, the isomorphism duly registered by Deleuze has an essential function: it is because the symbolic formulas of the calculus of problems, literally taken, are indiscernible from the corresponding formulas in the propositional calculus that the calculus of problems has a discriminating power on the propositional calculus. In other words, the calculus of problems detects differences in the propositional calculus on condition that it is (morphologically) identical to it. 'Difference' is detected by (literal) 'repetition'. But on the level of the whole predicament, this means that the Kolmogorov calculus is a kind of medal, with its reverse and its obverse. For in the Deleuzian balance, the same isomorphism that motivates the critical attitude on the calculus is also a key condition of the discriminating power which constitutes its value. Nevertheless, there is no inconsistency between the two faces of the medal. On the contrary, the more the Deleuzian assessment recognises the unquestionable value of the Kolmogorov breakthrough, the more its reservations are well anchored, with its own doctrine well erected.

III. The Metaphysical Calculus of Problems

It must be noted that Kolmogorov does not define the notion of 'problem' but gives only some examples. These are the paradigmatic problems according to Kolmogorov. One of these examples is the following:

Find four positive integers x, y, z, n, such that $x^n + y^n = z^n$ and $n > 2$.

Here we can already recognise the target of the Fermat–Wiles theorem. A truly tiny target for a truly titanic proof! But this paradigmatic problem of mathematics leads us to an exegetic problem in philosophy: where in Deleuze do we find an example on the level of Kolmogorov's?

To our knowledge, taking into account that the Deleuzian concept of a calculus derives in part from the 'metaphysics of the calculus' in Carnot and that the paradigmatic problem of Kolmogorov is a case of exponentiation, this is an *apax*:[12]

> Hegel shows that variability in the function is not confined to values that can be changed (2/3 and 4/6), or are left indetermined ($a = 2b$), but requires one of the variables to be at a higher power ($y^2/x = P$). For it is then that a relation can be directly determined as differential relation dy/dx, in which

> the only determination of the value of the variables is that of disappearing or being born, even though it is wrested from infinite speeds. A state of affairs or 'derivative' function depends on such a relation: an operation of depotentialisation has been carried out that makes possible the comparison of distinct powers starting from which a thing or a body may well develop (integration). (Deleuze and Guattari [1991] 1994: 122)

These lines from *What Is Philosophy?* are directly referred to a page by Hegel in the *Science of Logic* [1816] (2010).[13] In fact, they are an abstract of two or three pages of Hegel's on the differential and integral calculus – a strange abstract, no less, because it admits of a double reading.[14] Upon a first reading, it can be said to follow some lines on the representation of velocity and acceleration in the famous diagram of Nicole Oresme, so that we have in two pages a philosophical epitome of the infinitesimal calculus considered in its genesis and evolution, a subject which Deleuze had studied at length in *The History of the Calculus and its Conceptual Development* by Carl B. Boyer.[15] A second reading is induced by a tiny anomaly of the text. In his abstract of Hegel on the calculus, Deleuze retains the examples given in the *Science of Logic* but with one exception. Hegel begins his series of examples by the equality $2/7 = 4/14$. Without any warning, Deleuze replaces it by the equality $2/3 = 4/6$. Why? We are in a book where Spinoza is proclaimed 'the prince of philosophers' (Deleuze and Guattari [1991] 1994: 48). So we can recognise here 'the proportion 2, 4, 3, 6', taken as example from the *Treatise on the Emendation of the Intellect*.[16] And this proportion illustrates a general request: 'Three numbers are given – it is required to find a fourth, which shall be to the third as the second is to the first.' That is, we are here before a paradigm of the problem. In the *Ethics* (II, XL, n. 2), this paradigm is even made both more simple and more explicit: 'one, two, three, being given, everyone can see that the fourth proportional is six'. In this version, the paradigm is more simple since it begins with the three first numbers; and it is more explicit as a case of problem since only the given numbers 1, 2 and 3 are named, leaving the solution of the problem in the dark or, better, as a blank. So, if we put this paradigm in the same form as $2/3 = 4/6$, we obtain

$$1/2 = 3/\ .$$

This is the Deleuzian paradigm of problem. And now that we have this paradigm, we may proceed to its dogmatic exposition. It has the nice form of an ABC.

Problems, Rhemes and Themes in the Procession of a Same Theme

We are also in a chapter of *What Is Philosophy?* where the first sentence declares: 'The objects of science are not concepts, but functions . . . '. The sequel of this thesis is to be found in the first page of the following chapter, where Deleuze, speaking about logic, says that 'following the route marked out by Frege and Russell, it wants to turn the concept into a function' (Deleuze and Guattari [1991] 1994: 135). Deleuze adds the condition of this transgression: 'Thus a new, specifically logical type of function must be invented', the 'propositional function'. And he gives an example of propositional function:

x is human.

But this is only the parvis of the temple. Because Deleuze knows as well the paradigm of the giving in C. S. Peirce (Deleuze [1983] 1986: 197). He writes it as:

A 'gives' B to C.

In Peirce we find the following writing:

–gives ¬ to – (Peirce [1898] 1992: 154)

And Deleuze has adopted this writing by hyphens on the case of the Other as a paradigm of concept with two components: 'its concept is that of an other – a subject that presents itself as an object – which is special in relation to the self' (Deleuze and Guattari [1991] 1994: 16). Peirce explains this kind of writing in the definition of his concept of rheme, also written 'rhema':

> If parts of a proposition be erased so as to leave blanks in their place, and if these blanks are of such a nature that if each of them be filled by a proper name the result will be a proposition, then the blank form of proposition which was first produced by the erasures is termed a rheme. According as the number of blanks in a rheme is 0, 1, 2, 3, etc., it may be termed a *medad* (from *μηδ*, nothing), *monad*, *dyad*, *triad*, etc., rheme. (Peirce [1903] 1998: 299)

> In a complete proposition there are no blanks. It may be called a *medad*, or *medadic relative*, from *μηδαμός*, none, and *–άδα*, the accusative ending of such words *μονάς*, *δυάς*, *τριάς*, *τετράς* etc. A non-relative name with a substantive verb, as '– is a man', or 'man that is –', or '–'s manhood' has one blank; it is a *monad*, or *monadic relative*. An ordinary relative with an active verb as '– is a lover of –' or 'the loving by – of –' has two blanks; it is a *dyad*, or *dyadic* relative. A higher relative similarly treated has a plurality of blanks. It may be called a *polyad*. The rank of a relative among these may be called its

> *adinity*, that is the peculiar quality of the number it embodies. (Peirce 1933: *CP* 3.465, 294)

But all this means that the rheme of Peirce is exactly the same thing as the propositional function of Russell as a case of the function of Frege. 'A gives B to C' is only a notational variant of '*x* gives *y* to *z*'. And since the Deleuzian writing of the concept is borrowed from the Peircean writing of the rheme, the conclusion seems unavoidable: Deleuze himself has remelted the concept of Concept in the mould of the function. What Peirce has labelled 'adinity', now called 'arity' by the logician, is in the vocabulary of Deleuze a case of *multiplicity* (Deleuze and Guattari [1991] 1994: 15).

We must, however, remark that this reasoning does not go without saying for the Peircean step:

– gives ¬ to –

As we may notice, in the Peircean paradigm of the giving, we have to distinguish three heterogeneous 'roles': the donor *A*, the donee *C*, and the gift *B*. And the juridical difference between the persons and the things is appropriately marked by a difference between the allotted hyphens '–' and '¬ '. This implies that here the limits of formal logic are exceeded, since the difference donor/donee, for example, pertains to the matter of the meaning. And such a difference of roles defines, as we shall see, a stepping stone for the Deleuzian logic of problems.

The key concept, here, is exhumed by Deleuze when, in opposition to the Kolmogorov calculus, he takes up[17] a notion that Leibniz himself had borrowed from 'some logicians of the reformation century': the concept of theme which immediately divides itself in incomplex theme and complex theme according to the distinction between 'ideas or terms' and 'propositions or truths' (Leibniz 1992: IV, i, § 2).

In these Leibnizian terms, an incomplex theme is 'a thing or idea', such as 'in love', and a complex theme is 'a thesis, proposition or truth' such as 'Candide is in love' or 'Candide is in love with Cunegonde'. As it is well known, from a propositional function such as '*x* has a daemon', propositions are obtained by what Frege has described as the saturation of the function, that is, either by the substitution of constants for the variables – as in 'Socrates has a daemon' – or by quantifying on the variables – as in '$\exists x$. *x* has a daemon' ('There is an *x* such that *x* has a daemon'). This means that the conceptual couple incomplex theme/complex theme is the ancestor of the conceptual couple

propositional function/proposition (x is in love/everybody is in love, etc.).

But Deleuze quotes the following lines from Leibniz:

> There are indeed 'themes' which can be said to be midway between an idea and a proposition, namely *questions*. Some of these ask for the Yes or the No, and these are the closest to propositions; but there are others which ask the how and the circumstances, and so on, and more must be added to these if they are to become propositions. (Leibniz 1981: IV, i, § 2)

For example, we have the following procession on a same theme:

[a] — is in love

[b] Is Marcel in love?

[c] Marcel is in love with Albertine.

In this paradigm, [a] is a term, [b] is a question (formulation of a possible problem) and [c] is a proposition. But the procession [a]–[b]–[c] as a whole is on a same theme. From the Deleuzian point of view, this is the fundamental fact of logic. And in the conceptual conflict with Kolmogorov, this is exactly what challenges the isomorphism so well exploited by Kolmogorov, for example between '$p \wedge q$' and '$A \wedge B$'. As its name recalls, iso*morph*ism is identity of form. The thematic identity, on the contrary, is an identity of matter, content or topic. It is an 'iso*hyl*ism' or, better, iso*top*ism.

Let us compare the formulas of the following thematic table:

(1) $1/2 = 3/x$	[1] Pleasure/$x = y/z$
(2) $1/2 = 3/6$	[2] Pleasure/Act = Beauty/Youth in its flower
(3) $x/2 = 3/6$	[3] x/ Act = Beauty/Youth in its flower
(4) $x/y = 3/6$	[4] x/ y = Beauty/Youth in its flower
(5) $x/y = z/6$	[5] $x/y = z$/Youth in its flower
(6) $x/y = z/w$	[6] $x/y = z/w$
(7) 2/y = z/w	[7] Queen/y = z/w
(8) $2/4 = z/w$	[8] Queen/Monarchy = z/w
(9) $2/4 = 5/w$	[9] Queen/Monarchy = President/w
(10) $2/4 = 5/10$	[10] Queen/Monarchy = President/Republic

In this table, we must begin with line 6, where (6) = [6], being a propositional function with four free variables. From this starting point, we can then proceed either downwards or upwards. If we proceed

downwards, along the series from (5) to (10) or [5] to [10], following the method recalled by Deleuze when he says that we arrive at '$f(a)$ for a variable x', we shall obtain finally, by the progressive elimination of all the free variables, a proposition that is true or false such as (10) or [10]: '2/4 equals 5/10' or 'The queen is to a monarchy what the president is to a republic'. This is the logical genesis of propositions by quantification binding the free variables of the propositional function or by substitution of constants for these variables. Here, it is illustrated by the second method, the more fundamental one.

But if we proceed upwards, we penetrate into another territory. First, we must notice that a formula such as (1)

$$1/2 = 3/x$$

is virtually ambiguous. If it is taken in a book of formal logic, it is probably, as (9), a propositional function with one free variable, on a par with the Deleuzian example 'x is human'. If it is taken in a book of mathematics, it is probably a proposition. This proposition may be formulated, as in Kolmogorov, under the form of an imperative:

$$\text{Find one integer } x \text{ such that } 1/2 = 3/x.$$

But it may also take the form of an interrogative proposition:

$$\text{What is the number } x \text{ such that } 1/2 = 3/x?$$

In its two forms, the proposition enunciates a problem by an equation. In a propositional function the variables are dummies disposed of in order to be clothed by constants. In an equation they are the unknown variables, here to be suppressed by their solutions. (By 'virtually ambiguous', we mean that the ambiguity cannot cause any misunderstanding since propositional functions with free variables have no use – but only mentions. Consequently, the amphibology is recommended as an economy!)

The case of '$1/2 = 3/x$' may be generalised. When in our table we proceed from (6) to (3) and (1) or from [6] to [3] and [1], we obtain in each column some examples of (soluble or insoluble) problems. The propositions (2) and [2] contain respectively the solutions of problems (1) and [1]. Therefore, we arrive at the following conclusion: the arity or adinity of propositional functions extends to the problems, taking the form of the number of their unknown variables. In Deleuzian terms, this means that the multiplicity characteristic of the rhemes extends to the problems or, better, that the same multiplicity extends indifferently to propositional functions and to problems. Since problems are naturally

expressed in questions and since the logic of questions is called erotetic logic (from the Greek *erotesis*, questioning) we shall call this thesis of a same arity shared by all themes (in rhemes and problems) the principle of rhema-erotetic arity.

This thesis must be appreciated in its full significance. Formal logic, in its totality, is constituted by the propositional calculus and quantification theory. But since propositions are nothing but saturated propositional functions and since quantification is the binding of variables in propositional functions, the concept of propositional function is the arch-concept of logic in its totality. The fact that the arity of propositional functions exceeds formal logic and qualifies also the problems, therefore, may be said the fundamental fact of logic.

In taking from Spinoza the $1/2 = 3/x$ as paradigm of problems, endorsing the hyphen symbolism of Peircean rhemes and recycling the Leibnizian themes, Deleuze has discovered on the path problem–rheme–theme the principle of rhema-erotetic arity as the thesis of isotopy.

In Kolmogorov's calculus, the only problems at stake are mathematical problems. But, as the thematic table shows, the principle of isotopy is not confined to mathematics. As the example from Aristotle attests, philosophical problems illustrate the same law. The problem [1] may be rephrased more explicitly:

[1bis] Found a good analogy exhibiting the place of pleasure in human life.

In order to reach the full generality of a calculus of problems, how can we neutralise the difference between philosophy and mathematics? Following Coquand in his commentary on Kolmogorov,[18] we shall introduce the conceptual character imagined by Hilbert: **Aristide** = $\tau_x A$. The so-called Aristide is defined by Hilbert in the following way: if A is the predicate 'to be corruptible', then $\tau_x A$ would be a man 'of such absolute integrity that, if he happened to be corruptible, all men in general would be corruptible' (Hilbert [1923] 1996: 1140–1; translation modified). With such a definition, Hilbert's Aristide is obviously an amphibian between mathematics and philosophy.

But in order to reach such a result, and even if, as Kolmogorov, one confines the calculus to mathematics, the fundamental fact of logic itself is not sufficient. Deleuze declares:

> Sense is located in the problem itself. Sense is constituted in the complex theme, but the complex theme is that set of problems and questions in relation to which the propositions serve as elements of response and cases of solution. (Deleuze [1968] 1994: 157)

This thesis precedes the reference to Leibniz[19] which leads us to his division of the concept of theme into complex themes and incomplex themes. As we have seen, in Leibniz, an incomplex theme is for example 'in love' or 'in love with Cunegonde', and a complex theme is, for example, 'Candide is in love' or 'Candide is in love with Cunegonde'. That is, in Leibniz, incomplex themes are terms to be conceived as rhemes or propositional functions, and complex themes are propositions. But when we penetrate into the Deleuzian dialectics, the opposition incomplex/complex acquires an entirely new meaning.

In order to understand the Deleuzian dialectics in its full significance, we have to enlarge our conceptual apparatus and consider at least the following conceptual triplet that we shall call the entire dialectic triad:

$$\begin{array}{c}\text{Problems}\\ \text{Terms} = \text{Rhemes} = \text{Propositional functions}\\ \text{Propositions}\end{array}$$

In the dialectic triad, the layer of rhemes represents the level of incomplex themes. But the main point of Deleuzian dialectics is that, from this layer of incomplexity, two kinds of logical 'complexity' can be reached; two kinds that are not only different but entirely heterogeneous.

There is the well-known complexity of propositions, which qualifies them as complex themes in the Leibnizian sense. This is the 'complexity' obtained by the saturation of rhemes as propositional functions. For example, from the incomplex

$$x/y = z/w$$

there is the increasing complexity of

$$\begin{array}{l}x/y = z/\text{Aristide}\\ \exists x.x/y = z/\text{Aristide}\\ \text{Etc.}\end{array}$$

But there is a quite different complexity in the bargain: the complexity qualifying the problems.

Lautman in Bergsonian territory: incipit Albert Lautman

From here onwards, the Deleuzian doctrine on problems is mainly borrowed from Lautman.[20] In mathematical philosophy, the Lautman posture is an *apax*. On the category of problem, according to Deleuze, Lautman is grasped in a kind of analogy with the doctrine of Bergson on intuition, intelligence and instinct. According to Bergson, between

intelligence and instinct we find the following chiasmatic paradox:

> *Intelligence sets problems of which it has no solution.*
> *Instinct has solutions of problems it has never set.*

The function of intuition follows:

Intuition has the function of giving to the problems of intelligence the ready-made solutions worked out by instinct.

Mathematics is, among others, a case of this Law of Bergson. In mathematics, as in other disciplines, the solutions are the affair of an 'instinct'. And the royal art is the weaving of unforeseeable problems by intelligence. This is the true story of mathematical 'intuition'.

This paradoxical situation is paralleled by the main relation between philosophy and mathematics as it is conceived by Lautman. According to Lautman, philosophy sets latent problems to which it has no solution, and mathematics offers patent solutions of some problems it has never set. The task of 'mathematical philosophy' follows: mathematical philosophy must give to the latent problems of philosophy their patent solutions in mathematics:

> Nowhere better than in the admirable work of Albert Lautman has it been shown how problems are first Platonic Ideas or ideal liaisons between *dialectical* notions, relative to 'eventual situations of the existent'; but also how they are realised within the real relations constitutive of the desired solution within a *mathematical*, *physical* or other field. It is in this sense, according to Lautman, that science always participates in a dialectic which points beyond it – in other words, in a meta-mathematical and extra-propositional power – even though the liaisons of this dialectic are incarnated only in effective scientific propositions and theories. (Deleuze [1968] 1994: 163–4)

The mathematical philosophy of Lautman, itself, is exfoliated on two Platonic plateaus: on a first plateau, Lautman holds that even 'at the mathematical level' there is a real 'drama' which is 'played' in the heights, and that it qualifies as a 'logical drama' (Lautman [2006] 2011: 167, 189). On a second plateau, this logical drama, played at the level of mathematics, is in its turn explained by an even more secret history or action, developing itself 'at the background' of the drama, or, more exactly, above it. This double doctrine is contained in the following lines:

> Mathematics, and above all modern mathematics, algebra, group theory and topology, have thus appeared to us to tell, in addition to the constructions in which the mathematician is interested, another more hidden story made for

> the philosopher. A dialectical action is always at play in the background … (Lautman [2006] 2011: 91)
>
> One may say that distinct mathematical theories participate to a common dialectic which dominates them … participation of mathematics to a higher and more hidden reality which, in my opinion, constitute a real world of ideas. (Lautman, qtd in Cavaillès [1939] 1946: 596, 605; also Cavaillès 1994: 596, 605; my translation)

This action, which is played above the Lautmanian drama, will be called the Lautmanian *gesta*. Corresponding to these two plateaux of Lautman's theory, Deleuzian dialectics will itself develop in a drama crowned by a *gesta*.

The proper complexity of problems, taken in its main lines, is described by Deleuze as follows: 'The complete determination of a problem is inseparable from the existence, the number and the distribution of the determinant points *which precisely provide its conditions* (one singular point gives rise to two condition equations)' (Deleuze [1968] 1994: 163; [1969] 1990: 54).[21] Here we have an ascending dialectic of four floors:

> 4th The singular determinant points giving rise to the equations.
> 3rd The equations of conditions.
> 2nd The conditions of the problem.
> 1st The problem.

In this ascending dialectics, the conditions of a problem and the equation of conditions are borrowed by Deleuze from Carnot (Deleuze [1968] 1994: 175):

> after having introduced these quantities in the calculus in order to facilitate the expression of the conditions of the problem, and having treated them, in the equations which expressed these conditions, as zero by comparison with the proposed quantities, in order to simplify these equations, it suffices to eliminate these same quantities … (Carnot [1881] 1970: 11)

The 'conditions of a problem' are a case of dialectical amphibian. Suppose that the problem is

$$x = 100 - a.$$

Here, a 'condition of the problem' is that $a \leq 100$, *if* we are confined to natural numbers. But if we have at our disposal the algebraic numbers, positive or negative, the 'condition' evaporates. And you know that the same tale may be told for the invention of $\sqrt{2}$, 0, $\sqrt{-1}$, etc. In other words, the whole history of mathematics may be rewritten as

the history of superstitious 'conditions' and their successive dissolutions in the ocean of heroic generalisation. But this positively means that, since the quadrature of the circle, the problems are the erotetic fountain from which the whole stream of mathematics flows with 'the rule and the compass' as paradigm of obsolete 'conditions' for a construction problem.

At the other extreme of the dialectical spectrum, the same 'conditions of a problem' are a matter of algebraic routine in the standard cooking of equations. Here, the paradigm is an interdict in mosaic form: 'Never divide by zero' ('Par zéro jamais ne diviseras!'). If this condition is not fulfilled, this is the problem ('set in equation') which evaporates. But in a descending dialectic, Deleuze relies first on a paradigm borrowed from Lautman, with two illustrations of the determinant points:

> [a] The cases that we are going to envisage[22] are those of the functions admitting 3 singular points: the points 0, 1 and ∞. It can still in effect be obtained by a linear transformation that the singularities are produced at these points here. (Lautman [2006] 2011: 179)

> [b] The points of indetermination[23] where $P = Q = 0$, constitute the singularities of the vector field. (Lautman [2006] 2011: 259)

The main fact here is that the two illustrations lead to the same conclusion on the singular points:

> [a*] the nature of singular points on a domain determines, at each point of the domain of the variable z, the existence of solutions of the proposed equation. (Lautman [2006] 2011: 181)

> [b*] The existence and distribution of singularities are notions relative to the vector field defined by the differential equations. The form of the integral curves is relative to the solutions of this equation. (Lautman [2006] 2011: 259)

So Deleuze can conclude:

> Albert Lautman has clearly indicated this difference in kind between the existence and distribution of singular points which refer to the problem-element, and the specification of these same points which refer to the solution-element. (Deleuze [1968] 1994: 324)

> For example, in the theory of differential equations, the existence and distribution of singularities are relative to a problematic field defined by the equation as such. As for the solution, it appears only with the integral curves and the form they take in the vicinity of singularities inside the field of vectors. (Deleuze [1969] 1990: 54)

As for the 'equations of conditions',[24] when the problem is in the differential equation

$$w'' + p_1(z)\,w' + p_2(z)\,w = 0$$

the two alluded 'equations of conditions'[25] are, at the vicinity of the point $z = a$ on the complex plane **C**:

$$w_1 = (z-a)^l_1 P(z-a)$$

and

$$w_2 = (z-a)^l_2 P^*(z-a) + \text{eventually a logarithmic term.}$$

But where is there a 'drama'? This term 'drama', used by Lautman, finds its best ratio in Proclus: 'Proclus defines the problem by means of the events which come to affect a logical subject matter (sections, ablations, adjunctions, etc.)' (Deleuze [1969] 1990: 54). In proper Proclean terms:[26] 'it is in imagination that the constructions, sectionings, superpositions, comparisons, additions and subtractions take place . . .' (Proclus 1970: 64 [78]). But here, the problems whose complexity is exhibited by Lautman are typically equations. This means that we remain in the domain of mathematics. So, we do not see so far how this description could be valid about philosophical problems. In order, then, to reach the level on which the Deleuzian dialectics embraces as well philosophical and mathematical problems, we must move, in its Lautmanian top, from drama to *gesta*.

The Lautmanian Gesta and its Themes

Over and above the Lautmanian dialectical drama, what is the Lautmanian dialectical *gesta* of problems? The kind of themes providing the plots of this *gesta* are described by Lautman in the following terms:

> the materials of which the universe is formed are not so much the atoms and molecules of the physical theory as these great pairs of ideal opposites such as the Same and the Other, the Symmetrical and Dissymmetrical, related to one another according to the laws of a harmonious mixture. (Lautman [2006] 2011: xxviii)

This thesis must be labelled the Lautman Law. The 'great couples of ideal contraries' alluded in the Lautman Law have a celebrated register in a Pythagorean table:

1. Limit & Unlimited
2. Odd & Even

3. One & Many
4. Right & Left
5. Male & Female
6. Rest & Move
7. Straight & Curve
8. Light & Darkness
9. Good & Bad
10. Square & Oblong

Lautman simply adds to this table two homogeneous lines:

11. Same & Other
12. Symmetric & Dissymmetric

Here we understand why the theory of problems which dominates mathematics according to Plato and Lautman is called a dialectic by them. It is a dialectic because it is a doctrine of dualities. But in order to obtain in this dialectic a calculus of problems at the level envisioned by Leibniz, that is a calculus covering not only of mathematical but also of philosophical problems, the 'great couples of ideal contraries' alluded to by Lautman must extend to the whole register that is due to Plato. This list is drawn up in a dialogue between Socrates and Theaetetus:

> **Soc.** To which class, then, do you assign being; for this, more than anything else, belongs to all things? **Theaet.** I assign them to the class of notions which the soul grasps by itself directly. **Soc.** And also same and other [likeness and unlikeness] and identity and difference? **Theaet.** Yes. **Soc.** And how about beautiful and ugly, and good and bad? **Theaet.** I think that these also are among the things the essence of which the soul most certainly views in their relations to one another, reflecting within itself upon the past and present in relation to the future. (Plato 1921: 186ab)

With this ultimate adjunction:

> **Soc.** Is it possible for one to attain 'truth' who cannot even get as far as being? **Theaet.** No. (Plato 1921: 186c, pp. 163–5; translation modified)

This is in advance an inventory of the transcendental terms, enumerating the objects of philosophy. So, with these 'great couples of ideal contraries' enlisted in their complete enumeration, Lautmanian dialectics reaches its top level and the calculus of problems can satisfy the requisites of the Leibnizian programme. Because, from Plato's listing of transcendental terms to a calculus, there is only one step. This can be shown if we realise that Hilbert's Aristide is a kind of Platonic or Lautmanian 'Idea'. Aristide, as we may recall, is 'of such absolute

integrity that, if he happened to be corruptible, all men in general would be corruptible' (Hilbert [1923] 1996: 1140–1; translation modified). Similarly, according to Plato, the Idea of the Good is of such absolute goodness that, if it happened to be bad, all things in general would be bad. Hilbert's Aristide, therefore, is only a personalisation of the Platonic Idea. So, along with Aristotelian or Stoic logic, with its Boolean and Fregean offspring, Hilbert has forged a Platonic logic. And Lautman, with his dialectics, has maximised the efficiency of Hilbert's Aristide.

Consequently, reconsider our paradigm of an amphibian problem:

$$x/y = z/\text{Aristide}.$$

According to Plato's analogy of the line, this paradigm must be vertically restated.[27] In this new manner it takes the following form:

$$\begin{array}{c} \text{Aristide} \\ \text{- - - - - - - - - - -} \\ z \\ = \\ y \\ \text{- - - -} \\ x \end{array}$$

And on this ladder, at its top rung, since Aristide is only a personification of the Platonic Idea, he can be replaced by any analogous term, with its two main species, mathematical and philosophical. In the mathematical realm, a paradigm is already offered by Plato:

$$\begin{array}{c} \text{(4th Elevation at the Square)} \\ \text{- -} \\ \text{3rd Intelligible Square} \\ = \\ \text{2nd Visible Square} \\ \text{- -} \\ \text{1st Shadow of Square Body} \end{array}$$

Here, in mathematics, we follow an ascending dialectics: the stages x, y and z are given, and the problem is to find the 'fourth proportional' $= Power2 = (\,)^2$. In the philosophical realm, this is the other way round: in the whole vertical procession, Aristide is given at the top level, and the xyz series follows by measured participation to the Idea, in a triad of

hypostases. For example, if Aristide = the Other:

$$\frac{\text{Other}}{x = y}$$
$$z$$

So that, in its Lautmanian empyrean, the calculus of problems permits the deduction of the Platonic dialectics with its two inverse moves of ascending and descending dialectics. Accordingly, the metaphysical calculus of problems in its full development may be exposed in the following Lautmanian table:

	Lautman	Spinoza	Hilbert in Plato	Deleuze
Invisible	*Dialectics*	*x*	Aristide	**Same and Other**
Invisible	Mathematics	3	*a*	*Mathematics*
Visible	Natural philosophy	2	*b*	*Natural philosophy*
Visible	Physics	1	*c*	*Physics*

In this table, the essential fact to be read and emphasised is the difference between the three first columns and the fourth. In the Lautman column, physics, natural philosophy, and mathematics are *given*; the problem, situated at the level of dialectics, is the determination, as 'fourth proportional', of the 'X' which qualifies as the object of dialectics. In the Spinoza column, the *x* is the algebraic unknown variable to be found. In the Hilbert and Plato column, Aristide himself, after all, is only a dummy for Göttingen geometers. But in the Deleuzian column, all this indetermination is suppressed. With the Same and the Other (or similar transcendental terms), the Lautmanian dialectics receives its adequate Object, qualifying it as a philosophical calculus (philosophical, since Aristide becomes a transcendental term; and calculus since the entire column retains the algebraic form of its Spinoza counterpart). And all this means that the entire table functions as a mathematical proportion, where the fourth column is the solution, obtained as 'fourth proportional': QED.

IV. Conclusion

On the problem predicament, the Kolmogorov calculus of problems was received by Deleuze as the summit of mathematical intuitionism and as a challenge to the Leibnizian *Calculemus* in philosophy. The challenge is taken up at least in two results:

1. The thesis of isotopy disclosing the procession of a same theme in the Peircean rhemes and the Leibnizian problems.
2. The deduction of a Lautmanian dialectics where the Hilbertian Aristide is the variable whose values are the transcendental terms defining the objects of philosophy.

On the level of transdisciplinarity *qua* transdisciplinarity, this double result has a huge significance. Since the objects of philosophy are the transcendental terms (*esse*, *unum*, *verum*, *bonum* and *pulchrum*), philosophy transcends all categories, which are the top of all *generality*. And since the territory of all theoretical sciences is generality, philosophy transcends the whole territory of theoretical science. So, philosophy is 'transdisciplinary' by itself. But in the territory of science, mathematics is the top of apodicticity. Hence the Leibnizian programme of the *Calculemus*: to transport into philosophy the apodicticity of mathematics. In solving the proportional problem exposed in the Lautmanian table, Deleuze has accomplished the decisive step in this transfer.

Notes

1. Special acknowledgements are due to Marjorie Gracieuse, Chryssa Sdrolia and Masa Kosugi for their kind invitation to the Deleuzian symposium where this talk took place, for their generous and invaluable help, as well as for the logistics of our agapistic meeting and the sophisticated predicaments and intellectual delicacies, which make its growing attractiveness and spell.
2. Chryssa Sdrolia saw immediately that the oral version of my paper was better than the original written version. The following text is revised according to this trusty verdict.
3. In this paper, we will follow the alternate spelling 'Kolmogorov'.
4. With the exception of Carl Posy (2005) 'Intuitionism and Philosophy', in Stewart Shapiro (ed.), *The Oxford Handbook of Philosophy of Mathematics and Logic*, Oxford: Oxford University Press, but for very different reasons.
5. When Deleuze wrote that sentence, the unique source he referred to on the calculus of Kolmogorov was a Note by Paulette Destouches-Février to the French Academy of Sciences, 'Rapports entre le calcul des problèmes et le calcul des propositions', published in 1945.
6. 'Quo facto, quando orientur controversiae, non magis disputatione opus erit inter duos philosophos, quam inter duos Computistas. Sufficiet enim calamos

in manus sumere sedereque ad abacos, et sibi mutuo (accito si placet amico) dicere: Calculemus' (Leibniz [1687] 1978 '*Scientia Generalis, Characteristica*'; my translation).

7. From a genetic point of view, we must recall that *Difference and Repetition* was in Deleuze's PhD the 'thèse principale' and that its initial subject was the 'idea of problem' (Dosse [2007] 2010: 116–17).
8. *Différence & Répétition*, p. 204; (translation slightly modified).
9. He stipulates that 'the use of the word *problematics* as a substantive' is 'an indispensable neologism' (Deleuze [1968] 1994: 323).
10. As Coquand says: 'The solution of the problem B must be reduced to the solution of the problem $A \wedge (A \to B)$. So, suppose a solution of this problem is given. This means that one has both a solution of problem A, and a solution of problem $A \to B$, i.e. one may reduce the solution of problem B to that of problem A. Hence, as desired, we can solve problem B.

    On the other hand, the principle of excluded middle in the form

    $$A \vee \neg A$$

    can not be justified. Indeed, a solution would be a general method which, given a problem A, would either give a solution or show that a contradiction follows from the assumption that problem A is solvable. As Kolmogorov states, unless one is bold enough to consider oneself omniscient, it must be recognized that there is no solution to this problem' Coquand [2004] 2007: 31–2.

Deleuze's Third Synthesis of Time[1]

Daniela Voss Free University of Berlin

Abstract

Deleuze's theory of time set out in *Difference and Repetition* is a complex structure of three different syntheses of time – the passive synthesis of the living present, the passive synthesis of the pure past and the static synthesis of the future. This article focuses on Deleuze's third synthesis of time, which seems to be the most obscure part of his tripartite theory, as Deleuze mixes different theoretical concepts drawn from philosophy, Greek drama theory and mathematics. Of central importance is the notion of the cut, which is constitutive of the third synthesis of time defined as an a priori ordered temporal series separated unequally into a before and an after. This article argues that Deleuze develops his *ordinal* definition of time with recourse to Kant's definition of time as pure and empty form, Hölderlin's notion of 'caesura' drawn from his 'Remarks on *Oedipus*' (1803) and Dedekind's method of cuts as developed in his pioneering essay 'Continuity and Irrational Numbers' (1872). Deleuze then ties together the conceptions of the Kantian empty form of time and the Nietzschean eternal return, both of which are essentially related to a fractured I or dissolved self. This article aims to assemble the different heterogeneous elements that Deleuze picks up on and to show how the third synthesis of time emerges from this differential multiplicity.

Keywords: synthesis of time, Kant, Hölderlin, Dedekind, eternal return

I. Kant's Definition of Time

In his 1978 lecture series on Kantian philosophy, Deleuze states what seemed to be most essential to him: 'all of the creations and novelties

Deleuze Studies 7.2 (2013): 194–216
DOI: 10.3366/dls.2013.0102

www.euppublishing.com/dls

that Kantianism will bring to philosophy turn on a certain problem of time and an entirely new conception of time' (Deleuze 1978a: 1). According to Deleuze, Kant's greatest achievement is the radical reversal of previous cosmological and psychological conceptions of time. With Kant, time is no longer subordinated to the measure of movements in nature (such as the movement of celestial bodies in their orbits), nor can it be defined by the simple succession of psychological states. Instead, Kant defines time as a 'form of interiority', a pure and empty form, in which all change of appearances is to be thought, but which does not change itself. In Deleuze's words, time loses its modal character and ceases to be cyclical. It becomes a pure straight line that cleaves the subject into two unequal halves: the empirico-transcendental doublet. Referring to these novelties that Kantianism brings to the philosophy of time, Deleuze chooses two poetic formulas: (1) 'The time is out of joint', uttered by Hamlet in Shakespeare's tragedy *Hamlet, Prince of Denmark*, and (2) 'I is an Other' from the French poet Rimbaud.[2] In what way do these poetic formulas apply to Kant's theory of time?

(1) Hamlet's utterance 'The time is out of joint' refers to a particular time, that is, the time through which he is living. However, in the way that Deleuze uses the formula it has a much wider, metaphysical import: 'Time out of joint' now means that time has become 'demented time' (*temps affolé*), it has lost its balance, its groundedness, its stability, which it still possessed in ancient Greek cosmology. According to Plato, time presented a 'moving image of eternity' (Plato 1997: 37d), which moved according to number. For both Plato and Aristotle, time was defined as a 'number of movement', counted by the celestial revolution of planets passing through certain 'cardinal points'. The uniform and circular motion of planets provided a means to mark off regular periods of time. Consequently, time was thought of as cyclical and inseparable from the movement of physical bodies. As Aristotle put it: 'time is a number of movement – but there is no movement without physical body' (Aristotle 1995: 279a15). This is why Deleuze attributes to the ancient Greeks a concept of time which 'is a mode and not a being. No more than number is a being, it's a mode in relation to what it quantifies, in the same way time is a mode in relation to what it measures' (Deleuze 1978b: 2). According to Deleuze, time loses its modal character and ceases to be circular only subsequent to the establishment of modern science in the sixteenth and seventeenth centuries (in particular, in the scientific cosmology of Newton). With Kant finally, time becomes purely formal, it has unrolled itself into a pure 'straight line'. As we will see, the consequences of this new Kantian definition of time are tremendous: the

ancient cosmological harmony between the world and the heavens, man and the heavenly gods has broken down. Time has ceased to be an image of the eternal order. It has shaken off its subordination to the periodical movements of planets. It is as though Timaeus's prediction has become true: 'Be that as it may, Time came into being together with the Heaven, in order that, as they were brought into being together, so they may be dissolved together, if ever their dissolution should come to pass' (Plato 1997: 38b). The time of antiquity has perished together with the gods and the heavens, and a new time is born. Pure and empty time is now the true subjectivity. It has become an infinite, straight line, which cuts right through the consciousness of the modern subject.

(2) Deleuze expresses this fracture of the modern subject with Rimbaud's formula 'I is an Other'. This is then the second novelty that Kant brings to philosophy by uncovering 'that schizophrenia in principle' (Deleuze 1994: 58). By defining time as a form of interiority, Kant introduces a fundamental split in the subject. The Kantian subject is torn between the form of spontaneity, that is, the 'I think' which accompanies all concept production and guarantees the unity of synthesis, and the empirical self which experiences the effects of thought rather than initiating the act of thought itself. According to Deleuze, Rimbaud's formula 'I is an Other' is apt to express the alienation to which the Kantian subject succumbs. It should be noted, however, that Rimbaud's phrase occurs in a rather different context. Rimbaud understands the formula 'I is an Other' in the light of Aristotle's distinction between determining form and indeterminate matter. This becomes evident, when Rimbaud says: 'Too bad for the wood which finds itself a violin! If the copper wakes up a bugle, that is not its fault' (Deleuze 1984: ix).[3] By means of the formula 'I is an Other', Rimbaud expresses the experience of being formed by thought rather than being the originator. Thought forms me – I am not the master of thought at all.

With Kant, however, the concern is no longer of a form that informs matter but – in Deleuze's words – of 'an infinite modulation, no longer a mould' (Deleuze 1984: ix). *Thought works within me*. I am affected by thought that is both mine and the thought of an Other. The fracture or crack in the 'I' is produced by the pure and empty form of time. This means that I experience myself, that is, my feelings, thoughts, actions and bodily sensations, always under the condition of time, which is the interior form of receptivity. But the synthesis of all these different representations within the unity of consciousness is performed by the transcendental I, or the 'I think' as the transcendental form of apperception. Phrased more precisely, the I affects itself under the

form of time. The remarkable outcome of this kind of auto-affection is that the difference between being and thought, or matter and form, is *interiorised*. Deleuze refers to this establishment of internal difference as the moment of 'discovery of the transcendental, the element of the Copernican Revolution' (Deleuze 1994: 86). Thus, for Deleuze, the transcendental difference that Kant discovers is necessarily linked to his definition of time as form of interiority or form of auto-affection which splits the subject into two unequal halves: the empirico-transcendental doublet.

II. Hölderlin's Caesura

Certainly, Deleuze does not simply adopt the Kantian empirico-transcendental doublet with its distinctive distribution of active synthesis and passive receptivity without synthesis. What he takes up instead is the idea of an internal difference or fracture in the subject, which occurs through the disruptive introduction of a caesura or cut. Deleuze's account of the third synthesis of time deviates from the Kantian definition of time as an a priori given, infertile subjective form. Instead, Deleuze conceives of time as a productive power of synthesis – in his words, a 'static synthesis' which is constituted by a 'caesura' or cut. He finds the notion of the 'caesura' in Greek drama theory, more concretely, in Hölderlin's 'Remarks on *Oedipus*'.

Hölderlin interprets Sophocles's *Oedipus Rex* as the undoing of the coupling between man and god: man and god have become 'an unlimited One', which, however, can be 'purified' only through an 'unlimited separation' (Hölderlin 1969: 736). Deleuze describes this unlimited separation as a double deviation: 'God turns away from man who turns away from God' (Deleuze 1978b: 4). While in the tragedies of Aeschylus or Euripides the gods still ensured justice, they punished and pardoned according to their judgement, Sophocles's tragedy marks a significant change. The bond between man and the gods has broken. The gods abandon Oedipus in the critical moment of his suffering, and Oedipus rages against the divine betrayal, searching desperately for who he is and trying to recover his identity. Hölderlin describes the moment as follows:

> In the utmost form of suffering . . . there exists nothing but the conditions of time and space. Inside it, man forgets himself because he exists entirely for the moment, the god [forgets himself] because he is nothing but time; and either one is unfaithful, time, because it is reversed categorically at such a moment, and beginning and end no longer rhyme; man because at this moment of

> categorical reversal he has to follow and thus can no longer resemble the beginning in what follows. (Hölderlin 1969: 736)

Oedipus is left with the pure form of time, which is emptied of all meaningful content and announces neither punishment nor relief from the interminable, incessant suffering. As Hölderlin says, time is reversed categorically: it no longer forms a cycle in which beginning and end rhyme – as it was still the case in the tragedies of Aeschylus and Euripides, when the unity of the cosmos was intact, and when the divine law revealed itself in the order of the universe, the course of nature and human fate. Now, the cycle of time has unrolled itself and become a straight line, the tortuous, indivisible and incessant labyrinth that Deleuze finds in Borges (Deleuze 1984: vii, 1978b: 2).[4] It is the straight line that Oedipus wanders in his long and lonesome wandering through the desert with no aim and no end in sight. As Hölderlin says in very Kantian terms, 'there exists nothing but the conditions of time and space' (Hölderlin 1969: 736).[5]

Moreover, when Oedipus's crime is finally discovered, that is, when the blind seer Tiresias reveals to Oedipus that he had killed his own father Laius and married his own mother Jocasta of Thebes, Oedipus can no longer resemble what he has been before. Tiresias's intervention has put before Oedipus the thought that he may not be the son of King Polybus of Corinth and his wife Merope who raised him. This is a thought which is almost impossible to think. All of the personal memories in which Oedipus has believed so far, together with his future expectations are eliminated, destroyed at a single blow. In fact, the caesura is not only a break in time, but also a split of Oedipus's self. Oedipus is other to himself. He experiences this internal difference in the pure present, the 'pureness' of which signifies that it occurs like a cut. The series of former presents do not converge with this present moment.

We thus have an order of time, determined by the caesura which draws together a before and an after and thereby the totality of time. It is of little importance when the caesura, that is, the exact moment of the fracture of the self, happens in empirical time. It can be at the moment of Tiresias's revelation or a little later after Oedipus's further inquiries. Or a crack might have appeared when Oedipus committed the crime of killing his father and then marrying his mother. To complicate things further, maybe an invisible crack already became manifest when the infant Oedipus was saved from death against the will of his father and in defiance of the gods' oracle. The empirical incarnation does not count: the caesura or cut refers to a symbolic event, which determines

the order of time a priori. Thus, the past is the time before the caesura; the pure present is the becoming equal to the event and the experience of internal difference; the future finally is the time after the caesura.

III. Dedekind's Method of Cuts

As we have seen, Deleuze's third synthesis of time has to be understood as an *a priori ordered series* that is produced by a caesura. The caesura is the formal element which distributes on both sides the before and the after which no longer rhyme together. Deleuze insists that

> the future and the past here are not empirical and dynamic determinations of time: they are formal and fixed characteristics which follow *a priori* from the order of time, as though they comprised a static synthesis of time. The synthesis is necessarily static, since time is no longer subordinated to movement; time is the most radical form of change, but the form of change does not change. (Deleuze 1994: 89)

The idea of the form of time, which does not change itself, is clearly a Kantian thought. Repeatedly, Kant says in the *Critique of Pure Reason* that 'time itself does not alter, but only something that is within time' (Kant 1998: A41/B58).[6] But is it true that Deleuze still adheres to the traditional philosophical conception of form? Deleuze's remarks on a 'static synthesis' should make us suspect that Deleuze is not simply repeating Kant's theory here. Equally, the idea of a 'caesura', which constitutes a serial and linear time by distributing a before and an after, indicates a source other than Kant. For sure, Deleuze deduces the term 'caesura' first and foremost from Greek drama theory, but in his lecture course on Kant of 21 March 1978, he does not hesitate to compare it to the mathematical terms 'limit' and 'cut' (*coupure*).[7] Moreover, the word 'caesura' derives from the Latin root '*caes*' and can thus be rendered as 'cut'.[8] For these reasons, we suggest that the 'caesura' can be understood by means of the concept of 'cut' in Dedekind's theory of real numbers, which Deleuze discusses in Chapter 4 of *Difference and Repetition* in the context of the continuousness of Ideas (Deleuze 1994: 172).

The mathematician Richard Dedekind (1831–1916) is famous for giving a rigorous arithmetical foundation to differential calculus, and thereby expunging from calculus geometric undefined concepts such as 'infinitesimal' quantities and the limit concept involving the idea of *approaching*. Deleuze acknowledges his achievements, in particular the renewed conception of limit: 'the limit no longer presupposes the ideas of a continuous variable and infinite approximation. On the contrary,

the notion of limit grounds a new, static and purely ideal definition of continuity' (Deleuze 1994: 172). Indeed, it can be argued that Dedekind invents this new 'static and purely ideal' conception of continuity. His thoughts on continuity were first published in the groundbreaking essay 'Continuity and Irrational Numbers' in 1872, fourteen years after he developed the basic ideas on which it relies. The main question the essay deals with is: what is the nature of continuity? As Dedekind states:

> an explanation of this continuity is nowhere given; even the most rigorous expositions of the differential calculus do not base their proofs upon continuity but ... they either appeal to geometric notions or those suggested by geometry, or depend upon theorems which are never established in a purely arithmetic manner. (Dedekind 1901a: 2)

That is, the notion of continuity was either geometrically explained as a vague hang-togetherness, an 'unbroken connection in the smallest parts' (Dedekind 1901a: 10–11) or was based on insufficiently founded theorems, such as that every magnitude which grows continually, but not beyond all limits, must certainly approach a limiting value. Dedekind set himself the task of securing a real definition of the essence of continuity. He first approached the problem by trying to 'map' the geometrical continuum (the straight line) onto ordered systems of discrete quantities (numbers). Comparing the system of rational numbers with the points of the straight line, he saw that they cannot be put into a one-to-one-correspondence with each other: although each rational number can be correlated with a point on the line, not every point of the line can be expressed as a rational number. In fact, in the straight line there are infinitely many points which correspond to no rational number. To identify these points, which are inexpressible as rational numbers, Dedekind used a method of division: the Dedekind 'cuts' (*Schnitte*). Any cut divides the points of the line into two classes, such that all the points of one class are always to the left of all the points of the other. Furthermore, there is precisely one and only one point determined by this cut. The cut can correspond to a rational number, or else designate a 'gap' between the rational numbers, that is, an irrational quantity (such as $\sqrt{2}$). In the latter case, cuts define a new type of number, that is, the irrational numbers.

Dedekind first made use of geometrical considerations in order to introduce the notion of the cut. However, he sought to define cuts directly in terms of the number system, so that any reflections on geometric lines can be put aside. As Robert Bunn says:

> Geometry was to serve only as the source of the idea for constructing an arithmetical foundation. The continuous system which was to be Dedekind's foundation would be arithmetical in the sense that its operations would ultimately be defined in terms of operations on natural numbers, and no mention would be made of any geometrical objects. (Bunn 1980: 223)

Dedekind demanded that the system of rational numbers be improved by 'the creation of new numbers such that the domain of numbers shall gain the same completeness, or as we may say at once, the same *continuity*, as the straight line' (Dedekind 1901a: 9). As it is, the system of rational numbers is marked by a certain incompleteness or discontinuity, due to the existence of gaps. Thus, in order to render the domain of rational numbers into a continuous system, Dedekind defined for each cut that is not produced by a rational number a 'new object', which he called an irrational number. For example, $\sqrt{2}$ can be defined as the cut between two classes, A and B, where A contains all those numbers whose squares are less than two and B those whose squares are greater than two.

It should be noted that Dedekind did not identify irrational numbers with cuts, since every definite cut produces either a definite rational or irrational number. Rather, Dedekind cuts constitute 'the next genus of numbers' (Deleuze 1994: 172), namely 'real numbers'. The order of real numbers allows the treatment of both rational and irrational numbers as elements in an encompassing number system, which forms a continuous and ordered system. It has to be emphasised that this continuity of the number system is something quite different from the traditional conception of continuity founded on the intuition of the way in which geometric quantities arise: according to an intuitive conception of continuity, a line is considered continuous insofar as it arises from the continuous movement of a point, and a plane from the movement of a line. By contrast, Dedekind's new conception of continuity claims not to rely on intuition, or any considerations of smooth movement. It claims to contain nothing empirical, since it can be deduced from number systems alone. For Dedekind, 'numbers are free creations of the human mind' (Dedekind 1901b: 31). As he explained in his 1888 essay 'The Nature and Meaning of Numbers' (*Was sind und was sollen die Zahlen?*):

> In speaking of arithmetic (algebra, analysis) as a part of logic I mean to imply that I consider the number-concept entirely independent of the notions or intuitions of space and time, that I consider it an immediate result from the laws of thought. (Dedekind 1901b: 31)

Accordingly, Dedekind's project of arithmetising the conception of continuity was not to be grounded on vague, geometrical intuitions of

space and time but rather on an Idea of reason: the Idea of an infinite, ordered and dense set of numbers each of which can in principle be identified by a Dedekind cut.[9] In fact, Dedekind's 'continuity' can better be described as the property of the 'completeness' that characterises certain densely ordered number systems. As Robert Bunn puts it:

> a densely ordered system is *complete* (*continuous*) in Dedekind's sense if every cut in the system is produced by exactly one element of the system, that is, if there is an element of the system which is either the maximum of the lower section or the minimum of the upper section. (Bunn 1980: 222)

Bunn concludes that 'the term "continuous" is not an especially apt one for the characteristic involved, but it indicated the correlate in the old system – continuous magnitude' (Bunn 1980: 222). Carl Boyer, a historian of mathematics, explains that the notion of continuity 'specifies only *an infinite, discrete multiplicity of elements*, satisfying certain conditions – that the set be ordered, dense, and perfect' (Boyer 1949: 294; emphasis added), whereby the mathematical term 'perfect' is synonymous with the term 'complete', which are both translations of the German term '*vollkommen*'. Boyer further argues that there is 'nothing dynamic in the idea of continuity' (Boyer 1949: 294).

However, it is not altogether clear whether Dedekind really succeeded in giving a purely ideal, arithmetic definition of continuity. In fact, he is criticised by Russell and Wittgenstein for failing to get away from the geometrical image of the number line.[10] Russell argues that Dedekind's method of dividing all the terms of a series into two classes, one greater than the cut and one less than the cut, proves problematic in the case where the point of section is supposed to represent an irrational. In this case, the two classes of either side of the cut have no limit or last term. For instance, in the case of the irrational section at $\sqrt{2}$, 'there is no maximum to the ratios whose square is less than 2, and no minimum to those whose square is greater than 2.... Between these two classes, where $\sqrt{2}$ ought to be, there is nothing' (Russell 1919: 68). Thus, a 'gap' appears at the point of section where the irrational is supposed to be. According to Russell, the spatial image of a line and the unsettling idea of a gap led people to postulate that there must be some limit:

> From the habit of being influenced by spatial imagination, people have supposed that series *must* have limits in cases where it seems odd if they do not. Thus, perceiving that there was no rational limit to the ratios whose square is less than 2, they allowed themselves to 'postulate' an *irrational* limit, which was to fill the Dedekind gap. Dedekind, in the above-mentioned work ['Continuity and Irrational Numbers'], set up the axiom that the gap

> must always be filled, *i.e.* that every section must have a boundary. (Russell 1919: 71)

Russell condemns this method of 'postulating' and aims to give a precise definition of real numbers by a method of 'construction' (Russell 1919: 73). That is, he abandons the idea of points of space or extension and substitutes for them the logical construction of 'segments'. He finds that 'segments of rational numbers... fulfil all the requirements laid down in Cantor's definition, and also those derived from the principle of abstraction. Hence there is no logical ground for distinguishing segments of rationals from real numbers' (Russell 1937: § 270).[11]

Wittgenstein joins Russell in his criticism of Dedekind's method of cuts, although he does not follow Russell's set-theoretical solution. According to Wittgenstein, the major error that Dedekind committed was using the concept of cut – a concept which is '*taken over from the everyday use of language* and that is why it immediately looks as it if had to have a meaning for numbers too' (Wittgenstein 1956: 150; original emphasis). The verb 'cutting' is commonly used to refer to an activity that divides a spatially extended object into parts. The cutting of a number line is supposed to work analogously: the division produced is seen 'under the aspect of a cut made somewhere along the straight line, *hence extensionally*' (149; original emphasis). 'The cut is an extensional *image*' (150; original emphasis). For Wittgenstein, the idea of a cut is 'a dangerous illustration' and yields only an 'imaginary', a 'fanciful application' (148). However, Wittgenstein admits that in a way we can attach a meaning to the expression that every rational number is a principle of division of the rational numbers (149), but this is not so in the case of irrationals, which are not even defined as numbers yet. From the erroneous image of a number line the idea ensues that irrationals can be represented as points on the line just like the rationals, and that both are elements of an encompassing number system, the real numbers. 'The misleading thing about Dedekind's conception', Wittgenstein says, 'is the idea that the real numbers are there spread out in the number line' (151). 'The picture of the number line is an absolutely natural one up to a certain point; that is to say so long as it is not used for a general theory of real numbers' (148). Wittgenstein faults Dedekind for his general way of talking, which, although it might prove useful, implies 'the danger... that one will think one is in possession of the complete explanation of the individual cases' (153). Thus, we are led to believe that 'the *general* account could be quite understood even without examples, without a thought of intensions (in the plural), since really

everything could be managed extensionally' (153; original emphasis). The problem with irrationals surely is that no example of an irrational number could really be given. The ancient Pythagorean example of the square root of two again relies on a geometrical illustration, namely the square's diagonal, which proves incommensurable with the square's sides whose lengths measure one unit. Within this geometrical image, the square root of two can be represented by the intersection of a circular arc (generated by taking the diagonal as the radius of a circle) and the straight line extending from the square's base. However, by what right can we say that this intersection identifies a point and defines a number? As Wittgenstein hypothetically suggests: 'For, if I were to construct really accurately, then the circle would have to cut the straight line *between* its points', and he continues: 'This is a frightfully confusing picture' (151; original emphasis). We almost feel forced to assign to the irrational a point on the line, because we are in the grip of a picture (the picture of a continuous straight line consisting of points). However, why can we not define the irrational as a number? The expression $\sqrt{2}$ certainly seems to indicate a number, yet what it does is simply to provide a rule for generating an indefinitely expanding decimal fraction. For Wittgenstein, irrationals are rules or laws; they do not indicate some Platonic arithmetical entity, a perfectly definite number, but rather 'the unlimited technique of expansion of series' (144).

As we have seen, both Russell and Wittgenstein doubt that Dedekind managed to escape the geometric image of the number line in his attempt to provide a purely arithmetic definition of irrationals. Let us now bring Deleuze into the discussion. It seems that Deleuze does not have qualms about Dedekind's method of cuts and definition of continuity. Indeed, he says that we gain 'a new, static and purely ideal definition of continuity' (Deleuze 1994: 172), which is grounded on the Dedekind cut, inasmuch as it constitutes this new continuous and ordered system of real numbers. Deleuze also calls the Dedekind cut the 'ideal cause of continuity' (Deleuze 1994: 172). Now the question to ask is: in what way can Deleuze benefit from Dedekind's theory of cuts and the notion of continuity that designates not a 'vague hang-togetherness' but rather an infinite, discrete multiplicity of elements whose order is a priori determined? Deleuze uses Dedekind's ideas in order to construct a time that is not empirically defined through our intuition of a dynamic flux of events, but one that is determined a priori and designates a *static state of affairs*. This latter time is a 'static synthesis' of discrete elements (past and future moments), which are distributed by the caesura, that is, 'a genuine cut (*coupure*)' (Deleuze 1994: 172), into a before and an after.

The caesura or cut is constitutive of this continuous ordered system of time, which maps onto the straight line. Thus, Deleuze transforms the Kantian definition of a purely formal time by means of mathematical considerations on the notion of 'cut' and 'static synthesis'. For Deleuze, the third synthesis of time is not simply an a priori subjective form, but an a priori and a-subjective static synthesis of a multiplicity of temporal series.

However, Deleuze's account of a serial and linear time is not as straightforward as we have presented it above. Deleuze does indeed make use of the Dedekind cut and the idea that it constitutes a static continuum, yet he takes licence in modifying Dedekind in a way that is not Dedekindian at all. The way that Deleuze conceives the series of time rather incorporates the idea of the irrational cut designating a 'gap'.[12] In *Difference and Repetition*, Deleuze says that 'the irrational numbers... differ in kind from the terms of the series of rational numbers' (Deleuze 1994: 172). They are 'constructed on the basis of an essential inequality' in relation to the next-lowest type of numbers, that is, the rational numbers. That is to say, they express the 'impossibility of determining a common aliquot part for two quantities, and thus the impossibility of reducing their relation to even a fractional number' (232). However, they compensate for their characteristic inequality by their 'limit-equality indicated by a convergent series of rational numbers' (232).[13] Now the interesting move by Deleuze is to ascribe an original intensive nature to irrationals, an implication of difference or inequality, which is cancelled or covered over as soon as they are constructed as elements of an extensive plane of rational numbers. In fact, Deleuze holds that an intensive nature belongs to every type of number, insofar as they are not explicated, developed and equalised in an extensity:

> Every number is originally intensive and vectorial in so far as it implies a difference of quantity which cannot properly be cancelled, but extensive and scalar in so far as it cancels this difference on another plane that it creates and on which it is explicated. (Deleuze 1994: 232)

Deleuze's claim that irrationals have a certain intensive depth, an inequality or implicated difference, which is cancelled in the general definition of a continuum of real numbers, seems to resonate with Wittgenstein's remark: 'The extensional definitions of functions, real numbers etc. pass over – although they presuppose – everything intensional, and refer to the ever-recurring outward form' (Wittgenstein 1956: 150). However, while Wittgenstein seems to understand the

'intensional' nature rather in terms of a rule or law, Deleuze speaks of 'intensity' and its differential nature.[14]

Deleuze's reflections on the nature of irrationals show that he also regards the number line as a fiction, a spatial image, which covers over an intensive depth. The straight line of rational points is but 'a false infinity, a simple undefinite that includes an infinity of lacunae; that is why the continuous is a labyrinth that cannot be represented by a straight line' (Deleuze 1993: 17). We have already come across Borges's labyrinth of the straight line. Thus, it seems that Deleuze, when he speaks of a line of time, does not mean a simple straight line, but one that is perforated by lacunae.[15] These lacunae or gaps are precisely designated by the irrational cut, that is, the interstice between series of rational numbers. They symbolise the irruption of the virtual event within the empirical continuum of space and the chronological succession of instants.

In order to better understand the impact of the cut, that is, the irruption of the virtual event on the subject, we have to turn to Nietzsche. As will become clear, all threads come together with Nietzsche's eternal return.[16] In Deleuze's reading, the eternal return is a *series of time*, constituted by an irrational cut, 'which brings together the before and the after in a becoming' (Deleuze 1989: 155). This irrational cut or caesura produces a split subject and brings it into contact with an outside, the realm of virtual events. In fact, in *Cinema 2*, Deleuze explicitly connects the concept of the irrational cut with Nietzsche's conception of time in his definition of the third time-image:

> This time-image puts thought into contact with an unthought, the unsummonable, the inexplicable, the undecidable, the incommensurable. The outside or the obverse of the images has replaced the whole, at the same time as the interstice or the cut has replaced association. (Deleuze 1989: 214)[17]

IV. Nietzsche's Eternal Return

The cut or caesura of serial time has a detrimental impact on the subject. We have already seen that Deleuze's third synthesis of time is profoundly linked to the notion of a fractured I, be it Kant's empirico-transcendental doublet or Oedipus's dissolved self, as developed in Hölderlin. Now Deleuze turns to Nietzsche, who will be the last and most important philosopher in this Deleuzian line-up of great thinkers. Nietzsche's eternal return will be defined as a series of time, which is cut by a unique and tremendous event, namely 'the death of God [that] becomes effective only with the dissolution of the Self' (Deleuze

1994: 58). However, as will become clear, the eternal return does not only have a destructive and lethal impact, rather it manifests a positive and productive power. It carries the ungrounded and abandoned subject to a point of metamorphosis, when all its possibilities of becoming are set free. It liberates the subject not only from the rule of identity and law, but also from the form of the true and thus bestows it with the power of the false and its artistic, creative potential. As we will see in this section, the dissolved self becomes Nietzsche's aesthetic concept of the overman, who is capable of affirming difference and becoming.

It should be noted that Nietzsche never fully laid out his thought of the eternal return in his writings and that the existing interpretations in secondary literature vary to a great extent. What interests us here is solely Deleuze's reconstruction of the eternal return, which is considerably influenced, as we will see, by Pierre Klossowski's reading of Nietzsche.[18]

According to Deleuze, the thought of the eternal return is not to be understood as a return of the Same or the Similar. Rather, what passes the test of the eternal return is that which differs internally, simulacra or the dissolved self. The eternal return has to be seen as a test of selection, which banishes identity, that is, the identity of God, the identity of the world or the represented object, and the coherence of the self. Thus, the landscape of the eternal return is that of difference-in-itself, the irreducibly unequal, of metamorphosis or becoming. In Deleuze's words:

> Essentially, the unequal, the different is the true rationale for the eternal return. It is because nothing is equal, or the same, that 'it' comes back. In other words, the eternal return is predicated only of becoming and the multiple. It is the law of a world without being, without unity, without identity. (Deleuze 2004: 124)

Therefore, in a first move, it is important to distinguish Nietzsche's eternal return from the conception of a 'return of the Same and the Similar' which is the essence of a cyclical conception of time. Thus, the ancient Greeks presupposed an identity or resemblance in general of all the instances that are supposed to recur. They regarded the recurrence of planetary motion, the uniform change of seasons and qualitative changes in things as laws of nature. According to Deleuze, Nietzsche's thought of the eternal return cannot be presented as a natural law and identified with the ancient Greek hypothesis of cyclical time.[19] First, he argues that as a connoisseur of the Greeks, Nietzsche could not have been ignorant of the Greek hypothesis of time as a cycle. Thus, when Nietzsche insists that his thought of the eternal return is something effectively *new*, we

have to take him seriously. Furthermore, Nietzsche is a thinker who is very much opposed to the notion of law. He would not have submitted to the simple notion of a law of nature. As textual evidence, one can adduce two passages in *Zarathustra*, where Nietzsche explicitly rejects the interpretation of the eternal return as cyclical time: (1) during the encounter between Zarathustra and the dwarf, the dwarf says, 'All truth is crooked; time itself is a circle', whereupon Zarathustra replies, 'Thou spirit of gravity! . . . do not take it too lightly' (Nietzsche 1936: 167); (2) on another occasion, Zarathustra rebukes his animals that they have already made a 'refrain' out of his doctrine of the eternal return. In a refrain, the same always returns, but apparently Zarathustra does not want the eternal return be understood as a refrain (see Nietzsche 1936: 234).

In what way, then, is the eternal return different from a natural cycle, a cycle of time? The crucial issue is that the eternal return is *selective* and *creative*. It is selective with regard to desires or thought and with regard to being. Let us first consider its mechanism of selection with regard to desires. If the doctrine of the eternal return is stated in terms of an ethical rule, it becomes a sort of Kantian imperative: 'Whatever you will, you have to will it in such a way that you will its eternal return.' That which is expelled by the selection test of the eternal return is all instances of willing that want a thing only for once: 'only this one time'. In an unpublished note contemporaneous with *The Gay Science*, Nietzsche says that it does not matter whether the act I am about to perform is informed by ambition, or laziness, or obedience, if only I re-will my present action again, for innumerable times.[20] The eternal return excludes any half-hearted willing and affirms the extreme forms: it separates an active, superior will, which wants to enact its force to its highest power, from a reactive, gregarious will. Moreover, the eternal return not only excludes any 'half-desires' but also any reactive mode of being (such as the passive small man or last man possessed by a will to revenge). Furthermore, it is necessary to note that the superior forms of willing and being do not simply pre-exist the eternal return, but are *created* by the eternal return. In other words, the eternal return is more than a 'theoretical representation' (Deleuze 1994: 41) or ethical rule to be made a self-chosen principle of life. Rather, it is a positive principle that actively creates the superior forms that pass the test of eternal return.

In his book *Nietzsche and the Vicious Circle* (1997), Pierre Klossowski offers an interpretation of the selective and creative power of eternal return. According to Klossowski's analysis, the thought of the eternal

return jeopardises the subject's identity; it is an aggression against the apparently limited and closed whole of the subject. The reason for this is that the thought of the eternal return demands that I re-will myself again for innumerable times, but this demand makes me at the same time fall into incoherence. In relation to the codes of everyday society, I am a particular identifiable individual, *once and for all* determined by laws, contractual relations and institutions. The thought of the eternal return addresses me but at the same time demands my destruction as this particular identifiable individual. This is so because I have to re-will *all* my prior possibilities of being:

> All that remains, then, is for me to re-will myself, no longer as the outcome of these prior possibilities, no longer as one realization among thousands, but as a fortuitous moment whose very fortuity implies the necessity of the integral return of the whole series. (Klossowski 1997: 58)
> I deactualize my present self in order to will myself in *all the other selves whose entire series must be passed through*. (Klossowski 1997: 57; original emphasis)

Thus, the eternal return does not demand that I return the same as I am, 'once and for all' (this would amount to a 'bare repetition' in Deleuzian terms), but as a variation, a simulacrum, for an infinite number of times (this would be a repetition 'by excess, the repetition of the future as eternal return' (Deleuze 1994: 90)). The coherence of the subject is thus jeopardised. Nietzsche himself suffered the consequences of the thought of the eternal return: 'I am every name in history,'[21] 'Dionysus and the Crucified.'[22] In Deleuze's reading, which coincides with Klossowski's interpretation in this regard, 'the thinker, undoubtedly the thinker of the eternal return, is... the universal individual' (254). For Deleuze, the universal individual or the 'man without a name' (91) designates someone who has relinquished the well-defined identity of the subject with fixed boundaries, and affirmed the system of a dissolved self with all its processes of becoming.

The dissolution of the identity of the subject and the advent of a non-identical, dissolved self has become possible with the death of God. The cut or caesura in Nietzsche's eternal return coincides therefore with the symbolic event of the killing of God. In *The Gay Science*, Nietzsche describes the act of killing God as a deed that is almost 'too great for us', and yet we have done it ourselves. However, according to Nietzsche, the tremendous event has not yet reached the eyes and ears of men. That is, the absence of God, who hitherto guaranteed the identity of the subject by creating man in his own image, ruling him according to

divine laws, and securing the immortality of the soul, has not yet become effective. The moment this happens, the identity of the subject will be destroyed. The future marks the time when the excessive event turns back against the subject, dispersing it in a discrete multiplicity of little selves, of egos with many names or, what amounts to the same thing, a universal ego with no name at all:

> What the self has become equal to is the unequal in itself. In this manner, the I which is fractured according to the order of time and the Self which is divided according to the temporal series correspond and find a common descendant in the man without name, without family, without qualities, without self or I, the 'plebeian' guardian of a secret, the already-Overman whose scattered members gravitate around the sublime image. (Deleuze 1994: 90)

The universal individual or man without name is thus to be understood as Nietzsche's overman. The overman is not another higher species of man, but a non-identical, a dissolved self, which is liberated from the judgement of God and open to intensive processes of becoming. Interpretations that regard the overman as 'an evolutionary product, rising higher – as man does relative to the worm – to some indeterminate evolutionary height from which he can look back, amused, at that from which he came' (Grosz 2004: 148), treat the overman as someone beyond man, a higher species that is not yet present. In our view, Deleuze's reading rather suggests that the overman is someone who is always beyond himself, that is, never identical with himself, and who allows for all possibilities of becoming, as Klossowski says, becoming stone, becoming plant, becoming animal, becoming star (Klossowski 1963: 223). Deleuze takes up this thought and states that the thinker of the eternal return 'is laden with stones and diamonds, plants "and even animals"' (Deleuze 1994: 254). Features of the overman can in fact be found in the artist or poet – in short, someone who is willing to undergo metamorphoses and to become-other in favour of an act or a work yet to come. As Deleuze explains in his concluding paper given at the Nietzsche conference in the Royaumont Abbey in July 1964:

> The overman very much resembles the poet as Rimbaud defines it: one who is 'loaded with humanity, even with animals,' and who in every case has retained only the superior form, and the extreme power. (Deleuze 2004: 125; translation modified)

Another suitable example besides the poet or artist might be the political subject, someone who engages in processes that not only demand a becoming-other, that is, an annihilation of the past self that he or she

was, but that also put the existence of a future self at risk and thus leave the process of becoming open to success or failure. The ancient rhetorical practice of *parrhesia* can serve as an example here: *parrhesia* can be translated as 'the telling of the unvarnished truth' and specifies a type of discourse in which the speaker commits himself to a free and unbound speech and in doing this puts himself at considerable risk, including the risk of death.[23] The *parrhesiast* or 'truth-teller' cannot be defined in terms of a self-authoring subject, but must be understood as a split subject: through his words he constitutes himself as the one who speaks freely and who is willing to pay for it with his life. He forsakes the identity and securities of his past self, and projects an ideal future self that would find the approval of his listeners, but his project might just as well end in failure.

All these examples, the poet or artist and the political subject (for example, the *parrhesiast*) can be seen as instantiations of a dissolved self, or the overman in Nietzschean terms. Thus, the overman is a real possibility or even a present reality, if one thinks the thought of the eternal return and wills oneself through the *entire series of all the other selves*, that is, affirms all possibilities of becoming. What is expelled by the wheel of eternal return and its centrifugal force is only that which desperately clings to its identity.

V. Conclusion

Deleuze's account of the third synthesis of time involves different theories from philosophy, Greek drama theory and mathematics. It is important to note that Deleuze's method of mixing theoretical concepts is not to be conceived in terms of assimilating differences and blending one concept into the other. Rather, Deleuze maintains their heterogeneity and relates them to one another as differences. It can be regarded as a technique of montage operating by cuts commonly used in cinema. In his second cinema book, Deleuze analyses the time-image of modern cinema with the mathematical terms of incommensurables and irrational cuts (adding, however, the particular meaning of an irrational cut as an irreducible 'gap' and independent 'intensity'):

> The modern image initiates the reign of 'incommensurables' or irrational cuts: this is to say that the cut no longer forms part of one or the other image, of one or the other sequence that it separates and divides. It is on this condition that the succession or sequence becomes a series... The interval is set free, the interstice becomes irreducible and stands on its own. (Deleuze 1989: 277)

The technique of cutting, which Deleuze finds equally in mathematics and film, can perfectly be used to describe his own method of bringing together different heterogeneous theories and concepts.[24]

In this article we have gathered the different heterogeneous elements, from which Deleuze's third synthesis of time emerges. Starting with Kant, it was shown how he revolutionises the philosophy of time, first, by reversing the subordination of time to movement and uncoiling the cycle of time into a straight line; second, by introducing a fracture in the I through the form of time as a form of auto-affection. Deleuze adduces Hölderlin's interpretation of Oedipus to illustrate the impact that the condition of pure and empty time has on the subject. He also gains from Hölderlin the notion of the 'caesura', which distributes a past and a future that are non-coincident or non-symmetrical. The notion of caesura finds its mathematical expression in the notion of the cut, deployed by Dedekind in order to constitute a static and purely ideal conception of continuity. Deleuze, it was argued, makes use of Dedekind's notion of a static continuum in order to create a new notion of time, which has nothing to do with the empirical phenomenon of a continuous flux of moments, but on the contrary with the notion of an a priori static synthesis, which brings together divergent series of past and present moments and future becomings. The Kantian empty form of time, which never changes, thus becomes a static synthesis of time constituted by an irrational cut. For Deleuze, the irrational cut indicates an intensive depth, an outside or virtual event, which breaks with the empirical continuation of space and time. The primary example of such a virtual event is the death of God, which Nietzsche intrinsically connects with a dissolved self. Deleuze argues that Nietzsche's eternal return is Kantianism carried to its highest and most radical form. The Kantian empty form of time produced the split subject or empirico-transcendental doublet, but Kant lost the schizophrenic momentum and reintroduced a new synthetic identity. For this reason, Deleuze resorts to Nietzsche, who maintained the dissolved self and liberated it from the rule of identity and law altogether. Faced with the death of God, the Nietzschean subject becomes ungrounded and free to run through all its possibilities of becoming: it is the universal individual or overman.

The Nietzschean thought of the eternal return is indispensable for Deleuze's third synthesis of time, which introduces a cut or caesura into consciousness and produces the system of a dissolved self. Deleuze thus ties together the themes of the Kantian empty form of time and the Nietzschean eternal return, that is, the straight line and the wheel with its centrifugal force.

> This is how the story of time ends: by undoing its too well centred natural or physical circle and forming a straight line which then, led by its own length, reconstitutes an eternally decentred circle. (Deleuze 1994: 115)

Notes

1. A substantial portion of this article also appears in Chapter 4 of my book *Conditions of Thought: Deleuze and Transcendental Ideas* (Edinburgh University Press, forthcoming 2013). I gratefully acknowledge the editor's permission to republish this material.
2. See Gilles Deleuze, 'On Four Poetic Formulas which Might Summarize the Kantian Philosophy', Preface to *Kant's Critical Philosophy* (Deleuze 1984).
3. In fact, Deleuze contracts here two quotations by Rimbaud from different letters. In his letter to Georges Izambard from 13 May 1871, Rimbaud says: 'Je est un autre. Tant pis pour le bois qui se trouve violon' (Rimbaud 1975: 113), and in his letter to Paul Demeny from 15 May 1871: 'Car Je est un autre. Si le cuivre s'éveille clairon, il n'y a rien de sa faute' (Rimbaud 1975: 135).
4. See Borges 1962: 86–7.
5. Hölderlin's *Oedipus* raises the following problem: if Sophoclean tragedy already involves a thinking of the pure and empty form of time, of a time of abandonment by the gods, then the Kantian revolution, that is, the breaking with ancient cyclical time and the unrolling of time as a straight line, had already been performed in Greece two thousand years before Kant. This view fits well with Deleuze's thought that Ideas are virtual and that they become actualised in different places at different times. We should therefore read Deleuze's claim that Kant revolutionised the ancient cyclical model of time not simply in chronological terms, that is, in terms of historical development, but as the actualisation of a virtual Idea, which is to say that the movement is not going from one actual term to another, but from the virtual to the actual. We owe this suggestion to Nick Midgley.
6. See also Kant 1998: A144/B183 and A182/B224–5.
7. In this lecture course on Kant, Deleuze uses the term 'limit' in two different senses: in a first sense, limit means 'limitation' and refers to the ancient cyclical conception of time according to which time limits something, that is, measures the movements of celestial bodies. Limit in a second sense is said to be characteristic for the linear conception of time, time as pure and empty form. According to Deleuze, limit designates an internal limit, which he describes as 'that towards which something tends'. This definition matches with the mathematical definition of limit during the early geometrical phase of infinitesimal analysis, which depended upon theorems stating the continuous and infinite approximation of magnitudes toward a limiting value (Deleuze 1978b).
8. In his recently published book on Deleuze's philosophy of time, James Williams also renders 'caesura' as 'cut'. However, he does not refer to the mathematical definition of 'cut', which would have helped him in answering the question why the third synthesis is said to involve 'a formal cut, when in fact it is deduced from a somewhat narrow dramatic event (the appearance of a ghost to the Prince of Denmark)' (Williams 2011: 89).
9. It should be noted that both the rational numbers and the real numbers are infinite, ordered and dense number systems. The property of denseness means that between any two numbers there is at least one other number. Denseness is not continuity, as Bolzano mistakenly believed. The property of continuity,

which is attributed to the system of real numbers (but not to that of rational numbers), is precisely defined by Dedekind's method of cuts (see Kline 1972: 985).

10. I am indebted to Nathan Widder for drawing my attention to Russell's and Wittgenstein's critical remarks. For a comprehensive view of the mathematical debate on continuity, see Widder 2008: ch. 2, 'Point, Line, Curve', pp. 22–33.
11. For Russell, 'segments' are series of rational numbers whose terms become closer as the series progresses in order of magnitude. He defines real numbers as segments, and distinguishes segments that have limits and segments that do not (Russell 1919: 72). A rational real number, then, is defined as a segment whose terms converge to a rational limit (for instance, the series 0.49, 0.499, 0.4999, ... converges to the rational number 0.5), while an irrational number is defined as a segment without limit (this shows that Russell still refers to the place of irrationals as 'gaps'). A fuller treatment of real numbers can be found in Russell 1903: chs 33 and 34. For a brief summary see Widder 2008: 27–9.
12. We do not claim that Deleuze refers to Russell or Wittgenstein; in fact, it is doubtful that Deleuze might have even known their criticism of Dedekind. But as will become clear, Russell's and, in particular, Wittgenstein's critical remarks are in a way quite close to Deleuze's modified interpretation of Dedekind.
13. By assigning to irrationals the characteristic of limits of convergent series of rational numbers, Deleuze seems to borrow from Dedekind's definition of irrationals as limits and the axiom that every series of rationals *must* have a limit – in Russell's words, Dedekind's postulation that an irrational limit had to fill the Dedekindian gap (Russell 1919: 71).
14. These two positions are not so much apart as they might seem: thinkers, such as the eighteenth-century philosopher Salomon Maimon and the Neo-Kantian philosopher Hermann Cohen, conceived differentials as both intensive magnitudes and intelligible laws of production.
15. Thus, James Williams rightly insists that Deleuze's model for the third synthesis of time cannot be the ordered line of time, and that the division produced by the caesura does not equal a thin logical point. In his own words: 'the caesura is an event and has a depth to it. It is not instantaneous but rather must be considered with its effect on the points before and after it. This is why the caesura implies a drama: it divides time such that a drama is required to encompass this division. This event-like and dramatic division is in contrast with the thin logical point and set account of the line of time where an arbitrary point is taken on a line and every point before it is defined as before in time and every point after as after in time.... This misses the process at work on Deleuze's thought and model.' (Williams 2011: 91).

    It is true that Deleuze's third synthesis of time cannot be reduced to the number line and the cut to a thin logical point. But it should come as no surprise that Deleuze makes use of Dedekind's idea of a 'cut' and 'static synthesis' without following him in everything he says. Deleuze certainly over-interprets the notion of cut, insofar as he equals it with the irruption of the virtual event (the unthought, the inexplicable, the incommensurable) and the fracture in the subject.
16. For instance, in his cinema book on the time-image, Deleuze explicitly connects Borges's 'labyrinth of time' with the Nietzschean eternal return, as both conceptions of time plunge into a depth that poses 'the simultaneity of incompossible presents, or the coexistence of not-necessarily true pasts' (Deleuze 1989: 131). Borges as well as Nietzsche substitute 'the power of the false' for the form of the true, and a line of time 'which forks and keeps on forking' (131) for the empty form of time.

17. As Nathan Widder argues, the third time-image is distinctly Nietzschean, insofar as it concerns the *series of time*, while the other two time-images, which Deleuze analyses, emphasise the simultaneous layers of time and the coexistence of relations, and are thus rather Bergsonian by nature (see Widder 2008: 48–9). However, all three time-images refer to virtual time and hence 'shatter the empirical continuation of time, the chronological succession' (Deleuze 1989: 155).

Ontology of the Diagram and Biopolitics of Philosophy. A Research Programme on Transdisciplinarity[1]

Éric Alliez Kingston University[2]

Abstract

In this article, the diagram is used to chart the movement from Deleuze's transcendental empiricism and engagement with structuralism in the 1960s to Deleuze and Guattari's ethico-aesthetic constructivism of the 1970s and 1980s. This is shown to culminate in a biopolitical critique and decoding of philosophy, which is part of the unfolding of a transdisciplinary research programme where art is seen to come ontologically ahead of philosophy.

Keywords: diagram, biopolitics, signs, aesthetic, structuralism, transdisciplinarity

I

In the eyes of many, my title could read as a *reparation* of the mistake Deleuze supposedly made when he translated Bacon's expression 'a sort of *graph*'[3] as *diagram* (following the French translation of 'graph'), and in doing so invested the term with nothing less than a *Logic of Sensation* dealing with the *figural* conversion of painting's fundamental 'hysteria'. This was frankly laughed at by the global village of contemporary art criticism.[4] One had to be French to learnedly explain that one needed to pass from the diagram's 'asignifying traits' – whose random marks (lines-traits, colour-patches) hurled the 'optical organisation of representation' into *catastrophe*, into *chaos* – to the 'pictorial Fact' of the painting.

Deleuze Studies 7.2 (2013): 217–230

In what could not fail to appear as a classic *Aufhebung*, a line was traced between, on the one hand, the symbolic-abstract coding of the figurative which substitutes for the diagram an axiomatic that is as visual as it is mental, and on the other hand, the manual outburst where the diagram abandons its 'preparatory' stage and attacks the entire painting with its line-patch, carrying the whole surface away with it in the '*all-over*' disfiguration of action painting (Deleuze 2004c: 105–8, ch. XII: 'The Diagram').

Between Kandinsky and Pollock (or Morris)

> [t]here would thus be a tempered use of the diagram, a kind of middle way in which the diagram is not reduced to the state of a code, and yet does not cover the entire painting, avoiding both the code and its scrambling . . . (Deleuze 2004c: 111)

If the new figuration, whereby the figural substitutes itself for the false alternative between the figurative and the abstract, must 'emerge from the diagram', we must nonetheless *step outside the diagram* so as to 'make sensation clear and precise' (Deleuze 2004c: 110). So French, is it not, this will to organise to the point of chaos in order to 'succeed in producing a more profound resemblance' (83) . . . Hence the necessity of *saving the contour* of the line that delimits nothing.

One could argue that if there is an incontestable classicism here, and even so in the schematisation of the three great pathways of modern art, this classicism is rigorously determined by the will to make the 'capture of forces' (a *forcibly* Nietzschean classicism) pass through a constructivist modulation. Making use of the category of synthesiser, this constructivist modulation replaces any model of expression which would hold that forces are simply *present underneath representation*, in which particular the 'matterist' exploration realised, or was the fact of, abstract expressionism.[5] What we are dealing with is a diagram functioning '*as a modulator*' of synthesis, triply freeing planes from the perspective they replace, colour from the painterliness[6] beyond which it is deployed, and the body from the organism it overflows.[7] But this would be to engage in a defence and illustration of the pictorial aesthetic of Deleuze (a position, I say in passing, which is so unlike my own that I wrote *La Pensée-Matisse (2005)*[8] in order to depart from it *completely*). On the contrary, it seems to me that it is more interesting to accept, as all the evidence suggests, that Deleuze's *Bacon* (or, better still, the *Deleuzian Bacon*) originates from strata anterior to the double-sided works co-written with Félix Guattari (*Anti-Oedipus* (1972), *A Thousand Plateaus* (1980), with *Kafka: Toward a Minor Literature* (1975) functioning as

a component of passage from one to the other).[9] In fact, the double negotiation which Deleuze's *Bacon* engages in with, on the one hand, phenomenology, and on the other hand, modernism, and which leads them to their respective points of rupture (Body without organs vs. lived body, haptic vs. optic[10]) by means of a 'diagrammatic line' held in place by the 'artistic will' (*Kunstwollen*) specific to the *aesthetic image*, testifies to this anteriority and to this independence. This is because Guattari's was a specifically *semio-political* investment in the diagram which manifested itself as the 'power of machinic assemblage [*puissance d'agencement machinique*]' (Guattari 1977: 244)[11] capable of intensely fuelling their joint work.[12]

Well before the diagram underwent its most important conceptual developments in *A Thousand Plateaus* (2004),[13] it is indeed Guattari who had already oriented Deleuze back to the term 'diagram' in an essay from 1975 on *Discipline and Punish*.[14] In this essay Deleuze focuses on the *hapax* Foucault had used when qualifying the Panopticon as 'the diagram of a mechanism of power reduced to its ideal form' (Foucault 1979: 207). But the 'ideal form' is expunged by Deleuze, who immediately connects this to a 'functioning abstracted from any obstacle, resistance or friction' (Deleuze 1975: 1216–17), allowing him to conclude that the diagram must be detached from any 'specific use', that is to say *immanent*. This immanence of the diagram involves the question of politics in an 'abstract machine … coextensive with the entire social field' (1216–17),[15] where the *pure mutations animating the diagram* must be explained by cartography. From the non-representational nature of the diagram, Deleuze in fact deduces that

> *the diagram cannot be used to represent an objectivised world*; on the contrary it organises a new type of reality.… The diagram is not a science, it is always a matter of politics. It is not a subject of history, nor does it survey history from above. It makes history by unmaking its previous realities and significations, constituting so many cutting edges of emergence or of creationism, of unexpected conjunctions, of improbable continua. (Deleuze 1975: 1223; my emphasis)[16]

Here the Deleuzian demonstration suddenly accelerates when it addresses the movement from one society to another through mutations of the diagram, this 'complex' problem which had, with Guattari's help, *practically* set in motion Deleuze's break with structuralism.[17] Everything here goes so quickly, one is swept away by phrases manifesting the *diagrammatic forcing* of the Foucauldian concept of apparatus of power, that really one must project oneself several

years forwards, to *A Thousand Plateaus*, where the differences now established between Deleuze–Guattari (or Guattari–Deleuze[18]) and Foucault are made explicit, to be able to understand the reasons for these differences. One must adopt the perspective of this 'new way of thinking' which is no longer just 'diagrammatism' (as Deleuze put it in his article from 1975[19]) but *a new way of thinking about the diagram affirmed in its full machinic alterity*: 'the diagram and abstract machine have lines of flight that are primary, which are not phenomena of resistance or counterattack in an assemblage, but cutting edges of creation and deterritorialisation' (Deleuze and Guattari 2004: 585, n.39). Assemblages will thus no longer be 'of power but of desire (desire is always assembled), and power seems to be a stratified dimension of the assemblage'[20] (585, n.39). It is at the end of this Copernican Revolution in desire/power, which involves an entire constructivism of desire dependent on its complete immanence to the social field, that the machine-diagram will be called *abstract insofar as it 'constitutes and conjugates all of the assemblage's cutting edges of deterritorialisation'* (155). So much so that the *enforced* deterritorialisation of the diagram comes first, as the *machinic* key to the movement from the dimension of historical formations as strata to the non-stratified dimension of power as strategy, as found in *Discipline and Punish*. From the archive to the diagram … or from the History (of forms) to the becoming (of forces). We must understand here *a becoming capable of explaining the prevalence of relations of power over relations of knowledge without, nonetheless, remaining imprisoned by 'the immanence of power'*.

(Foucault will himself take on this problem in *The History of Sexuality: The Will to Knowledge*, independently of the *biopolitical critique of philosophy* which it implies for Deleuze *with Guattari:*

> Should it be said that one is always 'inside' power, there is no 'escaping' it, there is no absolute outside where it is concerned, because one is subject to the law in any case? Or that, history being the ruse of reason, power is the ruse of history, always emerging the winner? (Foucault 1998: 95)[21])

Since Deleuze credits Foucault with the notion of 'assemblage' (*agencement*) in his article from 1975,[22] it is therefore at the level of this reoriented 'assemblage' that the Foucauldian problematic of power-knowledge will be renewed, as well as its later adjustment in terms of the relation between discursive formations (referring to the sayable, the set of all enunciations) and non-discursive formations (which designate, in its positive sense (*dans sa forme positive*), the visible, the set of all bodies). In this relation between formations one must bear in mind that

it is necessary to affirm both their *de jure* heterogeneity and *de facto* interpenetration, which are irreducible to the pairing between signifier and signified.[23] Deleuze renewed this in terms (alien to Foucault) of *form of expression* (the sayable) and *form of content* (the visible),[24] which are put in relation and in *relations of force* in a double-sided assemblage which does not formalise expression as an 'assemblage of enunciation' without also formalising contents as a 'machinic assemblage, or an assemblage of bodies' (Deleuze and Guattari 2004: 155). Deleuze and Guattari go on to say that

> [w]e must therefore arrive at something in the assemblage itself that is still more profound than these sides and can account for both of the forms in presupposition, forms of expression or regimes of signs (semiotic systems) and forms of content or regimes of bodies (physical systems). (Deleuze and Guattari 2004: 155)

And it is thanks to Guattari's semiotics and pragmatic critique of linguistics, inspired by a *de-structuralised* Hjelmslev,[25] that the concepts of abstract machine and diagram will inter-define this 'something . . . that is still more profound' (Deleuze and Guattari 2004: 155) where there is no longer either any substance or form, content or expression, but *'traits' of content and of expression* functioning to ensure the most deterritorialised of connections between *'pure matter'*, that is, unformed matters or *intensities*, and *'pure function'*, that is, informal functions or '*tensors*' (156).[26] At the level of 'the most deterritorialised content and [of] the most deterritorialised expression' (156), retained by the diagram 'in order to conjugate them' (156), one can thus recognise the etymo-archaeology of the diagram as a drawing-writing. Binding itself to (*en prise sur*) a becoming of forces-signs which are at work in the strata, the diagram is the surface of experimentation of an Abstract-Real (*un Abstrait-Réel*), of a writing *flush with the real writing a new type of reality* held in the very fabric of the most concrete of assemblages by the joint deterritorialisation of expression and content. We are dealing with the *virtualities* of a 'revolutionary diagram from which are derived both a new way of doing and a new way of speaking' (Deleuze 1975: 1227) in conditions that will 'display the relations of force constitutive of power' (1227) – and that will reveal economic materialism[27] to be the other side of the structuralist idealism of the signifier – in order to diagram the informal element of forces in which both the visible and the sayable are submerged. It is in these relations of force *between content and expression* that, on the one hand, 'the stabilisation of relations of deterritorialisation' (Guattari 1977: 243) determines itself

from the viewpoint of power and, on the other hand, that is assembled an intensive deterritorialising machine carried by the flows of signs which it involves in diagrammatic processes of conjunction, which are always more dominant over the material flows of all kinds and in which they are at work *anyway*.

It is now my turn to accelerate, and to say all too quickly that we do not touch on the diagrammatic *implication* of Deleuzo-Guattarian (and/or Guattaro-Deleuzian) thought in its most political plane of consistency without it immediately *explicating* and complicating itself as *Art and Politics*. For even if art cannot bring to light the most contemporary 'capture of forces' without also *harnessing the intense-abstract light of the diagram* – 'which renders the sayable visible, and which renders action sayable – but for another language, for another way of acting' (Deleuze 1975: 1226) – the social field must nonetheless first define itself by its lines of flight so that the conjunction (in art *and* politics) can *construct a real to come*. This is a 'Real-Abstract [which] opposes itself all the more to the fictitious abstraction of a supposedly pure machine of expression' (Deleuze and Guattari 2004: 157; translation modified) since it tries to *bring about the continuum, the conjunction of all that flees* (*tout ce qui fuit*) *and of everything that slides under – and pushes through – the grid or net*. Or to put it another way: so that art ceases to be an end in itself, the artist must – in one way or another, but in the most singular of ways – invest him- or herself in this 'social' affirmation by experimenting with 'signs', not as bearers of *something else* (the invisible at work in the visual-aesthetic image), but as *forces-signs of deterritorialisation and of reterritorialisation*. So art is never an end in itself,

> it is only a tool for blazing life lines, in other words, all of those real becomings that are not produced only *in* art, and all of those active escapes that do not consist in fleeing *into* art, taking refuge in art, and all of those positive deterritorialisations that never reterritorialise on art, but instead sweep it away with them toward the realms of the asignifying, asubjective, and faceless. (Deleuze and Guattari 2004: 208)

It is this *sign-aisthesic*[28] (*signesthésique*) politics of art which can be called, as a rigorous contemporary alternative to its 'conceptual' version, *Art after Philosophy*. This 'after' (*après*) does not mean art '*according to*' (*d'après*) philosophy – nor does it mean an analytical finish or varnish (*un apprêt*) applied to philosophy (à la Kosuth) – since ontologically art comes *ahead of* it (*en-avant*) (along with the *postconceptual* critique/clinique of philosophy which it carries with it).

II

To develop this political ontology of the diagram into a biopolitical critique of philosophy and to envelop in its plane of immanence the construction of the question of transdisciplinarity – *as postphilosophical problem* – one must first make the art–politics conjunction operate retroactively on (*rabattre sur*) the historico-philosophical sequence which *stretched the former between Deleuze and Guattari*. In one direction we will find this constitutive affirmation of transcendental empiricism in the *Difference and Repetition of philosophy*, where it is the role of 'the modern work of art' to indicate 'to philosophy a path which leads to the abandonment of representation' by identifying the conditions of real experience – instead of and replacing the conditions of possible experience – (the) experimentation in and of the work of art (*l'expérimentation de/dans l'œuvre d'art*), with the development of its simulacral 'permutating series' (Deleuze 1994: 65–8), etc. This is thus one path, a post/structuralist logic of sense. In the other direction we will be taken to 'this ontological root of creativity that is characteristic of the new processual paradigm' (Guattari 1995: 116), which Guattari preferred to call the 'proto-aesthetic [rather than 'aesthetic'] paradigm' (101), 'to emphasise that we are not referring to institutionalised art' (102), and that the two (Kantian) meanings of aesthetic (theory of the sensible and theory of the beautiful) would be less *conflated in the work of art*[29] than they would be *absolutely deterritorialised* in the 'machination for producing existence' (109), in the 'generative praxis [of] heterogeneity and complexity' (109). We know that such praxis involves this '*diagrammatic politics*' (Guattari 2011: 174), its equally semiotic and material 'onto-logic'[30] having been thoroughly explored in *A Thousand Plateaus* as a machinic and critical (*machinique-critique*) alternative to the play of series on the surface of structures. But it is inevitably also an alternative to the philosophical re-foundation of the transdisciplinary research programme initiated by structuralism, a structuralism which Deleuze had reworked as a 'new transcendental philosophy' (Deleuze 2004a: 174), before giving in to the *anti-structuralist motif* developed in 'real time' (the paradigmatic axis) by Guattari[31] since the *anti-Oedipus* could equally well read as *anti-structure*.[32] Here we must weave (*croiser*) our first historico-philosophical sequence into a second, reorienting the question of transdisciplinarity as *problem of philosophy*.

This sequence starts with the transdisciplinary research programme of structuralism based on linguistics' structural functionalism and

developed in a transformative system of relations mobilising the humanities and social sciences *against the theoretical primacy of philosophy*. This first 'moment' is followed by a *philosophical re-foundation of transdisciplinarity* through the re-definition of structuralism as *the* 'new transcendental philosophy' (Deleuze 2004a: 174), Deleuze's key expression in 'How do We Recognize Structuralism?' – and let us notice (1) that it tends to a *poststructuralist complication* of Structuralism's problematics by a full integration or transduction of Deleuzian 'superior empiricism' (Deleuze's post-Bergsonian *bio-transcendental* empiricism is *differentially re-actualised* in post/structuralist terms); (2) and that, at the end of the article (written in 1967, that is, contemporary with the *Structuralist Controversy*, the Baltimore Conference), Deleuze reinvests or reworks, with the question of the 'structural mutations', the structure/genesis or system/transformation problem in practical terms which are understood as a *challenge to (the new transcendental) philosophy* and as *the criteria of the future*. The third moment – but the transdisciplinary problematics oblige us to reunify *in tension* the three moments – is the moment of the 'rhizome' as this anti-structuralist war machine that can only make *structure take flight* (according to a machinic apparatus that appropriates structure's real-abstraction so as to *animate the whole process radically put into becoming from the outside*) by producing a critique/clinique of philosophy, a kind of *schizoanalysis of philosophy* undertaken from the radical perspective of a *politics of transversalisation* liberating transdisciplinarity from its structural *ordination* as *disciplinary regulation* of structuralist transdisciplinarity (the operational closure of the structure). At the end of the day, Lévi-Straussian *bricolage* is substituted for a pragmatics starting to work as a critical developer of the political economy of language. Pragmatics means thus an anti-linguistic ontology of the sign that extracts the transformational component of post-structuralism, that is, *structuralism driven to its constitutive tension*, redirecting it diagrammatically towards *a total de-epistemologisation and re-ontologisation* to attain – 'at the absolute horizon of all processes of creation': which is to say an 'ontological transversality' (Guattari 1995: 38) – a *politics of multiplicities* as a *postphilosophical ungrounding* (*effondement*) of transdisciplinarity. At its point of greatest tension, in a *post modo*[33] modality which is none other than the politics of thought and politics inside thought (*la politique de/dans la pensée*), as oriented by the analysis of capitalism, it reads, as Guattari puts it: 'Being does not precede machinic essence; the process precedes the heterogenesis of being' (108).

What is at stake in this rupture is a renewed machinic biopolitics of 'assemblages'. The rupture will have begun by *opposing* transdisciplinary experimentation to 'structural interpretation' at the same moment that the 'critique of philosophy' exceeds the philosophy of representation[34] to involve itself in a *clinical practice of the social sciences* (meaning a practice of *all* the human sciences, which become at once pragmatic – and de-structuralised – and political – and re-socialised). For if Guattari puts an end to the project Deleuze had long had of opening philosophy up to *artist-thought* (*la pensée-artiste*) and of *aesthetically* intensifying its system of interpretation in order to let in its own outside (which *forces* it to think, as constrained by the sensibility and the real conditions of these 'new works of today'[35]), it is indeed because his assemblage with Guattari bears a whole new potentiality (and effect) which became necessary after 1968. That is, to make philosophy step outside itself by undergoing a process of *decoding*, which functions textually and arrives at its logic of sense *at the same time* that this process invests the destruction of the codes used by capitalism to represent this very process, and in a historical narrative inseparable from a *semiotic machination* of the subject. (It is here that *Foucault-thought* (*la pensée-Foucault*) will be invested with a *diagrammatic function*.) This means that Deleuze will put the Guattari-effect to work in a biopolitical critique of philosophy which, brought outside itself and into the social field, gains an absolute power of decoding. Its *first effect* will be to undo the philosophical image of thought by breaking that which codes its material-ideal form of interiority. This is the 'book of philosophy' which we no longer propose to replace with another form of *expression* and a new *style* – as Deleuze famously puts it in the preface to *Difference and Repetition*: 'The time is coming when it will hardly be possible to write a book of philosophy as it has been done for so long: "Ah! the old style . . . "' (Deleuze 1994: xxi). Instead, we oppose to it another regime of production which *incorporates* the 'book of philosophy' into the material *milieu* by *plugging* it into the *machinic* conditions of reality of the most external and the most internal of forces. The diagram names this process where signs flush with material flows[36] – and whose cutting edges of creation are ontologically affirmed and analytically assisted – turn back on philosophy's reterritorialisation onto the concept, at the very same moment that philosophy absolutely deterritorialises capital (*porte à l'absolu la déterritorialisation relative du capital*) by suppressing it as an internal limit (Deleuze and Guattari 2003: 98). Postconceptual or postphilosophical mean nothing else than the following: that the general function of diagrammatisation

proliferates beyond itself; not 'in general' – either *philosophically* in general or generally in a *philosophical* manner, solely because of the identity-alterity (not so recently) posited BEING = BECOMING, or MONISM = PLURALISM, 'the furniture we are forever rearranging' (Deleuze and Guattari 2004: 23) – but rather in *an* assemblage *to be constructed*, always as both a 'collective assemblage of enunciation' and a 'machinic assemblage of desire'.[37]

Notes

1. This paper was presented at the 'Deleuze, Philosophy, Transdisciplinarity' Conference, Goldsmiths University of London, 10–12 February 2012, and is part of the CRMEP's research programme on Transdisciplinarity (AHRC 914469, with P. Osborne and S. Stanford). With the exception of the endnotes, no major changes have been introduced for this publication. When referencing in dual languages, non-English editions of texts follow the English language references.
2. Translated by Guillaume Collett.
3. As found in his Interviews with David Sylvester: *The Brutality of Fact: Interviews with Francis Bacon* (Sylvester 1975: 56/110–11).
4. Cf. Art & Language, T. Baldwin 2004; Roberts 2010 – the first lines of the article read: 'Modern continental philosophers – or more precisely modern French philosophers – have, historically, not been the best or most welcome judges of art. When they have not been hitching a ride on the back of some blue chip reputation in order to stoke the fires of high-end conceptualisation, they have been scuttling around in artistic marginalia pursuing some unfathomable fancy, like a love-struck teenager indifferent to the absurdity of their love-object. Top prize in the former category goes to Deleuze's hystericised Francis Bacon as grand master . . . ' (Roberts 2010: 70).
5. 'But with Pollock, this line-trait and this colour-patch will be pushed to their functional limit . . . a decomposition of matter, which abandons us to its lineaments and granulations' (Deleuze 2004c: 105). Matterism here would be the fruit of the diagram's own self-reflexivity: 'rather than making the flux pass through the diagram . . . , it is as if the diagram were directed toward itself' (117). Matterism *qua* Mannerism.
6. [Translator's note: this is the standard translation of the German *malerisch*, used by Alliez, a word popularised by Swiss art historian Heinrich Wölfflin (1864–1945). This term refers to a manner of painting in a less than controlled style, where the brushstrokes themselves are visible or spill over the drawn lines. Painterliness is found particularly in impressionism and abstract expressionism.]
7. See the whole of Deleuze [1969] 2004b: ch. XIII, 'Analogy'
8. A recent development from this work has been published; see Alliez 2012.
9. Published in 1981, which is to say one year after *A Thousand Plateaus*, *Francis Bacon: The Logic of Sensation* (2004c) can be considered as directly and autonomously related to *The Logic of Sense* (2004b), *short-circuited* by the hysteria of Artaud's Body without Organs, which endows sensation with a radically non-phenomenological logic (cf. 2004c: ch. VII: 'Hysteria'). The volcanic eruption of the Body without Organs in the very middle of the structuralist logic of sense (13th series) in truth had already put an end to this philosophical project for Deleuze himself.

10. But haptic could equally lead, via Hildebrand, to a modernist phenomenology of art.
11. If it is too late not to follow the standard translation of '*agencement*' as 'assemblage', we ask the reader to keep in mind the '*agencement*' as a *diagrammatic kind of agency*.
12. Cf. Guattari 1977, 1979, 2006, 2011.
13. Developments of the diagram are indissociable from a pragmatics of signs of which we will find more than one sketch in Félix Guattari's *The Machinic Unconscious* (2011), first published in 1979 before *A Thousand Plateaus*.
14. 'Écrivain non: un nouveau cartographe' (Deleuze 1975). The article is republished in a very modified form in *Foucault* under the general title of 'From the Archive to the Diagram' (2006: 1–38).
15. For the Guattarian heterogenesis of the concept of 'abstract machine', see for example Guattari 1995: 35.
16. 'It doubles history with a sense of continual evolution [or becoming]', concludes Deleuze when he repeats this phrase in *Foucault* (2006: 31) (translation modified).
17. It is the end of the article entitled 'How Do We Recognise Structuralism?' (Deleuze 2004a: 170–192) where Deleuze must launch a 'structuralist hero' so as to set up a praxis there.
18. For the montage of this syntagm, cf. Alliez 2011.
19. 'Une nouvelle pensée, positive et positiviste, *le diagrammatisme*, *la cartographie*' (Deleuze 1975: 1223; original emphasis).
20. See Deleuze 2007: we will find the differential principle of the Deleuzo-Guattarian note on Foucault of *A Thousand Plateaus* in this letter addressed to Foucault after *The History of Sexuality: The Will to Knowledge* was published in 1976.
21. Profoundly different from the Deleuzo-Guattarian 'lines of flight', Foucault's political philosophy requires a notion of 'resistance', considered as irreducible vis-à-vis relations of power.
22. Resolutely Deleuzo-Guattarian (and not Foucauldian), the concept of assemblage appears for the first time in *Kafka: Toward a Minor Literature* (1986), particularly in the last chapter ('What is an Assemblage?/Qu'est-ce qu'un agencement?').
23. In *A Thousand Plateaus* (2004: 66), Deleuze and Guattari return to the whole analysis of the diagram-prison (which makes them return to *The Archaeology of Knowledge*).
24. Cf. Deleuze 1975: 1213, 1219ff. These two terms come from the Danish linguist Hjelmslev from whom Guattari had long appropriated this distinction – not without modifying its structuralist character in order to radicalise the rupture with the pairing between signifier and signified. Cf. Hjelmslev 1968, particularly ch. 13 cited in *A Thousand Plateaus*.
25. Since form continues to fall on matter 'like a net' (an expression of Hjelmslev's) to engender substance as much of expression as of content. Cf. Guattari 1995: 24, 1979: 226.
26. Cf. Deleuze 1975: 1216–17, for the first appearance of the analysis of diagrammatism developed in terms of 'pure function' and 'pure matter' – and related to the Panopticon insofar as it ignores the finalisation of functions (caring for or supervising (*surveiller*), teaching or punishing, etc.), and the organisation of matters (hospital or workshop, school or prison, etc.), from which is derived its 'informal' dimension.
27. 'In any case, content and expression are never reducible to signified-signifier. And . . . neither are they reducible to base-superstructure. One can no more posit

a primacy of content as the determining factor than a primacy of expression as a signifying system' (Deleuze and Guattari 2004: 76). The lesson here is as much Foucauldian as it is Guattarian (Guattari's anti-Althusserianism).

28. [Translator's note: the Greek term *aisthesis* (αισθησις) refers to sensation, perception, as opposed to intellection (*noesis*). Alberto Toscano explains that, following Alliez's 'distinctive concern with the sensible conditions of philosophy, science and art', *aisthesis* functions 'transversal[ly] … as both affect and experiment, passive synthesis and invention'; see Toscano's preface to Alliez 2004: xi. We should hear echoes of a transversal or transdisciplinary 'synaesthesia' (*synesthésie*) in Alliez's neologism.]
29. Cf. Deleuze (1994: 82): 'Everything changes once we determine the conditions of real experience, which are not larger than the conditioned and which differ in kind from the categories: the two senses of the aesthetic become one, to the point where the being of the sensible reveals itself in the work of art, while at the same time the work of art appears as experimentation.'
30. This is another term Guattari uses; cf. Guattari 1995: 65.
31. See the texts collected in Guattari 1972 – with a preface by Deleuze.
32. Following – and *as an inversion of* – J.-C. Milner's expression in *Le Périple structural* (2002).
33. [Translator's note: in *The Postmodern Condition: A Report on Knowledge*, J.-F. Lyotard tells us that '*Post modern* would have to be understood according to the paradox of the future (*post*) anterior (*modo*)' (1984: 81).]
34. According to the movement of thought which leads Deleuze from the Nietzschean critique of Kant to an anti-representative philosophy of Difference and Repetition at first commanded by the post-Romantic appropriation of Proustian literary experience. It is here that 'Thereby is manifested the "philosophical" bearing of Proust's work: it vies with philosophy' (Deleuze 2000: 94), while art is the exclusive domain of an experimentation whose 'problematic' character is precisely defined by its interpretation. This will be reproblematised in structuralist terms ('structural interpretation' in fact comes from the *first* criterion by which we recognise structuralism: the symbolic; cf. Deleuze, 'How do We Recognise Structuralism?', *op. cit.*, p. 172).
35. As 'this [structural] reinterpretation only has value to the extent that it animates new works which are those of today' (Deleuze 2004a: 173). This is the key example of Pop Art in *Difference and Repetition*.
36. According to the animation stands of 'Échafaudages sémiotiques' (1977: 250ff.).
37. This is the definition of assemblage proposed by Deleuze and Guattari at the end of *Kafka: Toward a Minor Literature* (1986). This is thus rigorously contemporary with Deleuze's 'diagrammatic' article on Foucault. – To conclude in a kind of re-opening, let me say that this *paper* had no other aim than to explore this contemporary diagrammatic regime by means of the unfolding of the same gesture in which I oppose the 'aesthetic regime' of Jacques Rancière. On this diagrammatic agency vs. aesthetic regime, see my 'Body without Image: Ernesto Neto's Anti-Leviathan' (2013 forthcoming).

Who Are Our Nomads Today?: Deleuze's Political Ontology and the Revolutionary Problematic

Craig Lundy University of Wollongong

Abstract

This paper will address the question of the revolution in Gilles Deleuze's political ontology. More specifically, it will explore what kind of person Deleuze believes is capable of bringing about genuine and practical transformation. Contrary to the belief that a Deleuzian programme for change centres on the facilitation of 'absolute deterritorialisation' and pure 'lines of flight', I will demonstrate how Deleuze in fact advocates a more cautious and incremental if not conservative practice that promotes the ethic of prudence. This will be achieved in part through a critical analysis of the dualistic premises upon which much Deleuzian political philosophy is based, alongside the topological triads that can also be found in his work. In light of this critique, Deleuze's thoughts on what it is to be and become a revolutionary will be brought into relief, giving rise to the question: who really is Deleuze's nomad, his true revolutionary or figure of transformation?

Keywords: nomads, political ontology, multiplicities, State, dualisms and triads

Introduction

In concluding a paper titled 'Nomadic Thought' delivered to a Nietzsche conference in 1972, Gilles Deleuze sums up the problem of the revolution as follows:

Deleuze Studies 7.2 (2013): 231–249
DOI: 10.3366/dls.2013.0104

www.euppublishing.com/dls

> As we know, the revolutionary problem today is to find some unity in our various struggles without falling back on the despotic and bureaucratic organization of the party or State apparatus: we want a war-machine that would not recreate a State apparatus, a nomadic unity in relation with the Outside, that would not recreate the despotic internal unity. (Deleuze 2004: 259)

It is no longer the early 1970s, and our world has changed significantly since then. But although the question of 'the revolution' that troubled the political Left of Deleuze's France has changed in tenor somewhat, the problem which Deleuze refers to in the above passage is arguably as pressing now as it has ever been. Recent revolutionary events across North Africa, the Middle East and Greece obviously spring to mind, as does the ongoing attempt of environmentalists to 'find some unity' for their movement, or more specifically, a mechanism that can successfully coordinate mass-action in a way that does not wait for or rely upon State apparatuses. Others are better placed than I am to comment on the particularities of these examples. What I would like to do in this paper, however, is not so much speak about the specifics of these struggles, as investigate what Deleuzian philosophy and politics have to say about revolutionaries in general. In short, who is, according to Deleuze's practice of thought, a real nomad or revolutionary? Who is it that is capable of bringing about genuine and practical transformation? Contrary to the belief that a Deleuzian programme for change centres on the facilitation of absolute deterritorialisation and pure lines of flight, I will demonstrate in this paper how Deleuze in fact advocates a more cautious and incremental if not conservative approach – an approach, moreover, that is revolutionary precisely because of its distancing from the absolute in favour of prudence.

It must be acknowledged from the outset that Deleuze will not exactly provide us with an explicit answer to the question in this paper's title. This is because instead of naming names and setting down step-by-step instructions, Deleuze directs his energies towards altering our understanding and approach to the question of who is a revolutionary and the revolutionary problematic it is a part of. Appreciating the nature of this alteration and the ontology that underpins it will therefore form the major task of this paper. It will be pursued through a close examination of the relevant primary material.[1] To begin with, I will briefly touch on some of the abiding dualisms in Deleuze's work that are largely responsible for determining the shape and direction for much of his political philosophy. Chief among these will be the dualism mentioned in the above quote of the nomad and the State. Following

this initial presentation, which will evidence Deleuze's transdisciplinary practice, I will demonstrate how this basic and well-formed dualism is far more complex than it might initially seem. In fact, I will show how Deleuze's political ontology contains not one but two possible nomads, thus calling into question the dualistic premises upon which much Deleuzian commentary and Deleuzian-inspired political thought is based. After distinguishing between these two nomadic figures, the question with which Deleuze closes his 'Nomadic Thought' essay will be rejoined: who really are our nomads today, our true revolutionary figures of transformation?[2]

Absolute Nomads

1972 was a big year for Deleuze. That year saw the publication of a number of important works, including his much discussed interview with Michel Foucault 'Intellectuals and Power', and his key essay 'How Do We Recognise Structuralism?'. More significantly, it was in that year that *Anti-Oedipus* first appeared. But while there is a good chance that the participants at the 'Nietzsche Today' conference held in the summer of that year at Cerisy-la-Salle (which included luminaries such as Klossowski, Derrida, Lyotard, Nancy, Gandillac and Lacoue-Labarthe) would have been aware of Deleuze's new philosophical direction with Guattari, it is highly unlikely that they would have had any idea what exactly he was referring to in his paper by the conceptual distinction between the nomad and the State. Indeed, when asked a question by Mieke Taat in the discussion following Deleuze's paper about the incongruity between his current work and certain positions in his last book (*The Logic of Sense*), Deleuze simply responded: 'I've undergone a change' (Deleuze 2004: 261). Four years later Deleuze would elaborate on this curt (and rather unsatisfactory) response:

> Fortunately I am nearly incapable of speaking for myself, because what has happened to me since *The Logic of Sense* now depends on my having met Félix Guattari, on my work with him, on what we do together. I believe Félix and I sought out new directions simply because we felt like doing so.... I believe also that this change of method brings with it a change of subject matter, or, vice versa, that a certain kind of politics takes the place of psychoanalysis [the method of *The Logic of Sense*]. Such a method would also be a form of politics (micropolitics) and would propose the study of multiplicities... (Deleuze 2006: 65–6)

Taking advantage of this collaborative material, we find ourselves in a position denied the participants at Cerisy to make sense of Deleuze's understanding and treatment of what he referred to as 'the revolutionary problem today'. What Deleuze is after, to restate his presentation of the problematic, is a way of organising a revolutionary movement, or more specifically, revolutionary *force*, that does not end up reproducing what it is fighting against in the act of resistance. Pure anarchy is one thing, and at certain times a good thing. But such disorganisation is statedly not Deleuze's objective. For him, the question is more exactly: is there a way of *organising* that is more structured than pure anarchy yet avoids the despotic State form? This is Deleuze's revolutionary problem.[3] His response with Guattari is for the most part strategic, as befits the practical thrust of the problem. But it is also ontological. Let us then briefly look at the ontological basis for Deleuze's political philosophy, before specifically turning to his various statements on revolutionaries.[4]

In seeking an alternative kind of organisation to the State form, Deleuze and Guattari nominate its historical opponent: the nomad. It is most common for the term 'nomos' to be associated with the law. Deleuze and Guattari, however, contest this straight connotation by emphasising its opposition to the 'polis':

> The *nomos* came to designate the law, but that was originally because it was distribution, a mode of distribution. It is a very special kind of distribution, one without division into shares, in a space without borders or enclosure. The *nomos* is the consistency of a fuzzy aggregate: it is in this sense that it stands in opposition to the law or the *polis*, as the backcountry, a mountainside, or the vague expanse around a city ('either nomos or polis'). (Deleuze and Guattari 1987: 380)[5]

The nomad and the State thus form a dualism for Deleuze and Guattari, whereby the State works to 'reclaim' land by building 'walls, enclosures, and roads between enclosures' while the nomads do not so much tame the earth as populate its expanse, inserting themselves into the continually shifting nature of the desert, tundra, etc. (Deleuze and Guattari 1987: 381).

As this description suggests, the distinction between the nomad and the State is largely predicated on their differing relations to space, and more precisely, their distribution *of* and *in* space. Deleuze had been playing around with this distinction for some time. As he explains in *Difference and Repetition*, there are two types of distribution, one 'which implies a dividing up of that which is distributed' and another

which is 'a division among those who distribute *themselves* in an open space – a space which is unlimited, or at least without precise limits' (Deleuze 1994: 36).[6] Moving forward to *A Thousand Plateaus*, Deleuze and Guattari discover another novel way to describe this distinction, employing terms created by the musical composer Pierre Boulez. In his musical compositions, Boulez distinguishes between a smooth space-time that 'one occupies without counting' and a striated space-time that 'one counts in order to occupy' (Deleuze and Guattari 1987: 477). These two ways of engaging with sound involve contrasting attitudes towards, and experiences of, space-time. In a striated space, a 'standard' is imposed onto music, providing an organisational structure to which sounds then correspond. Frequencies of sound are thus distributed within various intervals respective to the breaks that separate them. In a smooth space, on the other hand, frequencies are distributed without breaks; there is no transcendent scale from which to judge the frequency, for the space-time itself continuously modulates. For this reason, smooth space has no boundaries between one interval and another – there is no inside and outside – since it is composed entirely of an alteration that continuously expands or unravels.

At base, however, all of these distinctions of smooth/striated and nomad/State can be traced back to one of the earliest and most enduring of Deleuzian dualisms: Henri Bergson's separation between differences of nature and differences of degree. As Deleuze explains in his 1956 essay 'Bergson's Conception of Difference', differences of nature are heterogeneous while differences of degree are homogeneous (Deleuze 2004: 32–51). This means that for a difference of nature to be genuinely heterogeneous, it must not merely refer to the difference between two homogeneities, since this would reduce heterogeneity to the identity of homogeneities. Therefore, a difference of nature must differ first and foremost *from itself*: what defines a difference of nature is not merely the way it differs from other external objects, but the way it differs internally, being composed of a heterogeneity on the inside.

Another way that Bergson describes this separation of difference is by employing the theory of multiplicities as developed by the mathematician Bernhard Riemann. Following Riemann, Bergson distinguishes between metric and nonmetric multiplicities, or in other words, those multiplicities that can and cannot be divided without changing in kind. Metric multiplicities lend themselves to striation, for they can be easily sub-divided and manipulated without changing their nature, only their extensive quantity. Nonmetric multiplicities, on the other hand, are smooth, making it impossible to carry out such

operations without changing them in kind or converting a smooth-nonmetric multiplicity into a striated-metric one.

This last remark should flag up why Deleuze and Guattari's ontology, and in particular the theory of multiplicities borrowed from Bergson and Riemann, is of relevance to 'the revolutionary problem', and more broadly, a form of political analysis that proceeds via the study of multiplicities (as the quote I mentioned above on the 'change of method' refers to).[7] If there is a kind of organisation that avoids reproducing the State form, for Deleuze and Guattari it will be ontologically composed as a nonmetric or internally heterogeneous multiplicity – a smooth space or nomadic organisation that is not only 'outside [the State's] sovereignty and prior to its law', but 'of another species, another nature, another origin than the State apparatus' (Deleuze and Guattari 1987: 352).

In light of this radical alterity between the nomad and the State, it is tempting to emphasise the destructive power of the nomads and their disorganising effect – their process of 'deterritorialisation' – and valorise it in contrast to the oppressive power of a State apparatus. As Deleuze and Guattari express on many occasions in various registers, nomads propagate smooth space by breaking through the walls of striated space in order to 'add desert to desert, steppe to steppe, by a series of local operations whose orientation and direction endlessly vary' (382). Furthermore, the nomad does not just differ from the State, but 'brings a *furor* to bear against sovereignty' (352). This furor is for the purposes of undermining and abolishing the well-ordered territories of States. Nomads are thus said to be 'the Deterritorialized par excellence' (381), since their onto-ethical prerogative and political aspiration is to evade being territorialised and sedentarised, whether on a reservation or through the gradual appropriation of their smooth space by State forces.

But in drawing this sharp distinction between the nomad and the State we must be careful, for although they may differ, it is not the case that nomads are *defined by their opposition* to the State or that they live to fight it. Deterritorialisation and/or destruction of the State, Deleuze and Guattari point out, is 'neither the condition nor the object' of their existence, but at best a 'supplement' or 'synthetic relation' (Deleuze and Guattari 1987: 471). Similarly, it would be mistaken to construe absolute deterritorialisation as the defining feature of revolutions or revolutionaries, according to Deleuze. For as was illustrated above by his concern for 'the revolutionary problem', what Deleuze is after is not merely a disorganising force, but more specifically an *alternative kind of organisation* – what he hopes for is to *find some unity* of a *particular kind*. Playing up the destructive or negative aspect of the

nomad can thus only take us so far – as far as the revolutionary problem: if we revolutionaries are opposed to the status quo, then what kind of organisation can and could we give rise to, and how will we be able to avoid certain forms that we find detestable? Once this problem is posed, it becomes clear that the deterritorialising effect of nomads will at most be a component within a larger strategy. Subsequently, what is needed is not a further rehearsal of oppositions – the constricting State on one side and the deterritorialising nomad on the other – but an attempt to move in-between these two absolutes in order to determine whether there is a nomadic organisation that could satisfy our revolutionary problematic.

Real Nomads

Moving beyond the opposition of absolutes towards an analysis as to the underlying nature of nomadism is made easier through a recognition that Deleuze and Guattari themselves spend much time complexifying and overcoming their dualistic ontology of nomad/State, smooth/striated, etc. While the early sections of Deleuze and Guattari's 'Nomadology' plateau focuses on clearly distinguishing the pure forms of the nomad and the State, immediately following the completion of this task Deleuze and Guattari begin to unpick and problematise this relation.[8] For example, as it turns out, the smooth and the striated, for Boulez, are not fixed spaces, but rather undergo transformations whereby one becomes the other:

> Boulez is concerned with the communication between two kinds of space, their alternations and superpositions: how 'a strongly directed smooth space tends to meld with a striated space'; how the octave can be replaced by 'non-octave-forming scales' that reproduce themselves through a principle of spiralling; how 'texture' can be crafted in such a way as to lose fixed and homogeneous values, becoming a support for slips in tempo, displacements of intervals, and *son art* transformations comparable to the transformations of *op art*. (Deleuze and Guattari 1987: 478)[9]

And it gets better. Not only do the smooth and the striated meld and alternate into one another, but they even do so while remaining the same in nature. To explain this Deleuze and Guattari borrow an example from Paul Virilio: the fleet in being (Deleuze and Guattari 1987: 387). The purpose of this example is to illustrate how one can spread oneself across the entirety of a smooth space, in this case a vector of sea, at once. Tactically speaking, a fleet of warships can have the effect of extending itself across an expanse of water, simultaneously occupying every crevice

of the vector from its ability to appear at any point without prior notice. This capacity is best epitomised by the nuclear submarine, whose power to strike extends across the globe. By doing so, however, the State navy does not convert the sea – the archetypal smooth space – into a striated space. Rather, the State harnesses the power of the smooth for the purposes of State control. In other words, the smooth is employed by the State *as smooth* for the promotion of striation. The smooth characteristics of the sea are thus maintained, but they are redirected by State powers to achieve a level of control that the State on its own would be incapable of.

Here we have an excellent reason for why Deleuze and Guattari would say: 'Never believe that a smooth space will suffice to save us' (Deleuze and Guattari 1987: 500). As we can see, in some cases it clearly will not, and might even aid in the repression of nomadic tendencies, even when its nature remains unchanged. Nomadism and smooth space are thus not always easy bedfellows – a fact rarely commented on within Deleuze studies. For the point Deleuze and Guattari are trying to make here is not only that reality is constantly undergoing processes of striation and smoothing, but furthermore that it is not always so easy to tell which is which. If the sea can be striated *as smooth*, then so too can the very concrete of cities be smoothed out, to cite another example:

> [I]t is possible to live smooth even in the cities, to be an urban nomad (for example, a stroll taken by Henry Miller in Clichy or Brooklyn is a nomadic transit in smooth space; he makes the city disgorge a patchwork, differentials of speed, delays and accelerations, changes in orientation, continuous variations . . . The beatniks owe much to Miller, but they changed direction again, they put the space outside the cities to new use). Fitzgerald said it long ago: it is not a question of taking off for the South Seas, that is not what determines a voyage. There are not only strange voyages in the city but voyages in place: we are not thinking of drug users, whose experience is too ambiguous, but of true nomads. (Deleuze and Guattari 1987: 482)

The earlier suggestion that a space was *either* smooth-nomos *or* striated-polis was therefore somewhat misleading: it is both, as one becomes the other. In one direction, striated spaces are undone from within as urban nomads redeploy the very constructs of the city to a smoothing. And in the other direction, the power of smooth spaces is harnessed for the purposes of control. Articulating the pure and fixed dualisms of nomad/State and smooth/striated is thus only the beginning. While it might be initially convenient to abstract the two apart, this is

only of use insofar as one goes on to complexify these abstractions. As Deleuze and Guattari say in the conclusion of *A Thousand Plateaus*:

> It is not enough, however, to replace the opposition between the One and the multiple, with a distinction between types of multiplicities. For the distinction between the two types does not preclude their immanence to each other, each 'issuing' from the other after its fashion. (Deleuze and Guattari 1987: 506)

Things are, however, even more complicated. Aside from the various tricky relations between the two types, it turns out that there are more than two types after all. If the nomad and the State are rendered 'immanent to each other', it is by virtue of a third element: the phylum. As Deleuze and Guattari understand it, the phylum is a 'phylogenetic lineage, a single machinic phylum, ideally continuous [and] in continuous variation' (Deleuze and Guattari 1987: 406), that 'simultaneously has two different modes of liaison: it is always *connected* to nomad space, whereas it *conjugates* with sedentary space' (415). For this reason, the phylum, when conceptualised spatially, is neither smooth nor striated but *holey* – the Swiss cheese of space – since it is expressed in some instances as smoothly spread and in others as contracted into a polis (413–15).

All of this is a bit abstract, but there is a political point. When Deleuze and Guattari set out their version of politics as 'micropolitics', they will do so by employing a further topological triad that will be related to this spatial setup. As Deleuze remarks in an interview on *A Thousand Plateaus*:

> We think lines are the basic components of things and events. So everything has its geography, its cartography, its diagram. What's interesting, even in a person, are the lines that make them up, or they make up, or take, or create. Why make lines more fundamental than planes or volumes? We don't, though. There are various spaces correlated with different lines, and vice versa . . . Different sorts of line involve different configurations of space and volume. (Deleuze 1995: 33)[10]

The primacy of lines is another idea that Deleuze had been working on in his days before Guattari.[11] It is, however, not until the intermediary years between *Anti-Oedipus* and *A Thousand Plateaus* that Deleuze sets out clearly his analysis of lines in an essay written with Claire Parnet, titled 'Many Politics'. Put briefly, Deleuze claims that all things and events are composed of three types of lines. The first line is the line of rigid segmentarity. These are the great segments of rich–poor, young–old, health–sickness, and so on, which dominate the easily visible and communicable aspects of our social lives (Deleuze and Parnet 2002:

126). In contrast to this line of rigid segmentation, the second line is supple. These second lines are the cracks that split through the lines of great segmentary cuts: 'rather than molar lines with segments, they are molecular fluxes with thresholds or quanta' (124). There is then a third kind of line, a line of flight or rupture. On this line, it is 'as if something carried us away, across our segments, but also across our thresholds, towards a destination which is unknown, not foreseeable, not pre-existent' (125).

So far so good – what we have here is a spatialisation of three different aspects and/or processes of existence: one that consists of our acquiescence to clearly identifiable oppositions; a second that reveals cracks in this façade and various accumulations of exceptions to the binary rule; and a third aspect and/or process of life by which we become something completely new. But now we reach a problem: how do the various spaces we have looked at correlate with these three lines? And more pertinently: *which line is the nomadic line?* Presuming that the molar line of rigid segmentarity aligns with the State and the striated, which of the latter two lines belongs to the nomad: the second line of 'mobile and fluent thresholds' (Deleuze and Parnet 2002: 127) upon which 'the most secret mutations' occur (Deleuze and Guattari 1987: 203), or the third line, the line of abstract detachment and absolute becoming? Adequately responding to this question, I believe, is of critical importance if we are to make sense of Deleuze's revolutionary politics. To do so, however, is by no means straightforward. Let me demonstrate.

In some instances the answer is obvious. For example, Deleuze and Guattari described the three lines at one point as (1) the rigid Roman State, (2) the line of the advancing Huns, with their war machine fully directed towards destroying the Roman peace (*pax romana*), and (3) the barbarians caught between the two, who pass from one to the other (Deleuze and Guattari 1987: 222–3). The order of presentation has changed here, but the nomads are clearly placed on the pure abstract line that comes 'from the east' (Deleuze 1990: 129). But on other occasions, the matter is more confused. For example, from pages 130–4 of Deleuze and Parnet's 'Many Politics' essay, the molecular line and the line of flight (crack and rupture) appear to be read together, to the extent that Deleuze and Parnet even feel the need to defend the apparent dualism that 'rigid and binary segmentarity' forms with 'molecular lines, or lines of border, of flight or slope'. And for the remainder of this essay, Deleuze and Parnet will often slip between an analysis of three to one of two (see Deleuze and Parnet 2002: 130–4, 141–2). These confusions persist throughout *A Thousand Plateaus*. In one location, for instance, Deleuze

and Guattari state that 'From the viewpoint of micropolitics, a society is defined by its lines of flight, which are molecular' (Deleuze and Guattari 1987: 216). Elsewhere, however, Deleuze and Guattari clearly describe the second line as a rhizomatic line in distinction to the line of flight, where it is the rhizome that 'belongs to a smooth space' and constitutes 'anomalous and nomadic multiplicities', 'multiplicities of becoming, or transformational multiplicities' – in short, Bergson's heterogeneous or non-metric multiplicity (Deleuze and Guattari 1987: 505–6). Which line is it, then, that is truly nomadic, that belongs to a smooth space? Which of these two lines is the line of becoming, and on which line does creativity occur? The crack or the rupture, the molecular line or the line of flight, the rhizomatic line or the pure abstract line?

There is another problem of significance closely related to this question. When Deleuzians speak of the dualisms major/minor, molar/molecular, State/nomad and others like them, it is common to associate the 'major' term in each set with consolidation, stasis, identity and being, while the 'minor' term is grouped with dispersion, flow, difference and becoming (to name but a few).[12] But as we have seen above, the molar and molecular are themselves only two of three lines, the third of which – the line of flight – is also commonly equated with these same 'minor' terms. How, then, are we to reconcile the three lines with Deleuze's great dualisms? How does three fit into two, and vice versa? This problem is often glossed over and/or inadequately explained in the secondary literature. There are numerous examples, but let us briefly consider two. In his glossary of Deleuzian vocabulary, François Zourabichvili explains for us most capably the contrast between a line of flight and the process of striation, which proceeds via binary couples. He has rather less to say, however, on how lines of flight differ from and relate to molecular lines; indeed, Zourabichvili barely admits the existence of these other lines, and when he does so he is careful to omit their molecular name, preferring to call them by their other moniker – supple (Zourabichvili 2012: 179). Given that Zourabichvili will elsewhere directly relate the molecular to the nomadic and the smooth (182), this omission is certainly most convenient, as it would patently jar with the link he also wants to claim between the line of flight and smooth space (179).

In her essay 'Politics as the Orientation of Every Assemblage', Véronique Bergen goes farther than Zourabichvili in explicating Deleuze's political topology. Bergen, however, does not take note of the slippages in Deleuze's own treatment of the three lines that I revealed above; on the contrary, she reproduces them. After

noting that a Deleuzian political ontology is composed of, on the one hand, the molar/molecular schema, and on the other, the three lines, Bergen proceeds to predictably align the molar/molecular schema with various other Deleuzian dualisms, such as actual/virtual, macroscopic/infinitesimal and history/becoming. But when it comes to discussing the three lines, subtle shifts occur in explication that make it difficult to understand how these two topologies relate. For example, while we are initially told that it is with molecular lines that 'becomings emerge, occurring in a non-chronological time', Bergen subsequently reveals that it is lines of flight 'that are characterised by a primacy that is ontological and not chronological' (Bergen 2009: 36–7). And as her analysis continues, lines of flight are described using the terms 'micropolitics', 'evental efflugences' and 'becoming', in direct opposition to 'macropolitics', 'the state of things' and 'history' (37). It is thus not surprising that when Bergen attempts to juxtapose the two topologies, she fails to refer to all three lines. As she says:

> Mixing the types of lines – the molar being equivalent to hard segmentary lines, the molecular to quantum lines – the 'molar' and the 'molecular' compose a double mode of being, in immanence, which, in every assemblage, signals the existence of a virtual which insists as pure reserve and an actual without resemblance to the transcendental forge from which it emanates. (Bergen 2009: 36)

As we can see here, the dualistic molar/molecular schema is accounted for, but where are all three lines? If the molar term in the dualistic molar/molecular schema is equivalent to molar lines (rigid segmentary lines), then which line is equivalent to the molecular half? Bergen evades this question somewhat by referring to 'quantum lines', but which of the three lines are these? Molecular lines or lines of flight? To the best of my knowledge, the phrase 'quantum lines' never appears in Deleuze's work – he instead refers to lines 'marked by quanta' or 'with quanta'. But to be fair to Bergen, Deleuze is himself confused on this very question. Depending where you look, it can be either the second or third line that is 'marked by quanta' (compare Deleuze and Parnet 2002: 124 and Deleuze and Guattari 1987: 195 with Deleuze and Guattari 1987: 222). The same problem can be found when tracking the respective dangers of the three lines. While falling/reverting into a black hole is at times said to be the danger of the second molecular line, at others times this is the danger of lines of flight (compare Deleuze and Parnet 2002: 138 with Deleuze and Guattari 1987: 205). Thus, while it is clear that molar lines hold up one half of the dualism, we are left to wonder by Bergen and

Deleuze alike as to how the second and third lines conspire to form the other half, whether one takes the place of the other, and/or which one of them is 'becoming' if it is the molar that is 'history'.[13]

What, then, are we to make of all this confusion? Are nomads molecular, or do they instead pursue a line of flight distinct from molecular lines? In light of the shifting and/or confused presentation of the material that I have highlighted – itself exacerbated by the fact that the texts we are drawing from here were written by three people, two of whom never collaborated and could very well have penned the passages in question – we as Deleuzians are somewhat liberated to make of this political ontology-topology what we will (within limits, of course). Granted this licence, and contrary to the previous stated evidence that names the nomad as 'the Deterritorialized par excellence' and the 'man of deterritorialization' (Deleuze and Parnet 2002: 134), I would suggest that if the nomad is to be the figure of transformation, then it might in fact be more appropriate to place him or her in the continually shifting and amorphous space *in-between* the Romans and the advancing Huns. For is it not the barbarians who come closest to the ontology and ethic of transformation? The Huns are sure of their task – destruction of the State – but the barbarians, by contrast, have mastered the art of disguise and metamorphosis, continually going *between* the Romans and the Huns, becoming one, passing off as another, and then taking up arms against either or both. It is the barbarians, in other words, that are truly between known and immutable identities. As Deleuze and Guattari note at one point: 'It is odd how supple segmentarity is caught between the two other lines, ready to tip to one side or the other; such is its ambiguity' (Deleuze and Guattari 1987: 205). But is not this 'oddity' precisely the essence of metamorphosis and transmutation? Is not this 'ambiguity', as opposed to pure being or pure becoming, precisely what is so 'Interesting, Remarkable, and Important' (Deleuze and Guattari 1994: 82)? Such, in my opinion, is the virtue of this other transformative figure, or second force of nomadism, who moves between purities – the molecular barbarians, or what we might possibly think of as the *real* (but not absolute) nomads of Deleuze and Guattari's nomadology.[14]

The majority of Deleuze's pragmatic and prescriptive moments support this reading. Invariably, every call made by Deleuze for 'revolutionary becoming' is tempered with a precautionary reminder. To demonstrate, witness the conclusion to the 'Many Politics' essay (which is then replicated and developed further in the 'Micropolitics' plateau). First, dissolution of the State and the line of rigid segmentarity is not the point in itself. As Deleuze says:

> Even if we had the power to blow it up, could we succeed in doing so without destroying ourselves, since it is so much a part of the conditions of life, including our organism and our very reason? The prudence with which we must manipulate that line, the precautions we must take to soften it, to suspend it, to divert it, to undermine it, testify to a long labour which is not merely aimed against the State and the powers that be, but directly at ourselves. (Deleuze and Parnet 2002: 138)

Second, to those who are too sure of their calling, Deleuze has the following to say: 'You have not taken enough precautions' (Deleuze and Parnet 2002: 138). 'Precaution', 'prudence' – not exactly the words that would support a Deleuzian politics founded on the celebration of absolute deterritorialisation. In fact, in a direct response to those readers who would overly glorify (or attack) his analysis of becoming and deterritorialisation, Deleuze remarks:

> Some have said that we see the schizophrenic as the true revolutionary. We believe, rather, that schizophrenia is the descent of a molecular process into a black hole. Marginals have always inspired fear in us, and a slight horror. They are not clandestine enough. (Deleuze and Parnet 2002: 139)

Such 'marginals', in other words, are a bit too obvious. One should not be able to identify a nomad from their haircut. If it were that easy then genuine creation would not need encouraging or protecting. This is why the question of the revolution is so problematic:

> The question of a revolution has never been utopian spontaneity versus State organization. When we challenge the model of the State apparatus or of the party organization which is modelled on the conquest of that apparatus, we do not, however, fall into the grotesque alternatives: either that of appealing to a state of nature, to a spontaneous dynamic, or that of becoming the self-styled lucid thinker of an impossible revolution, whose very impossibility is such a source of pleasure. (Deleuze and Parnet 2002: 145)

We can thus see from these passages precisely who is *not* a true revolutionary for Deleuze: both acolytes of pure flux and 'marginals' will be incapable of thinking, let alone bringing about, a 'new type of revolution' (Deleuze and Parnet 2002: 147).[15] This new type of revolution is not entirely sure of the way forward; it is not even always sure where the impediments are or who are the nomads. But it could not be otherwise, since

> we can't be sure in advance how things will go. We can define different kinds of line, but that won't tell us one's good and another bad. We

> can't assume that lines of flight are necessarily creative, that smooth spaces are always better than segmented or striated ones. (Deleuze and Guattari 1987: 33)

A tempered position marked by prudence is therefore the most appealing. It is also the most difficult, and in a certain sense, the most radical: as the molecular barbarians know, there is arguably nothing harder than charting one's own path between a binary of oppositional lines. It is no doubt true that Deleuze often partakes in dualistic decisions, especially when it comes to the ontologies of becoming and being. But in the end, Deleuze always hopes to go beyond these, to itinerate between so that he can both become and defend against its dangers at the same time. This is why it is important to remember that what Deleuze calls 'the crack' (originally taken from F. Scott Fitzgerald's autobiographical essay *The Crack-Up*[16]) in fact refers to the molecular or rhizomatic line *in-between* the lines of rigid segmentary that 'proceed by oversignificant *breaks*' and the line of rupture: '*Break line, crack line, rupture line*' (Deleuze and Guattari 1987: 200). Only then can we understand the following guideline:

> Well then, are we to speak always about Bousquet's wound, about Fitzgerald's and Lowry's alcoholism, Nietzsche's and Artaud's madness while remaining on the shore? . . . Or should we go a short way further to see for ourselves, be a little alcoholic, a little crazy, a little suicidal, a little of a guerrilla – just enough to extend the crack, but not enough to deepen it irremedially? (Deleuze 1990: 157–8)

Become a little bit, but not too much. Leave the shore, certainly, but do so in order that you may find a new land – do not hope to become irrevocably lost at sea. In other words, extend the crack and connect the rhizome, but do not become the rupture. When you do so, a line will be drawn that is distinguishable from both the inexpressive and the expressions of State segmentarity: a nomadic line that is *invested with* abstraction and *connects with* a matter-flow (that moves through it); a *developmental* line of becoming that is not enslaved to the incorporeal surface or corporeal depth, but is the progressive movement between them. That this line is distinct from the line of flight, yet also distinct from the striae that express and organise in an entirely different way (Deleuze and Guattari 1987: 498), once again reaffirms the middle status of the nomad that I have re-emphasised in this paper.

Conclusion

What, then, does it mean to be a real nomad or true revolutionary according to Deleuze's political ontology? As we can now see, it is questionable whether an absolute nomad placed in binary opposition to the State is capable of living up to the real nature of Deleuze's nomadism. This is because bringing down a State apparatus is insufficient on its own in responding to 'the revolutionary problem', since there is every chance (as history well shows us) that a revolutionary force will become despotic. Revolutionary forces and becomings thus cannot be simply ascribed to those who call for the Revolution and devote their waking lives to its fulfilment, for not only is it difficult to determine who is a nomad or what is a smooth space by appearance, but the nomad and the smooth are themselves susceptible to appropriation by the State and the striated. These appropriations can occur, furthermore, not simply through the transformation of what was once nomadic-smooth into something statist-striated, but even more worryingly through a maintenance of its nature redirected towards other ends. As Deleuze and Guattari warn:

> We say this as a reminder that smooth space and the form of exteriority do not have an irresistible revolutionary calling but change meaning drastically depending on the interactions they are part of and the concrete conditions of their exercise of establishment. (Deleuze and Guattari 1987: 387)

As for who are our nomads today, our true revolutionaries . . . ? Ultimately, this is a question to which Deleuze's practice of thought brings us rather than answers – or perhaps more specifically, rephrases and reapproaches as follows: where are your lines, your breaks, cracks and ruptures? Do you recognise these lines in yourself or the various organisations you are a part of?[17] Chances are you will – if Deleuze is correct, then there is a little bit of each in all of us. And chances are that this evaluation can aid in avoiding formations that slide dangerously to one side. If we are thus unable to name names in our search for nomads and revolutionaries, what I think we can safely say is that to be a real nomad or revolutionary in the Deleuzian sense, one must be attuned to the different lines that we are composed of, maintain an appropriate respect for each of them (without collapsing one onto the other), and pursue any engagement and experimentation between them with a healthy dose of 'prudence' and 'precaution'. For it is only through such a practice that creativity and transformation can not only

be embarked upon, but concretely realised in a strata of organisation that facilitates life.

Notes

1. For a comprehensive survey of the field of Deleuze and politics, see Gilbert 2009.
2. Nicholas Thoburn poses a similar question to this in his excellent piece 'What Is a Militant?' (Thoburn 2008). Thoburn's pursuit of this question takes the form of a critique of militant groups (in particular the Weatherman group) through the use of Deleuzian philosophy. My paper, in contrast, will provide a description of this philosophy, followed by a critical analysis of it, for the purposes of addressing a Deleuzian problematic. Thoburn's paper, furthermore, does not really complicate the notion of the militant, but on the contrary specifies and clarifies the figure of the militant, before going on to suggest an a-militant alternative. In distinction to this, my paper will demonstrate the complexities involved in determining the figure of the nomad, and will suggest that there might be more than one alternative. For these reasons and more,

   I would consider our papers to be both distinct and complementary. I would furthermore consider my paper to be distinct from and complementary to Véronique Bergen's 'Politics as the Orientation of Every Assemblage' (2009). As with Bergen's analysis, my paper will emphasise the significance of topology to Deleuze's political ontology. This analysis, however, will subsequently proceed to a critique of this political ontology that reveals insights absent in Bergen's paper.
3. Deleuze is, of course, not the first or last person to identify this revolutionary problem. The purpose of this paper, however, is not so much to integrate Deleuze with other literature on the topic, but rather to articulate more specifically the nature of Deleuze's response to this problematic, and by doing so complicate the dualistic tropes upon which much Deleuzian political philosophy rests, whether normative or descriptive.
4. While much of what I will describe in the first section of the paper is no doubt familiar to learned Deleuzians, I would point out that it nevertheless remains necessary to state the basic concepts and standard positions of Deleuzian thought that this paper will subsequently attempt to complexify and challenge.
5. See also Deleuze and Guattari 1987: 369, where *nomos* is opposed to *logos*: 'there is an opposition between the *logos* and the *nomos*, the law and the *nomos*'.
6. See also Deleuze 1990: 75, where nomadic distribution is explained as 'distributing in an open space instead of distributing a closed space'.
7. For further evidence of how Deleuze and Guattari's conception of the nomad/State and smooth/striated is derived from Bergson's theory of multiplicities, see Deleuze and Guattari 1987: 477, 479, 488.
8. For a fuller analysis of the Nomadology that chronicles the plateau's movements (from dualism to a triad to monism and pluralism) see Lundy 2012: ch. 3.
9. For the Boulez reference, see Boulez 1971: 87 (translation modified). For more on the dissymmetrical passages between and transmutations of the smooth and the striated, see Deleuze and Guattari 1987: 474, 480, 482, 486, 493, 500.
10. See also Deleuze and Guattari 1987: 202: 'Individual or group, we are traversed by lines, meridians, geodesics, tropics, and zones marching to different beats and differing in nature.'
11. See Deleuze 1990: 154–61.
12. For one amongst numerous examples of this, see Buchanan 2008: 16–17.

13. For one further example, see Gilbert 2009: 18. As we find here, the major/minor schema is invoked, molar lines are affiliated with the 'major', lines of flight with the 'minor', and there is no mention of molecular lines. Gilbert, it must be said, is only referring to these issues in passing, as opposed to Zourabichvili and Bergen's more direct/extensive treatments. But it is for this reason that I would bring attention to this example – for if the reconciliation of the two topological schemas is perennially passed over as a problem within the literature on Deleuze and politics, it is for the most part due to such pervasive casual references to, and uses of, the relevant terms.
14. I am willing to concede that this advocation of the molecular barbarian over the nomadic rupture is, to a certain extent, rhetorical. However, given the paucity of coverage within the secondary literature of this middle figure, in between the nomad and State, I would argue that this polemical treatment is justified. One could note, for instance, that it is far more common to find within the secondary literature on Deleuze a defence of the State and the virtues of molarity than it is to find any discussion of molecular barbarians – their positive features and their distinction from both the nomad and State.
15. Thoburn's investigation into 'what is a militant' also arrives at this point (Thoburn 2008: 114). I would point out, however, that Thoburn's route to this conclusion is quite distinct from mine.
16. See Fitzgerald 1945.
17. As Deleuze puts it: 'This is why the questions of schizoanalysis or pragmatics, micro-politics itself, never consists in interpreting, but merely in asking what are your lines, individual or group, and what are the dangers on each' (Deleuze and Parnet 2002: 143). In drawing attention to this feature, it must be noted that I do not mean to suggest that the question of 'who' is a bad one or needs replacing with the question of 'where'. While I would not disagree with commentators who suggest that the question of 'where' is of the utmost importance to a Deleuzian politics (Bergen 2009: 34–5), what my analysis has endeavoured to demonstrate is no more or less than the manner in which the questions of 'who', 'where' and 'what' are intertwined in Deleuze's thought – a feature that is perhaps most evident in Deleuze's final book with Guattari, in which all of these questions are posed and shown to inform one another. At any rate, the question of 'who are our nomads today?' is Deleuze's own question (Deleuze 2004: 260), and thus one that is presumably worth pursuing within Deleuzian thought, even if or when this pursuit involves forays into topology.

What Is Called Thinking?: When Deleuze Walks along Heideggerian Paths

Benoît Dillet University of Kent

Abstract

When on the last page of *What Is Philosophy?*, Deleuze and Guattari (1995: 218) claim that philosophy needs a non-philosophy, this statement is the result of a long engagement with the problem of thinking in society. It is this engagement that we intend to reconstruct in this article. By developing an original definition of thinking after Heidegger, Deleuze is able to claim that philosophy is not the only 'thinking' discipline. Our point of departure is Deleuze's constant reference to a phrase from Heidegger's lecture course *What Is Called Thinking?*: 'We are not yet thinking' (Deleuze 1988: 116, 1989: 167, 1994: 144, 2002: 108; Deleuze and Guattari 1995: 56). This phrase points to the demand for a new distribution of the relation between philosophy and its outside. The purpose of this article is to trace Heidegger's influence on Deleuze's definition of thinking and to raise two points. First, Deleuze borrows some elements of Heidegger's definition of thinking to further his own understanding of politics as an involuntary practice. For both, the question of thinking is *political*. Second, by departing from Heidegger, Deleuze can democratise the definition of thinking, beyond its confinement to philosophy, by turning to cinema. Deleuze calls cinema the art of the masses because it brings the masses in contact with external signs. Finally, in the last part of this article, we will discuss how Deleuze raises stupidity (and not error) as a transcendental problem that should be constantly fought. In this way, we hope to shed light on how Deleuze moves from Heidegger's question 'what is called thinking?' to the problem of stupidity and shame.

Keywords: Heidegger, involuntary, thinking, politics, cinema, stupidity

I. Asking the Question: What Is Called Thinking?

A reflection on thinking ultimately requires us to question not only the relation between thinking and being, but also to answer the question 'who thinks?' or 'who can have access to "thoughts"?'. After Heidegger, thinking has to do with ontology and this is even more true for Deleuze who decidedly follows Heidegger's uncovering of the question of being by affirming that 'philosophy merges with ontology' (Deleuze 1990: 179). Yet for Deleuze, thinking refers less to a constituted subject than to a set of singularities and processes that sometimes constitute themselves as a subject (sharing similarities with what Foucault calls subjectivation). Drawing on Simondon, Deleuze's ontology manifests itself as psycho-collective, or impersonal and pre-individual, individuations, always in the making. This Deleuzian ontology is distinct from the ontological difference put forth by Heidegger (as the Being of beings), whose project is a constant search for the un-concealing (*aletheia*) and the clearing of the Truth of Being by de(con)structing the history of Western metaphysics. Deleuze's ontology of the actual and the virtual resembles the twofold nature of Heidegger's ontological difference but ultimately differs from it. This becomes clear when looking at their political thought.[1] As we will see, Heidegger believes that philosophy founds science and that the university should remain independent from politics, whereas for Deleuze thinking happens in all disciplines, as illustrated by the example of cinema. We will attempt to make sense of Deleuze's references to Heidegger in order to understand how – from a Heideggerian perspective – he can develop an understanding of politics as an involuntary practice. The main objective of this article is to understand why, for Deleuze, politics too should start thinking. In this sense, we will be arguing that the question 'what is called thinking?' is not only crucial for Deleuze's philosophy but also for his political thought, since for Heidegger this already is a *political* question.

Deleuze left us with some indications as to how and where his philosophy meets Heidegger's. While in *What Is Philosophy?* he famously wrote with Guattari that 'it is not always easy to be Heideggerian' (Deleuze and Guattari 1995: 108), he did not hide his disagreement with Heidegger's understanding of ontological difference and the project of overcoming metaphysics (Deleuze 1995: 136). There are two places where he explicitly presents his relationship to Heidegger. The first is in the preface to *Difference and Repetition*, where he signposts that the book is, among other things, a confrontation with

him (Deleuze 1994: xix). The theme of the univocity of being that lurks throughout Deleuze's philosophy draws directly from Heidegger's reading of Parmenides and Duns Scotus, while at the same time departing from Heidegger to posit that being is difference independently from identity (A = A) and the repetition of the same.[2] The second is in Deleuze and Heidegger's respective interpretations of Nietzsche. Following Malabou (2010), we can claim that shifting the interpretation of Nietzsche away from Heidegger's reading, but also, more broadly, away from any conservative and reactionary reading, is one of the main objectives of *Nietzsche and Philosophy* (2002). Deleuze discusses Heidegger's reading of Nietzsche by referring to the lecture course *What Is Called Thinking?* in a footnote (Deleuze 2002: 220), criticising his interpretation of the eternal return for remaining bound to identity and opposition. For Heidegger, the eternal return happens in life and is an affirmation against death and weakness, whereas for Deleuze the eternal return cannot be subjected to identity and the same but is the repetition of difference. In Deleuze's case, then, the eternal return belongs to a philosophy of difference that breaks with recollection as a philosophy of identity (Boundas 2009: 332). 'The Identical does not return ... only affirmation returns – in other words, the Different, the Dissimilar' (Deleuze 1994: 299). Since repetition is disburdened from identity and representation, thinking is without an origin and a destiny; most importantly, it cannot happen 'between two things, between a point of departure and a point of arrival, not even between Being and being' (Deleuze 2004: 159).

As Malabou (2010) notes, by interpreting the eternal return as the return of difference Deleuze (with other French philosophers such as Derrida, Blanchot, Klossowski) performs 'an interpretative *coup*', reintroducing a concept that is not found in Nietzsche back into the latter's philosophy.[3] The conflict constitutes without doubt a decisive step in Deleuze's formulations that 'being is difference' and that 'to ground is to metamorphose' (Deleuze 1994: 64, 172). In brief, we find a univocity of being which is disengaged from Heidegger's thought.

Now that we have referred to the main places where Deleuze explicitly confronts and disagrees with Heidegger's philosophical project, we can investigate their common ground. Deleuze borrows the concepts of *Denken* (thinking), *Stimmung* (mood) and *Gelassenheit* (releasement) from Heidegger. We will argue that much of Heidegger's theory of thinking[4] (in relation to waiting and releasement) influenced Deleuze's conception of thinking and other practices as 'involuntary'. The emphasis placed on the involuntary is not an apology for renunciation or

resentment, but rather it means that thinking and other practices must be opened up to an impersonal and collective dimension disburdened from the object and the subject. Thinking, but also other realms, such as politics, can be conceived from the perspective of the involuntary (see Zourabichvili 1998). But before we extend this claim to politics, it is important to understand that this involuntary practice of thinking is both an interpretation and a continuation of Heidegger's claim that 'we are not yet thinking'.[5] For instance, Deleuze notes in an interview soon after the publication of *Difference and Repetition* that: 'what we're looking for these days is a new image of the act of thought, its functioning, its genesis in thought itself' (Deleuze 2004: 139–40).

Although thinking can be conceived as a traditional problem since the first philosophy of Descartes in his *Metaphysical Meditations*, with Heidegger it takes on a collective, hence *political*, meaning that is taken up by Deleuze with different aims. Deleuze wants to 'renew' the image of thought *with* but also *contra* Heidegger: 'It is definitely Foucault, along with Heidegger but in a quite different way, who has most profoundly transformed the image of thought' (Deleuze 1995: 95; translation modified). The expression 'image of thought' should be read as a continuation of Marx's concept of ideology (Sauvagnargues 2010: 38), with the distorted reality here figuring as a certain 'dogmatic' representation within philosophy, a kind of false consciousness existing in philosophy. It is Marxist precisely because this dominating ideology is the result of an alienating historical development: 'An image of thought called philosophy has been formed historically and it effectively stops people from thinking' (Deleuze and Parnet 2006: 10). But equally, the notion of the 'image of thought' can be interpreted in a different and positive way, in which thinking refers to faculties other than the cognitive faculty: a sensibility and a visibility (as we shall see in sections II and V, regarding signs and the cinematic image). For Deleuze, the form of thought should be expressive and performative and not simply reduced to its content: the couple form/content of thought cannot be separated. The image should not simply be used in philosophy as an example or a metaphor, but according to Deleuze (which is arguably true for many twentieth-century French philosophers), the very expressivity found in art should also be considered. To connect thought with images, or to introduce images into thought, is to establish parallels with other spheres of contemporary life, in order to create resonances in tune with the spirit of our time. Indeed, as he puts it, 'What can be more joyful than a spirit of the time? [*Quoi de plus gai qu'un air du temps*]' (Deleuze 2004: 142; translation modified).[6]

It is our claim that the spirit of the time helps differentiate between philosophy and thought. For Deleuze, thought is simultaneously larger and more democratised than philosophy. Another example can help us make this point: in the same text 'Nietzsche and the Image of Thought', Deleuze explains that his project in *Difference and Repetition* is 'simply' to compose the philosophical treatise which synthesises the 'current thought', drawing directly from his present, which is France in the 1960s (Deleuze 2004: 142). The question of the spirit of the time [*air du temps*] can be juxtaposed to Heidegger's concept of *Stimmung*, or 'mood', precisely because it refers to an impersonal realm of affects. Françoise Dastur offers, in *Heidegger et la question du Logos* (2007), an interesting etymological analysis of the word *Stimmung* in German:

> It will be worth noting that *Stimmung* and *stimmen* come from *Stimme*, a German word from unknown origins, but whose first meaning is the voice in its juridical sense as to give a voice to a vote. *Stimmen* consequently means to make one's voice heard, to call, to name, then to be in agreement and also to be disposed, hence *Stimmung*, which has the meaning of tuning (as in tuning a musical instrument), then as a disposition, mood, tonality, atmosphere. (Dastur 2007: 113; my translation)

Deleuze seems to use the expression '*un air du temps*' in a very similar way to this Heideggerian notion of *Stimmung*, as a manner of doing philosophy in tune with its contemporary times. As Dastur quotes from Heidegger's first lectures on Nietzsche, '*Stimmung* is precisely the fundamental manner according to which we are exterior to ourselves' (Dastur 2007: 117; my translation). It is this spirit of the time that shatters the constituted subject and presents the possibility to individuate, to compose with the world as psycho-collective individuations. For both Heidegger and Deleuze, *Stimmung* and *air du temps* are ontological formations rather than psychological perceptions. For both, yet very differently, an image of thought reflects a present, challenging all forms of doing philosophy by inscribing in them a political imperative, and opening thoughts and politics to other realms as the means to a process of transindividuation.[7] In short, thinking is a dangerous and a transformative activity. In order to bring to the fore the political elements contained in this untimely question 'what is called thinking?', it is necessary to think the present against eternal and ahistorical truths. As we may recall here, Foucault claimed that this thought of actuality was first expressed in modern times by Kant, in *What Is Enlightenment?* as an attempt to answer the question: 'what is it in the present that currently has meaning for philosophical reflection?'

(Foucault 2010: 12). Before coming back to the historical determination of thinking (especially in relation to nihilism), we should first turn to the question of the role of signs in shaping the involuntary practice of thinking.

II. The Thinking Path: A Typology of Signs and Thinking as an Involuntary Practice

One of the key themes running throughout Heidegger's lectures on thinking is the process of learning. The emphasis on learning is crucial to understanding the objectives of the book, and as the translator notes in his introduction, Heidegger's 1951–2 lectures on *What Is Called Thinking?* were the first he had been allowed to deliver since his suspension in 1944 for his involvement with the Nazi regime (Glenn Gray in Heidegger 1968: xviii). Here, Heidegger claims that

> in order to be capable of thinking, we need to learn it first. What is learning? ... We learn to think by giving our mind to what there is to think about ... Everything thought-provoking gives us to think ... [What is] [*most*] *thought-provoking is that we are still not thinking*. (Heidegger 1968: 4; original emphasis)

This last sentence is referred to again and again by Deleuze. For Heidegger, if thinking is a human faculty, it does not mean that we are currently thinking. This is the first argument Heidegger presents, that thinking is not an innate faculty but a process to be acquired over time, through a process of learning. In fact, one cannot find what thinking is or what there is to think if one does not attempt to find the 'path' to thinking (Heidegger 1969: 23).

This process of learning is also inscribed in Heidegger's reflections on the role of the university and how knowledge should be taught. This is a concern already evident in his inaugural address at Freiburg in 1929 'What Is Metaphysics?' expressed through the questions of the role and the meaning of the sciences as political questions, concerns that awaken Heidegger from his unpolitical sleep (Heidegger 2003: 24–7). The lecture series *What Is Called Thinking?* raises political concerns but from an untimely angle: the task of thinking needs to be recuperated in the age of the atomic bomb, cybernetics and technology. When Heidegger, referring to *What Is Called Thinking?*, claims that 'perhaps it is also a sign of the times that this book of all my publications has been read the least' (Heidegger 2003: 42),[8] he emphasises the importance of these lectures in his body of work, but also maintains that the political stance

to be found in them is untimely and that the people are not ready to use the antidote to cure their disease.

For Deleuze, as well, thinking has to do with a learning process; it is not about following a 'correct' method but about looking for the path to thinking: 'Thought does not need a method but a *paideia*, a formation, a culture' (Deleuze 2002: 110). However, Deleuze does not fully agree with Heidegger that the concrete contemporary world is a non-thinking time and asserts instead that thinking should be democratised rather than repressed through 'correct' methods and certain institutions. This is precisely why he argues that thinking should be the work of both words and images, the image of thought.

> No one takes thought very seriously, except those who claim to be thinkers or philosophers by profession. But that does not stop it from having its own apparatuses of power … when [thought] tells people: 'Don't take me seriously, because I think for you, since I give you conformity, norms and rules, an image'; to all of which you may submit all the more as you say: 'that's not my business, it's not important, it's for philosophers and their pure theories'. (Deleuze and Parnet 2006: 10)

The last sentence of this quote admirably shows that Deleuze calls for the people to get involved in 'thought' and to refuse the division of labour between thought and action, and the competition between the two. Locating thought in the brain and in society has been a political enterprise ever since the development of phrenology in the early nineteenth century with Joseph Gall and Johann Spurzheim. What is called thinking?, '[T]he question has ceased to be a purely theoretical one. It now seems that more and more of the powers that be [*de plus en plus de pouvoirs*] also take an interest in our capacity to think' (Canguilhem 2008: 7).

Here Heidegger's argument about thinking overcomes two hundred years of mystification about where thinking comes from. To ask about the location of thought, whether 'the brain secretes thought as the liver does bile' (Canguilhem 2008: 8), is to challenge the common belief that thinking is genetic, natural and, most importantly, effortless. In fact, thinking is a natural faculty whose practice does not come naturally to us. How do we come to realise that we are not yet thinking? Heidegger explains that when we are looking for thought, we become aware of its withdrawal, which functions as 'a sign' pointing in a particular direction. 'As [man] draws toward what withdraws, man is a sign' (Heidegger 1968: 9). Heidegger repeatedly refers to Hölderlin's sentence 'we are a sign that is not read' (Heidegger 1968: 9). Surely as a rational animal,

man should be able to think, Heidegger claims, yet it is perhaps because man wants it too much that he is not currently thinking.

If thinking is not a natural condition, then a necessary struggle is required to trigger thought. Again Deleuze agrees with and follows Heidegger on these points: 'we are not going to think unless . . . we are forced' (Deleuze 2002: 110). Thinking is not a voluntary activity but needs to be triggered by the unthought, or what Deleuze calls after Blanchot and Foucault, the outside. Collecting signs for Deleuze mostly means tracing the disjunctive relation between the sensible and the intelligible, between non-sense and sense, between unthought and thought. Only in their discord, when they are 'out of joint', can the faculties produce the new. By emphasising the role of violence and the outside, Deleuze wants to move away from the model of recognition, since the maintaining of their accord fixes the faculties. The chapter 'The Image of Thought' in *Difference and Repetition* presents the difficult argument that for 'real' thinking – that is, thinking the new – the faculties should be discordant in order for them to be raised to their transcendent order (Deleuze 1994: 143).

Deleuze also writes in *Proust and Signs* that learning how to think concerns signs, and compares the thinker to an Egyptologist trying to decipher hieroglyphs and signs, to give them sense and value. Faculties can only be discordant once they are disturbed by external signs. It is these signs that give thought sense and value (Deleuze 2000: 4). 'What is essential is outside of thought, in what forces us to think' (Deleuze 2000: 95). Thinking for Deleuze is both involuntary and always-already involves extraneous elements – what he calls following Blanchot's reading of Artaud, 'powerlessness' (*impuissance*) (Deleuze 1994: 147). This powerlessness resembles what Heidegger calls 'waiting' or 'releasement' (*Gelassenheit*), which is an involuntary disposition towards thinking.[9] By releasement, Heidegger means that 'thinking' should be learned involuntarily, that is, it does not require a 'will': 'thinking is something other than willing . . . releasement does not belong to the domain of the will' (Heidegger 1966: 59).

This 'releasement' also functions in the second part of the lecture course *What Is Called Thinking?* to show that language can be used not as a mere means of expression, but also as a tool to interpret and unconceal the ontological difference to be rediscovered, since 'the time may finally have come to release language from the leash of common speech' (Heidegger 1968: 192).[10] What he calls a 'releasement toward things' (Heidegger 1966: 54) should not be simply understood as the opposite of practice or of any form of activity. On the contrary, since

men only 'want' to think but do not act, he calls for a releasement towards things, a kind of distancing that is already a way of acting: 'it may be that man wants to think, but can't. Perhaps he wants too much when he wants to think, and so can do too little' (Heidegger 1968: 3). In order to reach the thinking stage, one should be predisposed to it by disengaging and distancing oneself from the calculative thinking predominant in Western societies and Western thought.

III. Nihilism and Thought

It is precisely because for Heidegger thinking is a matter of remembering what metaphysical thought has forgotten, of finding 'autochthony' and 'rootedness' (Heidegger 1966: 48–9), that his project (or 'historical mission') for 'Western civilisation' is to attain the truth of Being (Heidegger 2008: 233). Thinking should be understood as part of his philosophy of history, as the project of Western civilisation 'whether or not Western thought has yet attained the ground upon which it stands' (Pöggeler 1987: 4). The 'unthought' in Heidegger is not a desire for the new, but on the contrary the remembering of a forgotten thought. By contrast, for Deleuze the unthought is the radically new, echoing another question that he will ask in a conference paper entitled 'What Is an Act of Creation?' (Deleuze 2003). This thought of the new is a necessity but a pre-individual and impersonal one. While for Deleuze thinking is about becoming outside certain (reactive) conceptions of history, for Heidegger it seems that thinking refers to his philosophy of history as a history of philosophy. This is why in *What Is Philosophy?*, Deleuze and Guattari reproach Heidegger for remaining a 'historicist' (Deleuze and Guattari 1995: 95).

'We are not yet thinking' when we look for thought only to find its withdrawal. In fact, this withdrawal of thought points to the fact that our non-thinking stage is conditioned by the nihilism that lies at the heart of modernity. Heidegger defines nihilism, through his particular reading of Nietzsche, as the loss of meaning and value in our times. As Dreyfus points out, 'the strongest argument that some meaningful practices must have survived is that without some remnant of them we would not be distressed by nihilism' (Dreyfus 2006: 352). This distress is the beginning of thinking for Heidegger, a movement towards discerning the growing immensity of the desert. This is how Heidegger links the contemporary practice of thinking to Nietzsche's diagnosis of nihilism. Heidegger notes that what Nietzsche called nihilism is an anthropological condition within history but not a specific event in

the 'ontic' history, though it is an ontological condition in history as the history of Being. Nihilism is the result of the history of Western thought and the movement within Western history that has necessary links with our condition of thought. Or, with Nietzsche, Heidegger notes the devaluation of the highest values, their degeneration, their perishing and their decadence (Heidegger 2002: 166–7) and this is what the task of thinking has to face.

The overcoming of metaphysics that Heidegger diagnoses is the condition of our presence, of the history of Being, yet metaphysics does not and cannot disappear, as he insists in his essay 'Overcoming Metaphysics'. Hence his task is summarised in a lecture called 'Time and Being' as 'to cease all overcoming' (Janicaud and Mattéi 1995: 7). To stop this overcoming of metaphysics, for Heidegger, is to diagnose and reconquer thought. The condition of our nihilist times is the lack of awareness and knowledge of the history of Being; but on the other hand, memory is the gathering of our thoughts and what we should be striving for. This is what he has in mind when he claims in a public memorial address in 1955 for the composer Conradin Kreutzer:

> Man today is in flight from thinking. This flight-from-thinking is the ground of thoughtlessness. But part of this flight is that man will neither see nor admit it. Man today will even flatly deny this flight from thinking. He will assert the opposite. (Heidegger 1966: 45)

Yet, while we realise that we are 'in flight from thinking', for Heidegger, thinking is not easy and requires a certain degree of patience. This is why he then distinguishes between two kinds of thinking, calculative thinking and meditative thinking, and calls for a 'releasement toward things', defining it as 'this comportment toward technology which expresses "yes" and at the same time "no"' (Heidegger 1966: 54). But this attitude is already a rejection of the mere compliance to technology that was dominating society from the atomic bomb to the turning of logic into logistics, and philosophy into applied sciences. 'For us contemporaries the greatness of what is to be thought is too great', precisely because the current political regimes do not yet know how to accommodate with 'the technological age'; 'we still have no way to respond to the essence of technology' (Heidegger 2003: 47, 36, 37).

In contrast to Deleuze, for Heidegger, it is the task of thinking to invert this 'uprooting of man' by a returning to traditions and to understand that since the high time of Greek philosophy, there has been a decline and a regress, a desert in thought. Nietzsche has completed the history of Western metaphysics precisely because 'the wasteland grows'

(Nietzsche, qtd in Heidegger 1968: 30). This wasteland both prevents and demands thinking. The twentieth century is also for Heidegger the age of representation, the unification of the world that becomes conscious of itself. It is not a simple negation of the age of modernity that thought should accomplish but open itself to the 'incalculable', keeping the possibility of access to the truth as unconcealing. 'Reflection [or "creative questioning"] transports the man of the future into that "in-between" in which he belongs to being and yet, amidst beings, remains a stranger' (Heidegger 2002: 72). Hence, for Heidegger, thought should be a kind of opening of becoming and of newness but as the 'clearing' of Being.

Deleuze, too, speaks of the desert of thought and it is this unthought as an economy of stupidity organised by the dominating flows of capital that is to be resisted. He makes the task of thinking, both philosophical and non-philosophical, one of his prime political projects. For instance, thought in capitalism is the target of Deleuze and Guattari when they write in 1972 that capitalism organises a doubling of 'the capital and the flow of knowledge with a capital and an equivalent flow of *stupidity* [*connerie*] that also effects an absorption and a realisation, and that ensures the integration of groups and individuals into the system' (1983: 235–6). Individuals are not locked and disciplined in institutions anymore but controlled by an ever more vicious flow of money that discredits them through the creation of more debt: 'a man is no longer a man confined but a man in debt' (Deleuze 1995: 181). Using debt, a government functions to integrate and totalise the degree zero of thought, rejecting all theoretical thinking for the celebration of transparent, communicative and calculative thinking (Lyotard 1979: 15–16). Especially in the wake of the financialisation of economy and life, resulting in the economic crisis of 2008 immediately followed by what is now called the Great Recession, Deleuze and Guattari's cartography of capitalism as a flow of capital has never before been so relevant.

Following Zourabichvili (1998), we argue that the goal of politics in Deleuze is the opening of perspectives and the possible. The only way to have a politics of difference is first to start evaluating the desert of thought, to ask about new modes of life (the conditions of *real* experience). In this sense, politics needs to refer to the creation of joyful affects that increase the power to act and be acted upon. This is why the intolerable and outrage are situated at the level of politics in the same way that stupidity and shame paradoxically produce thought. What causes the possibility of an impossibility (an outside) is the intolerable

opening and creation of a new distribution of the possible: 'the possible or I shall suffocate' (Deleuze and Guattari 1995: 177). This rupture occurs at the limit between thought and the unthought, where the intolerable and the shameful can be expressed since this is to accept that 'we are not yet thinking'. It is by taking into consideration the contingency of action and thought that new possibilities of life are created. While creation for Deleuze is defined as a necessity, there is not only one necessity in the same way that there is not only one truth – there is only the production of necessities and of truths. This idea of finding 'new possibilities of life' can seem abstract but it simply refers to how one finds one's necessities, one's truths and this is precisely because for Deleuze 'we only have the truths we deserve' (Deleuze 2002: 104, 110). A thought and a truth are events that are possible when they accept and enter into relations of composition with the contingencies of the given situation.

In sum, while Deleuze is clearly interested in Heidegger's question, he turns it into a new problem about truth and pedagogy. His statement that 'we have the truths that we deserve' is a response to Heidegger's question but also a transformation of Heidegger's own response, 'we are not yet thinking'. If we are not yet thinking and we are to blame for it, this blame is not a moral or dogmatic one but a reaction (it is shame) which seeks to find a way to trigger thought.

IV. Thinking in Relation to Science, Arts and Politics

In one of the most controversial parts of *What Is Called Thinking?*, Heidegger claims that 'science does not think' (Heidegger 1968: 8, 134) and argues that scientists are too preoccupied with doing what 'science does' (research) to have the capacity to reflect on its essence. This expression functions as an order-word that calls to thought. Science does not provide access to the 'incalculable', or 'meditative thinking', but remains at the level of technology as 'calculating thinking'. This also coincides with the age of representation as driving 'everything into the unity of the thus-objectified' (Heidegger 2002: 85). Only the process of thinking can unveil the essence of science since science is too preoccupied with the application and the advancement of technology. 'Perhaps there is a thinking that is more sober-minded than the incessant frenzy of rationalization and the intoxicating quality of cybernetics' (Heidegger 2008: 449). Heidegger does not simply oppose calculative thinking (sciences and applied sciences) to meditative thinking (philosophy) but he retraces the originary task of philosophy as thinking the ground

and the essence of the disciplines, since only philosophy has 'access' to being. Heidegger's critique of the metaphysical–theological foundation of disciplines aims at retrieving 'the power of the beginning' (Heidegger 2003: 3; Macherey 2011: 140–89). This beginning was the irruption of Greek philosophy, and contemporary sciences have forgotten that all sciences originate in philosophy. This argument found in the controversial Rectoral Address from 1933 is extended almost twenty years later in the lectures referred to by Deleuze:

> by way of history, a man will never find out what history is; no more than a mathematician can show by mathematics . . . what mathematics is.
>
> The essence of their sphere – history, art, poetry, language, nature, man, God – remains inaccessible to the sciences . . . The essence of the spheres I have named is the concern of thinking. (Heidegger 1968: 32–3)

Thus, thinking discovers the essence of things and time, whereas the political and economic conditions of a given epoch are organised, according to Heidegger, by other disciplines (history, sociology, economics). 'To think' history is to define the essence of the domain of history and to avoid exhaustive descriptions and analyses of a given age. But, if we follow Heidegger, history cannot think itself (unto itself). Heidegger claims that philosophy grounds the sciences but that the opposite is not true (Heidegger 1968: 131), yet much of his later thought is devoted to this untangling of life and technology as the latter is seen to both enslave and open up new possibilities.

On the contrary, Deleuze responds that 'the idea that mathematicians need philosophy to reflect on mathematics is a comic idea' (Deleuze 2003: 292; my translation). This statement could be aimed at Heidegger, who does not open up all disciplines to creativity and thought. This is particularly true of his study of cinema, for which he became renowned. But he also allows dialogue between the sciences and philosophy. This was argued by de Beistegui in his *Truth and Genesis* (2004) in which, 'by turning to certain recent developments in science, from quantum mechanics to non-linear dynamics and complexity theory', and in order to remain Heideggerian, de Beistegui decided to dissociate himself from Heidegger and follow Deleuze with whom 'it is indeed possible to single out or extract a dimension of Being that is proper to physical and material systems' (de Beistegui 2004: 15).

By leaving science and all applied disciplines to the realm of calculative thinking, Heidegger is unable to imagine what sciences and technology can do beyond the technical reason and the practical determinism that certainly drive most university research activities (we could even speak of

a fascination or a blindness). Deleuze finds a way out of this pessimism and *diktat* of philosophy in Heidegger's thought by democratising the question 'what is called thinking?', that is, the desert of thought (as we will later discuss with stupidity) should 'call' to each of us (Deleuze and Guattari 1995: 107).

By relating thinking to the overcoming of metaphysics, Heidegger builds a hierarchical structure of thinking. It follows that if, for both Heidegger and Deleuze, thinking is a collective and a political attitude as we defined it earlier, for Heidegger philosophy (with poetry) has a privilege over other realms. Heidegger, in the *Letter on Humanism*, presented the danger that philosophy and philosophers face when they believe that they can justify philosophy's existence before the 'sciences' by elevating it to the rank of science, but 'such an effort is the abandonment of the essence of thinking' (Heidegger 2008: 219). Therefore, he believed that philosophy could leave the realm of science and return to thinking, but why could he not argue the same for sciences and the arts (other than poetry), and organise a fruitful dialogue between philosophy and the sciences? This is precisely the significant point of contrast with Deleuze, who has been constantly concerned with opening the realm of thinking up to other spheres, or at least recognising that other realms also 'think'. We shall attempt to explain this movement through his work on cinema-thinking.

V. Deleuze's Question: What Is Called Cinema-thinking?

Cinema 2: Time-Image is a project demonstrating Deleuze's transcendental empiricism at work:

> it is as if cinema were telling us: with me, with the movement-image, you can't escape the shock which arouses the thinker in you . . . simultaneously posit[ing] the unity of nature and man, of the individual and the mass: cinema as art of the masses. (Deleuze 1989: 156, 162)

Deleuze's work on cinema is paradigmatic of his project to democratise thought and philosophy, believing that people cannot simply satisfy themselves with stupidity and baseness of thought, but that if everyone has the capacity to think, one should make use of it, otherwise other institutions will. 'Thought' is a category larger than the categories presented in *What Is Philosophy?* – concepts, affects and percepts, functions, that respectively philosophy, arts and science craft. Thinking is an individuating activity – in the Simondonian sense – linking the psychological and the collective, entitling the artist to believe in this

world: 'the less human the world is, the more it is the artist's duty to believe and produce belief in a relation between man and the world, because the world is made by men' (Deleuze 1989: 171).

Deleuze's work on cinema develops another original element of his philosophy: the role given to the body. Doing away with mind–body dualism (Cutler and MacKenzie 2011: 58) means that the body enters thought and thought communicates with the body: 'not that the body thinks, but, obstinate and stubborn, it forces us to think, and forces to think what is concealed from thought, life' (Deleuze 1989: 189). What is called thinking for Deleuze is then transformed into a journey to the heart of the body, where the mind and the body become indiscernible, where it is no longer of any importance whether it is a movement, an image, or a word that makes us think. For Deleuze, a writer must become a seer and images must become thoughts, since an image only counts for the thoughts that it creates.

That is why Deleuze introduces a general definition of the act of thinking that he partly borrows from Heidegger, though mostly departing from him. Unlike Heidegger, Deleuze is not interested in describing the path to overcoming metaphysics, but the path to creation and the new (Smith 2007). We can now distinguish between Heidegger and Deleuze by asking the question 'who can think?'. While for both thinking is an impersonal activity, for Heidegger only philosophers can 'think', that is, can envisage the end of a metaphysical and theological foundation to philosophy, morality and politics;[11] only they can find the essence of things and disciplines.

By presenting signs – or what Deleuze calls 'noosigns' (Deleuze 1989: 279) – cinema can 'arouse the thinker in you', unfolding the involuntary (or contingent) enterprise of thinking by opening up a transcendental field that goes much beyond the history of Being to form a new image of thought. This can be created from the elements of the film-outside that shape and modify the brain. Already in 1985, with the publication of *Cinema 2: Time-Image*, Deleuze considered the breakthrough in neurosciences as a major event in philosophy, leading us to reconsider the synaptic connections as uncertain and non-deterministic, in short as 'plastic'. The priority given to the brain in Deleuze's work is most evident in the conclusion of *What Is Philosophy?* (Deleuze and Guattari 1995: 201–18), which entitles the brain to having the role of being the junction between the three planes (immanence for philosophy, composition for art and reference for science) where all concepts, affects, percepts and functions occur since it is the faculty of creation. Deleuze celebrates neurosciences so late in his oeuvre because the age of psychoanalysis

was fading and the revolution in neurosciences opened a new field of inquiry and was promising to liberate the 'dogmatic image' of the brain as a centralised machine, deterministic and responding to the laws of Darwinian psychology. But it is also because the plasticity of the brain, its resilience and its transdifferentiation resemble Deleuze's own ontology of metastability and difference, that a philosopher like Malabou can take up Deleuze's work where he left off.[12] While finally Deleuze and Guattari accept that 'it is the brain that thinks and not man' (1994: 210), this falsely appears as a simple claim since 'micro-brains' or synapses are far more than the simple unification or objectification of the brain. Creation is situated in the brain but it does not mean that the brain is the 'content' of a constituted subject. Rather, it means that all synaptic connections individuate and mould being as difference.

In short, Deleuze departs from Heidegger in that despite his creative play with language, the latter is still concerned primarily with thinking in relation to the metaphysical and representational foundation, with Nietzsche in the first part of *What Is Called Thinking?* and Parmenides in the second. Heidegger's definition of thinking remains an aristocratic one: real thought only occurs in philosophy, and in 1966, he goes so far as to wonder whether German and Greek can be the only languages one can think in (Heidegger 2003: 44). On the contrary, in Deleuze the task of thinking is democratised, even in 'the art of the masses' (his definition of cinema) 'the shock wave or the nervous vibration… gives rise to thought' (Deleuze 1989: 162, 158). It occurs when the 'powerlessness' of thought is uncovered as a problem. Cinema is the art of the masses and Deleuze the philosopher of the masses, making the task of thinking available to 'the common man'. The new pedagogy is a culture not of establishing the right method to find solutions and answers, but to raise problems. As he puts it, 'we do not possess a right to the problems' (Deleuze 1994: 158), and as long as we do not have this right we will remain 'slaves':

> Culture, however, is an involuntary adventure, the movement of learning which links a sensibility, a memory and then a thought, with all the cruelties and violence necessary, as Nietzsche said, precisely in order to 'train a "nation of thinkers"' or to 'provide a training for the mind'. (Deleuze 1994: 165–6)

Just as there is not only one 'thinking' discipline, there is not only one correct way to think. Errors are not as violent and problematic as stupidity; the latter can never be fully eradicated but should nonetheless be faced and fought. For Deleuze, we need a nation of thinkers in order

to democratise thought – by way of cinema, for instance – since thinking as explained earlier cannot be voluntary and contingent but must be involuntary and necessary. A new pedagogy means, for him, accounting for the multiple paths to thought since 'we never know in advance how someone will learn' (Deleuze 1994: 165).

VI. Stupidity, or Answering the Question 'What Is Called Thinking?'

It is our thesis that the question 'what is called thinking?' is doubled by a second question: 'a truly transcendental question: how is stupidity (and not error) possible?' (Deleuze 1994: 151; translation modified). Stupidity was defined in *Nietzsche and Philosophy* as '*that which it is a symptom of: a base way of thinking*' (Deleuze 2002: 105; original emphasis). Thinking then becomes a fight against the representation of truth as an ahistorical category: 'It is disturbing that truth conceived as an abstract universal, thought conceived as pure science, has never hurt anyone. In fact, the established order and current values constantly find their support in truth conceived in this way' (Deleuze 2002: 104; original emphasis). This is precisely the task that Deleuze assigns to thinking: to fight against the false problems of stupidity, philosophy must be violent and put the stupidity of our time on display, becoming by the same token *political*. Deleuze reads *Schopenhauer Educator*, by Nietzsche, as one of the best definitions of philosophy against the established order, which for Schopenhauer was Hegel, as the philosopher of the State. Even truth becomes politicised since we only have the truths that we deserve. This 'we' is truly political, a psychic and collective individuation, which is also found in Foucault's re-reading of Kant's text *What Is Enlightenment?*: 'We always have the truths we deserve as function of the sense of what we conceive, of the value of what we believe' (Deleuze 2002: 104).

Hence, if we always have the truths we deserve, we also always have the stupidity that we deserve and Deleuze gives one of his first definitions of philosophy as the discipline that should harm stupidity:

> Stupidity and baseness are always those of our own time, of our contemporaries, our stupidity and baseness. (Deleuze 2002: 107)
>
> [Philosophy] is useful for harming stupidity, for turning stupidity into *something shameful*. Its only use is the exposure of all forms of baseness of thought. (Deleuze 2002: 106)

Hence, stupidity should not be understood simply as the opposite of thinking; for Deleuze stupidity is a form of thinking, but a shameful

one. Yet, it is crucial to understand that stupidity also helps the process of both thinking and individuating, when it is turned into a shameful condition:

> [H]ow could the concept of error account for this unity of stupidity and cruelty, of the grotesque and the terrifying, *which doubles the way of the world*? Cowardice, cruelty, baseness and stupidity are not simply corporeal capacities or traits of character or society; they are structures of thought as such. The transcendental landscape comes to life: places for the tyrant, the slave and the imbecile must be found within it . . .
>
> [A] tyrant institutionalises stupidity. (Deleuze 1994: 151; emphasis added)

To fight stupidity is therefore to fight stupidity relentlessly as a tyrannical form of thought without any hope of final emancipation. Stupidity is not the only state of thought that philosophy should fight but also cowardice, cruelty and madness. But what tyranny wants with its 'bureaucrats of pure reason' (Deleuze 2004: 259) is to 'stop people from thinking' (Deleuze and Parnet 2006: 10), to have institutions or 'thinkers by profession' who think for others. Hence the project of Deleuze is to open philosophy to the outside, to the arts and any form of vitality. While thought and life come together and should revitalise philosophy, this also means for Deleuze to repoliticise philosophy, instead of merely having the labour of pure reason and the constant search for the verification of ahistorical truths. One finds this in his cartography or topology of affects, percepts and concepts, throughout his other books, but it is already on his mind when he writes in 1962: 'The theory of thought depends on a typology of forces . . . We have the truths that we deserve depending on the place we are carrying our existence to, the hour we watch over and the element that we frequent' (Deleuze 2002: 110). The existence of stupidity forces us to think higher than stupidity and find things and signs that call for new possibilities of life. Not that stupidity could vanish, but the constant fight against stupidity is what gives life its fullness, allowing one to live at one's limits: 'We write only at the frontiers of our knowledge, at the border which separates our knowledge from our ignorance and transforms the one into the other' (Deleuze 1994: xx).

We always have the risk of falling prey to stupidity; just as knowledge can never be grasped but only pursued and desired, stupidity can never be expelled from our condition but gives the energy to go beyond our condition (*ek-stasis*). 'Thought understood as pure determination or abstract line must confront this indeterminate, this groundlessness' (Deleuze 1994: 275). This unthought is both stupidity as a shameful

condition as well as a dispersal of singularities and affects that fascinates us.

> Thought is the highest determination, confronting stupidity as though face to face with the indeterminate which is adequate to it. Stupidity (not error) constitutes the greatest weakness of thought, but also the source of its highest power in that which forces it to think. (Deleuze 1994: 275)

It forces us to think because we are ashamed of our condition in stupidity, in this base form of thought. This fascination is not positive or negative but powerful, it gives a sovereignty and a realm of its own for thought. Some degree of stupidity is useful and indispensable for a psycho-collective individuation. Stupidity doubles thought, one cannot go without the other. Advertisements, the media and mundane conversations are needed to sell but also to create social bonds and to weave the social fabric. Without stupidity, there will be no thought and no knowledge. Feeling ashamed is also the expression that Deleuze borrows from Primo Levi to remember that the problem of fascism and Nazism remains a political problem, and that de-Nazification does not only concern Germany but 'each of us', yet not as a generalised guilt or resentment but as by being blemished, or 'sullied' (Deleuze and Guattari 1995: 107).

Deleuze also hints at the need to break away from the old model of the history of 'monuments' by also retaining non-sense and stupidity inside as historical forms: 'this is why history is no less the locus of non-sense and stupidity than it is the process of sense or meaning' (Deleuze 1994: 208). The complementarity of becoming and history functions in the same way as the couple thought–stupidity, precisely because we are never certain of the identity of each. History is not the 'error' of becoming, or becoming the 'error' of history but its unthought, becoming is located within history and vice versa.[13]

A 'thought-event' is precisely one that can be diagnosed and understood only in its conditions of possibility (its problems); stupidity is the problem of thought, it is its double that constantly threatens it. Or, in a different way, Deleuze calls for 'a right to the problems' (Deleuze 1994: 158). Aligning this argument with Deleuze's philosophy of law as jurisprudence (de Sutter 2009) is less to make stupidity 'illegal' or to draw up the right way to think than to establish 'cases' of stupidity, precedents that are already intelligible. Jurisprudence aims at creating new rights. This case-by-case approach is to recognise the role of 'user-groups' (Deleuze 1995: 170). Philosophers, artists and everyone who actualises his or her becoming-thinker shows to new generations the

capacity one has to think. It is much less about the glorification of great men, than about witnessing that the outside and the *Übermensch* is present within us, through life as an immanent process.

VII. Conclusion

We do not yet know how to make good use of poststructuralist thought when it concerns not only our minority but our majority. Poststructuralist thought as practice still escapes us. We stand by Philippe Mengue when he claims that we still do not know which sense we can attribute to Deleuze's concepts (Mengue 2009: 162). This argument is especially perceptive given the situation of the Occupy Movements in London and in New York in 2011 and we cannot help but witness its complete lack of ideas and theories. Hence, what we learn is that stupidity and knowledge are never far apart from one another and always come together; that is why for Deleuze it is the mission of philosophy and the other realms that 'think' to discern one from the other.

Asking the question 'what is called thinking?' is to start talking about politics, but grand politics, where constructions of new earths and new people take place, first in the brain – not of one individual but of a 'collective'. Foucault remarks at the end of his life, trying to shift his focus from a multi-faceted theory of power to the conduct of the self and others by raising again the question of thinking:

> We need to free ourselves of the sacralization of the social as the only instance of the real and stop regarding that essential element in human life and human relations – I mean thought – as so much wind. Thought does exist, both beyond and before systems and edifices of discourse. It is something that is often hidden but always drives everyday behaviors. There is always a little thought occurring even in the most stupid institutions; there is always thought even in silent habits. Criticism consists in uncovering that thought and trying to change it: showing that things are not as obvious as people believe, making it so that what is taken for granted is no longer taken for granted. (Foucault 2000: 457)

Precisely because there are no universal criteria to define stupid institutions, stupid policies and stupid discourses, Deleuze explains that we can only be ashamed of our stupidity, but when stupidity becomes systemic, 'a veritable revolution of the dominant industrial model' (Stiegler 2010: 49)[14] is required, emerging from a new enthusiasm or 'sympathy' (Deleuze and Parnet 2006: 39). In *Difference and*

Repetition, Deleuze explains that (systemic) stupidity is used by tyrants to preserve the existing order, whereas a becoming-revolutionary shows the intolerable and demands to think political difference, or, as Foucault puts it, 'to make harder those acts which are now too easy' (Foucault 2000: 457).

Notes

1. Deleuze's twofold ontology of the real (actual and virtual) has spurred some of the most controversial and heated discussions (Badiou 2000; Hallward 2006). We can also refer to the interesting debate between Reynolds (2007, 2008) and Williams (2008) about the priority of the virtual, and the innovative response by Williams that the notion of intensity functions in Deleuze as the middle ground between the actual and the virtual. Williams's proposition is, in many ways, furthered by Nunes's (2010) political reading of the twofold ontology of the real as a 'politics of the middle', and his interesting discussion of the notion of 'dyad'. However, Nunes remains ambivalent on the question of decisionism in Deleuze and Guattari's work.
2. Deleuze devotes a long footnote in *Difference and Repetition* to Heidegger to point out that he situates himself in the tradition of the univocity of being that Heidegger identifies but he also notes their divergence on the reading of the eternal return (Deleuze 1994: 66). On the question of the univocity of being in Deleuze, see Daniel W. Smith's classic study (2001). However, Miguel de Beistegui has argued recently that Heidegger's treatment of repetition departs from Kierkegaard and a retrospective reading of the early Heidegger highlights some common points of reference with Deleuze's differential repetition; see de Beistegui 2003: 49–50.
3. Malabou points out that this *coup* was started by Heidegger and then radicalised and displaced by Deleuze and Derrida (Malabou 2010: 24).
4. We agree here with Lee Braver that in Heidegger's later writings "'thinking' is being used here as *a technical term* with a distinctive meaning rather than just entertaining thoughts or the activity studied by epistemology" (Braver 2009: 116; emphasis added).
5. A confrontation between Deleuze's concept of 'event' and Heidegger's concept of *Ereignis* (the event of ap-propriation) is much needed but exceeds here the scope of this article. It would complete our attempt to understand Heidegger's concepts of *Denken*, *Stimmung* and *Gelassenheit* in Deleuze's philosophy, since after all for both of them thinking works at the level of the event, yet in different directions. Without being able to develop further, it is important to point out that Boundas's article helps distinguish Deleuze's theory of the event and Heidegger's concept of *Ereignis* as appropriation and recollection. The sense-event in Deleuze as the creation of the new and 'the memory of the future' is to be contrasted to Heidegger's project of gathering and recollection, back to an origin or forward to a destiny. On the event see especially Boundas 2009: 328–30.

   Jonathan Dronsfield (2008) already presented a first account of the confrontation between Deleuze and Heidegger, and in spite of a perceptive reading of Deleuze, Dronsfield comes to the surprising conclusion that questions and problems are similar for both philosophers, and their work becomes then indistinguishable. While being sympathetic to the approach of not trusting

Deleuze to the letter, it seems not only unfair but imprecise to confuse the role of the 'question' in Heidegger with Deleuze's notion of the 'problem' or the 'problematic'. One could have expected references to a tradition in French philosophy (Bergson, Bachelard and others) holding the 'problem' as a central concept.

6. This is also how Deleuze defines structuralism as 'problems, methods, solutions that have a relation of analogy, participating in a free "*air du temps*", a spirit of the time, but resulting from the discoveries and the singular creations in each of the domains' (Deleuze 2004: 170; translation modified).
7. Simondon defines the transindividual as the complementarity between action (at the collective level, dealing with affectivity) and emotion (at the psychic level, dealing with perception). See Simondon 2007: 104–11.
8. A little earlier in the interview, he summarises a theme of his late writings: 'A decisive question for me today is: how can a political system accommodate itself to the technological age, and which political system would this be? I have no answer to this question. I am not convinced that it is democracy' (Heidegger 2003: 36).
9. Bret W. Davis has provided a nuanced study of the notion of *Gelassenheit* (releasement) in relation to the question of the will, by demonstrating that *Gelassenheit* is not simply a negation of the will as unwillingness, even though a sense of passivity is found within it, but could be interpreted as "'actively letting' beings be themselves" (Davis 2007: xxvii). This releasement is also a releasement from the technological 'will to will' without simply being indifference and negligence. Releasement should then be understood as a reworking of Nietzsche's will to power, and could be defined as the 'middle voice' between willing and 'not-willing' (Davis 2007: 16). I would like to thank Gavin Rae for drawing my attention to this book.
10. Heidegger's suggestion is to turn to language (Heidegger 2001: 185–208), and by way of language he wants to find new meanings for old philosophical concepts and to introduce provincial language within a more national-majoritarian language. Translation is violent for Heidegger since it is both creative and generative of thought. In his last book, Deleuze also pays homage to the extraordinary power of Heidegger's play with language (Deleuze 1998: 97–8). Even though for Heidegger, this violence is to bring language closer to its originary place and to follow the 'call' of Greek thinking, Deleuze draws a parallel between Heidegger's creative reworking of language and his own thought.
11. In the confrontation of Heidegger and Deleuze, another point to take into account is the divergence on the end-of-metaphysics thesis. A precise reading of Deleuze's explicit rejection of the end of philosophy (Deleuze 1995: 136) could be developed to contrast the becoming and the event of thought in both philosophies.
12. Malabou argues for the practical use of the recent development in neurosciences at the service of new social and political advancements. Her resistance is to the neuronal ideology that 'models and naturalises the neuronal process in order to legitimate certain social and political functioning' (Malabou 2008: 68). She continues the Deleuzian and Derridean thought of the trace, of difference and becoming by applying it to the plasticity of the brain that is both receiving and giving form. The neuronal turn that she operates is interesting and furthers in many respects some of the remarks that we exposed here. For Malabou, the outside is also included as the possibility of a 'world to come', through an 'explosion' (other than terrorists' explosions) that is necessarily creative and self-generating: 'if we didn't destroy ourselves a bit, we could not live' (2008: 74). If

Malabou can claim after LeDoux that 'you are your synapses', it is encouraging since synapses are gaps and breaks, confirming that we are Difference.

This manifests the necessity to leave the correctness of thought to accept that 'every thought is an aggression' (Deleuze 2004: 139) and necessarily a dangerous and difficult activity. Deleuze later, in 1990, explained his optimism for the liberating potential of science: 'it's for science, rather, to try and discover what might have happened in the brain for one to start thinking this way or that' (Deleuze 1995: 176), yet in 2004, when calling for a neuronal materialism, Malabou writes that 'it seems that the neuronal revolution has revolutionised nothing for us' (Malabou 2008: 68).

13. Dork Zabunyan is particularly clear on this point when he explains that stupidity is contained within thought (and its condition of possibility) whereas the error is exterior to thought, and therefore only remains an adversary exterior to philosophy (Zabunyan 2008: 856).
14. And only then 'psychopower can be thrown over to become noopolitics' (Stiegler 2010: 50), but also a neuropolitics.

Book Reviews

Jason Wallin (2010) *A Deleuzian Approach to Curriculum: Essays on a Pedagogical Life*, London and New York: Palgrave Macmillan.

As a field rather than a discipline, education is potentially an interdisciplinary space capable of formulating new lines of thought that traverse the boundaries of the social sciences and humanities. Work in education also potentially serves as a venue for a radical form of pragmatism in terms of its direct impact on people's lives – an aspect of the field that one might think would lead to a greater consideration of education and learning within contemporary political thought. Unfortunately, however, these potentially exciting and important aspects of the field do not often come to fruition. More often than not, the field of education is the home of rigidly conservative work that contributes towards the reproduction of an image of pedagogical life prescribed by the increasingly homogenised, instrumentalised and test-focused interests of local schools and administrators. In higher education the field is becoming increasingly weighted down by the dictates of the neo-liberal marketplace and schizo-capitalism that force schools of education to become sites for the creation of flexible labour (that is, teachers) trained under the mind-numbing mantra of 'skills and knowledge'. At the same time, the arts and humanities – once the site for some of the most innovative and important work being done in all issues related to pedagogy and schooling – is quickly being dissolved in favour of more clearly identifiable forms of 'research' that conform and contribute to the increasingly overcoded domain of formal schooling and the infatuation with profit margin. Finally, at the same time that education has seldom been the home of the invention of new lines of political thinking (unless one understands the emergence of cultural studies as a direct product of the adult education programmes in the UK during the 1960s), there is a surprising disconnection between contemporary political theory and

Deleuze Studies 7.2 (2013): 275–297

questions pertaining to pedagogy in spite of what one could argue is their mutual interdependence.[1]

As this increasingly quantitative image of education has grown in recent years in direct proportion to the privatisation of the public sphere, new pathways for thinking pedagogy and learning have become more and more difficult to come by. Simply put, there is a drastic need to reconceptualise our approach to curriculum, teaching and learning in order to confront the way that pedagogy is currently being conceived of. Jason Wallin's new book, *A Deleuzian Approach to Curriculum: Essays on a Pedagogical Life* is precisely such a project. One of the many aspects of this book that make it so compelling is the way that Wallin is able to provoke the reader to engage with and utilise Deleuzo-Guattarian inspired concepts in exploring how a pedagogical life might go in place of the commonsensical, overcoded and rigidly institutionalised representations of contemporary education. While it is true that the book is directed primarily towards disturbing the habitual imagistic conception of pedagogy and the academic field of curriculum studies (a minor field within a minor field), in true Deleuzian fashion Wallin's work on this topic has implications for a wide variety of intellectual endeavours including philosophy, film studies, music studies and, perhaps most importantly, political theory. While there have been other admirable attempts in curriculum studies to connect Deleuzian thought to education, none have so thoroughly and successfully produced the kinds of conceptual tools necessary to create new pedagogical pathways – ones that are not merely critical, but productive in the sense that they provide the kind of creative impetus that compels us to think pedagogy and curriculum differently.

The argument that is dispersed through the book in relation to curriculum studies extends out of the word *currere* – the Latin etymological link to curriculum that means to run. It is with the understanding of curriculum as a course to be run that Wallin discusses the differences between a pedagogical life that *should be run* and one that *might be run*. In other words, in light of the way that habitual forms of education prioritise the construction of a course of pedagogical life that should be followed, Wallin's book prioritises *the run* thereby opening up our thinking about pedagogy to a range of potential lines of flight that seek to escape the beaten track of developmental, functional, structural and critical educational paradigms. It is perhaps in relation to the latter that Wallin's book is most valuable. Although sympathetic to the liberatory intentions of much critical thought within education, Wallin is careful to highlight some of the problems inherent to critical

pedagogy that allow it to be neatly appropriated into acceptable forms of thinking education. In other words, critical approaches to thinking pedagogy have become formulaic in their approach to critiquing contemporary trends in higher education and, as a result, insufficient to the task of remedying the problems inherent to the dominant image of pedagogical life.

In contrast to critical paradigms in education, Wallin's intention is the 'development of new concepts for pedagogy' that can 'transform the normative limits ascribed to pedagogical being' (9) – a difficult task for sure, but one that Wallin successfully takes on through an engagement with, and corresponding affirmation of, a wide variety of artistic, political and ethical forces that work to weaken the hold of the State of things in education today. Wallin's book is not a watered down approach to theorising education that one often finds in progressive educationalist approach to thinking Deleuze – the end result of which often equates Deleuzo-Guattarian thought with nothing more than the impetus to be more creative. Rather, the book is precisely the kind of active intervention and associated destabilisation of the commonsensical and predetermined course to be run that we need to confront the dominant image of education today. Wallin's engagement with Deleuzo-Guattarian thought is an active one. In other words, Wallin takes on the project of concept creation as a form of tool making in order to lead the reader through a discussion of pedagogical life via specific innovations in the areas of film, games and music.

The book begins with Wallin's prioritisation of the *one* of Spinoza's plane of immanence over the *two* of transcendent thought that marks the terrain of the Judeo-Christian God, Platonic forms, Cartesian ego and Foucault's 'ethics of knowledge'. For Wallin, the problem with transcendent thought is not so much related to the attempt to clearly differentiate right from wrong, but the way that transcendence a priori restricts ways of thought. For Wallin, particularly problematic for education has been the dominance of Marxian, Saussurian and Freudian frameworks that reduce pedagogical life to either the social ontology of the mode of production, the supposed neutrality of the structure of language or the familial Oedipal template. Again, the issue for Wallin is not so much their lack of verifiability as much as it is their power to 'capture' ontological becomings in pre-established images of the world, thus limiting the conceptualisation of difference. Throughout the book, Wallin relentlessly attacks the notion that pedagogy is the act of representing reality and thus merely posited as a form of communication aimed at showing the student the world as it really is.

In following Deleuzian thought, Wallin argues that a way out of the limitations of the otherworldliness of transcendence is through the embrace of Spinoza's *plane of immanence* that reorients a conception of pedagogical life from its already established course to be run, to one of becoming and difference. For him, 'without the presence of two ontological substances the conceptualization of a transcendent beyond would be impossible' (21). In the embrace of the two, learning is posited as that which occurs when one grasps a more accurate representation of phenomena instead of an open form of experimentation along a plane that has no ontological other.

In the world of curriculum studies, transcendent thought orients curriculum towards something to be planned and implemented. In other words, when curriculum is bound to transcendence it becomes territorialised and connected to an already identified course to be run. In the difference between transcendence and the plane of immanence, the concept of *currere* is construed as either a predetermined planned course of action or as an open field of deterritorialised potential. For Wallin, the claim of what *ought* to be run is bound to the work of negation where

> the reactive image of currere is figured, as much like the image of the race-track, within its own circumlocutionary negative feedback loop. In practice this negative feedback system confirms its identity (x = x = not y) by establishing specific parameters of control that discontinue virtual deterritorializations or rogue lines of flight. (33)

Transcendence and the labour of the negative in the form of unhappiness, representation and reduction are replaced by Wallin with the affirmative qualities of joy, liberation and creation. If education is here understood as the reorientation of habit, the state of things is not to be replaced with an alternative representational image of the world as it should exist, but rather with the way it might exist through the embrace of exploration, experimentation and chance. In regard to the affirmative, Wallin argues that what is important in thinking experimentation in the context of curriculum is that we not limit our thinking to the mere 'renunciation of stability', but rather that which renounces all a priori/foundational thinking, whether that emerges from a commitment to the future as a goal to be reached or as a never ending becoming. In both cases, Wallin argues that what is predetermined always imagines curriculum through the lens of the death drive – being as a 'fixed' location fuelled by the desire for identity. Whether that identity takes the form of a true representation or a permanent flow is irrelevant.

The avoidance of such territorialisation is a difficult undertaking, and one that for Wallin necessitates a commitment towards the affirmation connected to the 'powers of the false' – the term Deleuze (2006) utilised in reference to Nietzsche's 'eternal return of the same'. For Deleuze, Nietzsche's teachings of joy, difference and chance are what needs to be affirmed, not the repetition of a pre-constituted image of reality. 'The powers of the false thus become a "practice" of the affirmation of difference that inheres to repetition' not the identitarian logic of the death drive typified in the educational obsession of repeating (40). The 'eternal return of the same' should not be understood as everything always returning as it was before, but rather that difference is always returning and needs to be affirmed in each instance.

As a result, Wallin utilises the Deleuzian simulacrum as a potential way to outmanoeuvre the rigidity of the most readily available image of pedagogical life. For Wallin, '[I]n the Deleuzian positive simulacrum of virtual immanence and difference, the powers of the false mark the creation of counteractualities' (38). Following Massumi (1987), Wallin continues by adding that 'the false might be constituted as a working simulation injected into a society. Here the law is a transcendent truth that underlies reality while the powers of the false work to undermine that reality by seducing the conceptualization of another' (38).

Key here is the commitment to minoritarian production – that kind of unofficial production lying outside of the habitually acknowledged and accepted forms of pedagogy and that sometimes serves as a deceptive simulation of another life. Minoritarian forms of production are what actively bring foreignness to the familiar through an introduction of 'heterogeneity and variation' into the everyday (39). In the case of curriculum studies, minoritarian thought is that which opens up our thinking about pedagogy to a range of artistic mediums not commonly accepted as appropriate ways of engaging with and imagining education. Wallin's intervention into our thinking about pedagogy occurs in two primary ways: first, it aims to bring attention to the kinds of creative interventions often discounted a priori from the scope of pedagogical life; and second, it aims to focus our attention on those specific examples that, like the power of the false, seduce us into a defamiliarisation with what has become most commonplace. As a result, Wallin makes use of specific examples in film, games and music in producing what he calls a 'holey curriculum' – an example of *currere* that relies on minoritarian nomadic, rhizomatic and schizo creations in the process of considering a different form of pedagogical life that might be run. Instead of the

unhappiness of 'moribund' repetition, Wallin leads us towards 'play and artifice'.

Following Rajchman's (2000) conviction that the task of liberation today cannot be limited to a mere position of criticality, Wallin puts forth a number of minoritarian creations that potentially serve as affirmative and revolutionary forms of invention (121). Wallin engages with Jim Jarmusch's films *Dead Man* (1995) and *Ghost Dog* (1999); Todd Haynes's film about Bob Dylan titled *I'm Not There* (2007); the Japanese game Go, the artistic movement *parkour* and various hacking video games; and the most conceptually inspiring forms of improvisational jazz. For Wallin, all of these minoritarian creations serve as examples of an affirmative pedagogy. Respectively, they act as an 'ethics of singularity' and anti-institutional *enculage* or buggery; a body without organs; forms of anti-State deterritorialisation and creative becoming; and an improvisational circuit breaker that works to create a vital life.

With every example Wallin goes into vivid detail, describing the ways that he imagines each of these forms of minoritarian production working against what he refers to as the 'tyranny of overdetermination' – those rigid, predetermined and striated lines of thought that leave the state of things completely intact. In contrast to such pedagogical orientation, the minoritarian creations that Wallin utilises and holds up as affirmative anti-images and examples of how pedagogical life *might go* find common ground in the way that they 'move in difference from the determinations of habit, memory, routine, and the practices of identification in which the individual is often caught' (117).

Although most of Wallin's book is directed towards making connections between artistic creations and new forms of pedagogical thought, he does present us with a couple of specific examples of 'schooling' that resonate with Deleuze's intent to undermine the violence of representational thought. One example comes in the form of the *currere* in A. S. Neill's (1993) Summerhill School that serves as an example of how a pedagogical life *might go*. At Summerhill School there are no bosses; students are free to choose the classes and lessons they attend; delinquency does not necessitate a disciplinary response; and students are fully engaged in decision-making processes free of any formal disciplinary or moral code (180). Most importantly for Wallin, these various aspects of Summerhill exemplify a pedagogical life not driven by the assumption of lack on the part of its students, but instead are constitutive of 'a counter fascist site of desire-engineering capable of collapsing the hierarchical organ-ization of the mechanical

school… releasing the machinic potentials of a pedagogical life from its identitarian or representational mechanics' (180). One might well consider this example of pedagogical life as a form of anti-schooling that puts Summerhill, as well as Wallin, within an anarchist tradition in educational thought that runs through the work of William Godwin (1793), Ivan Illich (1971) and, more recently, Jacques Rancière (1991) among others.

It is Summerhill's approach to pedagogical life that, for Wallin, 'queers' the predominant image of State-run schooling. Here the author imagines a 'queer machine' for curriculum theorising that emerges out of a 'machinic ontology' that moves towards relations and replaces the component-oriented mechanical image of pedagogical life (179). In the case of Summerhill, pedagogy is oriented towards the freeing up of the 'desire-engineering' of its students and not the carrying out of a predetermined map of how learning ought to go. The 'queering' of curriculum is thus based on releasing the potential of new relationships and connections that act to spur the creation of subjectivities prohibited within the domain of the dominant image of schooling.

In much the same way that Summerhill works to create new conceptual relationships regarding how a pedagogical life might go, Wallin's book compels curriculum theorists to create new concepts that can change the trajectory of our thinking about pedagogy. He asks how we might

> think the concept as a *metallurgical* probe-head for creating, registering, and linking viroid lines of flight. In this way, the technics of the concept become intimate to the composition of a *queer machine* for stealing *a* life back from *life in general*. (187; original emphasis)

Wallin's utilisation of the concept of *currere* as a course that *may be run* is an effective example of such an intervention that is bound to the relationality inherent to machinic thought. It is 'the ethical undoing of norms' that machinic thinking provides that allows pedagogical thought to escape the *ought* for what *may be*.

In the midst of the exceptional way that Wallin is able to utilise the thought of Deleuze in thinking through some of the most pressing issues facing contemporary schooling and the state of education today, there are a few questions that emerged while reading the book. The first has to do with the relationship between creativity, learning and disciplinarity. Specifically, what is the role of discipline in the creation of a pedagogical life not bound to pre-constituted images? Might we also be able to think of strict disciplinarity as an impetus to creation? Although Wallin states

on multiple occasions that to engage with Deleuzian thought is not to advocate a permanent form of deterritorialisation, there are times when the critical role that territorialisation might play seems to be ignored. For example, in the case of music and discussion of the potential pedagogical import of improvisational music, the discipline and even preparatory training required to produce those rare cases of improvisation that Wallin seeks to utilise in the service of a pedagogical life seem to go unmentioned. If, against the goal of sonic unity in music and life, we need to 'allow the strands to sing polyphonically and pray that, on occasion, they glow white hot from within' (Aoki, qtd in Wallin 2010: 65), one wonders what role exists for disciplinarity and territorialisation in terms of preparing for the potential of a genuine form of improvisation to emerge. Second, in what ways would a Deleuzian inspired curriculum and pedagogical life work at various age levels in schools or elsewhere? In other words, how might we engage with Deleuze as teachers, researchers, curriculum theorists or concerned community members who are thinking about education and curriculum in terms of toddlers as well as high school students? How might we be able to utilise Wallin's discussion of pedagogical life of a course that *may be run* across various age groups where individual engagement with the world is not always the same? Finally, what is the relationship between a Deleuzian inspired curriculum and institutional settings? More specifically, is what Wallin calls a 'libratory' form of pedagogy possible within the school? Or, as might be imagined, is such education only possible within the context of what Ivan Illich (1971) called a 'deschooled society'?

In conclusion, Wallin's book makes a major contribution to the field of curriculum studies and leaves readers much to consider in terms of our approach to pedagogy, curriculum studies and its relationship to political thought. At a time when most thinking about education plods along with its continued dependence on critical, linguistic, structuralist and developmental approaches to learning and pedagogy, Wallin's intervention into the field could not be more *untimely* in the way that the book acts as a disturbance against our habitual orientation of what constitutes a pedagogical life. If work in the field of education is to inspire new approaches to pedagogy and learning and thus bring to fruition some of the above mentioned potentialities of the field, then curriculum studies needs the kind of engagement with artistic innovations and concept creation exemplified in this book.

Note

1. Besides Jacques Rancière's *The Ignorant Schoolmaster* (1991) and Alain Badiou's short essay on education in *Handbook of Inaesthetics* (2005) there has been a scarcity of new forms of creative intervention into the crossover between politics and education. The hesitation on the part of political theorists to engage with the question of education is, I believe, worthy of some consideration and thought. As Wallin points out in this book, one semi-recent exception to this rule is Félix Guattari, who did show some interest in A. S. Neill's (1993) *Summerhill School* and Fernand Oury's Group for Therapeutic Education. Deleuze, on the other hand, rarely discussed education directly. One of Deleuze's (1989) few references to education seems to exists in what he called the 'pedagogy of the image' – a concept that he borrowed form Serge Daney's work for the French film journal *Cahiers du Cinema*.

Imagine postmodernism without simulacra, virtuality or deconstruction, but instead with affirmation, passion and a continual emergence of the new. But wait – fantasy, myth and fabulation belong to fiction and art – not to philosophy, at least, not traditionally. And yet, as you may know, philosophy after Deleuze has meant exactly the opposite. Open to experimentation and speculation, today's philosophers are not compelled to speak within classical divisions between art and

science, or technology and the humanities. In fact, philosophers are encouraged to think of themselves as artists, 'creating concepts', as Deleuze and Guattari put it, and vice versa. Moreover, as philosophy fuses with disparate cultural practices and intellectual specialisations (all but enforced in a culture drunk on interdisciplinarity), philosophers can simultaneously think about the history of the field, its predecessors and its future, and do so with passion, emotion and creative visions of what is to come. This is precisely what we find in Wayne State University's DeRoy Professor of English, Steven Shaviro's recent book, *Without Criteria: Kant, Whitehead, Deleuze, and Aesthetics*, published in 2009 with the MIT Press.

The stakes of the project: to rethink postmodern theory – and in particular aesthetics – from the point of view of Whitehead instead of Heidegger. Philosophy from Plato to Heidegger has tended towards '*anamnesis* (reminiscence) and *alatheia* (unforgetting), towards origins and foundations, [and] towards the past rather than future' (71). Whitehead refreshingly breaks with this, showing something new. For this reason alone the text is worth a read, though the intricacies of his break and their importance for constructivist philosophies of the future make Shaviro's clear, eloquently written and insightful book that much more compelling.

Cut to the task at hand, Shaviro's analysis focuses on those aspects of Whitehead's work dealing with aesthetics, beauty, affect, innovation, creativity, his Enlightenment roots and especially his engagement with Kant (143). His critical method involves rereading Kant though Whitehead, and Whitehead through Deleuze. At first, Whitehead appears more like Deleuze than himself, and this is confusing, but such blurring of authorial boundaries is a part and parcel of the technique that many readers will (most likely) recognise as one borrowed from Deleuze. In his time, Deleuze often brought different philosophers into conversation, a process he provocatively termed 'buggery', to describe the way he sneaked in behind an author to reread and rewrite his or her ideas, producing an unrecognisable and monstrous offspring (6). In reference to his own work, Shaviro coins his three-way (between Kant, Whitehead and Deleuze) a 'relay'. Considering the goal – to create a constructivist philosophy for postmodernism (versus simply locating broken origins) – the choice of critical methods is more than par for the course.

In this review I will first discuss Shaviro's analysis of Whitehead and Heidegger, introducing some subtleties of Shaviro's arguments (via Whitehead, Deleuze and Kant) on metaphysics and aesthetics, and then

pause and question whether an aesthetically grounded constructivist philosophy is, in fact, *without criteria*.

Shaviro opens in the spirit of Deleuze proper, posing a 'Philosophical Fantasy' for the future of the field. But reality comes first: on one hand Heidegger asks, 'Why is there something rather nothing?' and on the other hand, Whitehead asks, 'How is it that there is always something new?' What it would it mean if the latter question, not the former, had laid the foundation for postmodern thought? Even in consideration of only these two very basic questions, evidence of the distinction between the two thinkers becomes clear. For Heidegger, *that* anything appears at all is always measured against its absence. But for Whitehead, the phenomenon of newness is creative. Newness is continual, affirmative and essential. Further exploration of the differences between the two reveals not only the complexity of Shaviro's project, but also the tweaking and twisting of thought required for such imaginings.

Both books *Being and Time* (1927) and *Process and Reality* (1929) speak to a crisis in modernity, and address the immensity of scientific and technological change, the dissolution of old certainties and the horrors of war. Both texts are anti-essentialist, anti-positivist, and are actively engaged in working out new ways to think, do philosophy and exercise our 'faculty of wonder' (i). However, the similarities are outweighed by the dramatic differences between the two thinkers.

Consider again the distinction between the tendency to return to origin and error versus the embrace of the creative and the new. This difference is reiterated in their respective approaches to history. Where Heidegger's work is concerned with locating the 'point where it went wrong', where 'possibilities were closed down', Whitehead, on the contrary, 'mines history for unexpected twists' (ix). Heidegger's thesis that the human subject is not only constituted by, but is also eternally haunted by, the enigmas of language, is well known. As he puts it in 1947, 'Language is the house of Being. In its home man dwells . . . ' (Heidegger 1993: 222). In contrast, Whitehead 'warns against' exaggerating the importance of language and consistently points to its 'incapacities' (x). Language enslaves; in its matrix of expression there is only one way out: through paradox that requires one to remember lost and long-forgotten origins. Embrace of the new neutralises this prison house of being and instead pushes forward towards the future.

Shaviro poses a hard and fast distinction on the subject of science and technology. In short: Heidegger is against it, Whitehead for it. Perhaps this is generally accurate; nonetheless I want to introduce a friendly

amendment. While Heidegger warns of the dangers of technology and enframing (*Gestell*), his judgements of modern technology as such may not be intrinsically negative. What I am suggesting is that Heidegger's supreme danger is the inability to *question towards truth*, in which case the danger and responsibility falls on the *human*, not on technological determinism. Regardless, it is undeniable that Heidegger 'demonizes science' (x). There are many examples throughout Heidegger's work, though to accept Shaviro's point here, one need only consider this statement: 'Color shines and only wants to shine. When we analyze it in rational terms by measuring its wavelengths, it is gone' (Heidegger 1993: 172).

Such demonisations are absent in Whitehead, who holds that, the 'red glow of the sunset should be as much as a part of nature as are the molecules and electrical waves by which men of science would explain the phenomenon' (Whitehead, qtd in Shaviro 2009: 144–5). Where phenomenologists focus exclusively on the former (Heidegger, Husserl) and scientists on the latter, Whitehead's metaphysics insists on a consideration of both (145). For Whitehead, science and technology are neutralised and treated as 'abstractions' that are not in themselves negative but merely simplifications and reductions that are necessary parts of life. The danger arises when these reductions are extended into situations 'beyond their limits, pushing them into realms where they no longer apply' (x).

In terms of representation – the holy grail of critical theory – Heidegger notoriously sets the stakes of the impossibility for anything to 'stand forth in [its] being' (xi), a thesis from which postmodernism, post-structuralism and cultural studies have made their bread and butter. Interestingly, Whitehead agrees with Heidegger to the extent that, from Descartes on, Western philosophy has privileged 'clear and distinct' conscious perception (what Whitehead calls 'representational immediacy') at the cost of affect, embodiment and a consideration of the ways 'perception is already grounded in the body' (xi). The distinction being, for Whitehead, that this everyday lack of clarity is the accepted and welcome ground from which his metaphysics is borne.

While metaphysics cannot be boiled down to any single project or person, there are schools. Heidegger's general project has been to seek a way out of the classical, Western metaphysics that began with Plato and Aristotle. Whitehead, however, does not cast away metaphysics at all. Instead, he simply does it. Subjectivity is central to understanding Whitehead's metaphysics because the subject, in his view, is always already embedded in the world. This may seem akin to Heidegger's

concept of 'thrownness' – denoting the factical state of having fallen in the world – but remember, in falling, a subject is drawn back into concealment, into another place and awareness that is *not* of the world. In contrast, for Whitehead, the subject is an 'irreducible part of the universe, of the way things happen. There is nothing outside of experience.' There is no before or after (as in *Being and Time*), only spontaneous configurations and exchanges between data and subjects. As Whitehead puts it, the subject, 'constitutes itself in and through experience; and thereupon it perishes, entering into the 'objective immortality' of a being a 'datum' (Whitehead, qtd in Shaviro 2009: xii).

Whitehead held that the great accomplishment of Kant was not that he placed the subject at the centre of experience (aka Kant's 'Copernican turn'), but rather, that he was the first to conceive of *experience as a constructive process* (47). Kant knew it was impossible to know 'things in themselves', so the alternative he came up with was to glean knowledge of the *how*: the *ways* one is 'involved with whatever it is that we experience or observe'. In this move, the doors opened for post-Kantian philosophy to shift the focus from the epistemological 'what' to the ontological 'how', which also meant philosophy opened itself to singularity and the new. Even though Kant did not go through this door, he nonetheless constructed (fabricated?) the frame.

Whitehead's metaphysics begins in this new space of process and change. Instead of explaining subjective experience through Kant's 'transcendental unity of apperception', Whitehead inverts the supposition and argues that experience moves from objectivity to subjectivity. Emotions do not cause bodily states, he argues; the bodily states come first and the emotions arise out of them (58). Shaviro contextualises this thesis within the tradition of American pragmatist, William James, who also rejects the conventional dualism between mind and object (20). For both, there is no 'stable and essential distinction' between the two. Whitehead proposes further indistinctions between the living and the dead, the human and nonhuman (what postmodernists call 'blurring the boundaries').

The thesis seems retroactively in line with (some) of the ideas emerging in speculative realism and object oriented philosophy today.[1] Indistinctions and anti-essentialist claims about distinctions between life and death pull the carpet out from the anthropocentricism rampant in Western philosophy (primarily in the work of Descartes, Kant, Hegel, Husserl and Heidegger). This has also been the project of Deleuze and Guattari, Foucault and, more recently, Quentin Meillassoux and Graham Harmon. Harmon and Whitehead, in particular, appear to lock

in step with their treatment of the non-human subject. For Whitehead, the subject may be a 'a dog, tree, mushroom, or a grain of sand' (xii) and similarly, in Harmon's object-oriented reinterpretation of Heidegger's work, 'crystal-effects' may be included in his reconception of Heidegger's otherwise anthropocentric and romantic Dasein (human subject). For Harmon, all subjects, whether human or rock, are a part of the 'equipmental contexture' (Harmon 2002: 30), decentring the privileged role of the human in Heidegger's philosophy. There are many, obvious differences between Whitehead and Harmon (and object-oriented philosophy and Whitehead's metaphysics), which must be expanded upon elsewhere.

A constructivist philosophy, or 'critical aestheticism', emerges in Shaviro's rereading of Kant's Analytic of the Beautiful. Instead of looking to the Sublime as *the* definitive moment of rupture, after which one endlessly speaks of impossibility and interpretation (the thesis of choice for postmodernism, poststructuralism and deconstruction alike), in the Analytic of the Sublime a new ground of singular, subjective and aesthetic experience is offered. On this point, the three – Deleuze, Whitehead and Kant – meet. All concur that aesthetic experience is non-personal and singular. In fact, aesthetic experience is so singular and new, it has no foundation at all, and 'offers no guarantees' (1). Herein lies the new ground for a constructivist philosophy, *without criteria*.

Perhaps as a response to the rise in cognitive science or simply the stakes of aesthetics after Rousseau and Goethe, in vogue today is philosophy that prioritises affect as central, if not as precedent, to cognition. On this point, Shaviro finds a surplus of allies. First and most obvious are Deleuze and Guattari. Second is Rancière (only briefly referenced in the book), whose 'poetic regime' abolishes hierarchies and pragmatic criterion, allowing for the proliferation of art and aesthetics in a society based on the 'primacy of fiction' (Rancière 2004: 83). There is also Fredric Jameson who, a decade earlier, argued that all cultural production had become a form of aesthetic production (Jameson 1991). One may also include Debord and Baudrillard, whose theories of the society of the spectacle and the primacy of the visual image equally support the primacy of affect in cultural and aesthetic experience.

But can we (and I mean readers) consider feelings as equivalent to affect? For Shaviro, the answer is a big yes. 'To feel something is to be affected by that something' (58). 'Only after the subject has constructed or synthesized itself out of its feelings . . . can [it] go on to understand the world – or change it' (15). Feeling may be defined in such ways in dictionaries, but it is not the way it is used by Deleuze and Guattari. For them, affect is not analogous to feeling. While both feeling and affect are

emotions, there is an important distinction. Feelings, or 'sentiments', are considered personal, or territorialised forces, 'feelings become uprooted from the interiority of a subject' (Deleuze and Guattari 1972: 356), whereas affects are more free-floating, pre-personal, intensities. They expand:

> Affects . . . relate only to the moving body itself, to speed and compositions of speed among elements. Affect is the active discharge of emotion, the counterattack, whereas feeling is always displaced, retarded resisting emotion. Affects are projectiles just like weapons; feelings are introceptive like tools. (Deleuze and Guattari 1992: 441)

To be fair, Shaviro's conflation of affect and feeling is justified by his reading of affect through Whitehead, for whom feeling is not actually feeling (in Deleuze and Guattari's sense). For Whitehead, an 'act of feeling is an encounter – a contingent event, an opening to the outside – rather than an intrinsic, predetermined relationship' (62). That is, feeling is conceptually on par with affect – both remain open, new, and impersonal. Whitehead-feelings – like affect – are abstract and unformed, 'vector transmission[s]', constituting the a priori conditions for understanding and cognition. Affect and feeling pave the road for diverse, novel entities: the 'ultimate metaphysical ground for everything' (Whitehead, qtd in Shaviro 2009: 62, 149).

And just how far does this fantasy go? For Shaviro, there are no limits. The 'new biology, as much as any new work of art', he writes, 'requires us to abandon everything we think we know, and make singular judgments that cannot be subsumed under preexisting criteria' (16). Readers must decide for themselves if it is even possible to do something like this (one wonders about history, the persistence of memory and the psyche), and furthermore, whether this new groundless-ground of aesthetics, once cleared by Kant, is not already filled with new interiors – a new carpet perhaps – woven with free-floating affect, sensation and physiology. Is without criteria really without criteria, or just certain kinds of (cognitive, rational and categorical) criteria? Either way, this minor and tangential afterthought should by no means deter from the highly significant and important project Shaviro has brought to the table.

Before concluding, a quick note on God. Like feeling and metaphysics, for Whitehead, God is not God in the conventional sense of the term. For him, God is the 'secularization of God's function in the world' (Whitehead, qtd in Shaviro 2009: 105). God is a 'God without a religion', one which is a 'force for novelty, precisely because he does not determine the actual course of events' (135). This is not so much

Leibniz's God of 'best possible worlds', nor Spinoza's privileged God (99–102), so much as it is a God that is (structurally) analogous to Deleuze and Guattari's Body without Organs: a 'recording surface, a site of inscription… "an enormous undifferentiated object… the unproductive, the sterile, the unengendered, the unconsumable" ' (124). Whitehead's God – like the Body without Organs – cannot be used as an excuse or 'fallback explanation' for the conditions created by human beings: 'God accounts for nothing and excuses nothing' (139).

God, then, like aesthetic experience and the Body without Organs, is like a modulator interfacing between data and (non-necessarily) human subject – always open to the new and change. People make science, technology, art and war, not God, language or technology. In the information age, a philosophical fantasy that makes philosophy look more science fiction by way of realistic, down-to-earth insight is, to be sure, a philosophy worth paying attention to.

Ian Buchanan and Patricia MacCormack (eds) (2008) *Deleuze and the Schizoanalysis of Cinema*, London: Bloomsbury Publishing.

As with Foucault's famous quote, printed on the cover of *Negotiations*, if one should choose to call oneself 'Deleuzian' it is always with a sense of irony and paradox. To apply Deleuze is not to be 'Deleuzian' in the sense of an acolyte or follower, but rather to draw lines of

flight from Deleuze's thought and expand, rhizomatically, into new terrain. The schizoanalytical project, as exemplified in this collection, performs precisely this dynamic operation. The critics, academics and philosophers here presenting their readings of schizoanalysis of cinema are all embroiled in making Deleuze anew – finding points of contention, adaptation and combination that can spring forth into new epistemologies, ways of seeing and becoming. Although varying greatly in tone and approach, the eleven essays in this collection are all concerned with making new assemblages from the entirety of Deleuze and Guattari's work. Each author takes Deleuze's study of cinema on a new journey, via schizoanalysis, to address issues of how the experience of cinema can allow the schizo to become. Common strands in the collection include: (1) a focus on the socio-political context of filmic production; (2) the interaction between brain, screen and the social field that is formed by experiencing cinema; and (3) faciality and delirium as cinematic affects that express the schizo. Treating each strand in turn (place, space and face), I will examine each of the essays in the collection to explore how they apply and expand on Deleuze and Guattari's theory in order to perform specific actions of schizoanalysis.

Place

The combinations and incursions attempted within the collection are addressed, as Ian Buchanan indicates in the introduction, towards combining conceptual structures from different Deleuzian texts, particularly the use of schizoanalytical strictures from *Anti-Oedipus* and *A Thousand Plateaus* alongside Deleuze's taxonomy of cinematic images from *Cinema 1* and *Cinema 2*. Several of the contributors also highlight possible weaknesses in the cinema books, specifically addressing concerns with those texts' possible Euro-centrism and concentration on auteur 'high-culture' cinema. In *Cinema 1* and *Cinema 2*, Deleuze's ascetic and exclusive view of the majority of films was that they are null and void, in terms of political and philosophical value, due to their empty repetition. In this view, the true artist's task is to avoid the given, to avoid 'opinion' and stagnant, mediocre thought (thought and images that reinforce the molar aggregates). Buchanan relates this 'gelatinous morass of the given' to the process of commodification in late capitalism, wherein cinema's potential is subsumed into propaganda and a global conduit for interpellation, hegemony and heterogeneity. According to Deleuze, *auteurs* escape commodification by producing avant-garde, signature films that produce genuine differentiation and new lines of flight. Buchanan posits a reversal of this concentration on

the molecular, to instead read the molar structure in order to ascertain how commodification is organised. This is schizoanalysis applied to understand the molar machine in order to better dismantle it, which is how Buchanan brings Deleuzian analysis to a point where any films, no matter how low-brow, can be examined through schizoanalysis for deconstructivist openings into new forms of thinking.

In 'Off Your Face: Schizoanalysis, Faciality and Film', Anna Powell makes her own incursion against the standard application of Deleuzian cinema theory to state that art-house cinema is 'pre-digested'. Auteur and experimental cinema challenges us with illogical cuts, a-temporality and non-linear narrative – but for Powell, this makes applying Deleuze and Guattari's theories to such films all too easy.

In contrast, popular cinema requires more work to deterritorialise, and examining mainstream science fiction and fantasy opens up the schizoanalysis of cinema to other possible lines of flight. In 'Schizoanalysis, Spectacle and the Spaghetti Western', David Martin-Jones addresses the spectacle of modern production and consumption of populist cinema. Referencing Rosie Thomas on Indian cinema and Tom Gunning on silent cinema, as well as Italian westerns produced in the latter part of the last century, Martin-Jones is particularly concerned with the schizoanalysis of the whole socio-political assemblage of cinema. Martin-Jones's essay uses *A Thousand Plateaus*' interactive planes to make a theoretical move to see movement and time-images as an interactive flow, as the linearity of movement-images is perpetually undermined by the virtuality of time-images. Martin-Jones views the time-image is an expression of the molecular, destabilising the molar. From this perspective, the cinema books are a formal taxonomy, but used in conjunction with schizoanalysis of *Anti Oedipus* and *A Thousand Plateaus*, image categories can be opened up to see how images, artefacts and historiographies all interact in re- and deterritorialising flows. Thus, schizoanalysis that takes into account context views cinema as striations, relevant to modes of production of its particular time and place, and its intentionality towards its audience.

With a similar concern for national context and modes of production, in 'Cinemas of Minor Frenchness', Bill Marshall addresses Quebecois cinema as specifically minor – that is, involved in de- and reterritorialisation through non-majoritarian positions of history, geography and language. Marshall states that social groups in these positions can reterritorialise in new language or seek a continual undermining of molar language. This proactive application and cross-fertilisation across Deleuze and Guattari's work is to be commended,

allowing as it does for cinema to be considered truly outside of the realms of signification and representation, not only at the level of time-images but as an entire machinic assemblage, including socio-political contextual factors. This widens the depth and variety of types of cinematic genre and form that can be explored through a Deleuzian lens, and furthermore allows us to take cinematic experience as a conduit for the evocation and instantiation of post-structuralist modes of consciousness and agency.

Space

As well as allowing socio-political factors to be considered in relation to Deleuzian theory and cinema, schizoanalysis of cinema (where multiple aspects of Deleuze are applied to the cinematic experience) allow openings of how cinema can come to expose the non-human, post-subjective aspects of a Deleuzian schizo consciousness. Several of the authors in the collection pursue this line of flight. In 'Schizoanalysis and the Phenomenology of Cinema', Joe Hughes embarks upon a phenomenological comparative study across a range of Deleuze and Guattari's work in order to draw from them a reading of schizoanalysis as particularly relevant to the concerns of post-structuralist subjectivity. According to Hughes's interpretation of Deleuze, images are not abstract ideals but rather particular potentialities or instances in a particular 'material subject' (16). Hughes contends that Deleuze's taxonomy of cinema is thus not semiological but semiotic, describing not a language structure but a phenomenology. Hughes considers the congruence of phenomenological structures in *Logic of Sense* and *Anti-Oedipus* and further applies these parallels to the system of images described in *Cinema 1*, aligning the depictions of unconscious, passive synthesis to demonstrate that 'all three are accounts of the same Deleuzian unconscious' (25). Through the exposition of parallel structures across the work of Deleuze, Hughes establishes that all three texts are examples of schizoanalysis, describing a 'transcendental unconscious beginning with its ultimate elements' (26).

Mark Riley's 'Disorientation, Duration and Tarkovsky' addresses Andrey Tarkovsky's films *Solaris* (1972) and *Stalker* (1979) to reveal how schizoanalysis must come from drawing variant lines. As Deleuze and Guattari expose desire as machinic and performative, to break existing patterns requires that we partake in nomadic practice. Hence the schizoanalytical power of cinema is in its capacity for indetermination. Riley locates this power in cinema specifically to 'temporal

de-coordination', this being the infarction of past into present and thus the virtual into the actual. Cinema is essentially de-coordinated in this way as it is specifically a recording of past experienced in a present. The experience of cinema illuminates that all perception is constituted in this way. The expression of virtuality into actuality is the constant becoming of experience and ultimately all experience is of this dynamic. For Riley, thought begins with an 'encounter with simulacrum' of individuality, but individuation is in fact a disguise or mask. What is experienced in the disorientation of Tarkovsky's cinema is the trace of the virtual that always accompanies phenomenological actuality.

Gregg Lambert's essay 'Schizoanalysis and the Cinema of the Brain' posits that brain and world have an interval, but not a separation. Deleuze's conception of brain function is non-Euclidean, accommodating synaptic gaps and gates that have random, changing connections. This framework correlates with the probability and uncertainty of quantum mechanics in the brain. Similarly, the time-image in cinema exposes quantum leaps of perception and apperception. Lambert illustrates this with reference to Stanley Kubrick's cinema: the delirium of General Ripper (*Dr. Strangelove*, 1964), The Overlook (*The Shining*, 1980) and HAL (*2001: A Space Odyssey*, 1968). The simultaneity of rational and irrational within the films is comparable to the uncertainty of the connection between brain and world. Kubrick's films, which incorporate simultaneity of delirium and the social fields that topographically locate that delirium, thus expose the schizoanalytical relation of multitudinous multiplicitous desire.

Patricia Pisters's 'Delirium Cinema or Machines of the Invisible?' draws its methodology from *Essays Critical and Clinical*. Pisters describes modern image abundance as 'madness'. Cinemas take place within this madness. Pisters uses Deleuze and Guattari's assessment of schizophrenia as a technique to draw philosophical value from immersion in cinematic delirium. Pisters differentiates between two strands of Deleuze and Guattari's treatment of schizophrenia. In *Anti-Oedipus*, we are advised of schizophrenisation, this being the movement and flow/process of de- and reterritorialisation. In *A Thousand Plateaus*, the figure of the schizophrenic is called upon to bring forth rhizomatics, the Body without Organs and Becoming. In both works, schizophrenia may be viewed as either process (breakthrough) or disease (breakdown). Pisters characterises the schizoanalytical project as bringing about a movement from cinema as 'machine of the visible' to 'machine of the invisible'. This is the move from representation and spectatorial interpretation, to brain/screen assemblage. Schizoanalysis is a 'new episteme' – prioritising choice and belief over knowledge.

In 'An Ethics of Spectatorship: Love, Death and Cinema', Patricia MacCormack takes these phenomenological analyses of the cinematic experience a stage further, to expose how we might go beyond mere subjective dissolution and even expressive creativity, into a specifically ethical relation with the world. MacCormack contends that representation, and its analysis through reading, 'massacre' the image. In the cinematic experience, any presumption of analytic understanding of the viewed images as objects of desire, to be resolved into representations, annihilates the Event of connectivity and being-with of the brain/screen assemblage. She states that ethics becomes impossible when interpretation becomes a quest to 'know'. Images cannot be desired as objects, to be understood as alterities, but must be directly absorbed into brain and body as integral to the forming of ourselves, viscera and thought combined. To suspend the assumption of subject/object divide between subjectivity and images is to enter a state of grace and 'we are gracious to cinema to the extent that we open up potentialities of thought without a compulsion to convert images to meaning for knowledge'. Such spectatorship, which allows images to be part of what we are, allows ethics as a love-relation between self, world and social formations.

Face

Continuing with the focus on non-subjective non-identitarian formations of singular consciousness, three essays in the collection address a specific focus to the issue of faciality in Deleuze's writings on cinema. In 'Suspended Gestures: Schizoanalysis, Affect and the Face in Cinema', Amy Herzog questions whether it is anomalous for Deleuze to relate faciality (specifically in Bergman's close-up shots) to a-linguistic, non-significatory expression of affect, given that (1) Deleuze is usually careful to avoid correlation between his taxonomic concepts and particular techniques and (2) Deleuze does not wish to reduce filmic expressions of affect to a communication to be psychologically interpreted. The face in close-up appears to attract both these eventualities, making Deleuze's concentration on Bergman seem, at first, to be problematic. This apparent anomaly is essentially set up as a straw man by Herzog, who goes on to explore the complexity of Deleuze's formulation of faciality, as it relates to the schizoanalytical project of dismantling ingrained assumptions and producing new traversals of the social field. Herzog explicates how the face is in fact integral to schizoanalysis by relating the affective force of faciality to the Bergsonian

interval in perception wherein the inescapable residue of the virtual (and the durational) is found. The face, in evoking both immobility and motion, becomes the 'sheer potential' of the 'suspended gesture'. Herzog addresses Francis Bacon's paintings and Pedro Almodovar's *Bad Education* (2004) as illustrative of the ways that faciality can be harnessed by art to evoke new lines of flight away from subjectivity and expose the constructedness and violence of individuation.

Returning to 'Off Your Face: Schizoanalysis, Faciality and Film', we can see that Anna Powell finds facial mutation to be specifically schizoanalytical because the affect of participating in a cinematic experience where faciality is corroded and delirious becomes an infective, viral force that impacts directly upon our consciousness (as brain/screen assemblage).

In 'Losing Face', Gregory Flaxman and Elena Oxman address the idea of faciality in cinema through a Deleuzian analysis that imbues the face with non-interpretative affect. They state that 'the face renders thinking problematic'. Confronted with the face as ultimately unrecognisable, we are thrown into non-thought, non-philosophy: that which thought arises against. Flaxman and Oxman's elucidation of The Other Person communicates the variability, the 'assemblage of relations' of recognising an Other. The chicken and egg games of self/other priority are exposed as the ongoing expression of thought, of the virtual into the actual. This moves past Kantian processional perception to remove exteriority/internality and replace it with intensity and extensity within variable parameters of contextual relation. Thus, the possible is not predicated as that which can be understood; what can be understood forms as experience out of our relations with the possible (the virtual). Cinema (in close-up) takes the face apart (from the body). Affection writes itself across the face as expressions pass in flux, fluctuating as passion. The affection-image short-circuits translation and representation, expressing instead a direct form of agency. Affect here becomes as expression that is without actualisation, as opposed to linguistically based interpretation that forms fixed identity and a personhood ascribed to that face particularly. The affection-image is thus shown by Flaxman and Oxman to escape the socio-political encoding of the face in modern culture, allowing for a radical reimagining of subjectivity as non-human, imperceptible and faceless.

As with schizoanalysis of cinema's concern for the analysis and deterritorialisation of molar aggregates, the value of using the schizo-analytical elements of Deleuze and Guattari's theories in reference to the phenomenological Event of cinematic experience is very clear. Through

cinema – through the time-image and its exposure of Duration and the Bergsonian gap of singularity as non-subjective consciousness – we can find a way to a post-structuralist ethics where care and love replace the phantoms of rationality and representation. This is an active, radical epistemology that produces multiple possibilities for new ways of engaging as singularities with societal structure and control. This conception places all forms of art at the heart of becoming, without isolating it in any way as a purely aesthetic practice. From the schizoanalysis of cinema as a phenomenology with necessarily ethical results, the category of aesthetics become enmeshed with affect, which in turn is enmeshed entirely in what enjoins consciousness with the flux of multiplicitous becoming. From this position, art and participation in art (of any kind) is always potentially radical when we engage in its Event as a schizo becoming. This collection is thus not just valuable to cinema studies. It also opens up avenues for engaging with wider issues about other art forms such as schizoanalysis of genres of literature, for one, and with ethical questions regarding how to engage, post-structurally, with global exploitation and greed, for another. The collection also raises the issue of how to write Deleuze: analytically and academically or poetically? The structures and strictures of academic writing preclude the rhizomatic, which might be better expressed in music or non-representational art. In the same way that the authors in the collection make a stand, in the spirit of Deleuze, against strict interpretation of his theories, and call instead towards combination, expansion and the advantages of delirium, we may consider if it is appropriate to write on Deleuze, more as Deleuze would push us to write. Patricia MacCormack achieves this, writing with huge passion and immersion in her subject and having the becoming of the thought express itself out of the pattern as much as the content of the words. This is another opening that could be made, from schizoanalysis of cinema and art, to schizoanalysis of what it means to write academically about Deleuze. The collection of essays titled *Deleuze and the Schizoanalysis of Cinema* may be said, then, to be an Event that has molecular potential far beyond the usual conception of writing about cinema, or Deleuze.

Call for Papers

Deleuze. Guattari. Schizoanalysis. Education.

Where: Murdoch University, Perth, Australia

When: Monday 9th December–Wednesday 11th December 2013

Abstracts Due: Monday 29th July 2013

Convener: Greg Thompson Greg.Thompson@murdoch.edu.au

> We're in the midst of a general breakdown of all sites of confinement – prisons, hospitals, schools, families. The family is an "interior" that's breaking down like all other interiors – educational, professional and so on. (...) Educational reforms, industrial reforms, hospital, army, prison reforms; but everyone knows these institutions are more or less in terminal decline. (...) It is not a question of worrying or hoping for the best, but of finding new weapons.
>
> Gilles Deleuze, "Postscript on Control Societies" p. 178

This conference is designed for theorists and practitioners working at the intersection of Deleuze, Guattari, Schizoanalysis and Education to share their work. We welcome papers addressing a broad range of issues relating to institutional education such as schools, universities, technical colleges and other institutions of higher education. We also welcome papers addressing the use of Deleuze, Guattari and their combined works in areas typically associated with mainstream education including pedagogy, teaching, learning, teacher education, theories of self, subjectivity, the space and time of the classroom and so on. Those working outside what may be termed mainstream education in alternative education contexts are also encouraged to participate.

Potential themes

- Education space-time
- Feminisms/Feminist theory and education
- Psychoanalytic theory and Education
- Schizoanalysis and Education
- Affect and Education
- Identity, faciality, education
- Geophilosophy and education
- De-/Re-/Territorialisation and Education
- Education, modulation and control societies
- Multiplicities and education
- Practical applications of Deleuze and Guattari's ideas in educational settings
- And then... and then... and then...

For further information go to the Conference website
http://www.murdoch.edu.au/School-of-Education/Research/Deleuze-Conference-2013/

Editors' Acknowledgements

We would very much like to thank the following people who acted as referees: Simon Duffy, Gavin Rae, Nathan Widder, Claudia Mongini, Brian W. Smith, Iain MacKenzie, Emma Ingala, Dorothea Olkowski, Edward Willatt, Caroline Williams and Gerald Cipriani.

Special thanks to Marjorie Gracieuse, Jean-Claude Dumoncel, David Savat, Ian Buchanan and Les Back.

Introduction

Paul Patton The University of New South Wales

The papers in this issue of *Deleuze Studies* represent a small selection of more than eighty papers presented at the Kaifeng International Deleuze Conference in May 2012 at Henan University in the ancient capital of Kaifeng City in Henan province. This two-day conference was the first of its kind to be held in China. It was attended by more than ninety Deleuze scholars from around the world, including around thirty from China, Taiwan, Hong Kong, Korea and Japan. Those attending came from a wide variety of disciplines including Literary and Film Studies, Anthropology, Architecture, Art and Philosophy. The plenary speakers were Rosi Braidotti (Utrecht), Ronald Bogue (Georgia), Brian Massumi (Montreal) and Anne Sauvagnargues (Paris X). The conference was jointly sponsored by Henan University and The University of New South Wales and organised by Professor Jihai Gao, Professor Paul Patton, and a team of academic and administrative staff and students from Henan led by Dr Jing Yin. Thanks to their efforts and those of the participants, the conference was acclaimed by all who attended as a great success. This conference marked the beginning of a process already underway for some decades, namely the translation of Deleuzian thought and concepts into the diverse languages and cultures of East Asia. It also represented a further small step in the long history of productive encounters between Asian and Western thought. Who knows where this will lead as the Asian century unfolds.

Details of the conference, including the full programme and photos, are available at http://deleuze.henu.edu.cn/index.php/c_home/over_view

On the Superiority of Anglo-American Literature

Ronald Bogue University of Georgia

Abstract

In *Dialogues*, Deleuze contrasts French and Anglo-American literatures, arguing that the French are tied to hierarchies, origins, manifestos and personal disputes, whereas the English and Americans discover a line of flight that escapes hierarchies, and abandons questions of origins, schools and personal alliances, instead discovering a collective process of ongoing invention, without beginning or determinate end. Deleuze especially appreciates American writers, and above all Herman Melville. What ultimately distinguishes American from English literature is its pragmatic, democratic commitment to sympathy and camaraderie on the open road. For Deleuze, the American literary line of flight is toward the West, but this orientation reflects his almost exclusive focus on writers of European origins. If one turns to Chinese-American literature, the questions of a literary geography become more complex. Through an examination of works by Maxine Hong Kingston and Tao Lin, some of these complexities are detailed.

Keywords: Anglo-American literature, empiricism and pragmatism, Herman Melville, Chinese-American Literature, Maxine Hong Kingston, Tao Lin

I trust no one is under the misapprehension that the title of this talk reflects my own judgement of the importance of English and American literature. The title, of course, is a citation of the Section Two heading of Deleuze and Parnet's *Dialogues*. In that section Deleuze speaks of

Deleuze Studies 7.3 (2013): 302–318

English and American literature as a single phenomenon, but my focus will be on American literature, how Deleuze conceives of it, and what relevance that conception might have for our gathering here in China. Besides considering the Deleuzian image of American literature as a whole, I wish to reflect on the geographic components of his conception, especially his valorisation of the West, both as locus and as direction. Within that national and geographical context, I will finally remark very briefly on Chinese-American literature, something Deleuze does not himself address.

I. Deleuze and American Literature

In the course of his career, Deleuze makes reference to thirty-eight American writers, most merely in passing. H. P. Lovecraft and Henry Miller are quoted several times in the two volumes of *Capitalism and Schizophrenia*, while James's 'In the Cage' and Fitzgerald's 'The Crack-Up' are given close, if compact, readings in Plateau Eight of *A Thousand Plateaus*. Deleuze includes a penetrating, brief essay on Whitman in *Essays Critical and Clinical*. But for Deleuze it is Melville who is the most important – indeed, one might say, the quintessential – American writer. Melville's pre-eminence is perhaps not immediately apparent in *Dialogues*, but it is worth observing that Deleuze begins his meditation on Anglo-American literature by making reference to D. H. Lawrence's salute to Melville's genius. Section Two's opening words are, 'To leave, to escape, is to trace a line. The highest aim of literature, according to Lawrence, is 'To get away. To get away, out! [. . .] To cross a horizon into another life [. . .] So [Melville] finds himself in the middle of the Pacific. Truly over a horizon" (Deleuze and Parnet 2002: 36; translation modified). Melville's primary function in *Dialogues* is to provide an example of becoming-animal, specifically in the figure of Ahab in his becoming-whale. (We might note that Ahab's becoming-whale is referenced seven times in the becomings plateau of *A Thousand Plateaus*, four times as an illustration of percepts and affects in *What Is Philosophy?*, and once in *Negotiations* in relation to Foucault's thought as a process of 'crossing the line' to the 'Outside' [Deleuze 1995: 111].) It is Ahab's becoming-whale that draws him into a line leading beyond the horizon, toward an open Outside. It is also through Ahab's becoming-whale that Deleuze brings together the themes of betrayal, choice and the demonic in *Dialogues*, in that Ahab's crime is that 'of having chosen Moby-Dick, the white whale, instead of obeying the law

of the group of fishermen, according to which all whales are fit to hunt. In that lies Ahab's demonic element, his treason, his relationship with Leviathan – this choice of object which engages him in a becoming-whale himself' (Deleuze and Parnet 2002: 42).

Melville's full significance for Deleuze, however, is only revealed in 'Bartleby; or, The Formula', one of Deleuze's finest pieces of literary criticism. Here, Deleuze reiterates *Dialogue*'s points about Ahab's becoming-whale and Melville's enduring effort to trace a line beyond the horizon to an Outside, but he also connects Melville to the themes of minor literature – the deterritorialisation of language, the immediate engagement of the social and political, the activation of collective assemblages of enunciation – while delineating in Melville an American political ideal based on pragmatism, democracy and sympathy. In *Dialogues*, minor literature's deterritorialisation of language is treated in terms of making language stutter, but Deleuze offers no concrete literary instances of this practice. Instead, he concentrates on the English language itself as both a repressive force of global homogenisation and a medium open to multiple internal deformations. These characteristics he finds especially true of American English. 'The American language', he says,

> bases its despotic official pretensions, its majoritarian claim to hegemony, only on its extraordinary capacity for being twisted and shattered and for secretly putting itself in the service of minorities who work it from inside, involuntarily, unofficially, nibbling away at that hegemony as it extends itself: the reverse of power. (Deleuze and Parnet 2002: 58)

In the essay 'Bartleby', unlike *Dialogues*, Deleuze offers a specific instance of stuttering in literature – Bartleby's 'I prefer not to' – and submits it to an exhaustive analysis. Bartleby's 'formula' is an essence of stammering, a simple, short phrase whose iteration induces a cascade of deterritorialisations. Bartleby himself belongs to no ethnic minority, but his deployment of his formula is paradigmatic of minor literature's deterritorialising usage of language.

In 'Bartleby', then, Melville shows himself to be an exemplary practitioner of minor literature's deterritorialisation of language, but Melville's treatment of Bartleby, Deleuze shows, is connected to broader themes that echo throughout Melville's works. In Chapter 44 of *The Confidence-Man*, Melville reflects on characters in fiction, differentiating 'new, singular, striking, odd, eccentric, and all sorts of entertaining and instructive characters' from what he calls 'originals'. The original

character, says Melville,

> is like a revolving Drummond light, raying away from itself all round it – everything is lit by it, everything starts up to it (mark how it is with Hamlet), so that, in certain minds, there follows upon the adequate conception of such a character, an effect, in its way, akin to that which in Genesis attends upon the beginning of things. (Melville 1964: 261)

No work of fiction may contain more than one Original, according to Melville (though Deleuze finds two in *Billy Budd*). Deleuze identifies two types of Originals in Melville: monomaniacs (Ahab in *Moby-Dick*, Claggart in *Billy Budd*, Babo in 'Benito Cereno') and hypochondriacs (Cereno and Billy Budd, but 'above all Bartleby' [Deleuze 1997: 80]). These two types, '*monomaniacs* and *hypochondriacs*, demons and angels, torturers and victims, the Swift and the Slow, the Thundering and the Petrified' (78–9), belong to a 'terrible supersensible Primary Nature, original and oceanic, which, knowing no Law, pursues its own irrational aim through them' (79). By contrast, non-Originals, that is, ordinary humans, belong to sensible, rational Secondary Nature of Law. The 'biggest problem haunting Melville's oeuvre', says Deleuze, 'no doubt [. . .] lies in reconciling the two originals, *but thereby also in reconciling the original with secondary humanity*, the inhuman with the human' (84).

Melville envisions that reconciliation in the annihilation of all father figures and the creation of a society of blood brothers and blood sisters. 'The American is one who is freed from the English paternal function', says Deleuze, and in founding a new world society, the American vocation 'was not to reconstitute an 'old State secret,' a nation, a family, a heritage, or a father', but 'to constitute a universe, a society of brothers, a federation of men and goods, a community of anarchist individuals' (Deleuze 1997: 85). Deleuze links the formation of such a universe to American pragmatism, which he regards as less a 'summary philosophical theory fabricated by Americans' than 'an attempt to transform the world, to think a new world or new man insofar as *they create themselves*' (86). (In this regard, Deleuze views Melville as a pragmatist *avant la lettre*.) Pragmatism affirms the world as '*in process, an archipelago*' (86), and the social order it advocates is one of 'islands and straits, immobile points and sinuous lines' (86). Deleuze likens this order to a wall of stacked stones with no mortar, 'a wall of uncemented stones, where every element has a value in itself but also in relation to others' (86). This order is 'an infinite patchwork with multiple joinings', 'a Harlequin's coat' (86). And what holds it together

is trust, hope and belief – not belief in a world to come, but belief in this world and its possibilities.

In pursuing a politics of the archipelago and belief in this world, American pragmatism faces a dual problem: that of overcoming all the particular differences among individuals that breed mistrust, but without succumbing to a fusion of souls in a grand Whole of philanthropy and charity. The solution is to counter particularities with singularities, and to replace charity with sympathy. Singularities are becomings, apersonal intensities that retain specificity without taking on a conventional identity. In their becomings, men and women discover what Melville calls a 'democratic dignity', a radical equality of human beings without regard to their particularities, yet one that recognises each person's singularities. Such becomings, as social phenomena, give rise to collective intensities, which Deleuze identifies with 'sympathy' as opposed to 'charity'. Here Deleuze is following Lawrence in his reading of Whitman and Melville as advocates of what Lawrence describes as 'all the subtle sympathizings of the incalculable soul, from the bitterest hate to passionate love' (quoted in Deleuze 1997: 87). Both singularities and sympathy are produced only when the individual

> takes to the open road (or the open sea) with its body, when it leads a life without seeking salvation, when it embarks upon its incarnate voyage, without any particular aim, and then encounters other voyagers, whom it recognizes by their sound. (Deleuze 1997: 87)

The open road is an American morality of sympathy, one 'with no other aim' than the journey, 'open to all contacts, never trying to save other souls, [. . .] with freedom as its sole accomplishment, always ready to free itself so as to complete itself' (Deleuze 1997: 87).

II. The Specificity of American Literature

In treating Melville as the paradigmatic American writer, Deleuze is able to differentiate American from English literature in his Bartleby essay, though the distinction he draws is somewhat problematic. Melville's Original characters are inexplicable, like life itself, and hence beyond rationality. 'The founding act of the American novel,' says Deleuze, 'like that of the Russian novel, was to take the novel far from the order of reasons' (Deleuze 1997: 81). Surprisingly, however, Deleuze contrasts the American and Russian novel in this regard with 'the English novel, and even more so the French novel' (81). Deleuze also attributes the patchwork ideal of American democracy, central

to the American literary project, to Americans, who, says Deleuze, 'invented patchwork, just as the Swiss are said to have invented the cuckoo clock' (87), even though in *Dialogues* he describes English empiricism as 'a Harlequin's jacket or patchwork' (Deleuze and Parnet 2002: 55). Yet these contradictions aside, which I regard as rhetorical strategies rather than definitive reassessments of English literature, other elements of Deleuze's analysis remain that may help us determine the specificity of American literature as Deleuze sees it. Deleuze is right to stress in Melville and American pragmatism the centrality of action, process, belief and community. American pragmatism builds on British empiricism, but as Gérard Deledalle notes, in a book cited by Deleuze, the experimentation of pragmatism, unlike British empiricism, is focused on 'the spirit of the laboratory', as Pierce expressed it, on science as method and on the collective enterprise of doing science. The stress on method entails a focus on actions and verifiable consequences, as well as on beliefs – as constituents of habits, as unavoidable in the formulation of hypotheses, and as confirmed or modified through experimentation.[1] Scientific inquiry, being an open-ended activity, envisions knowledge as process, and pragmatists situate this process within a world itself in the process of evolution. And science's collective dimension leads pragmatists to a general theory of action and inquiry as social activities, and eventually to Royce's ideal 'Community of Interpretation' and Dewey's democratic ideal.[2] Deleuze's focus on Melville and Whitman's sympathy, although not a theme in pragmatism, also helps differentiate English from American sensibilities. As Deleuze shows in his first book on Hume, sympathy figures prominently in Hume's social theory, as that which allows individuals to go beyond themselves to form larger communities. But Hume grounds his social theory in private property, whereas Melville's sympathy is part of a 'democratic dignity' that knows no distinctions of property. Sympathy regards the human as such, *homo tantum*, and in this regard, Deleuze argues, Melville's democratic ideal is the counterpart of the Russian communist ideal, Melville's ideal being envisioned as a universal community of immigrants, the Russian ideal as a universal community of workers. In sum, then, both English and American literature pursue lines of flight, deterritorialise language and form patchwork assemblages, but American literature stresses more fully action and process, and it alone articulates ideals of democratic sympathy, belief in this world, a universal community of immigrants and a camaraderie of the open road.

In principle, the open road of American sympathy has no privileged direction, but in its literary historical manifestation it has most often

been the road to the West, as Deleuze notes in *Dialogues* and *A Thousand Plateaus*. In *Dialogues*, he remarks that 'American literature operates according to geographical lines: the flight towards the West, the discovery that the true East is in the West, the sense of the frontiers as something to cross, to push back, to go beyond' (Deleuze and Parnet 2002: 37). In *A Thousand Plateaus*, he and Guattari state that 'directions in America are different: the search for arborescence and the return to the Old World occur in the East. But there is the rhizomatic West, with its Indians without ancestry, its ever-receding limit, its shifting and displaced frontiers' (Deleuze and Guattari 1987: 19). In both texts, Deleuze cites Leslie Fiedler's *Return of the Vanishing American* (1968) as the source of his comments, in *Dialogues* referring the reader to 'the whole analysis of Leslie Fiedler' (Deleuze and Parnet 2002: 154), and in *A Thousand Plateaus* providing a succinct yet detailed summary of Fiedler's book in an extended footnote (Deleuze and Guattari 1987: 520).[3] Fiedler's argument is that in pre-Columbian Europe the West already had a mythological significance that would persist in the New World imagination. The map of pre-Columbian Europe consisted of the North (Europe), the South (Africa) and the East (Asia, which, incidentally included China from as early as the second century BCE). The West was not on the map as such, but simply an unknown territory beyond the map's edge, the mythic site of either an earthly paradise (Atlantis, the Blessed Isles) or a forbidden land of death (best represented by Dante's account of Ulysses's transgressive voyage west beyond the Straits of Gibraltar into shipwreck and sin). Fiedler argues that American literature, from its inception, is informed by an imaginary geography that views the West as an Edenic and transgressive territory, a land without women in which American males of European descent divest themselves of their past and form homoerotic bonds with Native Americans, Africans and other non-Europeans. Deleuze ignores the psychoanalytic content of Fiedler's analysis, but agrees that in American literature the journey west is the direction of deterritorialisation. From James Fenimore Cooper, through Melville to Jack Kerouac, the westward journey or voyage is the trajectory beyond the horizon to the Outside. And with Ginsberg, Sanders and others, the movement West ends in a discovery of the wisdom of the East.

In *A Thousand Plateaus*, Deleuze and Guattari oppose the arborescent West of Europe to the rhizomatic East of China, citing Henry Miller's declaration that 'China is the weed in the human cabbage patch' (quoted in Deleuze and Guattari 1987: 18).[4] (For Miller, as for Deleuze and Guattari, the association of China with weeds is high praise, since

the weed is an exemplary rhizome, something that '*grows between*, among other things' [55].) Midway between arborescent Europe and rhizomatic China Deleuze and Guattari situate America. They counter Haudricourt's claim that India is 'the intermediary between the Occident and the Orient', and assert instead that 'America is the pivot point and mechanism of reversal' (19). In America, the movement east toward Europe is the line of reterritorialisation, whereas the movement west toward China is the line of deterritorialisation.

East and West, of course, are both locations and directions. Locations – *the* West, *the* East, West Coast, East Coast, and so on – are largely defined by their pertinent land masses, whether continents, islands or administrative territories (national, state, metropolitan, whatever). Directions, by contrast, are relations, and as we know, relations are separate from their terms. On a globe, every point is both east and west of every other point, depending on the direction in which one travels. Geographically, if not culturally, India is as much between Europe and China as is America. The westward trajectory of much American literature is a function of the European colonisation of the New World, begun on the east coast and continued in the incremental opening of western territories to those pursuing America's Manifest Destiny. (Go west, young man!) Deleuze's focus on American literature's western vector reflects his attention primarily to white authors of European descent. Of the thirty-eight American writers Deleuze names, only three do not fit this profile: the African Americans Chester Himes and LeRoi Jones (Amira Baraka), both cited only once in passing, and, if one labels him a writer, the Hispanic American Carlos Castaneda (a native of Peru). Deleuze, of course, is sensitive to questions of ethnicity and minorities in literary study – witness his analyses of Kafka, Sacher-Masoch and the concept of minor literature in general. In *Dialogues*, Deleuze does say that 'American is worked upon by a Black English, and also a Yellow English, a Red English, a broken English, each of which is like a language shot with a spray-gun of colors' (Deleuze and Parnet 2002: 58), but he never deals with the writers of black, yellow, red or broken English. One wonders what Deleuze's portrait of American literature would have been like had he read the multi-ethnic literatures of the United States written by immigrants arriving from all directions. And what his geography of American literature would have resembled had he treated authors whose movement to America has been eastward – as is the case with Chinese American writers.

Rather than offer vague generalities about Deleuze, American literature and Chinese American authors as a whole, I would like to

consider two such writers from a Deleuzian perspective: Maxine Hong Kingston, currently perhaps the most famous Chinese American writer, and a much younger, less well-known author, Tao Lin.

III. Maxine Hong Kingston: Becoming-Chinese-American, Becoming-Woman

Born in 1940, Kingston explicitly characterises herself as a Chinese American woman writer. Her first two publications, *The Woman Warrior: Memoirs of a Girlhood Among Ghosts* (1976) and *China Men* (1980), are hybrid works of what might be called 'memoir fiction' or 'collective autobiography'. The ostensible topic of *Woman Warrior* is Kingston's childhood in Stockton, California, and her relationship with her various female Chinese relatives – mother, grandmother, assorted aunts and distant relations. Yet over half the narrative is devoted to the lives of her ancestors in China and the Chinese myths and tales she absorbed from the 'talk-story' of her kin. Her fiction engages a becoming-woman as she rejects traditional Chinese sexism, refashions folk myths from a feminist perspective, and betrays family secrets about disgraced female ancestors by telling the stories her mother says must not be told. She deterritorialises English through language that is both colloquial and poetic, engaging a wide range of indigenous American and Chinese immigrant rhythms and phrases. Kingston's rendering of Chinese speech in English 'others' the language, such that Cantonese scholars fluent in English, when reading the Mandarin translation of her novel, told Kingston that they could hear the Cantonese rhythms of her Chinese speakers, and hence they retranslated the book into Cantonese (Skenazy and Martin 1998: 45).

If *Woman Warrior* is the story of her female relatives, *China Men* is the story of her male ancestors. More conventional in style than *Woman Warrior*, *China Men* has four principal narrative sections: one devoted to Kingston's great-grandfather's stint as a wage slave in a Hawaiian pineapple plantation; a second to her grandfather's labour on the Continental Railroad in the American West; a third to her father's emigration to California; and a fourth to her brother's army sojourn in Vietnam. In the first three narratives the journey east is highlighted, even more so than it had been in *Woman Warrior*, the goal of that journey being the 'Gold Mountain' (*jīn shāng*) as they called America, a paradisiacal land not unlike the fabled West of European immigrants. Between these biographical chapters, Kingston intersperses smaller stories about Chinese men in America, Chinese myths and stories

(including one she heard as a child about Lo Bun Sun – actually her parents' version of *Robinson Crusoe*). Throughout the work, Kingston stresses the injustices experienced by her ancestors, and in a central chapter, she simply lists the racist federal laws that have been directed against the Chinese from 1868–1978. In this regard, the collective autobiography of *China Men* is decidedly the collective enunciation of a minor people's immediately sociopolitical experience.

In her first two novels, then, Kingston's becoming-woman is a movement westward away from Chinese sexist culture and toward Western concepts of gender equality. For her ancestors, by contrast, the movement east to America is a line of deterritorialisation, a means of escaping class and economic stratification. And in her deterritorialisation of language, she is 'othering' English via Chinese, creating a zone somewhere between East and West.

In her third prose work, *Tripmaster Monkey: His Fake Book (1989)*, Kingston largely abandons autobiographical motifs and stories set in China, focusing instead on the meanderings of Wittman Ah Sing, a poet/playwright and fifth-generation American of Chinese descent living in San Francisco. Kingston has said that in her first two works, she felt the burden of 'translating a whole world, all of China and its myths and history', whereas in *Tripmaster* she experienced a 'great relief' as she explored 'the American language, the language that I hear and speak' (Skenazy and Martin 1998: 144–5), incorporating the riches of canonical American literary language, which she knows intimately, as well as the vibrant slang of the early 1960s, in which the novel is set. Primary among her Euro-American inspirations is William Carlos Williams's *In the American Grain*, but she also alludes to Whitman, Melville (Bartleby in particular), Dickinson, Faulkner, Fitzgerald and Kerouac, among many others. Yet she also makes use of Chinese texts, most notably *Journey to the West* (*Shīyóujì*), the sixteenth-century novel about the monk Xuánzàng's pilgrimage to India, in the company of the monkey Sūn Wùkōng, among others. Kingston makes reference in her title both to Monkey and Xuánzàng, who is also called the 'Tang Tripitaka Master' in the Chinese narrative. Kingston's hero is a Tripitaka trickster monkey, but also a 'tripmaster' in the parlance of the 1960s, that is, someone who guides LSD users in their hallucinogenic 'trips'. Wittman's Bay Area wanderings, from his firing as a toy salesman, to a psychedelic party, to an encounter with a Caucasian girl that leads in a day to a casual marriage, then to visits with his retired vaudeville mother and his peripatetic father, eventuate in the performance of a play he has written, in which all his acquaintances, of diverse racial and ethnic backgrounds,

enact an inclusive American collectivity (much like the global America Melville describes in a passage in *Redburn*, which Deleuze cites in his 'Bartleby' essay). Yet Kingston's utopian ideal is also tempered by the polemical edge of Wittman's monologue in the play, a twenty-page recitation of the racist indignities endured by every Chinese American. Wittman travels a good deal, but ultimately his journey is neither westward nor eastward; rather, it is a *voyage sur place*, as Deleuze calls it, a journey in intensities, a 'trip', though one induced less by drugs than by the poetic imagination. Wittman's intensive becoming-other is echoed in Kingston's language, which is replete with allusions to sources high and low, suddenly shifting in diction and cadence, improvisational in its jazz-like riffs, as in this passage describing Wittman as he dances:

> In sync. In sync at last. A ballet dancer and an m.s. spastic – no different – O democratic light. Innards at one with the rest of the world. And why not when we're doing the twist, and Chubby Checker does the twist, 'Let's twist again, like we did last summer,' and the light is a strobe, and a strobili is a twisty pine cone. All right. All right. And –. And –. And –. And then –. Bang bang. Bang bang. But –. But –. But –. Banga. Banga. Lost. Found. Lost. Found. Gotcha. Gotcher teeth. Gotcher face. Boom. Boom. Bomb. The Bomb. Bomb flash. Bomb flash. In what pose will the last big flash catch me? What if. This were. Bomb practice? We're training to dig flashes. And my fellow man and woman aglow. Like fast frequent pulsations of radioactivity. (Kingston 1989: 110)

Kingston, then, clearly fits the profile of Deleuze's American writer, though the journey of her becoming is both west and east, and finally neither, instead being a journey *sur place*, on site. Her becoming-woman and her becoming-Chinese-American entail a deterritorialisation of English, first through Chinese rhythms, then through the rhythms of American polyvalent speech and writing. And her politics follows the line of Melville in seeking a people to come, a collectivity performed and enacted in the artwork of Wittman's aesthetic creation, though one pursued through acerbic critique and resistance to the present and its demonic forces.

IV. Tao Lin: Becoming-Imperceptible

Tao Lin, like Kingston, is a Chinese American, but as writers the two differ in virtually every way. Born to Taiwanese parents in 1983, Lin grew up in a Florida gated community, graduated from NYU, and now resides in New York City. He has written one collection of short stories, two poetry volumes and three novels, *Eeeee Eee Eeee (2007)*, *Shoplifting*

from American Apparel (2009) and *Richard Yates (2010)*. Whereas Kingston identifies herself as a Chinese American woman writer, Lin says that being of Chinese descent has not particularly affected his life or his work. He told one interviewer that in a first draft of *Eeeee Eee Eeee*, the protagonist's parents came from Taiwan, but later he made the protagonist's parents German and replaced references to Taiwan with Germany and those to Shanghai with Berlin. He added that 'I want ideally in my fiction to edit race and name in the same way I might move or delete a comma', since in terms of what he calls 'existential issues', 'there is no difference between a Haitian or a Canadian or whatever', and his interest as a writer is in such 'existential issues' (Vizzini 2007). Most of Lin's characters are in their late teens and twenties, live in New York City, New Jersey or suburban Florida, work in dead-end jobs (when they work), hang out, talk, phone, text, email and Gmail chat, go to each other's apartments, and visit restaurants, bars, stores, malls and parks. In *Shoplifting from American Apparel* Lin incorporates some autobiographical material into the text – chiefly regarding his overnight incarceration for shoplifting – but otherwise the characters and settings are generic and minimally detailed. In terms of plot, things happen, but often in random if unremarkable sequence. Novels start and end, but with no clear markers of inception or closure, the story always remaining in the middle. In *Eeeee Eee Eeee* Lin indulges in the fantastic, his human characters encountering and speaking with a bear, a dolphin, a hamster, a moose and an alien, but these unlikely interactions lead to no unusual consequences. In his subsequent novels, there are no such flights of fancy, each narrative becoming increasingly spare and mundane.

Lin's interest, he says, is in 'existential issues', such as hunger, sleep, sex, boredom, death, and so on, but his approach to these issues has a pervasive strangeness, each fiction creating atmospheres, moods, haecceities, which involve existential issues but extract from them an elusive ambience, difficult to pin down – one that I personally find uncomfortable, often vaguely unpleasant and troubling, yet quietly powerful. That strangeness, I believe, comes from the style. If Kingston resembles Joyce in her exuberant verbal play, Lin is like Beckett in his ascetic reduction of language to its minimal elements. Sentences are short, syntax uncomplicated, diction limited and decidedly unliterary, adjectives rudimentary (good, bad, happy, sad, stupid), descriptions spare. Verbal repetition is pervasive, as are non sequiturs, which generally form low-key, conversational sequences that reappear as leitmotifs in the narrative. At times Lin's minimalism is used to comic effect, as in this passage from *Eeeee Eee Eeee*, when Shawn, Lelu and

Andrew meet 'the president' (presumably, the President of the United States) in a sushi bar and decide that 'it would be good to network with the president':

> They invited the president to eat sushi. At the sushi bar the president said that it was stupid to be the president.
>
> 'Power is stupid,' the president said.
>
> The president said he was an alien. He was from a different planet. He came here and was bored. 'I felt I needed a goal,' he said. 'Now I'm the president. I have no human preconceptions, because I'm from a different galaxy. Listen to me, since I'm the ruler. You chose me. People need to process what I say. [. . .] Politics is a pretend game where it is very important to block out the information that it is a pretend game. I'm the president, I think. There is no good or bad. You arrive. Here you are. No one tells you what to do. So you make assumptions. (Lin 2007: 193–5)

Generally, however, the effects of Lin's stylistic asceticism are more mundane, as in this Gmail chat between the main characters of *Richard Yates*, Haley Joel Osment, a twenty-two-year-old writer living in New York City, and Dakota Fanning, his sixteen-year-old girlfriend living with her mother in New Jersey:

> Haley Joel Osment said he wanted to funnel boiling water into his brain.
>
> 'That would be good,' said Dakota Fanning. 'I just thought of Bono and felt suicidal.'
>
> Haley Joel Osment said he was afraid of missing the train.
>
> 'If you miss the train again I'm going to shit myself,' said Dakota Fanning.
>
> 'I'm going to miss it. I feel like I can't not miss it,' said Haley Joel Osment.
>
> 'I got electrocuted today,' said Dakota Fanning.
>
> 'Sizzling hot,' said Haley Joel Osment.
>
> 'I'm going to be very sleepy tomorrow.'
>
> 'No,' said Haley Joel Osment.
>
> 'I'm always very sleepy the day after electrocution. I won't be able to do anything but lay.'
>
> 'Now what,' said Haley Joel Osment. 'Drink coffee.' (Lin 2010:41–2)

Lin's minimalism, I would argue, is aimed at becoming-imperceptible, which, we will recall, Deleuze identifies in *Dialogues* as 'the goal, the finality of writing' (Deleuze and Parnet 2002: 45). Lin's language seems anodyne and innocuous, and his characters appear to be like everybody else, nearly anonymous in their lack of distinguishing features, yet a pervasive strangeness signals the unsettling becoming-other of Lin's

fictional world. As befits his minimalism, Lin's political bent is decidedly molecular. His characters float over the world, each a kind of Bartleby 'preferring not to'. They show no career ambition or commitment to work, taking minimum-wage jobs, quitting abruptly or eventually getting fired for absenteeism. They routinely shoplift with no remorse. (Lin has said that he supported himself for extended periods of time by shoplifting goods and selling them on eBay.) Granted, their resistance to capital and consumerism is minimal and without collective organisation, but it is nonetheless omnipresent. Yet Lin's characters are not immune to the diseases of micro-power, which he explores with especial subtlety in *Richard Yates*. There, by the smallest of increments, Haley Joel Osment becomes a controlling, abusive figure, eventually demanding reports from Dakota Fanning of all her activities and of every lie she has ever told, no matter how miniscule. And Dakota Fanning slowly emerges as a bulimic and a compulsive self-harm cutter, the two of them forming an enabling, low-key *folie à deux*.

Kingston and Lin, then, are both Deleuzian American writers, despite their many differences. Whether they are both Chinese American writers, however, is another question. Kingston fits the standard profile of the Chinese American minority writer, whereas Lin seems merely a writer of Chinese descent whose fiction is unmarked by his ethnicity. The continuum I have implicitly drawn, from Kingston's becoming-woman and becoming-Chinese-American to Lin's becoming-imperceptible, could be seen simply as evidence of Chinese American assimilation within American culture and of American-dominated globalisation as a whole. In that case, the differences between Kingston and Lin would be merely functions of time and context: Kingston was reared in the small-town America of the late forties and fifties by parents who maintained in their American home the folk traditions of the pre-industrial, agrarian Gŭangdōng of their childhood, whereas Lin was reared in eighties and nineties suburbia by parents who themselves grew up in the increasingly Westernised world of postwar Taiwan.

In posing this question of Chinese American identity, I have clearly ventured into the territory of identity politics that has made Deleuze and Guattari's concept of 'becoming' controversial from its inception. At issue is the relationship between the minor and minorities, categories that do not always coincide, as Deleuze and Guattari repeatedly stress. Kingston's affirmation of herself as a Chinese American woman writer is an index of the diverse becomings her fiction has engaged, but also a possible sign of reterritorialisation, were one to view her works as eventuating in the reconstitution of fixed definitions of 'Chinese

American' or 'woman'. Lin's lack of interest in his ethnicity, by contrast, need not signal passive cultural assimilation. Just as a white male, like Melville, can become-other and make a minor usage of English, so can a Chinese male, like Lin, and without necessarily doing so *as* a Chinese American. But in Lin's becoming-imperceptible, yet another question arises: whether his 'othering' of the ordinary has been productive of something new or has simply devolved into a simulation of the mundane that is functionally indistinguishable from it. (Here, obviously, I am reviving old arguments about 'contestatory postmodernism' versus 'celebratory postmodernism'.)

Deleuze's conception of American literature – or at least the kind of American literature he finds superior to French literature – makes room for various minorities to pursue lines of flight, deterritorialise English, invent paths of resistance, envision a people to come, and so on, but it also allows members of majorities to do the same, and it does not declare that minorities *must* be minor as representatives of their minority status. Most important, both majorities and minorities can only attain these ends by becoming-minor themselves, whatever their class, gender, ethnicity, sexual orientation, and so on. For this reason, Deleuze's inattention to ethnic writers in his characterisation of American literature is not fatal to his project, and indeed it invites us to perform a discerning and careful examination of multi-ethnic American literatures from a Deleuzian perspective. The lines of flight within American literature, whether westward from Europe or eastward from China, ultimately must be situated on a map of intensities, one whose nomadic coordinates are those of a new people and a new earth. Kingston, Lin and many other Chinese American writers, as cartographers of intensities, complicate, but do not contradict, the Deleuzian image of American literature. Rather, they extend our sense of that literature's powers – of what an American literature can do, and what it might do in the future.

Notes

1. Here, too, the differentiation between English empiricism and American pragmatism is in doubt. As early as *Empiricism and Subjectivity*, Deleuze stresses the importance of belief for Hume. In his 1991 Preface to the English Edition, Deleuze lists as one of Hume's great achievements that he 'established the concept of *belief* and put it in the place of knowledge. He laicized belief, turning knowledge into a legitimate belief. He asked about the conditions which legitimate belief, and the basis of this investigation sketched out a theory of *probabilities*. The consequences are important: if the act of thinking is belief, thought has fewer reasons to defend itself against error than against *illusion*'

(Deleuze 1991: ix). If a distinction is to be drawn between Hume and American pragmatists in this regard, perhaps it is that belief among pragmatists ranges from Peircean belief as grounded in scientific method (a concept close to that of Hume) to James's belief in God and Royce's belief in an Infinite Spirit (views that Hume would have rejected) (see Deledalle 1983: 69–73, 160).

2. Perhaps an extension of Deleuze and Guattari's typology of geophilosophical tendencies could help separate English empiricism from American pragmatism. In *What Is Philosophy?*, Deleuze and Guattari contrast English thought with French and German philosophy by saying that 'the English are precisely those nomads who treat the plane of immanence as a moveable and moving ground, a field of radical experience, an archipelagian world where they are happy to pitch their tents from island to island and over the sea' (Deleuze and Guattari 1994: 105). We might contrast this characterisation with the geophilosophical tendencies implicit in Deledalle's analysis of the American values that underlie pragmatism: a belief in America as the promised land of liberty, equality and fraternity; in the myth of the pioneer and the frontier; in individualism and democracy; in success; and in 'manifest destiny' (Deledalle 1983: 15). Of course, this is mere speculation, since Deleuze nowhere suggests that he shares Deledalle's view of pragmatism in this particular regard.
3. Deleuze and Guattari's note reads as follows: 'This book contains a fine analysis of geography and its role in American mythology and literature, and of the reversal of directions. In the East, there was the search for a specially American code and for a recoding with Europe (Henry James, Eliot, Pound, etc.); in the South, there was the overcoding of the slave system, with its ruin and the ruin of the plantations during the Civil War (Faulkner, Caldwell); from the North came capitalist decoding (Dos Passos, Dreiser); the West, however, played the role of a line of flight combining travel, hallucination, madness, the Indians, perceptive and mental experimentation, the shiftings of frontiers, the rhizome (Ken Kesey and his "fog machine," the beat generation, etc.). Every great American creates a cartography, even in his or her style; in contrast to what is done in Europe, each makes a map that is directly connected to the real social movements crossing America' (Deleuze and Guattari 1987: 529).
4. Miller's China, as he himself says, is an 'imaginary China', one that bears little relation to the actual place. In his correspondence with Michael Fraenkel, published under the title *Hamlet* (1946), Miller counters Fraenkel's contention that Hamlet is heroic, asserting instead that Hamlet is cowardly and infected with a modern, Western disease of hyperconsciousness. The diseased Western mentality divides humans into animal and vegetable halves, the first being conscious, the second oneiric. As a result, 'The dream side of life, which the plant glorifies, gets pigeon-holed through our singular vision of things as morbid phenomena. The human side of life is the waking side.' Miller speculates that 'if it were possible to imagine an intermediate state in which one neither is nor does, then China might be regarded as the fairest example. China never becomes anything but China. By virtue of this intermediate logic China is becoming China more and more every day. China is the weed in the human cabbage patch. After every weeding China reappears as China. It has no further aspiration. [. . .] Eventually the weed always gets the upper hand. Eventually things fall back into a state of China. [. . .] If man is ever going to become himself, MAN, and not something different, he will have to stand outside the realm of Idea and, growing more and more satisfied with himself, vegetate. [. . .] My plan, then, in so far as the negation of all effort and purpose may be said to be a plan, is to stop evolving, to remain what I am and to become more and more only what

I am. [. . .] I want to become nothing more than the China I already am' (Miller and Fraenkel 1946, vol. 1: 54–5).

Translating Deleuze: On the Uses of Deleuze in a Non-Western Context

Yu-lin Lee National Chung Hsing University

Abstract

This paper aims to explore the appropriation of Deleuzian literary theory in the Chinese context and its potential for mapping a new global poetics. The purpose of this treatment is thus twofold: first, it will redefine the East–West literary relationship, and second, it will seek a new ethics of life, as endorsed by Deleuze's philosophy of immanence. One finds an affinity between literature and life in Deleuze's philosophy: in short, literature appears as the passage of life and an enterprise of health and thus seeks new possibilities of life, which consists in the invention of a new language and a new people. But what kind of health may such a view provide for a non-Western individual, people, literature and culture? This investigation further appeals to the medium of translation. This paper argues that the act of translation functions as a means of deterritorialisation that displays continuing variations of a language, and through translation, Deleuze's clinical and critical aspects of literature promote a transversal poetics that transcends the binary, oppositional conception of East–West and an immanent ethics of life that overcomes the sentiment of *ressentiment*.

Keywords: Gilles Deleuze, literary theory, translation, deterritorialisation, ethics of life, global poetics

I. The Problem and the Objective

This paper is inspired by Gregg Lambert's article 'On the Uses and Abuses of Literature for Life', in which Lambert examines Deleuze's

Deleuze Studies 7.3 (2013): 319–329
DOI: 10.3366/dls.2013.0114

views regarding literature and its effect on life in a similar fashion to that found in Nietzsche's treatise (Lambert 2000). Lambert's investigation is an allusion to Nietzsche's famous treatise titled 'On the Uses and Disadvantages of History for Life' (Nietzsche 1997). In it, Nietzsche examines various history ideas found in nineteenth-century Germany and argues that an excess of history may do harm to life when the pursuit of historical knowledge replaces the activities of life. Nietzsche does not oppose the science of history per se, just the abuse of it. More significantly, Nietzsche does not simply offer a criticism of history; he offers an outline for a project for life. The idea of life for Nietzsche, as Craig Lundy explains, 'is not reducible to the biological, but forms an immanent principle that encompasses society and culture' (Lundy 2009: 194). In his article, Lambert changes the topic from 'history' to 'literature' as a response to Deleuze's final published book, *Essays Critical and Clinical* (1997), and explores the idea of viable 'health' for life through critical and clinical use of literature, as Deleuze proposes. Lambert examines the criteria given by Deleuze's aspects of literature and situates them in the current social condition by asking the question, 'What is minor literature today?'

Although I share in Lambert's concerns, in this article my intention is to complicate both the question and its scope by exploring the appropriation of Deleuze's thought, literary theory in particular, in the Chinese context as a potential for mapping the idea of global poetics and finding a workable ethics for life. One can find an affinity between literature and life in Deleuze's thought, but to what extent can the use of Deleuzian literary theory bring about 'health' that can benefit the life of an individual, a people, or even a culture? These questions are suggested by the subtitle, 'On the Uses of Deleuze in a Non-Western Context'. Would Deleuze's philosophy (literary theory) still be the same if translated into Japanese and Chinese? Further, would there be any profound change in using Deleuze in the Chinese context, compared with its use in France, Germany, Japan and other nations or regions? In short, what kind of 'health' can the Deleuzian critical and clinical aspects of literature bring to life for non-Western people and their cultures? In other words, what kind of 'symptomatology' will the use of Deleuze actually produce?

Applying Deleuze's philosophy to a non-Western context is not merely a 'virtual' concern; it is an 'actual' problem. It involves asking multiple questions that concern East–West (literary) relations. It is undeniable that either in the logic of dialectal thinking or in the ideological framework of global mapping, East and West have been consistently

considered as being oppositional, with the West generally assuming a dominant pole, as exemplified by the postcolonial critique of Euro-centrism. Non-Western or Third World intellectuals are sensitive to Western 'imperial' eyes and thus often hesitate to 'adopt' Western theories to try and understand their own lives and cultures. As a result, they are often caught in an ambivalence of love and hatred. Gayatri Spivak's criticism of Deleuze is exemplary of this scenario. According to Spivak, Deleuze's theory embodies the rhetoric of Euro-centrism, thus repeating the typical form of Western subjectivity that eliminates the voice of non-Western 'subalterns' (Spivak 1988). Why and how Deleuze is brought into the non-Western world thus becomes a serious problem. What this argument actually reveals includes a demand for the voicing of the minor (or minority) as well as an entire remapping of global poetics. In other words, if the situation of the minor is not 'ready-made', as Deleuze insists, how can the people of East Asia, China, Japan, Korea and Taiwan be treated according to a concept of minor that has been fashioned elsewhere? Moreover, if a standard global mapping with the West as a privileged perspective is no longer adequate, what kind of global poetics might we imagine beginning from this situation?

A more direct and urgent question should be added to this line of inquiry: that is, the problematic of translation and not only the representation of translation, but also the act of translation itself. Deleuze's early work on Leopold Sacher-Masoch titled *Masochism: Coldness and Cruelty* was first translated into Japanese in the 1970s, and then *The Logic of Sense*, among others, was translated in the early 1980s, much earlier than they were into English in the 1990s. Now we see more and more of Deleuze's works being translated into Chinese, including *A Thousand Plateaus* in 2010. For non-native French speakers, Deleuze is inevitably understood through translation. The translation is not transparent, however, and the translator is never invisible. The translator's grasp of Deleuze's thought and his or her fluency in both the source and target languages certainly determine the success of a translation. We are not passing judgement on the qualities of those translations, however, but rather raising a more essential question: is Deleuze in French the same as Deleuze in English, in Japanese and even in Chinese? For example, it has been noted that the English word 'becoming' cannot fully convey the French '*devenir*', not to mention examining the Japanese word *naru* and the Chinese word *shengcheng* (生成) or *liubian* (流变). Other examples include 'assemblage', 'milieu', 'plan(e)' and 'affect'. There seems an irreducible signifying rupture between the meaning of these terms and their translations. And if this

is the case, what image of Deleuze's thought is offered in a foreign language such as Chinese, and what relation can then be established between French Deleuze and Chinese Deleuze, among others?

II. Translating Deleuze, or the Uses of Deleuze in the Chinese Context

To the best of my knowledge, most of Deleuze's major works have been translated into Chinese because of the growing interest in Deleuze during the last decade. This interest mainly centres on Deleuze's philosophy in relation to contemporary philosophies, and is not limited to Deleuze's thoughts on literature. There is no doubt that Deleuze is basically treated as a philosopher and not a literary theorist. And yet, when it comes to using Deleuze, one may wonder how Deleuze can explain the world and how he treats the arts.[1] We see a few Chinese scholars who make an effort to study Chinese literary texts using Deleuzian aspects of literature.[2] Such attempts immediately invite serious criticism. They ask: how should Deleuze's literary theory be used in the Chinese context, or are Deleuzian aspects of literature appropriate for the study of Chinese literature? These doubts result from the long history of receiving and appropriating Western theories in the East. As early as in the 1960s, Taiwan's academia was open to and embraced the West. Western critical theories, including structuralism, post-structuralism, psychoanalysis, postmodernism, Marxism, postcolonial theories, feminism, queer theories, eco-criticism, and many others, have been introduced and further adopted as the paradigms for literary and cultural studies. In this regard, Deleuze's philosophy and his idea of literature belong to the same line of Euro-American theory. As the quarrels between traditional Chinese literary canons and Western literary norms continue, one thing is for sure: the question is raised once again in the postcolonial atmosphere and in the global context. As a result, this kind of question is not so much an inquiry into the nature of interpretation and criticism as one concerning geopolitical cultural politics.

Consequently, a more direct and urgent question than the use of Deleuze is about the translation of Deleuze. As mentioned above, Deleuze has been appropriated by Third World intellectuals through translation,[3] which inevitably confronts the politics of translation in terms of whether a translation assumes Deleuze's thought as a set of principles of literature, and further stresses the authority of Western theories. Despite the recent discourse on translation that emphasises

'becoming' more than authenticity, Western theories remain the source of its 'originality' in the translation process.[4] Our inquiry then asks how to translate Deleuze for use in the Third World. In this regard, Spivak's understanding of translation provides a useful perspective. She considers the postcolonial reader as the 'outsider/insider', whom she calls 'the reader-as-translator' (RAT), and suggests a solution that produces sympathetic reading as translation: 'precisely not a surrender but a friendly learning by taking a distance' (Spivak 1993: 197). Spivak calls our attention to non-transparent postcolonial intellectuals, such as RAT, when reading and translating White theory. From a postcolonial standpoint, Spivak asks, 'should RAT expect an account of the passing on of the textualisation of the interior of the body through the voice, a metonym for consciousness, from master father to master son?' (199).

Following Spivak's insights on this problem, when translating White theory, should we not be aware that 'theory' has a tendency to legislate and dominate the practice, and even produce an excess that it cannot legislate and control? For example, in *A Thousand Plateaus*, Deleuze and Guattari compare the Chinese *Tao* to Spinoza's field of immanence, with *yin* and *yang* as its two innate energies and powers (Deleuze and Guattari 1987: 157). The RAT is excited and discerned in reading/translating this passage, and yet should one not doubt how Deleuze's body without organs (BwO) should be translated and interpreted by Taoist thoughts, or that the argumentation of *yin* and *yang* should not be surrendered to the Deleuzian assemblages of desire?

How to translate Deleuze, therefore, including his philosophy and literary theory? Does translation mean interpretation or transformation? For one thing, translation confronts neologism. There are many neologisms in Deleuze's writing. Neologism is always a challenging task for any translator of philosophical texts and especially for the translator of Deleuze. Deleuze regards philosophy as a discipline that 'involves *creating* concepts' (Deleuze and Guattari 1994: 5), which consequently involves producing neologisms instead of simply finding pre-existing terms and concepts. Accordingly, translators of Deleuze confront the problem of creating neologisms in the target language. Creating neologisms in translation should not be regarded as a matter of representation or interpretation of ideas and concepts, however; translation is and of itself an act that is akin to philosophy.

Let us take the translation of the key concept, *devenir*/becoming, as an example. Deleuze's particular use of *devenir*, as 'becoming' in English, has made it somewhat a neologism in French. The Chinese translator must meet the difficulty of finding its equivalent in the target

language. Usually the two Chinese characters *liu* and *bian* are chosen and combined to form a new term to convey the intention of the original. The Chinese character *liu* (流), with the radical of water, connotes the flow of matter and its movements. In addition, because of its close association with time in the Chinese context, the character can indicate the passing of time and time itself (both present and absent, actual and virtual). The meaning of the other Chinese character *bian* (变) is more profound. It has at least three readings of its literal meaning of 'change' (变/易), namely, the simplicity of hexagrams, the changes in time, and change (or more precisely, non-change) in the transcendental sense, based on the teachings of the *Book of Change* (*I-Ching*).[5] As such, the Chinese neologism *liubian* can by no means be treated as the equivalent of the Deleuzian *devenir*. And yet, *liubian* echoes the French *devenir* and marks a linguistic frontier on the terrain of the Chinese language. That is to say, *liubian*, as a foreign term to the Chinese, combines with the French *devenir* to form an indiscernible linguistic zone, whose meaning is indistinguishable but proper neither to Chinese nor to French. In other words, the neologism *liubian-devenir* forms a new zone of exchange, a 'rhizomatic' disjunction that lies in the middle.

As a result, the translation of Deleuze's concepts is less interpretation than becoming/transformation; the former involves representation, and the latter expression. Our suggestion, however, that *liubian* is not close to being the equivalent of *devenir* is not simply to announce the impossibility of any 'complete' translation or to emphasise the conditions of 'becoming' as the representation of translation. Rather, to translate Deleuze is 'to make the sequences vibrate, to open the word onto unexpected internal intensities – in short, an asignifying *intensive utilization* of language' (Deleuze and Guattari 1986: 22; original emphasis). In articulating his views on literature, Deleuze proposes a mode of writing and life through the process of minoritising language. The effect of literature on language, according to Deleuze, is to induce a foreign language within the language by pushing itself to the limit; in other words, to stimulate the lines of escape by initiating the forces of deterritorialisation within. The process can thus be enacted and accomplished through the very act of translation.

In his study and practice of translation, Lawrence Venuti relates his translation project to the Deleuzian concept of minor literature. He argues that certain 'radical heterogeneity' introduced by a translational remainder could submit 'the major language to constant variation, forcing it to become minor' (Venuti 1998: 10). This is then the 'becoming' of both the language and the translator; it is a passage of

life within language made possible by translation. Therefore, translation of Deleuze is not a simple 'repetition' that recounts his concepts and ideas, but rather a creation that constitutes life within language. It is with the same regard that translation can be regarded as a 'milieu/medium' in which and by which this new life is given to the language and also the translator. In the preface to the Chinese translation of *A Thousand Plateaus*, Brian Massumi reminds us of the function of translation, as being similar to that of philosophy:

> The Chinese translation of *A Thousand Plateaus* is a rigorous thought-event in its own right, 'involves as much creation and invention' as the original. It is only fitting that the Chinese reader, finding this new creation in their hands, treat the translation of their book as Deleuze and Guattari treat every achievement: break it open. Resist its 'being' European. Don't take it as prescriptive for where is has come from. And especially don't take it as prescriptive for where it has now arrived. Liberate the pure form of its potential – for Chinese thought, in a continuing of its own singular adventure in becoming-between, coming together again in a relation to the great outside its own futurity. (Massumi 2010: 13)

Massumi's provocative statement articulates many ideas. First, Massumi emphasises the function of translation as both 'creation and invention', which is akin to the tenets of philosophy and literature. Translation here for Massumi means mostly representation of translation (the Chinese translation). Yet he also implies the very act of translation by claiming that the Chinese translation is itself a 'thought-event'. Massumi admits that translation should not be treated as a mere copy of the original, and one should treat such tasks as the authors treated the original. It is well known that, for Deleuze and Guattari, philosophy is rigorously 'the discipline that involves *creating* concepts' (Deleuze and Guattari 1994: 5); this is why Massumi regards the translation of Deleuze's book as a 'thought-event', that is, 'a creative endeavor' (Massumi 2010: 12). Clearly, Massumi elevates translation to where it has the same function as philosophy and literature, that is, to create concepts and affects, respectively.

More significantly, a 'thought-event' is itself an ethical event that concerns life, especially for the Chinese reader. As Massumi explains, to regard translation (the act and its representation) as a 'thought-event' is neither to grasp Deleuze's thoughts as sets of principles, nor to understand them from a certain perspective by way of translation, but rather to incite instead the potentiality of the Chinese thought by pushing the thought itself to a limit, to an outside. This transformation process

can only be accomplished through translating Deleuze, thus forming an unexpected alliance with Deleuze.

III. Deleuze and Us

Deleuze maintains that literature/writing as a passage of life is neither a description of life experience nor personal memories, dreams and fantasies; rather, it is inseparable from actual 'becoming'. Simply put, for Deleuze, to write is to trace the lines of flight, which is a whole 'cartography': 'one only discovers worlds through a long, broken flight' (Deleuze and Parnet 2002: 36). This is also the task that Deleuze assigns to the writer, namely, to create a new earth, the movement of which is deterritorialisation (36–7). Deleuze distinguishes the writer from the author; the author is simply a subject of enunciation, and the writer, in contrast, is the agent who 'invents assemblages starting from assemblages which have invented him, he makes one multiplicity pass into another' (51–2). The assemblage is 'co-functioning; it is 'sympathy', symbiosis' (52).

The assemblage, instead of the word, idea and concept, is regarded by Deleuze as a minimum real unit and may provide a standpoint for viewing the 'manipulation' of translation. Translation is neither transport of words and ideas from one language to another, nor a search for an equivalent in the target language, but an 'assemblage' in-between two terms and concepts. The Chinese translator speaks *liubian with* and writes *with* French *devenir*: 'a conspiracy, a collision of love of hatred' (Deleuze and Parnet 2002: 52). Deleuze describes the 'process' of assemblage as 'being in the middle, on the line of encounter between an internal and the external world' (52). Assemblage is the 'function' of the writer, but it is also the 'elements' of translation and the task of the translator. Translation is pragmatic; in every translation, the translator tries experiments, assembling ideas, relations and circumstances. It is what Deleuze calls the 'geography of relations,' whose logic is AND rather than IS (56–7). Or more precisely, AND itself does not specify a relation conjunction; 'it is that which subtends all relations, the path of all relations' (57). Therefore, translating Deleuze into Chinese is on its own account the practice of the art of AND. The Chinese translator speaks and writes in Chinese *with* the French Deleuze. With Deleuze being an indiscernible stranger and a friend, the Chinese translator-writer is using an absolutely foreign language in its own stuttering and stammering in the terrain of Chinese language. And this logic of AND is also the idea for a remapping of global poetics informed by translation.

The translator invents his or her own assemblage in translation, as the writer also does in writing. Further, translation rises into 'becomings' and powers. In this regard, translation becomes a matter of 'health'. Deleuze declares that 'literature appears as an enterprise of health' (Deleuze 1997: 3). This definition, of course, does not mean that the writer constantly maintains good health, despite the opposite suggestion that writers are too often sick, physically or mentally. What Deleuze suggests is that the writer 'processes an irresistible and delicate health' as seen through his writing (3). Here, Deleuze, in following Nietzsche, considers writers as physicians rather than patients (3). Such a Deleuzian concept of 'health' delivered through writing is closely related to 'becoming', that is, a-personal and pre-individual affect. Deleuze concludes by saying, 'Health as literature, as writing, consists in inventing a people who are missing' (4). In a similar fashion, Massumi cautions not to take the Chinese translation of Deleuze as 'descriptive of [where] it has come from' and 'for where it has arrived' (Massumi 2010: 13). Consequently, the Third World translator is required to go beyond *ressentiment* towards the West. Hence, translation of Deleuze becomes not only Nietzschean health, but also Spinozist joy, and this request is precisely the force of Spinoza's question: ' "*What can a body do?*" ', or 'of what affects is it capable?' (Deleuze and Parnet 2002: 60). Affects for Deleuze are 'becomings', and the Spinozist 'joy' demands demolishment of the superiority of the West over the East and multiplies the maximum of affects. In a similar fashion, Nietzschean 'health' expects and seeks the invention of a new people.

As a result, Massumi's suggestion of the Chinese translation of Deleuze as a thought-event at least speaks of two things. Translation should be regarded as the same task of philosophy as creating concepts, as well as an enterprise of health, just as literature functions in its invention of a new people. Massumi describes such an activity as 'its own singular adventure in becoming-between' (Massumi 2010: 13). This perspective reminds us of the Deleuzian reading of Spinoza. Deleuze playfully titles the final chapter of his small book on Spinoza 'Spinoza and Us' (Deleuze 1988: 122). This phrase, according to Deleuze, primarily means 'us in the middle of Spinoza'; that is to say, 'to perceive and to understand Spinoza by way of the middle' (122). What Deleuze suggests, then, is that to comprehend a philosopher like Spinoza, one cannot simply pursue his philosophy as a single unity through a systematic reading of all his philosophical principles; one must also become involved in 'affective reading' (129), that is, 'the laying out of a *common plane of immanence* on which all bodies, all minds, and all

individuals are situated' (122). We note Deleuze's remark in the phrase 'in the middle of Spinoza': 'to be on this modal plane, or rather to install oneself on this plane – which implies a mode of living' (122). I have concluded this paper by giving this section the heading 'Deleuze and Us'. This mode of being 'in the middle' is what we learn from Deleuze and the works of Deleuze by way of translation: to create a new earth by inventing new assemblages and to obtain a delicate health through the continuous lines of encounter. Translation as a thought-event thus rises to 'becomings' and powers, and the Spinozist translator is born to embody it.

Notes

1. In comparison with the massive amount of English materials on Deleuze studies that includes a variety of disciplines, Chinese studies on Deleuze are limited to the fields of philosophy, literature, art and cinema. These fields are emphasised in the Chinese context not simply because they are Deleuze's primary concerns, but also because of some translations of commentaries on Deleuze, including Ronald Bogue's *Deleuze on Literature*, published in 2006. Bogue's two other books of the same series, *Deleuze on Music, Painting, and the Arts* and *Deleuze on Cinema* are also scheduled to be published. These publications may inspire the use of Deleuze in the Chinese context. It is worth noting that Hong Kong scholar Lou Guexiang published the first introductory book in Chinese language on Deleuze in 1997. In his comprehensive introduction to Deleuze's thoughts, issues concerning psychoanalysis, capitalism, language, literature and the arts are particularly emphasised. This book portrays Deleuze as a philosopher and critical theorist, thus providing a general image of Deleuze's thought to the Chinese reader.
2. In the relatively few articles and papers, Deleuze's idea of literature – for example, minor literature, the fourth person narrative, among others – scatter in criticisms of Chinese and Taiwanese literatures.
3. As it may be argued, Third World intellectuals are mostly bilingual and even trilingual, and likely able to access Deleuze's philosophical writings in their original language, or at least through English translations rather than Chinese ones. By emphasising the appropriation through translation, I use translation here in a general sense, that is, the transportation or transference of Deleuze's thought from the Western to the Chinese linguistic and cultural context.
4. Related arguments can be found in Edward Said's 'Traveling Theory' (1983), Tejaswini Niranjana's *Siting Translation* (1992) and Lydia Liu's *Translingual Practice* (1995), among others.
5. There has been much debate on the Chinese translation for the term *devenir*/becoming; scholars in Taiwan tend to use *liubian* (流变), while the traditional term *shengcheng* (流变) is selected, as in the newly published translation of *A Thousand Plateaus*. It should also be noted that the Chinese syntax *liubian*, albeit a bit awkward, emphasises the process of changing and thus a world of transformation; *shengcheng*, in contrast, suggests a finality or a determinate state of affairs, although it still has the sense of becoming.

Becoming-Animal: Becoming-Wolf in *Wolf Totem*[1]

Jing Yin Tsinghua University and Henan University

Abstract

Wolf Totem is not a novel which advocates 'molar' wolf characteristics such as violence, brutality and bloodthirstiness, and 'molar' wolf laws such as the law of the jungle and the law of profiting at others' expense, but a novel which reveals to readers a brand new life experience, different affects possessed by the 'molecular' wolf, and the becoming-wolf of human beings. Becoming-wolf is not to imitate the above-mentioned characteristics of the 'molar' wolf, but to see or imagine what affects the 'molecular' wolf has, and make the life force or the assumed life force possessed by the 'molecular' wolf transverse a person, so that he or she can also have those affects. Becoming-wolf is to find a line of flight between man and wolf, to get rid of all the restraints imposed by the Confucian culture on the law-abiding, abjectly obedient people, and thus regaining the force of the 'impersonal, inorganic' life, so as to become different by endless desiring productions, and enhance mankind's power.

Keywords: *Wolf Totem*, Deleuze, becoming-animal, becoming-wolf, molar wolf, molecular wolf

Since its publication in 2008, *Wolf Totem* has broken the majority of sales records in the following consecutive years. It has sold millions of copies both in China and abroad. In 2007, the novel received the first Man Asian Literary Prize, after which it won other major literary awards. It has become a cultural sensation, and has blown a strong 'wolf wind' through China's literary arena, leading to the popularity of different kinds of aggressive and predatory 'wolf culture' and 'wolf

thinking'. However, there are dramatically different critical responses to the wolf and its nature, which the novel describes in great detail and of which it speaks highly.

The editor of the novel says the subject of the novel is unique, that the writer provides us with 'a spiritual feast by which people in our era will profit all their lives' (An 2004: 1). A famous critic, Lei Da, praises the novel as 'a grand narrative with epic character' (Lei 2005: 4). Wang Xueqian maintains that it represents 'the strong will to life' of the grassland wolves, thus a continuation of the life narrative of twentieth-century Chinese literature (Wang 2005: 68). Ma Weiye says its description of the 'stubborn and intractable, unyielding and indomitable, courageous and vigorous' wolf nature 'renders clear a thrilling life power', thus providing 'mankind with a strong stimulant of life' (Ma 2007: 43). Zhao Shuqin and Long Qilin contend that the writer rewrites the image of the wolf in ecological terms instead of writing about wolves from a pan-moral perspective, thus revealing what wolves really are (Zhao and Long 2007: 25). Some of the detractors say that *Wolf Totem* advocates a brutal, ruthless wolf nature and wolfish living philosophy. Ding Fan and Shi Long contend that the 'wolf nature' and 'wolf spirit' it advocates is 'anti-cultural, anti-civilized and anti-human' (Ding and Long 2008: 21). It amounts to a degeneration of human values and 'the living philosophy it advocates is the animals' out-and-out laws of seeking survival, which defy the moral constraints and values brought into being in the development of human civilization' (26). He Tongbin maintains that 'the nomadic spirit', namely the 'wolf spirit' the writer admires so much, actually advocates 'violence and brutality' (He 2006: 90). Finally, Wu Xiuming and Chen Lijun contend that what *Wolf Totem* advocates is 'the unconditional obedience of the weak to the strong' (Wu and Chen 2009: 27).

Why do literary critics have such opposing responses to *Wolf Totem*? Maybe we can understand this through Deleuze and Guattari's concept of 'becoming-animal'. In fact, what those detractors see in *Wolf Totem* is what Deleuze and Guattari call 'molar' wolves, while what those who praise it or admire it see are 'molecular' wolves. Those critics hold such different attitudes towards the novel just because of the differences between 'molar' wolves and 'molecular' wolves. According to Deleuze and Guattari, 'molar' wolves belong to 'animals with characteristics or attributes; genus, classification, or State animals; animals as they are treated in great divine myths, in such a way as to extract from them series or structures, archetypes or models' (Deleuze and Guattari 1987: 240–1). These kinds of 'State animals' are 'molar' animals, which are

not the original form of animals, but are constructed by human beings to describe what we do not want to include under the category of 'Man'. Whether in traditional Western philosophy and culture or in China's Confucian philosophy and culture, 'animal' is the 'Other' which 'Man' tries his best to exclude and negate. Confucian philosophy and culture stress that man should have human relations and morals, unlike animals. Mencius once said:

> But men possess a moral nature; and if they are well fed, warmly clad, and comfortably lodged, without being taught at the same time, they become almost like the beasts. This was a subject of anxious solicitude to the Sage Shun and he appointed Hsieh to be the Minister of Instruction, to teach the relations of humanity: – how between father and son there should be affection; between sovereign and minister righteousness; between husband and wife attention to their separate functions; between old and young a proper order; and between friends fidelity. (Mencius 1991: 251–2)

Xunzi once said:

> Hence, what makes a man human lies not in his being a featherless biped but his ability to draw boundaries. Even though wild animals have parents and offspring, there is no natural affection between them as between father and son, and though there are male and female of the species, there is no proper separation of sexes. Hence, the proper way of Man lies in nothing other than his ability to draw boundaries. Of such boundaries, none is more important than that between social classes. Of the instruments for distinguishing social classes, none is more important than ritual principles. (Xunzi 1988: 206)

In other words, it is human relations and morals that distinguish man from animals.

In traditional Western philosophy and culture, 'man' is not a descriptive word, but what Deleuze and Guattari call an order word, which means 'to be a man'. This necessitates the organisation of flesh into a body with will, that is, to negate nature, to exclude or repress the real experiences of the flesh, such as desire, hunger, thirst, anguish or fear, and to prohibit and reject animal instincts. As Georges Bataille says:

> Man is the animal that negates nature: he negates it through labor, which destroys it and changes it into an artificial world; he negates it in the case of life-creating activity; he negates it in the case of death. The incest prohibition is one of the effects of the repugnance felt for his condition by the animal that became human. The forms of animality were excluded from a bright world which signified humanity. (Bataille 1990: 61–2)

The flesh which undergoes various natural experiences is transformed into a human 'body', 'impervious to whatever is not itself, above all impervious to suffering and (ignominious) death, including the experience of desire, hunger, pain, and fear' (Bruns 2007: 707). In order to construct the image of 'man', animals, like flesh, have to be excluded from 'humanity' to become, or to be more exact, to be constructed as, the 'other' which human beings must overcome.

Therefore, a variety of different living creatures are given the name of 'the Animal' by men, despite all the differences which exist among them. As Derrida points out, animal is 'a word', 'an appellation that men have instituted... that they have given themselves the right and the authority to give to another creature' (Derrida 2002: 392). Through naming, men not only place the 'animal' under their authority, but also deprive it of its language, force it to remain in a mute or silent state. According to Derrida, naming is 'a foreshadowing of mourning', for it implies the death of what is named and 'the longevity of a name that survives whoever carries that name' (389). The 'animal' is just such a name: when various kinds of living creatures are named 'the animal', as living beings they are already dead. Benjamin speaks of the 'deep sadness of nature', because he thinks that after man's expulsion from Paradise, 'the eternal purity of the names was violated' (Benjamin 1996: 71–2). As a consequence, the names man gives to nature and all living creatures cannot communicate their mental being or that of man himself (72–3).

In traditional Chinese Confucian culture, the wolf is a 'molar' animal. Confucian culture names the wolf as a 'bloodthirsty, greedy, relentless, cruel, brutal, and cunning' animal. It thinks that the wolf's ungratefulness, bloodthirstiness, bullying and preying on the weak and fearing the strong run contrary to the benevolence (仁), righteousness (义), propriety (礼), wisdom (智) and trustworthiness (信) advocated by Confucian culture; thus the wolf represents everything that has to be excluded by Confucian culture in the construction of 'man' in feudal times. Such derogatory idioms as 'wolfish nature with wild ambitions', 'rapacious as a wolf and savage as a cur', 'run like a wolf and rush like a boar', and so on have been used to measure human morality for thousands of years. Because of such naming, the wolf has been hated, despised by Han Chinese, and has been so distorted and demonised in muteness that it does not even have the right to enter literary works. The only works that write about the wolf, such as Ma Zhongxi's 'The Wolf of Zhongshan' (1999), some stories in Pu Songling's *Strange Tales from a Chinese Studio* (2006) and Ji Yun's *Yuewei Cottage Notes* (2012), depict the wolf as ungrateful, relentless and bloodthirsty, whose nature

is to kill, thus making the image of the 'molar' wolf find its way deep into people's hearts.

We can also see such a wolf image in some passages of Jiang Rong's novel *Wolf Totem*. There are many passages which describe how 'molar' wolves hunt and kill war horses or gazelles cruelly, relentlessly and brutally. After a group of gazelles has been brutally killed by a wolf pack, Chen Zhen said, 'Wolves are evil, killing the innocent, oblivious to the value of a life. They deserve to be caught and skinned' (Jiang 2008: 44). Looking out at the carcasses strewn around the horseshoe bend, Chen Zhen said maybe 'the wolves just love killing' (246). Chen Zhen told Bilgee:

> You can't imagine how much the Chinese hate wolves. We call the most malicious people wolves; we call sex fiends wolves; we say the greediest people have the appetite of a wolf; the American imperialists are referred to as ambitious wolves; and at any time an adult wants to frighten a child, he cries out 'wolf!' . . . [i]n the eyes of Chinese, wolves are the worst, the most vicious, the cruelest thing alive. (Jiang 2008: 271–2)

'The books were mostly of the "Little Red Riding Hood" genre of wolves eating little lambs, or cruel and scary stories of wolves eating the hearts and livers of small children' (Jiang 2008: 329).

Western philosophy and culture constructs the human/animal boundary in order to 'mark the recognition or denial of kinship' (Vint 2005: 287). Just as Derrida points out, the 'animal' encompasses 'all the living things that man does not recognize as his fellows, neighbors or his brothers' (Derrida 2002: 402). This does not only exclude some animals from the category of 'man', but also connects various 'others' – women, black people, lunatics, and so on – to animality, thus excluding them from the category of 'man', depriving them of their 'human' rights, and rendering them in a subjugate position, treating them irresponsibly like animals, so as to strengthen other ways of classification and 'othering' within society (Vint 2005: 287). As Cary Wolfe points out, so long as the humanist discourses persist, it 'will always be available for use by humans against other humans as well, to countenance violence against the social *other* of whatever species – or gender, or race, or class, or sexual difference' (Wolfe 2003: 8).

In fact, Chinese culture also does the same. We can see in historical works and *Wolf Totem* that many minorities, such as Hun, Turk, Wusun, Mongol and so on which compete with Han Chinese for living space, admire wolves and hold them in high esteem. Some regard them as their teachers and some of them even regard wolves as their ancestors. Out of hatred for these nomadic peoples, in order to raise Han Chinese

above other minorities, and in order to exclude them from the category of 'man', Han Chinese construct the image of 'molar' wolves as ruthless, bloodthirsty, cruel and greedy. In the eyes of Han Chinese, 'wolf' is synonymous with cruelty, brutality, ruthlessness, wickedness and greed. Just because of this, Han Chinese need not be ethically responsible for those minorities and no matter how cruelly they treat them, they will not be held accountable morally, and can preserve the image of 'man', just like the way in which Western colonists treated black people.

The wolf in 'becoming-wolf' is different from such 'molar' wolves. It is no longer the negative 'wolf' image constructed by traditional Chinese Confucian culture, no longer burdened with the symbolic meanings traditional Confucian culture has imposed on it, but becomes what Deleuze calls an 'affective' animal, with only active and passive affects. As in the eyes of Little Hans, the horse has become a set of active and passive affect: 'having a big widdler, hauling heavy loads, having blinkers, biting, falling down, being whipped, making a row with its feet' (Deleuze 1997: 64). Wolves have become 'molecular' wolves, which are not defined by the form, organs or functions, but by different points of intensity and thresholds. 'Molecular' wolves walk out of muteness and begin to display a variety of active and passive affects. In Jiang Rong's novel, what we see are not 'molar' wolves hated so much by Han Chinese, but 'molecular' wolves which have the following active and passive affects: wise and smart, courageous, stubborn, patient, family-oriented, with collective spirit, unyielding and indomitable, cherishing independence and freedom; in combat, they are fully cognisant of the limits of battle, highly organised and disciplined; like warriors and strategists, they know how to make plans and set goals, how to spy, encircle, ambush, assault, and intercept; they can resist thirst and hunger, and keep the ecological balance of the grassland.

The meticulous descriptions of the big wars in which the grassland wolves engage show the readers the military wisdom and talents possessed by them, all of which are among the active affects of 'molecular' wolves. The first scene is that in which an army of grassland wolves encircles and entraps a vast herd of gazelles in a half-frozen lake. The second scene, in which a wolf pack massacres a herd of seventy or eighty warhorses, shows the readers that the wolves knew

> weather, topography, opportunity, their own and their enemy's strengths, military strategy, and close fighting, night fighting, guerrilla fighting, mobile fighting, long-range raids, lightning raids, and concentrating their strength to annihilate the enemy… they undertook a measured campaign of total annihilation. (Jiang 2008: 97)

The third is the hunting and killing of the wolves by the grasslanders. Although they were directed by Bilgee, the Wise Old Man of the novel, they only encircled half of the wolves, six or seven of which escape from the trap. The wolves chose the weakest link in the encirclement, 'the group of women, who wore the most colorful clothing and had the fewest lasso poles' (Jiang 2008: 184). After the wolves sank into a desperate situation, having no chance of escape, they still kept their wits about them: 'They fight in threes and fours, coming to one's aid, using their deadly fangs and tasting blood with every bite' (189).

Besides the above-mentioned big wars, there are also many small stories which show their wisdom and intelligence. The grassland wolves know that gazelles run faster than them, so they wait very patiently until 'the gazelle gets up with a full bladder', knowing that it 'can't urinate while running, so before it's gone far, its bladder bursts, its rear legs cramp up, and it stops', only to be caught by the wolf (Jiang 2008: 25). Wolves can use their own bodies as springboards, helping the wolf pack 'fly' into the enclosure. After eating their fill, they 'fly' out, and the last wolf makes 'a springboard out of a pile of sheep carcasses' and flies 'out of the enclosure' (62). Grassland wolves use the bend in a stream to entrap a group of gazelles, hiding 'in the grass the night before' and waiting 'until the gazelles' come to drink. Then they will quickly seal off 'all avenues of escape' and trap 'the gazelles with the help of the stream' (242–3). Grassland wolves discover and utilise circle grass to set an ambush even earlier than humans (223). In the hot sun, when Chen Zhen does not know how to cool off the wolf cub, it digs a hole to shelter itself from the sun, from people and from dangers, the precision and location of which amazes him (335). When grassland wolves attack Batu and Zhang Jiyuan's horses, they make an

> all-out attack from four sides, hitting the east to divert attention from the west, covering for each other, feigning an attack on one side while mounting a major assault on the other; they advanced when they could, and when they couldn't, they tied us up so that we couldn't cover both the head and the tail, or both east and west. This strategy was more lethal than combining forces to launch assault waves. (Jiang 2008: 369)

The most cunning wolves even know how to trick the foals (Jiang 2008: 374).

Becoming-wolf is not to become a real wolf. Neither is it to imitate the behaviours, movements, gestures, and so on of the 'molar' wolf, thus becoming a 'molar' wolf. In *Wolf Totem*, we can see many examples of humans becoming 'molar' wolves. Chen Zhen felt that in the ruthless

war between man and wolf, both sides used 'cruelty to attack cruelty and cunning to thwart cunning', thus man will become more and more ruthless, like the wolf (Jiang 2004: 80).[2] When Chen Zhen, Yang Ke, Zhang Jiyuan and Gao Jianzhong watched the wolf cub kill and eat an old rabbit, they revealed 'the animal nature and the cruelty of loving watching the brutality and bloodthirstiness displayed on the Roman Colosseum, hidden deep down in man's heart' (Jiang 2004: 300). The killing of five wolf cubs excited Dorji (Jiang 2008: 170). Old Wang used a 'greedy, malicious extermination scheme' to virtually wipe out 'a marmot mountain that had been in existence for thousands of years', which renders the marmots near extinction (Jiang 2008: 481). Bao Shungui insisted on wiping out the Mongolian wolves, regardless of the ecological balance on the grassland. The greedy Old Wang and migrants used cruel methods such as dynamite and poison to hunt and kill wolves.

Becoming-wolf is to become 'molecular' wolf. It is to see or imagine what kind of 'affects' or 'percepts' wolves possess, finding or constructing a zone of proximity with the 'molecular' wolf, thus making the life force or the assumed life force possessed by the 'molecular' wolf transverse a human being, allowing him or her to acquire the affects possessed by it. Becoming-wolf necessitates finding an anomaly which marks the border of the multiplicity of the 'molecular' wolf, constructing a zone of proximity with it, and bringing the forces which transverse it into play in oneself, thus acquiring its affects. The Anomaly 'represents the threshold of absolute deterritorialization' (Patton 2010: 127), like the Moby-Dick hunted by Captain Ahab. Old Man Bilgee and the wolf cub play just such a role. Although raised as a pet since it was very little by Chen Zhen, the wolf cub never forgets that it is a wolf: it protects its food desperately and wolfs down the food when fed by Chen Zhen, as if the food is what it has fought to get. Like an ordinary wolf, it has 'an extraordinary ability to survive', and it is 'brave, intelligent, indomitable, patient, life-loving, never satisfied, never yielding, scorning harsh environments, and building a strong and powerful ego' (Jiang 2004: 220).

In Jiang Rong's novel, Bilgee is like a 'wolf king' in the primitive grassland. He possesses the wisdom and intelligence of the 'molecular' wolf, familiar with their ways and military strategies, and can rally hundreds of grasslanders during the wolf hunts, directing them to take the gazelles killed by the wolves, protecting war horses, encircling and hunting wolves. Like the grassland wolves, he has an intimate knowledge of the way of preserving the ecological balance of the grassland, never

killing off all the gazelles, marmots or wolves on the grassland. He also understands the dignity of life and death: he sees 'the grass and the grassland' as '*the* life, the big life', whereas other lives, including humans and wolves, are 'little life that depends on the big life for survival' (Jiang 2008: 45). He understands the meaning of the Mongol practice of 'sky burial': after the bodies of the deceased are eaten by the wolves, their souls will return to Tengger, that is, to nature. He believes that the wolves help turn them from meat-eaters to eaten meat, which is good for their souls, so he holds the wolf totem in reverence. By forming a zone of proximity with Old Man Bilgee and the wolf cub, Chen Zhen becomes wolf.

Before coming to the Mongol grassland, Chen Zhen was a senior high school student, deeply influenced by Han Chinese agricultural culture, hating 'molar' wolves very much. From what Gao Jianzhong (who lives with him in the same yurt) says about him, we know that 'he can neither use his four limbs nor tell the five grains apart' (Jiang 2004: 282). Old Man Bilgee and the wolf cub show him what 'molecular' wolves are like, allowing him to see the amazing world of 'molecular' wolves and many affects possessed by them. He then makes himself experience many of those affects, and thus becomes wolf. We can see this very clearly in the following passage:

> Enormous stress and dangers force Chen Zhen to grit his teeth to persist in his interest in raising and studying a wolf with the wolf's bravery, intelligence, pertinacity, patience, prudence and venturing spirit, and at the same time steel himself to have an indomitable, wild and stubborn personality. All of a sudden, Chen Zhen felt he has inexhaustible strength and the fortitude of never admitting defeat. (Jiang 2004: 281)

Becoming-wolf is 'creation' but not 'representation', so people cannot understand it based on common sense. Grasslanders find it hard to understand Chen Zhen's love for the wolf, his affection for the wolf cub, and the fact that he endures all kinds of hardships to raise the wolf cub. In their eyes, he is 'a man blind to reason' who should be looked down upon (Jiang 2004: 282). Some educated youth makes sarcastic remarks that he has become wolf since he raised the wolf cub, which is actually to the point, but the 'wolf' he becomes is not the 'molar' wolf in the traditional sense.

Becoming-wolf is an example of what Deleuze (and Guattari) call 'the line of flight', which aims to deterritorialise the binary opposition of man/animal, thus making humans escape from all the requirements and constraints imposed by human culture and civilisation, allowing them

to regain the 'impersonal, nonorganic life'. In *Wolf Totem*, we can see becoming-wolf escapes from all the constraints imposed on the law-abiding and obedient people by Confucian culture. After Emperor Wu in the Han Dynasty proscribed all non-Confucian schools of thought and espoused Confucianism as the orthodox State ideology, Confucianism is adopted by nearly all the later ruling classes. Confucian thought rules the country by three cardinal guides (ruler guides subjects, father guides son and husband guides wife) and five constant virtues (benevolence, righteousness, propriety, wisdom and fidelity), which requires subject, son and wife to obey ruler, father and husband absolutely, and requires all subjects to be law-abiding and obedient, to obey their rules. The Song Confucianists even put forward as a goal 'to eradicate human desires and maintain the heavenly principles', which aims to turn subjects into obedient and submissive sheep, and eradicate the wolf nature of being disobedient, upholding freedom, independence and dignity. Therefore, to become wolf is to eradicate the sheepish nature of Han Chinese – submissive and unconditionally obedient – to be like 'molecular' wolves, pursuing freedom, independence and dignity, therefore allowing them to regain the 'impersonal, inorganic life' and continuously carry out desiring productions, thus continuously enhancing their life power.

'Impersonal, inorganic life' is 'inorganic, germinal and intensive, a powerful body without organs' (Deleuze and Guattari 1987: 499), which is productive, creative and free-floating desire, which makes man continuously become other, thus enhancing his life power. This 'impersonal, inorganic life' is not limited to any individual life form or non-life form, but is a creative power possessed by Matter which can organise itself. This power makes Matter continuously produce, thus bringing about a variety of individual life forms and non-life forms. It is through becoming-wolf that Chen Zhen regains this 'impersonal, inorganic life' again, thus enhancing his life power:

> Since becoming bewitched by the grassland wolves, Chen felt that his already listless, weary blood had weakened further and that what seemed to be alien wolf blood had begun to flow in his vein . . . he treasured it even as it became more vigorous and fulfilling. (Jiang 2008: 267).

He began to 'feel fulfilling in both body and soul, and wild and vigorous blood began to flow in his vein' (Jiang 2004: 282); each time he sat down by the cub, he felt as if 'wilderness filled his heart, and he received a transfusion of roiling wolf blood, and the vigorous life in him began to swell' (347).

Therefore, becoming-wolf is not to imitate the 'molar' wolves' cruelty, relentlessness, greed and wickedness, but to see or imagine what affects and percepts they possess, to form a zone of proximity with them, thus making the life force or the assumed life force possessed by them transverse man himself, and make him have various affects possessed by them. Becoming-wolf is to find a line of flight between man and wolf, to escape from all the prescriptions and requirements imposed on people by Chinese Confucian philosophy and culture, thus regaining the 'impersonal, inorganic life', and enhancing man's life power by continuously becoming other. Through Deleuze and Guattari's concept of becoming animal, we can see that *Wolf Totem* is not a novel which advocates 'molar' wolf's characteristics such as violence, brutality, bloodthirstiness, the law of the jungle and the law of profiting at others' expense, but a novel which reveals to its readers a completely new life experience. It shows the different affects possessed by the 'molecular' wolf and the possibility of a becoming-wolf of human beings. Based on Deleuze's thoughts on literature, good literature is that which affirms the 'impersonal, inorganic life', allows it to continuously carry out its desiring productions, thus continuously creating new life experiences, new percepts and affects. In light of this, we can say that *Wolf Totem* is a great novel.

Nomadic Ethics

Rosi Braidotti Utrecht University

Abstract

Deleuze's ethics constitutes the core of his philosophy, which proposes a post-humanistic but robust nomadic vision of the subject that respects the complexity of our times while avoiding the pitfalls of postmodern and other forms of relativism. Deleuze's neo-Spinozist ethics rests on an active relational ontology that looks for the ways in which otherness prompts, mobilises and allows for flows of affirmation of values and forces which are not yet sustained by the current conditions. Insofar as the conditions need to be brought about or actualised by collective efforts to induce qualitative transformations in our interactions, it requires the praxis of affirmative ethics. The process of becoming-minor, which necessarily involves becoming-woman, is central to this pragmatic ethical project that includes human as well as non-human actors. This paper addresses this ethics in terms of ontological relationality, affectivity and endurance.

Keywords: Deleuze, ethics, becoming-minor, becoming-woman, nomadic subjectivity, relational ontology, affirmative ethics, non-human, endurance, affect

I. Introduction

The question of becoming-woman and hence the status of the feminine are central to Deleuze's ethics, which both in his specific monographs on Spinoza's thought and the more extensive engagement with affirmative nomadic ontology, constitutes the core of his philosophy.

Deleuze's radical ontological relationality is neutral in terms of moral norms, but it calls for active engagement in the project of

producing affirmative ethical values. Deleuze's immanence firmly locates the practice of affirmation in the exteriority, the cruel, messy outsideness of Life itself. Creative chaos, however, is not chaotic, but it is rather the virtual formation of all possible forms (Deleuze 1969). Life is not an a priori that gets individuated in single instances, but it is immanent to and thus coincides with its multiple material actualisations. I refer to this generative force as 'zoe', which is the opposite of Agamben's 'bare life', in that it is a creative force that constructs possible futures.

A nomadic Deleuzian ethics prioritises relation, praxis and complexity as its key components. It accordingly promotes a triple shift. Firstly, it emphasises a radical ethics of transformation in opposition to the normative moral protocols of Kantian universalism. It assumes that ethics is not morality, in that it is not confined to the realm of rights, distributive justice or the law. Ethics is rather the discourse about forces, desires and values that act as empowering modes of becoming.

Secondly, it shifts the focus from a unitary and rationality-driven consciousness to an ontology of process, that is to say, ontological relationality. Otherness is approached accordingly as the expression of a productive limit, or generative threshold, which calls for an always already compromised set of negotiations. Nomadic theory prefers to look for the ways in which otherness prompts, mobilises and allows for flows of affirmation of values and forces which are not yet sustained by the current social and historical conditions. Insofar as the conditions need to be brought about or actualised by collective efforts to induce qualitative transformations in our interactions, they require a pragmatic approach. The praxis of affirmative ethics actualises virtual possibilities and therefore constructs possible futures starting from here and now. This constructive approach transforms the negative conditions of the present into productive preconditions for affirmative practice.

Thirdly, it disengages the emergence of the subject from the logic of negation and attaches subjectivity to affirmative otherness. This makes reciprocity into a gesture of creation, not as the struggle for the recognition of Sameness. An ethically empowering relation to others aims at increasing one's *potentia* or empowering force and creates joyful energy in the process. The conditions that encourage such a quest involve processes of transformation aiming at affirming positivity.

Philosophical nomadism therefore shares Nietzsche's distaste for morality as sets of negative, resentful and life-denying reactive passions. This approach is replaced with Spinoza's ethics of joyful affirmation, which implies accountability, situatedness, and the composition of common planes of active collaborative ethical conduct (Lloyd 1994;

1996). Woman, as the privileged site of otherness, is a key component of this affirmative process of counter-actualisation, or intensive becoming.

II. Becoming-woman

Nomadic theory expresses a process ontology that privileges change and motion over stability. This is also rendered in terms of a general becoming-minority, or becoming-nomad, or becoming-molecular/woman/animal, and so on. The minority is the dynamic or intensive principle of change in nomadic theory, whereas the heart of the (phallogocentric) Majority is static, self-replicating and sterile.

Insofar as man represents the Majority, there is no creative or affirmative 'becoming-man': the dominant subject is stuck with the burden of self-perpetuating Being and the task of keeping up existing patterns. This static orientation acquires a schizoid character in the context of advanced capitalism. This is a 'spinning machine' that fabricates quantitative proliferations of objects, commodities and data which leave the power structures unchanged and unchallenged. A logic of quantitative multiplications – multiples of One – constitutes the core of the political economy of contemporary capitalism. This system has no single centre, but a scattered web of poly-located centres, which punctuate the global economy. Their task is to keep capital flowing in profit-oriented directions. No qualitative value or concern is allowed to stand in the way of profit. Nomadic thought opposes to this self-interested, greedy system an ethics of qualitative transformations, becoming-minor, which rests on the recognition of complexity and affirmation and challenges existing power structures.

By extension this scheme also implies that the subjects of power – the various empirical minorities (women, children, black people, natives, animals, plants, seeds, molecules, and so on) – are the privileged starting point for active and empowering processes of transformative becoming. There is no becoming of the centre, but only away from it. This process, however, is anything but automatic.

The marginal subjects who inhabit the multiple locations of devalued difference have their own task cut out for them, insofar as they too often tend to be caught in dialectical relationships of submission, frozen by the paralysing gaze of the master – hating him or her and envying him or her at the same time. For instance, in order to shift from this dialectically binding location, the feminist subject needs to activate different counter-memories and actualise alternative political practices. Becoming-nomadic means that one learns to reinvent oneself and to

desire the self as a process of qualitative transformation. Becoming-minor rests on a non-unitary yet politically engaged and ethically accountable vision of the nomadic subject. Both the Majority and the minorities need to overcome the Dialectic of Majority/Minority or Master/Slave and untie the knots of envy (negative desire) and domination (dialectics) that bind them so tightly. In this process, they will necessarily follow asymmetrical lines of becoming, given that their starting positions are so different. For the Majority, there is no possible becoming-other than in the undoing of its central position altogether. The centre is void; all the action is on the margins.

For the real-life minorities, however, the pattern is different: women, black people, youths, postcolonial subjects, migrants, exiles and homeless may first need to go through a phase of 'identity politics' – of claiming a fixed location or a majoritarian position. This is both inevitable and necessary because, as I have often argued, you cannot give up something you have never had (Braidotti 1991). Nor can you dispose nomadically of a subject position that you have never controlled to begin with. I think consequently that the process of becoming-nomad (-minority, -woman) is internally differentiated and it depends largely on where one starts off from. The politics of location is crucial. In other words, heterogeneity is injected into both poles of the dialectical opposition, which gets undone accordingly. The 'Molar' line – that of Being, identity, fixity and *potestas*, and the 'Molecular' line – that of becoming, nomadic subjectivity and *potentia* – are absolutely not the same. They are two dissymmetrical 'others', although within phallogocentrism they have been captured in a dualistic mould. They are differentiated by structural inequalities that impose Sameness in a set of hierarchical relations. Deleuze defines the Molar/Majority as the standard and the Molecular/Minority as the other in the sense of 'the other of the same'. The central challenge to nomadic philosophy, however, is how to undo this dualistic mode and redistribute the power relations of the two terms. More important than either of them, therefore, is the Line of Flight or of becoming. This is always and only a becoming-minor as in woman/child/animal/imperceptible.

This is an internally differentiated movement which overthrows the oppositional dialectics in a parallel yet asymmetrical move: 'There is no subject of the becoming except as a deterritorialized variable of the majority; there is no medium of becoming except as a deterritorialized variable of a minority' (Deleuze and Guattari 1987: 292).

Thus, an asymmetrical starting position between minority and majority – centre and margins – needs to be strongly emphasised here

(Braidotti 2011a). This means that the process of de-territorialisation is dual and the quantitative minorities can undergo the process of becoming only by disengaging themselves from the unitary identity as others, which is imposed by their opposition to the majority. It is in this sense that Woman as 'the second sex' or 'the other of the Same' needs to 'become-woman' in the molecular sense of the process, or 'the other of the Other', as Irigaray put it (Irigaray 1974).

Hence the imperative to become-woman as the first move in the de-territorialisation of the dominant subject (also known as the feminisation of Man). For those who start from the position of empirical minorities, on the other hand, more options are open. If the pull towards assimilation or integration into the Majority is strong for the minorities (hence the phenomenon of phallic women), so is the appeal of the lines of escape towards minor becomings. In other words, you can have a becoming-woman that produces Lady Thatcher and one that produces Lady Gaga: neither of them is 'feminine' in any conventional sense of the term and yet they are as different from each other as the workhorse is from the racehorse.

What matters here is to keep open the process of becoming-minor and not to stop at the dialectical role-reversal that usually sees the former slave in the position of new master or the former mistress in the position of dominatrix. We need to go beyond the logic of dialectical reversibility. This is especially important for those social subjects – women, black people, postcolonial and other 'others' – who are the carriers of the hopes of the Minorities. The process of becoming-nomadic is not merely anti-essentialist, but also a-subjective, beyond received notions of individuality. It is a transpersonal mode, ultimately collective. You can never be a nomad; you can only go on trying to become nomadic.

One must indeed start from somewhere specific: a grounded and accountable location, and the process of becoming is a time bomb placed at the very heart of the social and symbolic system which has welded together Being, Subjectivity, Masculinity, compulsory Heterosexuality and (Western) ethnocentrism. The different becomings are lines cutting open this space and demanding from us constant remapping: every time it is a question of finding the new coordinates. This is not only a spatial but also a temporal phenomenon. Crucial to this entire process of becoming-molecular, in fact, is the question of memory (*la mémoire*). The Majority – white, heterosexual, property-owning and male – is a huge data bank of centralised knowledge, which is relayed through every aspect of his activities. The Majority Subject holds the keys to the

central memory of the system and has reduced to the rank of insignificant practices, the alternative or subjugated memories of the many minorities. The line of becoming for the Majority is consequently an anti-memory, which instead of bringing back in a linear order specific memories (*les souvenirs*), functions as a de-territorialising agency that dislodges the subject from his or her sense of unified and consolidated identity.

A nomadic, non-linear philosophy of time as a zigzagging line of internally fractured coalitions of dynamic subjects-in-becoming supports a very creative reading of memory and of its close relationship to the imagination. This is especially important in the case of negative or traumatic memories of pain, wound or abuse. This sort of negative capital is an integral component of the consciousness of historically marginalised or oppressed subjects. The pain and negativity that structure the oppositional consciousness of the 'minorities' are a crucial concern for nomadic political theory and practice. While acknowledging this particular location – as a wounded memory of pain as well as a historically grounded space – nomadic political subjectivity defines the political as the gesture that aims at transcending the present state of affairs and empowering creative 'counter-actualisations', or transformative alternatives.

The corollary of this notion of time and of the political is that the specifically grounded memories of the minorities are not just static splinters of negativity forever inscribed in the flesh of the victims of history. Molecular or nomadic memories are also and more especially a creative force that gives the minorities – or 'wretched of the earth' as Fanon put it – a head start towards the world historical task of envisaging alternative world orders and more humane and sustainable social systems. It comes down to a double-consciousness of both the multiple axes of oppression and hence of hurt, humiliation and pain, as well as the creative force they can generate as motors of transversal and collective transformation.

Please note, however, that, whereas in classical dialectics the empirical minorities are automatically positioned as the motor of historical developments and the guiding principle of revolutionary action and ethical agency, in nomadic politics this is not the case. The negative capital of oppression is just a privileged starting point for a process of transmutation of values – to use Nietzsche's rather more heroic rendition of the same idea – that encompasses the minorities themselves: they have to become-minor as well. They also need to activate their memories against the black hole of dialectical counter-identity claims as well as against the grain of the dominant vision of the subject.

This type of nomadic remembrance is not identity-bound, or ego-indexed, but rather impersonal, or post-identitarian. It is linked to a radical process of de-familiarisation or dis-identification from dominant representational and even self-representational practices. What is at stake in the nomadic theory of becoming is a critique of the centre from the centre. All becomings are minor, that is to say, they inevitably and necessarily move into the direction of the 'others' of classical dualism – dis-placing them and re-territorialising them in the process, but always and only on a temporal basis.

Becoming-woman/animal/insect is an affect that flows, like writing; it is a composition, a location that needs to be constructed together with, that is to say, in the encounter with others. Becomings push the subject to his or her limits, in a constant encounter with external, different others. The nomadic subject as a non-unitary entity is simultaneously self-propelling and hetero-defined, that is to say, outward-bound.

Therefore, it is in the worst possible conceptual taste to even think of being able to separate out the becoming-woman from the other unfolding and deploying of multiple becomings. The process of becoming-nomadic is rather a zigzagging itinerary of successive but not linear steps that, starting from 'becoming-woman', marks different thresholds or patterns of 'becoming-minor' that cross through the animal and go into the 'becoming-imperceptible' and beyond.

'Becoming-woman' is integral to the concept and process of becoming, but there are no systematic, linear or teleological stages or phases of becoming. Each plateau marks a framed and sustainable block or moment of immanently actualised transformations. Thinking across these processes remains the central challenge for critical thought.

III. Minorities and Becoming-minor

There is a positive and creative tension between the identitarian claims of political movements that are grounded in the historical experience of oppression and the empirical transcendental aspirations of nomadic theory to postulate a new collective transversal bond through multiple processes of becoming.

As I asserted earlier, insofar as Man, the male, is the main referent for thinking subjectivity, the standard-bearer of the Norm, the Law, the Logos, Woman is dualistically, that is, oppositionally positioned as his 'other'. The consequence is that there is no possible becoming-minority of man and that the becoming-woman is a privileged position for the minority-consciousness of all. Man as the privileged referent of

subjectivity, the standard-bearer of the norm/law/logos represents the majority, that is, the dead heart of the system. The consequences are on the one hand that masculinity is antithetical to the process of becoming and it can only be the site of deconstruction or critique; and on the other hand, the becoming-woman is a fundamental step in the process of becoming, for both and for all sexes.

This creates an unresolved knot in Deleuze's relation to the becoming-woman and the feminine, which I have analysed extensively elsewhere (Braidotti 2002; 2006; 2011b). It has to do with a double pull, between on the one hand empowering a generalised 'becoming-woman' as the pre-requisite for all other becomings and, on the other hand, calling for its transcendence and worrying about the potentially despotic effect of such a priority or pole position attributed to women.

On the one hand, the becoming-minority/nomad/molecular/bodies without organs/woman starts from the feminine; on the other hand, it is posited as the general figuration for a process of transformation. Deleuzian becomings emphasise the generative powers of complex and multiple states of transition between, beneath and beyond the metaphysical anchoring points that are the masculine and feminine. But they do not quite solve the issue of their interaction.

Deleuze's work displays a great empathy with the feminist assumption that we have to start from the critique of phallocentrism. Insofar as woman is positioned dualistically – as the other – in this system, she is annexed to the phallus, albeit by negation. In this sense and in this sense only can it be said that sexual difference is the primary axis of differentiation and therefore must be given priority. On the other hand, nomadic theory aims at a tendency to dilute metaphysical difference into a multiple and undifferentiated becoming. Which prompts my question: what feminist politics follow from nomadic theory's emphasis on nomadic becomings?

Deleuze comes down on the side of basic feminist epistemological distinction between Woman as representation and women as concrete agents of experience, and ends up making analogous distinctions internal to the category of woman herself. Hence also Deleuze's explicit support for a feminist political position:

> It is, of course, indispensable for women to conduct a molar politics, with a view to winning back their own organism, their own history, their own subjectivity [. . .]. But it is dangerous to confine oneself to such a subject, which does not function without drying up a spring or stopping a flow. (Deleuze and Guattari 1987: 276)

In spite of such evident support for women's uphill struggle towards achieving full subjectivity, with human and citizenship rights, Deleuze opposes to the 'majority/sedentary/molar' vision of woman as the structural operator of the phallogocentric system the woman as 'becoming/minority/molecular/nomadic'.

The nomadic or intensive horizon is a sexuality 'beyond gender' in the sense of being dispersed, not binary, multiple, not dualistic, interconnected, not dialectical and in a constant flux, not fixed. This idea is expressed in figurations like: 'polysexuality', the 'molecular woman' and the 'bodies without organs' to which Deleuze's de-phallic style actively contributes. This is nomadic queer theory.

Thus, the becoming-woman is necessarily the starting point insofar as the over-emphasis on masculine sexuality; compulsory reproductive heterosexuality; the persistence of sexual dualism and the positioning of woman as the privileged figure of otherness, are constitutive of Western subject-positions. In other words, 'becoming-woman' triggers off the deconstruction of phallic identity through a set of deconstructive steps that re-trace backwards, so as to undo them, different stages of the social-symbolic construction of this and other differences.

IV. Deleuze's Critique of Feminism

Deleuze uses also his theory of the becoming-woman of women as the basis for a critique of identity-based feminist politics. All transformative politics should be about becoming-minor and to dissolve the subject 'woman' into a series of processes geared towards a generalised and 'gender-free' becoming. In other words, it is important to keep in mind the broader picture in order to avoid micro-despotisms and the repetition of power concentrations within the minorities.

Feminists, in other words, are conceptually mistaken, though their political heart may be in the right place, when they argue for a specifically feminine sexuality: exclusive emphasis on the feminine is restrictive. Deleuze suggests that feminists should instead draw on the multi-sexed structure of the subject and reclaim all the sexes of which women have been deprived:

> For us [. . .] there are as many sexes as there are terms in symbiosis, as many differences as elements contributing to a process of contagion. We know that many beings pass between a man and a woman; they come from different worlds, are born on the wind, form rhizomes around roots; they cannot be understood in terms of production, only in terms of becoming. (Deleuze and Guattari 1987: 242)

These different degrees of becoming are diagrams of subject-positions, typologies of ideas, politically informed maps, variations on intensive states. Multiplicity does not reproduce one single model – as in the Platonic mode – but rather creates and multiplies differences.

Ultimately, what Deleuze finds objectionable in feminist theory is that it perpetuates flat repetitions of dominant values or identities, which it claims to have repossessed dialectically. This amounts to perpetuate reactive, molar or majority-thinking: in Nietzsche's scale of values, feminists have a slave-morality. For Deleuze, feminists would be subversive if, in their becoming, they contributed both socially and theoretically to constructing a non-Oedipal woman, by freeing the multiple possibilities of desire meant as positivity and affirmation. This new general configuration of the feminine as the post-, or rather un-Oedipal subject of becoming, is explicitly opposed to what Deleuze constructs as the feminist configuration of a new universal based on female specificity or rather an exacerbation of the sexual dichotomy. The former aims at de-essentialised forms of radical embodiment; the latter to strategically re-essentialised embodiment.

V. Sexuality beyond Gender

In contrast to Deleuze's ambivalence about feminist politics, feminism strikes a clearer note. Nomadic feminism stresses the theft of the complex, polymorphous and perverse sexuality – in women and in all – and its reduction through the capture of a majoritarian scheme of sexuality that privileges heterosexuality.

As a consequence, nomadic feminism, resting on a relational monistic political ontology, shifts the focus away from the sex/gender distinction, bringing sexuality as process into full focus. The redundancy of the sex/gender distinction for feminist philosophies of the subject had been noted by English-speaking feminists working in Continental philosophy, like Gatens (1991), Grosz (1999), Butler (1991) and Braidotti (1991). Contemporary feminist philosophers argue the same case on different grounds. A renewed emphasis on sexuality, as opposed to classical or queer theories of sex and gender, emerges from the shift of perspective introduced by matter-realist feminism.

In what could be described as a classical exposition of Deleuzian feminism, Gatens and Lloyd (1999) argue that the political ontology of monism, which Deleuze adapts from Spinoza, offers some relevant opportunities for feminist theory. Mind–body parallelism, as opposed to Cartesian dualism, can be rendered in terms of simultaneous effects.

These entail the embodiment of mind as much as the 'embrainment of matter'. There is only one substance: an intelligent flesh-mind-matter compound. This implies that bodily differences are both a banality and a cornerstone in the process of differentiation of variation. The resonances between this feminist project and Deleuze's nomadism are many and many-fold.

Lloyd argues that the parallelism between mind and body and the intrinsically affective or conatus-driven vision of the subject implies that different bodies have different degrees and levels of power and force of understanding. This has clear implications for sexual difference. Given that, on a Spinozist account, the mind is nothing more than the actual idea of the body, sexual difference can reach into the mind as the mind is not independent of the body in which it is situated. If bodies are differently sexed, so are minds.

Lloyd emphasises the extent to which Spinoza recognises that there are distinctive powers and pleasures associated with different kinds of bodies, which then are enacted in different minds. Thus, a female body cannot fail to affect a female mind. Spinoza's mind is not neutral and this, according to Lloyd, has great potential for a feminist theory of female subjectivity that aims at avoiding the essentialist trap of a genuine female nature, while rejecting the idea of the neutrality of the mind.

Although Spinoza gives in to the traditionally subordinate vision of women of his times, and thus excludes women from the polity, Lloyd is careful in pointing out the liberatory potential of Spinoza's monistic vision of the embodied nature of the mind. Its worth can be measured most effectively in comparison with the Cartesian dualistic vision of the mind–body dichotomy, which historically proved more damaging for women than his idea of the sex-neutrality of the mind.

What a female nature is must consequently be determined in each case and cannot be spelled out a priori, because each embodied compound has its own specificity. This is due to the fact that, in a neo-Spinozist perspective, embodied subjects are constituted by encounters with other forces in patterns of affinity or dissonance that gives them very clear configurations which cannot be known in advance.

By extension, they also expose the absurdity of any political project that would aim at 'undoing gender' (Butler 2004). To undo gender would mean to unmake bodies, and much as this aspiration fits in with the consumerist logic of advanced bio-capitalism, it makes very little sense politically.

If for Lloyd and Gatens sexual difference is not a problematic issue, in that it remains of great relevance, for Claire Colebrook (2000) it

is no longer a problem. Sexual difference poses the question of the conditions of possibility for thought as a self-originating system of representation of itself as the ultimate presence. Thus, sexual difference produces subjectivity in general.

According to Colebrook, Deleuze's emphasis on the productive and positive force of difference is troublesome for feminist theory insofar as it challenges the foundational value of sexual difference (Colebrook 2000; 2002). The advantage of a Deleuzian approach is that the emphasis shifts from the metaphysics to the ethics of sexual difference. Deleuze's brand of philosophical pragmatism questions whether sexual difference demands a metaphysics at all.

Colebrook wants to shift the grounds of the debate away from metaphysical foundations to a philosophy of immanence that stresses the need to create new concepts. This creative gesture is a way of responding to the given, to experience, and is thus linked to the notion of the event. The creation of concepts is itself experience or experimentation. There is a double implication here: firstly, that philosophy need not be seen as the master discourse or the unavoidable horizon of thought: artistic and scientific practices have their role to play as well. Secondly, given that ethical questions do not require a metaphysics, the feminist engagement with concepts need not be critical but can be inventive and creative. In other words, experimenting with thinking is what we all need to learn.

This emphasis on the productive nature of desire and the view of sexuality as the vital force that de-territorialises gender and its binary system is the signature of nomadic feminism. Sexuality as the complex, multi-layered force that produces encounters, resonances and relations of all sorts cannot be contained in the power (*potestas*) structures of the dialectic masculine/feminine. It is rather an active space of empowerment (*potentia*) and becoming that is capable of producing spaces of intimacy, experimentation and relation to others.

Sexual difference no longer coincides with the rather narrow field of anatomical and sociological differences between the sexes. This is what I analysed elsewhere (Braidotti 2011a) as the first level of difference. Nor does it stop at level two of the differentiation process – the differences among different categories of women and three – the differences *within* each singular woman. A nomadic process of sexual differing is a permanent fracture and it is a block of becoming positioned outside the gender system, which mobilises untapped forces and energies and sets them to the task of sustaining processes of de-territorialisation.

Given that the only ethical question is the activation of affirmative and sustainable alternatives – then the force of an ethical relation consists

in supporting the actualisation of virtual possibilities geared to the empowerment of higher and larger forms of interrelation with multiple others. If 'empower us to act' is the ethical injunction of nomadic subjectivity, then sexuality as one of the strongest modes of encounters is the necessary premise to the enlargement of one's fields of perception and capacity to encounter and sustain the impact with others. The vitalist force of matter-realist feminism locates sexuality as a concrete and vital resource to both de-centre the individual ego and de-link desire from the restrictions of a gender system that is instrumental to the bio-political management and disciplining of bodies.

The wager is how to bring sexuality to allow the unfolding of ever-intensifying affects and thus to construct sustainable futures of and as becoming-other. Desire as the productive, de-territorialising force of radical encounters is post-identitarian and impersonal. It designs new landscapes of relationality around the face of the beloved, and thus it cannot be restricted to the mere human persona that enacts it. What is needed as the end result of the shift of perspective is a post-individual and non-anthropocentric theory of desire that may do justice to the complexity of materialist and vital nomadic subjects of becoming.

VI. Conclusion: For Nomadic Feminism

Feminist theory constitutes one of the most significant theoretical innovations, in what later became known as 'radical immanence' (Deleuze and Guattari 1987). Let me spell out the main reasons for this parallel.

To start with, let us look at the ethical and political underpinnings of Deleuzian feminism. Feminist theory and practice situates embodiment and hence sexuality, affectivity, empathy and desire as core values in the discussion about the politics of contemporary non-unitary subjects. This feminist philosophical critique of political subjectivity rests on two ideas. The first is the emphasis on the embodied and embedded nature of the subject, which results in unlimited confidence in lived experience. This translates in the politics of everyday life and renewed interest in the present. One has to think global, but act local. The second key argument is a focus on the dynamic interaction of Sameness and Difference. 'Difference' is not a neutral category, but a term that indexes exclusion from the entitlements to subjectivity. The equation of difference with pejoration is built into the tradition which defines the Subject as coinciding with/being the same as consciousness, rationality and self-regulating ethical behaviour. This results in making entire

sections of living beings into marginal and disposable bodies: these are the sexualised, racialised and naturalised others (Braidotti 2006).

Equally central is the focus on power as both restrictive (*potestas*) and productive (*potentia*) force. It also means that power formations are both monuments and documents – as Foucault teaches us – in that they are expressed in social institutions and in systems of representation, narratives and modes of identification (1975). They are both bound historical categories and flows of boundless energy – as Deleuze and Guattari teach us. Far from resulting in a suspension of political and moral action, the subtlety of this analysis of power becomes the starting point to elaborate suitable sites of political activity. Nomadic thought is the socio-political branch of complexity theory.

Furthermore, the emphasis on the politics of happiness or of feeling at home in one's culture – far from being a regression into narcissism – is an incisive comment on the mindless confrontation of dominant morality and social order. As such it encourages the counter-actualisation of different political economies of affect and desire. The pursuit of political felicity is collective, not individualistic and free of profit motivations, being elevated to the gratuitous tasks of constructing social horizons of hope.

This combination of critical acumen and creative potency is what I value most in feminist practice. Feminism put it clearly by voicing the need for a 'double-edged vision' of critique and creativity (Kelly 1979) that goes beyond complaint and denunciation, to offer empowering alternatives.

The ethical lesson of feminism is that there is no logical necessity to link political subjectivity to oppositional consciousness and reduce them both to negativity. Political activism can be all the more effective if it disengages the process of consciousness-raising from negativity and connects it instead to creative affirmation. In terms of the crucial relationship to sameness and Difference, this means that the dialectical opposition is replaced by the recognition of the ways in which otherness prompts, mobilises and engenders actualisation of virtual potentials. These are by definition not contained in the present conditions and cannot emerge from them. They have to be brought about or generated creatively by a qualitative leap of the collective imaginary.

Feminism draws a crucial distinction between the political and politics. Feminist theorists – from Beauvoir (1949) to Haraway (1990) and beyond – have distanced themselves from the nefarious illusion of revolutionary purity, which engenders inevitable flirtations with violence. They were equally suspicious, however, of the universalist

humanistic assumptions and the claim to human rights, or the self-correcting validity of human reason. They stress instead the need for a change of scale, to unveil power relations where they are most effective and invisible: in the specific locations of one's own intellectual and social practice. One has to start from micro-instances of embodied and embedded self and the complex web of social relations that compose the self.

This double emphasis on vulnerability to sovereign power on the one hand and despotic power relations on the other is crucial to a nomadic approach to the political. Activism as a frame of mind consists in connecting philosophy not so much to Politics – as in '*LA politique*' (organised or Majoritarian politics), as to the political – '*LE politique*' (the political movement in its diffuse, nomadic and rhizomic forms of becoming).

This distinction between politics and the political is of crucial importance; in the work of Michel Foucault it is postulated along the double axis of power as restrictive or coercive (*potestas*) and as empowering and productive (*potentia*). The former focuses on the management of civil society and its institutions, the latter on the transformative experimentation with new arts of existence and ethical relations. Politics is made of progressive emancipatory measures predicated on chronological continuity, whereas the political is the radical self-styling that requires the circular time of critical praxis.

In an even more grounded and ascetic tone, Deleuze and Guattari set the desire for transformations or becomings at the centre of the agenda. The crucial distinction for nomadic theory is that of the axes of time and the qualitative degree of affectivity they sustain. Politics is postulated on Chronos – the necessarily linear time of institutional deployment of norms and protocols. It is a reactive and majority-bound enterprise that is often made of flat repetitions and predictable reversals that may alter the balance but leave basically untouched the structure of power.

The political, on the other hand, is postulated on the axis of Aion – the time of becoming and of affirmative critical practice. It is minor and it aims at the counter-actualisation of alternative states of affairs in relation to the present. Based on the principle that we do not know what a body can do, the becoming-political ultimately aims at transformations in the very structures of subjectivity. It is about engendering and sustaining processes of 'becoming-minor'. This specific sensibility combines a strong historical memory with consciousness and the desire for resistance. It rejects the sanctimonious, dogmatic tone of dominant ideologies, Left or Right of the political spectrum,

in favour of a production of joyful acts of transformation. The spontaneous and creative aspects of this practice combine with a profound form of asceticism, that is to say, with an ethics of non-profit to build upon micro-political instances of activism, avoiding over-arching generalisations. This humble yet experimental approach to changing our collective modes of relation to the environment, social and other, is the most pragmatic manifestation of the politics of radical immanence.

The feminist movement is the perfect example of the political in the nomadic sense of the term. Of all the social movements of that period, the women's movement in particular illustrates the self-organising capacity, the organisational energy and the visionary force of a leaderless structure. Historically, the second feminist wave of the 1970s not only was based on the critique of the false universality of the liberal democratic system and the failed promises of its exclusionary humanism; it also interrogated the entrenched masculinism of the allegedly radical Left and of its leaders. Propelled by collectively shared aspirations to freedom, the respect of diversity, the desire for social and symbolic justice, and the 'politics of everyday life', 1970s feminism was a passionate, humorous and politically rigorous movement. Disrespectful of dominant norms, but aware of its responsibility for the masses of women whose rage and vision it embodied, the collective endeavour of the women's movement is one of the most successful political experiments of the twentieth century.

Nomadic feminism is built on the politics of desire as the positive affirmation of a collectively shared longing for plenitude and the actualisation of one's potential, regardless of sex, race, class or sexual preferences. A political form of felicity, this radical aspiration to freedom aimed to confront and demolish the established, institutionalised form of gender identities and the power relations they actualise. The aim of nomadic feminism is the actualisation of a virtual feminine, the structures and parameters of which are to be negotiated and sustained collectively.

Nomadic feminism also renews the task of critical theory. Deleuze (1953; 1962) redefines philosophy in the 'problematic' mode as the constant questioning of the humanistic 'image of thought' at work in most of our ideas with the aim to destabilise them in the 'nomadic' mode.

Deleuze redefines philosophy instead as a radical form of immanence, thus stressing the affective political passions which sustain the theoretical process. Accordingly, Deleuzian feminists are critical of rationality as the dominant vision of the subject and as a human ideal, but, rejecting both the plaintive mode of nostalgia and the glorification of the aporetic,

nomadic feminists propose instead a radical redefinition of thinking as the activity that consists in the act of creation of new forms of thought and of collective experiments with ways of actualising them.

This engagement with the present – and the spirit of the times – sets the political agenda in a variety of realms, ranging from sexuality and kinship systems to religious and discursive practices. The analyses of these themes are transmitted through narratives – mythologies or fictions, which I have renamed as 'figurations' (Braidotti 2002; 2006), or cartographies of the present. A cartography is a politically informed map of one's historical and social locations, to enable the analysis of situated formations of power and hence the elaboration of adequate forms of resistance. Michel Foucault worked extensively on the notion of genealogy or counter-memories as a tool to draw the 'diagrams of the present' in his analysis of the micro-physics of power in post-industrial societies (1975). Gilles Deleuze and Félix Guattari also stressed the importance of immanent analyses of the singular actualisations of concrete power-formations (Deleuze and Guattari 1987).

Independently of these philosophical notions, feminism also pioneered this method through the practice of the politics of locations (Rich 1985) as a method for grounding activism. It also perfected the strategy of positive renaming and re-signification of the subject. A location is an embedded and embodied memory: it is a set of counter-memories, which are activated by the resisting thinkers against the grain of the dominant social representations of subjectivity. A location is a materialist temporal and spatial site of co-production of the subjects in their diversity. Locations provide the ground for political and ethical accountability. Remembrance, cartographies of locations, political (dis-)identifications and strategic re-configurations are the tools for consciousness-raising which were devised by transformative epistemologies such as feminism and race theory.

In a nomadic perspective, the 'feminine' is neither one essentialised entity nor an immediately accessible one: it is rather both an embodied and embedded location and a site of intensive becoming. It is the effect of a project, a political and conceptual project of transcending the traditional ('Molar') subject position of Woman. This transcendence, however, occurs through the flesh, into embodied locations and not in a flight away from them.

Femininity is caught in the double bind of late postmodernity by being simultaneously 'Other' (of the same) and fully mainstream and integrated in the Majority. Woman today is both the pathetic and despotic face of white femininity and the scapegoat sacrificial victim of a

phallocentric political ontology that requires her symbolic absence and her social marginalisation. Becoming-nomadic points towards fruitful paths of qualitative transformation.

The Melodic Landscape: Chinese Mountains in Painting-Poetry and Deleuze/Guattari's Refrains

Kin Yuen Wong Hong Kong Shue Yan University

Abstract

By melodic landscape, this paper points to natural milieus such as mountains whose motifs are caught up in contrapuntal relations. With Merleau-Ponty, the structure of the world is a symphony, and the production of life which implicates both organism and environment as unfurling of *Umwelt* is 'a melody that sings itself'. For the Chinese culture, mountains have been deemed virtuous in Confucianism, immortal by Daoists, and spiritual for a Buddhist to reach a substrate level of pure stream of a-subjective consciousness. A Chinese painter-poet within the 'mountain-water' genre would consider mountains as performance of events, a concert of vibration of light, shape and sound, movement and rest. Insofar as art is to create energy transfer, Chinese artists of mountains aim at concerting with nature as organised by rhythms and conspecifics, unfolding contrapuntal melodies with all kinds of counterpoints. As Deleuze and Guattari's notion of refrains are the three forces or tempos of chaos, earth and world confronting/converging one another, this paper endeavours to find out, first, how Deleuze and Guattari's geological, organic and alloplastic stratifications can be put alongside mountains, animals, plants and arts, and second, how this notion can contribute to our new appreciation of the way Chinese mountains in arts can give out music.

Keywords: mountain-water painting, Daoism, events, refrain, ecosophy

The *shān shui* (山水) (mountain-water) poetry and paintings have been a main achievement in the history of classical Chinese arts.[1] Numerous works in both have presented mountains as their unique motif and a whole tradition of what can now be referred to as 'ecoaesthetics' has been closely related to 'how' mountains are presented and what values, practices, beliefs and identities are associated with them. For the Chinese culture, mountains have been deemed virtuous in Confucianism, immortal by Daoists, and spiritual and 'holy' for a Buddhist to reach a substrate level of pure stream of a-subjective consciousness. This paper proposes to argue that, for a Chinese painter-poet within this genre, mountains are natural milieus which, through an encounter between artists and their environment, inspire artistic motifs which highlight mountains as performance of events, caught up in contrapuntal relations which bring forward a concert of vibration of spatial-temporal registers such as light, shape and sound, movement and rest. Insofar as art creates energy transfer and makes more and more connections, Chinese artists of mountains aim at concerting with nature as organised by rhythms and their conspecifics such as notes, scores and melodies, all unfolding an aesthetic experience unique in itself.

In order to delineate a systematic argument that Chinese mountains in arts can actually – and physically – give out music, I would adopt a Deleuzian ecoaesthetics of creative difference and repetition, territory-milieu, affect-percept, affirmative becoming, body without organs, haecceity, structural coupling, transversal communication, and so on, all summated onto the context of refrain. By highlighting (here as an image of physics, image and thought) such an odd coupling – indeed, a monstrous cross-breed (Deleuze and Guattari 1987: 195) between, say the Daoist and Buddhist philosophy of the natural wilds (which spill over onto art theories and practice) on the one side, and Deleuze and Guattari's ecosophy on the other – my ultimate aim is to extract an ecoethical 'field' in which a certain resonance can be reached between the human and the non-human, the organic and the inorganic, painters-poets and the mountains. Here I would like to put forward three points. First, starting with spatial motifs, Chinese artists categorically turn to 'temporalising' mountains (or their mountain experience), so as to achieve eventful durations and affects, energy flows and oscillating rhythms in a spatio-temporal dynamic, particularly those entities with ethical and religious implications. Second, the hyphen between painting and poetry in the title and throughout this paper functions in emphasising a merger between painting and poetry, where paintings in the Chinese tradition are always accompanied by verses,

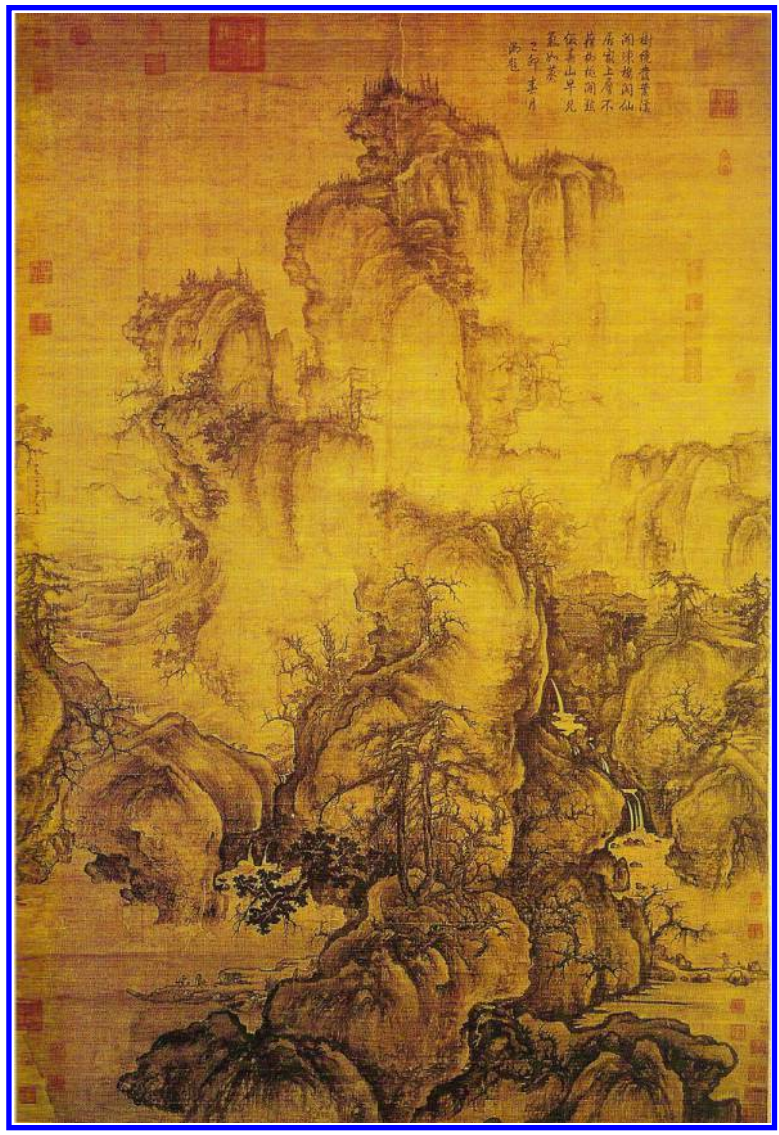

Figure 1. *Early Spring* by Kuo Hsi.

whose rhymes and rhythms are contributive to mobilising the mountain imaginary. Needless to say, the mountain-water poetry as a genre has always been known to be very pictorial, or rather very painterly in its presenting mountains and rivers or streams; hence we have many cases where the painter and poet are one single person. Finally, through a

presentation of Deleuze and Guattari's notion of refrain, the last part of this paper endeavours to find out how Deleuze and Guattari's geological, organic and alloplastic stratifications can be put alongside mountains, animals, plants and rock, and then how the refrain would amply support my argument that 'music in Chinese mountains' moves away from being representational or metaphorical. Amazing as it may sound, I am here making a claim that these mountains in art do physically emit rhythms and music.[2]

It is important here to reiterate that mountain-water painters in the classical world shared a common practice of temporalising their spatial experience. For Merleau-Ponty, perception is primarily conditioned and governed by temporality, and a new level of perception is always established by a movement or bodily motility; and thus there is 'a certain gearing of my body to the world' (Merleau-Ponty 1964: 250). Since in an act of perception, 'the unseen side is given to me as visible from another standpoint at once given but only immanently', the 'perceptual synthesis', for Merleau-Ponty, 'is a temporal synthesis', and 'subjectivity, at this level of perception, is nothing but temporality' (239). Merleau-Ponty's idea here reminds us of the tacit faith of Chinese landscape painters; and especially when Merleau-Ponty talks of 'the body of the painter' who, being 'an intertwining of vision and movement, never ceases adjusting his clairvoyance to them (things)' for a 'maturation of vision' (162, 166), we certainly recall the Chinese painters who 'saturate themselves with travels and looking' (飽游飫看) so that they can 'approximate the form of the Infinite (original void) with a single brush'.[3] This is what Wai-lim Yip calls 'the mobile point of view of the perceiver' in which the painters attempt to 'live with the "total" mountains and "total" rivers' (Yip 1980: 161). Kuo Hsi has this to say in relation to what painters actually do to 'saturate themselves with travels and looking':

> A mountain looks this way close by, another way a few miles away, and yet another way from a distance of a dozen miles. It looks this way from the front, another way from the side, and yet another way from the back. Its aspect changes from every angle, as many times as the point of view. Thus one must realize that a mountain contains in itself the shape of several dozen or a hundred mountains.[4]

When, therefore, Chinese painters theorise the phenomenon that 'Mountain shapes move step by step' (山形步步移) and 'Mountain shapes look differently face after face' (山形面面看),[5] we are affirming Merleau-Ponty's point that 'Everything I see is in principle within my

reach, at least within reach of my sight, and is marked upon the map of the "I can"' (Merleau-Ponty 1964: 162). Here we have a double folding: the time we move around the mountain and the time of the mountain itself.

In the Deleuzian system of time, this exemplifies the fluid nature of the syntheses through bodily movement in relation to sensibility beyond representation. For Deleuze, to repeat is to begin anew, since 'every present passes in favor of a new present because the past is contemporaneous with itself as present' (Deleuze 1994: 81). It is then a question of 'inviting vibrations, rotations, whirlings, gravitations, dances or leaps which directly touch the mind' (8). Right here the 'step by step' and 'face after face' of the Chinese poet finds support from Deleuze's relating repetition in terms of beats and rhythms with 'intensity as the condition for significance in a well-ordered space' (Williams 2003: 171). Each step in our walking is an acquired habit by our synthesising earlier steps as members in a series of time (or events). But then walking in relation to a practice of art has something to do with Ideas in Deleuze and the concept of *xing* (興) (giving rise to poetic ideas) in the Chinese artists. A habitual repetition is not the repetition of the same, and with that in mind, we should consider the repeated steps undergoing a process of virtual syntheses, driving actual syntheses not only in habit and memory, but also creativity.[6] Also, it is important to note here that neither the Chinese poet nor Deleuze is attending to a well-ordered space only. Within a moving field of intensities and a rhythmic change of excitation, the double folding of time in the Chinese practice of art is fully echoed by Deleuze's insistence on a double aspect of the order of intensities: 'Whence the double aspect of the quality as a sign: it refers to an implicated order of constitutive differences and tends to cancel out those differences in the extended order in which they are explicated' (Deleuze 1994: 228).

My first case in point is synaesthesia, the 'hidden sense' that has intrigued both scientists and artists. The word literally means to perceive (aesthesia) together (syn), and scientists have recorded cases of artists who 'experience sounds in images and images in music' (Van Campen 2008: 15). Seeing with one's eyes can evoke hearing of, say, a vibrato, and images with indistinct or fuzzy edges are reported to be able to induce music more easily in synaesthetes. This immediately reminds us of the Daoist concept on the visual perspicuity of *xiang* (象) (originally means elephant but later, phenomena, images and imagination). We remember the interesting parable in *Zhuangzi* '*xiang wang*' (象罔) (shapeless, formless and fuzzy images) which is personified to have

defeated 'knowing', 'seeing' and 'debating' in their efforts of retrieving the Dark Pearl (true knowledge) that the Yellow Emperor has left behind. At any rate, this involuntary fusion of optical and tactical impressions evoking acoustical ones happens more often to children, women and particularly artists such as painters and musicians. We have scientifically supported records of people who can perceive sounds in colour and taste, and for whom smell is mixed up with hearing; and famous musicians such as Michael Torke and painters such as Paul Klee, van Gogh, Wassily Kandinsky and Eugène Delacroix all have testified to their unique experiences of painting in music and music in painting, all aspiring towards the so-called 'total works of art (*Gesamtkunstwerke*)' (Van Campen 2008: 55). As for the Chinese arts, suffice it to say at this point that a montage structure as imaging forth our relation with the universe, with the environment and especially with mountains is always at work by virtue of the embrace of 'fuzziness' in art; and we only have to bring our attention to the design of the characters' etymologically in the concept of *yi-xiang* (意象) which means 'images', where *yi* is made up of the 'sound' placed above our 'heart'.

We have symbiosensation when a body feels certain haptic contactedness (the Chinese term '*chu-dong*' (觸動) – bodily fuzzy encounter as affects in an ethology of forces) in matter or synaesthetic contiguity among senses, thus, as Braidotti puts it, 'freeing organs from their indexation to certain prerequisite functions' (Braidotti 2010: 224). It should be noted here that Chinese medicine, known for its holistic approach, has recently been emphasising the 'musicality' of '*qi*' (氣的樂章).[7] *Qi* (氣) here variously means air, breath, blood flow and vital force or pulsation of the body. Such a synchronising, resonating and entraining dynamism in one's body function holistically, and our health, is defined by a certain harmonics of *qi*. The reason I mention this is that this same *qi* happens to be the major element which becomes the measuring rod whether a mountain-water painting has got what it takes to be a great piece of artwork. All paintings in this genre aspire towards the heraldic motto, namely *qi-yun-sheng-dong* (氣韻生動). *Qi-yun* here refers to 'rhythmic beats of force/energy', and *sheng-dong* means 'lively moving'. The four characters together bring forward an ideal where a dynamic arising and animation of some melodic forces becomes a golden moment in the art of mountains. After all, mountains are geological formations in *I-ching* (《易經》) (*The Book of Changes*) where *qi* or vital force is being energised.

That the Chinese *qi* belongs to the cosmic forces has been widely recognised; it can certainly manifest itself through various channels or

bodies beyond the designated 'organs'. Etymologically, the character *qi* has three layers of cloud or mist set above rice or food; and the way the lines of cloud hanging freely as air-currents would be an excellent visualisation of Deleuze and Guattari's attribute of 'fuzzy aggregates' as 'forces of the earth or of chaos' (Deleuze and Guattari 1987: 346). For such a 'nuanced' mixture of the visible and the sonorous, Deleuze and Guattari would induce some 'powers or coefficients' which give direction to the very movement of 'deterritorialization of sonorous and visual components', and it is at this very juncture that the two authors of *A Thousand Plateaus* mention the phenomena of synaesthesia:

> This is evident in phenomena of synesthesia, which are not reducible to a simple color-sound correspondence: sounds have a piloting role and induce colors that *are superposed* upon the colors we see, lending them a properly sonorous rhythm and movement. (Deleuze and Guattari 1987: 347–8)

It should be remembered that Deleuze and Guattari use the phenomena of synaesthesia to support their ideas of body without organs and the cosmic refrains, topics which will be dealt with later in this paper. Suffice it to say here that the Chinese concept of *qi-yun-sheng-dong* does embrace the ideal of fuzziness between painting and poetry as far as mountains are concerned, and both visuality and sound are enshrined in aggregates which are characterised by a certain indiscernibility through a process of becoming-molecular or becoming-imperceptible. Within an ecosystem of art forms, Chinese painting-poetry on mountains enjoys a symbiosis by a surplus value of codes such as lines, colours, ink-dots, brush work and calligraphy; all are granted with intensive transversality through a zigzagging flight in different directions. As an affective assemblage, both the visual image and sound are supposed to be connecting to a materiality of the mountains, rivers or streams, rocks, trees and animals, at the same time surrendering themselves to the mountainous twists and turns, following what they lead to in rhythmic undulations. Within art forms, however, the Chinese painting-poetry of mountains harbours pieces and fragments that refuse to belong to a whole. Between brushes of lines and colour on the one side and the actual calligraphy of characters in a poem's versification and rhyming scheme on the other, there is always a contrapuntal duet that forms a harmony as a universal law of musicality which is radically cosmic in nature. Insofar as art being defined as 'connecting' more and more things/events, such a symbiotic plane of composition orchestrates milieus across discrete art forms which are the most relevant endeavours to the

resounding elements one finds in the Chinese mountains, the elements of the emergent music of nature itself.

The Chinese mountain-painting-poetry is, I would argue, prone to be compared to the Deleuzian concept of haecceity. It 'allows the reformation of (moment of) wilderness' and 'the site of a generalized "haecology"' (Berressem 2009: 71):

> There is mode of individuation very different from that of a person, subject, thing, or substance. We reserve the name *haecceity* for it. A season, a winter, summer, an hour, a date have a perfect individuality lacking nothing, even though this individuality is different from that of a thing or a subject. They are haecceities in the sense that they consist entirely of relations of movement and rest between molecules or particles, capacities to affect and be affected. (Deleuze and Guattari 1987: 261)

The authors here quote the Japanese haiku to represent the oriental of having 'many more individuations by haecceity than by subjectivity or substantiality' (261); and I would submit that, had they been informed more about Tang poetry or mountain-painting for that matter, they would have been more than happy to accept them as good examples. Painter-poets of mountains generally promulgate a style of highlighting haecceities as individuating of 'thisnesses', as jets of singularities on the plane of a non-human dynamic, matter-movement, as tableaus of intensive forces. Nature being 'conjunctive', expressing itself through 'and' and not through 'is', exhibits contrapuntal arrangements of mutually corresponding melodies, which become what the painter-poet wishes to present in his art. Mountains are then matters, or rather, matter-movements (despite their duration being very very slow) bearing singularities and haecceities. They are modes of individuation in pairs such as the famous wasp/orchid, spider web/flies, night/day, mountain/water, yin/yang, and finally visual image/the sonorous or painting/poetry. 'The intensive field of individuation', by the way, is always 'dramatized' or 'actualized' by spatio-temporal dynamisms within the 'differential relations' (Deleuze 1994: 251), a 'process of progressive determination which is productive of real, multiple temporalities' (Toscano 2006: 193). Therefore, the mountain genre in painting-poetry excels in recording artistically this harmonic duet, these counterpoints in the cosmos, by going deep into elements of go-betweens: water and clouds, criss-crossing waves of earth and rocks, light and fuzzy shadows in infinite stratifications and folds, or folds in folds within a context called 'intra-temporalities'.

We have expounded the kinetic practice of mountain-painter-poets who materialise their relation with the mountainous *qi* which spreads itself to give rise to life as the force of foldedness, hiding the carrying capacity and affordance of the natural wilds. Following this first step of establishing how the painter-poets temporalise their experience in terms of Merleau-Ponty's temporal synthesis with the cosmic rhythm, we have also worked out the way they draw upon a seamless merger between poetry and painting so as to bring forth the idea of *qi-yun-sheng-dong* which in itself already always generates rhymes and rhythms. We can now come to the third point in our arguing for a melodic landscape in this paper, namely, Chinese mountains in art do have some 'power of coefficiency' in emitting actual, physical music. We have mentioned that we need to go into Deleuze and Guattari's concepts such as body without organs, affects/percepts and finally refrains, in order to substantiate our claim as such. But before we actually go into the very folds of these, we may rehearse a bit as to how rhythms emerge from chaos in Deleuze's onto-ecologics:

> From chaos, Milieus and Rhythms are born [. . .] Every milieu is vibratory, in other words, a block of space-time constituted by the periodic repetition of the component [. . .] The milieus are open to chaos, which threatens them with exhaustion or intrusion. Rhythm is the milieus' answer to chaos. What chaos and rhythm have in common is the in-between – between two milieus, rhythm-chaos or the chaosmos: '*Between* night and day, between that which is constructed and that which grows naturally, between mutations from the inorganic to the organic, from plant to animal, from animal to humankind [. . .].' (Deleuze and Guattari 1987: 313)

The Deleuzian onto-ecologics is such that where there is difference, there is rhythm. In the Plateau entitled 'Refrain', it amounts to any organising rhythmic pattern that brings together heterogeneous entities that function in concert with the natural world. Once again, I need to hark back to the famous poem *Bird-Singing Stream* by the Buddhist poet Wang Wei to initiate our discussion of how refrains can be relevant to Chinese mountain-painting-poetry:

> Human at leisure; cassia flowers falling.
> The night quiets; spring mountain empty.
> Moon rises; startling mountain birds.
> Singing time and time again in the spring stream.[8]

Several steps remain to be taken in our analysis here. First, the poem as a whole is about how movements, duration, movements in-between, or the

coupling of the conditioning with the conditioned, chaos/cosmos/milieus are a composite of the mountain refrains. As Deleuze and Guattari already suggest:

> This emergence of pure sensory qualities is already art, not only in the treatment of eternal materials but in the body's postures and colors, in the songs and cries that mark out the territory. It is an outpouring of features, colors, and sounds that are inseparable insofar as they become expressive. (Deleuze and Guattari 1994: 184)

Second, we have an 'intensive dynamics of spacing' of a circular movement in terms of Deleuze and Guattari's territorialising, deterritorialising and reterritorialising. Third, the poem incorporates both of my earlier points about the artists' temporalising spatial experience, and as an event, it also illustrates to a certain extent the painterly quality of a poem with sound.[9] What is more important is how it can be put alongside the concept of refrain which conveys certain qualitative measures of speed, tempo and rhythmic milieus as expounded by Deleuze and Guattari. We certainly have had a sizeable body of commentaries on this topic, notably in works by Keith Ansell Pearson (1999), James Williams (2003) and Ronald Bogue (2003a). But what is more relevant to our discussion is a book chapter titled 'Intensive Landscaping' by Yves Abrioux in which 'melodic landscape' becomes the crux of the matter (Abrioux 2009). By recalling our attention to the French '*ritournelle*', the author here expresses his dissatisfaction with the published English translation 'refrain', reasoning that 'ditty' could well be a better choice for the concept, since the latter can convey, even on the etymological level, the notion of 'difference through repetition' as different from Deleuze's '*rengaine*' (mere repetition without creativity) in *Difference and Repetition* (Deleuze 1994: 14).[10] Abrioux quotes the *Oxford English Dictionary* which states that a ditty refers to 'a short, simple song; often used of the songs of birds', and it quotes Cowper's 'Poplar Field' (1800) where 'The blackbird has fled… And the scene… Resounds with his sweet-flowing ditty no more' (Abrioux 2009: 254).

That Wang Wei's poem quoted above is a beautiful encounter with 'ditty' is clear enough. What remains to be worked out is how the 'jumping, skipping and singing' (Abrioux 2009: 255) one finds in ditties make significant sense to the Chinese mountains in art in terms of melodic landscape. By the way, we should note here, that the character *shih* (時) (time) in the last line of Wang's poem has a composite of the sun on the left, and a foot at a point of moving and stopping, thus

creating a certain sense of rhythm; and if the sun is replaced by *yen* (言) (speech) we will have *shih* (詩) (poetry). This is excitingly an echo of Abrioux's argument that to sing is always already to jump or skip (in the sense of, say, art which makes a difference); hence the *shih* as time as well as poetry resounds with Deleuze and Guattari's refrains which effect 'a jump out of chaos' and 'one ventures from home on the thread of a tune' (Deleuze and Guattari 1987: 311). The very 'crack' which is a 'circle' to join 'cosmic forces' is not just chaos itself, but something that embraces 'sonorous, gestural, motor lines', giving birth to 'loops, knots, speeds, movements, gestures, and sonorities' (311–12). That the lines and cracks relate directly to what we have discussed on haecceities in milieus should be readily recognised; and the whole concept of territory which includes earth as well as 'world' through 'an act that affects milieus and rhythm' is once again the major contribution of the jumps and the skips of refrains. For 'chaos, earth and World are forces or tempos confronting one another and converging within the *ritournelle* as simultaneously, territorialization and deterritorialization' (Abrioux 2009: 257).

It is therefore my major argument in this paper that such a block of expansiveness has become a configuration of intensive forces characterised by a tempo (or allure) unique in Chinese mountain-painting-poetry. From the image of *kung* in poetry, we can finally identify its more visual, and hence more sonorous counterpoint in poetry-painting, namely the famous practice of *liu-bei* (留白) (leaving-it-blank). It takes the form of a mediating line, a crooked but semi-continuous line of white mist or cloud staged right between the 'being-at-homeness' of human habitat and the unapproachable, ungraspable and inexhaustive backdrop of mountain peaks in many artworks of this genre.[11] Technically, this featuring of a more or less cutting off of the mountain as magnitude of extensity into two parts, enacting a seeping edge between the actual and the virtual, is considered to be able to create an incorporeal effect of height and magnitude of such a formation. Philosophically the Daoist concept of *wu-wei* (無為) (non-action) might have concretised itself in such a practice, later to be picked up by *chan* (禪) (Zen) Buddhist paintings where bigger and bigger portions of the painting surface are left blank, having the void as ground, or rather a non-figured and ungrounded as ground, a vast cosmic zone of indetermination which establishes a sense of interconnectedness of percepts. This line of virtuality, or rather, 'a thought without image' (Deleuze 1994: 147), is also to achieve an effect of matters being decomposed, and we have seen paintings with only one-tenth of the

surface occupied by ink brush. This void is also an intensive *spatium* which harbours 'the self-organizing capacities of the cosmos. If there is an empty space vacated by God, it is the space of virtual depth' (Kelso 2010: 128). Here, 'the ground has been superseded by a groundlessness, a universal ungrounding which turns upon itself and causes only the yet-to-come to return' (Deleuze 1994: 91). We should note here that Deleuze and Guattari themselves mention this Chinese practice when they say:

> However, blocs need pockets of air and emptiness, because even the void is sensation. All sensation is composed with the void in composing itself with itself, and everything holds together on earth and in the air, and preserves the void, is preserved in the void by preserving itself. A canvas may be completely full to the point that even the air no longer gets through, but it is only a work of art if, as the Chinese painter says, it nonetheless saves enough empty space for horses to prance in. (Deleuze and Guattari 1994: 165–6)

Also, in *The Fold*, we find Deleuze even suggests that Leibniz should have heeded 'the full and the void in a Chinese fashion' (Deleuze 1993: 36).[12]

In line with what we have discussed so far, I would turn this blank-space into a kind of 'absolute deterritorialisation' that permits the space to be void of all representation. It is a territory, a zone of proximity, a fluttering and rippling stillness, which encompasses and at the same time cuts across territories as melodic, polyphonic and contrapuntal sensibilia; it is therefore a body, or rather a non-body, of a sum total of intensive affects. All the intensities, duration, body, affect and wildness are lumped into a bunch of quantum-like existence. As 'the colored or, rather, coloring void, is already-force' (Deleuze and Guattari 1994: 181), it will become, as Colebrook puts it, 'a power to be seen (and varied) again and anew for all time' (Colebrook 2006: 104). Like the zero-point energy in new physics, this line of mist maximises connections and affective moments of the body in this so-called 'smooth' space where, by dismantling molar aggregates, carbon, marrow, water, molecules and particles freely flow. This is a space with an infinity of points and possible becomings, an intense, virtual world of all kinds of reciprocal implications. As 'an aleatory point at which everything becomes *ungrounded* instead of a solid ground' (Deleuze 1994: 200), and as a line between the milieu of human habitat and that of the unapproachable wilds, and as viewer of the painting our eyes move up and down across the divide, armed with Merleau-Ponty's tacit faith in the synthesis relation between the body and temporality,

rhythm is certainly created. Here the world sings itself with points and counterpoints, motifs and counter-motifs, the energies emitted from the brush work back and forth between the calligraphy of the poem and ink and colour of the lines which make up the mountain. Milieus are then orchestrated into a world where contrapuntal relations compose what we call the music of nature. This is a territory that 'joins up not only its spatiotemporal but its qualitative planes or sections: a posture and a song for example, a song and a color, percepts and affects' (Deleuze and Guattari 1994: 185).

As an art form, the Chinese mountain-painting-poetry provides us with an experience of a piece of landscape, expanding and contracting in repetition, height and depth requiring variable densities, becomes a melodic landscape which seeks to invent relations. It is an event of naming a mode of rhythmic but incorporeal transformation. Materiality takes precedence over representation, whereas matter is matter-movement as an event, an event that drives processes towards heterogeneous assemblages (ecosystems), where there are extensities of things (the matter that bodies forth a mountain), there are spatio-temporal dynamics uniting light waves with sound waves. At this point the Chinese saying *shan-ming-gu-ying* (山鳴谷應) (mountain-sounds-valley echoes) no longer works as a metaphor, since the interaction of the organic and inorganic breaks away from both representation and resemblance to achieve a differentiation status where rhythms occur. Mountains are incidents of extremely slow becomings; and geo-art is especially patient with this slow flow of music, as the earth-artist Robert Smithson remarks in an interview, 'You know, one pebble moving one foot in two million years is enough action to keep me really excited' (Smithson 1996: 205). As Deleuze and Guattari note, 'these relationships of counterpoint join planes together, form compounds of sensations and blocs and determine becomings' (Deleuze and Guattari 1994: 185). The Chinese painter-poets of mountains assign themselves the job of reminding us that 'we are made of contracted water, earth, light and air – not merely prior to the recognition or representation of these, but prior to their being sensed' (Deleuze 1994: 73). Fuzziness has gained an ontological status. The mountains therefore bring us back to a state of sensation way before our recognising things in the world with specific organs, and with the thematising of the mist as the body without organs, mountains remind us that we are part of our intelligent ecosystem in energetic terms.

Finally, having explored the melodic nature of mountains through painting-poetry, we can conclude that the very purpose of art is to

establish a fluid set of connectivity, sometimes even by resorting to disjunction and disruption just as the line of blank space between milieus within a vortex of energy. Connections are now transversal as all aspects of the mountain's surroundings are molecularised and resingularised as haecceities. The misty line of flight is physically a continuous line of cloud that consists of an aggregate, a nebulous set, a multiplicity whose exact definition escapes us. It can also be considered as a response to Deleuze's 'cut or caesura' in the third synthesis of time, which functions as ordering, assembling 'a seriation and a process of eternal return' (Williams 2011: 14). But the emptiness here is also a kind of pure spatial synthesis or a totality of time in which cosmic energies emerge from the depth, 'announcing the universal ungrounded', which 'unites a bubbling sensibility and a thought which rumbles in its crater' (Deleuze 1994: 230). For Deleuze, this cutting away situates itself at an 'aleatory point' which produces Ideas; and for the Chinese poet-painter, this Deleuzian Idea becomes the character *xing*, where all energies in art arise from an absolute stillness or virtual multiplicities. The mountains as presented by the Chinese painter-poet become the passing of intensities across bodies without organs as body-earth-mountain assemblage, and with Buddhism and Daoism, art here does not present essence but an insubstantiality, impermanence and interpenetration of all phenomena. For the Chinese artists, mountains do resonate together with our somewhat synaesthesian percepts which produce fuzzy bodily encounters of affects, and we are invited by the mountains to participate in a geological and inhuman duration. Facing the mountain, we are to lodge ourselves onto both the geological and social/cultural strata. Here we are to always alert ourselves that categorically all arts have a rhythm, arising from relations between a territory and an outside of this territory. We should finally accept the claim that the mountain-painting-poetry no longer represents reality but is reality itself. Here mountains in art become a physics of life, broken down into quantum-like 'fractals' through a complex composite of different scales, speeds and rhythms. All the rocks, plants, streams and animals are now mixtures of bodies through which affects are created as dark precursors of our contrapuntal rhyming system. According to the art critic Simon O'Sullivan, painting can be 'the making perceptible of the imperceptible, as the making the visible of affect' (O'Sullivan 2006: 47). I would say the leaving-it-blank practice of the Chinese painter tries to present the imperceptible as imperceptible, making the affect felt between the visible and invisible.

Notes

1. The term 'painting-poetry' in the title refers to the long Chinese tradition, in practice as well as in theory, where painting and poetry share a structural coupling, a merge or 'nuanced' overlapping, so as to become one single genre. Not only have we had something called *ti-hua-ju* (題畫句) (annotating-painting-verses), but there have long been explorations as to how paintings could be taken as 'poetry without sound' and conversely, poetry as 'painting with sound'. In many works of the *shān shui* tradition, we always find a poem occupying part of the screen. The famous example is *Early Spring* by Kuo Hsi (Figure 1). It should be noted here that the very calligraphy of the poem should be considered an integral part of the painting. This example, together with many others, would support my highlighting the contrapuntal relationship of words and image, since words in this case become artistic materials themselves.
2. My argument should not be as outrageous as it seems. We do have, after all, support from an art critic who urges us to listen to the beatings of Van Gogh's paintings. In describing Deleuze's philosophy as setting off on a journey where 'becoming' gets started as in a 'free-fall experimentation' and 'groundless-grounds', Johnny Golding calls for our learning to listen to Deleuze's 'task of art', as it 'names the segment' in 'the beat, beat, beatings, pace, speeds of the launching forth' (Golding 2010: 142,148).
3. The quotation is from Kuo Hsi (郭熙) (*c.*1020–90) in *Chung-kuo Hui-hus li-lun* (《中國繪畫理論》), ed. Fu Pao-shih, Taipei: n.p., 1934 (my translation).
4. *Chung-kuo i-shu ching-shen*《中國藝術精神》by Hsu Fu-kuan, Taipei: Hsueh-sheng, 1966, p. 332; trans. James Liu in *The Chinese Theory of Art*, New York: G. P. Putnam, 1967.
5. This is from the famous 'Lin-Quan-Kao-Zhi' (《林泉高致》) by Kuo Hsi, quoted from *Shan-Shui-Hua-Lun* (《山水畫論》) Taipei: Arts Books, p. 59 (my translation).
6. Again, James Williams has an interesting description of this practice of walking with changes of intensities: 'The walk that you take every day is different each time and significant each time because it involves variations in intensities with respect to earlier and later ones and changing relations with wider series. You change with the walk and with the sensations and their intensities' (Williams 2003: 14). Another even more directly relevant discussion of this step-by step mobility can be found in Claire Colebrook's explanation of Deleuze's concept of movement-image and time: 'Instead of seeing each step of my walk as linked up through time, I could see a flowing movement – my continuous passage from one point to another – which I then cut up into distinct steps. I would see the walk not as a collection of steps, but as a process of change' (Colebrook 2002: 40).
7. Wang, Weihung (2002) *qi-te-yue-zhang* (《氣的樂章》)Taipei: *Kuo-jia* Books. This is a book on how *qi* together with blood-flow, pulsation, and veins and arteries, blood vessels, together work towards harmonic dance in a physical way. In terms of what this *qi* can do to the painting of water flow, Philip Ball recognises its dynamic as 'the vital energy of the universe', and he notes: 'In Chinese art, the flow of water is commonly represented as a series of lines, approximating the trajectories of floating particles, like the streamlines employed by fluid dynamicists' (Ball 2009: 14–16).
8. In my 'Buddhist Consciousness, Deleuzian Ecoethics, and the Case with Wang Wei's Poetry', I have performed a detailed analysis of this poem, together with his other works (Wong 2008: 37–56).
9. With its pictorial and sound systems, the Chinese ideogram should be qualified as Deleuze and Guattari's 'sign' in *A Thousand Plateaus*. Stephen Zepke points

out: 'Signs do not, on this account, appear as signifiers or as representations, but as particular assemblages of material forces and functions stratified into relations of content and expression. This understanding of the sign is therefore ontological, because it puts the sign back into contact with the material and vital plane of consistency that constitutes it' (Zepke 2005: 121).

10. I am inspired by such an argument and have been tempted to want to go into a discussion of the exact repetition of the same character in many of the expressions in Chinese, both in daily use but more importantly in poetry. Such a practice, I would wish to argue, invites comparison with the Deleuzian ideas of singularities and multiplicities, difference and repetition. Unfortunately, a discussion of this is beyond the limits of this paper.
11. Whereas one can take the Chinese 'leaving-it-blank' as similar to Deleuze's idea of deterritorialisation by 'freeing the line' (Deleuze and Guattari 1987: 295) or the 'effacement of the contour' (Deleuze 1993: 32) in Venetian paintings and the baroque, one should note, nevertheless, that instead of an absolute non-doing of any brush stroke, the Western artists turn to making more use of colours so that, say, the dark ground of obscurity takes the place of clear-cut lines in order to highlight the interplay of the deterritorialised matter-function in paintings (Zepke 2005: 127–41). As for the Chinese, this line of mist acts as a dynamic materialisation of emptiness as screen in a Deleuzian sense, itself a connecting through absence, or a frame carved out of space-time (Deleuze 1986: 14), ensuring a 'deterritorialization of the image' (15). It is also a line of indetermination 'both separates and unities' (Bogue 2003b: 43), a mobile cut of duration delinking any fixed schematism. Within this mist, if there is any sense of time left, it would be something like the Deleuzian time as pure memories that does not spatialise itself by linkages or cuts of the montage; it is 'time out of joint and presents itself in the pure state' (Deleuze 1989: 271). Eventfully and eventually, the cut presents a kind of cosmic time, a multisensory space of encounter whose modus operandi is transformation of energy and affects.
12. It may be relevant for us to note that in a conversation between Stefan Czerkinsky the painter and Deleuze, we read: Czerkinsky: 'It sometimes happens that an infinitesimal part of the canvas will remain unpainted, forgotten; and sometimes yet forget to forget. There's a hole' … Deleuze: 'What it is is an interior border that echoes the exterior borders. Together they make up the difference of intensity between which everything happens and communicates' (Deleuze 2004: 283).

Temporality and Truth

Daniel W. Smith Purdue University

Abstract

This paper examines the intersecting of the themes of temporality and truth in Deleuze's philosophy. For the ancients, truth was something eternal: what was true was true in all times and in all places. Temporality (coming to be and passing away) was the realm of the mutable, not the eternal. In the seventeenth century, change began to be seen in a positive light (progress, evolution, and so on), but this change was seen to be possible only because of the immutable laws of nature that govern change. It was not until philosophers such as Bergson, James, Whitehead – and then Deleuze – that time began to be taken seriously on its own account. On the one hand, in Deleuze, time, freed from its subordination to movement, now becomes autonomous: it is the pure form of change (continuous variation) that lies at the basis of Deleuze's metaphysics in *Difference and Repetition* (and is explored more thematically in *The Time-Image*). As a result, on the other hand, the false, freed from its subordination to the form of the true, assumes a power of its own (the power of the false), which in turn implies a new 'analytic of the concept' that Deleuze develops in *What Is Philosophy?*

Keywords: Deleuze, Kant, time, temporality, truth, falsity

The concept of truth is inextricably linked to the question of time, if only because the traditional concept attempts to keep truth away from time: a proposition is true when it is true universally, eternally, 'in all times and in all places'. Stated in this manner, the link between the concept of truth and theology is evident. In this paper, I would like to make some preliminary explorations of this link between time and truth: when the form of the true is confronted with the form of time, Deleuze argues,

Deleuze Studies 7.3 (2013): 377–389

www.euppublishing.com/dls

the concept of truth enters into crisis. To explicate the nature of this crisis, I have organised my presentation around two phrases that appear in Deleuze's work: *the pure and empty form of time*, which will allow us to examine Deleuze's theory of time; and *the power of the false*, which will allow us to examine Deleuze's claim that time necessarily puts the form of the true in crisis.

I. 'The Pure and Empty Form of Time': Deleuze's Theory of Time

The Ancient Conception of Time: Originary Time

According to Deleuze, the modern mutation in our conception of time occurred with Kant: in Kant's work, time assumed an independence and autonomy of its own for the first time.[1] Before that, however, from antiquity through the seventeenth century, time had been subordinate to movement. Time, in Aristotle's phrase, is the measure or 'number of movement' (Aristotle 1957: 219b5–8). Since there is a plurality of movements in the world, this definition implied a plurality of times. The ancients were therefore led to ask the question: is there something immobile, outside of movement – or at least a most perfect movement – around which all other movements could be measured, a great celestial schema, or what Leibniz would call a kind of 'metaschematism'? Is there a movement of movements in relation to which all other movements can be coordinated?

This question wound up being answered in two different ways because there existed two fundamental types of movement: the extensive movement of the cosmos and the intensive movement of the soul. In the *Timaeus*, for instance, Plato sought to incorporate the movements of cosmos into a vision of a 'planetarium' comprised of eight globes, with the immobile earth at the centre, surrounded by a sphere of 'the fixed' (the stars) turning on its axis, with seven globes in-between (the planets) turning in a reverse direction. These revolving globes start from an initial position, and eventually return to the same position: a great year or circuit of the 'eternal return' (in the Greek sense) which, by some calculations, was thought to last ten thousand years. It was precisely this movement of movements that provided a reference point by which all other movements were to be measured: an invariant, a permanence. Time, in this manner, was subordinated to eternity, to the non-temporal: in Plato's apt formula, time was 'the moving image of eternity' (Plato 1929: 37d). Similarly, in the *Enneads*, Plotinus

incorporated the intensive movement of the soul into the movement of the One, with its emanative processes of procession and conversion.[2] In both cases, the result was a hierarchisation of movements depending on their proximity to (or distance from) the eternal: an *originary time* marked by privileged positions in the cosmos or privileged moments in the soul. The discovery of this invariant was itself the discovery of the true, since truth required a universally commensurable time and space over which it could govern: the form of the true was that which was universal and necessary, *in all times and in all places*. Contemporary modal logic, with its search for what is true 'in all possible worlds', attempts to extend, in a theological manner, the universality of truth from the domain of the real to the totality of the possible.

This conception of time as the measure of movement remains ensconced in our common chronological 'clock' time. Days, months and years measure terrestrial, lunar and solar movements in the cosmos, while weeks and hours are primarily religious determinations of the soul (God rested on the seventh day); and our watches and clocks remain dependent on movement, whether that of a pendulum or a quartz crystal. Modernity no less than antiquity remains engaged in a vast effort to render both time and movement homogeneous and uniform (time tables, time zones, the global positioning system).

Aberrations of Movement: Derived Time

Nonetheless, the Kantian revolution was prepared for by the fact that both these domains – the cosmos and the soul – were haunted by fundamental *aberrations* of movement, where a *derived time* increasingly tended to free itself from the posited originary time. The closer one came to the earth (the 'sublunar'), the more the movements of the cosmos tended to become increasingly anomalous: the unpredictability of meteorological movements, for instance, or the movement of everything that comes-to-be and passes-away. As Michel Serres notes, 'scientists can predict the time of an eclipse [the lunar], but they cannot predict whether they will be able to see it [the sublunar]' (Serres 2000: 67). It is not by chance that, in French and many Latin languages, the same word is used for time and weather – *le temps* – with its various cognates: *temperature*, *tempest*, *temperate*, *temperament*, *intemperate*, *temper* (see Serres 1994: 100). The question became: does the sublunary world obey the metaschematism, with its proportional rules, or does it enjoy an independence from it, with its own anomalous movements and disharmonies? The Pythagorean discovery of irrational numbers

had already pointed to a fundamental incommensurability between the speed and position of the various cosmic spheres. In short, the invariant provided by the 'movement of movements' was threatened by *crises* when movement became increasingly aberrant. Similarly, the intensive movement of the soul became marked by a *fear* that its restless movements in derived time would take on an independence of their own, and would cease to be submitted to the originary time of the One or God (the Fall). The search for 'universals' in philosophy is, in a sense, a remnant of this fear: the very term is derived from the Latin word *universus,* meaning 'turned toward the One' (*uni-* 'one' + *versus* 'turned', the past participle of *vertere*).

However, these aberrant or derived movements – marked by meteorological, terrestrial and spiritual contingencies – remained a downward tendency that still depended on the adventures of movement. They too posed a problem, a choice: either one could try to 'save' the primacy of movement (saving the appearances), or one could not only accept but *will* the liberation of time with regard to movement. In effect, there were two ways in which movement could be saved. The extensive harmony of the world could be saved by an appeal to the rhythms of *rural time*, with the seasons and harvests as privileged points of reference in the originary time of Nature. The intensive harmony of the soul could be saved by an appeal to *monastic time*, with its privileged moments of prayers and vespers; or more generally, by an appeal to an originary spiritual life of interiority (Luther, Kierkegaard). By contrast, the liberation of time would take place in the city, an 'enemy' that was nonetheless engendered by both the rural communities and monasteries themselves. The time of the city is neither a rural life nor a spiritual life, but the time of everyday life: there is no longer either an originary time or a derived time, but only an *ordinary time*.

The Liberation of Time: Ordinary Time

The sources of this liberation of time from movement were multiple, having roots in the Reformation as well as the development of capitalism. Max Weber, for instance, showed that the Reformation became conscious of this liberation of time by joining together the two ideas of a 'profession' – one's profession of faith and one's professional activity – so that mundane professions like that of a cobbler were deemed to be as dignified as any sacred calling. Unlike the monk, whose duty was to be otherworldly, denying the self and the world, the fulfilment of one's duty in worldly affairs became the highest form that the moral

activity of individuals could take. There was only one time – everyday time – and it is in this time that we would now find our salvation (Weber 2002). Likewise, Marx showed that this vision of *temporal activity* ('What do you do with your time?'), which is no longer grounded in a cosmic rhythm or a spiritual harmony, would eventually find its new model in the 'abstract' time of capitalism, which replaced the privileged moments of agricultural work with the any-instant-whatever (*l'instant quelconque*) of mechanised work. Time became money, the form under which money produces money (usury or credit); and money itself became 'the course of time': the abstract time of capitalism became the concrete time of the city (Deleuze 1984: 7 Feb.). It was Heidegger who would ultimately produce a prodigious philosophical concept of the everyday and its relation to time, though he still maintained the old distinction between an originary and a derived time (an authentic time and an inauthentic time).

This liberation of time resulted in a fundamental change in the relationship of philosophy to the thought of everyday life (opinion). Up until the seventeenth century, one could say that, philosophically, everyday life was suspended in order to accede to something that was not everyday, namely, a meditation on the eternal. By contrast, the ordinary time of urban everydayness would no longer relate to the eternal, but to something very different, namely, *the production of the new*. In other words, given the flow of average everydayness, I can either raise myself vertically toward the transcendent or the eternal, at least on Sundays (or Saturdays, or Fridays), through understanding or faith; or I can remain at the horizontal flow of everydayness, in which temporality moves toward the new rather than the eternal (the priority of the future as the fundamental dimension of time). The production of the new will be the correlate of ordinary time in exactly the same way that the discovery of the true was the correlate of originary time with the ancients. The aim of philosophy will no longer be to *discover* pre-existent truths outside of time, but to *create* non-pre-existing concepts within time (Deleuze 1984: 17 Apr., 4 May).

Kant: Time as Independent and Autonomous

If Kant was the first to give a philosophical expression to this new conception of time, it is because he freed time entirely from its subordination to movement, rendering it independent and autonomous.[3] Kant drew the necessary consequences from the cosmological and psychological anomalies of movement: he freed time entirely from

cosmology and psychology, as well as the eternal. In Kant, the Self (the soul), the World (the cosmos) and God (the eternal) are all shown to be transcendent illusions of reason that are derived from our new position in time. Time ceases to be the number of movement, and no longer depends on anything but itself; time no longer measures movement, but movement itself (whether originary or derived, anomalous or aberrant) now takes places within time. The reversal can be seen in the opening pages of the *Critique of Pure Reason*. Before Kant, time had largely been defined by succession, space by coexistence, and eternity by permanence.[4] In Kant, succession, simultaneity and permanence are all shown to be *modes* or *relations* of time: succession is the rule of what is in different times; simultaneity is the rule of what is at the same time; and permanence is the rule of what is for all times. Put differently, succession (series) is the synthetic relation between the parts of time, simultaneity (set) is the synthetic relation between the contents of time, and what is permanent (duration) is something that endures in time by passing through successive states and possessing simultaneous states. In Kant, the self becomes a temporal entity that endures in time (permanence), that has intensive states (simultaneity) and that passes from one extensive state to another (succession).

This is what Deleuze means, then, when he says that Kant reconceived time as a *pure and empty form*: time is an empty form that is no longer dependent on either the extensive or intensive movements that fill time; instead, time has become the pure and immutable form of everything that moves and changes – not an eternal form, but precisely the form of what is *not* eternal. Yet time itself is neither succession, nor simultaneity, nor permanence, since time cannot be reduced to any of its modes, or to what takes place within time (its content). We cannot even say that the immutable form of time is permanent, since what is permanent – no less than what is successive or simultaneous – appears and is perceived in time, whereas the immutable form of time itself cannot be perceived. As the pure form of change, time itself is defined by its infinite variability, and the definition of *chaos* that Deleuze gives in *What Is Philosophy?* is itself a description of the pure form of time: 'Chaos is characterized less by the absence of determinations than by the infinite speed with which they take shape and vanish' (Deleuze and Guattari 1994: 42). In other words, within the manifold of time, chaos is defined by the lack of any synthesis or rhythm between these determinations, 'which spring up only to disappear immediately, without consistency or reference, without consequence (118).

If there is any salvation within this pure and empty form of time – time rendered ordinary – it takes place, in Kant, through the activity of *synthesis*, which is a process brought to bear, not on time itself, but on the modes of time, in order to render both being and knowledge possible.[5] Under the aspect of succession, what appears in time is a multiplicity of parts, which must be synthesised by the subject in an *apprehension* that fixes them in an ever-variable present. Under the aspect of simultaneity, moreover, I must not only apprehend parts in order for knowledge to be possible, but I must also *reproduce* the past parts, that is, I must remember the preceding parts in time and synthesise or 'contract' them with the present parts. Under the aspect of permanence, finally, I can synthesise the apprehended present and the previous reproduced presents with the permanence of something that endures in time, which is related to a concept in an act of *recognition* ('so it's a table'). Readers of *Difference and Repetition* – notably in the third chapter on repetition – will recognise the ways in which Deleuze modifies the Kantian analysis of synthesis in the direction of a concept of *passive syntheses*.[6] The first synthesis (present) is reformulated into the passive organic and corporeal syntheses (habit) that make any receptivity, in Kant's sense, possible. The second synthesis (past), following Bergson, posits the need for a concept of the 'pure' past, without which the passing of time would be impossible. And the third synthesis (future), rather than appealing to *recognition*, instead is the condition for the production of the *new*.

'The more we study the nature of time,' Bergson would later write, 'the more we shall comprehend that duration means invention, the creation of forms, the continual elaboration of the absolutely new' (Bergson 1911: 13). The production of the new – including the activities of creation found in philosophy, science and art – is the direct consequence of this liberation of time. Though the term rarely appears in the text, *What Is Philosophy?* is a book on time, or more precisely, a study of the determinations of thought that take place within the pure form of time. What Hume called the association of ideas (resemblance, contiguity, causality) links together our ideas in time with a minimum of constant rules, thereby forming a realm of *opinion* that protects us from chaos. But philosophy, science and art do more than this, and Deleuze describes their respective activities using his own (created) vocabulary: from the infinite *variability* of time, philosophers extract *variations* that converge as the components of a consistent concept; scientists extract *variables* that enter into determinable relations in a function, thereby providing

a referent within time; and artists extract *varieties* that enter into the composition of a being of sensation (Deleuze and Guattari 1994: 202).

II. 'The Power of the False': Deleuze's Critique of the Form of the True

There are many consequences that Deleuze derives from his theory of time, including the analytic of concepts presented in *What Is Philosophy?* But the consequence I would like to briefly examine here concerns the problem with which we began. 'The pure and empty form of time', Deleuze says, places the traditional concept of truth in crisis. In saying this, of course, Deleuze is entering into heavily mined territory, since contemporary philosophers tend to speak of the true with a reverence once reserved for the divine, as if its value is and should be unquestioned. What philosopher would ever want to say that they are not interested in getting at the truth? Yet truth is itself a concept, with its own becoming, and Nietzsche was perhaps one of the first see that the concept of truth itself must be seen as a philosophical problem:

> Let us thus define our own task – the value of truth must for once be experimentally *called into question*. [. . .] Suppose we want the truth: Why not rather untruth? Or uncertainty? Or ignorance? [. . .] Though it scarcely seems credible, it finally almost seems to us as if the problem had never even been put so far – as if we were the first to see it, fix our eyes on it, and *risk* it. For it does involve a risk, and perhaps there is none that is greater. (Nietzsche 2000: 199)

Deleuze's thesis is that the concept of truth enters into crisis when it confronts the form of time: the *form of the true* then gives way to the *power of the false*. But what exactly does Deleuze mean by this? Rather than attempting to resolve this problem, I would simply like to pose five questions that will at least help us lay out the conditions of this problem.

1. Speaking in general terms, the true is not the same thing as the real; it is rather the distinction between the real and the imaginary (or between essence and appearance). The false is not the imaginary; it is rather the confusion of the imaginary with the real (or of the apparent with the essential). What we call error is the act that consists of making this confusion: the false is effectuated in error, which confuses the imaginary and the real. But this leads to the first question: how then do we normally distinguish the false from the true? Response: only the true has a *form* (*eidos*). The false has no form; error consists, precisely, in giving the false the form of the true. Since Aristotle, as we have seen, the form of

the true has had a precise sense: the universal and the necessary. The true is that which is universal and necessary, always and everywhere, in all times and in all places. This is not a universality of *fact* but a universality of *right*. In fact, it may be that people rarely think, and rarely think the true. But to say that only the true has a form is to insist that, in principle, for instance, if you think a triangle, you cannot deny that its three angles are necessarily equal to two right angles. Universality and necessity qualify the *judgements* that are made of the form of the true. Since the false has no form, judgements made about it are by right deprived of all universality and necessity.

2. Who then is the truthful person? In classical philosophy, what corresponds to the real in an idea is its power to *represent*, while what corresponds to the imaginary is the capacity of an idea (or image) to produce a *modification* of my body or soul. The former attains to essences, while the latter leaves one mired in appearances, and the anguish of the passions. The truthful person is thus someone who would allow their body and soul to be modified only by the form of the true. The activity through which this takes place can be called, following Simondon, the *in-formation* of the soul by the form of the true, which takes as its model the Eternal (the universal and the necessary).[7]

3. When does the false take on a power of its own? If time puts the concept of truth in crisis, it does so not at the level of its content ('truth changes with time'), but rather at the level of its form: the form of time takes the place of the form of the true (the universal and the eternal). One must be clear on the nature of Deleuze's critique: he is not making the claim that truth changes over time (for instance, we once thought the sun revolved around the earth, whereas now we think that the earth revolves around the sun), since that does not at all alter the *form* of the true (it was be true 'for all time' that the earth revolves around the sun – or rather, around the centre of gravity constituted by the sun and the earth and the other planets). Nor is he making the claim that truth is, as people like to say, 'relative' (relative to a culture, to an era, to an individual). Neither of these banalities calls into question the *form* of the true, which remains intact. The only thing that can call into question the *form* of the true (which is universal, eternal and necessary, in all times and in all places) is the *form* of time. And when the form of the true is put into question by the form of time, the false is thereby given a *power* of its own: if the false does not have a form, it nonetheless has a power. When, then, does the false take on a power of its own? When it is freed from the model of truth, that is, when the false is no longer presented as being true. What can disengage the concept of the false

from the model of truth? The answer is: time. Just as Deleuze attempts to formulate a concept of difference-in-itself, freed from its subordination to the concept of identity, so he attempts to formulate a concept of the false-in-itself, freed from its subordination to the concept of truth (and error). But this in no way implies the banal conclusion that 'everything is false', which would now be presented as a truth: as Nietzsche said, in one of his most profound phrases, in abolishing the true world we have also abolished the false world of appearances (Nietzsche 1954: 486). There is no longer either truth or appearance, and the false is no longer presented as being true; instead, the false assumes a power of its own.

4. What then is the *power* of the false, and how is it to be distinguished from the *form* of the true? Readers of Deleuze will quickly ascertain Deleuze's response to this question: if the form of the true is derived from the power of *judgement*, the power of the false is a power of metamorphosis, that is, it is a power of *creation*. Creative of what? At this point, there is no reason not to re-employ the word 'truth'. The power of the false is creative of truth – but this is, precisely, *a new concept of truth*: truth is no longer a timeless universal to be discovered, but rather a singularity to be created (in time). 'Philosophy creates concepts', writes Deleuze, 'which are neither generalities nor even truths; they are rather of the order of the Singular, the Important, the New' (Deleuze 2007: 238). The power of the false is nothing other than the power of creation, the power of metamorphosis.

5. A final question: when the form of the true gives way to the power of the false, who then takes the place of the truthful person? Deleuze's response: when the form of time is put into the concept, the *falsifier* [*le faussaire*] takes the place of the truthful person – and the falsifier is more or less equivalent to the artist, the creator. The falsifier is not a liar, since the liar is localisable (the liar 'owns' his lies), whereas the falsifier is non-localisable: the power of the false exists only under the form of a *series* of powers. To ask 'What is a falsifier?' is to ask a badly posed question, since the falsifier does not exist apart from an irreducible plurality or multiplicity: behind every falsifier there is only another falsifier (a mask behind every mask). The question becomes: where is one placed within the chain of falsifiers? As Nietzsche showed, the truthful person is himself nothing other than the first power of the false: Plato distinguished between the true world and the apparent world, but to do so he first had to *create* the concept of the Idea. If the power of the false is what Nietzsche called the will to power, one can distinguish two extremes or two powers within this will, namely, the

will to *judge* and the will to *create*, and it is the latter that constitutes the higher power.

To illustrate this distinction between the will to judge and the will to create, I would like to conclude with a consideration of Orson Welles's final film, *F for Fake*. Deleuze suggests that in fact there have been three great presentations of the theme of the falsifier: in philosophy, there is the final book of Nietzsche's *Thus Spoke Zarathustra* (the chain of the 'higher' men, each of which corresponds to a power of the false); in literature, there is Hermann Melville's final masterpiece, *The Confidence-Man*; and in cinema, there is Orson Welles's last film, *F for Fake* (see Deleuze 1989: 134, 145; 1984: 12 Jun.). Welles's film is instructive for our purposes because, among many other things, it examines the story of a man named Hans van Meegeren, who in the 1930s famously forged a number of paintings that he claimed had been done by Johannes Vermeer – the great Dutch painter. How did van Meegeren manage to pass off his forgeries as genuine Vermeers? Precisely because he made use of the criteria of experts, and the expert is someone who *judges*: the expert is able to recognise a true Vermeer by means of criteria he himself has established concerning Vermeer's style and periods. All that a forger like van Meegeren has to do is to study these criteria and use them to produce his forgeries – to the point where the expert will declare, 'This is clearly a genuine Vermeer because it corresponds to all the criteria that I have established.' The expert, Deleuze suggests, always has a forger within him, since they are both nourished off the same substance: the system of judgement (Deleuze 1989: 146).

What, then, is the difference between Vermeer and his forger? Both the artist and the forger belong to the chain of falsifiers, but the difference between them lies in this: Vermeer has a power of metamorphosis, whereas the forger and the expert scarcely know how to change: theirs is already an exhausted life that can do little more than judge the creations of others. The expert and the forger are united in their exaggerated taste for *form* (the form of the true), but the artist is able to take the power of the false to a higher degree that is realised, not in form, but in *transformation*.

It is precisely this vision that animates Deleuze's conception of philosophy: philosophy is the enterprise of the creation of concepts (or the creation of truth), that is, the will to power at its highest degree, which has as its necessary correlate the will 'to have done with judgment' (Deleuze 1997: 126). And this power of creation or metamorphosis, for Deleuze, is nothing other than the power of *time*.

Notes

1. For a comprehensive analysis of Deleuze's concept of time, see Williams 2011.
2. For Deleuze's discussions of the respective conceptions of time in Plato and Plotinus, see Deleuze 1984: 7 Feb.–27 Mar. Descartes's modern solution to the same problem was to conserve something invariant *within* movement, namely, the quantity of movement, *mv*, the product of mass times velocity.
3. One of the themes of Deleuze's two-volume *Cinema* is that the cinema, in its much shorter history, nonetheless recapitulated this philosophical revolution in the movement–time relation. For a useful summary of this revolution in the concept of time, albeit from a slightly different perspective than Deleuze's, see John Dewey's important 1940 article, 'Time and Individuality' (Dewey 1998: 217–26).
4. See Leibniz 1956: 15: 'As for my own opinion, I have said more than once that I hold space to be something purely relative, as time is – that I hold it to be an order of coexistences, as time is an order of successions. For space denotes, in terms of possibility, an order of things that exist at the same time, considered as existing together, without entering into their particular manners of existing. And when many things are seen together, one consciously perceives this order of things among themselves.'
5. Deleuze insists that it is important not to confuse the synthesis of time with time itself. In *Kant and the Problem of Metaphysics* (1962), Martin Heidegger reintroduced an originary time because he wrongly considered the synthesis of time to be an originary time. See Deleuze's critique in Deleuze 1984: 17 Apr.
6. For the *active syntheses* of the transcendental ego found in Kant, Deleuze substitutes a theory of *passive synthesis*, derived in part from Husserl. Joe Hughes provides an insightful analysis of the concept of passive synthesis in Hughes 2008. See also Faulkner 2005.
7. On the concept of information, in this sense, see Simondon 2005.

Deleuzian Dragons: Thinking Chinese Strategic Spatial Planning with Gilles Deleuze

Jean Hillier RMIT University
Kang Cao Zhejiang University

Abstract

As symbols of adaptability and transformation, together with qualities of vigilance and intelligence, we argue the relevance of dragons for spatial planning in China. We develop a metaphorical concept – the green dragon – for grasping the condition of contemporary Chinese societies and for facilitating the development of theories and practices of spatial planning which are able to face the challenges of rapid change. We ask Chinese scholars and spatial planners to liberate Deleuzian potential for strategic spatial planning in a 'becoming-between, coming-together' of concepts which can effectively make a difference in the world. Having outlined what we regard as key transversals or diagonals between our reading of Gilles Deleuze and aspects of Chinese philosophy, we then offer the metaphor of strategic spatial planning as Chinese literati landscape painting. This is a form of painting which rejects the idea of the world being supremely organised from a particular point of view, preferring to paint immanence and transformation. Chinese literati landscape paintings, like philosophy and strategic spatial planning, 'look only at the movements'. We conclude that connections between what concepts of Chinese philosophy and those of Gilles Deleuze can do, suggest that in China, a conception of strategic spatial planning as metaphorical green dragon may offer academics and planning

practitioners a transverse way to relate the legacies of past philosophies and current thinking.

Keywords: spatial planning, Chinese literati painting, concept, transversals, dragons

I. Introduction

> Everything is in[1] transformation [...] There is no possible [stereotypical] model.
>
> *I Ching* (《易经》)

> The assemblages are in constant variation, are themselves constantly subject to transformations.
>
> Deleuze and Guattari 1987: 82

The dragon represents a concentration of energy. Strongly associated with water and merging with clouds and mists, the dragon's energy is diffused through space. A dragon has no fixed form and is constantly evolving. It represents an ongoing process of transformation with the auspicious propensity to reach beyond itself. It symbolises the powers with which a form, such as a city, can be changed. A dragon symbolises efficacy, or strategy effective through variation: Deleuze and Guattari's 'pure strategy' (1987: 353) from the Chinese game of Go (*weiqi*, 围棋), the antithesis of rigid, mechanical practice. As Jullien (2004b: 97) suggests, 'strategic intentionality should have no fixed goal, is fixed in no particular plan, and so can adapt to every twist in the situation'.

As symbols of adaptability and transformation, together with qualities of vigilance and intelligence, dragons are relevant to spatial planning. Both in myths and paintings, Chinese dragons are depicted in a range of colours. A green dragon represents ideas of generating, growing, balancing and striving. It symbolises well-being and happiness, the new or different: 'energy renewed through change' (Jullien 1995: 153). The most auspicious placing for a green dragon is facing moving water – the archetypal smooth space of Deleuzian thinking.

The Urban Planning Society of China argues that 'urban planning is facing unprecedented challenges' which 'require a new planning system and methods' of theoretical innovation, institutional innovation and technological innovation in the production of urban or regional strategic spatial plans for a future twenty years or more. In this paper, we are inspired by the work of Gilles Deleuze and Félix Guattari to develop a concept – the green dragon – for grasping the condition of contemporary

Chinese societies and for facilitating the development of theories and practices of spatial planning which are able to face the challenges.

Much post-structuralist theory, however, is written by Europeans and Americans, who tend to see their worlds through their 'eyes'. We suggest that it is productive to develop a Chinese form of post-structuralism, appropriate to contemporary Chinese cultural, social and economic realities. We take this further and suggest that the ideas of Deleuze and Guattari have sufficient resonances with classical Chinese philosophy to be inspirational for the development of a theory and methodology for strategic spatial planning in a spatially coextensive, fragmented, plural country. This would be a hybrid Deleuzism: 'a palimpsest of nonsynchronous, emergent, and residual formations, a mixture of various space-times, and an overlap of different modes of production' (Lu et al. 2004: 13). We adopt a metaphor of strategic spatial planning as Chinese literati landscape painting to begin to develop a theory and methodology which takes detailed steps along a broader, more flexible, longer-term path or trajectory. We conclude that resonances between Chinese philosophy and the work of Deleuze and Guattari suggest that in China, a theory of strategic spatial planning as metaphorical green dragon illustrative of immanent change may offer academics and practitioners a means to relate the legacies of past philosophies and current thinking.

We now suggest some important points of resonance which can be identified between Chinese philosophy and the work of Gilles Deleuze: change/transformation, propensities/tendencies and blandness/indeterminacy. Space constraints, however, permit us only to indicate these few connections which might hopefully inspire further research.

II. Resonances between Chinese Philosophical Thought and Deleuzian Thinking[2]

Strategic spatial planning, like Deleuze and Guattari's philosophy, should be imaginative and constructive rather than prescriptive or copy-pastes of universal concepts or ready-made 'best practice'. For Deleuze, concepts entail thinking new possibilities, creating productive connections in terms of the 'contingent circumstances and dynamics that lead to and follow from them' (Stagoll 2005: 50). Every problem or experience, then, demands practical engagement, critically thinking new concepts, unsettling or challenging traditional approaches.

Massumi (2010: 9) points out that, for Deleuze, a concept is what it does, rather than what it is. A concept is a set of circumstances; a vector or point of application of a force moving through space (Massumi 1987: xii). Change stems from the power or force relations and the conditions of possibility which they forge. As we indicate below, the Chinese concept of *shi* (势) suggests force or energy of both a particular situation and the dynamic tendencies expressed through it.

For Jullien (1995: 124), Chinese reasoning 'weaves' from case to case, 'via bridges and bifurcations', as a journey of linked phases, the outcomes of which are not defined in advance, but rather unfold progressively, like a scroll. The path along which outcomes unfold does not exclude other possibilities. As one travels the journey, an experience is lived through; a landscape is sketched in.

Change/Transformation

Change or transformation has long been an important element of Chinese philosophical thinking. Epitomised, perhaps, in the *I Ching* (*Yijing*, 《易经》), philosophers and sages for over 2000 years have encouraged active participation in processes of creative transformation. It is known that Leibniz – whose work influenced Gilles Deleuze – was interested in the *I Ching*.

Like Deleuze and Guattari, Chinese thinkers have refrained from constructing a world of ideal forms or archetypes separate from reality. They regard reality, rather, as a 'regulated and continuous process that stems purely from the interaction of the factors in play' (Jullien 2004b: 15). Such a view of interacting elements resonates with Deleuze's account of an assemblage/*agencement* as 'a multiplicity which is made up of many heterogeneous terms and which establishes liaisons, relations between them [... Its] only unity is that of co-functioning' (Deleuze and Parnet 2002: 69). 'Order', in Chinese thought, is not perceived as coming from a model or strict plan, but is an immanent process, detecting those elements whose configuration is favourable to the task at hand. Chinese thought is 'a thought of processivity' (Jullien 2004b: 121), as is that of Deleuze and Guattari.

The notion of becoming (or moving beyond) is important to Chinese philosophy and also to Deleuze (see, for instance, Deleuze 1994; also Williams 2000 on becoming and architecture). For Chinese thinkers, every situation is rich with the possibility of change. There are no predetermined, rigid goals. According to Confucius's *Analects* (《论语》), there were four things 'from which the Master was entirely free. He had

no foregone conclusions, no arbitrary pre-determinations, no obstinacy and no egotism' (9:4, quoted in Jullien 2000: 240). Consciousness is not fixed, but always in the process of becoming and thus open to possibility rather than being immobilised in a certain point of view. Deleuze developed an ontology of becoming, in which reality is in a continuous state of flux or differentiation. He adopted 'creative becoming as the only way to affirm the underlying real processes of differentiation or constant change behind all apparently static things' (Williams 2000: 203).

Propensities/Tendencies

For Chinese philosophers, strategy consists of two notions: a situation (*xing*, 形) or relation of forces, and tendencies (*shi*, 勢) implied in the situation (Jullien 2004b). A sage can understand the forces present in a situation which constitute its tendencies. Deleuze also regards tendencies as the immanent expression of forces; a thing is 'the expression of a tendency before being the effect of a cause' (Deleuze 1999: 45). To regard issues as having determinable causes and effects, therefore, misses the importance of tendencies which cannot be captured by simple equations. Chinese sages, along with Deleuze, believe in the immanence of transformation. Strategies should develop in relation to the elements (actants) involved and their tendencies, rather than as 'copy-pastes' of 'best practice': 'Nothing could be worse than wanting to repeat what has previously led to success, for since the situation is new, so is its potential' (Sunzi, 孙子, quoted in Jullien 2004b: 177).

Jullien (1995) highlights the importance of *shi* as tendencies or forces generated by the disposition of a thing. As Liu (2008) explains, *shi qi* (势气) refers to organisational morale, *min qi* (民气) is public support, *jing qi* (精气) implies economic vitality and *qi shi* (气势) implies mental force or energy, including intentions and emotions; all of which are relevant to strategic spatial planning.

Strategy, then, exploits the propensities emanating from a particular set of force relationships in order to benefit from them. For Chinese philosophers, propensity 'provides the key to the actualisation of things' (Jullien 1995: 222). The term designates both the particular circumstances characterising different stages of a process or trajectory (perhaps major projects in spatial planning?) and the potential energy or force relations (tendency) produced. As Jullien explains, one should examine such force relations carefully as they offer information about the potential 'evolution of things' (223). Possibility is linked

to the disposition produced in relational links between elements or actants:

> If two pieces of wood are rubbed together, fire results,
> If fire and metal come into contact, fusion results.
> (Huainanzi《淮南子》, second century BC, ch. 1: 5)

In both examples in the quotation above, there is often an intercessor who manipulates the disposition. As such, this bears resonance with the idea of strategic planning practitioners 'tweaking' elements in urban assemblages: 'It is up to the general, and equally to the politician, the painter, and the writer [the strategic spatial planner?] to avail himself of the *shi* (势) [. . .] So as to exploit it to its maximum potentiality' (Jullien 1995: 260). We remind planning practitioners, however, that for Deleuze, production of the new cannot be prescribed or predicted. Neither is it inevitably beneficial and so it should not be automatically regarded as a panacea.

The key to Chinese strategy is to study the forces present, or potentially present, in a range of possible situations and to evaluate, or map, the conditions of possibility of various events taking place, by asking a series of questions, 'appreciating' the relations of force and 'assessing' the dispositions or capacities of actants (*Guiguzi*,《鬼谷子》, ch. 7). The strategist should discover powerful propensities and work out how to harness, exploit or block them. 'To manage things, one must establish the potential of the situation' (ch. 5).

There are strong resonances between Chinese strategy as outlined in the *Guiguzi* (《鬼谷子》) and Deleuze and Guattari's pragmatics explained in *A Thousand Plateaus* (1987: 139–40, 146–7). If strategists trace the present, retrospectively untangling or unfolding the constituent relational conditions of possibility, they may be able to 'sense' tendencies (Deleuzian mapping), diagram the relational forces that may come into play 'either as potentialities or as effective emergences' (146) and machine a programme or strategy for what might take place.[3] Strategy is concerned with implicating an effect, folding the outside in, knowing how to tackle a situation ahead of its actualisation; to 'steer it gently' (Jullien 2004b: 126) in the desired direction. Rather than following a predetermined model or template for action, good strategists adapt to circumstances which are often unforeseen and even unforeseeable. Strategy, then, aims not to predetermine an 'infinitely superior reality' (Jullien 2000: 304), but to pay attention to the tendencies which, 'given certain actions could lead to the unfolding of new ways of living' (Lorraine 2011: 3).

The *Guiguzi*'s (《鬼谷子》, ch. 2) advocacy of 'roundness' and 'mobility' upstream or in the longer-term future, together with 'sureness' and 'stability' downstream in the present or shorter-term future, resonate with a multiplanar theory of strategic planning (Hillier 2007; 2011), based in Deleuze and Guattari's (1987) planes of immanence and organisation. The concept of *shi* (势) gives us the importance of both standing back, at a distance, from something to gain an overall impression of the desired trajectory and the main lines (*shi*, 势) involved (see Deleuze's plane of immanence) and also of involvement with the technical detail of composition. 'Contemplating a landscape from afar, one grasps its lifelines; considering it close up, one seizes its substance' (Zong Bing, 宗炳, *Hua shanshui xu*,《画山水序》, quoted in Jullien 1995: 95).

As such, thinkers in the Ming and Qing periods advised artists to outline broad structural lines, or contours, to suggest major masses, while 'wrinkles' imparted detail (Jullien 1995: 98). The overall arrangement depends on a compositional logic (vision or trajectory in spatial planning) that is seen as a source of dynamism.

> Only when the painter, provoked by the very body of the landscape and the divisions through which its life pulsates, has intuitively apprehended its general movement, can the structure of the painting be planned in a more intellectual and controlled operation. (Dan Chongguang, 笪重光, quoted in Jullien 1995: 101)

Shi (势) is advanced at a stage of uncertainty, when it is barely detectable (plane of immanence), to actualise at a stage of detailed observation and measurement (plane of organisation). Resonating strongly with Deleuze and Guattari's two planes (1987; 1994), Jullien (2004b) points out that these are not two levels, but two interrelated aspects of a process.

The conjunction of the indeterminate or indirect with the more immediate, apparent in both Chinese and French-inspired post-structuralist philosophy, illuminates how desire or emotion is transformed into meaning as the two planes are joined. In Chinese poetic theory, for example, the incitatory mode is obscure, sinuous and evanescent (the plane of immanence), while the analogical mode is manifest, direct and clear (plane of organisation). As Liu Xie (刘勰) (fifth and sixth centuries) explained, in incitatory mode, one 'suggests indirectly' in a vague manner, while one 'speaks openly', using 'categorical' references in analogical mode (quoted in Jullien 2000: 154).

Further, 'the incitatory mode consists in being moved through contact with the world, and, while the world is found there, the meaning unfolds elsewhere. [...] The theme is not exposed directly as in the direct and

analogic modes of expression' (Luo Dajing, 罗大经, quoted in Jullien 2000: 154). The incitatory mode opens up all possible perspectives by going beyond their differences. It offers a 'complete availability of meaning' (Jullien 2000: 192) which constitutes indeterminacy or blandness, as Jullien (2004a) translates the Chinese word *dan* (淡) found in Chinese traditions of Confucianism, Daoism and Buddhism.

Blandness/Indeterminacy

The word *dan* (淡) has several meanings, including indifferent or bland and exhausted (but not tired). We can see resonances here with Deleuze's conceptualisation of exhaustion as a combinatorial of inclusive disjunctions (Deleuze 1995). Jullien (2004a) argues the positive qualities of blandness, honouring the presence of absence or the not-yet identifiable. He proposes that the bland comprises an unnameable, yet potentially harmonious, combination of all values, embodying an ontology of change and difference which offers an infinite opening for expression and activity.

We advocate that long-term strategic spatial plans should be bland; the advantage of which lies in their not being tied to fixed targets and, as a consequence, they possess the capacity to be flexible. Potentiality should not be blocked by overcoded plans, but allow practitioners to summon up appropriate strategies for new situations. 'A lightly sketched affirmation does not force me to defend a position but rather allows me to evolve as I will, while remaining master of the game' (Jullien 2000: 50).

Blandness or obliqueness, by not setting strict spatial planning targets for around twenty to twenty-five years ahead, allows practitioners more room for manoeuvre in a long-term strategic plan which is 'enriched by its indeterminacy' (Jullien 2000: 190). The intention of such plans is not to direct detailed behaviour, but to favour adaptability in relation to circumstances.

As in Chinese landscape painting, areas of indeterminacy or 'emptiness' allow creativity and a more spontaneous reaction to changing circumstances; the opposite of over-coding and over-regulation which stifle innovation and spontaneity. Indeterminacy captures the flavour of the invisible (*shen*, 神) (*Laozi*, 《道德经》, quoted in Jullien 2004b: 113).

Our outline of resonances above suggests a network of transversals or intersecting diagonals between Chinese and Deleuzian philosophical thought. Transversals assemble multiplicities which affirm their

differences through their connections (Bogue 2007: 2) and which generate new creative possibilities. As such, inspired by Deleuze's reading of Henri Maldiney's discussion of Hsieh Ho's (谢赫) advice to aspiring Chinese artists in the sixth century, we offer the metaphor of strategic spatial planning as Chinese literati landscape painting. This is a form of painting which rejects the idea of the world being supremely organised from a particular point of view, preferring to paint immanence and transformation.

III. Strategic Spatial Planning as Literati Landscape Painting

Deleuze gave a lecture on the subject of Hsieh Ho's (谢赫) advice to Chinese artists (on 27 April 1982) and published his ideas in *Cinema 1: The Movement Image* (1986). He was particularly impressed by Hsieh Ho's (谢赫) suggestion that the painter should first 'reflect the vital breath, that is, create movement' and then 'seek the *ossature* [skeleton]; that is, know how to use the brush' (Maldiney 1973: 167). The primary aim of the painter is to manifest the broad movement of the vital breath (*chi/shi*, 势) through the 'coming into presence' of things. But, as Hsieh Ho (谢赫) pointed out, the painter must also capture individual details in distinct brush strokes delineating the structuring *articulation* (infrastructure), rendering them in their 'disappearing'.

The school of literati, or scholarly, painting emerged in the eleventh to twelfth centuries in reaction to the strict conventions, regulations, minute detail (often tending to pedantry) and colour characteristic of the academic style. The literati style encompassed greater freedom of expression through varying thicknesses of brush strokes and lines of black ink on paper. Although not a typical literati art subject, broad movement and fine detail of the dragon are brilliantly depicted in Chen Rong's (陈容, 1244) work, *The Nine Dragons* (九龙图) (Figure 1). The concept of 'painting the eye of the dragon' refers to painting the eye in detail, often adding it last after less detailed elements have been sketched or outlined.

Deleuze sees in these processes both the two senses of exhaustion – 'the greatest exactitude and the most extreme indeterminacy' (1995: 5) – and two means of constructing space. The first means is a broad conceptualisation of an encompassing, ambient whole within which individual elements are situated and structured. The second means is a local operation whereby an individual element is connected to a neighbouring element and then to another and so on, constructing an open space of related but heterogeneous elements.

Figure 1. Fragment from *The Nine Dragons* handscroll (九龙图／九龍圖), painted by the Song-Dynasty Chinese artist Chen Rong (陈容／陳容) in 1244 CE. (Source: Francis Gardner Curtis Fund, courtesy of the Museum of Fine Arts, Boston, Acquisition No. 17.1697.)

Deleuze (1982: 6; 1986: 191) refers to the broad movement of vital breath (*qi*, 气) as an 'organic spiral' in which things appear and disappear 'like the dragon concealed behind the clouds'. He was much taken with the use of lines in Chinese art, incorporating such ideas into the development of lines in his own work (see, for example, Deleuze and Guattari 1987: 497). He liked the indefiniteness of Chinese art as 'not imitative, nor structural, but cosmic' (Deleuze and Guattari 1987: 280) and the notion of the artist as someone who 'makes a becoming of the world' (Bordeleau 2009).

For Deleuze (1982), Chinese painting resonated with his concept of immanence and, by analogy, with strategic spatial planning. We suggest that the following passage from *Cinema 1* – Deleuze's explication of Chinese painting – can be read as a metaphor for spatial planning as a process of shaping the longer-term future of a city or region through the production of a strategic vision:

> 'All the art of execution is in fragmentary notations and interruptions, although the aim is to achieve a total result'. How can one paint the pike without discovering the broken line of the universe which links it to the rock it brushes in the depths of the water, and to the reeds of the bank where it lurks? But how can one paint it without animating it with the cosmic breath of which it is only a part, an impression? (Deleuze 1986: 192)

Chinese landscapes often depict mountains, in an almost infinite variety of forms, rising through clouds and mists, emerging in the distance. We offer the analogy of such 'mountains in the mist' in long-range strategic spatial planning as the visions or broad aims for a geographical area over a period of perhaps twenty to twenty-five years or longer. Mountains, as a metaphorical 'plane of immanence', function rather like 'a sieve over chaos' (Boundas 2005: 273), depicting desired conditions to work towards, such as sustainability. As Han Zhuo (韩拙) wrote in the eleventh century, 'the landscape is at once extraordinarily entrancing and subtle-evanescent' (quoted in Jullien 2009: 36) and for Wu Daozi (吴道子, eighth century), 'even though, from the perspective of the brush, it is not complete, the sense-intentionality is complete' (quoted in Jullien 2009: 71).

In the foreground, elements in the painting are more concrete and individuated. Like Deleuze's 'plane of organisation', the artist is concerned with the development of identifiable forms. We offer the analogy for strategic spatial planning of local area plans, design briefs and detailed major projects, all of which tend to be relatively local

or micro-scale, shorter term and content specific. They facilitate small movements or changes along the dynamic, open trajectories of the plane of immanence or longer-term strategic plan.

Between the indistinct distance and the elements visible in the foreground, 'a narrow path takes shape' (Jullien 2009: 56). 'Between', here, implies opening a thing wide from the inside and allowing passage through it (95). 'Between' indicates the inseparability of the concrete, tangible foreground form and the more vague, bland, 'spirit dimension' (*xing-shen*, 形-神) of mountains or longer-term desires. As the tenth-century commentator Jing Hao (荆浩) explains, the artist must take care not to get bogged down in form, but keep everything in flight or movement. Jing Hao (荆浩), however, also reminds us that the artist cannot transmit the spirit dimension without resorting to tangible form. The artist, therefore, works between the two planes of spirit dimension and tangible form; not dominated by either, but open to both simultaneously.

Guo Xi (郭熙, eleventh century) wrote that artists must consider landscapes from a distance 'to grasp the lines of force' and must look at the close up 'to grasp their materiality' (Jullien 2009: 146).

> 'Directly before us, the ravines and the mountains, the woods and the forests curve and tangle together. Through that arrangement, the landscape comes to us; we do not tire of its details and our eyes are satisfied in their quest near at hand. From an angle, the far plane that deploys the mountain chains without interruption fades away. We do not tire of that remoteness and our eyes are open to the far reaches of the vastness.' (Guo Xi [郭熙], quoted in Jullien 2009: 156; original emphasis)

Resonance is strong here with Deleuze's suggestion of 'a turbulent, stormy zone where particular points and the relations of forces between these points are tossed about' above the 'solidified [. . .] visual dust' (Deleuze 1988: 121). Practitioners (whether artists or strategic spatial planners) need to engage creatively with this throbbing, pulsating graphic, to 'tear open the firmament itself, to let in a bit of free and windy chaos and to frame in a sudden light a vision that appears through the rent' (Deleuze and Guattari 1994: 203).

Chinese theorists construct 'a system of variance serving as a framework for difference' (Jullien 2009: 151). Resonant with Deleuze's (1994) ontology of difference, the constitutive being of a mountain, for example, is its potentiality. Form (*xing*, 形) is both a noun and a verb. It implies transformation; something *in* transformation. Painting

thus involves selection of form from a range of different possibilities, as does strategic spatial planning. Both are marked by a choice 'concerning the real' in the principle of its production (Jullien 2009: 205).

Chinese landscape paintings often contain depictions of mountains and water, especially oceans. In fact, as Jullien (2009: 121–2) points out, the term for landscape is *shan-shui* (山-水, mountain-water). Water exemplifies Deleuzian smooth space; seemingly undifferentiated, infinite, irregular, dynamic. Artists regard landscape elements as being in dynamic interaction. Each element of the painted landscape (or strategic plan) exists in relation to the others: 'each element is relational, constitutively and intrinsically' (188). Mountains and water are not regarded as properties, but as capacities (137) to which the artist gives vitality, just as spatial planners may attempt to give vitality to city centres, residential estates, and so on through plans and design guides.

Mountains and water are, in Jullien's (2009: 181) words, 'proposed' to the painting, not as proper forms, but as resources for exploration and exploitation. Plans may designate zones of land use in similar manner. If designation is too narrow, in either painting or planning, vision becomes limited and obstructs the interactions between actants and elements which give rise to beneficial transformation. Artists and planners need some rules, however. For Fang Xun (方薰, eighteenth century), 'wherever there is diligence, there are always rules' (quoted in Jullien 2009: 192) and for Deleuze, we require 'just a little order to protect us from chaos' (Deleuze and Guattari 1994: 201).

Literati painting, from the Song Dynasty onwards, paints 'intentionality' or potentiality. As Zhang Yanyuan (张彦远, ninth century) suggested, the 'formal resemblance that the painting has in view lies entirely in the brush's motion structuring forms' (quoted in Jullien 2009: 222), which is itself grounded in potentiality. A landscape painting (or a plan) is an image 'not of reality reified into a form, but of the momentum that brings it about' (230). It expresses an aspiration; a propensity.

Rather than describing and representing, the painting seeks to incite flows of energy (*shi*, 势). Rather than fixing qualities, the painting suggests capacities and potentialities. Shi Tao (石涛, seventeenth century) summarises the purpose of painting as 'the great rule of modification assuring the world's continuance' (quoted in Jullien 2009: 233). We propose that the purpose of strategic spatial planning could be summarised similarly.

IV. Conclusion: Painting Deleuzian Dragons

Rather than reveal, Chinese philosophy (and literati painting) aims to indicate. Scholars or sages advise that the deep meaning of a text should unfold gradually rather than be rigidly predetermined. In this paper, we have attempted to identify several resonances between Chinese philosophical and French-inspired post-structuralist thinking. Established connections between the *I Ching* (《易经》), Leibniz and Deleuze suggest that China, as Saussy proposes, could be 'the land where [Deleuzian] poststructuralism can come into its own' (2001: 178).

Following the Chinese year of the Water Dragon, we offer the metaphor for strategic spatial planning of Chinese literati painting which rejected the idea of the world being supremely organised from a particular point of view, preferring to paint immanence and transformation. Literati painting allows glimpses through mists and clouds of what might actualise, yet affords freedom for our understanding to evolve and change as we regard the work on different occasions or from different angles. Literati painting also depicts some foreground elements in detail. This is its inherent realism. Transformational vitality is then provided by 'painting the dragon's eye' of local detail.

Finally, we argue that the potential for change in Chinese strategic spatial planning comes from within, rather than copy-paste application of authors such as Gilles Deleuze and Félix Guattari. Western sources are part of the frame; but only a part. Chinese scholars and planning practitioners should 'break it open' as Massumi (2010: 13) advocates, in order to 'liberate the pure form of its potential' in processes of 'becoming-between, coming-together'.

Notes

1. We thank Paul Patton and an anonymous referee for suggestions which have strengthened the paper. A different version of the paper with a spatial planning (rather than a Deleuzian) emphasis has been previously published in Chinese as 绘制青龙：面向中国战略空间规划的后结构主义理论与方法论, *Urban Planning International*, 25:5, pp. 88–95 (2010).
2. Hillier, as a non-Mandarin reader, has relied on work by François Jullien, as quoted, for her very generalised understanding of Chinese philosophical thought.
3. See Hillier's (2010; 2011) methodology of strategic navigation for similar concept in strategic spatial planning.

Deleuze's Conception of Desire

Jihai Gao Henan University

Abstract

Desire is a key concept in Deleuzian philosophy. Deleuze's desire is quite different from that of other thinkers. Both in the West and in China, in the past as well in the present, desire is usually understood as something abnormal, avaricious and excessive, the opposite of rationality, to be controlled and suppressed in man. Deleuze's desire is much wider, referring not only to man, but also to animals, objects and social institutions. In Deleuze's view, desire is not a psychic existence, not lack, but an active and positive reality, an affirmative vital force. Desire has neither object, nor fixed subject. It is like labour in essence, productive and actualisable only through practice. This paper discusses the formation, evolution and limitation of Deleuzian desire.

Keywords: Deleuze, desire, philosophy, Marx, Foucault

Deleuze holds that philosophy is concerned with the creation of concepts, and a new concept may bring about a new way of thinking, then thereby a new way of living. On the one hand, Deleuze put forward many new concepts; on the other hand, he offered new interpretations to many existing concepts. Take the concept of desire as an example. It is taken as a pejorative word in both West and East, signifying something excessive, unjustified and wanton. That is why in China we have the Confucian motto of 'abiding by heavenly justice to suppress human desire', and society looks up to people who are upright as a result of exterminating individual desire. Plato in his *Republic* takes desire as the opposite of reason, something to be controlled.[1] Deleuze, based on his critique of the traditional, orthodox Western philosophy, holds that desire is a positive force, it is not purely psychic, not a lack as usually

Deleuze Studies 7.3 (2013): 406–420

www.euppublishing.com/dls

understood but productive in nature; like labour, desire is actualised in the course of practice. This paper discusses the evolution of Deleuze's conception of desire and the many implications of this conception.

Western philosophy since Plato has been emphasising the opposition between mind and body, taking mind as superior to body, rationality as preferable to desire. Representational thinking, Deleuze says, is State philosophy and rationalism derived from Plato and it characterises Western metaphysics. Traditional Western philosophy only cherishes the Platonic and Aristotelian belief that fixity is a nobler and worthier thing than change. Deleuze in his Conclusion to *Difference and Repetition* offers a critique of representational thinking, calling it a site of transcendental illusion. This illusion, according to Deleuze, comes in four interrelated forms which correspond particularly to thought, sensibility, the idea and being.

> In effect, thought is covered over by an image made up of postulates which distort both its operation and its genesis. These postulates culminate in the position of an identical thinking subject, which functions as a principle of identity for concepts in general. (Deleuze 1994: 265)

Deleuze believes there is no such thing as identical thinking subject, and concepts have no fixed, singular meaning.

According to Deleuze, the concept of desire has been misunderstood from the very beginning in Plato. Plato divides the human soul into three components of reason, spirit and desire, in which desire is the opposite of reason and is to be governed by reason:

> Platonic logic of desire forces us to make a choice between production and acquisition. From the moment that we place desire on the side of acquisition, we make desire an idealistic (dialectical, nihilistic) conception, which causes us to look upon it as primarily a lack: a lack of an object. (Deleuze and Guattari 1987: 25)

The productive side of desire has been neglected until Kant attributed to it the faculty of being, through its representations, the cause of the reality of the objects of these representations. But in Kant, according to Deleuze, the reality of the object is only a psychic reality, so Kant's critical revolution changes nothing essential, and this way of conceiving of productivity does not question the validity of the classical conception of desire as a lack. On the contrary, it reaffirms the validity of representational thinking, uses this conception as a support and a buttress, and merely examines its implications more carefully. Deleuze takes desire not simply as some psychic reality but as something real:

> If desire produces, its product is real. If desire is productive, it can be productive only in the real world and can produce only reality. Desire does not lack anything; it does not lack the object. It is, rather, the subject that is missing in desire, or desire that lacks a fixed subject; there is no fixed subject unless there is repression. Desire and its object are one and the same thing: the machine, as a machine of a machine. Desire is a machine, and the object of desire is another machine connected to it. (Deleuze and Guattari 1977: 26)

In her PhD dissertation, published as *Subjects of Desire: Hegelian Reflections in Twentieth-Century France* (Butler 1987), Judith Butler discusses how Hegel in his *The Phenomenology of Spirit* elaborates on the concept of desire. According to Butler, Hegel's discussion of human desire in the sections of The Truth of Self-certainty and Lordship and Bondage was derived from Spinoza's notion of desire as the essence of man, and the endeavour to persist in one's own being. Butler believes that Hegel endorses Spinoza's monistic refutation of the Cartesian mind–body dualism (Butler 1987: 46). Deleuze holds that desire is what makes humanity human. It does not point to any specific object, nor is it the Freudian drive of libido. Kojève, in his famous *Introduction to the Reading of Hegel: Lectures on the Phenomenology of Spirit* (1980), elaborated on the dialectics of Lord and Slave, and concluded that man is his desire.[2] This understanding of desire is highly appreciated by Deleuze.

When interviewed, Deleuze says:

> It was on Spinoza that I worked the most seriously according to the norms of the history of philosophy – but it was Spinoza more than any other that gave me the feeling of a gust of air that pushes you on the back each time you read him. We have not yet begun to understand Spinoza, and I myself no more than others. (Deleuze and Parnet 1987: 15)

Michael Hardt, tracing the development of Deleuzian philosophy, emphasises the influences on Deleuze by earlier philosophers such as Spinoza, Bergson and Nietzsche: 'With Bergson, Deleuze develops an ontology. With Nietzsche, he sets that ontology in motion to constitute an ethics. With Spinoza, we will take a further step in this evolution, toward politics' (Hardt 1993: 57). Deleuze agrees with Marx that in the human realm, 'what exists in fact is not lack, but passion, as a natural and sensuous object. Desire is not bolstered by needs, but rather the contrary; needs are derived from desire' (Deleuze and Guattari 1977: 27). Deleuze holds that social production and desiring production are one and the same thing, they are inseparable.

> The truth of the matter is that *social production is purely and simply desiring production itself under determinate conditions*. We maintain that the social field is immediately invested by desire, that it is the historically determined product of desire, and that libido has no need of any mediation or sublimation, any psychic operation, any transformation, in order to invade and invest the productive forces and the relations of production. *There is only desire and the social, and nothing else*. (Deleuze and Guattari 1977: 29)

There is no difference in nature between the desiring machines and the technical social machines, says Deleuze. There is a certain distinction between them in the field of régime, depending on their relationships to size:

> In the first place, technical machines obviously work only if they are not out of order; they ordinarily stop working not because they break down but because they wear out. Marx makes use of this simple principle to show that the régime of technical machines is characterized by a strict distinction between the means of production and the product. Thanks to this distinction, the machine transmits value to the product, but only the value that machine itself loses as it wears out. Desiring machines, on the contrary, continually breaks down as they run, and in fact run only when they are not functioning properly; the product is always an offshoot of production, and at the same time the parts of the machine are the fuel that makes it run. (Deleuze and Guattari 1977: 31)

On the one hand, we can say that social production under determinate conditions derives primarily from desiring production; that is to say, natural man comes first. On the other hand, however, desiring production is first and foremost social in nature, and tends to free itself only at the end; that is to say, social man comes first. The double nature of human being as both natural and social determines the dialectics of desire and production.

In expounding Deleuze's conception of desire, Claire Colebrook emphasises the connectivity of desiring machines. Desiring machines are nothing more than their connections or experiences according to her. From the connections of bodies or from experiences, human minds form ideas:

> The child's mouth, for example, that has experienced pleasure at the breast comes to desire or anticipate the breast. In this expectation desire can produce an image or investment. This is what Deleuze means when he says that desire is productive. We often think that desire is for what we lack, but for Deleuze desire is more than the actual. In the case of the child, the mouth's past pleasure produces an idea or image of further pleasure, and this creates an investment. The breast becomes more than what is actually is (a body part)

> and takes on an added virtual dimension – the breast of fantasy, pleasure and desire. (Colebrook 2002: 82)

Desire begins from connection, she asserts. Life strives to preserve and enhance itself and does so by connecting with other desires. These connections and productions eventually form social wholes. When bodies connect with other bodies to enhance their power they eventually form communities or societies. Against the idea that social wholes are formed through ideology, Deleuze argues for social wholes as positive and productive. Social wholes take desires in order to produce interests, coded, regular, collective and organised forms of desire.

In his *A User's Guide to Capitalism and Schizophrenia*, Brian Massumi interprets Deleuze's concept of desire as follows: desire is not desire for an object, except to the extent that whole attractors are imposed on the body by reactive forces. It is not a drive in the Freudian sense, and it is not a structure in the sense that language is a structure in the Saussurian model adopted by Lacanians. Desire is the production of singular states of intensity by the repulsion–attraction of limitative bodies without organs (governed by deterministic whole attractors) and non-limitative bodies without organs (governed by chance-ridden fractal attractors). In its widest connotation, it is the plane of consistency as multiple co-causal becoming. On the human level, it is never a strictly personal affair, but a tension between sub- and super-personal tendencies that intersect in the person as empty category. In *Anti-Oedipus*, a tendency of this kind was called a 'desiring machine'. Due to persistent subjectivist misunderstandings, in *A Thousand Plateaus* the word was changed to the more neutral 'assemblage' (Massumi 1992: 82).

We can trace the evolution of Deleuze's conception of desire by a rough examination of his books. In *Difference and Repetition* (1968) Deleuze launches a devastating criticism of representational thinking but does not discuss desire. In *The Logic of Sense* (1969) he mentions desire in several places and discusses it in some detail. In his essay 'Michel Tournier and the World without Others', for example, Deleuze makes an analysis of Tournier's novel *Friday*, which is a rewriting and parody of Defoe's *Robinson Crusoe*. The essay is about perversion, and Deleuze makes it clear that the world of the pervert is a world without Others, and thus a world without the possible. The Other is what makes the possible possible, and the existence of the Other is the condition for the extinction of perversion. On the barren island, without the Other, both Robinson and Friday become pervert. Deleuze calls the concept of

perversion a bastard concept – half juridical and half medical, but neither medicine nor law is entirely suited to it. Perversion, as he says, is not defined by the force of a certain desire in the system of drives. The pervert is not someone who desires, but someone who introduces desire into an entirely different system and makes it play the role of an internal limit, a virtual centre or zero point (Deleuze 1990: 304).

Deleuze believes that the pervert lives in a world without others. When catastrophes fall on the island, Deleuze says, the newly erected desire learns the nature of its true object. Nature and the earth have already told us that the object of desire is neither the body nor the thing, but only the Image. When we desire Others, our desires are brought to bear upon this expressed small possible world which the other wrongly envelops. And when we observe a butterfly pillaging a flower that exactly resembles the abdomen of the female of the species and then leaving the flower carrying on its head two horns of pollen, we are tempted to conclude that bodies are but detours to the attainment of Images, and that sexuality reaches its goal much better and much more promptly to the extent that it economises this detour and addresses itself directly to Images and to the Elements freed from bodies (Deleuze 1990: 313).

When Kierkegaard's hero demands 'the possible, the possible or I shall suffocate', when James longs for the 'oxygen of possibility', Deleuze suggests, they are only invoking the a priori Other. Even desire, whether it be desire for the object or desire for Others, depends on this structure. I desire an object only as expressed by the Other in the mode of the possible; I desire in the Other only the possible worlds the Other expresses. The Other appears as that which organises Elements into Earth, and Earth into bodies, bodies into objects, and which regulates and measures object, perception and desire all at once (Deleuze 1990: 318).

It seems that in *The Logic of Sense* (1969), Deleuze has not yet fully developed his notion of desire, relying heavily on Sartre and others while discussing the Other, perversion, desire, and so on. By *Anti-Oedipus* (1972) he has fairly well developed this concept with Guattari and in *A Thousand Plateaus* (1987) he has fully developed this concept. In the chapter 'How Do You Make Yourself a Body without Organs?', Deleuze and Guattari write:

> Every time desire is betrayed, cursed, uprooted from its field of immanence, a priest is behind it. The priest cast the triple curse on desire: the negative law, the extrinsic rule, and the transcendent ideal. Facing north, the priest said, Desire is lack. The priest carried out the first sacrifice, named castration, and all the men and women of the north lined up behind him, crying in cadence,

> 'Lack, lack, it's the common law.' Then, facing south, the priest linked desire to pleasure. For there are hedonistic, even orgiastic, priests. Desire will be assuaged by pleasure; and not only will the pleasure obtained silence desire for a moment but the process of obtaining it is already a way of interrupting it, of instantly discharging it and unburdening oneself of it. Pleasure as discharge: the priest carries out the second sacrifice, named masturbation. Then facing east, he exclaimed: *Jouissance* is impossible, but impossible *jouissance* is inscribed in desire. For that, in its very impossibility, is the ideal. The priest carried out the third sacrifice, phantasy or the thousand and one nights, the one hundred twenty days, while the men of the east chanted: Yes, we will be your phantasy, your ideal and impossibility, yours and also our own. The priest did not turn to the west. He knew that in the west lay a plane of consistency, but he thought that the way was blocked by the columns of Hercules, that it led nowhere and was uninhabited by people. (Deleuze and Guattari 1987: 154)

We notice several things in the quotation. First, the figurative use of words such as priest, facing north, south, east, sacrifice, and so on, which gives the reader vivid images of different understandings of desire by different people. Deleuze admits having been charged with over-quoting literary works, and his own style of writing philosophical treatises has always been literary. The translator Brian Massumi reserved the French word *jouissance* in its original form, to express exactly what English words could not convey: the combination of happiness and pleasure. The irony is that the priest uses castration to annihilate lack, masturbation to satisfy pleasure, and phantasy to achieve a virtual ideal. The directions are not accidentally chosen. People in the north suffer from severe cold, their temperament is usually austere and solemn, and they practise asceticism and have a better experience of what lack is. Southern people are romantic, easy-going and pleasure seeking; they would use every means to find pleasure, even by masturbation. The East is mysterious to Westerners, the place of one thousand and one nights, people there are both lusty and idealistic, and more likely to enjoy a sort of virtual *jouissance*. The priest did not turn to the west as he knows human nature better than to try that; the way to heaven is blocked by the Pillars of Hercules. Second, we come across two key Deleuzian concepts in the quotation, one at the beginning – 'field of immanence'– the other at the end – 'plane of consistency'. We quote Deleuze himself to explain the concepts:

> The field of immanence is not internal to the self, but neither does it come from an external self or a non-self. Rather, it is like the absolute Outside that knows no Selves because interior and exterior are equally a part of the

> immanence in which they have fused. The slightest caress may be as strong as an orgasm; orgasm is a mere fact, a rather deplorable one, in relation to desire in pursuit of its principle. Everything is allowed: all that accounts is for pleasure to be the flow of desire itself. If pleasure is not the norm of desire, it is not by virtue of a lack that is impossible to fill but, on the contrary, by virtue of its positivity, in other words, the plane of consistency it draws in the course of its process. (Deleuze and Guattari 1987: 157)

Again the two concepts appear together, and again one at the beginning, the other at the end. In his analyses of Proust, Sade and Masoch, Deleuze finds that they all explore a curious inter-world, in which bodies, words, things and ideas interpenetrate and the traditional demarcations between the physical and the metaphysical become blurred. For Deleuze, plateau, body without organs (BwO), field of immanence and plane of consistency are equated. They are interpenetrating and interconnected, and mutually nested and overlapping. Hence the configurations of a thousand plateaus of interconnections of thought are formed. Deleuze and Guattari give an authoritative interpretation of the plane of immanence. They say that the event does not relate to a transcendent subject (self), but on the contrary, is related to the immanent survey of field without subject. They illustrate the notion of the plane of immanence by stressing its impersonality. For example:

> The BwO is desire; it is that which one desires and by which one desires. And not only because it is the plane of consistency or the field of immanence of desire. Even when it falls into the void of too-sudden destratification, or into the proliferation of a cancerous stratum, it is still desire. Desire stretches that far: desiring one's own annihilation, or desiring the power to annihilate. Money, army, police, and state desire, fascist desire, even fascism is desire. There is desire whenever there is the constitution of a BwO under one relation or another. It is a problem not of ideology but of pure matter, a phenomenon of physical, biological, psychic, social, or cosmic matter. (Deleuze and Guattari 1987: 165)

Here Deleuze equates BwO with the plane of consistency and the field of immanence, and by logic the three are identical. In the following quotation, Deleuze introduces another concept that is still connected with the exposition of desire:

> Desire is never separable from complex assemblages that necessarily tie into molecular levels, from micro-formations already shaping postures, attitudes, perceptions, expectations, semiotic systems, etc. Desire is never an undifferentiated instinctual energy, but itself results from a highly developed, engineered setup rich in interactions: a whole supple segmentarity

> that processes molecular energies and potentially gives desire a fascist determination. (Deleuze and Guattari 1987: 215)

Desire is then inseparable from complex assemblages, and assemblages are passional compositions of desire:

> Desire has nothing to do with a natural or spontaneous determination; there is no desire but assembling, assembled, desire. The rationality, the efficiency, of the assemblage does not exist without the passions the assemblage brings into play, without the desires that constitute it as much as it constitutes them. (Deleuze and Guattari 1987: 399)

For Deleuze, life and work were a synthesis or assemblage of desire, and there is no distinction between public and private, domestic and academic. In fact, he had integrated writing and life as inseparable from each other, and reached an impersonal flux of desire. For him, writing is an experience of life, and life is an approach to academic research. In his mind, philosophy and art do not belong to separate domains of truth and fiction, or of objectivity and subjectivity, but inhabit a single realm of thought, whose fundamental goal is the creation of new possibilities of life.

Deleuze holds that to write is not to impose a form of expression on the matter of lived experience. Writing is a question of becoming, always incomplete, always in the midst of being formed, and goes beyond the matter of any liveable or lived experience. It is a process, that is, a passage of life that traverses both the liveable and the lived. Writing is inseparable from becoming: in writing, one becomes-woman, becomes-animal or vegetable, becomes-molecule to the point of becoming imperceptible. Also, to write is not to recount one's memories and travels; one's loves and griefs; one's dreams and fantasies. In this respect, he is like T. S. Eliot, advocating a kind of impersonal writing. He admits that all literature involves imagination (fabulation), but fabulation does not consist in imagining or projecting an ego. We do not write with our neuroses, because neuroses or psychoses are not passages of life, but states into which we fall when the process is interrupted, blocked or plugged up. Illness is not a process but a stopping of the process. Moreover, the writer as such is not a patient but rather a physician, the physician of himself and of the world.

In this sense, literature appears as an enterprise of health: not that the writer would necessarily be in good health, but he possesses an irresistible and delicate health that stems from what he has seen and heard of things too big for him, too strong for him, suffocating things whose passage exhausts him, while nonetheless giving him

the becomings that a dominant and substantial health would render impossible. The writer returns from what he has seen and heard with bloodshot eyes and pierced eardrums, and sits down to recount what he has experienced. The ultimate aim of literature is to set free, in the delirium, this creation of a health or this invention of a people, that is, a possibility of life.

The desire to become a writer must be supported by vital impulse. Deleuze, on the basis of the inseparable relation between the virtual and the actual, defines the vital impulse as 'a case of virtuality in the process of being actualized, simplicity in the process of differentiating, a totality in the process of dividing up' (Deleuze 1988: 94). Here, Deleuze stresses the virtuality of vital impulse and its corresponding actualisation in matter. Vital impulse is virtual, pre-individual and impersonal. But it can be actualised in matter. The process of virtuality being actualised is also called differentiation.

Deleuze believes that

> nomads in the strict, geographical sense are neither migrants nor travellers, but on the contrary, are those who do not move, those who cling on to the steppe, who are immobile with big strides, following a line of flight on the spot, the greatest inventors of new weapons. (Deleuze 1988: 99)

In this respect, his idea is similar to that of Lao Zi, the great Chinese sage, who says:

> Without leaving his door
> He knows everything under heaven
> Without looking out of his window
> He knows all the ways of heaven
> For the further one travels the less one knows
> Therefore the sage arrives without going
> Sees all without looking
> Does nothing, yet achieves everything. (Lao Zi 1995)[3]

Deleuze sees in Taoism a good example of desire being channelled into healthy use. For example, in Taoism there is the formation of a circuit of intensities between female and male energy, with the woman playing the role of the innate or instinctive force (yin) stolen by or transmitted to the man (yang) in such a way that the transmitted force of the man (yang) in turn becomes innate, all the more innate: an augmentation of powers. The purpose of this practice is for the balance between yin and yang in the human body, and for longevity. The condition for this circulation and multiplication is that the man does not ejaculate. It is not a question

of experiencing desire as an internal lack, nor of delaying pleasure in order to produce a kind of externalisable surplus value, says Deleuze, but instead of constituting an intensive body without organs, Tao, a field of immanence in which desire lacks nothing and therefore cannot be linked to any external or transcendent criterion. It is true that the whole circuit can be channelled towards procreative ends, that is, ejaculation when the energies are right; that is how Confucianism understands it:

> But this is true only for one side of the assemblage of desire, the side facing the strata, organisms, state, and family. It is not true for the other side, the Tao side of destratification that draws a plane of consistency proper to desire. The field of immanence or plane of consistency must be constructed. (Deleuze and Guattari 1987: 157)

In this passage, Deleuze equates Tao with assemblage of desire, with the BwO, with the field of immanence and plane of consistency. In his view, Confucianism stands for strata, organisms, State and family, while Taoism stands for destratification, for a new possibility of life. We notice Deleuze's use of Marx's idea of surplus value and his praise of the Taoist way of achieving the BwO or the field of immanence and plane of consistency, or assemblage of desire. In Oriental philosophy, Deleuze rests his critique of Western orthodox ideas.

Desire is a key concept in Deleuzian philosophy, and many critics call his philosophy the philosophy of desire. Deleuze holds that all philosophy is political in nature, and his conception of desire is highly political. Deleuze was deeply influenced by the May Movement of 1968 in France, and his philosophy is that which, to a certain extent, stands for the rebellion of the deprived against those in power, a subversion of the marginal towards the centre, a challenge of the buried histories to the established history. It reflects typically many postmodern trends. About the rise of fascism before World War II, scholars have done much research and put forward many valuable explanations. From Deleuze's conception of desire, we can say fascism is desire, is a desiring machine, a desiring assemblage. The thoughts of Hitler, his desire to rid Germany of the shame as a result of World War I, and his ambition to make Germany the greatest power in Europe, even in the world, were widely shared by the masses of Germany. Deleuze agrees with Wilhelm Reich that the German masses were not innocent dupes, that at a certain point, under a certain set of conditions, they wanted fascism, and it is this perversion of the desire of the masses that explains the rise of fascism in Germany in the 1930s.[4] That is also why the German people are more willing to take historical responsibility instead of shifting all the guilt to

Hitler alone. But Reich does not go further, according to Deleuze, falling back to the old division of rationality and irrationality in the human psyche, 'failing to discover the *common denominator or the coextension of the social field and desire*' (Deleuze and Guattari 1977: 29). In Deleuze's view, we cannot judge desire from the perspective of morality or ethics, as desire is 'beyond good and evil', a Nietzschean notion.

In a political elaboration of structuralist premises, Foucault argues that, first, language is always structured in a specific historical form and is, therefore, always a kind of discourse; second, this discourse invariably recapitulates and produces given historical relations of power; and third, these power-laden discourses produce desire through their regulatory practices. Hence, for Foucault, there is no desire outside of discourse, and no discourse freed of power relations. Deleuze does not make any comment on Foucault's idea, but the two of them share a lot from their readings of Marx.

They both agree with Marx's thesis, 'Philosophers have hitherto only interpreted the world in various ways; the point is to change it' (Marx 1845: 3). They both assent to Marx's assertion:

> The production of ideas, of conceptions, of consciousness, is at first directly interwoven with the material activity and the material intercourse of men, the language of real life. Conceiving, thinking, the mental intercourse of men, appears at this stage as the direct efflux of their material behavior. The same applies to mental production as expressed in the language of politics, laws, morality, religion, metaphysics, etc., of a people. Men are the producers of their conceptions, ideas, etc. – real, active men, as they are conditioned by a definite development of their productive forces and of the intercourse corresponding to these, up to its furthest forms. Consciousness can never be anything else than conscious existence, and the existence of men is their actual life-process. (Marx 1846: 8)

Deleuze in his elaboration and conception of desire uses quite a lot of Marxian terms such as capital, exchange, circulation, consumption and surplus value. He equates desiring production with social production, the accumulation and release of desire with the buying and using of commodities.

Deleuze makes a distinction between philosophy, science and art. In his view, science aims at the representation of objects and states of affairs by means of mathematical or propositional functions, art aims at the capture and expression of the objective content of particular sensations – affects and percepts – in a given medium, while philosophy

aims at creating concepts, the function of which is to transform existing forms of thought and practice. Here lies the political nature of philosophy. Though influenced by Marx's political economy, Deleuze pays more attention to the micropolitics that involves subterranean movements of individual and collective sensibility, affect and allegiance, than to the macropolitics that involves social classes and the institutions of political government. Paul Patton thinks that the tripartite division of thought outlined in Deleuze's *What Is Philosophy?* resembles the division found in Kant's three critiques, and that science, philosophy and art as distinct modalities of thought correspond to the Kantian domains of theoretical, practical and teleological reason. Kant distinguishes theoretical from practical reason by suggesting that theoretical reason is concerned with the knowledge of objects that are given to us by means of the senses, whereas practical reason is concerned with objects that we produce by means of action in accordance with certain principles. In this regard, Deleuze's philosophy is a form of practical reason (Patton 2010: 138–9).[5]

It is impossible to give Deleuze and his philosophy a fixed label, as can be seen from our discussion of his conception of desire. The conception of desire in Deleuze, like Deleuze himself, is a desiring machine or desiring assemblage, full of vital forces but also contradictions and conflicts. When reading *Anti-Oedipus* and *A Thousand Plateaus*, we are struck by his erudition, as the books touch on almost all the subjects of human knowledge. The subtitles of the two books are identical: *Capitalism and Schizophrenia*. His basic logic is that capitalism creates schizophrenia, and his ambition is to find a remedy for the illness of society. Successful or not, we are not sure, but we should accept Fredric Jameson's comment about Deleuze:

> The greatness of Gilles Deleuze was to have confronted omnivorously the immense field of everything that was thought and published. No one can read the two volumes of *Capitalism and Schizophrenia* without being stunned by the ceaseless flood of references that tirelessly nourish these texts, and which are processed into content and organized into dualism [. . .] It seems to me misguided to search for a system or a central idea in Deleuze: in fact there are many of those. It seems preferable to observe the extraordinary process whereby his intelligence rewrites and transcodes its overpopulated conceptual environment, and organizes it into force fields. But that organization, often so luminously schematic, does not aim to give us the truth, but rather a series of extraordinary representations. (Jameson 1997: 395)[6]

If we aim at finding definite, final, universally applicable truth in Deleuze's writings, we are doomed to failure, but if we aim at finding

the infinite complexities, the paradoxes, and behind them, the interesting ways of reasoning, narrating and arguing, we are sure to be rewarded plentifully.

Notes

1. See *Book Nine* of *Republic*, where Plato divides the human soul into three parts, corresponding to three desires and three kinds of people: those loving wisdom, those loving honour and those loving money. He argues that those loving wisdom are the noblest, those loving honour are good and those loving money are bad. Also in *Book Four* of *Republic*, he says that there are two things in the human soul: one is rational for the purpose of thinking and reasoning, the other is irrational, which is promoted by the sensual desire for the satisfaction of physical needs such as hunger and thirst, and so on.
2. Here Kojève's rationale is as follows: the basic driving force of history is man's pursuit for recognition, exhibited most clearly in the realm of politics. One person's desire for success is inevitably in conflict with that of another; those who win in the conflict become masters, and those who lose become slaves. Thus we see the perpetual struggle between master and slave and the forced labour of the slave (Kojève 1980).
3. Lao Zi (571–471 BC) was the tutor of Confucius (551–479 BC), and the founder of Taoism, a philosophy that emphasises the connection between metaphysical and ethical notions. Given the elusive nature of the universal truth, the Tao, Lao Zi conceives a sceptical philosophy that defines the notion of good based on the absence of intentionality and beliefs. According to Taoism, the world is originally one integral, inseparable whole. As the world evolves, the unity divides into two polar extremes, with yin (female) representing passiveness and yang (male) representing activeness. The two are interdependent and mutually enhancing. A movement towards one polar extreme often results in movements in the opposing extreme and when one extreme gets too violent, the tension will cause its opposing extreme to prosper.
4. See Reich's *The Mass Psychology of Fascism* (Reich 1970), in which Reich gives a thorough and in-depth analysis of the rise of fascism in Germany in the 1930s, which finally led Germany into World War II.
5. Paul Patton believes that all philosophy is essentially political, Deleuze's philosophy is particularly so. In *Deleuze and the Political* Patton elaborates further on the political nature of the Deleuzian philosophy.
6. *A Deleuzian Century?* is the journal's special issue on Deleuze, the title being taken from Foucault's assertion that the twentieth century would one day be known as the century of Gilles Deleuze. Jameson's essay is the first in the volume of fourteen essays.

Introduction: Deleuze, Virginia Woolf and Modernism

Derek Ryan University of Kent
Laci Mattison Florida State University

'To write is also to become something other than a writer', Deleuze concludes in 'Literature and Life'. 'To those who ask what literature is, Virginia Woolf responds: To whom are you speaking of writing? The writer does not speak about it, but is concerned with something else' (Deleuze 1997: 6). Just as literature attempts to reach 'the life in things' that is 'the outside of language' (2, 5), the 'writer' is concerned with *becoming* something else (woman, animal, molecule). As Deleuze's example of such a writer, Woolf has become impersonal, imperceptible, indiscernible, thus the question 'to whom are you speaking?' In one of Deleuze's other references to Woolf, she exemplifies the becoming-indiscernible in the naming of the author:

> The function of the proper name (the proper name, here, is precisely not a reference to a particular person as author or subject of enunciation; it refers to one or several assemblages; the proper name brings about an individuation by 'hecceity', not at all by subjectivity)... Virginia Woolf designates a state of reigns, ages and sexes. (Deleuze and Parnet [2002] 2006: 89)

'Virginia Woolf', and for that matter 'Gilles Deleuze', cannot be localised in a time or place; they are traversing planes and taking on becomings. The transversals shared between Woolf and Deleuze are the focus of this special issue: Woolf's becoming-Deleuze; Deleuze's becoming-Woolf.

Deleuze's comments about Woolf's writing (both process and product) appear in texts spanning from the 1970s to the end of his life in 1995, including his *Dialogues* with Claire Parnet, *A Thousand Plateaus* and *What is Philosophy?* with Félix Guattari, and essays such as 'Literature and Life'. A range of Woolf's texts, including *Mrs Dalloway*,

Orlando, *The Waves* and her modernist feminist manifesto *A Room of One's Own*, are variously cited in Deleuze's discussions of literature. For Deleuze, Woolf's writings are exemplary of 'becoming', 'haecceity', 'affects' and 'percepts', and the 'plane of consistency', and many of these concepts are explored in more detail in the essays collected here. Woolf also provides a rare example of Deleuze's references to a female author, with implications for how we think about the relationship between modernism, feminism and philosophy. Therefore, whilst previous work on Deleuze and modernism has tended to focus on the authors Deleuze wrote about most fully (such as Franz Kafka, Antonin Artaud, Samuel Beckett and Marcel Proust), this special issue demonstrates how Woolf's modernist aesthetics are integral to Deleuze's philosophical concepts. In so doing, we offer a dual examination of the instances where Deleuze 'plugg[ed] into' Woolf's 'electric circuit' (Deleuze 1995: 8) and also of the specific ways in which Deleuze's thought might offer new perspectives on Woolf's novels, essays, short stories and auto/biographical writings, and on the intersection of philosophy and literature more broadly. The essays that follow offer interdisciplinary, philosophically and critically engaged explorations of the creative convergences between Deleuze's and Woolf's writings, which, in turn, also unfold wider debates in fields including contemporary philosophy, feminist theory, modernist studies, animal studies and postcolonial studies.

The earliest attempts to consider the relationship between Deleuzian philosophy and aspects of Woolf's modernism can be found in John Hughes's *Lines of Flight* (1997) where he discusses the Bergsonian and Deleuzian 'movement' of Woolf's first novel, *The Voyage Out*, as well as in Catherine Driscoll's discussion of Woolf's feminism alongside Deleuze, Rosi Braidotti and Julia Kristeva (2000), and Jean-Jacques Lecercle's acute analysis of Woolf's 'Kew Gardens' in *Deleuze and Language* (2002). Following these critics, the relationship between Deleuze and Woolf has been brought to prominence in Jessica Berman's reading of Woolf's (ethical) writing alongside Mieke Bal's reconceptualisation of the Deleuzian 'fold' for feminist studies (2004; 2011) and Beatrice Monaco's *Machinic Modernism* (2008). Monaco's monograph, in particular, aligns Deleuze's thought with the modernist projects of Lawrence, Joyce and Woolf, and includes chapters on immanence and transcendence in *To the Lighthouse* and on form and rhythm in *The Waves* and *Orlando*. In the wake of this scholarship, there have been further attempts to bring their work together: Jason Skeet has provided a Deleuzian reading of *The Waves* and Woolf's essay 'The Cinema' (2008); Judith Allen has used Deleuze's 'rhizome' as a

conceptual paradigm for her discussion of 'wildness' in Woolf's work (2010); Gina Potts has provided a Deleuzian reading of Woolf's anti-authoritarian politics in *Three Guineas* (2010); Laci Mattison has read *To the Lighthouse* alongside Deleuze's conceptualisation of 'the fold' (2011); Carrie Rohman has considered the Deleuzian 'refrain' in her analysis of the inhuman in *The Waves* (2011); Claire Colebrook has considered new possibilities Deleuze offers for our readings of Woolf and of modernist literature more generally (2012); and Derek Ryan has forged creative links between key Deleuzian concepts and Woolf's theorising of the material world, especially in relation to questions concerning sexuality, animality and life itself (2013). In addition, some of the most recent Annual International Woolf conferences included papers focused on Deleuze, as did 'Virginia Woolf Among the Philosophers', a conference organised by the *La Société d'Etudes Woolfiennes* held in Paris (2012).[1] Woolf, then, has emerged in recent years as someone who demands serious consideration in dialogue with Deleuzian philosophy.

This special issue consists of new essays by several of the above-mentioned scholars that further consider the relation between Deleuze, Woolf and modernism. In the first essay, 'Modernism without Women: The Refusal of Becoming-Woman (and Post-Feminism)', Claire Colebrook takes on the concept of becoming-woman alongside Woolf's claim that it is 'fatal for anyone who writes to think of their sex' (Woolf 1989: 104). Such a modernism, according to Colebrook, is one notably separate from the 'regendering' of modernism of the late 1980s and 1990s (although this movement is arguably ongoing) in that it refuses 'both man and woman'. ' "Becoming-woman" ', Colebrook writes, must also 'be read as a defiant and affirmative refusal'. Essays by Beatrice Monaco and Jason Skeet more directly deal with Woolf's influential modernist aesthetics for Deleuze's consideration of how language becomes intense. In ' "Nothing is simply one thing": Woolf, Deleuze and Difference', Monaco provides a technical analysis of difference and repetition in Woolf's *Mrs Dalloway* and *To the Lighthouse*. Engaging with the 'micro-technics' of Woolf's modernist experiments, Monaco is particularly interested in the 'dynamic tension between prose and poetry or meter and radical rhythm'. Skeet's essay, 'Netting Fins: A Deleuzian Exploration of Linguistic Invention in Virginia Woolf's *The Waves*', focuses specifically on Woolf's verbal and syntactical constructions, including an exploration of four specific linguistic procedures found in this novel. In doing so, Skeet investigates how, for Deleuze and Woolf alike, ontology 'becomes intimately bound up with a problem of language'.

Complementary essays by John Hughes and Carrie Rohman likewise advance arguments surrounding ontology and genre. Hughes demonstrates how Woolf's experimental aesthetics in her 1921 short story collection, *Monday or Tuesday*, corresponds with Deleuze's philosophical thought, as well as Deleuze's 'recasting' of Henri Bergson's 'notions of creativity, virtuality, difference, and multiplicity'. In returning to Bergson via Deleuze, Hughes shows how Woolf's early short story collection is 'emancipated by its dislocation of the armature of conventional novelistic representation, as it pursues modes and themes that can be linked, through stylistic enactment and thematic staging, with Bergson's concepts of the virtual, intuition, sympathy, subjectivity, art, creativity, emotion, and language' and how this emancipation carries over into her later novels. In 'A Hoard of Floating Monkeys: Creativity and Inhuman Becomings in Woolf's Nurse Lugton Story', Rohman details how becomings-animal are important for the becoming-artistic of writing. She reads Woolf's overlooked children's story, 'Nurse Lugton's Curtain', alongside Deleuze's and Elizabeth Grosz's theories of art and the inhuman and argues that this children's book reveals 'an affirmative bio-poetics at the heart of Woolf's aesthetic project and suggests that Woolf's creative sources are embedded in inhuman, biological forces'.

Derek Ryan's essay extends a discussion of becoming-animal by exploring the (perhaps surprisingly) wide-ranging territory of cows in the writings of Woolf and Deleuze. Ryan demonstrates the ontological and ethical implications of Woolf's bovine aesthetics in texts including *Between the Acts* and *Flush*, and underscores the importance of Deleuze's animal philosophy for readings of animals in literature, as well as for animal studies more broadly. Taking her cue from the recent *Deleuze and the Postcolonial* (Bignall and Patton 2010), Laci Mattison transitions this consideration of ethics and becoming to address what scholars have seen as a complicity with imperialism in Woolf's and Deleuze's writings and to emphasise how Deleuze and Guattari's 'worlding' is inspired in part by Woolfian 'moments of being'. These moments are 'ethical enactments of potential becomings', visions and engenderings of new configurations of relationality, of new worlds. Mattison shows how Bernard's moment of being in the last episode of *The Waves* – his 'becoming-savage' – acknowledges an authorial complicity with empire making, while also marking a particularly anti-imperial mode of subjectivity.

In his letter to Michel Cressole, Deleuze outlines two ways of reading a book: the first, a wild goose chase after signifiers (what does it

mean? what does it represent?); the second, 'see[ing] the book as a little non-signifying machine, and the only question is "Does it work, and how does it work?"' The latter practice of reading is 'intensive' and 'relates a book directly to what's Outside' (Deleuze 1995: 8). Such a reading experiences the book 'as a flow meeting other flows, one machine among others, as a series of experiments in the midst of events that have nothing to do with books' (9). Readers of this collection of essays will find Deleuze and Woolf assembling not only with each other but also with various 'Outsides' – gender, language, art, animality, empire – in experimentations with and in the world. These multiple vectors of thought commonly demonstrate the intimately bound relationship between aesthetics, ethics, politics and ontology for both Woolf and Deleuze. The essays which follow thus extend what Bruce Baugh outlines in 'How Deleuze Can Help Us Make Literature Work' (2000), and in so doing, they affirm in varying ways a shared style in Woolf's modernism and Deleuze's philosophy: 'Style, in a great writer, is always a style of life too, not anything at all personal, but inventing a possibility of life, a way of existing' (Deleuze 1995: 100).

Notes

1. As well as 'Virginia Woolf Among the Philosophers', conferences themed on 'Woolf and the City' (New York, 2009), 'Contemporary Woolf' (Aix-en-Provence, 2010), 'Contradictory Woolf' (Glasgow, 2011) and 'Interdisciplinary/Multidisciplinary Woolf' (Saskatoon, 2012) have included Deleuzian readings by Marie-Dominique Garnier, Laci Mattison, Dolors Ortega, Caroline Pollentier and Derek Ryan.

Modernism without Women: The Refusal of Becoming-Woman (and Post-Feminism)

Claire Colebrook Penn State University

Abstract

Just as becoming-woman is a divided concept, looking back to a seemingly redemptive figure of the feminine beyond rigid being, but also forward to a positive annihilation of fixed genders, so modernism was also a doubled movement. But modernism was a pulverisation of 'the' subject for the sake of a plural and multiplying point of view, and like 'becoming-woman', should be read as a defiant and affirmative refusal.

Keywords: becoming-woman, feminism, post-feminism, post-humanist, gender, sexual difference, capitalism

I.

The topic of post-feminism is neither joyous nor rigorous. The 'post' of post-feminism can signal the redundancy of a feminist movement that has achieved about all it could achieve, implying an acceptance of gender politics. From this point of view, certain things are no longer acceptable – unequal pay, sexual harassment, the refusal of reproductive rights, discriminatory language or exclusion from the public sphere – and this renders feminism both triumphant and redundant. Alternatively, post-feminism is also a critical stance that attends to forces that are far more complex than those that could be explicable via categories of gender (McRobbie 2004). It is obvious that feminism has made gains that 'we' (humans and the non-humans who benefited from eco-feminism) are now enjoying; and yet we might also remind ourselves that such hard-won gains are 'one generation away from extinction'.[1]

Deleuze Studies 7.4 (2013): 427–455

It is no less obvious that for all those gains, figures of gender and tired clichés of sexual difference still organise much of our thinking (insofar as we are still thinking). Indeed, perhaps there is a third sense we could grant to the term post-feminism: in addition to referring to the completion of feminism and to the overcoming of the simplicities of feminism, perhaps post-feminism might be more akin to terms such as 'post-modernism' or 'post-structuralism'. Here, to be post-feminist would be at one and the same time a refusal of the implicit borders of gender politics, while also a recognition that any supposed era after feminism will be haunted by the figures of binary sexual difference that were exposed, criticised, deconstructed and parodied. It may well be that we live in a time of the post-human, where we recognise the claims of animals, technology, the planet and other unbounded forces; and yet it is precisely here, in the genre of the post-apocalyptic, that the most tiring gender narratives are repeated. One can think of Cormac McCarthy's *The Road* (2006) in which the world after the end of the world (the world after the destruction of capitalism and civility) is nevertheless ordered by a familial narrative: a man journeys with his son through post-human wreckage, mourning the child's mother. Or, consider any number of post-apocalyptic cinematic events where the disaster narrative is entwined with a heterosexual romance: *The Book of Eli* (2010) is at once a reflection on a world in which the archive of Judeo-Christianity has been destroyed (with one fabled remaining copy of the Bible), and also a terrain in which a heroic Denzel Washington fights the forces of post-human evil. Yet the narrative is still structured (as nearly all narratives are) by a male–female encounter. The heroic Eli not only saves the world by preventing the one remaining Bible from falling into the wrong hands; he also saves Solara, the young female who signifies the future at the film's close.

One might say that it is easier to imagine the end of the world, and the end of capitalism, than it is to think outside the structuring fantasies of gender.[2] There must always be an active male heroism driven by a feminine fragility that appears to hold the promise of the future. Explicit narratives of this form, such as *Children of Men* (2006) in which a world that has stopped breeding is given the feeble hope in the form of a young pregnant woman to be saved by the male lead, are surrounded by less overt regressions to the romance plot and its variants. *The Walking Dead* (2010), *I Am Legend* (2011), *The Day the Earth Stood Still* (2008), *28 Days Later* (2002) – all these imaginings of the end of the world nevertheless remain within a sentimental Oedipal structure of the family. It might make sense to think in Gilles Deleuze and Félix Guattari's

terms that 'becoming-woman' is the key to all becomings (Deleuze and Guattari 1987: 291): gender and sexual binaries seem to be the last archaism in a world that is elsewhere proclaiming itself to be post-human. Finance capital has destroyed the notion of a locus of capitalism; the era of the brain and artificial intelligence has put to rest any notion of the exceptionalism of the human; research on non-human languages and cognitive archaeology has meant that we are truly post-structuralist (no longer believing in the linguistic paradigm). We are post-capitalist, post-linguistic, post-political, post-racial and yet not fully post-feminist. We have gone through the performative turn, the affective turn, the non-human turn, the theological turn and the ethical turn, and yet we seem to keep turning back to woman.

Even so, for all the rigidity of gender and notions of woman, surely the twenty-first century seems to demand that we think *beyond* woman, rather than beginning with woman as our first step to human freedom. Why, now, would we want to keep talking about a category as tired and flabby as 'woman'? And why would we want to take a philosophical corpus, such as Deleuze and Guattari's with all its energy directed at moving beyond human normality, and tie it back – again – to the question of becoming-woman? If Deleuze and Guattari (1987: 280) had anything to say on the issue, it was to insist on becoming-woman as a moment of passage, and so – not surprisingly – they cited Virginia Woolf's claim that it would be fatal for writing to 'think of' one's sex:

> All who have brought about a state of sex-consciousness are to blame . . . Even so, the very first sentence that I would write here, I said, crossing over to the writing-table and taking up the page headed Women and Fiction, is that it is fatal for anyone who writes to think of their sex. It is fatal to be a man or woman pure and simple; one must be woman-manly or man-womanly. It is fatal for a woman to lay the least stress on any grievance; to plead even with justice any cause; in any way to speak consciously as a woman. And fatal is no figure of speech; for anything written with that conscious bias is doomed to death. It ceases to be fertilised. Brilliant and effective, powerful and masterly, as it may appear for a day or two, it must wither at nightfall; it cannot grow in the minds of others. Some collaboration has to take place in the mind between the woman and the man before the art of creation can be accomplished. Some marriage of opposites has to be consummated. The whole of the mind must lie wide open if we are to get the sense that the writer is communicating his experience with perfect fullness. There must be freedom and there must be peace. Not a wheel must grate, not a light glimmer. The curtains must be close drawn. The writer, I thought, once his experience is

> over, must lie back and let his mind celebrate its nuptials in darkness. He must not look or question what is being done. Rather, he must pluck the petals from a rose or watch the swans float calmly down the river. (Woolf 1989: 104)

If identity is fatal, and anti-self-consciousness is the order of the day, why would one ever waste thought and ink on this relatively isolated, and manifestly transient, notion of becoming-woman?

One way of defending a continued focus on 'woman', if not 'becoming-woman', would be strategic: even if gender and sexual difference were blunt organising categories, they nevertheless have their persistence and need to be dealt with rather than willed away. Part of the value of psychoanalysis has been in acknowledging the gap between what we may know to be true and an archaic psychic economy that continues to operate. (Juliet Mitchell [1974] argued for the pertinence of psychoanalysis precisely because – and despite the women's movement's reasoned claims – intractable Oedipal structures remained in place.) When Deleuze and Guattari wrote *Anti-Oedipus*, they accepted the truth of the Oedipal individual: insofar as we demand to be recognised as subjects, we must submit to an either/or disjunction of male/female. Yet they strenuously insisted that *subjection* was not the sole logic. Instead, they took up a modernist notion that other forms of language, perception and embodiment would be possible, beyond the current logic of Oedipal individualism. If modernism was in part a critique of the West, and in part a critique of the subject, it was also an ambivalent critique of 'man' tied to a concept of writing. When Deleuze and Guattari quote Virginia Woolf, they are drawing upon an author whose modernism was already in dialogue with centuries of anti-humanist critique, ranging from Friedrich Nietzsche's tirade against a 'consciousness' whose interiority could only be established by a severing from the intensity of life, to Henri Bergson's argument that the intellect had reified the life of spirit. At first glance, modernist anti-humanism seems to be marked by a neo-Romantic positing of 'the feminine' as that which might operate as an exit from the Western subject of judgement. (One can think here of the 'oceanic' conclusion of Joyce's *Ulysses* with the affirmative repetition of Molly Bloom's 'yes' and Julia Kristeva's [1980] appeal to Joyce's 'semiotic' mode of pre-Oedipal poetic language.)

In addition to ostensibly 'feminist' modernisms that celebrated a redemptive power of the feminine, there was also a modernism that refused both man *and* woman. If Deleuze and Guattari's aesthetics

is indebted to modernism, it is not surprising that they appealed to Woolf in their description of the transition from becoming-woman to becoming-imperceptible. Just as becoming-woman is a divided concept, looking back to a seemingly redemptive figure of the feminine beyond rigid being, but also forward to a positive annihilation of fixed genders, so modernism was also a doubled movement. Modernism was in part a logic of the subject in its striving to be nothing other than the distanced observer, or nothing other than any of the personae though which one speaks (Ellmann 1987). But modernism was also an anti-subjectivism, or rather a pulverisation of 'the' subject for the sake of a plural and multiplying point of view. In addition to the arched, refined and urbane distance of impersonality, modernism was also a tactic of positive and positively destructive refusal. One might note, though, that impersonality is a stratum with two sides: on the one hand, in its high modernist mode, especially as articulated by Eliot and Joyce, the artist detaches himself from every constituted voice and becomes a godlike purveyor of all the voices of history; the direction is one of ironic elevation. For Deleuze, by contrast, becoming-imperceptible is not the creation of a grand godlike position that subsumes all viewpoints, but a multiplication of smaller and smaller perceptions, decreasing the distance and elevation of the authorial voice. We could distinguish then between an impersonality of ironic elevation, and a radical becoming-imperceptible that destroys any transcendental subject (Colebrook 2003: 214). Radically anti-humanist modes of modernism would not just be *other than* any determined subject; one would not just be post-human or post-feminist. Rather, one would take up and decompose the rigidity or stupidity of the figures that had strangled thinking, not imagining that one might simply and too quickly will away the forms, figures or 'territories' that had oriented thinking.

'Becoming-woman', I would suggest, needs to be read as a defiant and affirmative refusal. It is quite distinct from the Lacanian notion of imagining that there is no woman (that there is no 'beyond' that would exceed subjection and no 'thing' that would guarantee my enjoyment [Copjec 2002]); and becoming-woman is also distinct from attempts to destabilise the 'heterosexual matrix' from within by repeating and distorting gender's already constituted figures (Butler 1993). That is, 'becoming-woman' is not an authentic recognition that gender is some fantasmatic lure whose 'beyond' I need to think in the form of a radical negation, as in the Lacanian insistence that 'woman does not exist'. Nor does one take up the existing figure of woman to repeat or perform it ironically (Cornell 1991). For both these

positions – that we must negate gender or perform it parodically – suffer from simultaneously overvaluing and undervaluing thinking. Such strategies overvalue thinking by assuming that one can pass from recognising the fantasmatic status of thinking to adopting a distanced and critical attitude; at the same time, the future potentiality of thinking is constrained by not creating or writing other modes of perception. For the Oedipal structure is just that, a style or mode of perceiving: one views the world as a subject, as a point of view opening onto a world that is structured and differentiated according to a certain common logic. The broader claim and project of Deleuze and Guattari's *Anti-Oedipus* is to destroy that style of subjectivism by creating a mode of thought that is not that of a world differentiated by 'a' system of signification for 'the' speaking subject. Becoming-woman is one of the ways in which they imagine a different mode and temporality of perception: not a world that I can only live as always already differentiated, a world to which I am subjected, with only a fantasmatic or negative 'beyond'.

II.

The problem of considering the worth of political or tactical concepts such as 'becoming-woman' opens onto the broader terrain of human stupidity and the relation between stupidity and time. Is it sufficient for us to look back across the philosophical or literary corpus, spot the moments of racial, gendered, sexual, ethnic or historically embedded bias (where thought has allowed itself to be captured by cliché), and then proceed to separate the dynamism of ideas from the stupidity of unthinking inertia? If this were so, then one could see modernism as an attempt to rid thought of its opacities in order to arrive at a moment of renewed vision. One would overcome the limits and biases of thought to arrive at a pure becoming. (And one would apply the same to Deleuze and Guattari, reading certain aspects of their corpus as moments of a 'little Oedipus', where they remained too faithful to their forebears [de Landa 2003].) By contrast, an acknowledgement of something like a transcendental stupidity (Deleuze 2004: 187; Ronell 2002: 20) would require us *not* to see becoming-woman as a local movement, adopted in the late twentieth century to take us once and for all beyond man. Becoming-woman would be a perpetual act of war, waged against both the upright morality of man *and* the redemptive otherness of woman. Further, this might relate to the broader project of a counter-organicism: destroying the parochialism in which the thinking body folds the world

around its own practical needs, imagining itself as a thing among things. There is another capacity for thinking, which would take it beyond its own bounded self, and would do so via perception. Becoming-woman might possess some privilege or legitimacy, not just because it was *not* the perception of man, and not because it would be perception from another point of view, but because it would shift the problem of point of view. Becoming-woman would *not* be perceiving as a woman, but perceiving in such a way that perception would be a form of becoming.

This way of reading becoming-woman would relate directly to Woolf's refusal to think of sex alongside her use of point of view, where sentences move ever closer to intuiting the world of the beings that the narrative voice perceives – the worlds perceived by waves, particles, moths, light and air. In this respect one might read *The Waves* as a Deleuzian/Leibnizian monadology that expresses the truth of the relative rather than the relativism of truth. That is: it is not the case that we are enclosed within signs and can only perceive the world at one remove (where stupidity would be a negative limit, an inability to escape already constituted points of view). Rather, the world is composed of multiple perceptions and points of view, each one finite, but through finitude disclosing the capacity of the world to produce ever more perceptions. There is no grand perception of the whole, no truth of the world beyond perception, but this is because of a positive stupidity: it is precisely in the smallest and most located of perceptions that the world discloses its differences. *The Waves* oscillates between the personal or human attribution of perceptions ('I see . . . ') to the perceptions of a thousand tiny glances. In *The Waves* the sentences shift from human observers who, via perception, are becoming-imperceptible – 'We are whirled asunder. My sense of self almost perishes' – to natural description – 'The sun rose' – to birdsong: 'In the garden the birds that had sung erratically and spasmodically in the dawn on that tree, on that bush, now sang together'. The description of birdsong then shifts and the birds become possible observers, 'perhaps they saw the splendour of the flowers making a light'. What the birds 'perhaps' see is not a world of things, but other perceptual relations, the falling of water producing a possible lens that opens a new world: 'Or they saw the rain drop on the hedge, pendent but not falling, with a whole house bent in it' (Woolf 2008: 59).

To accept a transcendental stupidity is to elevate thinking above the upright image of pure thought and to encounter a swarm of becomings. Becoming-woman would be a strategy that refused both the Lacanian

notion that 'woman does not exist' (or that woman has served as a lure to cover the fact that we are necessarily subjected to a symbolic order that produces the effect of an originary plenitude) *and* an easy post-human exit that would escape man and woman altogether in a moment of post-feminist, post-cognitive and post-Cartesian unity. (One would need to distinguish here between those modes of post-humanism, such as that of Rosi Braidotti [2013] or Donna Haraway [2007] who see the post-human as an ongoing task and challenge, and those that declare the era of man to be already over.) *Becoming*-woman would be an affirmative rejection of reactive negations – would abandon the idea of stepping outside man once and for all – but it would also be a refusal of active submission, or the idea that we always already think within a system that we repeat parodically or ironically.

Becoming-woman, read as a twin refusal (of both purity and subjection), might not then be a minor or casual remark in the works of Deleuze and Guattari and would indicate a different mode of the politics of philosophy: the stupidities that populate the philosophical corpus – including the concept of 'woman' – are indicative of tendencies that always have two sides. The concept of becoming-woman would be beyond good and evil: neither a sign that we might move beyond man to some redemptive outside, nor a mark or stain in Deleuze and Guattari's work that signals a moment of weak (1960s and hippy) and unthinking feminist sympathising. Rather, the concept itself – considered as a *concept* created to do work in reconfiguring the philosophical plane – serves both to reorient the speeds and styles of thinking, and to confront philosophy's concepts with its own stupidity (Weinstein 2010). To this extent, the creation of the concept of becoming-woman might also be aligned with a certain style of modernism: at once recognising that the canvas is always populated with clichés (Deleuze 2005: 8, 61) and that we speak in a wasteland of dead phrases, while at the same time affirming that the refusal of cliché and dead letters does not give us some grand present of rebirth, but instead a more profound death. (Later in this essay I will turn to Woolf's story on the perception of the death of a moth. It is the witnessing and writing of death, the perception of the waning of the spark of life, that takes writing beyond the expressing subject to the life that gives itself in both annihilation and survival.)

In what follows I will argue that a certain valorisation of becoming-woman is already at play in dominant modes of literary aesthetics and politics, and that it is a refusal of this assumed or normative

becoming-woman that is enabled by a reconsideration of Deleuze and Guattari's mobilisation of Woolf's modernism. In brief:

1. If we read modernism as an anti-humanism of impersonality, in which the artist is nothing other than the voices he adopts (distanced from the panorama of futility that he surveys), then we arrive at a modernism of ironic elevation and negation (a modernism of heightened or hyper-subjectivism that perhaps paves the way for today's post-humanism in which man finds himself at one again with a creative life of which he is but one self-aware fragment).
2. Such a modernism would, therefore, be in line with a long tradition of celebrating literary 'becoming' in which writing is pure act, without determining essence, and in which the pure existence of the creative word destroys man as a being within the world and allows something like a pure subject to emerge – a subject who is godlike in his distance from any of the determinations through which he expresses an infinite productivity: 'For this is quite the final goal of art: to recover this world by giving it to be seen as it is, but as if it had its source in human freedom' (Sartre 1988: 63).
3. A *post*-modernism that followed such an anti-human and negative modernism would lead to at least one of the modes of post-humanism that is being affirmed today: a post-humanism in which there is, and never has been, anything like 'man', for man is nothing other than all the events, acts and perceptions that bring him into being (Hayles 1999: 3). Man would always be other than any determined 'man'. Man would always be pure 'becoming', and whatever was, or has been, determined by the notion of 'woman' would always provide man with a playground for his own self-becoming.
4. Against this, we might consider the Deleuze-Guattari-Woolf concept of becoming-woman in which writing occurs not as a self-unfolding but as an encounter with another becoming – two quantities entering into a differential relation. Becoming-*woman* would therefore not be a pure becoming in which 'woman' would stand for playful self-invention, but would be a becoming in which positive traits or tendencies would orient the event of writing. Becoming-woman would necessarily be only one moment in other becomings and would then open a necessarily sexual (but not gendered) writing: writing would be sexual because it would always be in relation to other relations, and sexuality would always

be a form of writing (but not signification) because encounters would produce distinct maps and orientations.

5. Whereas 'the signifier' indicates the dominant system through which the world would be mediated and would be central to theories of gender that define 'sex' as that which precedes and is presupposed by gender norms (Butler 1990), sexuality is tied to a mode of writing in which differences are inscribed in multiple strata. Sexuality would no longer be what takes place among signified genders, for genders would emerge from sexual processes (processes of inscription, tracing, marking, miming, coupling, distancing, perceiving): 'Sexual difference is the principle of radical difference, the failure of identity, destination, or finality. It is the eruption of the new, the condition of emergence, evolution or overcoming' (Grosz 2011: 103).

III.

Before we decide to consign becoming-woman to the dustbin of high theory (and its 'high theoretical', French and affirmatively pseudo-feminist) moments, it might be best to check just once more whether the concept (if it is a concept) has any purchase today. Here are the possibilities:

1. However we articulated feminist projects (equality, difference, androgyny, anti-essentialism) we are now in a post-feminist era. We have achieved whatever could be achieved via gender politics, and we now need to move on to more complex terrain, acknowledging complexities of class, sexuality, ethnicity and culture. Becoming-woman would be a post-feminist concept, a way of thinking the transition from molar women's movements to a micro-politics in which both man *and* woman would be abandoned as basic political units.
2. 'Becoming-woman' was indeed, as Deleuze and Guattari argued, the 'key to all becomings'. If something like the figure of man has been crucial to the ways in which politics has proceeded – assuming a basic social unit of a reasoning individual who acts in order to extend and maximise his interests – then this is both because a certain notion of becoming has been normative and because the figuration of the man of reason is thoroughly Oedipalised.

The liberal subject, as self-defining, is nothing other than his own becoming. One might recognise this valorisation of the self *as pure act*

as Oedipal (as Deleuze and Guattari do). According to this structure, the world as it is in itself lies beyond the capacities of finite human reason, and man can only know the world through the systems and order that he himself has constituted. Man is submitted and subjected to a system of his own making, beyond which he can neither think nor live. Without that system of differences 'he' would have no being. The Oedipalism of this mode of liberalism lies in its formalism and proceduralism: man is subject to a general system, and must always speak of the world only in terms that are shared and communicable; beyond that system of communication and ongoing legitimation there is only the chaos or fantasy of some lost origin. The notion of the 'beyond' of communicative reason, and politics generally, would be fantasmatic and other, figured Oedipally as that imagined plenitude that is constitutively lost when man accedes to the order of society. Man *is* becoming; he is nothing more than his own self-deciding and legislating actions. It follows, for Deleuze and Guattari, that there is no becoming-man; one cannot take on traits or styles or rhythms *of man*, because the very notion of 'man' is that of a being whose existence is nothing other than that of free self-variation. Becoming-woman challenges this normalising Oedipalism in a number of ways. First, if there *is* such a thing as becoming-woman, or entering into variation by taking up those traits and predicates that lie beyond man, then this is because what is other than man is not some dark night of undifferentiated chaos. There are other durations and pulsations of life. For Woolf, the task of writing was not – as one dominant definition of modernism would have it – to present the signifier *as signifier* and to de-naturalise a life that has (ideologically) presented itself as natural when it is indeed thoroughly human and historical (MacCabe 1979). Such a constructivist or mediated notion of reality would not only be Oedipal in Deleuze and Guattari's terms (presenting reality always as given only through organising systems), but would be in Woolf's terms fatally destroyed by sex: it would give the world to us only as it is *for man*. The alternative is not then to write from a specifically woman's point of view – for that too would be the world at one remove – nor to write the world of the animal, as if life were nothing more than multiple mediated and meaningful worlds. Beyond the world as it is given, there would be the durations and pulsations – the moments – from which worlds emerge: the task would be to write the waves and particles that might yield a pure perception. 'Man' would always be the being who – via language, meaning or his own sense of life – gives himself the world. Becoming-woman would be a mode of writing in which the waves and particles that compose the gender of woman might be released.

Deleuze and Guattari write of 'a Continuum inhabited by unnameable waves and indefinable particles':

> The properly musical content of music is implied by becomings-woman, becomings-child, becomings-animal; however, it tends, under all sorts of influences, having to do also with the instruments, to become progressively more molecular in a kind of cosmic overlapping through which the inaudible makes itself heard and the imperceptible appears as such: no longer the songbird but the sound molecule. (Deleuze and Guattari 1987: 248)

Working against the idea of the writer who exists above and beyond his handiwork, as some presupposed but never discernible ground, 'becoming-woman' is a process of saturation, in which the force of the world composes the writer (or perceiver) as a canvas or zone of perception, nothing more than a refraction of a shower of atoms:

> The mind receives a myriad of impressions – trivial, fantastic, evanescent, or engraved with the sharpness of steel. From all sides they come, an incessant shower of innumerable atoms . . . Is it not the task of the novelist to convey this varying, this unknown and uncircumscribed spirit, whatever aberration or complexity it may display, with as little mixture of the alien and external as possible? (Woolf 1925: 189)

Man is not a composer of the world, so much as one of the world's many compositions (an effect, rather than a ground, of becoming).

Second, 'man' as the basic political unit relies on a racial and historical (and, again, Oedipalised) narrative: in the beginning is the individual who enters into social relations for the sake of collective efficiency; from the nuclear family of father-mother-child, sympathies are extended to broader social groupings, with women also – eventually – being granted the right to enter the public sphere. But for Deleuze and Guattari, the reverse is the case: in the beginning is the territory, in which human bodies assemble according to various rhythms, durations and sympathies with the earth. From that original grouping, or organisation of the 'intense germinal influx', a certain deterritorialisation can occur whereby a single body stands above the group, figured as its point of law. That elevated 'despot' is able to territorialise the network of bodies, at least in part, through an excess of desire – including the taking over of women's bodies. (There would be some convergence here between Deleuze and Guattari's account of social machines being constituted through sexual consumption and Gayle Rubin's [1975] insistence that the token of 'woman' is constituted through systems of exchange. The difference would lie in Deleuze and Guattari's insistence that before there is exchange of women, or before woman is constituted as that which is

exchanged, there is theft: not theft in the face of scarcity, but a theft that produces a power of excess – the despot who, in seizing the surplus of all forms of production, becomes a distinct and organising point of power.)

When 'man' – in the liberal era – regards himself as the basic social unit, who gives himself law and mediation in order to avoid the chaos and psychosis of bare life, he must do so by repressing the racial and collective history that has passed from the intensive difference of life to the generalising figure of man. For Deleuze and Guattari it is not the case that life begins with a figure of man who must come to terms with his world (who must become social and extend from the biological family to the social collective); rather, it is after a long, complex and inhuman history – in which racial, sexual and organic complexity is increasingly reduced to general figures – that the supposedly underlying generality of the human emerges. Becoming-woman would be a way of releasing man from the notion that beyond the sexual binary there is only the primitivism of chaos; by looking at the coming into being of the genders of humanity one would open up a geology. This geology would then open out onto all the racial and historical differentials that have been frozen into the unit of man, and beyond that into all the differentials of life that have been reified into figures of bounded organisms opposed to unorganised matter.

Finally, becoming-woman would challenge both the linguistic figure of modern man, as well as all the declared post-linguistic (supposedly post-human) turns. The notion that we become subjects by submitting ourselves to the system of signifiers, and that we then live this subjection as a law that prohibits some maternal beyond, is thoroughly Oedipal. The concept of 'the' signifier is despotic, and both ties modern Oedipalism back to a history in which the complex territories of life have been subjected to a body that has leapt outside the assemblages of relations, and also looks forward to a 'postmodern' world in which there is supposedly no reality or world other than that given through signifying systems, or in which the pre-linguistic is always given *ex post facto* after the event of sex. If, by contrast, language were considered to be one of many systems – including systems of non-linguistic signs, such as all the gestures we read in a lover's face, or the signs of art in which formed matters can be presented as signs of colour or light as such – then it might become possible to liberate writing from 'the subject' (Deleuze 2003: 167). Becoming-woman would signal that there are positive modes of difference and articulation. It is not language that differentiates; the differences of language overcode far more complex systems. Becoming-woman opens up a positivity that not only destroys

the notion that language differentiates (because there are traits that one can follow, develop, vary and extemporise beyond the man of linguistic communication), but also challenges various supposedly post-human or post-linguistic motifs. It would do so by destroying both the natural kinds of bounded sexes (male or female) and the notion of constructed genders; in its place there would be neither a gender politics nor a sexual politics (in which the polity would be a site for the contesting of variously sexualised interests), but there would be a sexuality of becoming. Every becoming would be sexual because no becoming is a power unto itself: there is no self-present, self-sufficient, self-organising power. When we perceive something like an essence (such as what colour *would be* in all of its potential manifestations for any time whatever), we perceive the force of its expression, a power's capacity to differ in all its events of encounter and actualisation.

IV.

There should be something disturbing, destructive and untimely about the concept of becoming-woman. If we were to define becoming-woman as a temporary strategy of the women's movement, then we would be assuming an orthography of thought: it would be as though we might use certain concepts provisionally, achieve the aims of the women's movement, cleanse thought of its opacities and stupidities, and then move on. But what if man were a persistent transcendence: a tendency of thought or life to be captivated and rendered docile by images of good sense?

One of the notions that lie behind various 'turns' – the affective turn, the vital turn, the performative turn, the non-human turn – is that the figure of man, and the notion of linguistic construction, was an error or false turn that can be overcome by turning to the true life and vitality that is man's real milieu. It is as though we might recognise, by an act of reason, that there is no such thing as man and that we are in fact really emotional, embodied, affective and active beings who – following that recognition – can now live interactively, ecologically and dynamically. The Cartesian subject would be an accident or error that we could will away by an act of decision, allowing us to become post-human and at one with a single world of interconnected life. I would suggest that we think otherwise: Cartesianism is neither an unfortunate nor external lapse, but a result of a tendency for thought to be captured by its own images (Toscano 2010). That tendency – like all tendencies – has two sides, and it is the task of becoming-woman to *deterritorialise* those

traits from which the 'man' of modernity has been composed. According to Deleuze and Guattari's theory of becoming-woman, it is not by annihilating one's being and then taking up a relation of proper knowing towards one's milieu that one overcomes the miserable normality of 'man'. Rather, becoming is always a relation *to* some other becoming: there would be no post-human world or single ecology that we could arrive at after man. Becoming-woman would be *one* line of exit, one way of thinking some mode of duration and rhythm that would yield a particular refrain. From there one might discover other differential pulsions. There would not be a single ground of life that could be retrieved or found after man; but there would be multiple ways in which one might encounter 'a' life. Each predicate, trait or singularity would open to the infinite in its own way. By beginning with woman – and not some general notion of becoming – one would be adopting the truth of the relative (which is quite different from the truth of relativism). And it is here again that we might turn to Woolf and writing: the imperative to write is counter-democratic, if by democracy one were to refer to consensus or majority opinion (and it is no surprise that in this respect modernism in general has been accused of having a certain contempt for the masses). But there might be a destructive, rather than deliberative, democracy in writing and becoming-woman whereby everything that has stood for good sense and propriety is annihilated by a constant and exacting perception. Rather than begin with a relativism, in which there is no view of the world outside that given by various voices, becoming-woman aims to write from a positive perception of traits, with each intuition opening towards a power's capacity. There is a truth of the world, but it is given infinitely, from all the powers to perceive that compose the world in their own way. This might help us to think the specifics of Woolf's style, and the ways in which she writes, neither in a strict free-indirect style (in which sentences occupy a certain mode or way of speaking) nor in stream of consciousness.

One of the key features of Woolf's mode of writing might be given in the contrast between a deliberative democracy and something like a democracy of powers, or what Deleuze refers to as the 'swarm' of the world. Jacques Derrida, for example, has argued that literature is tied to democracy in its capacity to 'say anything'; because the literary text detaches what is said from any ownership of the voice, language circulates freely, *as language*. We see text as text in its own right, producing its relations and differences, performing a relation between inside and outside in its 'scene of writing'. Woolf, by contrast, speaks of her own writing as oriented towards the expression,

perception, articulation and life of other powers: waves, moments, particles, predicates or qualities: 'Life is not a series of gig lamps symmetrically arranged; life is a luminous halo, a semi-transparent envelope surrounding us from the beginning of consciousness to the end' (Woolf 1925: 189). If a certain privileging of writing manages to relativise the world, presenting the world as always a world from this or that point of view, then Woolf's privileging of perception and intuition would always tie writing to the forces that prompt its movement: 'no perception comes amiss' (154). Becoming-woman is not a writing of, or about, sex – but the writing of becoming-woman is sexual in being drawn towards powers not its own. Such writing would not be a form of relativism, but it would open the truth of the relative, that each perception opens *in its own way* onto an infinite and dynamic whole (Deleuze 2006: 21).

There is a truth of the relative that would open towards an ethics of *amor fati*, or an embrace of the encounters that do violence to thinking (without the prima facie assumption that we know what thinking is). Liberalism is, by contrast, a powerful ethics of relativism: I cannot know the law, cannot know the other's good, cannot make an exception of my own desires or opinions on the basis of possessing better or higher knowledge; from there it follows that I can only act and speak through deliberation and an ideal of consensus, aware all the while that every achieved consensus must be open to further deliberation. Relativism would not be an acceptance that 'anything goes', for it would require me to decide upon those systems that enabled the maximum plurality of opinions; a liberal might have to intervene in cases where unjustified exceptions were imposed. But relativism would be in line with what Deleuze refers to as 'equivocity': there is the world as it is on the one hand, and the world as it is known on the other. Deleuze's univocity posits one substance expressing itself in infinite difference, in which all voices sing the truth of being in their own way: 'MONISM = PLURALISM'. The truth of the relative, in contrast with liberal formalism, would pose a quite different imperative. There would be no possibility of a 'veil of ignorance' that would allow one to act *as if* one might speak from an ideal position of 'nowhere'. Whereas liberalism insists that one can only speak *as if* one might be any subject whatever, Deleuze and Guattari offer a counter imperative to speak for 'any moment whatever': what a force or power would be in all its expressions and actualisations. There would not be 'a' world that might be suspended in order to think in a manner that was purely formal or procedural. There would be multiple worlds, each opened from the

force of a single becoming. It would be the challenge of perception and thinking to encounter the difference of those worlds, not find some abstract point or field of conciliation.

V.

If the foregoing is true, it follows that becoming-woman is only one possible trait or singularity among others, and that its power lies in moving beyond the historical formation of 'man'. If so, with the end of man and the end of liberalism we might also have reached, happily and finally, the end of woman. As already stated, there can be no becoming-man, no orienting oneself towards the styles and motifs of 'man', because man *has always been pure becoming*. He is nothing other than that which exceeds and precedes any of his given acts; his essence is to have no essence other than that which he gives himself though existing. Once becoming-woman opens 'us' (we humans) to the notion that becoming is always singular, always the becoming of this or that singularity and always in responsive relation, then writing would be presented with the tireless and ongoing destruction of genders and proliferation of sexes; it is not that there are beings – women – who become. Rather, what something *is* is its rhythm of becoming. The refrain that beats time to this rhythm is always in relation to other refrains. Becoming-woman would be an orientation to those traits that had been posed as man's other, but once this orientation opened up positive and divergent becomings, we would need to move beyond genders and dehumanise the predicates through which genders and sexual difference had been contained.

Such a jettisoning of becoming-woman would seem to be particularly urgent today, precisely because there is no longer any reason to adopt strategies against liberalism and humanism in a twenty-first century when the problems of climate change, terrorism, systemic economic collapse and mass disenfranchisement are no longer suitably countered by tactics of anti-humanism. It would seem that both sides – both rapacious global capital and post-left, post-feminist thinking – accept that there is no such thing as the man of reason. It is no longer the case that the ruthless market forces of capitalism present themselves as outcomes of free and open individual decision making. In the US, where 'liberal' has become a pejorative (referring to the destruction of family values and leftist interventionism in free markets), the notion of the freely deciding individual seems to have less political force than the sanctity of the markets and efficiency. This is so much the case that when the 2010 US Supreme Court decided that corporations were individuals,

it was the left that was forced to defend the human individual, against the notion of free buying power that could operate beyond a bounded human person. Bourgeois liberal humanism is not the ideological enemy it once was. It would seem to make sense to exit this terrain altogether. In the era of global finance – where there is no longer any capital to buoy up capitalism, and where systems operate by hedging, default swaps, futures and derivatives – it makes no sense either to return to the individual against corporations, or to celebrate some post-human end of man in one great ecology of becoming.

'Theory', too, seems to have long abandoned man, the subject, the system of signifiers and (even strategic) essentialism. After language there was the turn to the body, in which sex could only be known as that which had been belied and reified by gender. If we go beyond the frame of the subject who must recognise herself through the gender system, then we are left with a vital, affective, emotive and non-human order that may be *sexual* (in its proliferating relations, attachments and mutations) but certainly not gendered. If we get over all our feminist and leftist gripes, recognising that workers and women can no longer offer us some outside lever against a patriarchy that no longer has any men left to hold the fort, then it seems the appropriate direction to move towards would be beyond human figures *tout court*.

To pause and offer a possible conclusion: 'becoming-woman' may have had its time, may have once indicated that without *some* attention to sexual difference there could be no real escape from the rigid logic of man, but after more sustained work on sexual difference beyond gender binaries, we should accept that becoming-woman is, as Deleuze and Guattari suggest, the 'key' to all becomings, and that we have moved beyond the 'key' moment to more nuanced post-human (perhaps even post-sex) becomings.

Here is the problem, or series of problems, with such a consignment of this 'key' of becoming-woman to the past: first, do we accept that humans have the capacity to assess their figural and semantic history, locate gender motifs in a blind past, and then move on to the post-human? Do we grant the human species a capacity to see life as it properly is without the intrusion of rigid stupidities, and would life be the type of 'thing' we might view once we liberated ourselves from humanist framings? (Here, I would suggest that we read Deleuze and Guattari alongside Paul de Man's concept of the sublime, where the exit from anthropocentric projection would not be an intuition of nature or the lived world but a brute sense of materiality.)[3] Second problem: do we accept that within a corpus, such as Deleuze and

Guattari's, where the historical event of capitalism and the discovery of the differential calculus disclose some universal truth of life as such, that sexual difference is an unfortunate dated motif that can be grouped with Deleuze and Guattari's almost embarrassing references to drugs (as though they were a little too sixties-ish at certain moments)? Here we would assume some practice of critical hygiene, where the real philosophy and theory might be detached from the unthinking regression to dated stupidities. Doing so would rely upon a distinction between free unimpeded thinking on the one hand, and an external milieu of inherited notions on the other. And it is just that notion of thought as pure self-becoming that Deleuze and Guattari sought to question. Third problem: what do we do with what remains of the archive? Do we stop reading all the works of fiction and cinema that are structured around gender binaries? Do we (theorists or literary critics) place ourselves in a world other than that of a still present and insistent gender binary? Do we avoid the evidence that it is easier to imagine the end of the world and the end of capitalism than it is to imagine the end of gender? Perhaps the problem with Deleuze and Guattari's affirmation of becoming-woman as the 'key to all becomings' was not its dated seventies radical-feminist hint of sexual politics, but its suggestion that one might and should move from becoming-woman to becoming-imperceptible. It seems that in our post-human, eco-aware, post-liberal, post-capitalist and even post-racial world we still remain firmly gendered. This is because gender is not just one mode of establishing distinct kinds, a mode that could be abandoned once we take on a 'process' notion of being or a vitalist and dynamic conception of creatively evolving life; for gender is *the* difference that has been deployed to figure difference in general. And it is gender – the tired male/female binary – that covers over a profound and multiple sexual difference beyond bounded kinds.

It would follow, then, that if we do *not* pass through becoming-woman, and if we go straight to becoming-imperceptible without engaging with the logic of man, then all our post-humanisms will remain as ultra-humanisms. And, to return to Woolf, it would not be the case that Woolf *added* the problem of woman to modernist projects, but rather that whatever modernism would be (whether an apocalyptic vitalism or an affirmative refusal of the trajectory of the West), writing would be destroyed by thinking of one's sex. Writing would need to take place beyond man, which in turn would require a destruction of 'woman'. The structure of *To the Lighthouse* expresses this at the level of content: the first section is organised around familial figures of gender. Mrs Ramsay appears as the epitome of maternal care and

other-directedness; and this female-maternal empathy is opposed to the 'subject/object' philosophy of Mr Ramsay. This 'window' section of the novel, a section with a relatively clear demarcation of narrative voice and character, is severed by the middle section, 'Time Passes'. The final section – following Mrs Ramsay's death and the falling of darkness – describes Lily Briscoe being taken over by the matters that are presented to her. Her 'vision' follows what Deleuze and Guattari describe as haptic; it is as though the eye can *feel* the paint and canvas and draw out its tendencies. The canvas presents itself not as a milieu for creation ex nihilo, but as a resistance or force that elicits a certain mode of becoming. The canvas itself bears a perceptive power or 'cold stare':

> She saw her canvas as if it had floated up and placed itself white and uncompromising directly before her. It seemed to rebuke her with its cold stare for all this hurry and agitation; this folly and waste of emotion; it drastically recalled her and spread through her mind first a peace, as her disorderly sensations (he had gone and she had been so sorry for him and she had said nothing) trooped off the field; and then, emptiness. She looked blankly at the canvas, with its uncompromising white stare; from the canvas to the garden. There was something (she stood screwing up her little Chinese eyes in her small puckered face), something she remembered in the relations of those lines cutting across, slicing down, and in the mass of the hedge with its green cave of blues and browns, which had stayed in her mind; which had tied a knot in her mind so that at odds and ends of time, involuntarily, as she walked along the Brompton Road, as she brushed her hair, she found herself painting that picture, passing her eye over it, and untying the knot in imagination. But there was all the difference in the world between this planning airily away from the canvas and actually taking her brush and making the first mark. (Woolf 1981: 119)

Lily's becoming is not one of self-unfolding, but an encounter between a physical sensation of surging forth that achieves 'an exacting form of intercourse'. If there is a post-human element to this becoming, it does not lie in a return to life so much as a separation or detachment from the lived:

> With a curious physical sensation, as if she were urged forward and at the same time must hold herself back, she made her first quick decisive stroke. The brush descended. It flickered brown over the white canvas; it left a running mark. A second time she did it – a third time. And so pausing and so flickering, she attained a dancing rhythmical movement, as if the pauses were one part of the rhythm and the strokes another, and all were related; and so, lightly and swiftly pausing, striking, she scored her canvas with brown running nervous lines which had no sooner settled there than they enclosed

> (she felt it looming out at her) a space. Down in the hollow of one wave she saw the next wave towering higher and higher above her. For what could be more formidable than that space? Here she was again, she thought, stepping back to look at it, drawn out of gossip, out of living, out of community with people into the presence of this formidable ancient enemy of hers – this other thing, this truth, this reality, which suddenly laid hands on her, emerged stark at the back of appearances and commanded her attention. She was half unwilling, half reluctant. Why always be drawn out and haled away? . . . It was an exacting form of intercourse anyhow. (Woolf 1981: 158)

What emerges is not a figure or scene that expresses the world as it is, but something like difference as such, a line that makes no claim to a physical eternity – for the canvas may lie unviewed in an attic until its destruction – even though it expresses the power of colour and difference for all time:

> Quickly, as if she were recalled by something over there, she turned to her canvas. There it was – her picture. Yes, with all its greens and blues, its lines running up and across, its attempt at something. It would be hung in the attics, she thought; it would be destroyed. But what did that matter? she asked herself, taking up her brush again. She looked at the steps; they were empty; she looked at her canvas; it was blurred. With a sudden intensity, as if she saw it clear for a second, she drew a line there, in the centre. It was done; it was finished. Yes, she thought, laying down her brush in extreme fatigue, I have had my vision. (Woolf 1981: 209)

But it is not only the young female artist whose perception opens onto a world of other durations. Woolf's essay, 'The Death of the Moth', begins in standard third-person description, assuming a common point of view:

> Moths that fly by day are not properly to be called moths; they do not excite that pleasant sense of dark autumn nights and ivy-blossom which the commonest yellow-underwing asleep in the shadow of the curtain never fails to rouse in us. (Woolf 1942: 4)

This 'us' of common accepted perception is disturbed by the passage of perception, which eventually discerns something akin to 'an energy'. The passage begins with description of rooks, but then passes to a different subject of the sentence, 'the same energy':

> The rooks too were keeping one of their annual festivities; soaring round the tree tops until it looked as if a vast net with thousands of black knots in it had been cast up into the air; which, after a few moments sank slowly down upon the trees until every twig seemed to have a knot at the end of it. Then, suddenly, the net would be thrown into the air again in a wider circle

> this time, with the utmost clamor and vociferation, as though to be thrown into the air and settle slowly down upon the tree tops were a tremendously exciting experience.
>
> The same energy which inspired the rooks, the ploughmen, the horses, and even, it seemed, the lean bare-backed downs, sent the moth fluttering from side to side of his square of the windowpane. One could not help watching him. (Woolf 1942: 4)

The subject then becomes an impersonal 'one', so that what is being described is a passage from a living being (rook), to the energy that enables that life, and then to something like that energy's perceptibility:

> Watching him, it seemed as if a fiber, very thin but pure, of the enormous energy of the world had been thrust into his frail and diminutive body. As often as he crossed the pane, I could fancy that a thread of vital light became visible. He was little or nothing but life.
>
> Yet, because he was so small, and so simple a form of the energy that was rolling in at the open window and driving its way through so many narrow and intricate corridors in my own brain and in those of other human beings, there was something marvelous as well as pathetic about him. It was as if someone had taken a tiny bead of pure life and decking it as lightly as possible with down and feathers, had set it dancing and zigzagging to show us the true nature of life. Thus displayed one could not get over the strangeness of it. (Woolf 1942: 4)

The passage of perception, traced from the rook, to energy, to watching to the moth, then travels back via an explicit figure to first person: 'I could fancy that a thread of vital light became visible'.

> The insignificant little creature now knew death. As I looked at the dead moth, this minute wayside triumph of so great a force over so mean an antagonist filled me with wonder. Just as life had been strange a few minutes before, so death was now as strange. (Woolf 1942: 4)

The 'death' here is not a death drive in which life is a quantity of energy aiming to return to quiescence; it is a positive and multiple death in which the sparks of life become discernible in their distinction and singularity as they approach some degree zero. Deleuze and Guattari's notion of becoming-woman, like becoming-animal, is not one of copying or miming, but operates by the perception of traits: and this positive and relational notion of becoming would help to explain why there could be no becoming-man. It would also require a subtle distinction between becoming-woman and various notions of performativity. It is not the case that one becomes who one is by repeating an already given norm or imperative, and then concluding that there must have been

a subject who was the agent of the action. On the contrary, what is repeated when one becomes-woman is not the resulting effect – such as female qualities – but the differential power from which such qualities emerge. In this sense becoming-woman is the reversal of a performative pragmatics or strategic essentialism; one does not adopt a style or norm and then destabilise the figure of woman from within, nor adopt the role of 'woman' ironically (Cornell 1991). Rather, one repeats the tendencies, traits or rhythms from which the figure of woman emerged.

The difference, if you like, is that between Madonna (or Lady Ga Ga) and a Marilyn Monroe impersonator. The latter focuses on the end result and may come to that actuality by any possible ends (cosmetic surgery, practice of speech inflections, mirroring of Marilyn's walk, the re-creation of certain specific dresses); the former repeat tendencies, seizing the event of performance, style, display and movement, becoming a hyper-feminine and yet singular icon. If woman – as an actual social figure – appears as a general composition of certain styles of dressing, moving, desiring, dissimulating, looking, displaying, speaking and feeling, then becoming-woman begins with exploring different modes of dress, appearance, affect and movement. If Marilyn Monroe was a singular expression of a tendency of body-voice-face-screen stylisation, then repeating that differential power (rather than copying the result) would approach something like becoming-Marilyn. One of the key features of the notion of the trait is tied to a broader notion of singularities or pure predicates: each actual individual occurs as the differentiation of a potentiality. Each human body comes into being by drawing on a range of virtual potentialities, and continues to do so for her entire life: not only does my ongoing biological and neurological identity occur in my relation to other powers (such as my brain becoming a reading brain after encountering script, my eye becoming more and more readily distracted with the purchase of various portable screen devices, my bones becoming stronger after years of running, or my blood pressure rising after decades of a Western diet), it is also the case that my given capacity to become in these ways has a long racial, cultural, sexual and political history. This is the partial truth of evolutionary psychology and cognitive archaeology, which have sought to trace our current responses and capacities back to a hunter-gatherer and warring tribal past, along with the early human gendered division of labour. But the problem with cognitive archaeology is not its seeming sexism, or its assumption that 'men are from Mars and women are from Venus'. The problem is that these 'just so' stories are not sexist enough; they do not discriminate sufficiently, nor do they pay adequate attention to

the sexuality of discrimination. Man – the hunter-gatherer and hyper-attentive tribal prototype of our past – is already the result of a desiring history: formed by assembling in territories, organising the body to react first collectively, and then privately, to visual stimuli. As the history of man and social machines continues, what counts as 'man' is the result of reducing racial intensities and sexual difference, and then proposing that there is 'man' in general, eventually emerging as the reading-thinking-reasoning individual of modernity.

To begin to think about the 'traits' that would compose an event of becoming-woman would require both an attention to manifestly stylistic features from which any woman (or man) is composed – so that acts of drag would emphasise the performance of gender in terms of dress, body grooming and modes of comportment – but also to broader traits, the geologies of which are traced by Deleuze and Guattari in the universal history of capitalism. The reading eye that judges in accord with the measuring hand, and that in turn feels itself to be a subject of speech submitted to 'the' law: this composition of the human animal is, Deleuze and Guattari argue, racial and sexual. The notion that there is some universal underlying humanity, presented in general as 'man' (and about whom various neo-Darwinists might theorise), occurs *after* certain traits have been rendered hegemonic, and after a certain understanding of sexuality as private and familial has reorganised (or reterritorialised) collective qualities onto the individual. It is only if I assume that one becomes human by abandoning one's pathological and exceptional (racial, sexual, ethnic) particularities, and does so in order to enter into the great enlightened conversation of consensus, that sexuality is deemed to be private, personal and individual. For Deleuze and Guattari politics and history are sexual: social machines are formations of desire – both the despot becoming powerful by hoarding, consuming and visibly enjoying the violence of public torture, and the later formations of fascism where a series of traits mobilise a body politic (swastikas, jackboots, tanks, anthems, the straight lines of modernist design and so on).

VI.

The concept of becoming-woman – and I would suggest that we think of it as a concept, created to reconfigure a plane of related notions – is tied to a broader history of capitalism. Capitalism, Deleuze and Guattari argue, has always been 'warded' off by various social machines that seek to limit and overcode flows and exchanges: this ranges from obvious

examples, such as early modes of despotism and feudalism in which there is no open market and a hoarding of goods by a central power, to early modern laws against usury, sumptuary laws, royal displays of excess and protective subsidies, as well as a broader and more subtle fixing of bodies as units of exchange (such as capitalist democracies where labouring bodies and commodities become the two flows of capitalism). Becoming-woman is not a solely feminist gesture, or if it is, it is only because feminism (for Deleuze and Guattari at least) is a path to a broader critique. Capitalism is the abstract essence of social machines: desiring life is composed of quantities entering into relation, and it is from those dynamic relations that relatively stable points of bodies are composed. Bodies – human bodies, political bodies, economic bodies, corporate bodies – are mixtures of powers. Quantities, entering into relation, become qualities, and those qualities in turn become relatively stable bodies. Capitalism tends to liberate quantities from bodies, releasing labour power and commodities into a general system without fixed centre or transcendent body, but capitalism also limits the free flow of quantities through an axiomatic of exchange. Nowhere is this axiom more evident than in liberalism, both in its economic form of laissez-faire exchange (which is always an exchange via the market), and in liberal political theory in which I am nothing other than a capacity to deliberate and communicate, always capable of imagining what it would be to think of justice, in general, regardless of my position in the polity.

By contrast, becoming-woman would not abstract from concrete individuals to individuals in general – would not operate *ironically* by imagining that justice or humanity would occur as regulative ideas towards which a process of consensus would tend, but never achieve. Nor would becoming-woman be post-human, if post-humanism were taken to be a return of man to a world of living systems of which he would be but one of many instances. Rather, becoming-woman is the beginning of a humour of depths, moving towards the traits, singularities or predicates that have been actualised by differentiation – and then moving towards the intuition of a virtual potentiality that has a full reality beyond the world as it is given. Becoming-woman would be quite distinct from a performative theory of gender, whereby I become who I am by recognising and seeking recognition. Rather, becoming-woman enables a creatively destructive theory of sexuality in which genders are decomposed into traits, and then further decomposed into tendencies, moving towards the infinitely small, or 'a thousand tiny sexes'.

When Deleuze and Guattari write about capitalism, they do not adopt the still current criticism that capital reduces the qualitative complexity

and richness of the world to system and quantities, with the implication that if we overthrow capitalism's reduction of qualities to quantities, we will return to the full dynamic flux of the world (to the praxis from which technological systems emerged). Deleuze and Guattari are not what Mark Protevi and John Bonta refer to as 'flow enthusiasts'. The problem, for Deleuze and Guattari, is that capitalism is not systemic enough, not quantifying enough, not sufficiently technical. We allow certain blunt figures – such as the image of the working, desiring man of reason – to operate as a limit and lure. It is as though exchange must always serve individuals' interests, and yet we do not ask how it is that something like human interests are constituted historically. How has the commodity-acquiring, property-owning, familial, heterosexual, labouring, reading, judging and political man of modernity been formed? And has not the figure of gender been crucial here: man is deemed to be defined against a femininity that is caring, nurturing, other-directed, domestically attuned, emotional, empathetic and oriented towards a man who will provide suitable genetic material? The current vogue for evolutionary psychology or cognitive archaeology is evidence of a tendency to explain quantities and tendencies from already qualified forces: we argue that the gender system emerges from (say) male interests in spreading as much genetic material as possible, and female interests in investing in quality partners. What we fail to look at is how those bounded forms emerged from intensities: how the human body becomes a gendered, familial and identified labouring individual.

Life arrives, historically, at capitalism because of a certain potentiality that has been 'captured' by capitalist political systems, by relatively open markets. Relations amongst intensive quantities, such as the various forces of a body entering an encounter with (say) the intensive potentialities of another body, are organised in capitalism as a relation between labour and capital. The standard political response has been to try to find some point outside of exchange; but Deleuze and Guattari aim to take capitalism beyond itself. What is required is not a step outside exchange and quantities, but more exchange, more quantification, a multiplication of powers and encounters. Capitalism is neither quantifying nor systematising enough; what is required are far more nuanced, discriminating, systemic (rather than imaginary) systems.

Here, then, one might begin to see the force of becoming-woman: what if the figure of 'man', the supposed basic social unity of life – a unit that today has become entirely rigid in the proliferating pseudo-Darwinian narratives about the emergence of morality, language, art and all other human practices – were to encounter other traits? As

already noted, the concept of becoming-woman is not at all similar to strategic essentialism; it is not the tactical adoption of the voice of woman in order to create a political force. On the contrary, becoming-woman acknowledges the reality of traits, intensities and quantities that need to be released from the dull and insufficiently nuanced systems of gender. It is not the case that – as a certain mode of deconstruction would have it – the concept of woman is some imposed abstraction that has no reality, allowing one only to speak as a woman parodically or ironically. Nor is it the case that 'woman' is some signifier that we are subjected to, which then creates the illusion of the reality of sex. Rather, what has fallen under the concept of woman has *more reality* than the insufficiently technical and systemic concept of 'woman' in its current form allows: what if, historically, what we know as woman were composed from series of complex tendencies? *Becoming-woman* appears, after all, as a concept in Deleuze and Guattari's *A Thousand Plateaus* where the modern figure of political man covers over a complex, multiple and intensive history of racial and sexual investments. Practices of marriage, kinship, reproduction, pornography, art, fiction, courting rituals, fashion systems, cosmetic surgery, sports, affective rituals, body styles (and so much more): all these are techniques operating in highly complex ways that neither the notions of gender (as two stable kinds) nor sexual difference (as reproductive chromosomal identity) can intuit. It is fatal, when writing, to think of one's sex. Here we can turn back to Woolf's task of writing: not only does she argue that writing follows from a nuptial that must fall back into darkness, but a darkness of intense difference (so that good writing requires an androgyny that is the consummation rather than annihilation of difference); she also insists that sex requires writing. There is no identity of woman lying in wait to be described, but must be created in an encounter with the force of perception.

Notes

1. I quote Ronald Reagan from his first inaugural speech as governor of California, 5 January 1967, for whom freedom was 'never more than one generation from extinction'. This Reagan quotation was repeated recently by Julianne Moore (playing Sarah Palin) in the 2012 HBO film *Game Change*. Such a reminder of generation-paced extinction was timely in 2012 when the constant threat of civil rights reversals seemed to actualise into a fully fledged war, both with a supposed 'war on women' and with a resurgence of claims of racial lynching. (Democrats accused Republicans of opening a war on women when certain states legislated for compulsory vaginal probe ultrasounds prior to pregnancy terminations, while Republicans countered with an attack advertisement against 'Obama's War on

Women' because the Obama campaign accepted donations from a supposedly misogynist comedian Bill Maher [Halper 2012].) The March 2012 killing of Trayvon Martin was not only compared to a lynching, so were the following calls for his alleged killer's arrest. An article on 'The Lynching of George Zimmerman' (Martin's alleged killer) was posted on Occidentaldissent.com immediately following large rallies calling for Zimmerman's arrest following what Democracynow.org declared to be a 'modern day lynching' (Democracy Now! 2012). Wars and lynching: none of these seems at all 'post' anything, and so we might wonder why we would want to complicate matters at all by turning to 'becoming-woman' when the basic 'molar' issues of race and gender seem so intractable. On the other hand, maybe the fact that we seem to be *still* involved in wars and lynching demands that we think of other strategies.

2. The idea that the end of the world is easier to imagine than the end of capitalism is widely quoted (though the source is vague). See Jameson 2005: 199; Žižek 2011.
3. Paul de Man, *Aesthetic Ideology*: 'The dynamics of the sublime mark the moment when the infinite is frozen into the materiality of stone, when no pathos, anxiety, or sympathy is conceivable; it is, indeed, the moment of a-pathos, or apathy, as the complete loss of the symbolic' (De Man 1996: 126).

‘Nothing is simply one thing’: Woolf, Deleuze and Difference

Beatrice Monaco Open University

Abstract

This paper explores some key texts of Virginia Woolf in the context of Deleuzian concepts. Using a close reading style, it shows how the prose poetry in *Mrs Dalloway* engages a complex interplay of repetition and difference, resulting in a remarkably similar model of the three syntheses of time as Deleuze understands them. It subsequently explores Woolf’s technical processes in a key passage from *To the Lighthouse*, showing how the prose-poetic technique systematically undoes the structures of logical fact and rationality inscribed in both language and everyday speech to an extremely precise level.

Keywords: Virginia Woolf, Deleuze, difference, repetition, three syntheses of time, rhythm, prose-poetry

It is possible for there to be multiple Deleuzian ‘readings’ of Woolf depending on which theories or sets of terminology we choose to visit in the process. We are fortunate that in her non-fictional writings (letters, diaries) Woolf left ample explanation of her technical processes and the philosophical motivations behind them. Her comments on rhythm in a letter to Vita Sackville-West are a fruitful starting point for a Deleuzian reading:

> As for the *mot juste*, you are quite wrong. Style is a very simple matter: it is all rhythm. Once you get that, you cannot use the wrong words. But on the other hand here I am sitting after half the morning, crammed with ideas and visions, and so on, and can’t dislodge them, for lack of the right rhythm. Now this is very profound, what rhythm is, and goes far deeper than words. A sight, an emotion, creates this wave in the mind, long before it makes words

Deleuze Studies 7.4 (2013): 456–474

> to fit it and in writing (such is my present belief) one has to recapture this, and set this working (which has nothing apparently to do with words) and then, as it breaks and tumbles in the mind, it makes words to fit it. But no doubt I shall think differently next year. (Woolf 1977: 247)

This candid technical admission reveals much about the shared ground between Deleuze and Woolf: in the obvious modernist sense, and in the questions of multiplicity and fragments ('crammed with ideas and visions, and so on') and in the need to synthesise these fragments (the 'wave in the mind') as a means of going 'deeper than words'. There is no '*mot juste*'; words are secondary to sensibility. Woolf needs the element of postmodernist mobility, in this case, rhythm. As I explore in *Machinic Modernism* (2008), rhythm is Woolf's paradoxical tool for working through the fundamental dualism of form/fragment or pluralism–monism that besets the modernist artist-philosopher. In Deleuze's terms rhythm is a 'science of the sensible' (Deleuze 1994: 68) enabling her to pass 'outside' of thought. Woolf's technical journey is often seen as a graduated (in a series of key works) process of working up to a formal 'equation' of rhythm, which is realised in the expression of pure rhythmic form, *The Waves*. Like Deleuze, mobility characterises her working processes; hence 'but no doubt I shall think differently next year' and 'such is my present belief'. If we search for a singular definitive theory or explanation of her technique here, we are disappointed. It depends on which element of the process Woolf happens to be privileging at a given point.

Deleuze comes at the process from the opposite end. If Woolf starts from sensibility and allows words to rhythmically 'find' her, Deleuze starts from words and conscious thought but pushes them to their limits in order to find an exit point and *arrive at* sensibility and the 'unspeakable' (Deleuze 1989: 260). If rhythm for Woolf, the philosophical writer, is the cause, for Deleuze, as highly literary philosopher, it is the effect. He reshuffles and unscrambles the conceptual codes and pretexts of language and philosophical systems and the result is a strikingly sensuous style with an 'evocative, incantatory' rhythm (Bogue 2004**:** 23). His new style of thought almost requires that he enter into a new 'rhythm' of thinking. The 'outside' of thought can partly be sensed or even heard in the rhythm of his language.

Indeed we find rhythm at all levels of Deleuze's discourse, in his decisive formulations: for example, in the key formulation of difference in *Difference and Repetition*, 'it is not the differences which are and must be: it is being which is Difference, in the sense that it is said of

difference' (Deleuze 1994: 48). The dancing rhythm of the sentence is the effect of the action of intrinsic rearrangement of logic, the ontological heaves and shifts that must occur to undo the equivocal and actualise the univocal in language, to reinstate difference as different only to itself, not as negative. Rhythm is the index of its logical alterity. We also find rhythm in his larger 'poetic flights' (Bogue 2004: 23) of conceptual exposition. Deleuze often expounds ideas and concepts in great sweeping and swelling waves; not a linear unfolding but an increasingly expanding circle and process of augmentation; of further qualification and distinction of terms (such as the expansive qualification of the two types of repetition in *Difference and Repetition*) (Deleuze 1994: 97, 106). The rhythm is an effect of his complex, unique process of conceptual 'stuttering', in which concepts and the work of other philosophers are in a constant process of formulation and reformulation. Ronald Bogue describes the process thus:

> concepts Deleuze develops in one book reappear in another, enter into new combinations, then dissolve and form further alliances and interconnections in a third. In each work, the concepts undergo a slight metamorphosis, as if each repetition of a concept were a mere approximation, an effort once again to give it a name, but also a discovery of something new in the concept that only emerges with its restatement in a different context. (Bogue 2004: 22)

The process mirrors Deleuze's theories of difference and repetition in which terms/concepts do not converge onto a singular fixed definition or model, but are subject to a continual process of 'divergence and decentring', of being made and remade, through the displacing and disguising action of repetition. Because pure difference must be that which differs from itself, rather than from what it is not (the orthodox view of difference in the Hegelian model), any concept of difference is false difference; it refers difference to an order of sameness. Difference must always involve an element of repetition, which is its paradox, because no repetition is ever the same; the act of repeating implies an alteration, however slight. The relation of difference to repetition is paradoxical, two-fold; each is 'in' the other.

Repetition is the motor of difference because of its two aspects or forms: one a mechanical, 'bare' repetition of the Same, and another 'clothed' or 'disguised' which allows difference to emerge in-itself. These two repetitions are not independent because the second is hidden in the first; the clothed repetition is 'the singular subject, the interiority and the heart of the other, the depths of the other' (Deleuze 1994: 27).

The mechanical repetition 'is only the external envelope, the abstract effect' (27). Repetition 'at the level of external conduct' relates 'to something unique or singular which has no equal or equivalent' (1–2). To illustrate the duality, Deleuze gives the example of an event like a festival, the 'apparent paradox' of which is that it repeats an 'unrepeatable'; it does not 'add a second and third time to the first, but carr[ies] on the first to "nth" power' (2); cloaked or disguised in bare or mechanical repetition.

Woolf's narrative metaphysic engages this process in which difference reverberates through a two-fold process of repetition and this is actualised in the exchange between poetry and prose. In order to analyse the process, it is important to translate the two levels of repetition – extensive (which produces the world as the same) and intensive (which creates singularity and in which real difference is hidden) – into a distinction of rhythm, namely that which Deleuze sets up between meter and rhythm, between conservative and standardised and radical and discontinuous time. Meter is the regimented form of rhythm which operates in homogeneous space-time and measures 'noncommunicating milieu' (Deleuze and Guattari 2004: 313). Any use of meter, which can only move between the general and the particular (between general concepts and individual facts), has the same effect as subjecting difference to the identity of the concept. Meter is the empty extensive structure; the beat of spatialised time, devoid of content; it is rhythm's 'conceptual remainder' after it has been cut out of the picture and 'abstracted to its own transcendental plane' (Hulse 2010: 28–9). But the other radical form of rhythm, that which allows difference to emerge, is 'unequal and incommensurable'. 'Always undergoing transcoding . . . it ties together critical moments or ties itself up in passing from one milieu to another. It does not operate in a homogeneous space-time, but by heterogeneous blocks. It changes direction' (Deleuze and Guattari 2004: 313).

Woolf's prose poetry thrives off a tension between meter and what, for the purposes of its distinction from meter, I shall call 'radical rhythm'. The double action of meter and radical rhythm enables her to set up the tension between inner and outer levels of being; between the 'movement of thought, feeling and bodily sensations in the "depths" and the facts, events and actions on the "surface" of life' (Laurence 1991: 13) that is so important in her novels. Thus repetition as Deleuze understands it is the general action of her narrative. The rhythm of the prose-poetic technique, the dance between meter and rhythm, works the text into

its ontological discoveries, the proper moments when pure difference is encountered in intensity, is 'felt' in the rhythm of repetition, and the paradox of the 'universality of the singular' becomes a concrete part of experience (for both character and reader).

Meter measures out life in equal portions, horizontally scaling meaning; it is the plot-driven, business-like 'getting on from lunch to dinner' (Woolf 1953: 139) approach to narrative of the Victorian realists that Woolf loathed. If meter is a tool of organic generality and spatialised time, repetition is a materialist tool of the parts or fragments. Repetition in poetry can be of a sound, syllable, word, phrase, line, stanza or metrical pattern, and in both poetry and prose it can take the more elaborate form of a symbol, image, motif, recurring or extended metaphor. Repetition presumes synthesis; it allows the author to atomise and unify simultaneously. It cannot operate predictably, only unexpectedly and discontinuously through displacement and disguise. Unlike meter, time's conceptual 'shell', repetition is 'full'; it is both a qualitative spatial and quantitative temporal tool.

Repetition mobilises the spatial relation between part and whole, and the temporal one between present and past. Perhaps the ultimate repetitive 'agent' in this respect is memory, which is central, both thematically and structurally, to Woolf's novels. Memory, as a form of structural repetition and synthesis, is central to the materialist aspect of Woolf's literary technique, as it is to Deleuze's thought. Mary Ann Gillies explores how Woolf uses a series of single images in the novel *Jacob's Room* to foreground memory as a mode of textual synthesis. She argues that Woolf engages memory

> largely through a series of images – leaves, waves, colours, voices (noises), and such personal items as Jacob's shoes – which join the linear narrative to the fragments of Jacob's life that the reader shares, even though these fragments must be imagined since access to them is denied. When a particular image reappears [. . .] the subtle alterations in their representation demonstrates how memory links the two times. (Gillies 1996: 114)

Memory thus enacts the paradox of Deleuze's concept of repetition; it generates difference in the alteration (in which difference differs from itself, rather than from what it is not). The action of displacement in Woolf's technique is not confined to the text, but actually carries into the reading process in that the reader is compelled to use her own memory to connect or 'transcode' the two times. As Gillies therefore argues: 'Woolf expects an affective aesthetic response from her audience and

plays upon this by making them use memory to retain the elements of the novel and the subsequent transformation of early events (objects) by later ones' (Gillies 1996: 114). This displacement of the process onto the reader is the 'disguised' or hidden element of repetition; it draws attention to the exteriority of the book's relation to the world. It is also what we can understand as the passive side to the process in that syntheses are generated elsewhere, outside of the narrative's 'conscious' determination.

The reflexive nature of the technique means that what is inscribed in technical processes cannot but appear as theme. So in *To the Lighthouse*, for example, daily life is conceived as a form of repetition, a physical action of accumulation. Thus Lily observes that she was

> only trying to smooth out something she had been given years ago folded up [. . .] in the rough and tumble of daily life, with all those children about, all those visitors, one had constantly a sense of repetition – of one thing falling where another had fallen, and so setting up an echo in the air which made it chime with vibrations. (Woolf [1927] 2006: 215)

Repetition creates the fabric of daily life. It is the external layer, the regular cycles of habit and daily activity, which accrue and are given to Lily 'folded up'. But of course these repetitive folds are also the 'stuff' of art, and it is the task of the artist to penetrate the 'symmetrical ensembles', the repetition of 'ordinary points', and tap the 'secret vibration' (Deleuze 1994: 2), the repetition of 'dissymmetry' and 'distinctive points' which animate them (27).

Lily's aesthetic problems stand for those of the author; the author symbolically 'repeats' herself in the text through Lily. Woolf's task is to penetrate the everyday, the silted layers of material repetition, the accumulation of the quotidian and the traffic of people and daily events in order to unleash deeper moments of being, the spiritual repetition that animates life. The hindrances to Lily's (and by proxy Woolf's) artistic production derive from the bare repetition of social convention, the social tyranny that would generalise her female status by expecting her to become a wife and not an artist. This includes both Mrs Ramsay's expectations that people 'must marry!' (Woolf [1927] 2006: 59), and the toxic words of the young male academic Charles Tansley: 'women can't paint, women can't write' (42). The book often uses hypnotically repetitive, almost mantra-like phrases, to draw its distinctive characters. It also suggests the tyranny of words and their power to resound and painfully reverberate, to repeat through time, and hinder the individual.

Memory is thus also the symbolic structure of the novel, as well as its materialist action. Memory allows characters to synthesise past and present and is the process in which characters often use the past to find answers to present problems. Philosophical questions, like large-scale waves 'in the mind', are posed or cast and the answers eventually 'return' through memory. Hence Lily does not have her 'vision' and her searching questions about Mrs Ramsay are not answered until the final section of *To the Lighthouse*, during her sustained recollection of the past. Repetition allows Woolf to produce unobtrusive (disguised) syntheses at unexpected moments, when 'the least moments of existence . . . rebound with unforeseen intensity at surprising intervals' (De Mille 2011: 381). It is the unexpected everyday revelations, as opposed to the grand philosophical answers, that Lily finds are important.

In short, repetition allows Woolf to create a flexible form from within, rather than impose a rigid one from without. Because these 'inner' events of consciousness are the big events of the novel, repetition in individual phrases can mark important structural turning points, moments of realisation or vision. Language at such points often has an incantatory power; repetitious individual phrases often signal significant changes in the direction of the plot, hence: 'What does it mean then, what can it all mean?' asks Lily Briscoe at the beginning of third and final section of *To the Lighthouse* (Woolf [**1927**] 2006: 121). The processes of difference and repetition – of repetition but with an alteration – are evident in the two questions and this is a common feature of Woolf's language. The structural tension is always between meter and (radical) repetition. The question seems to ceremonially usher in her creative vision, her event of difference.

This brings me to my final point about repetition. It is no accident that *To the Lighthouse* consists of three main sections. Woolf's most experimental prose-poetic texts reflect Deleuze's use of and preoccupation with triadic structures, and his idea of their 'persistence' (Deleuze 1994: 115). Triadic patterns and rhythms are central to Woolf's literary innovation; her technical structures often repeat via threes. The number three has had symbolic importance throughout history, most notably in religious and magical practices, for example in being associated with the Holy Trinity.[1] Its importance in respect of the philosophies of Deleuze and Woolf is because it is beyond two, beyond dualism. Three is an act of creative repetition. *To the Lighthouse* needs the third section and Lily the third person (beyond the dualism of Mr and Mrs Ramsay) to act as the differentiator.

I. Slicing 'Through Everything': *Mrs Dalloway* and the Three Syntheses of Time

> We are made up of fatigues as much as of contemplations.
> Deleuze 1994: 98

> Even the most mechanical, the most banal, the most habitual and the most stereotyped repetition finds a place in works of art [. . .] there is no other aesthetic problem other than that of the insertion of art into everyday life.
> Deleuze 1994: 365

In Woolf's novels some of the most structurally rich (and strikingly Deleuzian) moments are when the character is portrayed as engaged in practical daily activities and their mind is off guard and passive. These unobtrusive everyday moments are moments of unconscious synthesis, both in the context of the characters (in that memory is revealed as the passive structure of subjectivity) but also in the text which reveals its own 'passive' construction (when content is almost indistinguishable from form). Hence the following moment, portraying Mrs Dalloway going upstairs:

> She began to go slowly upstairs, with her hand on the banisters, as if she had left a party, where now this friend now that had flashed back her face, her voice; had shut the door and gone out and stood alone, a single figure against the appalling night, or rather, to be accurate, against the stare of this matter-of-fact June morning; soft with the glow of rose petals for some, she knew, and felt it, as she paused by the open staircase window which let in blinds flapping, dogs barking, let in, she thought, feeling herself suddenly shrivelled, aged, breastless, the grinding, blowing, flowering of the day, out of doors, out of the window, out of her body and brain which now failed, since Lady Bruton, whose lunch parties were said to be extraordinarily amusing, had not asked her. (Woolf [1925] 2004: 25–6)

This short yet intensive cycle of Being is a composite of thought, emotion, memory and physical movement, a enactment of what Deleuze describes as the 'rhythms', 'reserves', 'reaction times', the 'thousand intertwinings' that make up subjectivity (Deleuze 1994: 98). Rhythm is paramount here; in the metered phrasing we can feel Mrs Dalloway's plodding ascent of the stairs. The passage is a rich composite of both extensive (metered) and intensive (radical rhythm) time. If we take this as a single moment of being, we can discern the three syntheses of time as Deleuze understands them. It is because of the near indivisibility between the subject (Mrs Dalloway's mind) and the form (prose-poetry) that I shall hereafter refer to this as the 'mind-text'.

The First Synthesis: Habit

Woolf starts the first stage or synthesis of this passage 'She began to go slowly upstairs, with her hand on the banisters, as if she had left a party' in meter; three clauses of prose that frame the moment. These three 'noncommunicating' individual units are the metrically 'dogmatic' (Deleuze and Guattari [1987] 2004: 313) building blocks of narrative. They are the 'habit' stage of what I am calling the mind-text; both Mrs Dalloway's habit, the habitual action of climbing the stairs which she performs automatically, but also the representational 'habit' or convention of prose; the grammatical order of subject-predicate clauses and the third-person narrator. Form and content coincide here; meter measures out homogeneous space-time in the same way that the body moves through space in a succession of mechanical steps or units. The action of going up the stairs suggests the cyclical nature of this first synthesis of time; each step is an act of exertion which must be completed before an – identical – other can occur.

This is repetition in its most relaxed and conventional form, the bare mechanical 'material' form; 'repetition of the same' (Deleuze 1994: 97). For Deleuze this habit stage is important because habit is 'the foundation from which all other psychic phenomena derive' (99). This stage shows us the world given in extension, to be viewed objectively, as an apprehension or 'dream' of matter (106) in which everything is 'given at once' (Colebrook 2006:101). In temporal terms it is the condition of the passage of the present, the 'foundation of time' (Deleuze 1994: 101); it establishes the ground that will eventually be ungrounded. This is the least interesting of the three syntheses, existing as it does to provide a foundation for successive stages.

The Second Synthesis: Memory

This 'external husk' of habit quickly gives way to another synthesis which contains a 'kernel of difference and more complicated internal repetitions' (Deleuze 1994: 97). In the fourth clause we move into Mrs Dalloway's psyche (we cease observing her from outside) and into memory and the mind. As with Deleuze's model of subjectivity, in the passage from *Mrs Dalloway* these complicated internal repetitions are a function of memory. If the first synthesis of habit or the present concerned extensity (expressed in prose), the second synthesis, which concerns memory and the past, is intensive; it is that on which rests 'the implication of depth' (289). The implied depth is signified in the

clear shift into poetry, in the stabbing erratic phrase 'where now this friend now that had flashed back her face, her voice' which disrupts the metrical regularity and grammatical order built up in the previous three clauses. Here is a burst of involuntary memory; the illogical phrase, which contrasts with the predictable good sense of the previous phrases, enacts Deleuze's idea that pure memory and the past can only ever emerge as fragment and reappear 'underneath representation' (107). The memory fragment has the fertile 'erotic' (111) quality that Deleuze describes; the repetition of 'now' bringing the memory of 'this friend', and her 'face' and 'voice' (it is likely to be Sally Seton) to immediacy in the reader's mind almost in the manner of an 'optical effect' (111). The syncopated rhythm of the phrase (which falls slightly off beat and yet still just keeps up with the steady meter) creates the effect of a simultaneous 'double level'; a virtual reaching back into the past by memory and the immediate present physical action – her footsteps going up the stairs. The complex rhythm of the phrase actualises the ontological shift into depth and effectively allows the reader to experience this coexistence of present with past, and feel, as Deleuze puts it, a sense of the past 'in-itself' (111) as contemporaneous with the present.

But what is also very clear here is that this past 'in-itself' is still, as Deleuze argues, a 'correlate of representation' (Deleuze 1994: 111), and therefore an illusion. Hence in the following series thoughts, images and associations seem to repeat/spiral from the fertile memory: 'had shut the door and gone out and stood alone, a single figure against the appalling night, or rather, to be accurate, against the stare of this matter-of-fact June morning; soft with the glow of rose petals for some, she knew, and felt it'. In this second synthesis time and repetition are linear as opposed to cyclical; the mind unravels a succession of (apparently) different categories of thoughts. But the narrative, which has returned repetitively to the conservatism of prose (albeit with a slight change – longer phrases now), is ontologically registering little more than the bare repetition that we witnessed previously. This is consistent with what Deleuze says about memory: although it is a 'profound repetition', it is 'hidden by the bare repetitions that it inspires' (364). Memory draws off difference, but cannot escape bare repetition. Radical in itself, memory cannot give birth to anything other than a representation. Therefore, 'in the same movement, the ground falls back into the representation of what it grounds, while the circles begin to turn in the manner of the Same' (364). Thus the imaginative projections, negative contrasts and judgements, reasoning processes, signify the mind-text back in its prosaic comfort zone, under the four shackles of organic representation as Deleuze

understands them. This is not yet living difference, difference in itself, but the mind's pretence of difference.

For Deleuze, involuntary memory, the recurrence of the pure past, is the author of artifice. The imagined or dream-like aspect of memory causes the mind to blend fiction and fact, so here we see it is not clear whether the associations are linked to the recalled real event, or if they refer to associated real past times when Mrs Dalloway left parties, or if the mind is rather impressionistically and self-consciously 'filling in' the story. There is an overall sense of narcissism; a sort of recycled fiction in which the imagination intervenes in order to gather 'the traces of the former present' and model 'the new present upon the old' (Deleuze 1994: 128). By recollecting a real time when she felt like 'a single figure against the appalling night' *or* currently imagining herself as such, Mrs Dalloway's ego is constructing its own 'fatal affection' (Deleuze 1994: 139); feeling left out of a current social event (she has not been asked to Lady Bruton's lunch party), she is privately casting herself as the tragic heroine. The rationalising ('or rather, to be accurate') through which Mrs Dalloway compares her meagre lot with other women whose lives are apparently 'soft with the glow of rose petals' (we should not miss the irony here), is part of the fiction; the psyche is the author of a cruel narcissism.

Mrs Dalloway is feeling both physically and mentally old. Moments like this confirm Deleuze's idea that 'we are made up of fatigues as much as of contemplations' (Deleuze 1994: 98); both the physical act of going up the stairs and the attendant reminiscences and regret that mark her sense of having grown old gather into a powerful singularity of feeling.

The Third Synthesis: The Future

The mind-text process up until this point has been strictly dialectical; a dance between opposites: the moving body and the wandering mind, between prose and poetry, past and present, narrator and character. Apart from the involuntary memory, everything has been unravelled to us as a series of representations, occurring in chronological time/space, and at each point the thought or feeling has been stamped with identity – either Mrs Dalloway's or the narrator's. In Deleuze's terms these first two syntheses/repetitions – habit repetition, memory repetition – fail because they both build up and fail to eliminate the 'I', the subject or ego. But now in this final synthesis dualism is fully released and, as in Deleuze's model, the identity of the subject gives way. This

evacuation of the subject occurs in the final poetic triad, which I have formatted to emphasise its status as such:

shrivelled, aged, breastless
the grinding, blowing, flowering of the day
out of doors, out of the window, out of her body and brain which now failed

In this third triad body and brain, present and past are evacuated in a movement that suggests the time that is 'yet to come'. Woolf has been slowly kneading prose into poetry but now prose completely gives way to poetry; in this final synthesis the prose-poetic method is 'saturated'. The first synthesis established prose in triadic meter; the second synthesis increasingly lengthened this pattern of rhythm + prose by using whole prosaic clauses – 'soft with the glow of rose petals for some, she knew, and felt it' – as one beat (hence a radical stretching of the triad to its limit); and finally here is the 'ultimate' three; the triplicate of three-beat rhythms, of three times three: 'shrivelled, aged, breastless', 'grinding, blowing, flowering' and '*out* of doors, *out* of the window, *out* of her body and brain' (my emphasis). Even as the three threes rhythmically repeat and consolidate the three clauses of the first synthesis they also overturn it, taking it beyond organic representation. The first two triads seem to review and crystallise the essence of Mrs Dalloway's overwhelming feeling of middle-aged womanhood; both mentally, in the harshest idea of it, 'shrivelled, aged, breastless', and as an amorphous physical reality, 'grinding, blowing, flowering', before aborting the feeling altogether.

This third triad, for Deleuze, is the crucially anti-intellectual moment of the 'aborted *cogito*', a state corroborated here in the image of 'out of her body and brain which now failed'. This is the point at which we see 'the thought and production of the "absolutely different" ' (Deleuze 1994: 118) expressed here in series; the abstract states without a subject, 'shrivelled, aged, breastless', and verbs in a present continuous (-ing form) state of becoming, 'grinding, blowing, flowering'. This 'state of free differences' is no longer subject to the 'form imposed upon them by an I or an ego' (Deleuze 1994: 138). These are the kind of structural conditions which give rise to the 'purity' of time, as Deleuze understands it. Uninhibited by the binary of prose, the triplicate of triads (the three within threes) are like time's optimum vehicle; the 'empty' form of time through which pure difference can pass. Woolf's ontological literary technique implodes into the depths of the present moment, showing us that past and future are dimensions of the present.

This small yet rich moment of the text lends much credence to Deleuze's idea that our conscious lives are dictated by affect and in a cycle of 'continuous variations of joy and sadness'. The movement here is deterritorialisation, becoming a movement towards the increasingly abstract and impersonal – and yet entirely lived – feeling of old age. What is so important in Woolf's method of impersonality is that the construction of these emotional moments, whether joyful or, as is the case here, sad, is the same; sadness is no less a passion than joy. The character is passive to the affect, 'therefore passive . . . in the world of passion' (Deleuze 1978).

II. The View 'From Below': *To the Lighthouse* and Difference

One of the central features of Woolf's technique as I have been exploring it is her exploitation of the dynamic tension between prose and poetry or meter and radical rhythm. By pushing the tension of prose-poetry to its limits, narrative ontologically 'saturates' and prosaic and mental sameness are transformed into living difference. The passage from *Mrs Dalloway* reveals how Woolf's differential technique works in the (micro-)depiction of subjectivity. But the complex practices of difference and multiplicity are evident in other spheres of the text; including the 'outer' drama of character interaction. Woolf's central differentiating tool in this sphere is her remarkably flexible use of narrative voice and point of view, the technique of free indirect speech.

In *To the Lighthouse*, the Ramsays' argument about the weather and the viability of a trip to the lighthouse is a prime example of the mercurial use of narrative voice:

> There wasn't the slightest possible chance that they could go to the Lighthouse tomorrow, Mr. Ramsay snapped out irascibly.
>
> How did he know? she asked. The wind often changed.
>
> The extraordinary irrationality of her remark, the folly of women's minds enraged him. He had ridden through the valley of death, been shattered and shivered; and now, she flew in the face of facts, made his children hope what was utterly out of the question, in effect, told lies. He stamped his foot on the stone step. 'Damn you,' he said. But what had she said? Simply that it might be fine tomorrow. So it might.
>
> Not with the barometer falling and the wind due west.
>
> To pursue truth with such astonishing lack of consideration for other people's feelings, to rend the thin veils of civilization so wantonly, so brutally, was to her so horrible an outrage of human decency that, without replying,

> dazed and blinded, she bent her head as if to let the pelt of jagged hail, the drench of dirty water, bespatter her unrebuked. There was nothing to be said.
>
> He stood by her in silence. Very humbly, at length, he said that he would step over and ask the Coastguards if she liked. There was nobody whom she reverenced as she reverenced him. (Woolf [**1927**] 2006: 29)

Again, the text is working dialectically, this time in the context of the arguing couple and comically we are being shown how marriage 'really' (ontologically) *works*, not only as a contest of wills, but with much going on under the surface. Although is it Mr Ramsay who is finally 'right' – the weather is not fine and the trip is prevented – the triumph in this instance is Mrs Ramsay's.

The scene represents the triumph of ontology (of her inner life of feeling and difference) over epistemology (his exterior, factual world). 'Not with the barometer falling and the wind due west' is a harsh fact with the capacity to damage the immediate – internal, domestic – fabric of life; that is, present joy, childish/human expectation and hope. Ramsay's spouting of facts is, in Deleuze's terms, an act of transcendence and, insofar as it denatures the differential richness of life by referring it to a larger epistemological system of meaning, qualifies as a sterile type of repetition. It sucks the positive out of the present. But for Deleuze, 'difference is not negation. On the contrary, the negative is difference inverted, seen from below' (Deleuze 1994: 295). With its domestic setting and highly interiorised rhythmical narrative style, *To the Lighthouse* creates the optimum conditions for both looking at and showing us life as if 'from below'; for undoing the extended world.

The study of the relationship of the Ramsays is by now well-traversed thematic critical ground in Woolf studies, as are the strategies, both structural and symbolic, by which Woolf undoes the external 'masculine' world and shows us the view 'from below'. The quarrel over the viability of a trip to the lighthouse stands for their profound opposition of values, of the rational versus the emotional; his scientific realism and fact versus her humanitarian ethics. In this way the novel has been read as a feminist critique of the individualistic, essentialist 'male-coded thought and language' of Western epistemological systems (Laurence 1991: 26). The refusal of narrative omniscience and the problematising of the third-person narrator in *To the Lighthouse* are often linked to the book's attack on Western philosophy, and seen as symbolic of the idea of 'the problem of achieving epistemological certainty' (Lilienfeld 2006: 44). Feminist and post-structuralist theorists take this further by arguing that the book seeks to displace the authority of a logocentric,

subject-centred order of thinking with a feminist communal vision, one involving a radical 'sharing of voice' (Snaith 1996: 147).

In this respect critics focus much on Woolf's use of free indirect speech, the technique which gives the reader a sense of direct access to the consciousness of the character by blurring the third- and the first-person narrative voice. It has been noted how Woolf uses the technique in a particularly mercurial way, often (although not always) omitting the attributions of thought, thus making the process of identifying what is being reported and what a character is thinking difficult to discern (Snaith 1996: 134).[2] Indeed Woolf's novels absolutely thrive on the instability and ambiguity of the technique; the overlapping of character and narrator, of point of view, the lack of mediation between characters and narrator, has the effect of a 'choral or group protagonist' and this is, Rachel Blau DuPlessis argues, a 'major strategy of female modernism' (DuPlessis 1985: 162).

The problems of narrative indeterminacy, and indeed the ontological stakes between inner and outer, are particularly heightened in this scene; the question is not simply that of identifying point of view (whether it is the narrator or a character thinking), but of identifying whether something is being internally thought/felt or *actually* spoken. The few incidences of actual speech in the text so far have been single verbal interjections punctuating a largely interiorised narrative. Almost all of these actual speech incidences have centred on the question of going to the lighthouse and in the passage above the problem is finally raised through an actual verbal exchange. Earlier scenes have contributed to our sense of the ontologically close relation between speech and facts, implicitly criticising the externality of a male discourse of spoken facts, the capacity of which to inflict human cruelty is presented as an effect of their ontological condition *as* extended. More ethical behaviour tends to be synonymous with a passive female withholding of (harsh) speech. As if to make both these points a whole interlude or subchapter is taken up with Charles Tansley's callous (mechanically repetitive) echoing of his mentor Ramsay's forewarning 'no going to the lighthouse tomorrow, James' and Mrs Ramsay's inner response, 'odious little man . . . why go on saying that?' (Woolf [1927] 2006: 16).

The conflict between inner and outer is played out dramatically here as a battle between silence and speech. Speech's main antagonist in this scene is silence. Symbolically, it is her intensive silence that 'defeats' his external speech, but the text is also 'performing' silence. Silence is both a trope and a practice in Woolf's novel. Silence, argues Patricia Laurence, not only appears as a word, concept and theme, but there

is also a 'lexicon, punctuation, metaphor, space, or rhythm of silence' (Laurence 1991: 3). The turning of the theme of silence to effect in *To the Lighthouse* is part of the wider way, according to Laurence, in which the book displaces speech and dialogue. Silence, particularly women's silence, functions as an 'enlightened "presence" and not just an absence in the conventional sense of "lack" or "emptiness" in life and narration' (11). Here, Mrs Ramsay's communicative silence denotes not the absence of speech but simply a different *kind* of speaking or communication, one that is intrinsically positive.

III. The Triadic Unpeeling of Logic

The couple's argument is staged, unsurprisingly, through a triadic rhythm of assertion and counterpoint in which both husband and wife have three rhythmical 'strokes', and at the end of her third stroke, starting with 'To pursue truth . . . ' and finishing 'there was nothing to be said', he backs down. Mrs Ramsay's strokes enact a progressive undermining of and departure from speech. So her first stroke in the argument is the only instance in which we are supplied with any concrete 'evidence' of her speech: 'How did he know? she asked. The wind often changed.' The indirect speech attribution 'she asked' confirms or 'proves' this. But her next stroke – 'But what had she said? Simply that it might be fine tomorrow. So it might' – which is in free indirect speech (and thus with no accompanying attribution) is more ambiguous. Although the argumentative context, and the fact that it provokes a response in him, suggests that this is *likely* to be spoken, we really cannot be certain. ('What had she said?' indeed! – Mrs Ramsay's words/thoughts coincide with those we might be asking of the text at this point, and this technical literalism is not accidental.) The absence of quotation marks and our familiarity with the personality of the character (which includes a way she has – particularly in the face of male talk and its characteristic acerbic finality – of withholding her thoughts; the Tansley example quoted earlier a case in point) calls into question its validity as spoken. But the final, third stroke, which wins the argument – 'there was nothing to be said' – is unambiguous; she has now stopped speaking. This is categorically thought and not spoken; the act, which is also the 'truth' of its not being said, is axiomatic to the statement.

Therefore where Ramsay's rational order of speech, assertion and fact is premised on the binary of true/false, her virtual order of silence is premised on that of difference. Mrs Ramsay's active silencing of her husband is an analogy of the inner action of the text in which

the order of proof, evidence and logic (Ramsay's order) is empirically dismantled to make way for the logic of positive difference. Difference is revealed through a process of the displacement and reshuffling of the terms/configurations. Speech and silence mark the two ends of a (triadic) process which sees a subtle progressive removal of the textual 'evidence' of speech and utterance. Hence that Mrs Ramsay speaks in her first stroke is 'proven' by the evidence (as opposed to the absence) of the attribution 'she said'. The second stroke is – as the middle ground – unsurprisingly indeterminate; we do not know either way whether speech occurs. But in the third stroke the transformation has happened and logic has successfully been reconfigured into positive terms, because it can be 'proved' that she does not speak (in other words, that her silence is real), but not by the same negative logic that Ramsay would use (that would here involve a total absence of statement; either textual or from the character), but by the non-dialectically negative statement 'there was nothing to be said', in which the negative 'nothing' is couched in positive terms, silence as radical difference.

It would be a mistake to confuse the radically indeterminate effect of this technique with its function/structure; structurally it is in fact uncannily precise, as we see here in the graduated deduction of quotation marks denoting speech, each and every stage of which is needed to overturn Ramsay's logic. We also see the frequent instances here in which the text 'speaks' its own technical truth, as if in obedience to Woolf's claim, quoted earlier, that she 'cannot use the wrong words' (Woolf 1977: 247). It is hard to see how the seamlessness of the method, which carries down onto such minute technical levels, can have been premeditated on the author's part. In my view we must accept Woolf's claim that the method is intuitive – worked out through rhythm. The vocal imbrications and entrances and exits are differential processes executed with logical precision; things *really* could not be any other way.

Critical readings, both modernist and postmodernist, have not been precise or far-reaching in their analysis of the micro-technics of Woolf's texts and her use of rhythm. We would do well to structurally comprehend these differences, rather than simply register their effect (of communality, feminism, and so on). Otherwise there is a tendency to fall back into the dualistic categories of understanding from which Woolf herself was struggling to break free.[3] In order to put her writing and its extraordinary technique into new Deleuzian and interdisciplinary readings, we must continue to expand the categories of our terms, and think of new ways for reading the multiple in writers like Woolf.

Notes

1. According to Stephen Wilson, in Pre-Modern European magical rites three was a 'propitious number' and spells were ritually structured as a three-part process, for example, 'stepping three times over a grave'. Wilson also argues that 'tripartite divisions were a fundamental feature of Indo-European social and cultural ordering' (Wilson 2000: 447).
2. Moreover, understanding the complex focalised narrative voice relies on our familiarity (built up through repetition) with the separate discourses and idioms that define the Ramsays. The task involved in identifying who is communicating (and indeed how they are – through speaking or thinking) can be read in Deleuzian terms as part of the process of repetition, in which the action of the text, and the burden of understanding, is 'displaced' onto the reader.
3. As is the case for example with Snaith's modernist reading, quoted here, which uses the dualism public/private to explain the complex movement between internal and external in Woolf's narratives.

Netting Fins: A Deleuzian Exploration of Linguistic Invention in Virginia Woolf's *The Waves*

Jason Skeet Cardiff University

Abstract

Linguistic invention is a key feature of Virginia Woolf's novel *The Waves*. An exploration of its innovative verbal and syntactic procedures can add to an understanding of Woolf's importance for the philosophical thought of Gilles Deleuze (and his sometime collaborator Félix Guattari). In *A Thousand Plateaus*, *The Waves* is used to exemplify an ontology of becoming. However, in their reference to *The Waves*, Deleuze and Guattari only draw attention to what they term the 'vibrations, shifting borderlines' between and across characters in the novel. Given Deleuze's considerations of style, it is perhaps surprising that he never took up this idea in terms of how these movements also take place at the level of language in the novel, as the explorations in this essay of four different linguistic procedures from *The Waves* show. When Woolf completed writing *The Waves*, she wrote in her diary that she had 'netted that fin in the waste of water'. By investigating the multiple, and often discordant, associations of this image of netting a fin, various connections between Woolf's linguistic procedures and Deleuze's philosophy can be configured, particularly in terms of the approach to language put forward in *A Thousand Plateaus*. Reading Woolf alongside Deleuze in this way reveals how ontology becomes intimately bound up with a problem of language.

It is undone business
I speak of, this morning,
with the sea
stretching out
from my feet
Charles Olson, *The Maximus Poems*[1]

I. Introduction

What makes literature contemporary? According to the poet Charles Bernstein, writing only enters into the present when it breaks formal conventions, creating, in the process, other ways of putting words together. On this basis, Virginia Woolf's *The Waves* maintains a power to disrupt and avert, as Bernstein puts it, 'business as usual, including literary business' (Bernstein 1992: 2): that is, the business of the expressive-realist novel. The linguistic invention that Bernstein identifies as a necessary function of writing is a key feature of Woolf's text, and an exploration of its innovative verbal and syntactic procedures can add to an understanding of Woolf's importance for the philosophical thought of Gilles Deleuze (and his sometime collaborator Félix Guattari). In *The Waves*, Woolf uses language in ways that resonate with Deleuze's concerns. Moreover, Woolf's writing reveals how ontology becomes intimately bound up with a problem of language, a recognition that is crucial for appreciating the conjunction of Deleuze with Woolf.

Writing *The Waves* was possibly the most demanding literary project Woolf ever embarked on, and her diaries offer an insight into the labour put into it as she documented the shifting emotions towards her work.[2] At one point in her diary she refers to *The Waves* as 'the play-poem idea: the idea of some continuous stream, not solely of human thought' (Woolf 1982a: 139). The idea of life as flow and flux also raised a particular problem for Woolf: the development of a narrative technique for conveying her ontological ideas. When the first draft of the book was completed in April 1930 Woolf immediately began a re-write, and it is in the second manuscript that its distinctive structure emerges.[3] In her diary she indicates that 'several problems cry out at once to be solved. Who thinks it? And am I outside the thinker? One wants some device which is not a trick' (257). What resulted needs to be seen as the outcome both of a desire to experiment, to seek out, as Woolf says, 'an entirely new kind of book' (Woolf 1978b: 35), as well as a response to the problem Woolf had encountered. *The Waves* comprises a series of soliloquies by six characters over the span of their lifetimes, which are broken up by short interludes depicting time passing, through a day

and across different seasons, images of the sea, a garden and birds, of a world outside the human. This narrative structure engenders what can be described as rhizomatic writing, expressing being as a condition of becoming, a novel, as Woolf put it, written to 'a rhythm not a plot' (Woolf 1982a: 316).

References in *A Thousand Plateaus* to Woolf's well-known declaration to 'saturate every atom' show that Woolf's writing was relevant to Deleuze's project in a number of ways.[4] For example, the concept of the haecceity is invoked in connection with Woolf (a term adapted by Deleuze from the medieval philosopher Duns Scotus). The significance here is with how Woolf is no longer concerned with

> subjects, persons or characters, which let themselves be attributed, formed or developed. There are only particles left, particles definable solely by relationships of movement and rest, speed and slowness... there are now only haecceities left, individuations which are precise and without subject, which are definable solely by affects or powers. (Deleuze and Parnet 2006: 91)

In *A Thousand Plateaus* Deleuze and Guattari make specific reference to Woolf's *The Waves* in terms of an 'abstract machine of the waves', with these waves as 'vibrations, shifting borderlines'. They continue:

> In *The Waves*, Virginia Woolf – who made all her life and work a passage, a becoming, all kinds of becomings between ages, sexes, elements, and kingdoms – intermingles seven characters, Bernard, Neville, Louis, Jinny, Rhoda, Suzanne [sic], and Percival. But each of these characters, with his or her name, its individuality, designates a multiplicity (for example, Bernard and the school of fish). Each is simultaneously in this multiplicity and at its edge, and crosses over into the others. (Deleuze and Guattari 1988: 252)

For Deleuze and Guattari then, *The Waves* is an example used as part of their exploration of an ontology of becoming that is the focus of the tenth chapter of *A Thousand Plateaus*. Writing is also conceived as becoming, so that, accounting for the processes a writer puts into practice, Deleuze describes these as a movement justified by their own trajectory, so as to 'lose one's face, to jump over or pierce through the wall' (Deleuze and Parnet 2006: 34). Likewise, Woolf refers to her own progress with writing *The Waves* as a case of 'always to follow, blindly instinctively with a sense of leaping over a precipice – the call of – the call of –' (Woolf 1982a: 203). This willingness to pursue something that cannot be put into words also suggests a route into an unknown. As Woolf states, such movement is an escape from the personal, to 'provide a wall for the book from oneself' (Woolf 1978a: 13); that is, a means of becoming-imperceptible. As is made clear at the outset of

A Thousand Plateaus, becoming-imperceptible concerns the conditions for, and the components of, the construction of a subjectivity: 'To make ourselves unrecognizable in turn. To render imperceptible, not ourselves, but what makes us act, feel, and think' (Deleuze and Guattari 1988: 3). Furthermore, this process of becoming is not a retreat into the imaginary, an escape from life. On the contrary, writing understood as becoming is a flight into the real, this flight itself is life: 'to flee is to produce the real, to create life, to find a weapon' (Deleuze and Parnet 2006: 36), a production that is also possible and even necessary, it should be added, at the level of language.

In their reference to *The Waves* in *A Thousand Plateaus*, Deleuze and Guattari only draw attention to the 'vibrations, shifting borderlines' between and across characters in the novel, a point relevant to this present discussion, since these movements also take place at the level of language. In addition, it is notable that Deleuze never discussed Woolf to the same extent he did other writers; Woolf, for instance, is not amongst those that Deleuze chooses to examine in detail in *Essays Critical and Clinical*.[5] This omission, I would argue, and the specific nature of the movements that operate in *The Waves*, calls for a further exploration of Woolf's writing alongside concepts drawn from Deleuze's philosophy, in order to examine how 'the abstract machine of the waves' is effectuated in and by Woolf's novel not only at a narrative but also at a linguistic level. However, before undertaking these explorations, we have to consider in what ways language can be considered a shared problem for Deleuze and Woolf.

II. The Problem of Language

On completing *The Waves*, Woolf wrote in her diary that she had 'netted that fin in the waste of water' (Woolf 1982b: 10). A reader might infer from the phonemic connection between 'fin' with 'finished' that Woolf's statement conveys a sense of resolution, the establishment of something whole.[6] However, the idea of a net hints at permeability, whilst a fin is only a partial object. This evocative image therefore raises a number of problems. The water that escapes capture by a net, the almost unnameable 'waste', intimates the liquid flows of experience of the characters in the novel. Furthermore, in her diary Woolf links this fin with an ontological preoccupation:

> I wish to add some remarks to this, on the mystical side of this solitude; how it is not oneself but something in the universe that one's left with. It is this that

> is frightening and exciting in the midst of my profound gloom, depression, boredom, whatever it is: One sees a fin passing far out. What image can I reach to convey what I mean? Really there is none I think. The interesting thing is that in all my feeling and thinking I have never come up against this before. Life is, soberly and accurately, the oddest affair; has in it the essence of reality. I used to feel this as a child – couldn't step across a puddle once I remember, for thinking, how strange – what am I? etc. But by writing I don't reach anything. All I mean to make is a note of a curious state of mind. (Woolf 1982a: 113)

Deleuze provides another way of thinking about Woolf's 'fin', as an idea of writing that draws on the different meanings of this word in French:

> Style gives writing an external end [*fin*] – which goes beyond what is written. And this is the same thing: writing does not have its end in itself precisely because life is not something personal. The only aim [*fin*] of writing is life, through the combinations which it draws. (Deleuze and Parnet 2006: 4)

For both Deleuze and Woolf, writing is always more than itself. In this regard Woolf's fin can point to the presence of a non-human being or force behind language, only ever partially seen. But what precisely is this force? Deleuze and Guattari argue that what lies behind language is a machinic assemblage, so that an individual is always just one element plugged into a collective arrangement of various elements (including psychological, social, technological components): 'Each of us is caught up in an assemblage of this kind, and we reproduce its statements when we think we are speaking in our own name; or rather we speak in our own name when we produce its statement' (Deleuze and Guattari 1988: 36). Yet, just as Woolf writes about netting a fin, it is through writing that this invisible assemblage is brought into the open. Moreover, just as the fin is the motor principle for the fish, writing carries with it a particular power for directing the assemblage, a way 'to gather the tribes and secret idioms from which I extract something I call my Self' (Deleuze and Guattari 1988: 84). However, for Woolf this then leads to another problem: of the relation between being conceived as becoming and language. Woolf can only ever 'note' her state of mind, implying that writing is always incomplete, only ever a sketch of reality (something continually evading it) and therefore, by necessity, unfinished.

This concern with ontology is developed throughout *The Waves*, and significantly it is Bernard, the story-telling character or maker of 'phrases and phrases' who also refers to the image of a fin (Woolf 1992: 22). Bernard and Woolf share a complex relationship with it. In old age

Bernard records how 'No fin breaks the waste of this immeasurable sea' (237), a moment he had predicted as a young man in terms of 'a self who does not come' (62). The fin is also used by Bernard to indicate a non-rational sensation or apprehension experienced at the edge of language: 'Leaning over this parapet I see far out a waste of water. A fin turns. This bare visual impression is unattached to any line of reason, it springs up as one might see the fin of a porpoise on the horizon' (157). However, as Woolf reveals in her diary, this image can also suggest something more sinister, as she records how 'now the old devil has once more got his spine through the waves' (Woolf 1978a: 270). A fin, so it seems, is as liable to augur danger as much as it might be attached to a playful porpoise.

The image of the fin indicates Woolf's determination to use her writing to investigate ontological questions, and at the same time the dangers that can be attached to such a project. For Woolf, finding her words (or netting fins) institutes an ongoing oscillation between pleasure and fear, alongside of which is the pervasive threat and even excitement of losing oneself in the vast 'waste' or chaos outside of language. Jean-Jacques Lecercle, in *Deleuze and Language*, describes an analogous alternation, on the one side the determination to push language to its limits into silence, and on the other the 'inexhaustible garrulousness that defeats exhaustion, of the constitutive effability that inhabits even the ineffable' (Lecercle 2002: 2). This problem of language also raises the question as to what it is that words do precisely. In an essay Woolf describes the

> strange . . . diabolical power which words possess . . . to suggest the writer . . . Why words do this, how they do it . . . nobody knows. They do it without the writer's will; often against his will . . . Even words that are hundreds of years old have this power; when they are new they have it so strongly that they deafen us to the writer's meaning. (Woolf 1966: 248)

Here Woolf addresses two different but associated problems that Deleuze likewise highlights. First, the relation between enunciation and the subject, how only through the act of language in use is a subject position actualised. This is why words 'deafen us to the . . . meaning', as a writer realises the forces that allow for language and the tensions from which subject positions are derived, including that of the reader. Second, the connection between the writer and his or her work, the way that words 'suggest the writer'. Just as Deleuze and Guattari, in their study of Kafka (1986), draw upon diaries and letters as much as Kafka's novels and short stories, thus blurring a boundary between life and art, Woolf is interested in what a literary machine tells us about

the qualities and problems of the writer. But such an investigation also shows how the author becomes imperceptible, merely a conduit for words that operate 'against his will'. The *word* in this way is indeed the *wyrd*, as in its ancient sense where to utter/write is to be an agent of an enaction.

Woolf's 'diabolical power' of words echoes the 'order word', a component of the model of language put forward in *A Thousand Plateaus*. In this model, at an elementary level, language functions as command (regardless of grammatical construction) so that any given statement presupposes a particular action. In fact, the relation between statement and act is one of reciprocal presupposition, as Deleuze and Guattari put it, 'each statement accomplishes an act and the act is accomplished in the statement' (Deleuze and Guattari 1988: 79).[7] Order words operate within a social terrain, as Deleuze and Guattari insist, so that language, since it is neither grounded in signification or subjectification, 'in its entirety is indirect discourse' (84). The critic and poet Denise Riley picks up this problematic of language, and argues that the choice between 'language as speaking us, and our status as freely choosing users of language' is in reality specious. Both approaches – and Riley contends that this opposition is reflected in the contrast between Continental and analytical philosophical accounts of language – fail to grasp language's 'affect as that outward unconscious which hovers between people' (Riley 2005: 3–4). As with the image of Woolf's fin that can give rise to conflicting associations, language is both impersonal and at the same time that which we use to form 'the fibre of the personal... Language as a speaking thing, neither my master nor my instrument, is amiably indifferent to me' (1–7). Riley indicates an important tension here, indifference on one side and amiability on the other, and one which is then reflected, I would argue, in the dynamic that Deleuze and Guattari present between order words and 'passwords', 'compositions of order' and uses of language that convert order words into 'components of passage' (Deleuze and Guattari 1988: 110).

By emphasising how the order word can be transformed, Deleuze and Guattari thereby reject a purely syntactic model of language. For them, such models are reductive. By postulating rules governing application, they separate language from real world contexts, from what Lecercle describes as the 'ontological mixture of event and sense' (Lecercle 2002: 156). Linguistics, therefore, has to question its basis as a homogenous system established out of language's heterogeneity, as the extraction of constants from variables. This is an enterprise, Deleuze and Guattari

maintain, that goes hand-in-hand with a political agenda whereby language is centralised and standardised, to become a major or dominant language (Deleuze and Guattari 1988: 100–1). However, in making this point, Deleuze and Guattari do not then subsequently set up a dualism between major and minor (or between constants and variation in language) as a fixed power relation, so that the major is said to dominate the minor. Rather, they insist that these two poles continually pass over and into each other. There are not two kinds of language in opposition to each other but rather two 'treatments' of language: '*Constant is not opposed to variable*; it is a treatment of the variable opposed to the other kind of treatment, or continuous variation' (103; original emphasis).

Additionally, the conception of pragmatics that Deleuze and Guattari put forward does not involve, as in other models, notions of linguistic competence, or a distinction between language and speech. Deleuze and Guattari argue that such ideas presuppose treating language in terms of an extraction of constants (Deleuze and Guattari 1988: 103–4). All the pragmatic features of language (for example, prosodic aspects such as intonation and, I would suggest, the procedures that a reader encounters in *The Waves*) have the ability to put language into a state of continuous variation. This is how language can be said to have a politics: a politics of the pragmatics of language as it continually operates between the two poles of constancy and variation. The problem of how to use language, in line with Woolf's ontological concerns, forms a critical component of *The Waves*, a novel that was written during a highly political phase in Woolf's career.[8] In order, then, to understand the nature of these politics at stake here we must shift attention to specific examples of four different linguistic procedures that Woolf invents in *The Waves*.

III. Linguistic Procedures

The Interstitial Discourse Marker

Deleuze and Guattari's insistence on language as indirect discourse can shed light on what Daniel Ferrer regards as a particular difficulty in reading *The Waves*, namely, how each character's utterance should be 'materially impossible to pronounce . . . at the same time as the actions they evoke', so that the word 'said' in the text cannot be taken literally (Ferrer 1990: 66). The interior monologue of each character is presented in the novel as if it was uttered as exterior speech, as the following example towards the beginning of the book demonstrates:

> 'I see a ring,' said Bernard, 'hanging above me. It quivers and hangs in a loop of light.'
>
> 'I see a slab of pale yellow,' said Susan, 'spreading away until it meets a purple stripe.'
>
> 'I hear a sound, said Rhoda, 'cheap, chirp; cheep chirp; going up and down.' (Woolf 1992: 5)

Ferrer argues that we must understand this narrative structure of *The Waves* as an 'interstitial' construction and 'as essentially figurative', since once the idea of representation is rejected this stylised mode of enunciation can be seen as the narration, not of a dialogic scenario, but of other ways of being (Ferrer 1990: 66). These procedures can only be explored in a space between third- and first-person narrative points of view. Although speech marks separate each voice, they are permeable, so that utterances leak into others through the repetition of language and grammatical structures across different speakers. Additionally, the first person of the present tense used by each character is made to suggest a position of distance that is conventionally associated with a third-person narrative. Ferrer, following a Lacanian conception of psychological loss, sees this style of enunciation as reliving experience in a 'hallucinatory mode' (91). However, in Deleuzian terms, such shifting distances and collectivised voicing allows language to move, to explore its own ambiguities in an interval, a space between fixed points of view. Furthermore, the use of the present tense as the prevailing mode of enunciation for each character's soliloquy is significant as this draws attention to speech as becoming, language as process.

Deleuze and Guattari's concept of a collective assemblage of enunciation can help us understand further this ambiguous position of the discourse marker in Woolf's text. Deleuze and Guattari's insistence on language as, fundamentally, indirect discourse, so that language always 'speaks from a second party to a third party, neither of whom has seen' (Deleuze and Guattari 1988: 77), posits that language is never grounded in an individual subject's experience. On this basis, they criticise linguistics for tying itself too readily to a concept of individualism (79–80). The characters in *The Waves*, like the subject in Deleuze's philosophy of language, do not occupy a central position in their usage of language; nor do they possess a voice arising from the privacy of an inviolable and isolated mind-space. Instead, they have a status and function as one dimension amongst a multiplicity involved in the construction of a collective assemblage of enunciation. A lack of differentiation between voices and also of voice across

time indicates this collectivised speech-making at work in the novel. Language embodies a multiplicity of externally enmeshed psycho-social conflicts and struggles. The interstitial discourse marker that Woolf devises for *The Waves* enables a particular power of affect that demonstrates a mode of speech mobilising words freed from an individual subject of enunciation. This procedure, and the ambiguous point of view that it produces, has a particular resonance with Deleuze's notion of the point of view made possible by the impersonal power of an event, 'like a third person of the infinitive, a fourth person singular' (Deleuze and Parnet 2006: 48).[9]

Grammatical Variation

Following Deleuze we can go further in exploring the construction of an interval in language, and look at how Woolf creates, through grammatical variation, an expression of the problems of language that concern her:

> 'Those are white words,' said Susan, 'like stones one picks up by the seashore.'
>
> 'They flick their tails right and left as I speak them,' said Bernard. 'They wag their tails; they flick their tails; they move through the air in flocks, now this way, now that way, moving all together, now dividing, now coming together.'
>
> 'Those are yellow words, those are fiery words,' said Jinny. 'I should like a fiery dress, a yellow dress, a fulvous dress to wear in the evening.'
>
> 'Each tense,' said Neville, 'means differently. There is an order in this world; there are distinctions, there are differences in this world, upon whose verge I step. For this is only a beginning.' (Woolf 1992: 14–15)

As Julie Vandivere observes, this passage enacts a movement between indicative and subjunctive grammatical structures, revealing the 'flux between the abstract and the concrete' involved in any process of self-definition, in this case in relation to conceptions of language (Vandivere 1996: 223). Susan uses indicative statements to insist that words have a material reality; they are 'like stones', a comparison also linked with the action of picking the stones up. Bernard expresses a different understanding of language, of its fluidity, mutability and the reliance on words that 'flick their tails', moving 'now this way, now that'. Jinny then moves into a subjunctive construction, the use of the modal 'should' indicating uncertainty and speculation. Her connecting 'fiery words' with a 'fiery dress' also shows a desire to locate language in relation to her own body and not outside of herself, as Susan and

Bernard have done. Differing conceptions of language are associated with different grammatical constructions, also demonstrating dissimilar ways of constructing reality. As Vandivere puts it, the 'indicative signals the myth of the concrete world wherein one can theoretically construct a sense of self, whilst the subjunctive signals a refusal of this myth' (224). This tension is extended into Neville's insistence on a need for order that attests to the differences within language, how 'each tense means differently', which is a difference coextensive with essential differences in the world. Neville's assertions repeat the verb 'to be' four times ('is', 'are'), an attempt to establish order through repetition. Yet this ordering is undercut by the tautological nature of his assertions. As Vandivere comments, the pronouns of the first part of each formulation ('there', 'this') provide no further support for the second part; in other words, Neville's statements do not possess the foundation in concrete reality that they claim and instead move 'pointlessly in circular modification' (Vandivere 1996: 226). Likewise, as the passage moves between the indicative and subjunctive, syntactic parallelism across the speakers ('Those are white words', 'Those are yellow words', the repeated use of demonstrative pronouns at the start of sentences linked with forms of 'to be') underlies an ordering and patterning, which is simultaneously destabilised as these recurring syntactical structures draw attention to the different semantic possibilities between them. This language play recalls Woolf's problems with language and the image of the fin continually oscillating between a potential porpoise or monster.

What also becomes significant here is that this movement across different and repeated forms of syntactical construction both requires and produces gaps, or borders, whilst at the same time the forms of repetition also become a movement across and between these gaps. Such movements constitute an affect, and, moreover, assert the linkage between language and ontology, since 'affects are becomings' (Deleuze and Guattari 1988: 256). Discussing Spinoza's concept of affect, Deleuze insists that this is not to be conceived as 'indicative or representative, since it is involved in a lived duration that involves the difference between two states' (Deleuze 1988: 48). Woolf's procedure can be understood as an attempt to capture (that is, to net) an affect of language involving the durations, or intervals, of movement between and across different states or forces of grammar, by doing so revealing the fragility of any linguistic or ontological claim.

A Route to the Outside of Language

According to Deleuze, one way to open up language is to engineer a route to its outside, to the point at which language becomes silence or encounters another medium, such as painting or music, to produce what Deleuze terms 'Visions and Auditions', found at its asyntactical and asignifying limits (Deleuze 1997: 5). In *The Waves*, Woolf offers this possibility, something Rhoda discovers when she attends a concert following Percival's death:

> An axe has split a tree to the core; the core is warm; sound quivers within the bark. 'Ah!' cried a woman to her lover, leaning from her window in Venice. 'Ah, ah!' she cried, and again she cries 'Ah!' (Woolf 1992: 133)

Rhoda, in an echo of the singer's repetitious cries, asks: ' "Like" and "like" and "like" – but what is the thing that lies beneath the semblance of the thing?' (Woolf 1992: 134). The repetitions across the syntactical construction of the sentence indicate Rhoda questioning whether language really is governed by a logic of signification, and, hinting at the ontological concerns of the novel, moreover coming up against language's limit-point. The singer's cries are the outside of language, showing this as a pure force of affect, an affective power of pure phonological effect, something that Deleuze dubs 'breath-words' (Deleuze 1997: 5). Here we also encounter that 'waste of water' beyond language's net, and significantly Woolf shows that it is here that a form of community can be founded. At the concert following her question as to what lies beneath language, Rhoda continues:

> Percival, by his death, has made me this gift, let me see this thing. There is a square; there is an oblong. The players take the square and place it upon the oblong. They place it very accurately; they make a perfect dwelling-place. (Woolf 1992: 134)

This is an extraordinary vision, compressing synaesthetic experience into an image of what could be termed molecular community; the sounds made by the 'players' visualised as shapes that build a 'perfect dwelling-place'. For Rhoda, 'The sweetness of this content overflowing runs down the walls of my mind, and liberates understanding' (Woolf 1992: 134). Significantly, Rhoda's vision is explicitly linked to the death of Percival, the event that initiated the trip to the concert, so that Percival functions in the book both as a force instituting the macropolitical body of Empire building (he dies serving British interests in India) but also as an enabler of micro-political organisation. Rhoda has perceived a sonic community of provisional structure: intensive and affective, made possible by the

molecular flows of becoming, and by necessity outside language since this is a form of community founded on what cannot be communicated or shared verbally.[10]

Woolf, in revealing to us the outside of language, where it can become, for example, pure phonological affect, creates a trajectory that in turn formulates a logic confirming the problem of language – the way, as Deleuze puts it, is 'so burdened with calculations and significations, with intentions and personal memories, with old habits that cement them together, that one can scarcely bore into the surface before it closes up again' (Deleuze 1997: 173). Words, Deleuze argues, are so 'bound to the general or the particular' that they lack the force of a disruption, the bursting open of a singular, indefinite intensity that he finds in music or visual arts. Words can smother the speaker, as the characters in *The Waves* demonstrate with their difficult and contradictory relationship to language (as well as with each other). Deleuze's formulation is that it is necessary to push language to its frontier, the outside of language where it becomes a music or an image 'like a new style in which words would at last open up by themselves, where language would become poetry, in such a way as to actually produce the visions and sounds that remained imperceptible behind the old language' (173).[11]

Transegmental Drift

For Deleuze, it is through syntactic creativity that language's becoming is activated (Deleuze 1997: 5). Style is understood in terms of the procedures writers invent to disrupt syntactical conventions, the ways that sentences can be transformed into rhizomes, to be made into a line that turns, bends, or folds back on itself. Deleuze's concept of the stutter refers to those procedures by which language is used in this way. Lecercle provides a useful definition of stuttering as

> the work or play of negation at the linguistic level, which entails consequences, in the shape of variation and the blurring or subversion of constraints at the rhetorical or stylistic level, and eventually points towards the utterly Other which human language, at its limit, enables us to glimpse, beyond the world, at the metaphysical level. (Lecercle 2002: 230)

The stutter is the production of syntactical variables. Almost a decade before starting work on *The Waves*, Woolf had had the idea of a novel in which 'one thing should open out of another' (Woolf 1978a: 13) as a discourse in perpetual movement, a web of proliferating connections that can also function in terms of a movement between words. In *The Waves*,

a particular style of stuttering is put into play through a procedure that Garrett Stewart calls 'transegmental drift', the 'undoing of the clear-cut difference between one word and its grammatically bonded neighbour in the chain of syntax' (Stewart 1987: 432).

Stewart offers the following examples of this procedure. In the novel's second sentence we read that 'the sea was slightly creased' (Woolf 1992: 3). By reading and listening to these words closely, it can be both seen and heard how language is put into motion. There is a chiastic progression from 'sea' to the 'eas' in 'creased' which draws attention to the space between these words, and in this space the shared sibilant in 'was' and 'slightly' drifts when voiced and gives a further semantic potential: 'lightly'. This ambiguity is a moment of vibration as the sound oscillates between two words. Similarly, when Bernard relates Rhoda's death and how, 'I… feel the rush of the wind of her flight when she leapt' (241), a drifting between 'rush' and 'of' of the 'sh' phoneme allows the possibility of hearing the word 'shove'. This vibration can also depend on the effect of voicing two different words in close proximity as in the 'moth-wing quiver of words' (180) in which the shift from sounding the 'g' to the 'q' is what Stewart calls a 'mere quaver of voicing' (Stewart 1987: 424). Sounds can be made to echo and mutate, as with: 'all the blades of the grass were run together in one fluent green blaze' (Woolf 1992: 122). Here 'blaze' is almost a repetition of 'blades', and 'one' echoes 'were run'. These internal rhymes and the drifting of phonemes and morphemes across the boundaries between words produce a subterranean syntax of flows and breaks.[12]

These few examples (Stewart provides many more) indicate how transegmental drift activates several linguistic energies. It creates disequilibrium as words change semantic potential or as morphemic and phonemic elements occupy other positions in grammatical variation. Reading becomes the discovery of 'pass-words beneath order-words… words that pass, words that are components of passage' (Deleuze and Guattari 1988: 110). Words are also made to vibrate as they become sites of phonological effects and phonetic ambiguity. Stewart identifies a further aspect to this procedure, how this activity incurs the body of the reader into its processes. Reception of the text is disturbed, occurring in the space between 'thinking (reading) and hearing (voicing) the text… an *evocalization*, as it were, of the reader's own physical presence' and a disturbance of sound that thereby privileges the reader's interpretative act and enables his or her active participation (Stewart 1987: 458–9; original emphasis). Language is neither informational nor communicational; it is as 'an act or event of

the real' (Blaser 2006: 113). This, I would suggest, aligns Woolf with a certain conception of writing as 'undone business' (to adopt a phrase from Charles Olson's poetry) as something by necessity incomplete.[13]

The stuttering in the syntactical gaps of Woolf's prose is like a rupture in the language: 'like an eternity that can only be revealed in a becoming, or a landscape that only appears in movement' (Deleuze 1997: 5). The new words that emerge between words recall Woolf's image of fins breaking through the surface of the sea. If such operations are more often associated with poetry than the novel, then this adds to the argument here for appreciating the formal innovations of Woolf's novel writing. As chris cheek explains:

> There are differing kinds of performance and often versions of writings, and this is particularly the case for poems, where there is a kinship between exophonic (sounded out) and endophonic (sounded within) body-mind on page as 'stage' and stage as 'page'. Readers, writers included of course, are temporary operators of a text with which there is reciprocity: a text performs its reader and its writer, and a reader and a writer perform a text. (cheek 2004: 23)

Such time-based operations, or performances, are descriptive of the ways of reading *The Waves* engenders. Furthermore, these uses of the text are supported by Woolf's insistence that reading be seen as an activity 'to refresh and exercise our creative powers' (Woolf 1966: 5). In one of her final essays, Woolf describes the reader engaged in an act of analysis and imagination: 'He can read directly what is on the page, or, drawing aside, can read what is not written... We are in a world where nothing is concluded' (Woolf 1979: 429). This idea of reading 'what is not written' can enable space for the reader's own creativity. It also suggests the possibility of a moment in which a reader challenges all a text presupposes, the reality that it presents as 'natural' (Flint 1996: 196). For Deleuze, too, reading is a creative engagement that exposes and builds on the mutual concerns of philosophy and literature: 'Try your own experiments', Deleuze urges,

> each time there is an assemblage of ideas, relations and circumstances: each time there is a veritable novel, where the landowner, the thief, the man with the javelin, the man with the bare hands, the labourer, the painter, take the place of concepts. (Deleuze and Parnet 2006: 42)

Woolf's syntactical operations function as an emerging dynamic and form flows within the flows of thought constituting the lines of flight or deterritorialisations of each character assemblage in *The Waves*. Each character records their mutations and multiple transformations,

initiated by encounters with other bodies and minds. A process, as Neville describes, 'to be recalled, to be mitigated, to have one's self adulterated, mixed up, become part of another' (Woolf 1992: 67), but also, at the same time, entailing a reorganisation or reterritorialisation. This concern with an ontology of becoming is precisely what Deleuze shares with Woolf, or as she describes it in *The Waves*, 'this veil of being, this cloud that changes with the least breath, night and day, and all night and all day' (Woolf 1992: 245).

IV. Conclusion: An Ontological Politics?

I have argued that Woolf's uses of language, and the linguistic procedures she invents, must be understood in terms of their connection with an ontological problem that preoccupied her whilst working on *The Waves*. These procedures, and the complex cluster of concerns that they raise, are encapsulated in Woolf's image of netting a fin, with its multiple, even discordant, associations. Woolf's concerns have also been shown to resonate with Deleuze's philosophy in a variety of ways, particularly in terms of the approach to language put forward in *A Thousand Plateaus*. This conjunction of Woolf with Deleuze reveals how ontology becomes intimately bound up with a problem of language. By way of a conclusion, I want to sketch three ways in which connections between Woolf's novel, her fin image and Deleuze's philosophy can be said to offer a preliminary mapping for what I would provisionally term an ontological politics.

First, Woolf's image of the fin provides productive, and novel, perspectives on some key Deleuzian concepts. Woolf's image can suggest distinct kinds of movement: floating, swimming and even moving across the water's surface. Behind all these forms of movement hovers, as Deleuze and Guattari state, 'the abstract machine of the waves'. This notion of something operating behind the machinic assemblages behind language is suggested in the motion of the ocean itself, in which Woolf discovers 'eternal renewal, the incessant rise and fall and rise again' (Woolf 1992: 247). The abstract machine of the waves puts into operation a power of repetition which, as Deleuze shows, is a condition of becoming: 'Returning is being, but only the being of becoming' (Deleuze 2004: 50). Woolf's notion of netting fins in a 'waste of water' is then suggestive of how movement is always predicated upon points of stagnation. As Tessa Dwyer comments in relation to Deleuze's work on cinema, this notion of 'waste' is necessary for the 'structural unit which Deleuze identifies as integral to thought, language, and knowledge

production' which is the interval, the space between that allows for movement (Dwyer 1997: 553). Movement subsists virtually in stasis, so that, as Deleuze describes it, the interval 'designates the point at which movement stops and, in stopping, gains the power to go into reverse, accelerate, slow down' (Deleuze 2005: 85). Likewise, Woolf's linguistic procedures function on the basis of a construction of an interval or holes in language. Such procedures show that Woolf does not seek to solve the problems that she sets herself; rather, what she wants to do is expose these concerns, enter into and explore them. This indicates how an ontological politics is alert to its own necessary incompleteness.

Second, Woolf's linguistic procedures implicate the reader in a problem of power. Since minor writers deterritorialise the major language by overturning privileged forms, introducing new semantic possibilities and subverting standardised syntactical and grammatical structures, not only should we consider *The Waves* as an example of minor literature, we also need to consider to what extent, since these procedures can be said to engage the reader in their actual processes, reading *The Waves* is a process of becoming-minoritarian. What matters in a relation between major and minor is not a fixed relation of forces but a process of becoming-minoritarian, one which 'continually oversteps the representative threshold of the majoritarian standard, by excess or default' (Deleuze and Guattari 1988: 106). In this regard, Bernard makes a significant comment at the close of the novel: 'I begin to long for some little language such as lovers use, broken words, inarticulate words, like the shuffling of feet on the pavement' (Woolf 1992: 199). Later, returning to the street, he notes how, 'The canopy of civilization is burnt out' (247). Woolf's 'shuffling of feet on the pavement', with its combined suggestions of movement, collective agency, and noise, provides us with an image of becoming-minoritarian, that figure of continuous variation that Deleuze and Guattari invoke. Significantly, alongside the shuffling of feet is a usage of language, the 'broken words' (a stuttering) showing that within an ontological politics the problem of language is central.

Finally, Deleuze's recognition of the event as 'incorporeal transformation' is echoed by Woolf when Bernard comments in *The Waves* that 'we are edged with mist. We make an unsubstantial territory' (Woolf 1992: 11). However, there is a further relevance here in connection with this discussion of Woolf's linguistic procedures, since in Deleuze's formulation the event requires close attention to grammatical construction. Deleuze contends that only the infinitive form of a verb captures the process of becoming that is an event, a dynamic distinct from the objects or terms that the event operates with and through

(for example, Deleuze and Parnet 2006: 47). Deleuze's emphasis on verb formation, considered in the light of Woolf's linguistic procedures, draws attention to the relation between thought and the discursive structures of language. Deleuze likewise indicates this relation in terms of philosophy's connection with the novel: for example, he suggests that *Difference and Repetition* can be considered as a type of detective novel (Deleuze 2004: xix), and in *Dialogues* states that there is a way of doing philosophy, of 'philosophising as a novelist, of being a novelist in philosophy' (Deleuze and Parnet 2006: 41).

What becomes apparent, then, from these points of connection between Deleuze and Woolf, is the possibility of an ontological politics, contested and created within and through language. A key component of this politics is the relation between writing and thinking, both conceived in terms of an ontology of becoming. Deleuze's statements on the link between philosophy and the novel (and indeed the ways in which he drew on literature throughout his work) can also be understood as a concern for border crossing, between all kinds of genres, disciplines and discourses, as well as for making problematic whatever forms of expression are used for doing philosophy and/or novel writing. In other words, integral to an ontological politics are the ways in which linguistic conventions are contested. As Woolf shows with her operations of language, this is a necessary resistance against an all too limiting and prescriptive compartmentalisation of thought and creativity. Since reading *The Waves* can be an activity of moving in differing ways between, across and within sentences, Woolf invites us to listen and look and think again. Style, as this examination of *The Waves* shows, can also be said to have an ontological politics, since, as Claire Colebrook puts it, we must ask '*what style* of life something – a political form, a work of art or a philosophy – enables' (Colebrook 2006: 4; original emphasis). The challenge that *The Waves* presents us with, as a novel that seeks to get beneath the 'cotton wool' of daily life, is how to operate its linguistic procedures of 'vibrations, shifting borderlines' in our own lives.[14] How to net fins?

Notes

1. Olson 1960: 53.
2. Woolf began *The Waves* (initially calling it 'The Moths') in July 1929, and, as her diary shows, during the first nine months of writing her mood towards her work alternated sharply. See Woolf 1982a; 1982b.
3. For a comparison of the two manuscripts see Woolf 1976.
4. For example, see Deleuze and Guattari 1988: 280, 329.

5. Deleuze does mention Woolf at the end of the opening essay of *Essays Critical and Clinical*: 'To write is also to become something other than a writer. To those who ask what literature is, Virginia Woolf responds; To whom are you speaking of writing? The writer does not speak about it, but is concerned with something else' (Deleuze 1997: 6).
6. Daniel Ferrer draws attention to this correspondence. See Ferrer 1990: 89.
7. In this context, Deleuze and Guattari (1988: 79) undertake a significant transformation of the concept of redundancy. In linguistics, redundancy is used within a communicational framework: to refer to the use of linguistic constructions that carry more information than is necessary; or at a phonological level, to explain how messages are understood despite the ambiguity of certain phonemic units. However, rather than see redundancy in terms of a transmission of information, Deleuze and Guattari make redundancy primary to the relationship between the statement and the act. Information is a minimal, not maximal, condition for the transmission of order words. Order words are in a relation of immanence or redundancy to the acts they presuppose; language is not a representation or a code, because the statement always 'speaks *on the same level as*' the act (Deleuze and Guattari 1988: 87; original emphasis).
8. As Gillian Beer comments in her introduction to the Oxford World's Classics Edition of *The Waves*, this was a period in which Woolf spoke regularly at both public and private events on issues of class and gender (Woolf 1992: xii).
9. Deleuze adopts the phrase 'fourth person singular' from Lawrence Ferlinghetti's novel *Her*: 'and now in the fog a permanent hole, a hole I knew, the seeing-eye of the fourth person singular that saw everything and understood nothing, yet still saw, the eye that saw and understood everything but myself, not able to see that in which it was itself imbedded' (Ferlinghetti 1960: 134).
10. For an examination of the different conceptions of community in *The Waves* see Gordon 2005. My identification of Rhoda's experience at the concert with a certain conception of community is taken from Gordon's formulations.
11. The procedures that Deleuze draws attention to here with regard to Beckett's works for television suggest comparisons with those of Woolf's: using words to 'enumerate, to expound, or to create a decor, which loosens them and allows things and movements to be introduced between them'; 'emphasizing certain words according to an interval or a bar, the rest passing by in a barely audible murmur' (Deleuze 1997: 173).
12. Charles Bernstein has picked up Stewart's term *phonotext* and put forward the notion of *audiotext*, as the 'audible acoustic text' of a poem, in terms of a poet's performance of a poem (an idea relevant, I would suggest, to Woolf's novel in terms of this discussion of the reader's active participation). Bernstein is interested in what he terms aurality or a/orality as the 'sounding of the writing . . . what the mouth and tongue and vocal chords enact' and the relation of these soundings to meanings (Bernstein 1999: 288–9). In a formulation that recalls Deleuze's conception of language's outside and its 'Visions and Auditions', Bernstein proposes an upper limit for the performance of poetry as music (and realised in sound poetry) and a lower limit as silence, realised in visual poetry.
13. In this regard, *The Waves* is again exemplary for Deleuze and Guattari, displaying a 'power of metamorphosis' that corresponds closely to the matter-function of its abstract machine (Deleuze and Guattari 1988: 513).
14. Woolf writes: 'From this I reach what I might call a philosophy; at any rate it is a constant idea of mine, that behind the cotton wool is hidden a pattern; that we – I mean all human beings are connected with this; that the whole world is a work of art; that we are parts of the work of art' (Woolf 2002: 85).

Deleuze, Bergson and Woolf's *Monday or Tuesday*

John Hughes University of Gloucestershire

Abstract

Deleuze's references to Woolf's work, and his work on Bergson, allow for a more far-reaching as well as more nuanced and diverse account of her correspondences with Bergson than have been noted. Her early collection of stories, *Monday or Tuesday*, reveals a powerful, many-sided metaphysical and aesthetic inspiration that bears out in detailed, various and fundamental ways what can be called the Deleuzian or Bergsonian aspects of Woolf's creativity and style at this crucial phase of her development as a writer.

Keywords: style, subjectivity, aesthetics, temporality, becoming, virtuality, memory, perception, emotion

For at least eighty years, literary critics have found the parallels between Woolf's writing and Bergson's metaphysics irresistible, their accounts tending to concentrate on oppositional framings of *durée* and *l'étendu* and inflected in terms of Woolf's modernist and feminist contentions of mechanical chronology, 'materialist' realism, and masculine politics and rationality.[1] This essay takes Deleuze's various comments on Woolf's writing as signalling towards further nuances in the manifold correspondences between the metaphysical motivations of her writing and Bergson's work, the latter read under the rubric of Deleuze's influential recasting of it in relation to notions of creativity, virtuality, difference and multiplicity.[2] In exploring what is seen as the fundamental nature of Woolf's philosophical inspiration in these terms, the focus will be on what is seen as some of her most decisively experimental and intriguing fiction: the eight short stories comprising her earliest

Deleuze Studies 7.4 (2013): 496–514

www.euppublishing.com/dls

collection, *Monday or Tuesday*. The stories were written at a critical early juncture, when her writing was arguably at its most fluid and emergent, and were published in 1921.[3] This focus has at least two main benefits. In the first place, as suggested, the exploratory verve of the stories allows one to identify at close quarters how innately Woolf's creativity is configured by ontological issues and problems. This is a fiction emancipated by its dislocation of the armature of conventional novelistic representation, as it pursues modes and themes that can be linked, through stylistic enactment and thematic staging, with Bergson's concepts of the virtual, intuition, sympathy, subjectivity, art, creativity, emotion and language. In the second place, this focus allows for an account of how decisively this philosophical inspiration contributed to the internal evolution of Woolf's style and thinking, and passed – by way of the minor form of the short story – into the major work. These comments brings to mind Ruth Gruber's argument in her 1935 dissertation, which Woolf herself welcomed in a letter the same year as 'a most sympathetic and acute study of my books' (Gruber 2005: 44). One of Woolf's first and most philosophically minded critics, Gruber identified the Bergsonian strain in Woolf's writing, as well as noting how Woolf's determination to 'write as a woman' was inseparable from the 'variation of experiments' that was 'ultimately liberated' in her work as she attained 'her completed style' (61, 99).

I.

In an extended passage in *A Thousand Plateaus*, Deleuze and Guattari identify Virginia Woolf as one of those Anglo-American writers who 'made all of her life and work a passage, a becoming, all kinds of becomings between ages, sexes, elements, and kingdoms' (Deleuze and Guattari 1988: 252). Her novel, *The Waves*, internally divides itself according to the lines of flight of its various narrators, their proper names raised to expression as the designations of the multiplicities they compose ('for example, Bernard and the school of fish'):

> Each advances like a wave, but on the plane of consistency they are a single abstract Wave whose vibration propagates following a line of flight or deterritorialisation traversing the entire plane (each chapter of Woolf's novel is preceded by a meditation on an aspect of the waves, on one of their hours, on one of their becomings). (Deleuze and Guattari 1988: 252)

Woolf recurrently identified her style in terms of the idea of the wave as a movement exceeding the representational logic of subjectivity, as in

her comment to Vita Sackville-West that 'a sight, an emotion creates this wave in the mind, long before it makes words to fit it' (Gordon 1984: 193). In 1919, Lytton Strachey praised her for having invented a new form of sentence, and her biographer, Lyndall Gordon emphasised her aesthetic desire to make the 'waves' rhythm . . . sound all through her greatest books' (3). In *Monday or Tuesday*, one can see how her writing comes to accommodate this wave-like capacity of style, capturing the rhythmical, indefinite foldings by which the mind is generated from the sensible, and by which rational, integral subjectivity is conceived as effect and epiphenomenon rather than origin. In such ways, her style reveals itself as expressively conditioned by the affective, by its opening out into the pre-personal fluctuations and intensities that precede and compass cognition, as prefigured in her abiding childhood memory where she had associated the sound of the Cornish waves with 'the purest ecstasy I can conceive' (3).

More broadly, Deleuze recurrently described Woolf's aesthetic practice in terms of concepts of motion and emotion – of passage, intensity, experimentation, sympathy and fluidity – that apply to the qualities, temporality and themes of her work and that can be taken as creating a productive counterpoint with her own thought and reflections about her art. In *Dialogues*, he describes Woolf as one who made 'writing an act of thought and life a non-personal power'. Her writing is an opening or voyaging out like one of Clarissa Dalloway's strolls, 'a walk as act, as politics, as experimentation, as life: "I spread myself out like fog BETWEEN the people that I know the best", says Virginia Woolf in her walk among the taxis' (Deleuze and Parnet 2002: 23). For Deleuze, in such ways, Woolf exemplifies that Anglo-American practice of writing that produces encounters and lines of flight through its rigorous experimental expressivity. Woolf's style goes out and goes between, its excursive stylistic intensities and rhythms effectively dislocating the stabilising designations of identity, genre, gender, history, culture and class that she perpetually contests in the forms of content and in the *mise en scènes* of her fiction:

> On her stroll Virginia Woolf's heroine penetrates like a blade through all things, and yet looks from the outside, with the impression that it is dangerous to live even a single day ('Never again will I say: I am this or that, he is this, he is that . . . '). But the stroll is itself a hecceity. It is hecceities that are being expressed in indefinite, but not indeterminate, articles and pronouns; in proper names which do not designate people but mark events, in verbs in the infinitive which are not undifferentiated but constitute becomings or processes. (Deleuze and Parnet 2002: 68–9)

Though affirmative of transpersonal events of becoming, it is important to stress the nuance in Deleuze's emphasis on what is 'dangerous', as well as elating, in the vitality expressed through Woolf's writing. The point can be expanded by reference to a conversation with Antoine Dulaure and Claire Parnet in 1985 in which Deleuze described Woolf as a writer whose 'writing has to be liquid or gaseous simply because normal perception and opinion are solid, geometric'. He continued:

> It's what Bergson did in philosophy, what Virginia Woolf or Henry James did with the novel. Not becoming unearthly. But becoming all the more earthly by inventing laws and liquids and gases on which the earth depends. So style requires a lot of silence and work to make a whirlpool at some point, then flies out like the matches children follow along the water in a gutter. Because you don't get a style just by putting words together, combining phrases, using ideas. You have to open up words, break things open, to free earth's vectors. (Deleuze 1995: 133–4)

Her style is identified with the risks of breaking, as well as the 'whirlpool', and the flying, perhaps flaring, matches that children throw into it. Suitably enough, Deleuze's imagery intimates the transporting, inspiring power of Woolf's style, and evokes its vivid, brilliant profusion. However, it also suggests how riven her writing is and how far the values of life and death, inspiration and silence, ecstasy and threat are entwined in the creative, destabilising dynamics of Woolf's work. The subjective displacements of Woolf's writing entail a groundlessness, a power of dissolution and emergence, that is destructive and vortical as well as constructive. The stakes of Woolf's experimental practice as a writer are again suggested by Deleuze's identification of her work here (as in the passage on *The Waves* in *A Thousand Plateaus*) with the water that always offered her the means of unifying and dissolving experience, an element productive of both a line of flight as well as of disappearance. As Joanne Trautmann Banks comments:

> Eventually, of course, all fictions failed to sustain her, and she committed suicide by walking into a river. It was an interesting choice in that water always has dichotomous potentials in Woolf's stories. Water either unifies conflicting elements or it dissolves the self utterly. (Banks 2004: 23)

Of course, this sense of deliquescence precedes the stories collected in *Monday and Tuesday*, and one remembers the emancipating yet fatal sea-voyage in Woolf's preceding publication, *The Voyage Out*.

It is one of the sub-themes of this piece to explore this complex imbrication of the values of extinction and transport in Woolf's writing,

in terms of the 'line[s] of flight or deterritorialisation[s]' it produces, through concentrating on her early short stories and their particular experimental salience in her evolution as a writer. In approaching this ethical duality briefly, one can recall two parallel moments from her later, developed fiction. Fazel Asadi Amjad points out two scenes in *Mrs Dalloway*, where characters 'look . . . from the outside', in Deleuze's terms. In the first of these, the suicidal Septimus is unable to find relief in the old man he spies from the window and ignores him, whereas in the second Clarissa Dalloway becomes the narrative vehicle for an excursive, dislocating and indefinite moment of becoming (Amjad 2011: 130). She muses on the old lady she accidentally espies across the street:

> Oh, but how surprising! – in the room opposite the old lady stared straight at her! She was going to bed. And the sky. It will be a solemn sky, she had thought, it will be a dusky sky, turning away its cheek in beauty. But there it was – ashen pale, raced over quickly by tapering vast clouds. It was new to her. The wind must have risen. She was going to bed, in the room opposite. It was fascinating to watch her, moving about, that old lady, crossing the room, coming to the window. Could she see her? It was fascinating, with people still laughing and shouting in the drawing-room, to watch that old woman, quite quietly, going to bed. She pulled the blind now. The clock began striking. The young man had killed himself; but she did not pity him; with the clock striking the hour, one, two, three, she did not pity him, with all this going on. There! the old lady had put out her light! The whole house was dark now with this going on, she repeated, and the words came to her, Fear no more the heat of the sun. She must go back to them. But what an extraordinary night! She felt somehow very like him – the young man who had killed himself. She felt glad that he had done it; thrown it away. The clock was striking. The leaden circles dissolved in the air. He made her feel the beauty; made her feel the fun. But she must go back. She must assemble. She must find Sally and Peter. And she came in from the little room. (Woolf 2003a: 207)

The exclamation, 'Oh, but how surprising!', introduces the values of sympathetic inwardness and aesthetic responsiveness that the passage conveys and meditates on, as it prises open the heroine's subjectivity and creates its haecceity, or moment of being, unfolding a counterpoint to the customary, defining closures of the clock, self, pity, self-pity, social assembly and the little room. Like the sky that is 'new to her', Woolf's passage dedicates itself to the intensities of a renewal whose impersonal expansiveness goes beyond Clarissa as she also becomes ever-more dissociated from herself ('But what an extraordinary night. She felt somehow very like him . . . The clock was striking. The leaden circles dissolved in the air'). Woolf's writing, with its poetic flashes

and rhythms, 'open[s] up words, break[s] things open', in Deleuze's words, producing the means for an eventual becoming that transcends the self-awareness of the heroine and incorporates the reader, even as it is nonetheless also shadowed by the vocabulary of darkness, dissolution and death that inhabits the writing.

II.

Woolf had experienced one of her most severe breakdowns in 1917, prior to the setting up in July of the Hogarth Press in the basement of her Richmond home with its top-floor view over Kew Gardens. *Two Stories*, laboriously typeset by Virginia, would be its first publication and would include 'The Mark on the Wall', the first-written of the stories in *Monday or Tuesday*.[4] The air of freedom that accompanies the story was very real, bound up with her awareness that her circumstances made her 'the only woman in England free to write what I like' (Lee 1997: 375). Of the story itself, Woolf wrote to David Garnett: 'In a way it is easier to do a short thing, all in one flight than in a novel', and she would later write to Ethel Smyth of how she wrote it 'all in a flash as if flying, after being kept stone breaking for months' (Woolf 2003b: viii). This latter reference is to the arduous process of writing her second novel, *Night and Day*, a work that strains against its own conventional romantic form and thematic fixations. This novel was to be published in 1919 by Duckworth & Co., under the aegis of her half-brother Gerald Duckworth, who along with his brother George had sexually abused Woolf and her sister, Vanessa in their youth.[5]

Within this context, and given its air of untrammelled inspiration, it is possible to see 'The Mark on the Wall' as one of those early signature pieces by which a writer's creativity often appears to announce itself unforeseen, arriving on the page in a *mis en scène* that condenses repeating themes and expresses a singular power of individuation that will unfold itself over and again in later works. Within the story itself, everything proceeds from the indefinite nature of the obscure mark, which becomes the repetitive, generative occasion for the story's inspired displacements of the generic, defining protocols of fictional narration. Sitting in her chair, the narrator ponders the spot, reflecting that it might be a hole, a leaf, a crack, 'some round black substance' (Woolf 2003b: 78) or 'the head of a gigantic old nail' (81). As if by a kind of contagion, the world of the story and the narrator's mind both become affected by radical, proliferating kinds of uncertainty and possibility. The obscure mark forces an opening in the mind, and

thought unravels into bifurcating, disjunctive trails of fancy, association, sensation, reverie, imagination, memory and rumination.

At the start, in a way reminiscent of many Poe stories, the narrator's words passingly mimic a fiction bent on the recognisable world, before disarticulating it: 'Perhaps it was the middle of January in the present year that I first looked up and saw the mark on the wall' (Woolf 2003b: 77). As it continues, the writing accommodates different fluxes of time and becoming, and the material world turns relative, insubstantial and theatrical. The 'three chrysanthemums in the round glass bowl on the mantlepiece' appear hallucinatory, whereas the narrator comes to imagine a man setting out to sit 'himself solidly in an arm-chair', while '[a] shower of ideas fell perpetually from some very high Heaven down through his mind' (79). The paragraphs themselves similarly dissolve into burgeoning images, provisional fictions and serial reflections, as everything becomes process, transformation and multiplicity, and rationality and cognition are overrun on every side: 'because once a thing's done no one ever knows how it happened. Oh! dear me, the mystery of life! The inaccuracy of thought! The ignorance of humanity!' (78). The iterative, mesmerising, sonic and rhythmical features of this prose coalesce with the vocabulary of sinking and slipping to make style the register of that double sense of self-evanescence: both lyrical transport or ecstasy, and the darker gravity of disappearance. Thus at the end of the story, the narrator describes that 'vast upheaval of matter' with '[e]verything . . . moving, falling, slipping, vanishing' (83) and stresses her own fugitive desire to 'slip easily from one thing to another, without any sense of hostility, or obstacle. I want to sink deeper and deeper, away from the surface, with its hard separate facts' (Gordon 1984: 194).

Eventually, the writing leaves the human world behind as the narrator meditates on the becomings of flowers, fish, birds, water-beetles, even of forest trees and insects:

> The tree itself: first the close dry sensation of being wood; then the grinding of the storm; then the slow, delicious ooze of sap . . . how cold the feet of insects must feel upon it, as they make laborious progresses up the creases of the bark, or sun themselves upon the thin green awning of the leaves, and look straight in front of them with diamond-cut red eyes. (Woolf 2003b: 82–3)

Kathryn Benzel and Ruth Hoberman have described the experimental verve of these stories, as Woolf uses the form to develop 'an anti-anthropocentric discourse, dissolving human/nonhuman boundaries, and privileg[ing] the perspective of objects and animals' (Benzel and

Hoberman 2004: 11). Indeed, within this tale the everyday world breaks up, so that all the fixtures of the social world float by on the fast-flowing tide of the narrative as so much absurd and illusory flotsam: the world of photographs and domestic interiors; of 'Sunday afternoon walks, Sunday luncheons, and ... ways of talking of the dead, clothes, and habits'; of Colonels and Archbishops; of national history and 'Whitaker's Table of Precedency'. Eventually, she reflects, 'Knowledge' and subjective identity become apparitional, revealed as absurd fictions – desperate bulwarks against 'the impersonal world which is proof of some existence more than ours', while her mind figures its own dissolution, as if from the bottom of a river-bed:

> Yes, one could imagine a very pleasant world. A quiet spacious world, with the flowers so red and blue in the open fields. A world without professors or specialists or house-keepers with the profiles of policemen, a world which one could slice with one's thought as a fish slices the water with his fin, grazing the stems of the water-lilies, hanging suspended over nests of white sea-eggs ... how peaceful it is down here, rooted in the centre of the world and gazing up through the grey waters, with their sudden gleams of light and their reflections – if it were not for Whitaker's Almanac – if it were not for the Table of Precedency. (Woolf 2003b: 81–2)

The inspired intensity and urgent profusion of 'The Mark on the Wall', with its rhizomatic style, brings to mind the famous diary entry cited by Deleuze whereby she identifies the moment with 'thought', 'sensation' and 'the voice of the sea', and claims that her aim is to 'saturate every atom' and 'eliminate all waste, deadness, superfluity: to give the moment whole; whatever it includes'. She continues:

> Say that the moment is a combination of thought; sensation; the voice of the sea. Waste, deadness, come from the inclusion of things that don't belong to the moment; this appalling narrative business of the realist: getting on from lunch to dinner: it is false, unreal, merely conventional. Why admit any thing to literature that is not poetry – by which I mean saturated? Is that not my grudge against novels – that they select nothing? The poets succeeding by simplifying; practically everything is left out. I want to put practically everything in: yet to saturate. (Woolf 1980: 209–10)

The few years or so that followed the publication of 'The Mark on the Wall' would certainly produce an extraordinary efflorescence in Woolf's short story writing, bearing out her remark to her sister Vanessa that 'I mean to write a good many short things at Asheham' (Lee 1997: 375). As we have seen, Woolf herself appeared to identify this outpouring in terms of a vivacious displacement of generic constraints

and fictional protocols, inseparable from the sense that the form was a respite from her novelistic writing.[6] The other stories in *Monday or Tuesday* were 'Kew Gardens', 'The String Quartet', 'A Haunted House', 'A Society', 'Blue & Green', 'Monday or Tuesday' and 'An Unwritten Novel', and within the collection this sense of emancipation is abundantly, peculiarly, evident. By turns exuberant, aleatory, sketchy or darkly meditative, the stories reveal an experimental variety and effervescence that makes their neglect by writers on Woolf nothing less than 'astonishing', as Benzel and Hoberman have remarked (Benzel and Hoberman 2004: 3). Michelle Levy sees the form as offering Woolf the purest kind of liberation from 'conventional types of plot and characterisation', and it seems undoubted that her experiments in the form would have accelerated her progress from the more hybrid forms of early works like *The Voyage Out* and *Night and Day* towards what Alice Staveley has termed that 'breakthrough modernist novel', *Jacob's Room*, in 1922 (Staveley 2004: 39).

In such ways, the short form allowed Woolf a peculiarly privileged experimental arena to pursue, like Bergson, through a comparable exercise of writerly intuition, 'the conditions of experience, towards the articulation of the real' (Deleuze 1991: 26). As with the latter's philosophy, her stories overturn the false composites that distort the workings of sensation, affectivity, memory and temporality by subsuming them within fictions of human consciousness and narrative. 'The String Quartet' is a clear case of this disruption, narrated by a speaker who finds the initial small-talk and anxieties of the concert hall suddenly exploded by the mercurial music-becoming that consumes the story. As the quartet starts up, the writing compounds itself with the ungrounded, self-differentiating virtuosity of Mozart's music: 'Flourish, spring, burgeon, burst!' (Woolf 2003b: 133). Music blooms in a syntax that rhythmically and sonically dilates, accommodating music's transmission of the percepts of an endlessly expressive, inhuman nature:

> The pear tree on the top of the mountain. Fountains jet; drops descend. But the waters of the Rhone flow swift and deep, race under the arches, and sweep the trailing water leaves, washing shadows over the silver fish, the spotted fish rushed down by the swift waters, now swept into an eddy where – it's difficult this – conglomeration of fish all in a pool; leaping, splashing, scraping sharp fins; and such a boil of current that the yellow pebbles are churned round and round, round and round. (Woolf 2003b: 131)

The writing is expansively subject to the temporal effects of this music as an art of different, coexisting durations. The narrator's imaginings

of water, birds and fish brings to mind Bergson's comments in a comparable passage from *Duration and Simultaneity*, glossed by Deleuze as showing how the pluralism of time coexists with an encompassing, self-dividing monism: 'The flowing of the water, the flight of the bird, the murmur of my life form three fluxes; but only because my duration is one of them, and also the element that conjoins the two others' (Deleuze 1991: 80). One can say that my duration is itself a flux and an instance of duration, while my awareness of other fluxes is predicated on this underlying unity and simultaneity of 'duration as the virtual coexistence of all the degrees of a single and identical time' (85).

Further, through such means 'The String Quartet' clearly transmits the creativity it expresses and corresponds to Bergson's notion of 'creative emotion' as described by Deleuze in *Bergsonism* in response to citations from Bergson's account – in *The Two Sources of Morality and Religion* – of the transcendent, contagious power of music, and the precedence of emotion over representation and volitional subjectivity:

> 'Imagine a piece of music which expresses love. It is not love for a particular person . . . . The quality of love will depend upon its essence and not upon its object.' Although personal, it is not individual; transcendent, it is like the God in us. 'When music cries, it is humanity, it is the whole of nature which cries with it. Truly speaking, it does not introduce these feelings in us; it introduces us rather into them, like the passers-by that might be nudged in a dance.' In short, emotion is creative (first, because it expresses the whole of creation, then because it creates the work in which it is expressed; and finally, because it communicates a little of this creativity to spectators or hearers). (Deleuze 1991: 110–11)

Emotion in art 'expresses the whole of creation' through the work (Deleuze 1991: 110), communicating its vital and virtual power to the audience who participate within it. The work is both microcosm and component of the opening out that it expresses. This recalls Deleuze's discussion of the cinematic image and the ontology of the whole as the 'Open': 'if the whole is not giveable, it is because it is the Open, and because its nature is to change constantly, or to give rise to something new, in short, to endure' (Deleuze 1992: 9).[7] And at the end of Woolf's story, there is a palpable sense of collapse and closure, of everything returning to the partitioned world of social consciousness:

> 'Good night, good night. You go this way?'
> 'Alas. I go that.' (Woolf 2003b: 135)

In 'A Haunted House' the incursive temporal effect of time is of a Bergsonian virtual past that insists in the present as the condition

of its persistence, its coming and going, and which is figured as encompassing the lives of the living and the dead. The narrator's pervasive sense is of the couple who haunt the house, disembodied yet real ('Not that one could ever see them' [Woolf 2003b: 126]). Reunited in death, their continuance is figured as safely contained within the 'pulse of the house' (117). The virtual reality of the past enters into strange, endlessly recurrent commerce with the lives of the living, haunting consciousness itself. In such ways, the story illustrates again the metaphysical nature of Woolf's stories, which can be viewed as profoundly metaphysical essays, open-ended examinations of a philosophical problem of memory, understanding and temporality. And as such, in more general terms, philosophy can appear as itself the silent, virtual, ever-haunting accompaniment, even the milieu, of these fictional explorations and constructions.

Again, in 'Blue & Green', for instance, Woolf does strikingly 'open up words, break things open, to free earth's vectors', in Deleuze's words. The story evokes and ruminates on the changing effects of light, variously reflected, radiated and refracted at various times of the day through the glass pendants of a Tiffany lamp. From a formal viewpoint, the story turns fiction inside out, diversifying its own incidental, fugitive, poetic intensities of perception and reverie. It is an intermezzo, an experimental unfolding of the percept through the substance of language that corresponds to the refraction of light within the substance of the glass:

> The pointed fingers of glass point downwards. The light slides down the glass, and drops a pool of green. All day long the ten fingers of the lustre drop green upon the marble. The feathers of the parakeets – their harsh cries – sharp blades of palm trees – green, too; green needles glittering in the sun. (Woolf 2003b: 136)

The story creates fleeting passages of lyricism, beauty and intensity, as ephemeral effects of colour become transmuted by the narrator into visionary reveries that capture the duration in perception and the associative powers of imagination and memory. In the day, the light's green summons to mind feathers, parrots, palm trees, pools, desert sand, lurching camels, weeded pools and marble before in the evening it yields to a blue that produces images that are much more portentous and troubling, associated with a 'snub-nosed monster' that rises from the depths before being beached where he lies 'blunt, obtuse, shedding dry blue scales'. The story ends with the beast's blue tones staining a

'wrecked rowing boat' and then evoking images of a cathedral, 'faint blue with the veils of madonnas' (Woolf 2003b: 136).

In the title story, 'Monday or Tuesday', the difference between narrator and reader is collapsed in a dense, if elliptical, meditation on ontology and representation that begins and ends with the image of a heron 'shaking space easily from his wings, knowing his way', his autonomy contrasting with the fugitive, riven voice that periodically surfaces in the text to register the narrator's troubled, suspended imperative in 'desiring truth' (Woolf 2003b: 131). Reader and narrator alike are effectively confounded by the quandaries, sensations, imaginings and scenes that succeed each other in the flow of mind as it turns, at once invigorated and questioning, from sky to mountain, from lake to city, and then on to the striking of a clock, the colours of a cityscape, the niceties of social intercourse and the interior of a room. The writing occupies the interval between perception and the closures of rational consciousness, endlessly displacing itself between different frames, modes, registers and types of experience, and confronting the difficulty of 'laboriously distilling a few words'. Writing and reading are both internally divided, between the evanescent actualities of imagination and affectivity, and the synthetic, belated labours of socialised cognition:

> From ivory depths words rising shed their blackness, blossom and penetrate. Fallen the book; in the flame, in the smoke, in the momentary sparks – or now voyaging, the marble square pendant, minarets beneath and the Indian seas, while space rushes blue and stars glint – truth? or now, content with closeness? (Woolf 2003b: 131)

In contrast to the gravity that besets the riven human consciousness, the story returns to the self-sufficiency of heron and sky that effortlessly reveal and express their truth: 'Lazy and indifferent the heron returns; the sky veils her stars; then bares them' (Woolf 2003b: 131).

Ambitious and searching as these stories are, they coexist also with other stories that are more programmatic and less ambitious, easily identifiable with more obvious, familiar and predictable kinds of modernist topics or pretexts. 'A Society' deals with issues of female education and male condescension, whereas 'An Unwritten Novel' deals with the presumptions of writing fiction where life and the life of the individual must always elude one's understanding and judgements. What is clear is that these stories lack the driving sense of metaphysical query

that motivates the collection as a whole and 'Kew Gardens' in particular, perhaps Woolf's most celebrated short story.

III.

Harvena Richter reports that by 1922 at least (the year in which Woolf began to read Proust) 'Woolf had not read Bergson or even Karin Stephen's book on him' (Richter 1976: 72), and Mary Ann Gillies refers to 'the silence maintained by Woolf' on the philosopher (Gillies 1996: 7). It seems impossible that Woolf would have been ignorant of Bergson (though it is possible she chose not to read someone whose philosophical writing, through its very proximity, might threaten to subsume her own literary investigations). Indisputably, Bergson was a major intellectual influence permeating the thought of the period, and aside from the fact that Karin Stephen was her sister-in-law, Woolf's friend, T. S. Eliot, had enthusiastically attended Bergson's Paris lectures in 1913, and his ideas of literature show a canny assimilation of Bergsonian logic.[8] What is also clear is that dominant themes in Bergson's radical metaphysics of vital process, duration and consciousness were part themselves of a larger intellectual assemblage, overlapping in so many respects with the work of writers close to the Bloomsbury group like Alfred North Whitehead, Bertrand Russell and William James.

Following the publication of *Jacob's Room*, Woolf wrote that she had 'found out how to begin to say something in my own voice' (Staveley 2004: 39). This discovery, however, is particularly inseparable from Woolf's most acclaimed story, 'Kew Gardens', published in 1919, and perceptively described by Leonard Woolf as a 'microcosm of all [Woolf's] then unwritten novels, from *Jacob's Room* to *Between the Acts*' (Staveley 2004: 43). But if it was a microcosm, it was by elevating the microcosmic itself to the condition of art. The story's main concern can be said to be with generating open exchanges between sensation and memory, self and other, human and inhuman, garden and universe in ways that call out for description in terms of the metaphysics of heterogeneous multiplicity, of qualitative division, that Deleuze traces throughout Bergson's career in those concepts that themselves implicate and exemplify Bergsonism: duration, memory, *élan vital* (but also emotion, laughter, art). The snail that recurs throughout the story is both other and correspondent to the people that walk far above him. He is consumed within an unfathomable world that nonetheless also

parallels their own passages of mind, between affectivity, absorption and reaction:

> In the oval flower-bed the snail, whose shell had been stained red, blue and yellow for the space of two minutes or so, now appeared to be moving very slightly in its shell, and next began to labour over the crumbs of loose earth which broke away and rolled down as it passed over them. (Woolf 2003b: 85)

The narrator's reiterated references to the snail's progress and perspective emphasises also the story's decentred, inhuman world. Beyond its shell, the snail enacts the mind's experimental, sensitive relation to its outside, in ways which can bring to mind Bergson's description of the self in *An Introduction to Metaphysics*:

> There is, beneath these sharply cut crystals and this frozen surface, a continuous flux which is not comparable to any flux I have ever seen. There is a succession of states, each of which announces that which follows and contains that which precedes it. (Bergson 1916: 22)

The snail also figures the story's rejection of any overarching narrative synthetic viewpoint, by which the fiction could represent the different durations that interweave within it. In such a way, from the celebrated opening, *Kew Gardens* turns inside out the conventional hierarchies and procedures of fiction. The conventional human, subjective and social stuff of narrative is reduced to fugitive inconsequence, as with parenthetical snatches of dialogue that flit in and out of the story's universe. They appear estranged, as if heard from the midst of the flower-bed, or as passing back and forth incidentally within the green-blue atmosphere, the afternoon haze, that envelops the garden, as in the cursory postscript that closes the paragraph ('the men and women who walk in Kew Gardens in July').

> From the oval-shaped flower-bed there rose perhaps a hundred stalks spreading into heart-shaped or tongue-shaped leaves half way up and unfurling at the tip red or blue or yellow petals marked with spots of colour raised upon the surface; and from the red, blue, or yellow gloom of the throat emerged a straight bar, rough with gold dust and slightly clubbed at the end. The petals were voluminous enough to be stirred by the summer breeze, and when they moved, the red, blue and yellow lights passed one over the other, staining an inch of the broad earth beneath with a spot of the most intricate colour. The light fell either upon the smooth grey back of a pebble, or the shell of a snail with its brown circular veins, or, falling into a raindrop, it expanded with such intensity of red, blue and yellow the thin walls of water that one expected them to burst and disappear. Instead, the drop was left in

> a second silver grey once more, and the light now settled upon the flesh of a leaf, revealing the branching thread of fibre beneath the surface, and again it moved on and spread its illumination in the vast green spaces beneath the dome of the heart-shaped and tongue-shaped leaves. Then the breeze stirred rather more briskly overhead and the colour was flashed into the air above, into the eyes of the men and women who walk in Kew Gardens in July. (Woolf 2003b: 83)

Nothing could be more clearly opposed to the rationalities, the masculine order-words and precedents of novelistic realism, than the bifurcating, rhythmically intensified, appositions of this hybrid of poetry, prose, philosophy and painting. Woolf's sentences themselves spread and unfurl, inhabited by silence, proliferation, repetition, and by a material insistence that passes into the sensations that the prose releases. The effect of the writing is to create a quasi-hypnotic zone, in which the reader passes outside him- or herself, mind reconstituted in the multiplicities, the compounds of sensation that are carried forward by the inclusive disjunctions and emergent movements of this prose. In the terms of Deleuze and Guattari's *What is Philosophy?*, Woolf can be said to write the garden as percept, through shifts in scale and temporality that suspend daily consciousness and use language to create 'a bloc of sensations . . . a compound of percepts and affects' independent of the author, narrator or reader who belatedly circulate and pass through the writing like the strolling, anonymous, incidental, provisional figures in Woolf's garden (Deleuze and Guattari 1994: 164).

Within the story too, Woolf represents human beings as often estranged and awkward. Their 'figures' 'straggled past . . . with a curious irregular movement', as if irregularity were a marker of their self-division or alienation from the scene. Yet the garden also becomes in the story the condition for individuating moments and transversal, irregular movements, for encounters through which people overcome their divisions from each other and themselves, and from past and present, through entering into movements of inclusive heterogeneity. Relatedness in the passage is again figured as a relation to the outside, conveyed in writing that is endlessly sensitive to nuance, movement and difference, like the snail's eyestalks. The intimacy of a married couple, often the terminus or vanishing point of fiction, is here premised on a strange divergence. The couple are described as bound up with the sense of experience as an evolving, involving whole – with their common acknowledgement that 'one's happiness, one's reality' is bound up with memories of other people: he remembers an earlier lover, and she remembers being kissed by her painting-teacher. The past returns

to them as a Bergsonian virtuality, as if through haze. The past enters into passage with the vivid, obdurate physicality and materiality of the garden itself, in ways that recall the compoundings of memory and perception in *Matter and Memory*: 'perception is never a mere contact of the mind with the object present; it is impregnated with memory-images which complete it as they interpret it' (Bergson 1911: 170).

In this inverted world of 'Kew Gardens', the narrative constantly reverts to the inhuman world and encounters of the snail. At one point his sensibility is taken up with the dead leaf in his path, and the 'high-stepping angular green insect' who stops before it, 'its antennae trembling as if in deliberation' before 'stepping off as rapidly and strangely in the opposite direction' (Woolf 2003b: 85). In parallel, two pairs of people pass by, oblivious to the garden, and incapable of overcoming what divides them. There are first two men, the elder consumed by thoughts of the dead and spiritualism, and the younger sympathetic yet stoical, powerless to communicate with him. In contrast, there follow two elderly women, initially consumed by domestic trivia before one becomes surprised by the flowers, seeing them 'as a sleeper waking from a sleep sees a brass candlestick reflecting the light in an unfamiliar way':

> So the heavy woman came to a standstill opposite the oval-shaped flower-bed, and ceased even to pretend to listen to what the other woman was saying. She stood there letting the words fall over her, swaying the top part of her body slowly backwards and forwards, looking at the flowers. (Woolf 2003b: 87)

The flowers produce a modest yet irrefutable kind of vitality and becoming, as the sensible becomes the involuntary basis for a kind of entrancement, involuntary and temporally indefinite in mode. Finally, a young couple trade inconsequential remarks in 'toneless and monotonous voices', their words betraying their absent-mindedness before again, everyday consciousness is indefinitely surprised and interrupted, affected by a dissolution that in turn yields to a returning, somewhat desperate, sense of a representable world:

> Even when she wondered what sort of tea they gave you at Kew, he felt that something loomed up behind her words, and stood vast and solid behind them; and the mist very slowly rose and uncovered – O Heavens, – what were those shapes? little white tables, and waitresses who looked first at her and then at him; and there was a bill that he would pay with a real two shilling piece, and it was real, all real, he assured himself. (Woolf 2003b: 88)

The indefinitely sustained, rhythmical elaborations of Woolf's style are here again the register of a creative vitality that exceeds and compasses the merely spatial, representable world of cognition, as well as a further index of Woolf's intuitive inwardness with Bergsonian ratios of duration and metaphysics. In this world and language, the transactions of reality, meaning and the self, appear relative, transitory constructs ('there was a bill that he would pay with a real two shilling piece, and it was real, all real, he assured himself'). Again Woolf's world appears to pass into Bergson's, as if the tale was philosophy by other means, a searching allegory and enactment, a becoming-conscious, of processes and principles of becoming made explicit in the latter's work. As Gruber identified, this is the 'inherently Bergsonian' creativity and inspiration of Woolf's writing:

> It is Bergson's problems and solutions which modulate her thinking and with it her style. The poetic concept of reality, peculiar to the French philosopher, is the kernel of her writing . . . It is conceivable that she would have found her way without him; yet living in the Bergsonian atmosphere, she draws even unconsciously from the truths he had established. Life is to be understood, he had proclaimed, not through the brain or mechanical reason, but through poetic intuition . . . Like Bergson, she denounces science in its attempt to explain mechanically the processes of the mind and the human consciousness. (Gruber 2005: 109)

Notes

1. Floris Delattre's 1932 article, 'La Durée bergsonienne dans le roman de Virginia Woolf' is cited by Gillies as the first explicit publication asserting actual influence, though Winifred Holtby in the same year and David Daiches (in 1942) would follow. These and other contributions to the debate over influence are charted in Mary Ann Gillies's, *Henri Bergson and British Modernism*. I am grateful also to Laci Mattison for referring me to Ruth Gruber's 1935 study of Virginia Woolf.
2. The closing paragraph of *Bergsonism* is a neat articulation of Deleuze's Bergson:

   > At the outset we asked: What is the relationship between the three fundamental concepts of Duration, Memory and the *Élan Vital*? What progress do they indicate in Bergson's philosophy? It seems to us that Duration essentially defines a virtual multiplicity (*what differs in nature*). Memory then appears as the coexistence of all the *degrees of difference* in this multiplicity, in this virtuality. The *élan vital*, finally, designates the actualization of this virtuality according to the *lines of differentiation* that correspond to the degrees – up to this precise line of man where the *Élan Vital* gains self-consciousness. (Deleuze 1991: 112–13)

3. The phrase, 'Monday or Tuesday', of course, occurs in Woolf's famous essay, 'Modern Novels' published in the *Times Literary Supplement* in 1919 and later reworked as 'Modern Fiction'. This essay is often taken as a breakthrough piece, a manifesto for the purely psychological and formal dimensions of her work. Nonetheless, in line with the reading offered here, it is also a profoundly

Bergsonian document, and of a piece with these relatively neglected stories, its themes and modes of expression decisively setting themselves against the normative 'order-words', the chronological demarcations, materialism and false composites, of conventional fiction.

4. Famously, the press would soon move on to publish works by T. S. Eliot, Sigmund Freud, Robert Graves, John Maynard Keynes, Vita Sackville-West, Christopher Isherwood, Katherine Mansfield and Woolf herself, though it would turn down an option on early chapters of *Ulysses*. Delivered to the Woolfs over tea by Harriet Weaver in a brown paper bag, Joyce's work, its sheer length aside, was apparently regarded as 'underbred' and too indecent to hazard publishing. See Henig (1973: 203).
5. See Woolf's account in 'A Sketch of the Past' in *Moments of Being* (Woolf 1985: 69).
6. In 1919, her second novel, *Night and Day*, was to be published by Duckworth, a novel consumed by themes of generational conflict.
7. This is a fuller citation of Bergson's description of the emotional and transcendent power of music in *The Two Sources of Morality and Religion*:

> We feel, while we listen, as though we could not desire anything else but what the music is suggesting to us, and that this is just as we should naturally and necessarily act did we refrain from action to listen. Let the music express joy or grief, pity or love, every moment we are what it expresses. Not only ourselves, but many others, too. When music weeps, all humanity, all nature weeps with it. In point of fact it does not introduce these feelings into us; it introduces us into them, as passers-by are forced into a street dance. (Bergson 1977: 40)

8. And what could be more Bergsonian (however cunningly dissimilated), for instance, than Eliot's signature statement in his 1919 essay, 'Tradition and the Individual Talent', about the paradoxes of depersonalisation in literary creativity, or the open multiplicity that is literary tradition:

> The existing order is complete before the new work arrives; for order to persist after the supervention of novelty, the *whole* existing order must be, if ever so slightly, altered; and so the relations, proportions, values of each work of art toward the whole are readjusted; and this is conformity between the old and the new. (Eliot 1975: 38)

A Hoard of Floating Monkeys: Creativity and Inhuman Becomings in Woolf's Nurse Lugton Story

Carrie Rohman Lafayette College

Abstract

This essay analyses how Virginia Woolf's critically under-examined children's story about Nurse Lugton connects the becoming-artistic of writing to animal becomings. Examining the links between creativity and the other-than-human via Gilles Deleuze and Elizabeth Grosz, I claim that the 'animation' of the stitched animal figures on Nurse Lugton's 'canvas' reveals that art is the enlivenment of vibratory and affective qualities, as opposed to a monumentalising of symbols or concepts. Moreover, the curtain in Woolf's story should be read as creative materiality itself, its folds participating in the self-varying dynamism of the virtual and actual. My analysis of the two published versions of the story, and their accompanying illustrations, outlines an affirmative bio-poetics at the heart of Woolf's aesthetic project and suggests that Woolf's creative sources are embedded in inhuman, biological forces.

Keywords: Virginia Woolf, Nurse Lugton, animal, creativity, inhuman, art, becoming, Elizabeth Grosz, vital materialism, life

Virginia Woolf's children's story about Nurse Lugton depicts a woman whose stitched figures come alive whenever she falls asleep. Lugton sews various animals onto a curtain; they activate after she dozes off and are then returned to their 'frozen' positions on the drapery when Lugton awakens. The tale has been most famously known for

its discovery in 1963 at the British Museum by Mr Wallace Hildick, amid the manuscript notebooks of *Mrs Dalloway*. That story was titled *Nurse Lugton's Golden Thimble* by Leonard Woolf, and was published by Hogarth Press in 1966. Perhaps less well known is the discovery of a second, revised version of the story in the 1980s at King's College Library, Cambridge.[1] Thus, as Kristin Czarnecki points out, we know that Woolf revisited her tale, re-worked it, and gave it a name, *Nurse Lugton's Curtain*. This revised version was published in 1991 by Harcourt, with accompanying illustrations by Julie Vivas. In the foreword to the original, 1966 Hogarth Press book, Leonard Woolf claims that the 'story appears suddenly in the middle of the text of the novel, but has nothing to do with it' (Woolf 1966: Foreword). This assertion practically begs for a critical response, precisely because Leonard Woolf makes the counter-intuitive claim that the story appears *in the centre* of the *Mrs Dalloway* manuscript yet has 'nothing' to do with it.[2]

This seemingly benign story, however, is not just central to an interpretation of a single Woolf novel, but it also reveals something fundamental about Woolf's understanding of aesthetic principles. Those principles are specifically Deleuzian in that they ground the artistic in the animal and inhuman. It is, after all, Gilles Deleuze and Félix Guattari who write, 'Not only does art not wait for human beings to begin, but we may ask if art ever appears among human beings, except under artificial and belated conditions' (Deleuze and Guattari 1987: 320). Similarly, Deleuze and Guattari ask whether 'art begins with the animal' and suggest that 'art is continually haunted by the animal' (Deleuze and Guattari 1994: 181, 182). Woolf's story might be said to literalise this continual haunting of aesthetic practice by the animal or animality.

Indeed, I agree with Czarnecki, who maintains that 'Woolf confronts the creative process head-on in the story' (Czarnecki 2012: 226), as opposed to avoiding it, as other critics have claimed. What is more, this shadow text reveals something foundational about Woolf's views regarding a writer's relationship to the inhuman. The Lugton tale catalogues an awareness of the way that a writer's aesthetic powers are profoundly linked to becomings that are animal in nature. Moreover, the specific becoming-other/becoming-animate of the prosaic curtain suggests a vital materialism in which matter cannot be cordoned off from the forces of life itself. In the wake of such recognitions, the formerly exceptional human creative genius must be recast from its 'verticality' and placed on a horizontal plateau with inhuman artistic intensities.

Despite Leonard Woolf's emphasis on a thematic distance between the children's tale and *Mrs Dalloway*, critics have worked to read the texts together and to understand how they might exemplify both a thematic and a psychological or temperamental reciprocity. Geneviève Sanchis Morgan's 1997 essay goes a long way towards linking the metaphorical work of the children's story with the themes of Woolf's novel, what Morgan calls the 'obvious interrelations between the two' that have to do with 'Woolf's development as a writer and as a modernist [being] predicated on her negotiation of domestic material' (Morgan 1997: 95). Her essay renders both texts, therefore, intellectually serious. Among a number of insightful corollaries that Morgan describes is that between sewing and writing. Convincingly, she makes the case that 'if sewing is a metaphor for writing, or art making, then the nexus of the two stories implies that the key to changing reality lies within the grasp of the artist's needle and pen' (101). Sayaka Okumura elaborates on this theme and calls the knitting Nurse Lugton 'a version of the author herself' and Woolf's 'self-caricature' or 'self-portrait' (Okumura 2008: 175).

If sewing is a metaphor for writing in Woolf, then this modest, critically unheeded children's story might be seen as a key of sorts to Woolf's own understanding of her creative practice. This possibility may be all the more likely because Woolf wrote the tale for children. In the collection *Human, All Too Human*, Diana Fuss discusses three 'border identities' for humanism: animal, thing, child. Her introduction to the book's essays reminds us of the age-old alliance between children and animals, beings whose liminal status troubles the 'integrity of the human' (Fuss 1996: 5). Framing this narrative for children allows Woolf to be less rigid or prescriptive in her 'artistic' and high modernist expectations of herself, as a stylist and a thematic innovator. She can 'play' with the analogue between sewing and writing more easily, without censoring her own conclusions, or judging them as 'childish' or naïve. That is, she can work in a space that is generically removed from the all-too-human, internalised censor that demands respectable, elaborate themes in the serious-minded novel.

Czarnecki takes up the question of just how 'child-friendly' the story really is, a question that has provided occasion for some rather pointed critiques of Woolf's text as being too serious for children.[3] Sceptical of such critiques, Czarnecki intimates that the second version was revised by Woolf to be more accessible to the child who reads or hears it. Perhaps counter-intuitively therefore, the first version of the story often reveals the deep philosophical contours of Woolf's creative vision more clearly. In other words, Woolf's technical revisions for the child reader

occasionally work to dilute the more striking or radical elements of this narrative. For that reason, I often refer to the *Thimble* version (1966) rather than the *Curtain* version (1991).[4]

The opening page of *Nurse Lugton's Golden Thimble* usefully sets the stage for considering questions of the post-human, animality and the vibratory:

> She had given one great snore. She had dropped her head, thrust her spectacles up her forehead, and there she sat, by the fender with her thimble on her finger, and her needle full of cotton, snoring, snoring – on her knees, and covering her apron, a large piece of figured blue stuff. The animals had not moved until – one, two, three, four, five – Nurse Lugton snored for the fifth time. Ah! the old woman was asleep. The antelope nodded to the zebra; the giraffe bit off a leaf of the tree. For the pattern on the stuff was this: all the animals in the world were trooping down to the lake and the pagoda, and the boat and the bridge to drink. (Woolf 1966: 5)

Woolf begins her tale with a snore (in the later version Lugton is asleep at the opening, and the snoring is downplayed). The nurse had given a *great* snore: Woolf commences this 'childish' story with the provocations of vibration. Deleuze and Guattari begin their chapter on the refrain in *A Thousand Plateaus* with a child and vibration: 'A child in the dark, gripped with fear, comforts himself by singing under his breath . . . The song is like a rough sketch of a calming and stabilising, calm and stable, center in the heart of chaos' (Deleuze and Guattari 1987: 311). Deleuze and Guattari's additional examples on this page are of a female child and a woman, but not of a grown man. Perhaps the most clichéd case of the 'universal' artistic (albeit this universal is often limited to the human) is the mother humming to her infant. The genre of the children's book, as I have already claimed, may allow Woolf to make more explicit these elementary forces of creativity. Children, women, mothers, nurses are expected to rock, sing, sew and play circle games. They have cultural permission to make primal refrains (ring around the rosy) a mainstay of their daily play and ritual.

Elizabeth Grosz theorises the Deleuzian role of vibration for the artistic when she discusses the movement from rhythm to refrain to music as 'nothing but *vibration*, resonance, the mutual condition both of material forces at their most elementary levels, and of music at its most refined and complex' (Grosz 2008: 54). 'What is transmitted and transmuted throughout this vast evolution', she maintains, 'is nothing but vibration, vibrations in their specificity, vibrations as they set objects moving in their wake' (54). The vibratory not only connects human life

to the inhuman, but I would also assert that Grosz figures vibration as a kind of *invitation* to the creative. We inevitably partake in the tremor of the rhythmic and the territorial in Deleuze's terms, to be sure, but the vibratory also functions as an incitement to become *more* vibratory:

> Vibration is the common thread or rhythm running through the universe from its chaotic inorganic interminability to its most intimate forces of inscription on living bodies of all kinds and back again. It is vibration that constitutes the harmony of the universe with all its living components, enabling them to find a vibratory comfort level – neither too slow or too fast – not only to survive but above all to generate excess, further vibratory forces, more effects, useless effects, qualities that can't be directly capitalized. (Grosz 2008: 54)

The story's opening with one great snore signals a provocation to creativity through vibration, and this provocation involves a necessary becoming-inhuman. We can apprehend this necessity through Grosz's broad thesis: art cannot be understood as exclusively human if it is fundamentally about excesses and displays that we share with other animals. In this story, the inhuman becoming-enlivened of art is manifested specifically through animality and, I want to suggest, places animality at the centre of Woolf's own artistic universe.

While it may seem peculiar at first to emphasise Lugton's snoring as Deleuzian vibration, Woolf dwells upon this activity in a text that occupies only six short pages: she accentuates these tremors which seem almost to penetrate and shake the animals 'awake'. By enumerating Lugton's snores, 'one, two, three, four, five' (Woolf 1966: 5), Woolf emphasises the rhythmic and pulsating intensities that resonate from and through bodies, that incite the aesthetic and ultimately get transferred from bodies to proper works of art. Grosz describes how the forces of the universe connect the arts to one another through sensation:

> Deleuze suggests that this is because there is indeed a common force shared by all the arts and the living bodies that generate sensations out of material forms that derives from the universe itself. This is precisely vibratory force – perhaps the vibratory structure of subatomic particles themselves? – that constructs sensations as neural reactions to inhuman forces. (Grosz 2008: 83)

Indeed, Deleuze and Guattari note, 'Sensation is excitation itself, not insofar as it is gradually prolonged and passes into the reaction but insofar as it is preserved or preserves its vibrations' (Deleuze and Guattari 1994: 211). Lugton's snoring inaugurates the story with an invitation to a becoming-artistic, an initiation of aesthetic emergence through rhythm and vibration.

The opening snores are accompanied by a symbolic beheading and a disavowal of the specular that challenges the centrality of the human in terms of aesthetics, authorship and creative 'vision'. When Nurse Lugton drops her head, she relinquishes the reign of the Enlightenment *cogito* in which human rationality – or in this case human 'genius' – is the source of artistic production. Moreover, as she pushes her spectacles up her forehead, she also specifically renounces a humanist 'vision'. This moment reminds us of Freud's claim in *Civilization and its Discontents* (1930) that the acquisition of human identity coincides with the process of 'organic repression', whereby man replaces the olfactory with the specular in his sensorium. In that text, Freud imagines early man's transition from a quadruped to a biped stance and the various results of this rising up from an animal way of being. Walking upright brings about the rejection of formerly stimulating smells – particularly blood and faeces – and the consequent transition from an olfactory mode of sensing to a visual one. Moreover, organic repression performs a disavowal of the inhuman and thus thwarts the possibility for becomings. Deleuze and Guattari's discussion of desire as lacking a *subject* rather than an object acknowledges this operation: 'it is, rather, the *subject* that is missing in desire, or desire that lacks a fixed subject; there is no fixed subject unless there is repression' (Deleuze and Guattari 2009: 26). Lugton's spectacles represent the dependence upon and, indeed, the sharpening of that most human visuality which helps maintain the static subject. When she removes them, she relinquishes a humanist way of perceiving and being. That, and her vibratory snoring, are answered with the activation of animality in the story. Once the animals realise Lugton has closed her eyes, which they ascertain from the five snores, they come alive.

I. Aesthetic Animals

A significant difference between the original and revised texts is that in the first, Woolf discusses the pattern on the curtain in extraordinarily universal terms. This moment appears on the very first page of the Hogarth Press story. After the initial animation of antelope nodding to zebra and giraffe biting a leaf off the tree, Woolf writes: 'For the pattern on the stuff was this: *all the animals in the world* were trooping down to the lake and the pagoda, and the boat and the bridge to drink' (Woolf 1966: 5; my emphasis). In the later version, Woolf economises to 'all the animals began to toss and prance' (Woolf 1991: [3]). The obvious difference here is that in the second version 'all' refers only to

the animals on the drapery, while in the first version Woolf marshals animality as such by using the phrase 'in the world'. This revision marks an understandable whittling down of what Woolf may have considered 'excess' in her original text. But having all the animals in the world galvanised in an image of creativity clarifies my claim that Woolf reveals in this text how her artistic practice, *pace* Deleuze and Grosz, has its roots in the inhuman. That is, if the curtain serves as a placeholder for creativity, and Woolf figures it as harbouring the activation of animality itself, then we can make more extensive claims about Woolf's own relation to inhuman aesthetic forces.

Grosz has refined her understanding of art as having its roots in animality and specifically in the workings of sexual selection in her most recent book *Becoming Undone* (2011).[5] She emphasises the bodily and affective nature of artistic experience via Deleuze and insists, via Darwin, that animals have the power of discrimination or taste that is central to aesthetic appeal and choice. 'Music, painting, dance, and the other arts', she explains,

> are only possible because the power to appeal and enhance seems to reside in regular ways in [animals'] use of colors, sounds, and shapes for the purposes of resonance and intensification. Art is the formal structuring or framing of these intensified bodily organs and processes which stimulate the receptive organs of observers and coparticipants. (Grosz 2011: 135)

Grosz goes even further to speculate that sexual selection as Darwin outlined it is the 'most elementary form of discernment or taste', and may be understood as 'the evolutionary origin not only of all art, but of language use and intelligence more generally' (Grosz 2011: 136). The idea here is that the protocols of sexual selection may produce and fine-tune 'processes of perception and reception … intelligence, communication, and collective living' (136). Whether or not one agrees with these more catholic claims, Grosz's discussion of enhancement, bodily intensification and taste locates aesthetic behaviours and discernments well outside a limited human purview. In the broadest terms, then, Woolf's story reveals to us the evolutionary underpinnings of artistic experience, emphasising the human's deep ontological coincidence with animality. At its most basic, her writing and creating are linked, stitched we might insist, to animal forces, to the rhythms and affects that are shared not just by humans but by the living in general. The images in both versions command our attention, especially because they represent other artists' rendering of a text that, in my view, is primarily about creativity. The 1966 Hogarth Press book

includes illustrations by Duncan Grant, who was known for his rich use of colour. It is unfortunate that the black and white renderings of his pictures eliminate that element of his work. In contrast, the contemporary version of the story (1991, Harcourt) is illustrated in bright watercolours by Julie Vivas, and it includes more than double the number of images that we find in the 1966 text. One striking fact about Grant's comparatively spare set of images is that the curtain is only represented in two of his six illustrations, while animals are represented in five. Indeed, after the initial image of Nurse Lugton dozing in her chair, every Grant illustration includes animals.

Grant's second and third illustrations are composed only of animals that seem to hover in their own space, which suggests a dream-like quality that critics have discussed as a space 'free of constraints' (Czarnecki 2012: 224) and in which cross-species interactions occur 'peaceably' (Levy 2004: 148). As I will discuss further, the liminal state between waking and sleeping is a prime condition in which becomings can occur. In these Grant images, we see giraffes, zebras, rams, leopards, elephants, birds, bears and monkeys. In the third image, an elephant seems to merge with an ostrich, perhaps suggesting a dynamism and instability of the block of animality itself that also reflects the border-crossing between human and inhuman creativity. The dream-like image of an elephant-ostrich hybrid suggests the constant mutation, improvisation and ultimately species instability that are hallmarks of Darwin's theory of evolution, though these qualities are rarely associated with his concept of species even today. Grosz reads Darwin's account of the unfurling of life itself through a Bergsonian/Deleuzian durational force. She emphasises that Darwin

> develops an account of a real that is an open and generative force of self-organization and growing complexity, a dynamic real that has features of its own which, rather than simply exhibit stasis, a fixed essence or unchanging characteristics, are more readily understood in terms of active vectors of change. (Grosz 2004: 19)

Grosz goes on to detail Darwin's 'quite peculiar, and thoroughly postmodern, account of origin' as it impinges on the idea of species (Grosz 2004: 23):

> Origin is a consequence of human, or rather, scientific taxonomy, a function of language. Origin is a nominal question. What constitutes an origin depends on what we call a species, where we (arbitrarily or with particular purposes in mind) decide to draw the line between one group and another that resembles it, preexists it, or abides in close proximity with

> it… A species is an arbitrarily chosen set of similarities that render other differences either marginal or insignificant. Species are a measure, an incalculable, nonnumerical measure of significant differences. (Grosz 2004: 23)

For these reasons, Grosz claims that, in the 'durational unfolding' of evolution, 'what evolves are not individuals or even species, which are forms of relative fixity or stability, but oscillations of difference' (Grosz 2004: 24). If the image of an elephant-ostrich dismantles our conventional sense of species distinctions in this story, that dismantling only confirms the way in which creativity or the aesthetic sensibilities deterritorialise the human via animality.

That specific deterritorialising of the human as Creator is perhaps most keenly registered in the images of monkeys that Duncan Grant contributes to the original, Hogarth Press edition of the story. The first of these appears on the second page of the text, in the initial animal conglomeration in which the creatures seem to float about unanchored. The monkey in this illustration is almost distressingly hybrid in its oscillation between human and animal features. It appears 'monstrous' or uncanny, with the legs and feet of a monkey, and the head and arms of a human. Particularly strange and even difficult to articulate is the way in which the monkey seems to have a human hairstyle, as if this animal woke up and groomed itself with a comb and hair oil. If hair is a residual reminder in humans of their 'beastly' pre-history,[6] then the taming of the monkey's hair through styling proves especially captivating in our discussion of aesthetic framing. In a fascinating, perhaps unconscious, visual translation, Vivas renders a similarly coiffed monkey in the 1991 *Nurse Lugton's Curtain*. On the third page of text, as the animals begin to climb off and away from the 'blue stuff' – the material of the curtain – one of six enlivened and descending monkeys is drawn in profile and seems to have a cap of human hair. That particular monkey also has unusually human-like hands compared with the other monkeys in the text, whose hands and feet are more web-like.

Like other monkeys envisioned in Woolf's broader fictional universe, the coiffed one in the original edition seems to hold a nut at which it gazes.[7] Its thoughtful contemplation of the object in its possession renders the monkey all the more 'human' and all the less 'animal', as the creature almost appears to be reading a text. If, as Georges Bataille suggests, our development of tool-use as a kind of transcendence of the object subtends the 'human' participation in symbolic systems, then this monkey's consideration of its nut places it at least in a liminal space

between animals, who are erroneously considered tool-less, and humans, at the zenith of technological manipulation.[8] Grant's portrayal of this hybrid creature reminds the reader with an almost shocking force that she too is a primate with an object in hand to contemplate, the very children's book she is reading at that moment. This implicit analogy figures taste and discernment within a dizzying *mise en abyme* produced by the interchangeability between nut and book, between 'animal' and 'human'.

Monkeys figure prominently in the fifth and penultimate illustration of the Hogarth Press edition, as well. Probably the most surreal of Grant's images in the text, this one depicts the imaginary Queen of the fictive town 'Millamarchmontopolis', where the animals roam for their pleasure and to secure food and drink while Nurse is sleeping. The Queen in Woolf's story has come to town in her palanquin and sits reposed, in her regalia. Hovering bizarrely just in front and above her in Grant's image is a cluster of seven monkeys. While some of the monkeys' faces and heads are obscured, there are nonetheless a few that suggest pensive examination. Moreover, the monkey most in the picture's foreground holds a proverbial nut. If Woolf as conventional artist can be understood as residing in the 'trappings' of the Queen's highly symbolic and humanist personage – one with a crown that circumscribes and ornamentalises the 'rational' or conceptual lodged in the head – then we must also reckon with her attendant hoard of floating monkeys. Indeed, the Queen of modernism (and of high modernism) is nearly surrounded by monkeys, and their hovering suggests that her own imaginative sources are animal rather than royal. This image, perhaps more than any other in the 1966 text, elucidates a replete, Woolfian becoming-animal/artistic.

At this juncture in the story, Woolf has emphasised how the awakened animals freely range over Nurse Lugton's apron, despite the fact that in her waking life Lugton is terrified of even 'a little beetle' (Woolf 1966: 11). That Woolf chooses to depict the animals crossing freely from the curtain right onto Lugton's apron powerfully accentuates an intimacy or familiarity with non-human creativity that comes only when the strictly conscious or rational mind is relaxed. Some critics have asserted that the story's reliance on a sleeping state suggests Woolf's dread of the unconscious creative forces at work in her own psyche. For instance, Hodgkins discusses Lugton as Woolf's double and as an 'image of the creative female unconscious', but also argues that the association connotes 'a fear of its author, that of the artist who wants to avoid confronting the creative process lest its products die in their amber'

(Hodgkins 2007: 361). Similarly, Michelle Levy suggests that Woolf's description of Lugton as not seeing the awakened animals amounts to an 'alienation from the animal world' and a kind of 'anthropocentricity' (Levy 2004: 148). Perhaps a more useful way to read the question of conscious and unconscious here is to see the drifting into an unconscious state in the story as the submerging or relinquishing of the humanist self, the 'ego' that attempts to cordon itself off from the natural and affective. That is, when Lugton enters an unconscious or semi-conscious state, the edicts of organic repression diminish and the affective forces of becoming are triggered. Thus, when the head drops and the glasses are pushed away, Lugton opens herself to the inhuman creative forces that are less accessible to the 'waking' self. The snore signals Lugton's letting go of the impossibly reified and carefully maintained 'human', and the ushering in of a world in which the human has a participatory relationship with the animal, natural and material worlds. It is important to put this process in a Deleuzian context. In his late discussions on immanence, Deleuze refers to the dying figure whose individual life 'gives way to an impersonal and yet singular life that releases a pure event freed from the accidents of internal and external life, that is, from the subjectivity and objectivity of what happens', and he discusses small children who 'are infused with an immanent life that is pure power and even bliss' (Deleuze 2005: 28, 30). And it such a liminal subject, fading between waking and sleeping awareness in Woolf's story, that is best equipped to demonstrate the human's interlacing with the other-than-human.

Another monkey that requires attention in these stories is the mandrill. In both versions, Woolf includes a litany of animals just after she declares officially that they had begun to move. Grant does not represent the mandrill; he uses only chimp-like monkeys throughout the Hogarth version. Vivas, on the other hand, depicts an almost Biblical parade of animals (reminiscent of the Ark story) at this point in the narrative, illustrating each of the creatures that Woolf mentions in the passage: 'First went the elephant and the zebra; next the giraffe and the tiger; the ostrich, the mandrill, twelve marmots and a pack of mongeese followed; the penguins and the pelicans waddled and waded, often pecking at each other, alongside' (Woolf 1991: [9]).

The mandrill is an especially interesting case for my argument not because mandrills are the world's largest species of monkey, but rather because they are the most vibrantly coloured. Notably, Charles Darwin wrote in *The Descent of Man* that 'no other member in the whole class of mammals is coloured in so extraordinary a manner

as the adult male mandrill (*Cynocephalus mormon*)' (Darwin 1871: 292). Most descriptions of mandrills emphasise the male's brilliant colouration, with a red stripe down the middle of the face and ridged blue muzzle. The 'rump' is strikingly saturated with bright pinks, blues, reds and purples. Indeed, the mandrill seems almost alien in its pigmentation. In Grosz's terms, such extreme colouration would be understood as a particularly incisive example of the way that sexuality itself requires creativity: 'sexuality needs to harness excessiveness and invention to function at all' (Grosz 2008: 64). Additionally, the mandrill exhibits one of the most pronounced cases of sexual dimorphism in the primate world where males and females are radically asymmetrical in their physical appearances. For Grosz, such divergence specifically links, in a rather surprising philosophical lineage, the work of Darwin and Luce Irigaray around the crucial Deleuzian question of difference:

> Darwin insists that sexual bifurcation, the division of species into (at least) two sexes, is an evolutionary invention of remarkable tenacity and value, for it multiplies difference *ad infinitum*. Irigaray's conception of nature as the differentiating and differentiated condition of subjectivity . . . remains consistent with Darwin's conception of sexual selection – the division of species into two sexes, two different morphologies, and with it the advent of sexuality and sexual reproduction, and the generation of ever-new (genetic and morphological) characteristics and qualities, ever more morphological or bodily differences. (Grosz 2011: 104)

Thus the mandrill is an especially significant animal in Lugton's creative universe because it is a primate whose bodily apparatus testifies to the intensely evolutionary, yet non-adaptive, investment of living beings in the 'spectacular performance' of creative sexuality (Grosz 2011: 125).

Grosz's broad discussion of difference *as such* is too complex for me to rehearse here, but it partly elaborates Deleuze's notion that difference is 'something that distinguishes itself', and that 'is made, or makes itself' (Deleuze 1994: 28). Grosz's assertion that 'difference is the generative force of the universe itself, the impersonal, inhuman destiny and milieu of the human, that from which life, including the human, comes and that to which life in all its becomings directs itself' becomes a useful way to read the animality in and of Nurse Lugton's story and Woolf's writerly process (Grosz 2011: 94). The mandrill in this text functions as an exemplar of creative difference that is specifically aimed to reveal the human's species liminality.[9] That is, the excessively bright, almost painterly monkey seems to insist with a shameless intellectual

effrontery that – clearly – the creative can never be a strictly human affair. Moreover, in Vivas's illustration, the mandrill, who marches along in the Ark-like procession, is the only creature who stares directly out at the reader. As I have noted elsewhere,[10] recent work in animal theory has often coalesced around a kind of 'primal scene' in which subjectivities that we call human and animal confront one another, retreat, respond or otherwise intermingle. Perhaps the most well known of these is Derrida's naked-in-front-of-cat scene and, subsequently, Donna Haraway's insightful reading of its limitations. Testifying to the centrality of the interspecies look or gaze, Kari Weil begins her recent book about the 'animal turn' in critical and cultural theory with Derrida's now well-known proclamation, 'An animal looks at us and we are naked before it. Thinking, perhaps, begins there' (Derrida 2008: 29). Weil rightly emphasises the link between an animal's look and the concept of human nakedness or nudity. 'Does a confrontation with and acknowledgment of another animal', she asks, '*expose* us as humans by stripping us of those clothes and thinking caps with which we have claimed to stake our differences from animals?' (Weil 2012: xv; my emphasis). In this case, the mandrill's gaze can be read as a direct challenge to our humanist notions about the artistic. The monkey's look strips away aesthetic human exceptionalism by emphasising the magnificent becoming-artistic of one of man's more proximate primate relatives.

Similarly, in a subtle but nonetheless striking visual staging of human animality that again seems less than conscious on the part of Vivas, the back cover image for Woolf's short story cleverly shows Nurse Lugton viewed from the back, as she sits in her sewing chair hard at work. We see the back of her kerchiefed head, the chair rungs and pillow she leans upon. The way that Vivas draws the backs of Lugton's shoes, especially the seam down the centre of each heel, makes Lugton's shoes appear entirely hoof-like. Lugton seems to enact a becoming-bovine, which takes on a certain fascinating quality if we consider Nietzsche's claim about reading, art and the ruminative that Weil cites at the outset of her book: 'One thing is necessary above all if one is to practice reading as an *art*. Something for which one has almost to be a cow and in any case *not* a man: *rumination*' (Weil 2012: qtd in epigraph; Nietzsche's emphasis). The point here is that if Lugton is Woolf's alter-ego, then this would seem to be the only visual image of a Woolf-as-writer figure becoming-animal in all of Woolf's oeuvre. Combined with the mandrill's confrontational gaze, the becoming-ruminant of Vivas's final Lugton illustration may be prodding us to ask if the becoming-animal/artistic

of the writer does not also invite or compel the reader into a similar trans-species engagement.

II. This Fold

Okumura makes the important suggestion that Lugton's curtain ought to be understood in terms of textuality. She writes, 'Nurse Lugton is sewing a curtain, the description of whose pattern occupies the story's text. Her textile is equated to the author's text' (Okumura 2008: 175). Reading the curtain as creative materiality itself, in a new-materialist or neo-vitalist register that is indebted to Bergson and Deleuze, pushes these concepts about textuality even further. To start, consider the curtain's most basic, 'architectural' qualities. It is a large piece of fabric that is draped and folded over Lugton's lap. As she works, portions of the fabric are revealed and manipulated, while other portions are inevitably hidden. There are the active vectors being stitched, and in the many folds and creases that remain unworked or latent, there is the virtual, waiting to be actualised. The undulating folds of Nurse Lugton's curtain, coupled with its becoming-animal that serves as engine of the entire story, suggest an almost uncanny enactment of the active and creative force of enlivened matter. Thus for Bergson, the incalculable creativity of organic life exists, which 'we cannot in any way subject to a mathematical treatment' and which exhibits 'continuity of change, preservation of the past in the present, real duration – the living being seems, then, to share these attributes with consciousness . . . [And] life, like conscious activity, is invention, is unceasing creation' (Bergson 1998: 20, 23). Moreover, Deleuze outlines the virtual as a self-differentiating source for life's actualisations:

> The three requirements of a philosophy of life are as follows: (1) the vital difference can only be experienced and thought of as internal difference; it is only in this sense that the 'tendency to change' is not accidental, and that the variations themselves find an internal cause in that tendency; (2) these variations do not enter into relationships of association and addition, but on the contrary, they enter into relationships of dissociation or division; (3) they therefore involve a virtuality that is actualized according to the lines of divergence; so that evolution does not move from one actual term to another actual term in a homogeneous unilinear series, but from a virtual term to the heterogeneous terms that actualize it along a ramified series. (Deleuze 1991: 99–100)

Grosz remarks upon these concepts:

> Each [Bergson and Deleuze] distinguishes life as a kind of *contained dynamism*, a dynamism within a porous boundary, that feeds from and returns to the chaos which surrounds it something immanent within the chaotic whole: life as a complex fold of the chemical and the physical that reveals something not given within them, something new, an emergence, the ordered force of invention. (Grosz 2011: 27; original emphasis)

The folds of Lugton's curtain are more than suggestive of such revelations.

Deleuze insists upon the inseparability of life and matter in his discussions of the fold: 'Organic matter is not, however, different from inorganic matter (here the distinction of a first and a second matter is irrelevant). Whether organic or inorganic, matter is all one' (Deleuze 1993: 7). Grosz also reminds us that, in Bergson's terms, materiality is characterised by repetitions or 'near repetitions' (Grosz 2011: 29):

> The material world is that which is capable of unrolling or unfolding what has been already rolled or folded, that is caused: it is the inevitable unwinding or unfurling, the relaxation, of what has already been cocked and set, dilated, in a pregiven trajectory. (Grosz 2011: 29)

Thus the folding and unfolding of Lugton's curtain not only conjures the latency of the unknown that marks the possibility for the new and unexpected, the creative, but it also gestures towards the regularity with which the material world maintains itself.

If we remain within a Bergsonian framework for a moment more, we can consider how the animals' coming alive from the folds of the curtain might be read as the functioning of *élan vital*. Jane Bennett suggests that the 'task of *élan vital* is to shake awake that lazy bones of matter and insert into it a measure of surprise' (Bennett 2010: 78). What is more, Bennett recalls that the task of this vital spark is to 'increase the *instability* of material formations' (78; original emphasis). This indetermination associated with the creative, what Bergson calls 'a perpetual efflorescence of novelty', may also explain Lugton's trepidation at confronting the animals while she is fully conscious (Bergson 1992: 95). In other words, the creative does involve the incalculable, to use Derrida's terminology, and so Lugton or Woolf's disquiet about this unfolding can be appreciated rather than characterised as retrogressive.

In broader terms, Woolf's particular framing of a becoming-animal through the material or textual in this children's story supports a new

materialist (or vital materialist, in Bennett's terms) understanding of the relation between life and matter. The curtain – which would have traditionally been understood as inert or frozen matter – self-generates activity or force. The fluctuation between a 'living' state characterised through non-human animation and a kind of dormancy – in which the waking Lugton 'caught the animals, and froze them' (Woolf 1966: 15) – might best be understood as modelling the dynamics of material life itself: as Grosz asserts,

> Life is always on the verge of returning to the inorganic from which its elements, its very body and energies, are drawn. Life and matter cannot, in this tradition, be understood as binary opposites; rather they are divergent tendencies, two different directions or trajectories inherent in a single whole, matter as undivided, matter as it includes its 'others' – life, ideality, connectivity, temporality. (Grosz 2011: 32–3)

The becoming-life or animation of the curtain cannot be separated from the curtain itself, although Lugton's sleeping state does suggest that humans are perhaps not ordinarily attuned to this coincidence of life and matter. Grosz carefully explains that in Bergson's view 'life' cannot be understood as a separate or special force that is distinct from matter: 'The common impetus life carries within it is that of *materiality itself*, the capacity to make materiality extend itself into the new and the unforeseeable' (Grosz 2011: 33; original emphasis). More pointedly, Grosz reiterates this idea when she insists, 'Life is that tendency, *in matter* itself, to prolong, delay, detour, which means that matter, "an undivided flux," is as alive, as dynamic, as invested in becoming as life itself' (35). Woolf's text provides a perfectly double-edged example of this in that Nurse Lugton is stitching, writing, creating, thus participating in the activation or the becoming, but also the material or corporeal 'body' or vessel of that activity – the curtain – becomes more than itself semi-spontaneously, activates *itself* through a vibratory animation to take on a 'vitality'. Moreover, it is crucial to read this seemingly paradoxical, double activation as a recognition that human creativity is linked to inhuman creativity. That is, the intricacies of weaving, writing, painting, and so forth, are not without a space of profound overlap with the becoming-artistic of the animal and plant, and even more primitive forms of life. Grosz puts this in fundamental terms when she clarifies how we ought to understand the 'unity of life'. It is not that life can be connected through some genetic web or ecosystem, but rather that

> all life is equally pushed – in its originary emergence from the 'prebiotic soup' of chemical elements through to the vastly variable forms of life that have existed and exist today – by a temporal, or evolutionary, impetus to vary itself, to capitalize on its material conditions, to differ. The unity of life is not an end, a final harmony or cohesion, but the beginning, the impetus all of life shares with the chemical order from which it differentiates itself, and which it carries within it as its inherited resource. (Grosz 2011: 33)

In a traditional reading, the curtain itself might be understood as a proverbial 'blank slate' in materialist terms. In Woolf's story, however, that interpretation must be recalibrated, for the curtain is anything but blank in Deleuze's terms. In other words, one might initially want to read the fabric as one would read the 'canvas' of a painting – an inert substrate upon which art or creativity will be superimposed. But the becoming-animal of the 'blue stuff' suggests that such a reading would be erroneous. I am tempted to speculate about how Deleuze himself would have framed the curtain had he been familiar with Woolf's story in the way he was familiar with *The Waves*, for instance. If, according to Cliff Stagoll, a Deleuzian plane of immanence can be understood as 'a surface upon which all events occur, where events are understood as chance, productive interactions between forces of all kinds' (Stagoll 2005: 204), might Deleuze have recognised Woolf's curtain as such a plane? Might he have interpreted Woolf's curtain as, in his and Guattari's words, 'a section of chaos' that gives '*consistency without losing anything of the infinite*' and that harbours 'variable *curves* that retain the infinite movements that turn back on themselves in incessant exchange, but which also continually free other movements which are retained' (Deleuze and Guattari 1994: 42; original emphasis).[11] While Deleuze and Guattari refer to concepts here in the realm of philosophy, Woolf's plane in the Lugton story might be understood as referring to her own, or any artist's, creative concepts and the movements and variations, indeed the enlivened manifestations that they undergo. The suggestion in the story of an ongoing repetition of varying becomings-animal during Lugton's waking and sleeping intervals invites this comparison. That is, the reader understands that this 'cycle' of waking craft and sleeping enlivenment, this rotation of animal becoming and dormancy, will continue ad infinitum. As Stagoll explains further, a Deleuzian plane 'represents the field of becoming, a "space" containing all of the possibilities inherent in forces. On this plane, all possible events are brought together, and new connections between them made and continuously dissolved' (Stagoll 2005: 205). Again, the fluctuation

between creative activity and creative dormancy in Woolf's story has a distinctly Deleuzian resonance.

The operative dynamism of the curtain on a systematic level also invites us to read Woolf's text through what Rosi Braidotti calls an 'affirmative' ethics of biopower. Rather than focus unduly on *thanatos* or the questions of mortality and suffering in contemporary philosophy, Braidotti notes that we ought to consider the 'generative powers of *zoē* and to turn to the Spinozist political ontology defended by Deleuze and Guattari':

> Death is overrated. The ultimate subtraction is after all only another phase in a generative process . . . For the narcissistic human subject, as psychoanalysis teaches us, it is unthinkable that Life should go on without my being there. The process of confronting the thinkability of a Life that may not have 'me' or any 'human' at the center is actually a sobering and instructive process. I see this postanthropocentric shift as the start for an ethics of sustainability that aims at shifting the focus toward the positivity of *zoē*. (Braidotti 2010: 212)

What other than the *generative* power of *zoē* is portrayed in Woolf's story, in which it is the Life of non-human animality that subtends 'narcissistic' human creativity? Indeed, the illustration Vivas created to span pages 13 and 14 of the *Curtain* text (if it were enumerated) is a bio-poetic image par excellence. Viewed from above, as if from an aerial perspective, animals dip their heads to drink from a lagoon. We see only their backs, demarcated half-ways each, like cells preparing to divide. The landscape is represented almost as if sliced on a molecular level, with trees spreading out like microbial pili or flagella. The half-circular image, with cellular and microscopic overtones, seems to reference the power or creative potential of *zoē* itself. It is an extraordinary image at the centre of a book about a woman's creative sources in that it embeds her aesthetic powers in inhuman, biological forces.

What Braidotti calls the postanthropocentric shift is indeed what Deleuze often theorised as the impersonal. Grosz describes this decentring of the traditional conceptualisation of human life:

> Deleuze seeks to understand life without recourse to a self, subject, or personal identity, or in opposition to matter and objects. He seeks something impersonal, singular, that links a living being, internally, through differentiation or repetition, to elements and forces that are nonliving. This is what links the concept of life, for him, to becoming-animal, to the Body without Organs, and to immanence rather than to transcendence, the human, or the organism. He is interested in the nonliving tentacles that extend

> themselves into the living, the provisional linkages the nonliving and the living form to enable the living to draw out the virtualities of the nonliving; that is, to enable the nonliving to have a life of their own. (Grosz 2011: 35–6)

The tentacles of the inhuman are not only evident in the cellular image above, but the impersonal link to 'nonliving' forces is powerfully evident in the Vivas illustration that represents Lugton's face as a mountain. Near the end of the story, Lugton is conflated with the landscape: 'They could see her, from their windows, towering over them. She had a face like the side of a mountain with great precipices and avalanches, and chasms for her eyes and hair and nose and teeth' (Woolf 1991: [23]). Vivas draws Lugton's enormous head as partially submerged in the earth, with the sinews of her neck bleeding and blending right into the foothills of the landscape. It is as though her body itself *is* the earth, and her head, putatively the most 'human' and 'rational' portion of her body, can only be partially separated from the forces of the earth. This image recalls Annie Leibowitz's photograph of Rachel Rosenthal, buried neck deep in the desert. But Vivas can take the concept of merging even further because she blurs the distinction between Lugton's neck and the descending ripples of the mountain terrain in her watercolour depiction.

What we find in this story, then, is aesthetic enlivenment as that which takes place beyond the personal, beyond the egotistical, and beyond the human. Art is understood as the becoming-other of life itself, as the perpetual and recurrent emergence of difference, and as something having its foundation more in a latent animality than in a waking humanity. If Nurse Lugton's sewing is figuratively linked to Virginia Woolf's writing, then this 'minor' children's story persuades us to place the becoming-artistic of animality at the heart of Woolf's aesthetic practice. Moreover, the seemingly unremarkable 'blue stuff' of the curtain emerges as the generative, affirmative life-force of matter itself. Woolf's tale of 'magical' animals and curtains is actually a vital materialist narrative in which humans borrow their creative capacities from the becomings-other, from the differentialising and 'excessive' tendencies, of the inhuman.

Notes

1. See Czarnecki's (2012) discussion of both the original and revised texts.
2. It is important to note that Hildick, when writing of his discovery in the *Times Literary Supplement* in 1965, seemed to have a more nuanced, or at least more speculative, set of notions about the relationship between the novel and the story. As Czarnecki mentions, he wondered if the children's story gave Woolf

a sort of relief from the violent themes in *Mrs Dalloway*. See Czarnecki 2012: 222.

3. See for instance Hodgkins 2007.
4. The 1991 version, *Nurse Lugton's Curtain*, is unpaginated and so page numbers in references to it in this article are given in square brackets.
5. It is important to note that conditions of the artistic, according to Grosz, can also be found in plant and insect life. However, she focuses significant attention on animal activities through her re-reading of Darwin and sexual selection in relation to aesthetic questions.
6. See my discussion of human 'fur' in T. S. Eliot's 'Sweeney' poems in *Stalking the Subject: Modernism and the Animal* (Rohman 2009: 35).
7. For instance, the character Jinny in Woolf's novel *The Waves* discusses a monkey that 'drops nuts from its naked paws' (Woolf 1931: 176). Moreover, Louis in the same novel discusses his own social preening in similar terms: 'it is for them that I do these antics, smoothing my hair, concealing my accent. I am the little ape who chatters over a nut' (Woolf 1931: 128).
8. Bataille, like many twentieth-century thinkers and scientists, mistakenly understood tool-use as an exclusively human capacity. See chapter 2 in *Theory of Religion* (1989).
9. It is crucial to note here that Grosz's emphasis on sexual difference, *pace* Irigaray, does not cancel out queer or transgendered identities and thus should not be glossed as such. When discussing Irigaray's claims about sexual difference, Grosz notes that Irigaray

> questions, not homosexuality, nor ethnic identification, but only the disavowal of one's own morphological specificity. However queer, transgendered, and ethnically identified one might be, one comes from a man and a woman, and one remains a man and a woman, even in the case of gender-reassignment or the chemical and surgical transformation of one sex into the appearance of another. (Grosz 2011: 109–10)

   As fluid and flexible, as historically contingent and malleable as sexuality may be, Grosz insists 'there is no overcoming of sexual difference' (Grosz 2011: 111).
10. See Rohman 2012.
11. See also chapter 6 in *The Fold: Leibniz and the Baroque* in which Deleuze claims that events 'are produced in a chaos, in a chaotic multiplicity, but only under the condition that a sort of screen intervenes' (Deleuze 1993: 76). Laci Mattison discusses the relationship between chaos and art (and the event) in this register, as well, in her 2012 essay 'Woolf's Un/Folding(s): The Artist and the Event of the Neo-Baroque'.

'The reality of becoming': Deleuze, Woolf and the Territory of Cows

Derek Ryan University of Kent

Abstract

Woolf's modernist animals affected Deleuze and Guattari's animal philosophy, as they describe in *A Thousand Plateaus*. This essay focuses on the significance of these references to Woolf's aesthetics for Deleuzian philosophy, whilst also considering how we can better understand Woolf's broader exploration of animality (in texts including *The Waves*, *Flush* and *Between the Acts*) through close engagement with Deleuze's conceptual framework (in particular 'becoming-animal' and 'de-' and 'reterritorialisation'). In mapping various appearances of one of the oldest domesticated animals, cows, in the work of both, the essay builds an argument about the shared bovine territory in their writings and the ontological and ethical implications of this. It therefore expands upon the relationship between Deleuze and Woolf at the same time as affirming the importance of their animal ontology, ethics and aesthetics for animal studies more widely.

Keywords: Deleuze, Virginia Woolf, animality, animal studies, Donna Haraway, becoming, deterritorialisation, cows

I. Deleuze, Woolf and Animal Studies

"'Ladies and Gentlemen, behold the enemy!"' These words, which announce Donna Haraway's scathing critique of Deleuze and Guattari's treatment of the animal, are symptomatic of the mistrust some commentators have felt towards Deleuzian animal philosophy within the growing field of animal studies. Contemporary philosophers such as

Deleuze Studies 7.4 (2013): 537–561

www.euppublishing.com/dls

Haraway criticise 'becoming-animal' because they view it as a flight from the real, everyday, fleshly lives of animals, as well as the coevolutionary stories shared between human and non-human. Where Haraway 'had hoped to find an ally for the tasks of companion species', as she puts it in *When Species Meet*, she instead discovers a 'profound absence of curiosity about or respect for and with actual animals' (Haraway 2008: 27). Haraway is a philosopher 'of the mud' whilst Deleuze and Guattari are philosophers 'of the sublime, not the earthly, not the mud' (28). She goes on to argue that 'becoming-animal' demonstrates one of the clearest displays in all philosophy of 'misogyny, fear of aging, incuriosity about animals, and horror at the ordinariness of flesh, here covered by the alibi of an anti-Oedipal and anticapitalist project' (30).[1] Even when other critics want to claim that Deleuze's philosophy *can* be of value for animal studies, they have often conceded that it does not contain a real interest in ordinary, everyday animals. Therefore, at the same time as arguing for the use of Deleuze and Guattari in discussions of animal ethics, Lori Brown has noted that in emphasising becoming-animal as a means of 'challenging and breaking up various human institutions' Deleuze and Guattari fail to 'address institutions that have a negative impact on other animals' – that is, most of their examples of becomings-animal are concerned with what takes place in 'mental illness, in music and other art forms, in tales of wild men, vampires and werewolves' (Brown 2007: 262). Similarly, when discussing the importance of Deleuze to considerations of animals in art, Steve Baker has written that 'animals, for Deleuze and Guattari, seem to operate more as a device of writing . . . than as living beings whose conditions of life were of direct concern to the writers' (Baker 2002: 95).

Whilst it is true that Deleuze and Guattari do not provide sustained or detailed expositions of the daily lives of animals, the conceptual framework they offer is useful for thinking about human interactions with animals on ontological as well as ethical grounds. In *A Thousand Plateaus*, when they outline three ways in which we can distinguish animals, they are charting the potential to move from humanist doctrines to a post-humanist encounter with the animal and with animality. In other words, where the first two kinds of animals – the 'Oedipal animals' that are 'sentimentalised' and 'individuated' as "'my" cat, "my" dog', and the 'State animals' holding 'characteristics' and 'attributes' that fit them into 'divine myths' – are seen as stand-ins for some seemingly higher human concern, Deleuze and Guattari's third way of approaching animals – as more nomadic 'pack or affect animals that form a multiplicity, a becoming' – takes into account

their capacity to form assemblages, their ability for world-making, rather than assimilating them into an anthropocentric arrangement (Deleuze and Guattari [1987] 2004a: 265–6). What Haraway's critique of Deleuze and Guattari therefore misses is that the comment she finds particularly distasteful – '*anyone who likes cats or dogs is a fool*' – occurs only when they are outlining the Oedipalisation of animals which 'draws us into a narcissistic contemplation' and reinforces the tendency for anthropomorphism. Taking Deleuze and Guattari's (admittedly startling) statement out of context, Haraway risks giving the impression that they are cruelly dismissive of all animals, when in fact they are exposing the ways in which certain animals have been reduced to mere psychoanalytic facades with 'a daddy, a mommy, a little brother behind them' (Deleuze and Guattari [1987] 2004a: 265–6); they are attempting to unsettle and complicate our conceptualisation of human/animal relations by *including* non-human animals in their wider ethico-ontological project of mapping the radical immanence of de-individuated subjectivities (and as they stress even cats and dogs can become pack animals). In direct response to Haraway's accusation, we can note what Deleuze makes clear in *L'Abécédaire* interview – that 'generally people who like animals don't have a human relationship with animals, they have an animal relationship with the animal, and that's quite beautiful' (Deleuze and Parnet 2012).

To have an animal relationship with the animal is what Deleuze and Guattari mean by their concept becoming-animal, that is, to enter into a zone or territory of proximity or indeterminacy, the shared event of becoming different, of becoming entangled with the other in a de- and then re-making of traditional ontological categories of human and animal. As they stress in *Kafka*,

> there is nothing metaphoric about the becoming-animal. No symbolism, no allegory . . . it is an ensemble of states . . . a creative line of escape that says nothing other than what it is . . . it constitutes a single process, a unique method that replaces subjectivity. (Deleuze and Guattari 1986: 35–6)

To dismiss Deleuze and Guattari as 'the enemy' of animal studies is to fail to recognise how rare an example they provide in Western philosophy of an animal theory that accounts for both anthropomorphic and anthropocentric uses of animals at the same time as providing a line of flight from such anthropomorphic conceptualisations and anthropocentric arrangements.[2] Deleuze and Guattari's relationship with animals, and with animal studies, should not be characterised by a

lack of curiosity so much as by *fascination*,[3] a more intense, ontological and perhaps ethical encounter with animal life than Haraway allows; theirs is a fascination with 'an animal reality, *and* the reality of the becoming-animal of the human being' (Deleuze and Guattari [1987] 2004a: 267; my emphasis).

As well as seeking to affirm the continued importance of Deleuze and Guattari's approach to animals for animal studies, this essay is specifically concerned with how Deleuze's animal philosophy – and in particular 'becoming-animal' – is influenced by the modernist animal aesthetics of Virginia Woolf. Moving away from the focus on wild men, vampires and werewolves, Deleuze and Guattari playfully invoke Woolf when clarifying that their emphasis on 'pack animals' is not a comment on the fact 'that certain animals live in packs' or such 'evolutionary classifications':

> Virginia Woolf experiences herself not as a monkey or a fish but as a troop of monkeys, a school of fish, according to her variable relations of becoming with the people she approaches.... What we are saying is that every animal is fundamentally a band, a pack. That it has pack modes, rather than characteristics, even if further distinctions within these modes are called for. It is at this point that the human being encounters the animal. We do not become animal without a fascination for the pack, for multiplicity. (Deleuze and Guattari [1987] 2004a: 264)

This essay takes quite seriously Deleuze's linking of Woolf and animal encounters here. Indeed, the specific animals Deleuze chooses to describe Woolf's own becomings-animal are not as strange as they might, at first, appear.[4] That Deleuze describes Woolf's 'experiences of herself' as 'a troop of monkeys', for example, might allude to the fact that one of Woolf's nicknames, used by her family and by herself, was 'the Apes',[5] and it might refer to a passage in *The Waves* when Jinny describes her desire to let go of the mundane 'facts' that limit her 'body's imagination' to 'a monkey' that 'drops nuts from its naked paws' – it is by doing so that she can enter the 'heterogeneous crowd' (Woolf 1998: 146). Additionally, the 'school of fish' in the above quote certainly prefigures a later reference Deleuze and Guattari make to the closing section of *The Waves*, when Bernard describes the naming of himself and his friends as 'only a string of six little fish that let themselves be caught while a million others leap and sizzle' in the 'cauldron' of life (214): 'each of these characters', Deleuze and Guattari write, 'with his or her name, its individuality, designates a multiplicity (for example Bernard and the

school of fish). Each is simultaneously in this multiplicity and at its edge, and crosses over into the others' (Deleuze and Guattari [1987] 2004a: 278).

What we can add to Deleuze and Guattari's list, however, is Woolf's herd of cows, which provide an example of the animal becomings and multiplicities Deleuze detects in Woolf's modernist aesthetics – in her creation of a kind of literature that is fuelled by an affective fascination for non/human assemblages rather than simply a cautious curiosity. Indeed, by considering the cows that appear at crucial, and sometimes surprising, moments in Woolf's writings as well as in Deleuze's philosophy, we can find examples of the ways in which they both invite us to encounter such becomings-animal, demonstrating that Woolf is fascinated, like Deleuze and Guattari, in 'modes of expansion, propagation, occupation, contagion, peopling', as opposed to the emphasis placed by societies, states, natural history and natural science on characteristics and classifications (Deleuze and Guattari [1987] 2004a: 264). Like Deleuze, Woolf is more interested in events than characteristics, in the involution of human and non-human, body and environment, than in the evolution of character or the development of plot. This is evident again when Deleuze and Guattari return to her writings later in the tenth plateau, alluding this time to her 'thin dog' – which Woolf actually takes from fellow modernist Katherine Mansfield's diary (Woolf 1994a: 447) – to exemplify the symbiotic relations formed between the different elements that combine in an 'event' or 'haecceity':

> Climate, wind, season, hour are not of another nature than the things, animals, or people that populate them, follow them, sleep and awaken within them. This should be read without a pause: the animal-stalks-at-five-o'clock . . . Five o'clock is this animal! This animal is this place! "The thin dog is running down the road, this dog is the road," cries Virginia Woolf. That is how we need to feel. (Deleuze and Guattari [1987] 2004a: 290)

Clearly, Woolf's modernist animals are closest to Deleuze and Guattari's third kind of animal, but it is specifically her *bovine* aesthetic that expresses these affect animals. By expanding on the relationship between cows that appear in the writings of both Deleuze and Woolf, we can better understand how philosophy and literature reconceptualise the shared territories between human and non-human. In doing so, we can also challenge the view prevalent in animal studies that an ethical approach to animals must necessarily be one that seeks to provide a particular narrative of this or that animal's life, that seeks to pinpoint

its characteristics and capacities. Deleuze and Woolf demonstrate, following their cows, that the real value of philosophy and literature to animal studies is less about how successfully they document the 'facts' of the lives of animals and more about how they help us to think with, through and about animals. Might not the ultimate marker of respect for the animal be that of responding to the territory it enters in the ontological assembling of life?

II. Cows in Philosophical/Literary Landscapes

As one of the oldest domesticated animals, and one encountered by most humans in Western societies on a daily basis (most obviously in the form of milk and meat, but also in our use of cosmetics, deodorants, soaps and various other everyday products[6]), the presence of cows in Deleuze's philosophy testifies to the fact that he is not simply interested in wild creatures or minor insects.[7] Indeed when recounting his harshest rejections of both Oedipal and classification or State animals, Deleuze is critical of the way cows are reterritorialised within such modes of thought. Cows figure in his rejection of psychoanalytic treatments of animals where myths are created (linked to the Oedipal complex) of them as 'archetypes' or 'models'; in other words, this is where the first two kinds of animals outlined by Deleuze and Guattari meet in anthropomorphic and anthropocentric collusion. As Deleuze puts it in his 'Four Propositions on Psychoanalysis':

> Perhaps the most grotesque pages in all of Freud are those he wrote on fellatio: how in this instance a penis (*pénis*) stands for a cow udder (*pis de vache*), and a cow udder for the maternal breast. In other words, fellatio means you can't find a cow udder to pull, or that you want your mommy, or she has no more milk. This is merely a way of showing that fellatio is not a 'true desire' but means something else, that it is hiding something, some other desire. (Deleuze 2007: 80)

Very similar passages appear in Deleuze's Preface to pioneering queer theorist Guy Hocquenghem's *L'Après-mai des faunes*, where he denounces the fact that such

> bizarre and 'shocking' desire can have no worth of its own; it must be traceable to a cow udder, and from there to the mother's breast. Freud thinks we would get more pleasure sucking on a cow udder. Interpret, regress, push toward regression. (Deleuze 2004a: 285)

Where cows figure in psychoanalysis then, Deleuze is very much against their relegation (or elevation) to figures of speech such as metaphor or

metonymy (Deleuze and Parnet 2006: 57); not only does he criticise psychoanalytic structures of desire, but he also wants to deterritorialise cows whenever they are used as standing for something other than themselves.[8]

In *A Thousand Plateaus*, the territory occupied by cows marks the move from the first two kinds of animals described by Deleuze and Guattari and towards the third kind of affect, pack animals. In this respect, the opening pages of their tenth plateau are particularly relevant, when their discussion is concerned with how natural history works by organising in terms of 'progressions and regressions, continuities and major breaks', and where evolution, as originally conceived, works in terms of 'genealogy, kinship, descent, and filiation': 'Natural history can think only in terms of relationships (between A and B), not in terms of production (from A to *x*)' (Deleuze and Guattari [1987] 2004a: 258). This has important consequences in terms of how we think of relationships between animals, which are conceived as two forms of analogy: a 'series' of 'resemblance' of a and b, b and c, and so on until 'all of these terms conform in varying degrees to a single, eminent term, perfection'; and a 'structure' whereby 'a is to b as c is to d; and each of these relationships realises after its fashion the perfection under consideration'. In other words, what we have here is Nature as 'an enormous *mimesis*' (259). It is when Deleuze and Guattari introduce the change that structuralism and in particular Lévi-Strauss brought, that 'the cow' is reterritorialised:

> Symbolic understanding replaces the analogy of proportion with an analogy of proportionality; the serialization of resemblances with a structuration of differences; the identification of terms with an equality of relations; the metamorphoses of the imagination with conceptual metaphors; the great continuity between nature and culture with a deep rift distributing correspondences without resemblance between the two... structuralism represents a great revolution; the whole world becomes more rational... A man can never say: 'I am a bull, a wolf...' But he can say: 'I am to a woman what the bull is to the cow, I am to another man what the wolf is to the sheep.' (Deleuze and Guattari [1987] 2004a: 261)

It is precisely at the moment in which the cow is used as an example of this structuration of animals that Deleuze and Guattari, almost as if sparked into it by the reterritorialisation of the cow by structuralist thought, are quick to launch 'becomings-animal' in contrast: 'None of the preceding satisfies us... We believe in the existence of very special becomings-animal traversing human beings and sweeping them away, affecting the animal no less than the human.' By focusing on

a correspondence of relations, structuralism denies rather than affirms becomings. The territory marked by cows here escapes structuration within 'the true order' (Deleuze and Guattari [1987] 2004a: 261) and instead marks a transition to post-structuralism: the deterritorialising becoming-animal of Deleuze's own writing. And it is here, in refusing to follow the 'cow' understood through resemblance and analogy, that Deleuze emphasises the 'real' of becoming which is not an escape from the material world as Haraway and other critics within animal studies have argued, but is rather a reconceptualisation of materiality itself (262). It is important to note, too, that directly after this Deleuze and Guattari cite Woolf's 'troop of monkeys' and 'school of fish'; Deleuze's critique of structuralism's reterritorialisation of the cow therefore leads to his entering into closer proximity with Woolf's modernist animals.

The territory staked by cows in Woolf's writings is vaster than might initially be expected – from State cows that are firmly classified as part of pastoral England to an exploration of affect animals that disrupt ontological boundaries between human and non-human and raise ethical questions concerning how humans approach the lives of animals. Whilst Woolf's central role in Bloomsbury in the first decades of the twentieth century often leads to the associations between her writings and the bustling life of city dwellers, she also shows an interest in the natural world; her aesthetics are engaged with a conceptualisation of the non-human as much as the human, of nature as much as culture.[9] Many of Woolf's novels include a consideration of both country and city life, and where a novel such as *Mrs Dalloway* is set predominately in the city, *To the Lighthouse* and *Between the Acts* are set in more rural environments. And whether in her private writings or in her novels, cows are a part of Woolf's literary landscapes.[10] From her private writings, we know that Woolf frequently observed cows at Monk's House, her home in Rodmell in the Sussex countryside (Woolf 1976: 425, 480; Woolf 1977: 514; Woolf 1980: 36), and in one letter she even notes 'cows sheltering' whilst aeroplanes are 'booming' overhead as the war looms in 1938 (Woolf 1980: 281). Woolf's concern for cows is clear when, in the final month of her life, she worries over the 'starving' cows of her friend, Octavia Wilberforce – Woolf is given the task of buying two tons of hay for these cows that had been providing cream and milk to her and Leonard between 1940–1 (Woolf 1980: 475–6). But she clearly sees value in literary cows, too. In 'Outlines' she playfully notes that more attention should be paid to the changing life of non-human bodies and environments:

> There is something very charming in an ancient snowstorm. The weather has varied almost as much in the course of generations as mankind. The snow of those days was more formally shaped and a good deal softer than the snow of ours, just as an eighteenth-century cow was no more like our cows than she was like the florid and fiery cows of Elizabethan pastures. Sufficient attention has scarcely been paid to this aspect of literature, which, it cannot be denied, has its importance.
>
> Our brilliant young men might do worse, when in search of a subject, than devote a year or two to cows in literature, snow in literature. (Woolf [1925] 2003: 184–5).

One of Woolf's earliest literary experiments does indeed pay attention to cows, including a particular cow who 'departed life' due to starvation (Woolf 1994b: 16). 'A Cockney's Farming Experiences', a little-known text which was written by the ten-year-old Virginia Stephen,[11] details how a farmer forgets about this dead cow and is fined by the Sanitary Corporation for leaving it in the middle of the road. Then, feeling guilty about his actions, he thinks he sees a bull coming at him but realises it is actually just a calf going towards the pond and that this calf 'was much more frightened' than he was. Following the episode he is concerned that his wife would 'laugh' at him 'for being frightened by a cow' (16) and then worries that his wife has found a lover. When he discovers that she has not, he returns to the task of milking cows in better spirits; thus at this early age, Woolf reverses the gendered idyllic rural image of the milkmaid milking her cow peacefully. But Woolf also deterritorialises the cow from its typical functionality, its mechanical relationship with humans as provider of milk for consumption, at the same time as she pokes fun at the ineptitude of men ('It is just like a man to blunder') by exposing this man's inefficiency in having his pail upside down and therefore losing most of the milk. This provokes a humorous response from both him and his wife; the cow here provides laughter and 'joy' for the man and couple instead of milk. That is, the cow creates an event rather than fulfilling its characteristic role (20). Yet whilst the first part of Woolf's story ends with the farmer vowing 'I shall never forget my amateur farming experiences', the second part disrupts the zone of proximity created between human and cow. After inheriting money from his aunt, the husband hires an outsider to take over the farming duties and moves away with his wife to settle down near London, visiting the farm only on occasion during spring and summer. The farm becomes merely a place to generate income, and the cows are

reterritorialised as a key part of a capitalist enterprise; we witness the move from amateur encounters to professional profits: 'As the farm gave us a certain sum of money every year I had the satisfaction of feeling my money steadily increasing per annum' (22). Woolf's story therefore marks another example from the history of cows being reterritorialised within systems of exchange, a reterritorialisation that is written into the collective name of the species, where 'cattle' comes from the Anglo-French *catel* meaning 'property' and Medieval Latin *capitale*, meaning 'property, stock' (Velten 2007: 22). Perhaps more than any other animal, then, the cow reinforces Deleuze's point that when animals are removed from their territory by humans this is often due to 'the domain of property and ownership' (Deleuze and Parnet 2012).

Woolf's better-known novelistic landscapes are also populated by cows: in *The Voyage Out*, there are 'farmyards with pigs and cows' (Woolf [1915] 2004a: 320); in *Jacob's Room*, we read of how Jacob watches, and hears, the 'legs of cows' in the 'juicy and thick' grass: 'Munch, munch, he heard; then a short step through the grass; then again munch, munch, munch, as they tore the grass short at the roots' (Woolf [1922] 1992: 29); in *Orlando*, Woolf's protagonist sees 'cattle sprinkled on the dark fields' (Woolf [1928] 2004b: 161); and in *The Years*, we read of how cows 'munched' (Woolf [1937] 2002: 34, 148, 150, 224) and even 'coughed' (150) as they made their way through the smooth space of grassy fields – on a train ride north from London it was the sight of 'a quiet group of cows' that signalled to Kitty that 'they were in open country now' (198). Woolf's attention to such actions of munching and coughing is important in marking the territory of cows, for 'what intervenes in marking a territory is also a series of postures' (Deleuze and Parnet 2012). But it is in *The Waves* – the text Deleuze alludes to when discussing Woolf's becoming-animal – that cows lead us more clearly towards an involution of human and non-human that goes beyond characteristics and classifications and that signals the potential for a shared becoming-other. A clear example appears when Susan escapes the confines of her school and welcomes the beginning of the summer holidays:

> the day is still rolled up. I will not examine it until I step out on to the platform in the evening. I will not let myself even smell it until I smell the cold green air off the fields. But already these are not school fields; these are not school hedges; the men in these fields are doing real things; they fill carts with real hay; and those are real cows, not school cows. (Woolf [1931] 1998a: 48)

The real cows – as opposed to the State cows, or perhaps even Oedipalised cows, encountered in classroom materials and activities – begin Susan's process of escaping from the striated space of 'this school that I have hated' and her smoothing of the day that was 'rolled up' (Woolf [1931] 1998a: 48). Later in the novel, Susan is part of a zone of exchange or assemblage with cows. Unlike Bernard's 'school of fish' which figure in his description of his friends, here Susan is concerned purely with her ontological entanglement in a non-human event:

> 'At this hour, this still early hour, I think I am the field, I am the barn, I am the trees; mine are the flocks of birds, and this young hare who leaps, at the last moment when I step almost on him. Mine is the heron that stretches its vast wings lazily; and the cow that creaks as it pushes one foot before another, munching; and the wild, swooping swallow; and the faint red in the sky, and the green when the red fades; the silence and the bell; the call of the man fetching cart-horses from the fields – all are mine. I cannot be divided, or kept apart.' (Woolf [1931] 1998a: 78)

Susan is not claiming ownership over the natural world, but, in a similar vein to Woolf's, and Mansfield's, 'thin dog' cited by Deleuze, she is entangled in an ecological assemblage which includes 'the cow that creaks'. This is an example of where, as Susan describes a few pages later, 'all the world is breeding', and part of Woolf's worlding is undoubtedly cows 'push[ing] one foot before the other' and munching their way across the field (Woolf [1931] 1998a: 81). Woolf's countryside cows extend Deleuze and Guattari's description of *The Waves* beyond the indeterminate combinations of the human friends in the novel, emphasising that non-human animals are also 'simultaneously in this multiplicity and at its edge' (Deleuze and Guattari [1987] 2004a: 278).

The change from cows reinforcing the idyllic associations with the countryside landscape to cows as part of non/human assemblages is a more sustained theme in Woolf's final novel, *Between the Acts*. Detailing an English village pageant set in June 1939 on the eve of World War II, Woolf examines fears not only for humanity but for animality and the natural world. From the opening page, the proximity of human and cow that this novel will at various points explore is set out for the reader, when the first character we are introduced to, Mrs Haines, is revealed to have 'never feared cows' (Woolf [1941] 1998b: 3) – having lived in the Cornish town of Liskeard (where her family had lived for many years), she would have stayed near the cattle market that took place every Thursday.[12] And in the early stages of the novel, before the pageant begins, there are instances where Woolf playfully imagines a

'cow language' (25) and notes a desire of 'propinquity' shared between humans and cows (34). When the pageant begins, cows firmly mark their territory, with their presence more clearly affirmed due to the absence of humans on the stage:

> 'Ambitious, ain't it?' she said to Bartholomew, while they waited. Chuff, chuff, chuff went the machine. Could they talk? Could they move? No, for the play was going on. Yet the stage was empty; only the cows moved in the meadows; only the tick of the gramophone needle was heard. The tick, tick, tick seemed to hold them together, tranced. Nothing whatsoever appeared on the stage. (Woolf [1941] 1998b: 75)

But on this occasion, the presence of cows simply pacifies the audience, so that they 'sat gazing; and beheld gently and approvingly without interrogation':

> The view repeated in its own way what the tune was saying. The sun was sinking; the colours were merging; and the view was saying how after toil men rest from their labours; how coolness comes; reason prevails; and having unharnessed the team from the plough, neighbours dig in cottage gardens and lean over cottage gates. The cows, making a step forward, then standing still, were saying the same thing to perfection. (Woolf [1941] 1998b: 120–1)

Here, the cows' gentleness is transposed onto the audience, all of them settle into the calm and consoling territory associated with pastoral life: the return of 'coolness' and 'reason' after action.

As the novel progresses, however, we witness encounters which challenge the view of humans and cows divided by certain characteristics or features, or of cows that, as Bonnie Kime Scott has recently noted, 'model human behaviour' in Woolf's text (Scott 2012: 166).[13] As 'the stage was empty' and Miss La Trobe becomes 'paralysed' by the perceived failure of the play, it is cows who come to the rescue:

> Suddenly, as the illusion petered out, the cows took up the burden. One had lost her calf. In the very nick of time she lifted her great moon-eyed head and bellowed. All the great moon-eyed heads laid themselves back. From cow after cow came the same yearning bellow. The whole world was filled with dumb yearning. It was the primeval voice sounding loud in the ear of the present moment. Then the whole herd caught the infection. Lashing their tails, blobbed like pokers, they tossed their heads high, plunged and bellowed, as if Eros had planted his dart in their flanks and goaded them to fury. The cows annihilated the gap; bridged the distance; filled the emptiness and continued the emotion. (Woolf [1941] 1998b: 126; see also 77, 108, 157–8, 175)

Here cows are no longer passive extras in the background of the pageant, but are affirming their presence in 'the present moment', bellowing as an event of the pageant and of Woolf's novel. What we see here is less the cows making a 'human connection' (Scott 2012: 165) and more so the deterritorialisation of humanity where the human makes an *animal* connection. Articulating themselves in their herd, the cows 'annihilated the gap' not just between the acts of the play but between the past ('primeval') and the present (modernity), the relations between themselves and the human audience. Crucially, the 'dumb yearning' of the cows becomes precisely what 'bridged the distance' and 'continued the emotion' – their lack of language here is not seen as a privation.[14] Indeed the privation is on the side of the human audience; what they lack is an ability to engage with the play outside the chains of rationality and recognition – they continually need to know what the meaning of the pageant is, and how this relates to them. Woolf mocks this human desire for recognition, and the cows are in on the joke:

> Miss La Trobe waved her hand ecstatically at the cows.
>
> 'Thank Heaven!' she exclaimed.
>
> Suddenly the cows stopped; lowered their heads, and began browsing.
>
> Simultaneously the audience lowered their heads and read their programmes. (Woolf [1941] 1998b: 126)

The cows are not interested in any recognition from Miss La Trobe and they evade her attempt to capture them within her pageant, her attempt to thank them as though they had been actors on her stage. Her seemingly innocent wave is actually her effort to control the cows just as she wanted to capture her audience (she continually worries that they are 'slipping the noose'; Woolf [1941] 1998b: 161). But the cows resist the call to fall under human control, to become moulded or modelled as State animals, precisely because they do not desire to become stage animals.

The cows launch the becoming-animal of Woolf's novel, and specifically play their role in the becoming-animal of Lucy Swithin. Like the cows, Lucy is not interested in fixed meanings and rational responses, and like the cows she escapes the feelings the other characters have of being 'caught and caged', 'exposed', 'neither one thing nor the other', 'suspended, without being, in limbo' (Woolf [1941] 1998b: 158–9). Instead she affirms, reminiscent of Susan's 'I' in *The Waves*, the assembling of life shared amongst human and non-human: 'Sheep, cows, grass, trees, ourselves – all are one. If discordant, producing harmony.' This is not simply 'a circular tour of the imagination' as dismissed by

William and Isa (157), but a material-semiotic becoming. That is, if cows signal 'present-time reality' to the audience of the pageant (and to the reader of Woolf's novel), crucially this present-time reality is not one where human and non-human animals meet in homogeneous unity (161); rather, it is in the proliferation of differences that do not obey hierarchical rules, the affirmation of heterogeneous assemblages which include the cows as well as the human audience. This is evident as the pageant reaches its final act, when Miss La Trobe presents shards of glass reflecting to the audience:

> Ourselves! Ourselves!
>
> Out they leapt, jerked, skipped. Flashing, dazzling, dancing, jumping. Now old Bart... he was caught. Now Manresa. Here a nose... There a skirt... Then trousers only... Now perhaps a face... Ourselves? But that's cruel. To snap us as we are, before we've had time to assume... And only, too, in parts.... That's what's so distorting and upsetting and utterly unfair.
>
> Mopping, mowing, whisking, frisking, the looking-glasses darted, flashed, exposed. People in the back rows stood up to see the fun. Down they sat, caught themselves... What an awful show-up! Even for the old who, one might suppose, hadn't any longer any care about their faces.... And Lord! the jangle and the din! (Woolf [1941] 1998b: 165)

We read that 'the very cows joined in' to this multiplicity of mirrors reflecting the deterritorialisation of subjectivity as well as of nature: 'the reticence of nature was undone, and the barriers which should divide Man the Master from the Brute were dissolved' (Woolf [1941] 1998b: 165). As Louise Westling put it in her eco-critical reading of Woolf's text: 'this is the proper context for rethinking human destiny: a giddy tangle of forms and beings within each kind dances its own rhythm, irrepressibly intertwined' (Westling 1999: 867).

The final appearance of cows in *Between the Acts* involves 'a crude glass painting of a cow in a stable' rather than cows in the fields. Upon entering a public house, Miss La Trobe observes this painting, following which

> she raised her glass to her lips. And drank. And listened. Words of one syllable sank down into the mud. She drowsed; she nodded. The mud became fertile. Words rose above the intolerably laden dumb oxen plodding through the mud. Words without meaning – wonderful words. (Woolf [1941] 1998b: 191)

The combination of the artistic reproduction of the cow (despite its unsophisticated quality) and the words that make the mud fertile, affirms the becoming-animal of Woolf's novel itself, where a material-semiotic entanglement is presented – the muddy conceptualisation that leads to

consideration of a new type of language. The celebration of 'words without meaning' signals the pushing of language to its limit, what Deleuze describes as the becoming-animal of the writer:

> in a sense, if the writer is indeed one who pushes language to the limit, the limit that separates language from animality, that separates language from the cry, that separates language from song . . . One has to be on this limit . . . You always have to be at the limit that separates you from animality, but precisely in such a way that you are no longer separated from it. There is an inhumanity proper to the human body, and to the human mind, there are animal relations with the animal. (Deleuze and Parnet 2012)

We might draw a comparison here with the 'little language such as lovers use, words of one syllable such as children speak' that Bernard desires in *The Waves*. In fact, Bernard barely wants to sound human at all when he declares 'I need a howl; a cry . . . I have done with phrases' (Woolf [1931] 1998a: 246), and at one point he even specifies that what one really needs is 'a bark' (210). In the above quote from *Between the Acts* Woolf therefore provides us with an image of language and materiality meeting in a reconceptualisation of hum/animality; so at the same time as forming affinities with Deleuze's view of animality, the passage presents Woolf (and Deleuze) as, like Haraway, thinkers of the mud.[15]

III. City Cows: *Flush*, Flesh and *Anton Reiser*

Bringing Woolf and Deleuze into closer dialogue shows that they are also thinkers of the flesh. As Woolf recognises in *Between the Acts*, 'we're all flesh and blood under the skin' (Woolf [1941] 1998b: 36), and it is in moving away from the muddy countryside territories occupied by cows that Woolf's fleshly considerations of human–animal relations are most troubling, and that most clearly marks her ontological but also ethical affinity with Deleuze's becoming-animal (a concept which contrary to Haraway's claim about 'horror at the ordinariness of flesh' actually finds its reality precisely in the fleshly zone of indeterminacy between cow and human). This material-semiotic zone of proximity, a zone of fleshly reconceptualisation of human and animal relations, is shared by Woolf and Deleuze in their exploration of cows that are quite literally deterritorialised from their rural dwelling and reterritorialised in the city in Woolf's 1933 text *Flush: A Biography* and in Deleuze's reading of Karl Philipp Moritz's *Anton Reiser* (1785–1790).

It is not clear whether Deleuze and Guattari knew of Woolf's *Flush*, but they do bring Woolf and Moritz into a shared zone of proximity with cows in those pages of *A Thousand Plateaus* just before they outline their three kinds of animals:

> The German preromantic Karl Philipp Moritz feels responsible not for the calves that die but before the calves that die and give him the incredible feeling of an unknown Nature – *affect*. For the affect is not a personal feeling, nor is it a characteristic; it is the effectuation of a power of the pack that throws the self into upheaval and makes it reel. Who has not known the violence of these animal sequences, which uproot one from humanity, if only for an instant, making one scrape at one's bread like a rodent or giving one the yellow eyes of a feline? A fearsome involution calling us toward unheard-of becomings. These are not regressions, although fragments of regressions, sequences of regression may enter in. (Deleuze and Guattari [1987] 2004a: 265)

The section from *Anton Reiser* that Deleuze and Guattari allude to occurs in Part Three of Moritz's 'psychological novel' (as it is subtitled), after the narrator describes Anton's childhood reflections on '*the limitations imposed on each individual*', on the alienation of '*being lost amid the multitude*', and of the efforts to counter this:

> Often he would think himself into the entire being of another person – sometimes when he was walking along the street close beside a complete stranger – . . . he would press as close to such a person as decency permitted, in order to spend a moment in his atmosphere, and to see whether he could not penetrate the partition that separated this stranger's memories and thoughts from his own. (Moritz 1997: 182)

The narrator then recalls how Anton had witnessed the beheading of four criminals near Hanover, leading to the feeling that 'humanity seemed to him so worthless and insignificant that he buried his destiny and everything else in the idea that *humanity could be cut to pieces like an animal*' (Moritz 1997: 183; my emphasis). The shared vulnerability of human and animal is therefore brought to the fore; the simultaneous realisation of human dominance (those who will cut to pieces other humans and animals) and a more humble form of human agency (those who can be cut to pieces).

What is most striking about this passage, and why Deleuze was so drawn to it, is that it is about more than a simple bemoaning of the loss or lack of individuality, and of the fact that humanity could be reduced to such a 'small' and 'insignificant' act that compares to the 'cutting down of a tree in the forest, or the slaughter of an ox'; it intimates an

interest in the plight of the animal rather than only the human, and the affirmation of a shared vulnerability that brings them into a zone of proximity with each other:

> Thenceforth, whenever he saw an animal being slaughtered, he always compared himself to it mentally – and as he so often had the opportunity to see this happening at the butcher's, for a long time all his thoughts were fixed on the attempt to divine the difference between himself and such a slaughtered animal. – He would often stand for hours staring at a calf, with head, eyes, ears, mouth, and nose; and just as he did with *human strangers*, he would lean as close as possible to the calf, often in the foolish delusion that he might gradually manage to think himself into the being of such an animal – he wanted intensely to know the difference between himself and the animal – and sometimes after contemplating it for a long time he would forget himself so far that he really believed that for a moment he had apprehended the *nature of the existence* of such a being. – In short, from his childhood onwards he often wondered what it would be like for him if he were, for example, a dog living among people, or some other animal. (Moritz 1997: 183; original emphasis)

Indeed his search for 'some essential difference between himself and the animal' (Moritz 1997: 183) only leads him to the animality shared by human and non-human. Struggling to come to terms with the fact that 'he *had* unalterably to be *himself*, and *could* not be anyone else; that he was constricted and *confined* in himself' his senses are 'restored' by the realisation that

> that evening his landlord, the butcher, would give him fresh sausages to *eat* – and that the parlour would be warmly *heated* – These entirely sensual, animal ideas renewed his urge to live – he entirely forgot his humanity, just as he had done after the execution of the criminals, and returned home as an *animal* in his inclinations and sensations. (Moritz 1997: 184–5; original emphasis)

The narrator adds: 'As an *animal* he wished to go on living' (Moritz 1997: 185); the vitality of life is intertwined with the animality of life. What Deleuze sees in this novel is human and animal brought into a zone of proximity, a deep sympathy or symbiosis, a sense of shared territory.[16]

Although approaching the question of the animal from a very different literary tradition, Woolf's *Flush* shares similarities with *Anton Reiser* in that both explore the reterritorialisation of cows in striated city spaces (London and Hanover, respectively). Woolf's fictional biography writes the life of Elizabeth Barrett Browning's cocker spaniel – from his early

years in the country to a rear bedroom in London's Wimpole Street, dognapping and incarceration in Whitechapel, a journey abroad to Florence, and finally his death on Barrett Browning's lap. Whilst critics for a long time overlooked this text as a relatively unserious work which does not contain the innovative aesthetics or philosophical import of Woolf's more famous modernist texts such as *To the Lighthouse* and *The Waves*, there is now an increased interest in Woolf's canine aesthetics and philosophy in modernist studies and animal studies. Where the early critical responses that did take this text seriously tended to focus on its allegorical significance – where Flush was viewed as a vehicle to explore human concerns of gender and class – more recently attention has turned to how Woolf offers a nuanced exploration of the relationship between human and dog.[17] Yet Woolf's underdog book *Flush* is also populated by a variety of other animals; as Jeanne Dubino has illustrated, these include 'wild and tamed species – a menagerie of cats and lions and tigers, partridges and parrots and rooks, elephants and fish and fox, black beetles and blue bottles, hares and fleas' (Dubino 2012: 151). Although Woolf's canine protagonist remains a fascinating example of a literary exploration of animality accompanied by all these other animals, the most ethically charged and ontologically challenging passage of Woolf's fictional biography concerns a species that is absent from this menagerie: the cow.

In the fourth chapter of Woolf's text, after Flush has been dognapped from his home in the gentrified Wimpole Street, and before we learn of his suffering in the seedy area of Whitechapel where he is held for ransom,[18] the reader's attention is turned to the plight of cows resident nearby. As I note towards the end of my discussion of *Flush* in *Virginia Woolf and the Materiality of Theory*: *Sex, Animal, Life* (2013), Woolf refers to Thomas Beames, the British writer who undertook investigative journalism in Victorian London in his 1852 book *The Rookeries of London*:

> He was shocked. Splendid buildings raised themselves in Westminster, yet just behind them were ruined sheds in which human beings lived herded together above herds of cows – 'two in each seven feet of space'. He felt that he ought to tell people what he had seen. Yet how could one describe politely a bedroom in which two or three families lived above a cow-shed, when the cow-shed had no ventilation, when the cows were milked and killed and eaten under the bedroom? (Woolf [1933] 1998c: 52)

Whilst much of the remainder of this paragraph in *Flush* goes on to focus on the suffering of the human beings living in these and similar

conditions, it is significant that Woolf's narrative emphasises the exposed vulnerability of these cows, and that the sentence she quotes directly, 'two in each seven feet of space', refers to them. This phrase is actually taken from the Hon. Frederick Byng's 1847 pamphlet addressed to the inhabitants of St James, Westminster, which is quoted at length by Beames:

> Two of these sheds are situated at the angle of Hopkins and New Streets (*real Rookeries*), and range one above the other, within a yard of the back of the houses in New Street. Forty cows are kept in them, two in each seven feet of space. There is no ventilation save by the unceiled tile roof, through which the ammoniacal vapours escape to the destruction of the health of the inmates. Besides the animals, there is, at one end, a large tank for grains, a store-place for turnips and hay, and between them a receptacle into which the liquid manure drains, and the solid is heaped. At the other end is a capacious vault with a brick partition, one division of which contains mangold-wurzel, turnips, and potatoes; and the other a dirty liquid, called brewers' wash, a portion of which is pumped up, and mixed with the food of the cows. (Cited in Beames 1852: 214–15)

A report compiled by a medical practitioner, Mr Anselbrook, concludes: 'From the above-mentioned facts it is obvious, that much of the milk sold at the West End of the Metropolis is elaborated in the udders of animals unnaturally treated, and kept in an atmosphere impregnated with gases detrimental to common health' (cited in Beames 1852: 215). Indeed we now know that adverse effects on such confined cows (including in our contemporary context) can lead to various health problems ranging from infertility to lameness, and bringing cows into man-made territories has also posed risks for human health (for example, with measles, smallpox and tuberculosis).

Woolf therefore records another example of cattle as an object of exchange, as a kind of property that will be used to serve humans. But within the capitalist workings of the city, there is no longer even the kind of connection between human and cow that was possible on the farm – these city cows are not allowed to find their territory amongst the grass and the open air. The constriction facing such cows might be an effect of the way that anthropocentric attitudes to animals – whether through Oedipalisation or classification – result in a lack of interest in having an 'animal relationship with the animal', but the outcome is a very real, fleshly reterritorialisation. Woolf's city cows expose the fact that, as Hannah Velten has shown, 'in contrast to the pastoralists who still struggle to rely on the live cow for their

livelihood, Western civilizations have reverted to being reliant mainly on the dead cow – for meat and leather' (Velten 2007: 127). What is so difficult for Woolf (and for Beames) to describe in the above passage, and what is most troubling for the reader, is the way in which these cows are already reduced to food and drink by the humans with whom they share such close living quarters. Beames himself argues that this is overwhelming evidence that cow-sheds, including underground sheds in Whitechapel which 'reek with an abominable odour', are 'dens of destitution' and a 'disgrace to our age' (Beames 1852: 213–16). But in exposing the vulnerability of the shared proximity between human and animal here, Woolf launches the becoming-animal of her work and of her readers – the ethical and ontological questions raised challenge our treatment and conceptualisation of animals and how their very being is subsumed, or indeed *consumed*, by humans. In other words, Woolf's confined city cows occupy the territory of thought as well as of material reality. Instead of simply recognising the plight of these cows, Woolf calls on us to respond to their situation; these cows are affect animals calling the reader to question the ethical and ontological limits of our hum/animality.

Key in all of this is not to stop at pity, but to explore the way in which these encounters create a new relation between, and conceptualisation of, human and animal. As Deleuze and Guattari note in *What is Philosophy?*, 'the slaughter of a calf remains present in thought not through pity but as the zone of exchange between man and animal in which something of one passes into the other' (Deleuze and Guattari 1994: 109). And as Alain Beaulieu explains, if we are to discover an animal ethics in Deleuze's philosophy,

> it is not an ethics of compassion in the face of suffering but rather an ethics through which one becomes worthy of the zone of proximity that happens, an ethics of solidarity with affects that seem to be the furthest from those simply produced by humans. This ethics, or more precisely this ethology, asks us to be on the lookout (*aux aguets*) in order to grasp sign-affects common to both human and non-human beings. (Beaulieu 2011: 83)

Part of a Deleuzian animal ethics, or ethology, is therefore to understand that the ontological questions his philosophy raises concerning non/human boundaries are also fleshly questions concerning the real world – his is not a philosophy of the sublime of no use to those traversing the muddy field of animal studies.

The distinctly bovine territory shared by Woolf and Deleuze is evinced through a reading of Woolf's modernist animals, where she herself

is concerned with the immanent entanglements of human and non-human life. For what Woolf finally explores in *Flush* is the 'reality of becoming' as described in *Francis Bacon*, where Deleuze argues that Bacon's paintings draw our attention to the fact that

> meat is not dead flesh; it retains all the sufferings and assumes all the colours of living flesh. It manifests such convulsive pain and vulnerability, but also such delightful invention, colour, and acrobatics. Bacon does not say, 'Pity the beasts', but rather that every man who suffers is a piece of meat. Meat is the common zone of man and the beast, their zone of indiscernibility. (Deleuze [2003] 2005: 17)

Francis Bacon then returns us to Moritz and *Anton Reiser*, where part of the above passage detailing how Anton would 'stand for hours staring at a calf' is cited,[19] leading Deleuze to conclude that 'animals are part of humanity . . . we are all cattle'. For Deleuze, this is precisely 'the reality of becoming', which is not a question of resemblance between man and animal but 'a zone of indiscernibility more profound than any sentimental identification: the man who suffers is a beast, the beast that suffers is a man'. 'What revolutionary person', asks Deleuze, 'in art, politics, religion, or elsewhere – has not felt that extreme moment when he or she was nothing but a beast, and became responsible not for the calves that died, but *before* the calves that died?' (Deleuze [2003] 2005: 18). We can reject Haraway's accusation of his 'horror at the ordinariness of flesh', because, while Deleuze's cows might take part in his ontology without him having paid great attention to their fleshly realities, we can see here that he is clearly drawn to fleshly encounters. Woolf's encounter with cows in *Flush* similarly points to such a territory of indiscernibility. The 'horror' for Woolf, as for Deleuze, is not directed towards the 'ordinariness of flesh' but towards the ways in which this ordinary flesh is (mis)treated despite the fact it signals a zone of proximity between humanity and animality. By confronting this particular reality of becoming, we might find a way to affect a positive deterritorialisation of these cows that resists reterritorialisation within humanist and capitalist environments. This is the ontological and ethical territory in which Deleuze and Woolf ask species to meet.

Notes

1. For an even more scathing and polemical dismissal of 'becoming-animal' see Vitamvor 2009/10.

2. In *The Beast and the Sovereign*, Derrida speaks of Deleuze and Guattari's 'great, rich chapter' on becoming-animal (in *A Thousand Plateaus*) and urges students to read Deleuze's writings on the animal '*in extenso*': 're-read it all', he recommends. Derrida (2009: 141–2).
3. Calarco 2008: 42–3. Despite Calarco's interest in Deleuze and Guattari's writings on the animal, however, they are only discussed in a few pages of his book. Calarco instead concentrates on Heidegger, Levinas, Agamben and Derrida.
4. Within Woolf studies attention has also been paid, for example, to Woolf's 'queer fish' (see Simpson 2003). See Carrie Rohman's essay in this volume for a discussion of Woolf's monkeys.
5. Woolf referred to herself in numerous letters as the Apes (for some examples see Woolf 1976: 106, 157, 393).
6. 'While 54 per cent of a slaughtered cow is used as beef products for human and pet consumption, the rest of the carcass (fat, bones, viscera and hide) is broken down by renderers into a range of other substances. For example, beef fat and fatty acids are used in show creams, crayons, floor wax, margarine, cosmetics, deodorants, detergents, soaps, perfumes, insecticides, linoleum, insulation and refrigerants' (Velten 2007: 157–8).
7. Although beyond the scope of this current essay, it is important to note that cows also populate Deleuze's own discussion of the history of philosophy: in *Nietzsche and Philosophy* Deleuze discusses the rumination of cows in relation to 'The Voluntary Beggar' in *Thus Spoke Zarathustra* (Deleuze [1983] 2006: 156); in *Difference and Repetition* he argues that Hegel was too harsh in his rejection of Schelling's conception of absolute knowledge as 'a night in which all cows are black' (Deleuze [1994] 2004b: 240) and also references Bergson's discussion of two kinds of recognition: 'that of the cow in the presence of grass, and that of a man summoning his memories: the second can serve no more than the first as a model for what it means to think' (170–1).
8. Interestingly, when it comes to conceiving of non-Oedipal desire in *Anti-Oedipus*, cows this time figure when Deleuze and Guattari refer to cattle in their example of 'breaks-flows out of which desire wells up, thereby constituting its productivity and continually grafting the process of production onto the product'. They describe the 'continuous, infinite flux' of 'the anus-machine and the intestine-machine, the intestine-machine and the stomach-machine, the stomach-machine and the mouth-machine, the mouth-machine and the flow of milk of a herd of dairy cattle ("and then … and then …")' (Deleuze and Guattari [1977] 2004b: 39).
9. For a discussion of Woolf and nature see Alt 2010; Czarnecki and Rohman 2011; Scott 2012.
10. Perhaps more than any other animal, cows are associated with the idealism of rural life, including the image of the milkmaid (Velten 2007: 67). Whilst Woolf's exploration of rural environments is far from idealistic, her writing, as I have shown, does at various points portray the cow's association with rural territories. Woolf notes both this link with milkmaids and with women in texts including *Orlando* and 'On Being Ill'.
11. This story was written for the *Hyde Park Gate News*, the family newspaper written by the Stephen children. It was first published in 1994.
12. See < http://www.liskeard.gov.uk/Historic-Liskeard.aspx > .
13. Scott notes that Woolf's depiction of the bellowing herd of cows might be influenced by her reading of Freud on the herd instinct before working on *Between the Acts* (Scott 2012: 165).

14. As Derrida outlines in *The Animal That Therefore I Am*:

> It would not be a matter of "giving speech back" to animals but perhaps of acceding to a thinking, however fabulous and chimerical it may be, that thinks the absence of the name and of the word otherwise, and as something other than a privation. (Derrida 2008: 48)

15. Braidotti has suggested that what is shared between Haraway and Deleuze, and also her own 'nomadic subject', is a deep 'alliance' in presenting theories which are 'materialist' and 'neo-literal', and therefore not limited to the 'textual' and 'resolutely not metaphorical': 'Haraway shares with Deleuze two key features: serious neo-foundational materialism on the one hand and a rigorous theory of relationality on the other' (Braidotti 2006: 200).
16. In *The Animal Side* Jean-Christophe Bailly describes this novel as providing 'the most poignant narrative of the possible community – through thought – between man and beast' (Bailly [2007] 2011: 23). He suggests that

> behind the wish to move beyond simple pragmatic proximity and beyond customary practices, what is imposed is an instance of nonjudgement, a place from which it would be impossible even to think about values of establishment or hierarchies [. . .] while the calf in question may indeed be 'poor in world,' then at least one can and must plunge down into that poverty and contemplate it – a mystical vantage point here might have me say 'contemplate it in all its splendor' – but it seems to me that Moritz is elsewhere, is headed somewhere other than into this type of pathos. The 'nature of the creature's existence' is a feeble glimmer, it does not fall straight like a ray, indeed it scarcely illuminates at all; but with what it makes perceptible, or between what it makes perceptible and the open, the possibility *is opened* of a thought about a relation that would no longer owe anything at all to humanist postulations or dreamy effusions. (Bailly [2007] 2011: 25)

17. For details of this changing critical response to *Flush* see Ryan 2013: 132–8.
18. Elizabeth Barrett Browning's Flush was actually stolen three times in total (in 1843, 1844 and 1846), as Woolf herself notes (Woolf [1933] 1998c: 109), and this was not an uncommon occurrence at the time (see Adams 2007: 26–8, 36–8; Snaith 2002: 620).
19. Due to the different translations, Deleuze's citation in *Francis Bacon* is slightly different from the one I quote above from Moritz's text:

> a calf, the head, the eyes, the snout, the nostrils . . . and sometimes he lost himself in such sustained contemplation of the beast that he really believed he experienced, for an instant, the *type of existence* of such a being . . . in short, the question if he, among men, was a dog or another animal had already occupied his thoughts since childhood. (Deleuze [2003] 2005: 18)

Virginia Woolf's Ethical Subjectivity: Deleuze and Guattari's Worlding and Bernard's 'Becoming-Savage'

Laci Mattison Florida State University

Abstract

In Virginia Woolf's 1931 novel *The Waves*, one of Bernard's many becomings – his 'becoming-savage' – reveals a point of intersection between Woolfian aesthetics and Deleuze and Guattari's philosophy. Moreover, a triangulation of Woolf's 'moments of being', Deleuze and Guattari's 'worlding', and (post)coloniality provides a new and productive node for examining the debates surrounding imperialism in these thinkers' works, and an insistence that Woolf, read alongside Deleuze and Guattari, offers an alternate and precisely ethical way of being in the world.

Keywords: postcolonial, imperialism, primitivism, becoming, worlding, moments of being, language, de/territorialisation, subjectivity, ethics, desire

I. Woolf, Deleuze and Guattari and the Postcolonial

Jane Marcus's 1992 paradigm-shifting essay, 'Britannia Rules *The Waves*', carved out a space for thinking about Virginia Woolf's writing alongside imperial politics, and, ever since, scholars have examined and debated Woolf's relationship (whether it be critical or complicit) with empire. Twelve years after publishing this essay, Marcus revised her initial argument in the introduction to *Hearts of Darkness: White Women Write Race*, in which her earlier essay is reprinted, and claimed,

'*The Waves* does write empire, despite what I argue in "Britannia Rules *The Waves*" ' (Marcus 2004: 13). Marcus continues to account for her own complicity and eagerness in limiting *The Waves* to a singular 'anti-imperialist' narrative:

> The overdetermined radical reading of the chapter that forms the center of this book ['Britannia Rules *The Waves*'] is derived, I now think, from the cultural need to produce a white English feminist voice of modernism that is not totally racist and makes a certain critique of imperialism. . . . Woolf gives us the text for the reading. But that is not all she gives us. She gives us texts for many other readings, including one that mourns the loss of empire. Do we have a right to ask that *The Waves* offer itself to only one reading? (Marcus 2004: 13)

Marcus's question suggests an ethics (in the Spinozian sense) inherent in literary scholarship: the necessity that scholars come open to the difference and multiplicity a book like *The Waves* holds at its very core and that they be receptive to ontological change (of both subject and object, reader and text). Beatrice Monaco describes Woolf's writing as 'a kind of blueprint for good practice: an ethical, implicitly ecological, and a spiritual achievement' (Monaco 2008: 190). Following the ethical practice Woolf models, then, requires readers of her work to cast aside predetermined or overdetermined answers and to be sensitive to the various and variant registers and rhythms of her books. Quite certainly, an anti-imperialist rhythm is embodied in *The Waves* – and in many others of Woolf's books – but as Marcus realises, *The Waves* is not wholly or entirely against empire, as the title of Kathy Phillips's 1994 *Virginia Woolf Against Empire* supposes.

An alternate reading of Woolf's writing about empire arises in an examination of how her aesthetics influenced the process philosophy of Gilles Deleuze and Félix Guattari and, in particular, how Woolf's revision of subjectivity as a creative de- and reconfiguration (those transitory and illusive moments of being) intersects with her critique of the enforcement of borders – between nations, genders, races, and so forth. Deleuze and Guattari's theory of worlding, becomings-indiscernible/-impersonal/-imperceptible, 'becoming-everybody/everything' (Deleuze and Guattari 1987: 280), is importantly inspired in part by Woolf's moments of being: the 'saturated atom'[1] often figured as a ring, drop or globe in *The Waves*. Jean-Jacques Lecercle upholds moments of being as 'the best illustrations . . . of the Deleuzian event' (Lecercle 2002: 151), but Woolf's aesthetics are also an integral node of Deleuze and Guattari's philosophical (and literary) lineage. And in turn, their

interpretation of Woolf usefully illuminates the politics implicit in her aesthetics. In moments of being, one realises the 'pattern', the ontological and ecological network of connections, that we are not discrete entities but that, as Woolf writes,

> we . . . are connected with this; that the whole world is a work of art; that we are parts of this work of art. *Hamlet* or a Beethoven quartet is the truth about this vast mass that we call the world. But there is no Shakespeare, there is no Beethoven; certainly and emphatically there is no God; we are the words; we are the music; we are the thing itself. (Woolf [1976] 1985: 72)

Moments of being, then, are not intended as something that happens only on the page, in an insular 'text', but an occurrence that always opens into the world, crafting more and more ever mobile connections. A moment of being has nothing to do with a sense of self as static, complete and unified, but of a self perpetually in motion and in assemblage with other durations. Understood in these terms, moments of being are ethical enactments of potential becomings, and, as such, Woolf's fiction and Deleuze and Guattari's philosophy offer an unbounded way of being in the world in place of the imperialistic enforcement of borders.

Within the past twenty years, both Deleuze and Woolf scholarship has responded to various turns in postcolonial studies. Gayatri Spivak's early critique of Foucault and Deleuze in 'Can the Subaltern Speak?' (1988) and the recent *Deleuze and the Postcolonial* (Bignall and Patton 2010) are notable scholarly contributions on this point, as are the influential arguments of Marcus, Steven Putzel, Urmila Seshagiri, Anna Snaith and the like. Woolf's moments of being and Deleuze and Guattari's conception of 'worlding' stand in difference to the theory of worlding postcolonial critics like Spivak have advanced. Instead of violently severing groups of people into categorical communities, Deleuzian worlding creates, through a dispersal of subjectivity, fluid and ever rippling-outward radical communities. This worlding requires an aesthetics of desire as a function of deterritorialisation. As Deleuze argues and Woolf's fiction demonstrates,[2] fear reinforces borders, territorialises subjects, and consolidates both the 'self' and the 'other'. Cycles of de- and reterritorialisation(s) occur throughout Woolf's work, most noticeably in *The Waves*, which Deleuze and Guattari cite as an abstract machine (Deleuze and Guattari 1987: 252). More particularly, one of Bernard's many becomings in *The Waves*, his 'becoming-savage', reveals a point of intersection between Woolfian aesthetics and Deleuze and Guattari's philosophy that might begin to resolve the uneasy gap between both Woolf's and Deleuze's writings and postcolonial studies.

The Waves importantly recognises its own complicity with empire, and at the very intersection between authorial imagination and subjectivity, Woolf (via the author figure, Bernard) exposes 'epistemic violence' (Spivak 1988: 280–1), but she also offers a new notion of subjectivity in her insistence on an ontology of desire, the transgression of boundaries and an 'immeasurably receptive' (Woolf 1931: 291) mode of being which de- and reterritorialises, although momentarily, an unessentialised view of both subject and world.

Spivak, in her important essay 'Can the Subaltern Speak?', argues that Deleuze's philosophy (as well as Foucault's) not only offers nothing for postcolonial studies but values, implicitly, a Eurocentric 'transparent' subject. As Andrew Robinson and Simon Tormey write in 'Living in Smooth Space: Deleuze, Postcolonialism and the Subaltern', 'it is clear that unless the claims advanced by Spivak are examined on their own terms, there will continue to be a significant barrier to the reception of Deleuze – and indeed Deleuze and Guattari – as "postcolonial" thinkers' regardless of the ways Deleuze and Guattari's thought has impacted current theorists of postcoloniality (Robinson and Tormey 2010: 20).[3] Robinson and Tormey aptly identify Spivak's (mis)reading of Deleuze and Guattari as they revalue these philosophers as productive (re)thinkers of postcolonial studies. They rightly and usefully locate the crux of Spivak's misinterpretation of Deleuze and Guattari's philosophy on her Lacanian insistence on a lacking subject, thus her resulting claim that Deleuze's philosophy disallows 'counterhegemonic ideological production' (Spivak 1988: 275). Robinson and Tormey respond by emphasising that Deleuze and Guattari do indeed

> have a counter-project, whether it is "ideological" or "counterhegemonic" is more doubtful; but in this case, the response might be: why should it be? Ideology by its very structure requires the reproduction of the lacking subject; (counter)hegemony requires the reproduction of arborescent integration. (Robinson and Tormey 2010: 31)

Given Deleuze's (and Guattari's) emphatic insistence on desire as a productive force (not a quality arising from a predetermined lack), Robinson and Tormey show that subjectivity for Deleuze and Guattari is by no means 'transparent', as Spivak claims. 'Desire is not something "possessed" by the sovereign subject', they write, 'but something inter-, sub- and extra-subjective' (Robinson and Tormey 2010: 22). The subjectivity with which Deleuze and Guattari are concerned is not 'transparent' or given, but it certainly is 'imperceptible' and thus in process. This imperceptibility relies precisely on desire as the creative

force of becomings and also underscores the ways in which Deleuze and Guattari's reading of Woolf informs their philosophy. Moreover, a triangulation of Woolf's aesthetics, Deleuze and Guattari's philosophy, and (post)coloniality provides a new and productive node for examining the debates surrounding imperialism in Woolf's writing, as well as Deleuze and Guattari's, and an insistence that Woolf, read alongside Deleuze and Guattari's philosophy, offers an alternate and precisely ethical way of being in the world.

II. Subjectivity, Psychoanalysis and the Primitive

Woolf's oeuvre displays a nuanced concern, in both form and content, with subjectivity as a flux of becoming and as a network of (self-) differentiation in which, as John Hughes argues in his Deleuzian reading of *The Voyage Out*, characters, in interrelation, dramatically affect each other in durational, unforeseen and irreversible ways. Moments of being as modes of affective change hinge, then, on an opening outward of the individual or 'character' and result in a durational flux of desire in which borders between self and other are momentarily dissolved and finally reconfigured. These moments critique Helen Ambrose's fascination in *The Voyage Out* with a 'new world' and the imperial imagination revealed in the cross-stitched landscape she begins onboard the *Eurphrosyne* – 'a great design of a tropical river running through a tropical forest, where spotted deer would eventually browse upon masses of fruit, bananas, oranges, and giant pomegranates, while a troop of naked natives whirled darts into the air' (Woolf [1915] 2004: 27) – and demonstrate the ways Woolf's aesthetics influenced Deleuze and Guattari's theory of worlding (as becoming-imperceptible, -indiscernible, -impersonal). This influence becomes most obvious in a reading of *The Waves*, one of the novels explicitly cited by Deleuze and Guattari in *A Thousand Plateaus* when they put forth their philosophy alongside Woolf's writing.

Deleuze and Guattari's emphasis on *The Waves* comes as no surprise for those familiar with their philosophy and Woolf's fiction, for it is in this novel that the question of the 'self', both philosophical and ethical, is most pronounced. Although Hughes is right to emphasise the 'characters' participation in modes of relation' in *The Voyage Out* (Hughes 1997: 157), 'characters', in the traditional sense, still figure prominently in Woolf's first novel. (We might locate the change in her treatment of 'character' with *Jacob's Room*, as Arnold Bennett does, and with Woolf's response to Bennett's critique in 'Mr. Bennett and

Mrs. Brown', later revised and retitled as 'Character in Fiction'.) In *The Voyage Out*, Hirst tells Hewet that those peopling the hotel are 'all types' and that he 'could draw circles round the whole lot of them, and they'd never stray outside' (Woolf [1915] 2004: 102). Hirst's circle-drawing is a tool of categorisation and thus of the creation (and enforcement) of borders. Woolf certainly criticises Hirst's view of a world of chalk circles around people's feet (via Hewet's comments to Rachel), but not until *The Waves* does she formally and most explicitly dissolve the notion of 'character' to which those like Hirst subscribe.

From the outset of *The Waves*, boundaries are introduced; in the next moment, these lines of division lose hegemony. In the first lyrical interlude, the narrator describes 'the world seen without a self' (Woolf 1931: 287): 'Gradually as the sky whitened a dark line lay on the horizon dividing the sea from the sky'. Then, 'the surface of the sea slowly became transparent and lay rippling and sparkling until the dark stripes were almost rubbed out' (7). These lines of division lack permanence. They exist based upon light and (inhuman) perspective.[4] When light and perspective change, the lines fade and almost disappear. The six voices in *The Waves*, while arguably different, similarly lose their subtle distinctions as we read through the text, as images or phrases are introduced by one voice and later drift in and out of the narrative in another voice. These six voices are named (Bernard, Susan, Neville, Rhoda, Louis and Jinny), but Woolf notably did not intend these voices as characters. In a diary entry dated 8 October 1931, Woolf writes: 'The W[aves] is not what they say. Odd, that they (The Times) shd. praise my characters when I meant to have none' (Woolf 1982: 47). Alternately, Woolf envisioned these six voices as an irreducible whole, as a network of difference and of self-differentiation, not as quantifiable parts of a set.[5]

Woolf's formal choice to name the voices of *The Waves* parallels, also, Deleuze and Guattari's authorial decision in *A Thousand Plateaus*. They bring this stylistic choice into the larger philosophical tract by discussing, in the introduction, the reason they have kept their names:

> Out of habit, purely out of habit. To make ourselves unrecognizable in turn. To render imperceptible, not ourselves, but what makes us act, feel, and think. . . . To reach not the point where one no longer says I, but the point where it is no longer of any importance whether one says I. We are no longer ourselves. Each will know his own. We have been aided, inspired, multiplied. (Deleuze and Guattari 1987: 3)

This passage remarkably echoes Woolf's words in the first chapter of *A Room of One's Own*: ' "I" is only a convenient term for somebody who has no real being… (call me Mary Beton, Mary Seton, Mary Carmichael or by any other name you please – it is not a matter of importance)' (Woolf 1929: 4–5). For Woolf, Deleuze and Guattari, the 'I' paradoxically becomes a marker of imperceptibility. Certainly, these reasons for using the conventional (although refigured) 'I' might likewise be appropriate for a reading of *The Waves*, where 'I' is often mirrored and refracted in order to disrupt the idea of a singular self and where the globed moment of being makes perceptible the moment of imperceptibility, of worlding, in which subjectivity is revealed outside the narrative constraints of 'character in fiction'.[6]

To contextualise Woolf's aesthetics of subjectivity (and Deleuze's parallel philosophy of becoming), a larger discussion of the historical, philosophical theories of subjectivity becomes necessary; thus Freudian psychoanalysis (central to the 'primitive' in modernist literature) becomes a significant contrast for Bernard's figuration of the 'savage' in *The Waves*. Freud's thought notably influenced Woolf's Bloomsbury circle, as studies such as Elizabeth Abel's have shown; and the Woolfs of course published the first English translations of Freud at the Hogarth Press. Although Woolf claims not to have read Freud until after meeting him in 1939, she would have been familiar with the basic tenets of his theory and those of Melanie Klein (who lectured at Adrian and Karen Stephen's home) through conversations in the Bloomsbury Group.[7]

Seshagiri's reading of Freud accurately highlights the primitivist impulse of *Interpretation of Dreams*, which 'argued that each individual's movement from infancy to adult consciousness reenacts humanity's development from (dark) savagery to (white) civilization' (Seshagiri 2010: 29). This same theory of the subject figures prominently in *Totem and Taboo* (1913), the definitive translation of which was edited by Lytton Strachey's brother, James. In the first chapter of *Totem and Taboo*, 'The Horror of Incest', Freud claims:

> There are men still living who, as we believe, stand very near to primitive man, far nearer than we do, and whom we therefore regard as his direct heirs and representatives. Such is our view of those whom we describe as savages or half-savages; and their mental life must have a peculiar interest for us if we are right in seeing in it a well-preserved picture of an early state of our own development. (Freud [1913] 1950: 1)

The rhetoric Freud uses to convince his audience to attend to his argument, then, while positing a connection between the 'civilised'

and the 'barbarous', clearly categorises the two separately and affirms that, by studying the 'savages' and 'half-savages', civilised man might learn something about his former self and something about his own psychology.

Moreover, Freud overlays his study of the barbarous ('the most backward and miserable of savages, the aborigines of Australia') with his predetermined answer: the Oedipus complex. Freud links the neurotic and the savage in *Totem and Taboo* by way of a discussion of desire and repression (or, the 'fail[ure] to get free from the psycho-sexual conditions . . . [of] childhood'). 'It is therefore of no small importance', Freud writes, 'that we are able to show that these same incestuous wishes, which are later destined to become unconscious, are still regarded by savage peoples as immediate perils against which the most severe measures of defense must be enforced' (Freud [1913] 1950: 17, 1). By tracing the development of the Oedipus complex from the present and material danger to the unconscious, Freud continues to affirm the relation of the barbarous to the civilised, while also differentiating the two.

For Freud, desire originates from a 'lack' (castration), and desire always points to the familial structure (desire for the mother or father, desire to kill the mother or father, and so on). Deleuze and Guattari critique Freud on precisely this point when they discuss the multiplicity of assemblages: 'packs in masses and masses in packs' (Deleuze and Guattari 1987: 34). 'What does psychoanalysis have to say about all of this? Oedipus, nothing but Oedipus', they write. Psychoanalysis 'flattens everything, masses and packs, molecular and molar machines, multiplicities of every variety. . . . It all leads back to daddy' (34–5). For Freud, then, 'there will always be a reduction to the One: the little scars, the holes, become subdivisions of the great scar or supreme hole named castration; the wolves become substitutes for a single Father, who turns up everywhere' (31). Notably, 'Oedipus is the figurehead of imperialism' (Deleuze and Guattari [1977] 2009: xx), thus Deleuze and Guattari's alternate reading of the Wolf-Man show them to be not only anti-Oedipal, but also anti-imperial. The reading of the Wolf-Man Deleuze and Guattari offer exactly parallels their insistence on becoming(s) and multiplicity in difference to Freud's reduction of desire as lack and of psychoses to the Father.

> All of this should be understood in intensity: the Wolf is the pack, in other words, the multiplicity instantaneously apprehended as such . . . . If the unconscious knows nothing of negation, it is because there is nothing negative in the unconscious. (Deleuze and Guattari 1987: 31)

Deleuze and Guattari once again affirm: there is no lack, nothing but the fullness of desire.

Furthermore, in his case study of the Australian aborigines, Freud's discussion of desire and taboo (as a 'social danger' [Freud (1913) 1950: 33]) is entangled with a rhetoric of contagion (along with the expected moral and biopolitical overtones):

> Anyone who has violated a taboo becomes taboo himself because he possesses the dangerous quality of tempting others to follow his example: why should he be allowed to do what is forbidden to others? Thus he is truly contagious in that every example encourages imitation, and for that reason he himself must be shunned. (Freud [1913] 1950: 32)

Freud later reiterates the connections he draws from desire to morality to contagion:

> The magical power that is attributed to taboo is based on the capacity for arousing temptation; . . . it acts like a contagion because examples are contagious and because the prohibited desire in the unconscious shifts from one thing to another. (Freud [1913] 1950: 35)

Desire, for Freud, spreads like a disease if left unchecked, and his language here strikingly parallels the rhetoric of imperialism and reinforcement of borders between colony and metropole, civilised and barbarous, self and other.[8] Of course, 'the self is only a threshold, a door, a becoming between two multiplicities' (Deleuze and Guattari 1987: 249), and contagion is precisely an infection of becoming: 'what interests us are modes of expansion, propagation, occupation, contagion, peopling. I am legion' (239).

Woolf understands desire differently than Freud, however, and Deleuze and Guattari's critique of Freudian theory rests in part with their reading of Woolf. When Deleuze and Guattari write 'Virginia Woolfs experiences herself not as a monkey or a fish but as a troop of monkeys, a school of fish, according to her variable relations of becoming with the people she approaches' (Deleuze and Guattari 1987: 239), they echo their critique of Freud in '1914: One or Several Wolves'. Deleuze and Guattari affirm Virginia Woolf(s) is not one: she (and her writing) are a multiplicity, a peopling impossible without contagion.[9] Virginia Woolf is a pack of woolfs, and the W[o]olf is a 'multiplicity instantaneously apprehended as such' (31). Moreover, Deleuze and Guattari understand moments of being as nodes of desire in Woolf's fiction, and their discussion of desire as a worlding, as a reconfiguration of subjectivity, has notable implications for Woolf's figuration of the 'savage' in *The Waves*. Importantly, the 'savage' does not appear in *The Waves* as a case

study of what we (the 'civilised') once were, as Freud argues in *Totem and Taboo*. Here, I echo Abel's affirmation of Woolf's acute analysis in 'Freudian Fiction' (1920) that psychoanalysis had become, even in her time, 'a colonization of the literary field that transforms "characters" into "cases" through the application of a doctrinal "key" that "simplifies rather than complicates" ' (Abel 1989: 17). Instead, the 'savage' allows submersion in a moment of being, a reconfiguration of subjectivity as a network of difference in which the radial other no longer consolidates the self but instead reveals the porousness of identity (and of 'nation') as such. The 'savage' indicates Woolf's insistence on and celebration of the qualitative the multiplicity of subjectivity (Deleuze and Guattari's wolf pack), not as a part of subjectivity that should be repressed but as part of the self ever unfolding in the world – a celebration of identity as qualitative multiplicity.

In this way, Woolf differentiates herself from other modernist writers and artists of the time, who, as Simon Gikandi argues, subsumed the primitive (especially in visual art, but not exclusively) as an 'appropriat[ion] [of] the other' and, in so doing, 'separate[d] the body of the savage from its aesthetic objects so that the latter could be valued even in the face of hostility toward the former' (Gikandi 2005: 42). Gikandi writes: 'modernism is seen as having embraced the other as part of the same.... The canonical view of modernism is that it represents a positive form of ethnocentrism, what has come to be known as primitivism'. However, Gikandi does not see the primitive as a 'positive' and instead argues that it is 'an apotheosis of the dialectic of identity and difference that is so crucial in the making of modern culture' and that 'one cannot have a discourse of primitivism that is not at the same time an inscription of the radical difference of the other' (44–5). Gikandi is right only insofar as identity is dialectical and resolves itself by way of synthesis (in Hegelian fashion); however, when subjectivity is understood differently – as multiplicity – the 'savage' no longer consolidates or synthesises the self.

Although Gikandi does not reference Freud, his argument relies precisely on the notion of the repression of desire and the discussion of the primitive so apparent in *Totem and Taboo*. After highlighting Roger Fry's writing about African sculpture ('Negro Sculpture') in *Vision and Design* and by way of concluding his own argument, Gikandi posits:

> If Africa did not exist as the site in which the fears and energies of modernism could be projected, it would have been invented ... Africa is the unconscious

> of modernism – its 'absent cause' – a force whose presence can neither be negated nor endorsed and must hence be repressed. (Gikandi 2005: 49)

Gikandi is precisely correct in his affirmation that Africa, if not a material sight of otherness, 'would have been invented'. And in part, the idea of Africa (and the colonies more generally) circulating in modernist texts was a site of invention: a created, exoticised place onto which the 'selves' could project their fears of otherness. However, through Bernard, as author-voice in *The Waves*, Woolf subtly critiques this projection and repression by representing the imperial imagination in which, as Marcus has shown, India is conflated with Africa (Marcus 2004: 84) and the 'savage' is at first figured as the self-consolidating other, although Woolf, by the conclusion of *The Waves*, disrupts this idea.

III. Language, Imperialism and Bernard's Becoming

In *The Waves*, Woolf is particularly concerned with the ethics of language, and, as Deleuze and Guattari affirm, representational language disallows becomings, while language, in becoming minoritarian and thus intense, can engender becomings. Thus, Bernard, as author figure, must move beyond representational language before he can experience qualitative becomings. Throughout *The Waves*, Bernard 'writes [things] down in his notebook under A or under B' (Woolf 1931: 70), thus limiting himself to a quantitative experience with language, where (word) + (word) + (word) = (linked phrase). The products of his word equations can then be categorised in alphabetical order in his little notebook, where they remain handy until a particular moment necessitates the use of one of these crafted phrases. Instead of experiencing stories as qualitative, as multiple and multiplicitous, he limits his role as author to the quantitative, and, as a result, Bernard's words are static and merely representational. He has yet to figure out how to make language 'stutter', how to make language surpass representation and become intense.

Moreover, as author-voice, formations of the self always relate to language and meaning(s) for Bernard, and throughout *The Waves*, we hear him questioning the fixity of these constructs. He contemplates as he waits for the others to meet him for dinner:

> what am I? There is no stability in this world. Who is to say what meaning there is in anything? Who is to foretell the flight of a word? It is a balloon that sails over tree-tops. To speak of knowledge is futile. . . . We are forever mixing ourselves with unknown quantities. (Woolf 1931: 118)

The ambiguous phrase 'unknown quantities' could suggest unmeasured quantities or might indicate measurable quantities of unknown substance. Either way, Bernard's emphasis here is on the unknown or unmeasured and proves that he has not yet escaped from a quantitative mindset. Thus, this moment of flux must return to the limits of stasis. Bernard thinks: 'But, as I put down my glass I remember; I am engaged to be married. I am to dine with my friends tonight. I am Bernard' (Woolf 1931: 118). By naming himself, by crafting a linear narrative for his 'character', by giving that character actions, Bernard attempts to claim his (singular) identity. As Deleuze and Guattari affirm, desire produces a subject in the process of slipping between haecceities in perpetual, ontological becoming; thus, 'there is no fixed subject unless there is repression' (Deleuze and Guattari [1977] 2009: 26).

In the above passage, Bernard represses multiple identities and so restricts himself from mixing with 'unknown quantities'. Yet, in other moments of the novel, Bernard recognises himself as multiple. He says: 'I do not believe in separation. We are not single' (Woolf 1931: 67). In the concluding episode of *The Waves*, Bernard's soliloquy brings the novel to a point of something close to a conclusive territorialisation as he again posits questions of the self. 'I have been talking of Bernard, Neville, Jinny, Susan, Rhoda, and Louis', he says.

> Am I all of them? Am I one and distinct? I do not know. We sat here together. But now Percival is dead, and Rhoda is dead; we are divided; we are not here. Yet I cannot find any obstacle separating us. There is no division between me and them. As I talked I felt, 'I am you.' This difference we make so much of, this identity we so feverishly cherish, was overcome. (Woolf 1931: 289)

Bernard's language here, however lovely, suggests a claiming of identity or a territorialising of the subject in a subsumption of difference into homogeneity. While *The Waves* exhibits Deleuzian becoming throughout, Bernard's synthesising attempt here is not yet one of becoming. Rather, Bernard's language appears at first as more congruent with the Hegelian dialectic, as Bernard 'overcomes' the difference between himself and the other voices (otherwise called 'characters') in the novel in an attempt to 'represent' himself.[10] In contrast, Bernard's moment of being in a later passage is made possible precisely because he has replaced dialectical logic with a new philosophical framework, an understanding of life and of the so-called 'self' as process, a perpetual becoming. And importantly, this epiphany surfaces in *The Waves* when Bernard contemplates his relationship with the radical 'other', the 'savage', whom he mentions in key passages.

Bernard exposes his imperial imagination when he creates a narrative of his friend Percival's death and also demonstrates an authorial epistemic violence by crafting an Orientalised depiction of the 'savage'. Bernard says:

> The cart sways incompetently from side to side. Now one wheel sticks in the rut, and at once innumerable natives in loin-cloths swarm round it, chattering excitedly. But they do nothing. Time seems endless, ambition vain. Over all broods a sense of the uselessness of human exertion. There are strange sour smells. An old man in a ditch continues to chew betel and to contemplate his navel. (Woolf 1931: 136)

According to Bernard, Percival then 'solves' the 'Oriental problem' by 'righting' the cart (Woolf 1931: 136). Unlike Woolf, who uses this moment to mock British 'solutions' to the 'problems' in India, Bernard views Percival as 'a God' (136). Later, when Bernard recalls the cart and the old man (whom he later calls the 'savage'), he attempts to consolidate the self (and by extension, the nation) through a contrast between the 'civilised' and the 'savage', his British self and the colonial other: 'I do not wish to be a man who sits for fifty years on the same spot thinking of his navel', Bernard says. 'I wish to be harnessed to a cart, a vegetable-cart that rattles over the cobbles' (185). Bernard characterises the 'natives' as lazy, 'chattering' people who contemplate their 'navel[s]', and, in so doing, uses the rhetoric of imperialism to create an image of the 'savage' so that he can territorialise the self.

Yet by the conclusion of *The Waves*, Bernard recognises the ways he has used storytelling to affirm his own, singular identity and, in like manner, realises that to tell the true story of his life, he must include more than his so-called 'self', more than his singular voice. Bernard accurately understands his life to be an assemblage not only of people, places, memories, scents and visions, but also of 'dreams', 'half-articulate ghosts' and 'unborn selves' (Woolf 1931: 289). Bernard affirms that even the 'savage' is part of his network of self-differentiation. Certainly, as part of Bernard's imperial imagination, the 'savage' is part of his 'self' and, as the (radical although homogenised) 'other', has allowed Bernard to consolidate his identity. But when *The Waves* is understood in terms of Deleuzian becoming (as Deleuze and Guattari would have it and as scholars like Monaco have previously argued), we notice that Bernard (and Woolf) push this point beyond a simple affirmation that the 'savage' has figured as a projection of fears and repressed desires (in the psychoanalytic sense) – although this recognition, in part, allows for Bernard's self-differentiation, his ontological becoming. Bernard

states: 'There is the old brute, too, the savage, the hairy man who dabbles his fingers in ropes of entrails; and gobbles and belches; whose speech is guttural, visceral – well, he is here. He squats in me' (289). This comment shows that Bernard's soliloquy has moved away from the language of the Hegelian dialectic. He recognises that there exists no 'essential' or 'actual' self (Hegel [1807] 2001: 635), but rather 'a new assembly of elements' (Woolf 1931: 279) in which the borders between selves and voices disintegrate but in which difference is not flattened into homogeneity. Bernard and Woolf thus craft 'unity out of multiplicity' (Woolf 1938: 143). This 'new assembly', both one and multiple, is the multiplicity of the wolf (pack) and of the 'Virginia Woolfs' (Deleuze and Guattari 1987: 239). Monaco understands the last episode of *The Waves* in precisely this way, for, as she affirms, 'it submerges all duality in the univocal substance of narrative. . . . Bernard is paramount in this process in which everything becomes what it is not, and yet to acknowledge this, is a creative act in itself' (Monaco 2008: 183).

In this last episode of *The Waves*, Bernard comes to understand the 'savage', the 'old man in' the 'ditch' whom he has upheld as his 'radical other', as part of his network of enfolding self-differentiation:

> He now holds a glass of fine old brandy in his paw. He brindles, purrs and shoots warm thrills all down my spine as I sip. It is true, he washes his hands before dinner, but they are still hairy. He buttons on trousers and waistcoats, but they contain the same organs. He jibs if I keep him waiting for dinner. He mops and mows perpetually pointing with his half-idiot gestures of greed and covetousness at what he desires. I assure you, I have great difficulty sometimes in controlling him. (Woolf 1931: 290)

While Bernard initially imagined the 'savage' as someone distinct from his class and from himself, he recognises that no distinguishing boundaries exist between him and the other voices in the text or even between him and the imagined 'savage'. Bernard has savage-ised the 'savage' just as he has 'orientalised the Orient', and, in so doing, he has upheld the rhetoric of fear that is the foundation of imperialism. But Bernard's insight here corrects the imperialist and psychoanalytical idea (exemplified, for instance, in *Totem and Taboo*) of desire supposedly created through lack, which must then be repressed, exorcised from a community, in order to contain the 'barbarous' and to protect the metropolis from contagion. In this passage, Woolf uncovers this rhetoric with the direct acknowledgement of 'desire' and 'control'. As Deleuze and Guattari affirm, the only thing lacking in desire is the subject, and when desire is not captured and overcoded by control,

becomings occur: when desire is no longer 'repressed', becomings-otherwise transform the subject. Thus, the 'savage' can be situated on a plane of consistency out of which differentiation can be actualised, and Bernard's moment of being (or worlding) is a node of virtuality that activates a new assemblage of subjectivity. Moreover, this connection is precisely ethical, in the Spinozian sense, and might be understood alongside Simone Bignall's arguments in 'Affective Assemblages: Ethics Beyond Enjoyment', in which she argues 'that aspects of Deleuzian philosophy privilege a certain idea of careful sociability, which expands the realm of practical ethics . . . to include unmediated qualities of interpersonal relationship as defining aspects of political and ethical life' (Bignall 2010: 79). It is this sort of ethical politics that Woolf gestures towards at the conclusion of *The Waves* when Bernard opens himself outwards in a connection with the 'savage' and, in so doing, creates new possibilities for community and subjectivity.

Moments of being are inherently temporal, thus Bernard's connection with the radical 'other' occurs necessarily in and through what Henri Bergson calls *durée*. In the durational moment of being when Bernard connects with the 'savage' and, in so doing, creates a radical community, Bernard escapes his previously limited, quantitative mindset. He stops counting and categorising and instead experiences a qualitative, narrative vision. Duration (and durational difference) for Woolf, Bergson and Deleuze is a qualitative concept; thus, Bernard's selves are not measurable and categorical but immeasurable and unable to be categorised. He states:

> Immeasurably receptive, holding everything, trembling with fullness, yet clear, contained – so my being seems . . . . It lies deep, tideless, immune, now that he is dead, the man I called 'Bernard,' the man who kept a book in his pocket in which he made notes. (Woolf 1931: 291)

Bernard recognises the self that he had previously imagined, a complete person in possession of Being, a singular 'self', to be a false version, a limitation. Furthermore, Bernard revises his earlier 'unknown quantities' (Woolf 1931: 118) to 'immeasurab[ility]', and the language here proves Bernard has abandoned his quantitative outlook for a qualitative one.

It is no surprise, then, that Bernard also releases his notebook, letting it and all it symbolised (categorisation, linked phrases, representative writing, and so forth) drop to the floor. Bernard instead wishes to move beyond representative language and to communicate more fully, more truthfully: 'I need a howl; a cry', he says. 'When the storm crosses the marsh and sweeps over me where I lie in the ditch unregarded. I need

no words. Nothing neat. None of those resonances… false phrases. I have done with phrases' (Woolf 1931: 295). Not only does Bernard tell us he is done crafting 'false phrases' – part of his linguistic and epistemic violence as author-figure – but he also assembles in a moment of being with the 'old man in' the 'ditch' without naming him, and in this moment, desire moves freely and Bernard no longer even attempts (or comments on the attempt) to repress it. In this way, the linguistic separation of the earlier 'He squats in me' (289) dissolves. There exists no distinction between 'he' and 'me' in this later passage, where the man formerly known as Bernard 'lie[s] in the ditch'. This moment of being remains inconclusive to the extent that these moments by necessity are only momentary, not total or complete. To understand them thus would be to miss the point, to relegate becoming(s) to a teleology. Importantly, *The Waves* concludes at the side of permeable borders where '*the waves broke on the shore*' (297), the point of potentialisation where ever more ethical formations of subjectivity are made possible in ever new configurations of community: becomings enable through desire. In an openness with the world, then, Bernard shows us the way into a being in the world that is not founded on the borders between self and other or of nation and colony but instead gestures towards the ways in which we might more ethically assemble in time as well as in space in a community of difference.

Notes

1. Writing of *The Waves*, then conceived as *The Moths*, on 28 November 1928, Woolf writes, 'The idea has come to me that what I want now to do is to saturate every atom' (Woolf 1980: 209). Deleuze and Guattari quote this entry when discussing worlding (Deleuze and Guattari 1987: 280).
2. North most clearly articulates this point in *The Years*:

   > They're all afraid; afraid of being laughed at; afraid of giving themselves away.… We're all afraid of each other, he thought; afraid of what? Of criticism; of laughter; of people who think differently… That's what separates us; fear. (Woolf 1937: 414)

3. Robinson and Tormey (2010: 20) list thinkers Uday Singh Mehta, Achille Mbembe and Arjun Appadurai.
4. On this point see Rohman 2011; Monaco 2008: 177–9.
5. Deleuze discusses the difference between the 'whole' and the 'set' in particular relation to Bergson's notions of the 'open' and the 'closed' (most directly formulated in *The Two Sources of Morality and Religion*). While the set is closed, 'the whole', according to Deleuze,

   > is of a different nature, it relates to time: it ranges over all sets of things, and it's precisely what stops them completely fulfilling their own tendency to become completely closed. Bergson's always saying that Time is the Open, is what changes – is constantly changing in nature – each moment. (Deleuze 1995: 55)

6. See also Ruth Porritt's useful analysis of how the 'sense of "I" is cast into doubt' in *The Waves* in her article, 'Surpassing Derrida's Deconstructed Self: Virginia Woolf's Poetic Disarticulation of the Self' (1992: 327). Porritt examines the increasing repetitions of 'I' in the novel as the six voices age:

   > As the sound or voice of 'I' begins to stand starkly alone, the signifier is loosened from the signified. . . . The word 'I' is becoming fragmented and dispersed in its meaning. . . . Did 'I' ever actually carry a message of self-identity, a message of self-presence? (Porritt 1992: 328)

   Notably, Woolf's conception of the self differs from Derrida's, which is one of the reasons that limiting Woolf to a Derridean framework is unsatisfying. Derrida's conception of difference remains Hegelian: difference is always 'outside'. Thus, it is no surprise that Porritt finds *The Waves* 'surpassing' Derridean theory. She concludes: 'The success of the individual voice implies the language and values shared by "We." A self is not an entity in its own right, but what exists in relationship with others' (Porritt 1992: 334).
7. See Woolf 1984: 202, 248–9 for an account of Woolf's meeting with Freud in January and beginning to read his work in December. Abel provides an insightful discussion of Woolf's reaction to the psychoanalytic debates surrounding Freud's work in the 1920s. Although, as Abel makes clear, Woolf claims not to have read Freud until 1939 (Abel 1989: 14), she did, at least, remark on the proofs of his *Introductory Lectures* in a letter to Molly McCarthy, dated 2 October 1924 (18–19).
8. As Anne McClintock writes,

   > Central to the idea of degeneration was the idea of contagion (the communication of disease, by touching, from body to body), and central to the idea of contagion was the peculiarly Victorian paranoia about boundary order . . . The poetics of contagion justified a politics of exclusion. (McClintock 1995: 47)

   McClintock's argument, of course, takes a cue from Foucault's study of the ways in which leper colonies were historically replaced by houses of confinement for the mad (*Madness and Civilization*) and how these sites of confinement were also part of the imperial and capitalistic structures of 'civilisation' (McClintock 1995: 47).
9. 'Virginia Woolfs' has been changed to 'Virginia Woolf' in Continuum's 2004 edition of *A Thousand Plateaus*; I have kept the plural here, as it playfully expresses the deterritorialisation of the proper name and the multiplicity of subjectivity. Deleuze and Guattari's points on the one and multiple are obviously taken, also, from a reading of Bergson:

   > In Bergson there is a distinction between numerical or extended multiplicities and qualitative or durational multiplicities. We are doing approximately the same thing when we distinguish between arborescent multiplicities and rhizomatic multiplicities. Between macro- and micromultiplicities. On the one hand, multiplicities that are extensive, divisible, and molar; unifiable, totalizable, organizable; conscious or preconscious – and on the other hand, libidinal, unconscious, molecular, intensive multiplicities composed of particles that do not divide without changing in nature, and distances that do not vary without entering another multiplicity and that constantly construct and dismantle themselves in the course of their communications, as they cross over into each other at, beyond, or before a certain threshold. (Deleuze and Guattari 1987: 33)

   See also Deleuze's discussion of the unified multiplicity of duration in *Bergsonism* (1988: 37–43, 76–92).

10. Hegel writes of the process of recognition in *Phenomenology of Spirit* as a dual and mutual system of othering – between master and slave and also between artisan and the crafted object – which induces a 'pure abstraction of being-for-self' (Hegel [1807] 2001: 632). Yet no mutual overcoming of contradiction (the highest stage of difference for Hegel) exists between the voices in *The Waves*. Bernard's language seems Hegelian, but the novel disallows Hegelian synthesis (a negation of the initial negation) because Woolf's project moves beyond the sort of representation or reflection that, according to Hegel, creates consolidated subjectivity. As Neville states earlier in the novel, Bernard has crafted these other voices with his writing and has attempted a 'being-for-self' like that of the Hegelian artisan or worker. Bernard believes that he has come to a greater understanding, a synthesis of lives that evades other characters in Woolf's novels or comes too briefly, too momentarily, to be considered as more than a *moment* of being. Perhaps, Bernard's 'overcoming' here results from his role as author-voice. While his attempted 'synthesis' is beautiful and even moving, an inherent violence exists in such a statement. He does not say that these voices are inextricably linked (as in a network or assemblage, which of course, the book is), but that 'I am you' – *subject*, verb, *object* – a representation or reflection of himself as his (crafted) characters.

Entering Deleuze's Political Vision

Nicholas Tampio Fordham University

Abstract

How can Deleuzians make his philosophy as accessible as possible to political theorists and democratic publics? This essay provides principles to enter Deleuze's political vision, namely, to research the etymology of words, to discover the image beneath concepts, to diagram schemata using rigid lines, supple lines and lines of flight, and to construct rules that balance experimentation and caution. The essay then employs this method to explicate a fecund sentence about politics in *A Thousand Plateaus* and presents a case why Deleuze deserves greater visibility in the political theory canon.

Keywords: A Thousand Plateaus, Deleuze, democracy, philosophy, politics, vision

The task of political philosophy – according to Sheldon Wolin in his classic text, *Politics and Vision* – is to 'fashion a political cosmos out of political chaos' (Wolin 2004: 9). Many of the great statements of political philosophy arise in times of crisis, that is, when old paradigms and institutions have been shattered – for instance, in post-war Europe (Reggio 2007). A political philosopher advances a political metaphysics that includes categories of time, space, reality and energy; he or she describes what exists, but, more importantly, illuminates 'tantalizing possibilities' to inspire the formation of a better world (Wolin 2004: 20). A political philosopher may have a method, that is, a step-by-step procedure for initiates to arrive at predetermined destinations, but what gives a political philosophy richness is 'extra-scientific considerations', that is, knowledge of literature, cinema, religion, metaphysics, scientific

developments in other fields of inquiry, and the history of ideas (Wolin 1969). A political philosopher participates in a tradition of discourse, an ongoing conversation about how to order collective human life. And yet a great political philosopher innovates, that is, expresses a vision that no one has seen before, in the same way that Van Gogh's paintings have changed how many of us view sunflowers or starry nights. At the beginning of the twenty-first century, it seems, we need a new epochal political theory to make sense of our fast-paced, interconnected world in which multiple constituencies interact on many registers of being (Connolly 2002).

Deleuze may be becoming 'our Kant', that is, the philosopher who orients contemporary discussions of epistemology, metaphysics, ethics, politics and aesthetics in the same way that Kant dominated those discussions in the high Enlightenment (Protevi 2001: 6–7; see also Negri 1995: 108). Take Deleuze's magnus opus, *A Thousand Plateaus*.[1] The book constructs a stunning array of concepts to redescribe political time ('the geology of morals'), political space ('smooth' and 'striated', 'territory', 'earth' and 'the Natal'), political bodies ('assemblages', 'rhizomes', 'bodies without organs', 'multiplicities', 'apparatuses of capture' and 'war machines') and political energy ('macro- and micropolitics'). On the one hand, the book displays Deleuze's apprenticeship in the history of philosophy, with concepts recast from Hume, Kant, Leibniz, Bergson, Nietzsche and others (Jones and Roffe 2009). On the other, Deleuze presents a singular vision that seems to accomplish the mission he assigned transcendental philosophy in *Difference and Repetition*: to explore the upper and lower reaches of this world, that is, the mysterious factors that influence politics but that elude traditional categories of political science (Deleuze 1994: 135). For many leftist political theorists and activists today, Deleuze provides the impetus to replace or reformulate Marxist–Leninist and liberal–republican paradigms (Svirsky 2010).

Anyone who has read or taught *A Thousand Plateaus* knows, however, that the entry cost to glimpsing Deleuze's political vision is high. Consider, for example, Ian Buchanan's 'preliminary guide for how to get started' reading the first volume of *Capitalism and Schizophrenia*: *Anti-Oedipus* (Buchanan 2008: 152). Buchanan recommends that newcomers to that book examine Deleuze's earlier work (particularly *Difference and Repetition*, *The Logic of Sense*, *Empiricism and Subjectivity*, *Nietzsche and Philosophy*, *Dialogues* and *Negotiations*), study the classic texts of psychoanalysis (including by Freud, Lacan, Bettelheim, Klein and Reich), master the literature on

historical materialism (including books by Foucault, Sartre, Fanon and Turner) and peruse the referenced literary sources (including by Artaud, Lawrence, Proust, Beckett, Büchner, Nerval and Butler). Presumably, once one has accomplished this task, then one may begin to tackle the imposing secondary literatures addressed in *A Thousand Plateaus* on geology, linguistics, politics, aesthetics and (a thousand?) other topics. To be sure, great philosophers always demand time and effort and generate multifaceted research projects. Given that Deleuze envisioned his philosophy as an 'open system', whereby 'concepts relate to circumstances rather than essences', Deleuze scholars may rightly rejoice at all the myriad directions contemporary Deleuzians may explore (Deleuze 2005: 32). Yet setting the intellectual bar to entering Deleuze's political vision too high may confirm the accusation that Deleuze is a 'highly elitist author, indifferent toward politics' (Žižek 2003: 20). Is there a way to make Deleuze's 'grand style' (Olkowski 2011) more accessible without compromising its intellectual rigour or precision? May one democratise Deleuze's esoteric or hermetic passages, as it were, without collapsing into common sense?[2]

One of the more surprising remarks that Deleuze made in an interview about *A Thousand Plateaus* – a book in which one protagonist, Professor Challenger, empties a lecture hall (Deleuze and Guattari 1987: 64) – is that he wants to forge alliances with like-minded people:

> The question that interests us in relation to *A Thousand Plateaus* is whether there are any resonances, common ground, with what other writers, musicians, painters, philosophers, and sociologists are doing or trying to do, from which we can all derive greater strength or confidence. (Deleuze 2005: 27)[3]

Deleuze was indifferent, though not necessarily hostile, to many features of democratic politics as traditionally understood, including governance by the majority and the rule of public opinion (Patton 2010a: 161–84). Yet Deleuze declared himself a leftist (*homme de gauche*) and envisioned a left composed of an 'aggregate of processes of minoritarian becomings' in which everybody has some hand in governance though no one easily identifiable group (majority) dominates (Deleuze and Parnet 1996; see also Tampio 2009). Deleuze saw *A Thousand Plateaus* as a work of left political philosophy and wanted his book to be comprehensible to a wide array of people (each of whom is plied by difference and does not fit neatly into categories that define a majority). Deleuze did not think or desire his work to be easily accessible to currently existing mass populations, but he also did not envision himself as a beautiful soul who

cared about his own salvation rather than the well-being of society.[4] The question remains, though, how can Deleuzians advance the project of identifying or making common ground with an array of intellectuals and activists to enact concrete change? How can one make *A Thousand Plateaus* as easy to understand as possible while still honouring Deleuze's vision in all its singularity and complexity and injunctions to use it as a toolbox rather than as a package containing a settled meaning (Buchanan 2000)?

This essay proposes a handful of principles to facilitate entering Deleuze's political vision. Initially, I offer several rules of thumb that make Deleuze's political theory comprehensible with little more than a good dictionary and sketchpad. To extract these rules I plumb Deleuze's writings on Hume, Nietzsche and Bergson, as well as his books written in his own voice; and, once again, I emphasise that Deleuze's political theory 'ceaselessly establishes connections between semiotic chains, organizations of power, and circumstances relative to the arts, sciences, and social struggles' (Deleuze and Guattari 1987: 7). Deleuze's philosophy is an intricate, plastic and porous system that demands both careful study and receptivity to developments in philosophy, art, science and politics.[5] There is no royal road to Deleuzian political philosophy: but there are straighter ones. To substantiate this point, I explicate a sentence that contains an important political teaching of *A Thousand Plateaus*. The aim is not to simplify the Deleuzian 'abstract machine', or conceptual system, but to present a way to diagram the machinery so that others may more readily plug into it. I conclude by explaining why Deleuze deserves a more prominent place in the academic political theory canon.

I. The Political Vision of *A Thousand Plateaus*

> To comprehend *what is* is the task of philosophy, for *what is* is reason. As far as the individual is concerned, each individual is in any case a *child of his time*; thus philosophy, too, is *its own time comprehended in thoughts*. (Hegel 1991: 21)

A Thousand Plateaus may be the philosophical work that best captures our time in thought. Such a statement must immediately be qualified. Deleuze's entire philosophical corpus evades and opposes the Hegelian account of the phenomenology of spirit (Hardt 1993; Widder 2008). Each chapter title of *A Thousand Plateaus* has a date, but the dates are not arranged sequentially, thus subverting any attempt to find a

historical metanarrative that explains humanity's roots or *telos*. Deleuze prefers to view history stratographically, rather than chronologically, meaning that 'luminous points', physical or noetic, from the past may rise up to enrich or disrupt the present (Deleuze and Guattari 1994: 59; see also Lampert 2006). Yet our time expresses its own singularity, both because of political, economic, technological and social changes from earlier milieus – such as the collapse of the Soviet Union, the accelerated construction of global markets, the emergence of the Internet, and the growing consensus in favour of treating men and women as equals – as well as because the historical archive has a renewed vitality in our age. Today, we can travel the world quickly in thought and extension and thus take an interest in the history of humanity, religion, science, music, mathematics, the state, capitalism and other topics discussed in *A Thousand Plateaus*. Such investigations are spurred by curiosity, but also by a practical conviction that we have a much broader palette of ideas and practices than heretofore to paint, in words and deeds, our time. In this essay, I indicate why Deleuze may be the philosopher who best expresses the spirit of the age, though a fuller defence of his paradigm will require the sustained effort of Deleuzian political theorists to show its timeliness.

A Thousand Plateaus stretches the Greek definition of politics as *ta politika*, that which happens in a *polis*, or city. Take the sentence: 'everything is political, but every politics is simultaneously a *macropolitics* and a *micropolitics*' (Deleuze and Guattari 1987: 213). Most political scientists view politics as 'who gets what, when, and how' (Lasswell 1936). Deleuze differs from most political scientists by refusing to privilege human rational actors as the main or sole actants in the political realm as well as by attributing primary motivation to sub-representational desires rather than self-conscious interests. Political scientists may enter Deleuze's terminology by distinguishing levels of analysis, from state policies and elections to public opinion and political psychology. But that entry point may misrepresent the elusive and mysterious features of the micropolitical that Deleuze wants to illuminate. Deleuze views the political, in terminology he primarily used in the late 1960s, as an Idea. An Idea is a 'virtual multiplicity' defined by 'differential relations' and 'concomitant singularities' (Deleuze 2004: 100). Like a Platonic Idea, the Deleuzian Idea transcends the actual world that we perceive with our naked eyes and helps structure, or pilot, those things that we see and touch. Deleuze's Idea, though, is Dionysian, or wild, combating every effort to place an Apollonian, or static, framework upon it (Deleuze 2004: 101; see also Smith 2012: 106–21).

In the defence of his *doctorat d'État*, published as 'The Method of Dramatization', Deleuze uses terms that are both philosophic and poetic to describe the elusive forces that press us to think anew: Ideas inhabit 'a zone of obscure distinction' that generates more stable concepts and things, but Ideas also have an intrinsic power to overturn established orders (Deleuze 2004: 101). Like Hannah Arendt, Deleuze celebrates the political as the site of natality, the capacity to give birth to something new (Arendt 1998). Deleuze differs from Arendt, though, through his astonishing statement that everything – not just humans in their civic or personal roles – is political. Deleuze stretches and deepens the field that political theorists may investigate to determine how we – now including the trans- and non-human – do and ought to live together in the universe.[6]

So is it proper to describe *A Thousand Plateaus* as a work of political philosophy or political theory? Political philosophy, in academic political science departments, often refers to the quest 'to replace opinion about the nature of political things by knowledge of the nature of political things' (Strauss 1989: 5). Deleuze does not endorse Platonic metaphysics or its accompanying elitist politics, but given his extensive reflections on the nature of philosophy, we may still consider the possibility that he is a political philosopher. In the 1960s, Sheldon Wolin argued for a type of political philosophy – subsequently called political theory – that privileges the exercise of the imagination over reason. In this respect, Deleuze – whose first book, *Empiricism and Subjectivity*, dedicates a chapter to the power of the imagination in ethics and knowledge – would probably call himself a political theorist. But does this term connote a dualism – between theory and practice, or possible and real experience – that Deleuze sought to overcome (Smith 2012: 89–105)? *Theoria*, in Greek, means 'a looking at' (from *thea* 'a view' + *horan* 'to see'); *praxis*, from the Greek *prattein* 'to do', means 'action'. Theory, put simply, is what we do with our eyes and practice is what we do with our hands. The Platonic tradition tries to maintain a sharp distinction between these two activities. Deleuze recasts this dualism rather than discards it entirely. In an interview with Michel Foucault called 'Intellectuals and Power', Deleuze explains:

> The relationships between theory and practice are [...] partial and fragmentary. On one side, a theory is always local and related to a limited field, and it is applied in another sphere, more or less distant from it [...] Practice is a set of relays from one theoretical point to another, and theory is a relay from one practice to another. No theory can develop without eventually

> encountering a wall, and practice is necessary for piercing this wall. (Foucault 1977: 206)[7]

For Deleuze, it is senseless to talk of disembodied philosophising. We always inhabit bodies that interact with other bodies in concrete physical locations. Nerves connect our eyes and hands, and skin is porous. There is an open circuit linking the images in our eyes, concepts in our brains, sensations on our fingertips, and actions of other bodies.[8] And yet, Deleuze insists, the relationship between sensibility and thinking is asymmetrical, meaning that there is always a disjunction between Ideas and concepts, on one side, and actuality on the other. Corporeal practices can jolt thinking, but they cannot determine it. Conversely, Ideas and concepts can prompt action that transforms the political sphere, but there is always friction in the transition from theory to practice. Deleuzian political theory is a sort of practice insofar as it enriches our vision of political possibilities and inspires us to work toward goals that would otherwise have remained occluded or unimagined.

II. How to Enter Deleuze's Political Vision

Let us now propose a few rules, extracted from years of reading and teaching *A Thousand Plateaus*, to facilitate a deeper comprehension of its political vision.

First Rule: Track Etymology

A philosopher masters concepts in the same way that a painter masters percepts or an author masters affects (Deleuze and Guattari 1994). Deleuze's method minimises as far as possible 'typographical, lexical, or syntactic creations' (Deleuze and Guattari 1987: 22). Deleuze's language is both strange and familiar.[9] How? In his *Introduction to Kant's Anthropology*, Foucault notes that Romance languages follow 'the secret law of a Latinity [. . .] which serves to guarantee the intrinsic exchange value of what is said' (Foucault 2008: 98). If one uses a dictionary to find the etymology of Deleuze's concepts in *A Thousand Plateaus*, one almost inevitably finds a Latin, Greek and/or Indo-European root. One of the key concepts of *A Thousand Plateaus*, for instance, territory (*territoire*) – and its cognates territorialisation and deterritorialisation – emerges from both 'earth, land' (*terra*) and 'to terrorise' (*terrere*) (Connolly 1995: xxii).[10]

Why does Deleuze say that 'etymology is like a specifically philosophical athleticism' (Deleuze and Guattari 1994: 8) or that we learn to think in dictionaries (Deleuze 2005: 165)? Clearly, a philosopher must master the art of thinking and concepts are the basic thought units that enable us to mentally grasp the sensible. Intuitions without concepts are blind: to see with our minds, we need to have a reservoir of concepts. The purpose of Deleuze's earliest philosophical monographs is precisely to practise using mental tools and weapons that he can redeploy in his own philosophy (Deleuze 2005: xv). Reading a dictionary does not suffice to think new thoughts, but it is crucial exercise in a philosophical apprenticeship.

In addition, studying etymology lets you recover a language before Christianity 'ruined the Roman preservation of the Greek enlightenment' (Lampert 1996: 174). When Deleuze uses an ordinary word 'filled with harmonics so distant that it risks being imperceptible to a nonphilosophical ear' (Deleuze and Guattari 1994: 8) he is taking up the project of the Nietzschean Enlightenment: to resituate the accomplishments of the 'West' upon an Epicurean, rather than a Platonic, metaphysical foundation (Lampert 1996: 166–86). 'The untimely is attained in relation to the most distant past, by the reversal of Platonism' – and the way to do that is to use words in a sense before they were overcoded by democratic Platonism, or Christianity (Deleuze 1990: 265). In sum, Deleuze, like Nietzsche, thinks the art of etymology empowers one to think clearly and in a way that circumvents, at least in part, the Christian inheritance (Nietzsche 2007: 34).

Second Rule: Find Images

Let us dwell more on why etymology helps clarify thinking. One of the surprising features of researching the etymology for concepts in Deleuze's most abstract, dense passages is that virtually all of them have a root in a concrete object. 'Art thinks no less than philosophy, but it thinks through affects and percepts' (Deleuze and Guattari 1994: 66). Hegel drew a sharp line between concepts and percepts: 'in *thinking*, the object does not present itself in picture-thoughts but in *Notions*, i.e. in a distinct *being-in-itself*' (Hegel 1977: 120). According to the Hegelian narrative of the history of philosophy, primitives (such as the Egyptians) thought in terms of images and sculptures, whereas the march of self-consciousness is defined by its abstraction into concepts or Notions.

Deleuze, on this front as on many others, opposes Hegel's effect on philosophy. This is how Deleuze advises a fellow philosopher:

> In the analysis of concepts, it is always better to begin with extremely simple, concrete situations, not with philosophical antecedents, *not even with problems* as such (the one and the multiple, etc.). Take multiplicities, for example. You want to begin with questions such as what is a *pack*? [...] I have only one thing to tell you: stick to the concrete, and always return to it. (Deleuze 2006: 362–3)

Deleuze, like many of the canonical figures in the history of political philosophy, 'sticks to the concrete', even if the concrete today differs from that of earlier eras.[11]

Deleuze's defence of picture-thinking goes back at least to his reading of Hume. In *A Treatise of Human Nature*, Hume extols Berkeley's idea that 'all general ideas are nothing but particular ones, annex'd to a certain term, which gives them a more extensive signification, and makes them recall upon occasion other individuals, which are similar to them' (Hume 2000: 17). Abstract ideas always bear the trace of a sensation or impression: 'the image in the mind is only that of a particular object, tho' the application of our reasoning be the same, as if it were universal' (Hume 2000: 18). Thinking cannot be reduced to sensations given to us: Deleuze and arguably even Hume himself recognise that the mind imposes conceptual casting upon the raw material of sensation (Kerslake 2009: 4). Yet Deleuze shared Hume's suspicion of a priori theorising and thought that it led to duplicity or confusion. That is why Deleuze opens the English translation of *Dialogues* by declaring that he has always been an empiricist, committed to tracing 'concepts from the lines that compose multiplicities' (Deleuze and Parnet 2007: viii).

Finding the image, though, does not mean sticking to the banal. Hume's example of returning to the everyday, famously, is playing a game of backgammon (Hume 2000: 175). Deleuze calls his project *transcendental* empiricism, however, to suggest that we need to experiment with our philosophical studies and corporeal practices to open the aperture through which we receive the world. "'Transcendental empiricism" is a kind of cognition that violates the normal rules of experience, yet nevertheless attains a "superior" realisation of sensation, imagination and thought' (Kerslake 2009: 26; see also Colebrook 2002: 69–89). Deleuze is an empiricist, but he resists the attempts to domesticate the faculties through the doctrines of good and common sense. To visualise the strange, we may need to employ intellectual and

visceral techniques on our singular and collective bodies (see Connolly 2002: 80–113).

Third Rule: Diagram Schemata

A Thousand Plateaus uses the method of 'stratoanalysis' (Deleuze and Guattari 1987: 22). Stratum is from the Latin *stratum* 'layer' (and the Indo-European base **stre-to-* 'to stretch'); analysis is from the Greek *analysis* 'break up, unfastening'. Stratoanalysis means to diagram the layers, sides and components of a body. Deleuze wrote his book on Francis Bacon with reproductions of the paintings in front of him (Smith 2005: xi). One helpful exercise when reading Deleuze's texts is to reverse this project: to diagram their conceptual arrangements, or schemata.[12]

In *What Is Philosophy?* Deleuze advises philosophers to master 'the art of the portrait':

> It is not a matter of 'making lifelike', that is, of repeating what a philosopher said but rather of producing resemblance by separating out both the plane of immanence he instituted and the new concepts he created. These are mental, noetic, and machinic portraits. Although they are usually created with philosophical tools, they can also be produced aesthetically. (Deleuze and Guattari 1994: 55)

A 'noetic' portrait – from Greek *nous* 'mind' – represents the structure and content, the bones and flesh, of a philosophical argument. We need to grasp a philosophical argument with our minds; but we can also use our hands and eyes to make the argument more intuitive.

Take, for example, the paragraph from *A Thousand Plateaus* that opens: 'Let us consider the three great strata concerning us, in other words, the ones that most directly bind us: the organism, signifiance, and subjectification' (Deleuze and Guattari 1987: 159). One way to diagram this argument is to draw a circle with a compass, lifting the head frequently to convey 'the principles of connection and heterogeneity' that makes all borders in the universe porous (Deleuze and Guattari 1987: 7). Then, with a ruler, one may draw lines to make three strata, which may be labelled organism (body), signifiance (soul) and subjectification. And yet, the purpose of this paragraph is to draw attention to the side of the body (the one facing the pole of scission) that fluctuates and decomposes.[13] We may then make one side of our circle more perforated, with lines of flight fleeing this side of the body, and label the strata disarticulation, experimentation and nomadism (Figure 1). There is much more work to do to make this paragraph comprehensible

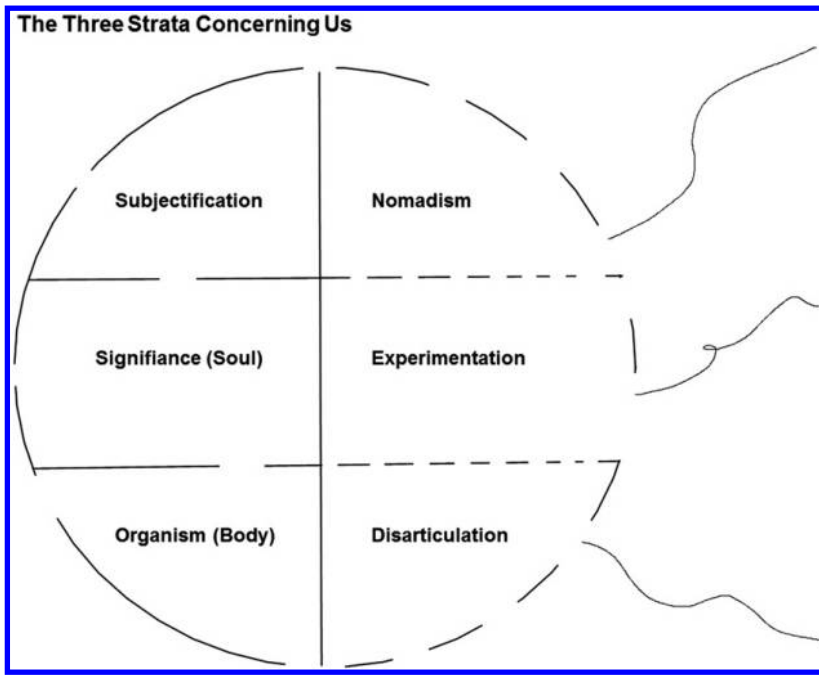

Figure 1. A diagram of the schema for *A Thousand Plateaus* (Deleuze and Guattari 1987: 159–60).

or usable: but we can begin to appreciate the Apollonian (and not just Dionysian) features of Deleuzian political theory.

This strategy also gives us a clue to why Deleuze calls his philosophy a 'constructivism' in *What Is Philosophy?* Like Kant in the *Critique of Pure Reason*, Deleuze thinks that philosophers can gain insight from mathematicians about how to construct concepts, objects and figures. What makes Deleuze a Kantian is his recognition that *we* draw the lines that define our concepts and mental representations of reality. Yet, in his practical philosophy, Kant thinks that *pure* practical reason lays the ground for the object of our striving (the 'realm of ends'), whereas Deleuze agrees with Hume that imagination is the key faculty of ethical and political thinking (Deleuze 1991: 55–72). The significance of this fact, for us, is that each of us may draw or fill in the schema with our own impure content. Just as there are no straight lines in nature, so too there are no straight lines in Deleuzian schemata (a wooden, plastic or metal ruler always has tiny divots). That is why Deleuze recommends cartography rather than decalcomania, map-making rather

than tracing: because any such drawing (one circle, two sides, three strata) is a provisional start to practical reflection or experimentation (Deleuze and Guattari 1987: 12).

Fourth Rule: Construct Theories

A norm is an ought-claim; it is also, etymologically, a 'carpenter's square' (Latin *norma*; Greek *gnomon*). By diagramming Deleuze's arguments, we begin to see that he is a profoundly normative thinker when he asks how we ought to draw the lines that compose our individual and collective bodies (see also Jun 2009). 'How do you make yourself a Body without Organs?' – the title of Plateau Number 6 – could also be restated: how ought we balance the side of our bodies that tend towards order with the side that opens up onto difference? An ethical question: how do I experience the heightened sensations afforded by drugs without self-destructing or contributing to social violence (Connolly 1999: 97–114)? A political question: how do we delimit the identity and borders of Europe or North America in conditions of globalisation (Braidotti 2006)? Once we attend to the normative dimension of *A Thousand Plateaus*, we begin to see a pattern of injunctions.

First, map or diagram the body of which we are composed. Deleuze speaks of 'territories and deterritorializations measured with the craft of a surveyor' (Deleuze and Guattari 1987: 160). Political theorists ought to avail themselves of empirical research produced by political scientists using techniques such as multiple linear regression, as well as relevant scholarship produced by sociologists, historians and economists.

Next, chisel the borders that delimit our identities. 'It is an inevitable exercise' for humans who must breathe, eat, defecate and perform other activities that involve taking or releasing things into and out of our bodies (Deleuze and Guattari 1987: 149). But it is also a political question par excellence: how do we define our ethical and political subjectivities? What historical material do we want schools to teach or not teach? With what countries, international organisations and foreign political parties do we want to forge alliances? What bodies threaten our integrity or amplify our joy? Deleuze's criteria for addressing these questions are Spinozist: 'life and death, youth and old age, sadness and joy' (Deleuze and Guattari 1987: 151). Sadness and joy diminish or increase the power of a body; thus, evaluative criteria always shift depending on the body and the forces that act upon it: 'each individual's pleasure or pain differs from the pleasure or pain of another to the

extent that the nature or essence of the one also differs from that of the other' (Spinoza 2002: 309). There is no a priori answer to the question of how to draw or puncture the lines that define us: so we need to experiment. And the sensibility of *A Thousand Plateaus* – though more sober than *Anti-Oedipus* (Holland 1999; Buchanan 2008) – is that we need to experiment more aggressively: 'Let's go further still' (Deleuze and Guattari 1987: 151).

Yet Deleuze also recommends the 'art of caution' to ensure that we do not experiment recklessly. 'You don't do it with a sledgehammer, you use a very fine file. You invent self-destructions that have nothing to do with the death drive' (Deleuze and Guattari 1987: 160). Philosophy, for Deleuze, may be about exploring the powerful and mysterious forces above and below the level of perception (the molecular), but *political* philosophy means translating these insights into concrete practice: 'molecular escapes and movements would be nothing if they did not return to the molar organizations to reshuffle their segments' (Deleuze and Guattari 1987: 216–17).

In an article on 'Dramatization as Method in Political Theory', Iain Mackenzie and Robert Porter detail the provisional and experimental procedure that Deleuze recommends for constructing concepts and principles. 'Dramatization is a method aimed at determining the dynamic nature of political concepts by "bringing them to life", in the way that dramatic performances can bring to life the characters and themes of a play script' (Mackenzie and Porter 2011: 482). A philosopher performs the role of screenwriter and director, issuing prompts on what to think as one goes through a text. But the text itself does not come alive unless the reader invests his or her own thoughts, interests and desires into it. Deleuze's philosophy has a systematic character that rewards determining how the parts fit together. Deleuze viewed his writing as an egg in which concepts and themes shoot off into every direction and yet reunite into a whole (Deleuze 2005: 14). At the same time, Deleuze encourages his readers to experiment with the concepts, looking for new ways to use them and to enlarge the stock of concepts. 'In political theory, dramatization as method requires that we stage new relations within and between the concepts that animate politics in order to express the indeterminate yet endlessly provocative nature of the Idea of the political' (Mackenzie and Porter 2011: 494). This process combines intellectual, aesthetic and practical faculties: no two people will dramatise a political theory the exact same way. Still, a political theory can provide a useful function by outlining a 'realistic utopia' towards which political bodies can strive (Patton 2010a: 185–210).

III. A Political Aphorism

> An aphorism, properly stamped and moulded, has not been 'deciphered' just because it has been read out; on the contrary, this is just the beginning of its proper *interpretation*, for this, an art of interpretation is needed. (Nietzsche 2007: 9)

There is a difference between how philosophers exposit their ideas (*Darstellung*) and how they formulate them (*Forschung*) (Hardt 1993: 87). I have been articulating an 'art of interpretation' that enables us to see a pattern, a refrain, in many of Deleuze's key political arguments; in this section, I employ this art to decipher a remarkable political theoretical statement in *A Thousand Plateaus*. This analysis reveals more of the steps (the *Forschung*) than may be necessary for most Deleuze commentary or application. But my hope is that this procedure will help us understand and explain to others – who may be on the fence about whether to invest time and energy in the Deleuzian venture – the power and appeal of Deleuze's vision.The aphorism addresses the question: how you do make yourself a body without organs? Or, how does one, as a political actor, maximise joy and minimise sadness (cf. Deleuze 1988: 28)?

> This is how it should be done: Lodge yourself on a stratum, experiment with the opportunities it offers, find an advantageous place on it, find potential movements of deterritorialization, possible lines of flight, experience them, produce flow conjunctions here and there, try out continuums of intensities segment by segment, have a small plot of new land at all times. (Deleuze and Guattari 1987: 161)

The image that informs the title of *A Thousand Plateaus* may be 'the landscape of Limousin, specifically the Millevaches plateau [Deleuze] could see from the windows of his house at Saint-Léonard-de-Noblat' (Dosse 2010: 249). Regardless, the terms in this passage paint a landscape of land (stratum, place, deterritorialisations, land), sky (lines of flight) and water (flow conjunctions).

Deleuze invites us to imagine ourselves inhabiting this landscape. Lodge is from the Frankish **laubja* 'shelter'; stratum is a 'horizontal layer'. To lodge yourself on a stratum means to inhabit a slice of the world: to be part of a family, country, religious group, profession, school of thought or any other customary practice. In each of our worlds, there are elements of stability, flux and uncertainty; the challenge is to diagram them with the 'craft of a surveyor'.

We can schematise this passage, like so many in *A Thousand Plateaus*, by drawing a circle with a perforated line down the middle, with the left side of the circle more solid (though, importantly, with holes) and the right side more porous, with lines of flight escaping out the side. The circle represents ourselves: the left side is our 'normal' or 'established' side (with a family, career, major language, profession, favourite sports teams, and so forth), the right side is our more experimental side (that gently challenges established family norms, that stretches the canon of our academic disciplines, that ignores popular customs and adopts unusual ones, and so forth), and the 'lines of flight' emanating from that side represent our nomadic tendencies of which we may not recognise their origin or anticipate their destination (listening to new music may germinate these tendencies).

Deleuze's practical rules in this passage are more 'counsels of prudence', given the various landscapes we each inhabit, than 'categorical imperatives', which apply unconditionally to every rational being (Kant 2002). On the one hand, Deleuze clearly presses us to test out (Latin *experiri*) new possibilities of life, to make the hemisphere of traditional values and practices smaller and the hemisphere of new values and practices larger. For each layer, stratum, we can try out appropriate strategies: say, by making friends with peoples of other religions, by attending lectures in other academic disciplines, by learning other languages, by going to the movies, by ingesting hallucinogens, by practising yoga, and so forth. If we are to imagine ourselves inhabiting a landscape, Deleuze presses us to cultivate a more 'wild' garden. On the other hand, Deleuze's advice to 'keep a small plot of new land at all times' indicates that we should not gamble everything at once in our experiments. Hard drugs or violent revolutionary politics may be terrible ways to become a BwO. From the perspective of a United States citizen, Deleuze reveals how misleading the dualities between liberals and conservatives, Democrats and Republicans, can be: we all balance traditional and experimental elements, though that fact does not diminish the still-relevant ethical distinction between how we balance those sides.

Finally, we have many options for how to flesh out this passage, for one, because we all inhabit multiple strata. In the same paragraph, Deleuze notes that 'We are in a social formation; first see how it is stratified for us and in us and at the place where we are; then descend from the strata to the deeper assemblage within which we are held' (Deleuze and Guattari 1987: 161). Social is from the Latin *sequi* 'to follow' and implies any way in which two or more humans

are connected. We could apply this passage to ourselves and our spouses, ourselves and our mentors, ourselves and Egyptian activists, ourselves and other people who aren't rich, and so forth. An aphorism 'must produce movements, bursts of extraordinary speed and slowness' (Deleuze 2006: xiii). The aphorism we are considering can move fast, as when a college student interprets this immediately in connection to how she ought to participate and intervene in her sorority ('gently tip the assemblage'); but the aphorism can also linger in our minds and produce new thoughts and connections ('actually, what happens in Egypt affects our own way of life', or 'maybe I thought I was more open-minded than I was on this particular issue: how can I expand my thinking or acting in productive ways?'). Deleuze's political vision bears the mark of its creator; but it also aims to enrich rather than supplant the singular ways that each of us views the world and ourselves. A genius does not want to be imitated but to be emulated 'by another genius, who is thereby awakened to the feeling of his own originality' (Kant 2000: 195). By this definition, Deleuze's political vision is both genius, or profoundly original, and aims to help all of us produce our own fresh ways of seeing the world.

IV. Deleuze and the Political Theory Canon

Wolin's *Politics and Vision* has been an extraordinarily influential text for leftist academic political theory since its original publication in 1960 (Frank and Tambornino 2000; Connolly and Botwinick 2001). Yet the updated edition dismisses postmodernists such as Deleuze for both misreading Nietzsche and corrupting democratic theory and practice with playfulness (Wolin 2004: 708). In a recent survey of political theorists in the United States, Deleuze is ranked number thirty-eight among scholars who have had the greatest impact on political theory in the past twenty years (Moore 2010: 267). Several decades into Foucault's prediction/invocation of what would come to be known as a Deleuzian century, Deleuze has not yet entered the canon of the history of political thought, though an increasing number of anglophone political theorists in political science departments employ Deleuzian approaches (see Beltrán 2010; Bennett 2010; Connolly 2010).[14]

Why should political theorists treat Deleuze with the seriousness hitherto reserved for Rawls and Habermas (numbers one and two in the aforementioned survey)? First, Deleuze illuminates aspects of the virtual level of politics that elude traditional political science and

theory. Joshua Ramey has shown that Deleuze participated in the hermetic and mystical traditions, as when he extols 'a politics of sorcery' in *A Thousand Plateaus*. As Rawls's and Habermas's constant invocations of reason and reasonableness attest, there is something deeply unsettling for post-Enlightenment philosophers to think about magic and the occult. Yet Kant himself recognised that there were limits to what could be explained phenomenally, and thus many of his most interesting (and controversial) passages consider the realm of reality that we can only think about but not know. Deleuze's explorations of the 'virtual' – his recasting of the Kantian 'noumenal' – illuminate 'the multiplicity of experiential states in which lines are blurred between human consciousness and animal awareness, between biopsychic life and the nature of matter itself' (Ramey 2010: 10). From the perspective of thinking about the subtle forces that influence politics – for instance, the way that support for a political idea or movement, as in the 2010 Arab Spring, can spread like wildfire – Deleuze provides an invaluable pair of lenses. Just as Van Gogh presented the energy radiating from trees, stars and sunflowers in a way that cameras cannot, Deleuze portrays the political flows and lines of flight that slip beneath the radar of most political scientists and theorists.

In addition, Deleuze provides a normative framework that enables us to recognise both the greatest threats to contemporary liberal democratic societies as well as the most fruitful avenues to their transformation. Al-Qaeda is a 'rhizome' – that is, an acentred, multidimensional, often-imperceptible network – that has befuddled political scientists and actors around the world. Deleuze helps us recognise the existence of these non-State 'war machines' and, as should be clear from Deleuze's more 'conservative' statements, marshal the resources to combat them.[15] More affirmatively, though, Deleuze's vision presses us to live life with a greater appreciation of the porosity that defines our ethical and political subjectivities. Many of us know, on some level, that bodies take things in from and leak out into the world and that, for instance, in seven years our bodies will retain none of their current cells. Yet this philosophical insight constantly combats the common-sense habit of ascribing fairly stable identities to bodies. Part of Deleuze's brilliance is that he provides a philosophical vocabulary – grounded in the roots of European languages and anomalous – to appreciate the plasticity and openness of our political identities, territories, parties, economies, and so forth. Reading Deleuze gives us insight into how to fold joy into our political practices.

Notes

1. Félix Guattari contributed key concepts – including the 'refrain' (*ritornello*) – to *A Thousand Plateaus* and wrote important essays and books on his own, including *The Three Ecologies* and *Chaosophy* (Dosse 2010; see also Guattari 1996 and Genosko 2009). In this essay, I focus on 'Deleuze' rather than 'Deleuze and Guattari' for two reasons. First, Deleuze had expressed his political vision before meeting Guattari in 1968 – see, for instance, the discussion of institutions in *Empiricism and Subjectivity* or the treatment of nomads in *Difference and Repetition*. Second, Deleuze wrote the final drafts and built a conceptual system from Guattari's 'schizoid writing-flow' (Smith 2006: 36–7). Deleuze is the proper name for the candidate to enter the history of political philosophy. On how proper names describe a collective machine of enunciation that includes multiple voices, see Deleuze and Guattari 1987: 37–8.
2. Or: 'Can we really envision and concretise a Deleuzian political activism, a becoming-active so badly needed in relation to today's political state of affairs?' (Thiele 2010: 29).
3. See also Deleuze's remark in an interview about *Anti-Oedipus*: 'We're looking for allies. We need allies. And we think these allies are already out there, that they've gone ahead without us, that there are lots of people who've had enough and are thinking, feeling, and working in similar directions: it's not a question of fashion but of a deeper "spirit of the age" informing converging projects in a wide range of fields' (Deleuze 2005: 22).
4. Deleuze rejects the mantle of 'the self-styled lucid thinker of an impossible revolution, whose very impossibility is such a source of pleasure' (Deleuze and Parnet 2007: 145).
5. 'Deleuze and the political can only refer to an open-ended series of relations between philosophy and politics, a series of encounters between philosophical concepts and political events' (Patton 2000: 10). Political thinkers can better grasp the singularity of contemporary political events by using and modifying Deleuzian concepts; see Hickey-Moody and Malins 2007. This process can be intensified, though, by a deeper grasp of how Deleuze's system fits together, and this essay aims to disclose a procedure to do that.
6. Deleuze's main contribution to contemporary political theory, according to Nathan Widder (2012: x) is 'an unwavering attempt to expose [the micropolitical], investigate its mechanisms and dynamics [. . .], show how it unfolds to form the concepts and categories that define so much of personal, social, and political life, and explore how it can be engaged and adjusted'.
7. On the differences between Deleuze's and Foucault's conceptions of the theory–practice relation, see Patton 2010b.
8. On the political implications of a Deleuzian conception of the body–brain–culture network, see Connolly 2002.
9. 'Perhaps it is finally the strangeness of the lexicon, the heterogeneity of the abstract terms and their sheer number that are most striking about Deleuze's diction: an abstract, incorporeal, alien vocabulary for a new foreign language' (Bogue 2004: 12). The question becomes, though, how can we democrats popularise Deleuzian insights?
10. The etymologies in this essay draw upon the *Oxford English Dictionary* (http://www.oed.com) and the *Online Etymology Dictionary* (http://www.etymonline.com).
11. Classical political philosophy 'hardly uses a term which did not originate in the marketplace and is not in common use there' (Strauss 1989: 130). On the one hand, Deleuze, in the Straussian narrative of the history of political philosophy,

is a modern, refusing his assent to otherworldly metaphysics or elitist politics. On the other, Deleuze replicates the ancients' efforts to follow 'carefully and even scrupulously the articulation which is inherent in, and natural to, political life' (Strauss 1989: 61). Robert Pippin (2005) argues that Kant and Hegel do the best job articulating the concepts of modern life. I contend that our era – the 'postmodern', for lack of a better alternative – requires a different conceptual system and that Deleuze may be its finest exponent. Even though Deleuze's political philosophy requires intense effort to analyse the concepts and synthesise the whole, the language almost always emerges from simple images, such as the flow of a stream or a gust of wind.

12. Much of the best Deleuzian secondary literature may be similarly diagrammed; see, for instance, Véronique Bergen's essay on the Deleuzian 'cartographic task' (Bergen 2010).
13. *A Thousand Plateaus* employs intuition, the method of Bergsonism: 'If the composite represents the fact, it must be divided into tendencies or into pure presences that only exist in principle (*en droit*)' (Deleuze 1988: 23). In *Bergsonism* Deleuze speaks of any body having two slopes, or directions, space and duration, whereas in *A Thousand Plateaus* Deleuze employs other comparable distinctions, such as between the poles of fusion and scission. On the one hand, Deleuze's philosophical corpus as a whole grapples with the question of how to convey the distinctions and interconnections between the visible and the invisible, the actual and the virtual. On the other, Deleuze tries out several 'planes of immanence' that do not necessarily present the (political) cosmos in the same way (Patton 2010a: 9–15).
14. Deleuze is a prominent figure in academic disciplines across the humanities and social sciences, but his name rarely appears in top political theory journals such as *Political Theory*, the *American Political Science Review* or the *Journal of Politics*. One purpose of this essay is to help Deleuzians explain Deleuze's importance to political theorists and indicate how his work may be translated into debates about matters such as immigration, the environment or economic justice.
15. For instance, Marc Sageman's (2008) examination of terror networks may be enriched through Deleuzian concepts of the crack (*fêlure*), regimes of signs, war machines and lines of destruction. This topic merits its own books and articles: I merely mention it as a promising research agenda for Deleuzian political scientists.

'The People Are Missing': Palestinians in Kuwait

Mai Al-Nakib Kuwait University

Abstract

This paper explores the effects of the Iraqi invasion on the Palestinian community in Kuwait. Specifically, it considers Gilles Deleuze's notion of the 'missing people' in relation both to the Palestinians deported after the 1991 Gulf War and to the majority of Kuwaitis who have not acknowledged the effects of this disappearance on either the Palestinians or themselves. The first section revisits the circumstances surrounding the deportation of approximately 380,000 Palestinians from Kuwait, while the second considers what was lost as a result. The final section proposes an 'ethics of the missing' as a possible means to engage and transform some of the ensuing problems.

Keywords: Deleuze, Palestinians, Kuwait, ethics, missing people, virtual, becoming

1991 is the year the Palestinian community in Kuwait went missing. Of the 380,000–400,000 Palestinians that lived and worked in Kuwait before the Iraqi invasion, only about 70,000 remained by the end of the year (Lesch 2005: 172). The consequences of the Gulf War on Palestinians deported from Kuwait to Jordan, Gaza and the West Bank are ongoing (Le Troquer and al-Oudat 1999). While the economic and, to some extent, political effects of this event on Palestinians can be calculated, the psychological, social and cultural effects are harder to tabulate. Twenty-two years on, between 55,000 and 70,000 Palestinians remain in Kuwait. They maintain a low profile, understandable given their precarious legal, socio-political and economic status. Kuwaitis tend

to remain silent regarding what can be described as the 'overlapping yet irreconcilable experiences' of living with and without Palestinians in Kuwait (Said 2004: 143). The effects of the untimely disappearance of this once vibrant and dynamic community on Kuwait and its citizens are generally not recognised as worthy of investigation by Kuwaiti scholars or the general population.[1] As it turns out, the people who are missing are not only the deported Palestinians but also a community of people in Kuwait who register this deportation as a mistake and this absence of Palestinians as a loss. This Kuwaiti silence can be read as a symptom of a greater tendency to brush aside singular histories, cultures and experiences in the name of the majoritarian, monovocal narrative of the Islamo-Kuwaiti nation. I contend that the disregard of such singularities as well as the highly partisan manipulation of national and historical memory keep Kuwait at an impasse. A move towards the figuration of a less monolithic and more ethical community to come necessitates acknowledging or remembering these missing singularities, the missing Palestinians not least of all, and, in the process, becoming worthy of the event that happened.[2]

I. Disappearance

The causes and circumstances of the disappearance of the Palestinian community in Kuwait after the Gulf War have been well documented (Abed 1991; Human Rights Watch/Middle East 1991; Lesch 1991; Mattar 1994; Amnesty International 1996; Ghabra 1997b). Nonetheless, I would like to revisit some of the details relevant to my analysis. Kuwait's production of oil coincided with the Nakba (setback) of 1948, and the first major wave of Palestinians to Kuwait was a direct result of this coincidence (Ghabra 1987: 33–80; Pappe 2004: 141–82). This group of migrants consisted of urgently required teachers, engineers, doctors, civil servants, scientists, technicians and labourers (Ghabra 1987: 33–80; Brand 1988: 110–15; Lesch 2005: 163). The second wave of Palestinians came after the June 1967 war (known as the Naksa or catastrophe). This group consisted mainly of families of men already in Kuwait or new families deciding to leave behind the intolerable conditions of the Israeli occupation of the West Bank and Gaza (Ghabra 1997b: 326; Lesch 2005: 164). The population of Palestinians in Kuwait grew from 15,173 in 1957 to 77,712 in 1965 and 147,696 in 1970 (the latter increase linked to the civil war in Jordan) (Lesch 2005: 163). In terms of percentage of the entire population, Palestinians went from 7.3 per cent in 1957 to 20 per cent in 1970 (Lesch

2005: 163). By 1990, the Palestinian population had reached between 380,000 and 400,000 (17–18 per cent of the entire population).

The complex and contradictory history of Palestinian–Kuwaiti relations attests to the often irreconcilable position of Palestinians in Kuwait. On the one hand, this community was organised, productive, rooted and relatively secure. As the largest and oldest expatriate group in Kuwait, the Palestinian community played a special role in the country's economic, political and social development. Palestinians occupied important positions in various ministries (notably the Ministry of Electricity and the Ministry of Public Works), in government bureaucracy, in the field of education (at primary, secondary and university levels) and in the media (Brand 1988: 111–12, 122). Kuwait's political and financial support of the Palestinian cause was strong. Abdul-Reda Assiri has outlined Kuwait's financial contributions to the Palestine Liberation Organisation (PLO) from 1961 until 1989 (Assiri 1990: 40). Government cash grants for this period amounted to approximately $892 million (Assiri 1990: 147–50). In addition, starting from 1965, a 5 per cent 'liberation tax' was deducted from the salaries of Palestinians working in Kuwait and contributed to the Palestine National Fund; from 1965–89, this amount totalled $122.5 million (Brand 1988: 122; Assiri 1990: 40). Aside from financial aid, Kuwait had been both politically and ideologically supportive of the Palestinian cause, often against other Arab states and, at times, the United States. The PLO established its first headquarters in Kuwait in October 1964, and Palestinian political activity was generally well supported by the Kuwaiti government. Palestinian cultural and social activities were popular and widely recognised. In 1967, with the new influx of Palestinians and overcrowding in government schools, Kuwait's Ministry of Education agreed to allow the PLO to operate its own schools using government school buildings and facilities at no expense (Brand 1988: 118–19).

On the other hand, despite their relative security, Palestinians in Kuwait had serious grievances that generally went unacknowledged by the Kuwaiti government and population. For example, while the Ministry of Education's decision to allow the PLO to operate its own schools may seem accommodating, in fact, singling out Palestinian students for different treatment would have exacerbated their sense of alienation from the Kuwaiti community. The PLO schools were closed in 1975 (for, as Laurie A. Brand explains, 'educational, financial, and political reasons'), and Palestinian children were 'reintegrated into Kuwaiti government schools' (Brand 1988: 120). But because overcrowding at government schools remained an issue, new regulations passed

in the 1980s once again threatened Palestinian students – especially those whose parents could not afford to register them in private schools (Brand 1988: 120–1). Even at the university level, Palestinian students encountered serious restrictions. Only 10 per cent of students accepted to Kuwait University – the only university in the country at the time – were permitted to be non-Kuwaiti. But, as Brand notes, 'this does not approach the number of Palestinian high school seniors seeking to continue their education' (Brand 1988: 121). Ann M. Lesch states that 'these restrictions, intended to discourage Palestinians from bringing their families to Kuwait, caused enormous resentment' (Lesch 2005: 166). For Palestinians, education has become a means of survival, and any threat to the educational process was, and continues to be, taken extremely seriously (Ghabra 1987: 76; Lesch 2005: 167).

On top of the uncertainty faced by Palestinian students and their parents, all Palestinians faced a threat to their residency in Kuwait. Very few Palestinians, even those born in the country and never having resided or worked anywhere else, had any hope of acquiring citizenship. Kuwait's naturalisation laws are notoriously restrictive. The nationality law of 1959 defined as 'first category' Kuwaitis those men and their descendants established in Kuwait since 1920. The children of Arab or Muslim fathers born in Kuwait could no longer obtain citizenship and neither could Arabic speakers who had worked and resided in Kuwait for ten years (as both groups had been allowed to do according to the 1948 nationality law). Nonetheless, tens of thousands of individuals, including hundreds of Palestinians, continued to be naturalised by the government after 1959, although, as per the law, naturalisation limited some of their rights. Further amendments to the nationality law over the years restricted rather than opened up opportunities for naturalisation. In 1960, for example, the number of individuals from outside the Gulf that could be naturalised was fixed at only fifty a year. Furthermore, non-Arab applicants had to reside in Kuwait for at least fifteen years before their applications were even considered. In 1981, naturalisation was restricted to Muslims only. In addition to Kuwait's own laws, Arab League resolutions which prohibited Arab countries from granting citizenship to Palestinians – purportedly in order not to weaken Palestinian political resolve and territorial claims – further reduced the chances for Palestinians to gain Kuwaiti citizenship (Shiblak 1996: 39). Unlike other migrant workers in Kuwait, who could return home once their contracts were up or they reached retirement age, most Palestinians had nowhere else to go.

Along with its restrictive naturalisation laws, Kuwait's *kafala* or sponsorship system was an added burden for Palestinians. The *kafala* system, introduced in 1975, requires that any non-Kuwaiti entering Kuwait must be sponsored by an individual Kuwaiti or a Kuwaiti-owned company. The Kuwaiti sponsor (*kafil*) must sign a form issued by the Ministry of Social Affairs and Labour to confirm that the non-Kuwaiti works for him or her; that any change in contract will be reported to the Immigration Department; and that the sponsor will pay for the worker's repatriation once the contract ends. Children below the age of twenty-one can be included on a working parent's residency (if that working parent's salary reaches the required minimum amount for inclusion). In practice, the *kafala* system is often abused, with sponsors selling sponsorships to the highest bidders and terminating or threatening to terminate sponsorships as they see fit. For the sponsored (especially those illegally sponsored), this results in a precarious residency. For Palestinians without citizenship in Kuwait or anywhere else, the *kafala* system was especially difficult. Male children above the age of twenty-one of parents living and working in the country could not remain on their parents' residencies. This meant that if they could not find a job or secure illegal *kafala* in Kuwait, they could be deported.

The economic downturn of 1986, caused by a serious drop in oil prices, led to unemployment in Kuwait (Ismael 1993: 162–3; Lesch 2005: 166). This, combined with a policy of 'Kuwaitisation' – a push to replace non-Kuwaiti workers with Kuwaitis – further restricted residency, entrance visas and employment opportunities for Palestinians (and other non-Kuwaitis). In 1989, due to its budget deficit, Kuwait drastically reduced its foreign aid in general; it halved aid to the PLO in particular, from $49.8 million in 1988 to $24.9 million in 1989 (Assiri 1990: 150). Political tensions in the country having to do with, among other things, the ongoing effects of the Suq Al-Manakh financial crisis of 1982, the Iraq – Iran war, recent terrorist attacks on Kuwaiti soil (linked to Kuwait's partisan support of Iraq), as well as pressure from Kuwaiti political activists for increased democratisation and a restoration of the National Assembly (unconstitutionally dissolved since 1986) contributed to a general atmosphere of unease. The government worried that the Palestinian community could trigger violence in Kuwait, as it had in Jordan and Lebanon. Finally, the Palestinian intifada was to become a cause for concern for the Kuwaiti government. As pro-intifada demonstrations in Kuwait became more political, leading to clashes with police, the government began to fear the effects on the local prodemocracy movement and on communal divides (Crystal 1992: 131).

In short, then, increasingly unequal education and employment opportunities in the 1970s and 1980s, together with restrictive practices against Palestinian social, political, residency and civil rights meant that life in Kuwait, while perhaps better for Palestinians than in other places, was far from perfect. It created a situation that can be described, in Edward Said's sense, as 'irreconcilable' or, in Deleuze's terms, as 'intolerable' (Said 2004: 143; Deleuze 1995: 171).[3] For Deleuze, the only viable response to the intolerable is through a 'people's revolutionary becoming', a process of becoming-minoritarian that invents or constitutes the people who are missing (Deleuze 1995: 171). This has been an ongoing process for Palestinians since their expulsion from Palestine in 1948. In Kuwait it resulted in the creation of an active and dynamic minor community. However, this hard-won state of affairs – precarious and problematic though it was – would not last.

The complex conditions of life for Palestinians in Kuwait described above make the response of some of these Palestinians to the Iraqi invasion understandable. Palestinian-Kuwaiti political scientist Shafeeq Ghabra has argued that Palestinians in Kuwait consisted of 'Iraqi sympathizers, opponents or protesters of the invasion, and neutral bystanders' (Ghabra 1997b: 328). He concludes that soon enough any 'sympathy for Saddam among Palestinians turned to feelings of fear and disgust' and that the at least 200,000 Palestinians who left Kuwait to Jordan 'could be classified as protestors' (Ghabra 1997b: 336–7). Add to that the 30,000 Palestinians who were already outside Kuwait for their summer vacation, this meant that only between 150,000 and 200,000 Palestinians remained in occupied Kuwait (Lesch 1991: 46; Mattar 1994: 41–2).

This is not to deny that some small groups of 'thugs, looters, opportunists, and ideologues' – Palestinians among other nationals – may have tried to benefit from the occupation (Ghabra 1997b: 336). Furthermore, some vulnerable and impoverished Palestinians – with no other recourse to income – may have participated in the workforce following Iraqi commands in order to survive (Ghabra 1997b: 331 – 2; Abu-Baker 2000: 53–4). Finally, as Ghabra has discussed, a small number of Palestinians did collaborate with the Iraqis and indeed acted violently against Kuwaitis (Ghabra 1997b: 334). However, based on the analyses and numbers provided by Ghabra, Lesch, Philip Mattar and Tawfiq Abu-Baker, among others, it is unlikely that most Palestinians in Kuwait supported the invasion.[4]

The position of the majority of the Palestinian community in Kuwait must not be confused with that of the PLO leadership, Palestinians

outside Kuwait, and Palestinian militants sent into Kuwait from Iraq (Lesch 1991: 46; Mattar 1994: 38–42; Ghabra 1997b: 333; Abu-Baker 2000: 56).[5] Examples of Palestinian resistance to the Iraqi occupation and assistance to Kuwaitis during the occupation are numerous. For example, several key leaders of Fatah were assassinated for their pro-Kuwait stance; some Palestinians worked with the Kuwaiti resistance, while others assisted their Kuwaiti friends to acquire food and supplies; Palestinians at Kuwait University helped salvage important papers for Kuwaiti professors; Palestinians who worked in the medical services and in the ministries of water and electricity helped to ensure that these essential services continued to operate; Palestinian bankers protected crucial bank records; and so on (Ghabra 1997b: 338–42).

The Kuwaiti response after liberation to the perceived Palestinian betrayal was disproportionate and, in Deleuze's Spinozist sense, unethical.[6] Amnesty International and Human Rights Watch/Middle East (formerly Middle East Watch), among others, have documented these widespread abuses, which included arbitrary arrests, unfair trials, summary executions, torture, detention, beatings, kidnappings and mass deportation (Human Rights Watch/Middle East 1991; Amnesty International 1996; Ghabra 1997b: 342–7; Lesch 2005: 170–2). The brutality of the initial Kuwaiti reaction subsided by June 1991, thanks to the efforts of the Kuwaiti Association to Defend War Victims, the Kuwaiti Bar Association, international pressure, a Palestinian committee organised to help resolve the volatile situation, and the intervention of then Prime Minister Saad Al-Abdallah Al-Sabah (Ghabra 1997b: 344). However, social, political and economic pressures against the remaining population of Palestinians in Kuwait continued, making it almost impossible for them to reside in the country. Palestinian students were banned from government schools and Kuwait University; Palestinians were restricted from working (both in the government and private sectors) and their residency permits were not renewed; rent, water and electricity bills for the period of occupation were enforced on Palestinians while such bills were cancelled for all Kuwaiti citizens; among many other forms of constraint and harassment (Lesch 2005: 171). 'It was', as Ghabra puts it, 'clear that Kuwait would no longer tolerate a large Palestinian community, and would have preferred that none stayed' (Ghabra 1997b: 346).

Today only about 55,000–70,000 Palestinians remain in Kuwait. A small percentage of these are Gazans with Egyptian documents who lack the Israeli permits needed to return to Gaza and, through international pressure, have been allowed to stay.[7] The rest, citizens

of various countries, are in Kuwait on residency permits that must be renewed annually or once every two years, but only if their employment contract is also renewed. Many parts of Hawalli, once the heart of the Palestinian community, are still eerily desolate. In autumn 1991, Michael Dumper came to the following prescient conclusion about the Palestinian community in Kuwait: 'Pockets of Palestinians will survive as restaurateurs, managers, and technicians, dependent as never before upon government and Kuwaiti approval. But the large, vibrant, challenging, virtually self-sustaining community has gone, probably forever' (Dumper 1991: 123).

II. Aftermath

As a result of the events described above, the Palestinians have become, once again in their modern history, a people who are missing. But what exactly is it that has gone forever and what are some of the implications of this loss to Kuwait? In terms of Kuwait's economy, the loss of the Palestinian community has meant a loss in rental and consumer spending. Unlike South Asian workers, who remit most of their earnings, Palestinians spent much of their income in Kuwait (Cordesman 1997: 62). Furthermore, the mostly unskilled, non-Arabic-speaking labour force that has replaced the Palestinian 'managers, professional and technical workers, and senior civil servants' is ill-equipped to manage financial capital or to move the country 'into the strategic development stage of a capital-intensive economy' (Ismael 1993: 177–8). The policy of Kuwaitisation has also contributed to this problem. While, in theory, Kuwaitisation aims to make the country more self-sufficient by replacing foreign labour with Kuwaiti labour, in practice, a government-imposed quota that forces private companies to hire a specific number of Kuwaitis is detrimental to productivity and discourages foreign investment.[8] It perpetuates an environment of non-professionalism, where Kuwaitis in the private sector are made to feel as though their positions are secure regardless of their performance (Al-Moosa and McLachlan 1985: 35–6). The situation is even worse in the public sector where firing Kuwaitis is prohibited.

In terms of Kuwait's demographic, the deportation of the Palestinians did nothing to reduce the ratio of Kuwaitis to non-Kuwaitis. If, as has been argued, Kuwait had hoped to use the circumstances of the invasion to reduce its reliance on foreign labour and balance the ratio of Kuwaitis to non-Kuwaitis, this plan has failed (Russell and Al-Ramadhan 1994). Based on the latest census in 2005, Kuwaitis are estimated to make up

39.5 per cent of the population today, with expatriates estimated to make up the majority 60.5 per cent (Kuwait Central Statistical Bureau 2011: 43). Of the expatriate population, at most 6.6 per cent are Palestinian. Had Kuwait considered naturalising a larger portion of this productive population (based on merit, contributions to the state, length of residency or other considered criteria), which for over forty years had helped to build the modern state, it might not have been in the demographic quandary it remains in today. The decision to naturalise mainly Bedouin was made primarily because it was believed they would be more supportive of government interests than others (as they had been historically) and because the government hoped it could count on their political support (Ghabra 1997a: 366).[9]

In the early decision to exclude Palestinians (and most other nationals) from citizenship, what was forfeited, in addition to highly skilled, educated and nationally loyal potential Kuwaitis, was an opportunity for diversity within the community and the chance to cultivate a sense of openness toward plurality and difference. As non-Gulf Arabs with a distinct cultural identity, their own specific social norms, dialect, culinary traditions and religious practices (Christian as well as Muslim), the large community of Palestinians in Kuwait contributed substantially to the country's heterogeneity. Because Palestinians and Kuwaitis shared educational experiences (most teachers in Kuwait were Palestinian and many Palestinians attended government schools), work (Palestinians were both employees under Kuwaiti bosses and bosses of Kuwaiti employees) and space (though the majority of Palestinians lived in Hawalli, shops, restaurants, streets and other communal spaces, obviously, were shared), differences were experienced at close range and, in most cases, comfortably. Citizenship would have legitimated this de facto heterogeneity of the country, helping to prevent the consolidation of a divisive national, social, cultural and religious logic.

Today, as was the case before the invasion, Kuwait remains sharply divided between Kuwaitis and non-Kuwaitis, both politically and in terms of identity (Longva 1997: 43–54; Al-Nakib 2000: 202–6).[10] Instead of a heterogeneous, open, 'experimental nation', Kuwait has become a closed, limiting, homogeneous and intolerant place (Bensmaïa 2003: 8). The 'virtual' presence of the missing Palestinians expresses this post-invasion striving for homogeneity (Deleuze 1989: 78). Réda Bensmaïa points out that 'under today's postmodern conditions, it is not geographical or even political boundaries that determine identities, but rather a plane of consistency that goes beyond the traditional idea of nation and determines its new transcendental configuration'

(Bensmaïa 2003: 8). Experimental nations are, for Bensmaïa, 'nations that writers have had to imagine or explore as if they were territories to rediscover and stake out, step by step' (Bensmaïa 2003: 8). Such experiments are 'transversal'; they 'assemble multiplicities, yet in such a way that the differences among entities are not effaced but intensified' (Bogue 2007: 2).

Transversals connect the seemingly separate without obliterating singularities.[11] As Ronald Bogue points out, they can form what Deleuze and Guattari describe as a 'people to come' (those who are, for now, missing) (Deleuze and Guattari 1994: 110; Bogue 2007: 3, 14). Kuwait's categorical divisions and politics of exclusion not only prevent experimental, transversal people-as-nations from actualising. They also prevent any active recognition of the potential benefits such experiments could have for everyone in the country. The seeds of this outcome were sown, I would argue, when Kuwait did not have the foresight to recognise the Palestinian community as anything other than a potentially threatening outside. To regard those Palestinians born in Kuwait, educated in Kuwait, working in Kuwait, often speaking Kuwaiti dialect, familiar with Kuwaiti customs and culture, and with nowhere else to go as outsiders displayed a short-sightedness and paucity of imagination for which certain segments of the population continue to pay today (among them women, naturalised citizens, immigrant labour and the *bidoun* – that is, those without citizenship, not to be confused with Bedouin).

With the loss of the Palestinian community, Kuwait also lost its ethical standing among its non-Gulf Arab neighbours. Before the invasion, Kuwait was financially and politically supportive of the Palestinian national movement (Assiri 1990: 40; Crystal 1992: 129). In addition, the Kuwaiti population was generally sympathetic to the Palestinian cause. Palestinian leaders were permitted to organise themselves politically in Kuwait, and, as mentioned, the PLO opened its office there in 1964. The Fatah movement, led by Yasser Arafat, established its headquarters in Kuwait, where it remained until 1966. Military training, myriad organisations, social and cultural programmes, union work, fundraising and demonstrations were all sanctioned activities for Palestinians in Kuwait before the invasion. Jill Crystal states that 'all that was explicitly forbidden was a military presence. Implicitly forbidden was the use of Kuwait as a battleground for internal Palestinian divisions and involvement in domestic Kuwaiti political issues' (Crystal 1992: 131). Crystal identifies the first intifada as the turning point away from full government support of Palestinians, since the government began to fear

both the potential of a more militant Palestinian community within its borders (especially given past events in Lebanon and Jordan) and the effects this could have on the prodemocracy movement among Kuwaitis themselves (Ryan and Stork 1977; Crystal 1992: 131). But despite these concerns, Kuwait's support of the Palestinian national movement financially, diplomatically and morally continued mostly intact. Kuwait's support of the Palestinian cause and the Palestinian community within its borders provided a bridge, a way to connect itself with non-Gulf Arabs politically and emotionally aligned with the cause. Had the deportation of Palestinians from Kuwait not occurred, this connection might have provided Kuwait with a valuable means to establish stronger relations with countries in the region other than those in the Gulf. By opening itself up in this way, it may have been able to expand its political influence, increase its national security and overcome its dangerous 'siege mentality' (Assiri 1990: 129). Assiri attributes this 'sense of encirclement' to the fact that 'the state's immediate environment frequently has been politically inhospitable to its existence and survival' (Assiri 1990: 129). As it stands today, Kuwait is more alienated than ever from its Arab neighbours – the citizens of these countries, if not their governments (Joffe 1993: 187). In addition, for reasons that go beyond the scope of this paper, Kuwait's political standing in the Gulf has also waned. Saudi political influence and social pressure now dominate a once fiercely independent Kuwait, while Qatar and the UAE, specifically Dubai and Abu Dhabi, have replaced Kuwait in attracting financial investment, garnering international prestige and in terms of sheer cultural clout.

Despite these negative repercussions for Kuwait, it took the Kuwaiti government thirteen years to normalise relations with the Palestinian Authority and twenty-two years to reopen a Palestinian embassy in Kuwait in 2013. In 2004, the government announced that it was no longer seeking an apology from the PLO and that the Palestinians were forgiven; nonetheless, Mahmoud Abbas apologised 'to Kuwait and the Kuwaiti people for what [the Palestinians and the PLO] did' (BBC 2004). There have been a number of visits by Palestinian delegations to Kuwait since then, and, officially, Kuwait's support of Palestine and its cause is solid. In August 2008, the government donated $80 million to the World Bank to support the Palestinian Reform and Development Program (PRDP) (El Naggar and Assaf 2008). Kuwait has continued to support the PRDP, contributing a total of $230 million to date (World Bank 2012). During the Israeli bombardment of Gaza in December 2008, Kuwait's National Assembly strongly condemned

Israel's 'genocide' of unarmed civilians (Kuwait Times Staff Writer 2008). The Arab Economic, Social, and Development Summit, already scheduled to be held in Kuwait in January 2009, coincided with the events in Gaza, and Kuwait was in a position to take a leadership role among the Arab delegates over the issue, which it did (KUNA 2009). The Amir of Kuwait, Sheikh Sabah Al-Ahmed Al-Sabah, described Israel's attack as a 'war crime and a crime against humanity' (Al Jazeera Satellite Network 2009). Public sympathy was strongly expressed for the Gazans in Kuwaiti newspapers, during a number of demonstrations, and through both public and private financial support (Taleb 2008). More recently, sixteen Kuwaitis – including Salafi member of the National Assembly, Walid Al-Tabtabai, and Deputy Secretary General of the Union of NGOs of the Islamic World, Mubarak Mutawwa – were part of the flotilla which attempted to breach Israel's naval blockade of Gaza in May 2010. On this occasion Mutawwa stated, 'Kuwait suffered the injustice of the Iraqi invasion in 1990. At that time of need we had the support of peace-loving nations. This is what Gaza needs now' (Kholaif 2010; translation modified). In addition to such financial and political support, the ongoing social and cultural work of the Kuwaitis for Jerusalem Committee, formed in 2000, has been a welcome development.

These positive steps by the Kuwaiti government are promising and should not be ignored. However, most average Kuwaitis today still do not express regret over the post-liberation events. At best, they are indifferent to or ignorant of the issue; at worst, they continue to hold a grudge. There remain voices in Kuwait that actively express anti-Palestinian sentiment, though none as virulently as Fuad Al-Hashim of *Al-Watan* newspaper in his daily column, 'Exclamation Point!!' For example, on 29 December 2008, two days after Israel's attack on Gaza, Al-Hashim had the following to say:

> I ask the Palestinians one question: How would the residents of Gaza and the West Bank feel if they saw the entire Kuwaiti population out demonstrating and shouting, 'With chemicals, Olmert, from Ramallah to Gaza?' Or, 'With nuclear weapons, Levy, from Jineen to Rafah?' [. . .] If they have forgotten the slogan, 'With chemicals, Saddam, from Kuwait to Damman', we have not!! (Al-Hashim 2008: 6, 21; my translation)

Not only is Al-Hashim's ill-timed tutorial to a besieged population struggling for survival in poor taste; it reveals that at least some in Kuwait have not learned from their post-liberation mistakes. Rather than accounting for the pre-invasion ambiguities that existed in the

relationship between Kuwait and the Palestinian population living within its borders and reading the reaction of those few Palestinians who collaborated with the Iraqis within the terms of such ambiguities, Al-Hashim continues to respond as reactively and indiscriminately as some Kuwaitis did immediately after liberation. The general lack of response to Al-Hashim's anti-Palestinian bent in Kuwait suggests that his position may be an extreme version of the norm.

Twenty-two years on, even those who follow a less vicious strain of Al-Hashim's thinking still have not taken responsibility for Kuwait's own role in constituting the reactive responses of those few collaborating Palestinians, have not apologised for the violence done to Palestinians in Kuwait after liberation, and have not accounted for the damage done both to Palestinians and Kuwaitis with the disappearance of this once integral community. In fact, in the conclusion to his recent study, Falah Abdulla Al-Mdeiris states that while official relations between the governments of Kuwait and Palestine may be on track to normalisation, the majority of the Kuwaiti population have no inclination to normalise relations with Palestinians (Al-Mdeiris 2008: 98). However, without a nuanced recognition of Kuwait's own complex role in past events, the conditions for an ethical polity are, I would argue, gravely undermined.

III. An Ethics of the Missing

In the context of the Israeli occupation and 'ethnic cleansing' of Palestine, there is a serious danger in describing the Palestinians in Kuwait or anywhere else as missing (Pappe 2006). To state that the Palestinians are missing in Kuwait is not in any way to suggest that this population no longer exists; nor is it simply to mark their absence in Kuwait as a result of the post-liberation events of 1991. For Deleuze, an absence of the people is no cause for sorrow or alarm but, rather, an opportunity for invention and experimentation. He declares, 'The missing people are a becoming, they invent themselves, in shanty towns and camps, or in ghettos, in new conditions of struggle to which a necessarily political art must contribute' (Deleuze 1989: 217). This process of invention intensifies the instant power proclaims: ' "There have never been people here" ' (Deleuze 1989: 217). It is as though, paradoxically, the emphatic denial of a people's existence uncovers their presence. Nowhere is this denial more evident than in the well-known Zionist declaration: 'A land without a people for a people without a land'. Deleuze describes this as the Zionist tendency to act 'as if the Palestinian people not only must not exist, but had never existed' (Deleuze 1998a: 30).

In the context of this denial of Palestinian existence, it may seem a dangerous move to consider utilising Deleuze's notion of the missing as an ethical apparatus. However, Deleuze makes a distinction between the actual Palestinians thrown out of Palestine – those Israel claims are missing who clearly are not – and the Palestinians who then begin to resist this event and Israel's denial – those who begin to constitute themselves as a people (Deleuze 1995: 126).[12] If the former Palestinians are not missing (they exist despite Israel's denial), the latter are, in fact, missing and will remain missing as long as a transformative struggle continues.

Therefore, to say that the Palestinians of Kuwait are missing, in Deleuze's sense, is to mark their ongoing virtual presence. Every present moment involves both an 'actual' present and a mirror-image 'virtual' present (Deleuze 1989: 79). The virtual component of the present is both what the actual present once was and some iteration of what it might still become. Virtualities may or may not be actualised at any particular moment, but they are always real and present (Deleuze 1991: 96–7). Deleuze explains this somewhat paradoxical understanding of time this way: 'The past does not follow the present that it is no longer, it coexists with the present it was. The present is the actual image, and *its* contemporaneous past is the virtual image, the image in a mirror' (Deleuze 1989: 79). In conventional terms, the Palestinians were a part of Kuwait's history, its past, and with their disappearance, they are no longer a part of its present. But understood from the perspective of a Bergsonian conceptualisation of time, the missing Palestinians currently maintain a virtual presence in Kuwait; they coexist with the present they once were and could yet become.[13]

What would an actualisation of this virtual presence look like? The outcome of any actualisation can never fully be predicted in advance. Regrettably, the likelihood of reintroducing a thriving Palestinian community within Kuwaiti borders is small. Nonetheless, an actualisation of the currently virtual Palestinian presence in Kuwait may have other effects. Today, as I have argued, it is rare to find Kuwaitis who acknowledge the rich history of Palestinians in Kuwait, the many contributions of Palestinians to the development of their country, and Kuwaiti complicity in tearing this important community apart. Such Kuwaitis are, in other words, themselves missing. Constructing a viable ethics in Kuwait necessitates an elaboration of the relationship between these two missing peoples, a transverse reconstruction, in other words, between minoritarian and majoritarian forces.

Understandably, as a 'democracy' in progress, Kuwait has made and continues to make mistakes.[14] To actualise the virtual presence

of the Palestinians in Kuwait might provide a means to negotiate the irreconcilable issues and crises that plague this small nation-state.[15] It may, for example, help actualise Kuwaiti recognition of its spotted recent history and, through this memory, a way towards an alternative future. Deleuze describes this kind of memory as 'the strange faculty which puts into immediate contact the outside and the inside, the people's business and private business, the people who are missing and the I who is absent, a membrane, a double becoming' (Deleuze 1989: 221). Putting the inside into contact with the outside through memory transgresses the divisive structuring of national identity and practice Longva and others have identified as dominating and disrupting Kuwaiti society, politics, and economics (Ismael 1993: 129–50; Longva 1997: 43–147). Paradoxically, the very existence of Kuwait – or a certain version of Kuwait – depends on its remembering the Palestinians who are missing as well as the history of their disappearance. This process can be described as a becoming-Palestinian of all Kuwaitis. It would involve the counter-effectuation of the event of Palestinians in Kuwait – that is, for Kuwaitis to recognise in terms other than those they have been rehearsing for the last twenty-two years what happened and what they helped make happen (no longer someone else's fault) (Deleuze 1990: 149; Deleuze and Guattari 1994: 158–9). This is not to say Kuwait will cease to be without this counter-effectuation, without such an ethics of the missing.[16] What it does mean is that the potential for a Kuwait open to differences, singularities and multiplicities, a Kuwait more capable than it currently is or ever has been of finding ethical and equitable resolutions to problems faced by those residing within its borders – both Kuwaiti and non-Kuwaiti – will diminish.

During a recent conference about Arab feminisms held in Beirut, Kumkum Sangari commented that to remove or to forget the past means that we are reduced to the temporality of the present, which would indicate either that we are in survival mode or that we are deeply embedded within the capitalist world system (Sangari 2009). Unlike Palestine, Kuwait's survival is not immediately under threat, although it has been in the past and, given its volatile location and its rentier status within the global economic system, it might be again. Kuwaitis may choose to ignore the past (that is, the virtual present) because they continue to feel threatened and under siege. Or, they may have unwittingly forgotten the past because the capacity to think critically required for such an engagement with memory has been thoroughly overwhelmed and liquidated by capitalist consumption. Either way, the Palestinians remain missing from Kuwaiti history,

Kuwaiti consciousness and Kuwaiti conscience. Without this memory of the actual past and the virtual present, however, the country is in danger of losing its ethical bearings.[17] What is at stake in this call to memory is the difference between a Kuwait open to the virtual potentialities of the future perfect and a Kuwait trapped in the present with no way back and only a distressingly restricted and one-dimensional way forward.[18]

Notes

1. The fine work of Palestinian-Kuwaiti political scientist Shafeeq Ghabra is exceptional in this regard (Ghabra 1997b). For a recent study more representative of the Kuwaiti stance, see Al-Mdeiris 2008.
2. In *The Logic of Sense*, Deleuze declares, 'Either ethics makes no sense at all, or this is what it means and has nothing else to say: not to be unworthy of what happens to us' (Deleuze 1990: 149). My argument is that majoritarian Kuwait has not become worthy of the event of the Palestinians in Kuwait – not of their historical presence and participation in the country since the early twentieth century, not of their alleged 'betrayal' of Kuwait in 1990, and not of their ongoing or virtual presence as a missing people. This inability to transmute circumstances and occurrences into something worthy has precluded (and continues to preclude) an ethical outcome and polity in Kuwait.
3. Said states, 'Overlapping yet irreconcilable experiences demand from the intellectual the courage to say that *that* is what is before us' (Said 2004: 143). He adds, 'Only in that precarious exilic realm can one first truly grasp the difficulty of what cannot be grasped and then go forth to try anyway' (144). Said arrives at his notion of the irreconcilable in part through his assessment of the Palestinian – Israeli impasse – the elusiveness of any fair resolution to this conflict. His own work exemplifies how the intellectual tries anyway and, in the attempt, manages to create opportunities again and again. That such chances are often ignored or, in the worst case, bring punishment to those who dare to produce them does nothing to diminish their exigency. Said's proposition, while perhaps more tempered than Deleuze's enthusiasm over the missing, remains intransigently persistent.
4. In an interview conducted in 1990, during the Iraqi invasion, Kuwaiti political scientist Hassan Al-Ebraheem stated: 'Contrary to what some have reported, our information is that the Palestinian community in Kuwait has been especially supportive both of the resistance and of persons in hiding, and has manifested little collaboration with the Iraqi forces. In fact, the reports of Palestinians who have themselves witnessed the character of the Iraqi occupation are now being felt in Jordan' (Al-Ebraheem 1991: 98).
5. For an analysis of some of the reasons behind the 1990 Palestinian position on the Gulf crisis, see Hallaj 1991; Husseini 1991: 99–101; Finkelstein 1992; Abu-Baker 2000: 92–105.
6. Deleuze would describe the Kuwaiti response as a form of *ressentiment*, unethical because unworthy of the event (of the Palestinian community in Kuwait in all its historical complexity). He puts it this way: 'To grasp whatever happens as unjust and unwarranted (it is always someone else's fault) is, on the contrary, what renders our sores repugnant – veritable *ressentiment*, resentment of the event. There is no other ill will. What is really immoral is the use of moral notions like just or unjust, merit or fault' (Deleuze 1990: 149).

This incapacity on the part of most Kuwaitis to grasp the event of Palestinians in Kuwait (and the actions of some of them during the invasion) in any terms other than 'betrayal' or 'fault' or 'injustice' reveals a majoritarian rigidity that continues to choke invention and experimentation in Kuwaiti society and politics today (recent debates in parliament focused around so-called 'morality' issues, at a time when the economy, education, healthcare and environment are in serious crisis, exemplify this narrow-minded rigidity).

7. Lesch put the number of Gazans in Kuwait in 2000 at 7,000 (Lesch 2005: 172). It is difficult to confirm the total number of Palestinians in Kuwait in 2013, in part because the majority hold passports from other countries. The Office of Palestinian Affairs in Kuwait estimates the total number of Palestinians in Kuwait today at anywhere between 55,000 and 70,000 and those with *laissez passer* between 6,000 and 7,000.
8. A recent brief published by the National Bank of Kuwait reports that Kuwait 'lag[s] significantly behind the rest of the [Gulf Cooperation Council states] as the least attractive destination for [foreign direct investment] in the region' (Al-Nakib 2010: 2). Reasons commonly identified for this low rate of investment include Kuwait's 'bureaucracy, stringent regulations, limited foreign ownership, and inflexible labor laws' (2). The policy of Kuwaitisation is one such inflexible law.
9. Between 1965 and 1981, about 220,000 people were naturalised, most of which were Bedouin (Ghabra 1997a: 364). This rate of naturalisation continued until the invasion in 1990 (Longva 1997: 72).
10. Anh Nga Longva identifies two additional classificatory dichotomies that structure Kuwait's politics of exclusion: Arabs and non-Arabs, and Muslims and non-Muslims (Longva 1997: 45). These oppositions divide the community into a complex set of insiders and outsiders, with some non-Kuwaitis (Arab Muslim men, for example) at times more inside than some Kuwaitis (women, among others). However, such categorical ambiguities in Kuwait today are as unacknowledged as they were before the invasion. The split between insiders and outsiders remains entrenched, to the disadvantage of those who happen to occupy the wrong side of the divide and to the detriment of the country's potential diversity.
11. For a discussion of transversality as intercultural experimentation and its potential benefits to collaborative struggle in Israel–Palestine, see Svirsky 2012.
12. For a sample of his comments on the Palestinians, see Deleuze 1998a, 1998b, 1998c, 2006: 194–200, 333–4.
13. Philippe Mengue suggests that this missing 'people' as virtual is 'condemned to be *forever* "to come", that it cannot have any historical existence. Always thought, never present' (Mengue 2008: 229). For Mengue, this creates a problem with regards to politics 'because peoples in their political actuality and reality have already been deserted' (234). Mengue resolves this problem by arguing that 'although the people [. . .] is necessarily virtual as Deleuze will have it, it must coincide with the plane of immanence proper to politics and to democracy, the plane that rightly *traverses* all "communities", all social formations, and is the sole guarantor of a veritable and effective "democratic future"' (238). My sense is that the missing people in Kuwait (both as the virtual Palestinians and the yet to come ethical Kuwaitis) can launch a process of 'becoming-democratic'–pointing 'towards future as yet unrealised forms of democracy'–that may not be politically efficacious immediately or actually but is nonetheless urgently required (Patton 2008: 180).
14. Despite its ostensibly democratic political institutions, it would not be correct to classify Kuwait as a 'democracy' as it is theorised by Deleuze and Guattari

in *What Is Philosophy?* (Deleuze and Guattari 1994: 108–9); see Patton 2008 for a lucid analysis of Deleuze and Guattari's understanding of democracy. 'Becoming-democratic' involves struggling on various fronts against 'democracy' as it currently exists (Patton 2008: 193). In Kuwait today, becoming-Palestinian would contribute to such a process.

15. In addition to the Palestinian problem discussed here, some of the intractable issues Kuwait faces concern the rights of the *bidoun* (stateless), expatriate labour (especially female domestic labour) and women; the discriminatory *kefala* (sponsorship) system; the tribal system and sectarianism; and the environment, among many others. In confronting such issues, Kuwait (by which I mean the government, the National Assembly or parliament, and citizens in general) tends not to look to its own past (that is to say, its virtual present). Instead, in the last two decades at least, Kuwait has turned to an atavistic Islam and to its role as a dependent oil supplier in a capitalist world system for solutions. Neither has proven to be especially beneficial to an ethical democratic practice in the country (if the last six dissolutions of parliament since 2006 are anything to judge by).
16. Audronė Žukauskaitė labels this Deleuzian understanding a 'minor ethics' (Žukauskaitė 2011: 193). Because I want to emphasise the component of the missing people in my analysis of the case of Palestinians in Kuwait, I choose to use an 'ethics of the missing'.
17. Along with the commendable efforts of the Kuwaitis for Jerusalem Committee (active since 2000), the more recent MinRASY Projects has also worked in innovative ways to generate this form of active memory. Formed by a Palestinian couple in Kuwait (both with long-established families in the country), MinRASY Projects since 2011 has organised a series of public interventions in Kuwait specifically as a means to trigger a local recollection of the Palestinian community, their history and their contributions. In May 2012, MinRASY sponsored a successful exhibition titled *Museum of Manufactured Response to Absence* (*MoMRtA*) as an intervention at the Museum of Modern Art in Kuwait. Curated by Ala Younis and, significantly, under the official patronage of the National Council for Culture, Arts, and Letters of the State of Kuwait, *MoMRtA* commissioned over twenty artists to produce objects in response to the historical presence and absence of the Palestinian community in Kuwait. The exhibition catalogue states: 'In light of the lack of collective images, narratives, and archives, memory is taken as the main point of reference for the museum's objects. Fragile and fragmented, this is a memory that has been accumulated, dismantled, reassembled, and at times lost. The museum's objects conflate pieces from this recollected past in order to recognise and make sense of the present, an act that bestows them with an appearance of being at once real, impossible and unreal, and that addresses, imagines and reclaims the story and legacy of Palestinians in Kuwait' (*Museum of Manufactured Response to Absence* 2012). This compelling exhibition conveys a sense of the golden age of Palestinian–Kuwaiti collaboration and coexistence, as well as the trauma and regret over its untimely loss. That *MoMRtA* as well as the simultaneously displayed sound installation piece *Unplified* by Tarek Atoui (inspired by Ghassan Kanafani's novella *Men in the Sun*) were both exhibited under the patronage of the National Council for Culture, Arts, and Letters at a government institution (the Museum of Modern Art) may signal a meaningful shift in official discourse and attitude toward the past. MinRASY's active engagement with the public – through commissioned installation pieces in public spaces, film screenings and panel discussions, as well as exhibitions specifically dealing with Palestinians in Kuwait – can encourage Kuwaitis to revisit an otherwise forgotten

past and to engage with it constructively towards the amendment of its outcome. For more on MinRASY Projects, see < http://www.minrasyprojects.com > .

18. The activities of Zochrot – an Arab-Jewish NGO in Israel that aims to remember the Nakba and spread awareness of its history among Jewish-Israeli people – provides an excellent model for the kinds of memory practices that could be of use in Kuwait (see < http://www.zochrot.org/en >). On the productive uses of traumatic memory from a Deleuzian perspective, see Parr 2008.

Deleuze's Aesthetic Answer to Heraclitus: *The Logic of Sensation*

Filippo Carraro

Abstract

The painter Francis Bacon and the philosopher Gilles Deleuze agree with Heraclitus: any phenomenon is constituted of movement or becoming and no appearance endures. I read *Francis Bacon, The Logic of Sensation* from the perspective of the Heraclitean flux. This allows me to show the eminent role of forces (movement beneath the soil of visibility) in the work of Deleuze, which he inherits from the Greek philosopher. I point at sensation as Deleuze's re-thinking of the notion of becoming. 'How can an artist make an object endure?' The artistic product, for Deleuze, embodies the force to recreate itself, and thus to endure in the universe. This phenomenon is a bloc of sensation.

Keywords: creation, Deleuze, Francis Bacon, Heraclitus, movement, real, sensation

I. The Figure is an Instance of Becoming

The work by Bacon, Cézanne and other painters represents a dynamic field of interpretation of the images it presents, rather than a static copy of them. In *Logic of Sensation*, Deleuze outlines his comprehension of art as an aesthetic *experience* (which, thus, includes time and motion). Deleuze's logic of sensation, in fact, assumes that modern painting produces 'musical' and 'rhythmic' effects, rather than resting on the unvarying opposition of copy and model (see Deleuze [2003] 2004: 71ff., 82ff.). However, although the artist's interest is greatly kindled

by the task of 'rendering movement', it is Deleuze's idea that in any creative process becoming is affirmed together with being – as in rhythm, subsequent beats are musical when they are thought of as part of a 'simultaneous' silent duration.

In Bacon's experience the primary pictorial subject, the Figure, is not just a compound of colour and form. The artist is never satisfied with 'rendering the visible'. Deleuze believes Bacon's aim is to 'render visible', that is, to discover the hidden pieces of a fact and to manifest them on the canvas. Common objects, as we *see* them, are images that can be separated into their two components: form (contour) and matter (which in painting is a question of colour). To render the visible would be to paint what one sees: contour and colour. In order to achieve his aim of rendering visible, however, Bacon has to paint what *seeing* means for him. This is to paint sensation; otherwise he would be painting what he senses. Therefore, to paint sensation is to re-create or re-interpret the perspective of the subject seeing, in addition to reproducing the object seen. Subject and object are indissoluble (Deleuze [2003] 2004: 34). For Deleuze, art does not associate a content to a correct formula which expresses it. Instead, art is interested in decomposing (sensed object, on the one hand, and viewing subject, on the other hand) and recomposing (sensation). The painter shares the musician's attentiveness for the harmony of the two moments: his aim is composition in the sense of a melody. Better put: his art consists in a resonance between visible and invisible, or heard and unheard. '*It is rhythm itself that would constitute the Figure*' (71).

Bacon never paints *one* Figure, he rather paints coupled figures, under the influence of a single force (Deleuze [2003] 2004: 65). Painting, being a matter of combining the dynamic and the static aspects, utterly prepares the audible aesthetic experience. More than melody, thus, canvases are places of resonance (69). A Figure is sensation, but sensation is 'difference of level' (65). Art aims not at reproducing the sensed model, but at re*producing* sensation. (Bacon's Platonism appears rather weak when he says that his series of Popes is meant to *re*produce Velázquez's work.[1]) Bacon, in an interview (easily accessible online), reveals to Melvyn Bragg his ambition as a painter: 'I want to be able to *re-make* in another medium the reality of an image that excites me', he insists. Inevitably, Bacon's Figure is not *one* figure. It only achieves the task of enveloping sensation by presenting not simply the superficial level of images or clichés, but also the level 'beneath'. Deleuze repeats that painting is not so much about representing images as it is about metaphysical forces. 'Everything is force' (Deleuze [2003] 2004:

59). For him, 'we can go behind the [apparent] movements to these forces'; in fact, 'the visible movements of the Figures are subordinated to the invisible forces exerted upon them' (62–3). In Bacon's work, Deleuze suggests separating three things: a Figure, its levels (a system of subordination) and the re-composition of its levels in one sensation. We have Pope Innocent X; we have the visible mouth and the invisible forces that make it; and we have the re-making of the aesthetic experience of the scream as such. From *one* representation Bacon leads the philosopher to an event (a movement, a becoming), that is, the moment in which a sensation passes from the level of an impetus to that where it becomes visible.

The question of sensation (that is, the essence of the artist's creativity) follows, for Deleuze, the stages of a thought that considers becoming together with being (or the river of chance together with the circular power of time). At first Deleuze acknowledges that any affirmation of being entails an affirmation of becoming. In order to recapitulate Deleuze's *Francis Bacon*, I found it necessary to compare this work with what the tradition attributes to Heraclitus. Heraclitus writes that by stepping in the same river one can only be flown upon by different water (Krik [1954] 2010: 367). Similarly, he writes that the sun rises every day and is ever changing (264). Everything is transformed, for the Obscure; for, if it were not, then it would not *be*. 'Even the barely-drink disintegrates if it is not moved' (255). In this affirmation of becoming, Deleuze is similar to Heraclitus and, with respect to the Obscure's convictions, he states:

> [Heraclitus] *made an affirmation of becoming*. We have to reflect for a long time to understand what it means to make an affirmation of becoming. In the first place it is doubtless to say that there is only becoming. No doubt it is also to affirm becoming. But we also affirm the being of becoming, we say that becoming affirms being or that being is affirmed in becoming. (Deleuze [1983] 2002: 23)

At first, thus, it is clear that Deleuze absorbs both notions. A second stage concerns their relation. If a Figure affirms becoming and being, what possibly admits their link? Logic allows to say that becoming just becomes, and thus to conclude that only being *is*. In aesthetics, however, Deleuze shows that an eye is not simply limited to contemplate what *is*. An eye is already a philosophical subject; it can always ask the question, 'what sustains that which I see?' There is a difference between a logical and crystallised 'screaming *before* or *about*', and an aesthetical 'screaming *at*' the forces it is going to become (Deleuze [2003] 2004: 61).

We are presented here with a figurative notion of image and a figural one. We could say that, with Bacon, Deleuze works on a separation of levels, and, by repeating the question 'what sustains?', a difference returns. The logic of sensation can bind being and becoming together for it works on a difference of level. Thus, we get a glimpse of a second element of similarity between Deleuze and Heraclitus, who also considers the confrontation of stable beings (the day as opposed to the night) to be a function of a 'divine Logos' (Krik [1954] 2010: 33), that is, the visible determinations to be a product of grounding forces.

We get to a last stage, the threat of Platonism. Difference of level is not new in philosophy, and Deleuze has to face Plato's philosophical reasons, if he wants the Heraclitean becoming to support his point of view on art (that the pictorial subject is not a copy, but embodies sensation and, even, a sensation that 'moves'). To put it differently, Deleuze has to show that there is no 'model', in the height of the sky; that the grounding forces also collapse under the strokes of becoming; that the reality of becoming is not contradicted as an unchanging reality. A third question arises: how can becoming be preserved? The Heraclitean answer to this question would be that there is no mistake in thinking becoming as a superficial effect of a 'stable' divine ground, precisely because, apart from metamorphoses, becoming is an immanent principle with no depth, or a cause with no substance different than its pure effect. 'War is the father of all and king of all' (Krik [1954] 2010: 245). Similarly, Deleuze describes the Figure. A Figure is already many entangled figurative moments; they fight like wrestlers, or they re-compose the rhythmic meter. It is a *war* of bodies that affirm one fact (one battle) (Deleuze [2003] 2004: 66). Our third question is answered as follows: becoming is not contradicted because only its surface returns – only the river of succession.

Bacon never stopped admiring those static images of movement – he never abandoned the question of 'how to render movement' (Deleuze [2003] 2004: 58). Time marks the passage from image to image; therefore images are present from time to time. The issue of a present that flows (the Baconian Figure, which descends the stairs – see *Portrait of a Man walking down Steps*, 1972) encounters one of the most beautiful answers in the wonder of the Obscure: one is the way up and the way down (Krik [1954] 2010: 105). As if we were before a paradoxical image or a 'geometrical improbability', the Figure is not more the isolation of the bodies that wrestle (before up, afterwards down), than it is the dynamic zones of the painting where the two bodies are indiscernible – a third possible body which is at once up and down.

In the same manner rhythm is not more a separation of two distinguished beats, than it is a re-composition of undistinguished intensity between them (resonance).

Heraclitus, like Deleuze, distinguishes between the level of the visible succession and that of an invisible co-existence. Heraclitus admires and praises the unrecognised and unseen connections. 'The real constitution of things – he says – [...] is accustomed to hide itself' (Krik [1954] 2010: 227). We also know that the distribution of distinguished and distinguish*ing* (of image and of force) in Deleuze corresponds to the relation of subordination of visible to invisible. In other words, on the one hand, the philosopher isolates the metamorphoses or oppositions visible to the naked eye, and, on the other hand, he points at forces which minister their becoming. Heraclitus, in a very similar manner, subordinates objects of succession (earth, water, soul) to forces of creation/destruction (life/death): 'For soul it is death to become water, for water it is death to become earth; out of earth water comes-to-be, out of water, soul' (339).

To the third issue we add that both Deleuze and Heraclitus say that the face of the invisible is that of *war*, but to war they assign a special meaning. The face of the ground is never collapsed to an identity: Heraclitus never says that all things, being at war, face the *same* (death). War is rather a principle of affirmation of becoming, for it is the generative concept of a philosophy that, within the field of battle, separates and *recomposes* forces (hunger – satiety, life – death). Deleuze also signals that war is not the cause of the coupling sensations; it is a surface effect. War, thus, should not motivate a figurative pessimism, for it is only one face of a figural optimism:

> What produces the struggle or confrontation is the coupling of diverse sensations in two bodies, and not the reverse, so that the struggle is also the variable Figure of two bodies sleeping intertwined, or which desire mixes together, or which painting makes resonate. (Deleuze [2003] 2004: 69)

There is something in the Deleuzian thought on art, which, without replacing endurance with temporariness, the figural with the figurative, or, even, the circle with the river, turns to the moment of birth as the clue of the whole business of becoming. What matters in art, for Deleuze, is the creative process of the artist, and not a static model of 'beauty', re-interpreted and copied to the best of the artist's abilities. The artist does not 'repeat' the model, nor does his work represent a 'different copy'. If the artist re-makes something real, all of Deleuze's effort is directed at arguing that any experience is an entirely *creative* experience.

In any experience (for instance, the aesthetic experience I have watching a painting) a new 'I' is created (an 'I' that has contracted the power of seeing the scream). It is a phenomenon of difference, or a habituation and repetition of one's 'I'.

Becoming is *creative* because, as rhythm, it has the same force of time to 'accumulate', to 'pass', to coagulate sensation or to destroy it. Deleuze's forces account for a becoming that becomes something; for Deleuze, an image truly endures on condition that it reveals the forces that sustain it. In the creation of a body, or in the re-creation of a Figure, a spirit becomes independent from every 'now' and every 'before'. It simply appears; it simply becomes and comes into being. If in *Difference and Repetition*, by creation, a body faces its destiny, in *Francis Bacon*, a Figure unshackles itself from the artist, as if the creator were able to bestow on it the strength that allows it to reproduce its own 'pictorial' life (see Deleuze and Guattari 1994: 163–5). 'This is the reality of becoming.'

If Bacon represented a figure opposed to the embodiment of its fears, he would have involved a segment of temporality in his representation. He would have painted the scream and the horror, as if they were two objects interacting through a spatiotemporal opposition (here is the feared and there is the scream; horror is the future and the squeal anticipates it). However, Deleuze notices that the artist avoids by all means presenting a given opposition of subject and object. This supports the Deleuzian intuition that art must rule out narration and temporal succession. At the core of this accord between the artist and the philosopher it is worth quoting the words by the philosopher himself: 'difference remains not the given itself but that by which the given is given' (Deleuze 1994: 226). Difference is never the product more than it is the producer. We must affirm the creative power of difference, for it 'makes itself, as in the expression "make the difference"' (28). The challenge in painting time is that of registering the difference in its making – the individuation of a spatiotemporal opposition in its source.

As to the destructive power of becoming, or the negative power of difference, the Deleuzian must understand that they are 'moments' of a creative difference and repetition. 'End' is just a face of becoming; its correlate – death – is only its negative representation. *There is no end*. (Aesthetic) experiences are products of a mechanism of difference and repetition. In Deleuze's writings there is a connection between 'becoming' and Difference, 'different' and negation. In fact, becoming and Difference represent the positive head of a negative facial expression,

or partial difference per negation. The excitement we sense for life is a creative source from where both different lives and a succession of deaths take place; life affirms both different lives and possible deaths (see Deleuze [2003] 2004: 62). Indeed, difference, for Deleuze, is no less generative than permanence and preservation are devitalising moments of an experiencing spirit.

II. Painting a Living Fact Alive, Painting Sensation

According to Deleuze, Bacon focused on the static as well as on the dynamic component of the aesthetic experience (in accordance with his philosophy of becoming and with the ancient image of the river). How then is a body real beyond a sequence of representations? In other words, how, despite the violence of an image's deformation (I used to be one metre tall, now I am one metre and eighty) can the body survive? Understanding the Deleuzian appreciation of the painter in *Francis Bacon*, therefore, means to be able to adopt the following point of view: we can sense something real beyond and besides the constant brutality with which facts are exposed to change.

An image can change and yet keep hold in the realm of the visible; it can assume much-distorted contours and colours; it can even change its mode of activity. The artist's aim is precisely to 'record' how things are, and how they can become in the future. This is why Bacon puts so much stress on the notion of 'free marks' or 'chance': 'I want a very ordered image – he says – but I want it to come about by chance' (Sylvester 2008: 56). Bacon's basic idea is to introduce a dose of chance or chaos into a pre-given image (like in a photograph), and thereby to trap the figure in its most natural movement, that is, in its most factual, intense appearing. Precisely this power of re-creating the real is what Bacon sought in his work (172), and clearly this is what makes art difficult and the life of the artist a struggle.

Merleau-Ponty had done something similar with Cézanne as Deleuze attempts to do with Bacon in *Logic of Sensation*. Merleau-Ponty writes that the artist discovers 'the geological foundation of the landscape' (Merleau-Ponty 1964a: 17); that the artist looks at 'germination', at birth, and puts all his effort into capturing the continual rebirth of existence. As with Bacon, Cézanne was plagued by self-criticism and doubt. Merleau-Ponty gives a name to his struggle: 'he considered himself powerless because he was not omnipotent, because he was not God and wanted nevertheless to portray the world' (Merleau-Ponty 1964a: 19). Though Bacon's life was probably very different from

Cézanne's, it is safe to say that they were both struggling for the same task: to paint the real, to paint the world, to avoid second-hand images, photography and clichés. In a word, their desire was to re-create reality. As with Heraclitus, the real constitution of things is thought of as hidden. The artist, who wants to capture a fact in its innocence, or in the moment of its pure presence, has to select its representations, clean its surface and reach what is beyond visibility. Painting is about creating forces, not about imitating skills.

Deleuze's focus on forces rather than on the represented images shifts the idea of art as imitation to that of art as creativity. Deleuze, by the notion of force, might be denoting a face of becoming, and contrasting the artist's creativity with the subject's static dependence from an object-model. Creativity, however, must not be interpreted as an inversion of such a dependence relation; in fact, Deleuze would not simply expect Bacon to populate the world by generating unknown images. Creativity is rather a complex process where the artist bestows on his creature the spirit of an independent struggler for survival, not without gaining for himself a renovated organ of sensation. For Deleuze, the aesthetic experience is always a double creation of a Figure and of a viewer – that is, a mutually dependent process of sensation.[2] Firstly, sensation coagulates on the side of the canvas; that is, a painter moulds a new Figure. Secondly, sensation coagulates on the side of the viewer; that is a spectator is educated to see (I learn from Bacon to appreciate the untold effort required to open a door). An artistic experience is a complex moment when a bloc of sensation produces the independence of the work from the subject, and measures their distance. This is creation proper; that is, to render durable a moment of the world, or to make it exist in its own right (Deleuze and Guattari 1994: 172).

Bacon, as Cézanne, was aware he had the mission to germinate, to implant on canvas the seed of the unseen perception; but Bacon also knew that he was not God. He could not create *ex nihilo*, for to create is always situated in a possible creation (Deleuze [2003] 2004: ch. 11). However creative the act of painting appears, the artist is limited to what is already on the blank canvas. The artist starts with decomposition, de-organisation (some say reduction). He compresses what is under his sight until it explodes. Only then will a new creation be possible: the artist moves reality or deforms it (making any object pulsate: compressing a head, letting a face come under explosive forces – see Deleuze [2003] 2004: ch. 8; Sylvester 2008: 8–18). In Bacon's portraits, he painted heads, not faces. Why heads? Because the head is the de-humanised human face. The head reminds one of a known person, but it is violently

manipulated under the hands of the artist. (Bacon's interest in that which is impersonal or purely de-subjectified recurs in *Interviews*; see Sylvester 2008: 40, 51, 194ff.) The body is also mere body, just matter under the pulsation of cosmic forces, the same that moves dust and planets in the universe. Perhaps this is even the same that actually makes the universe itself expand. The artist applies this merciless rhythm on heads and on other human bodies. Up and down, inhalation and exhalation, compression and expansion, the painter paints the forces that strike and inhabit the body. Bacon lets invisible forces 'strike the head from very different angles' (Deleuze [2003] 2004: 58).

The movement that distorts Bacon's Figures is not the spatiotemporal movement that drags creatures around (from place to place) until they meet their end. Rather, it is the same 'sacred source' that creates them.[3] 'What I want to do – says Bacon – is to distort the thing far beyond the appearance, but in the distortion to bring back to a recording of the appearance' (Sylvester 2008: 40). Pope Innocent X, for example, is moving *in place* when he makes his appearance first in the work by Velázquez (1650) and then in the work of Bacon (1953). Change is of two types: a change in place and a change of place. The latter is supported by the framework of narration: firstly there is the 'here', and then comes the 'elsewhere'. The former type of change, in contrast, is not as clear and straightforward: it is the exploration a subject makes of its own space, of the space where the subject takes place. Change is essentially movement, but of two types: a change in place is analogous to a movement of creation, while a change of place is analogous to a movement of narration. In his book on Bacon, Deleuze develops an ontology of artistic creation, that is, a study of movement that allows a 'fact' to occur. The first and only rule of this ontology is to exorcise the figurative or illustrational, of which narration is the correlate. What Deleuze was struck by in Bacon's work, and what he attempted to provide a philosophical account for, was the way Bacon was able to preserve the likeness between what he painted and the living object, all the while allowing the artistic product to move in place. Bacon attempts to preserve the likeness between the thing painted and the living thing, but not without allowing the artistic product itself to move in place. In so doing, Deleuze absorbs into his philosophy Bacon's task of 'reporting' or 'recording' sensation (Sylvester 2008: 60). Sensation is precisely what survives change.

Painting, in Deleuze's *Francis Bacon*, ministers the liberation of what is beneath representation (Deleuze [2003] 2004: 49, 52) – it captures a presence that survives change. Though faithful to a vision of flux, what

Deleuze is looking for is that element in flux which does not change, die or vanish. He looks into the way Bacon speaks about and understands his own work, and works out the philosophical implications of an artistic movement that tries to 'trap a living fact alive'. The resulting *Logic of Sensation* constitutes the philosopher's attempt to extrapolate from the work of Bacon the kind of movement that allows sensation to endure, that is, to persist in its rhythm.

What Deleuze wants to rule out is the type of movement that would never allow a fact to endure (namely, the movement of narration, the chain of which merely displaces sensation rather than allowing it to accumulate around the image). Bacon must exorcise figuration. The sole movement that inhabits his Figures must not be a movement that takes place in time; instead, time collapses on the original moment of the Figure's appearance. It is the Figure's movement of creation. Figures are not to tend to any model outside of time or to a narrative completion in time. They have to endure in the portion of time that allowed them to come to be and to reproduce that movement – this is why Deleuze insists on Bacon's capacity of painting time as such. They must stand up on their own, allowing a moment of the world to exist by itself (Deleuze and Guattari 1994: 164, 172). In much the same way, Merleau-Ponty was sensitive to Cézanne's wish to render the type of movement that sustains itself, is preserved in the object, and does not pass away. This is the issue of a creating original-time. Merleau-Ponty writes about Cézanne: 'an emerging order, of an object in the act of appearing, organizing itself before our eyes' (Merleau-Ponty 1964a: 14). In Deleuze's words: the artist concentrates a bloc of sensation *from the whirlwind of time and makes this bloc imperishable*, or at least it tends toward this direction as much as possible. Art must endure; the subject painted on the canvas must be capable to stay where he is, to do what he is doing, to scream his scream, forever.[4]

The study of appearances (as it is understood by Merleau-Ponty) allows Deleuze to conceive of becoming as subject to the laws of aesthetics. Aesthetics, in this sense, means simply 'that I see', or 'that which allows me to see'. In Deleuze's hands, the philosophical problem of sensuous determination may point at a series of artistic solutions. Among these Deleuze selects Bacon's paintings and interviews. It is here, with the converging of becoming and Bacon's Figures, that Deleuze's notion of difference is illuminated by Bacon's notion of sensation (that which hits upon one's nervous system). The action of a force on a body creates sensation: here an organ might temporarily take place. An eye 'sees' and 'allows the body to see'; it moves. From a sensation localised

on the head it transits to other parts of the body. Other parts of the body become visible:

> Painting gives us eyes all over: in the ear, in the stomach, in the lungs [...] This is the double definition of painting: subjectively, it invests the eye, which ceases to be organic in order to become a polyvalent and transitory organ; objectively, it brings before us the reality of a body, of lines and colors freed from organic representation. And each is produced by the other: the pure presence of the body becomes visible at the same time that the eye becomes the destined organ of this presence. (Deleuze [2003] 2004: 52)

It is as if the river became 'coagulated' sensation with the body leaning towards new sensations. We can therefore see how for Deleuze and for Bacon perception of the real is not a matter of sight, but a matter of creation. Their central problem is to capture and explore those forces that sustain the visible. Deleuze's insight into art is that capturing forces, which is the same as *painting sensation*, pushes a bloc of sensation outside of the circle of narration. The artistic Figure enters durability precisely within this movement.

Deleuze radicalises the question of 'germination' that troubled Cézanne: art not only reveals to us how things appear, but also the process through which they appear. In this way, art shows us how the real is created. For *art creates in the same way* – undoubtedly, Deleuze refers to a 'materialist creation'. Deleuze goes further than Heraclitus: metamorphosis is always already exposed to novelty, that is, to indetermination. For him, to the sequence earth – water – soul there follows nothing like its circular inversion (soul – water – earth). The three-layered Figure is the living present opened to *creative* zones of affirmation:

> Life alone creates such zones where living beings whirl around, and only art can reach and penetrate them in its enterprise of co-creation. This is because from the moment that the material passes into sensation, as in a Rodin sculpture, art itself lives on these zones of indetermination. They are blocs. (Deleuze and Guattari 1994: 173)

Logic is the realm of the ordered surfaces of meaning, and the sight that seizes upon such layers captures something of the reality that logic organises. It is as if the *terms* of some logic had the same creative power upon reality that the divine *Verbum* has on the shaping of being. Deleuze discovers some of those *terms*, and these are in line with Heraclitus's obscure but divinised reality.

III. Becoming and Sensation, Save the Contour

In *The Logic of Sensation* – chapters 1–11 – everything is in movement. Movement is the key to the interpretation of the book, because movement is taken as the true character of sensation as such. A perennial exchange between 'opposites' occurs – a perennial coupling of sensed and sensing. Just as physicists increasingly tend to conceive of matter as intensity, so Deleuze believes that whatever *is* in being is nothing but high-speed motion. An example will help us further understand. Let us take a worldly object and reveal its nature of pure motion. A mouth: the compound of teeth, lips and a hole. What is a mouth? How do cosmic forces relate to it? How does a mouth become a mouth?

Do I need to escape? We can assume that, in order for us to conceive of an organ, we also need a function for it.[5] What is the function of the mouth, for instance? Bacon might have suggested that the mouth's function is 'to let it out', or 'to let it in': a man wants to free himself through his own mouth (or through the washbasin – which amounts to the same thing). Bacon then has some solid, undetermined material which is the body, but the body does not have any organs yet. It is rather an 'indeterminate organ'. Furthermore, this unformed body is traversed by an intense wave which, in Deleuze's words,

> traces zones and levels on this body according to the variations of its amplitude. When the wave encounters external forces at a particular level, a sensation appears. An organ will be determined by this encounter, but it is a provisional organ that endures only as long as the passage of the wave and the action of the force, and which will be displaced in order to be posited elsewhere. (Deleuze [2003] 2004: 47)

Then a mouth comes to being – as a result of the unapparent intense movements under the radar of visibility.

It has been mentioned how the primacy of invisible movements over the representation of the appearing object brings Deleuze's ontology closer to that of Heraclitus. Deleuze considers the example of how two rather differentiated images reveal their invisible becoming, that is, how they lead to a region of being that allows no differentiability itself. Man and beast are not only similar; they are the same 'thing' in the realm of becoming:

> This is not an arrangement of man and beast, not a resemblance; it is a deep identity, a zone of indiscernibility more profound than any sentimental identification: the man who suffers is a beast, the beast that suffers is a man. This is the reality of becoming. (Deleuze [2003] 2004: 25)

But the experience of movement and becoming in Deleuze's work on aesthetics recapitulates the flux of Heraclitus, and adds two notions to it: creation and sensation. Becoming rests on the aesthetical encounter of a movement that creates and a movement that coagulates sensation; we have already seen above: 'painting gives us eyes all over'. For Bacon, these two are spontaneously related in the work of art: art creates sensation and it accumulates sensation around its creatures. But it is only with Deleuze that Bacon's intuition assumes an ontological import. Painting creates sensation (on the canvas and on the viewer), and sensation accumulates around creatures (around the 'I' and around the Figure). Music, for instance – the crossing of a number of waves in a complex topography of vertical and horizontal distances – has the power of generating and dissolving bodies. Different speeds, different timbres and music's crucial power of emanating sensation make this possible. The same is also true of Nature: there is first the tension that makes the appearance of different species of animals vibrate, and also a rhythm of several coordinates of sensation: food chain, or suffering. The concept is that the artist faces and manipulates chaos, or the flux. He filters the reality of becoming through the levelling of sensation (suffering, the need to escape, and so on); and finally he *creates*, that is, he allows an image to differentiate itself from those movements that make any image vanish into something else (flux). The Figures of Bacon, for instance, are objects which are able to sustain their own appearing; they do not undergo the movement that resembles first man, then beast; first soul, then water, then earth. They already *are* that movement – indiscernibility; they are closer to a pure bloc of sensation.

Deleuze discusses how the artist deals with movements that nest themselves in any possible appearance. In addition, although it is the task of the artist to break up the sovereign optical organisation, to face the chaos and reproduce its movement, he admits that the artist is never to let the catastrophe proliferate and shadow the Figure-ness. The hands of the artist touch the chaotic movements, his brushes and sponges recreate some of them on a canvas – then, the fight to limit and control the catastrophe begins (Deleuze [2003] 2004: 111). The artist faces the chaos or flux – the graph of the waves of a musical instrument, the several forces making the planets rotate – and strives to trap a fact alive, without allowing it to vanish. 'Save the contour' (110).

One might want to ask whether the mouth painted by Bacon (or the mouth of the figures which take shape on any *topos* of his canvas) is indeed a coming to rest of the flux. Is the activity of the artist a production of those differences that stop the flowing of differences?

Deleuze describes the artistic experience of creation as follows. In the first place the artist has to face the chaos by means of introducing on his canvas a-pictorial marks. This destroys the emerging figuration. It is as if the dominion of our daily sight is destabilised by measured doses of the unseen – it is in this pre-pictorial moment that the invisible chaotic reality of flux shows its face. However, the experience of this latent catastrophe can be dealt with in very different ways; every great painter has to find his way in it. 'Where painters differ is in their manner of embracing this non figurative chaos, and in their evaluation of the pictorial order to come, and the relation of this order with this chaos' (Deleuze [2003] 2004: 103). Deleuze designates the different 'manners' with a technical term: the notion of diagram. 'Van Gogh's diagram, for example, is the set of straight and curved hatch marks that raise and lower the ground, twist the trees, make the sky palpitate' (102). A diagram is called an 'operative set', and it is 'a possibility of fact – not the fact itself' (110).

Firstly, the question above receives a negative answer. Deleuze does not see the artistic product as an arresting of the flux which characterises any appearance whatsoever; instead, Deleuze is addressing art in general, though of course he focuses on the work of Bacon in particular. In the work of different artists, the flux finds virtually compossible resting points (Bacon and Kandinsky, Kandinsky and Pollock, and so on). In this sense it is not only Bacon's Figures that are an answer to the Heraclitean flux; it is also Deleuze's Figure-ness (the fact established by a bloc of sensation).

There is still another reason for giving a negative answer to the question above. If the work of the artist tries, at any price, to limit the chaos which precedes the becoming of the object, it does not do so by collapsing movement onto rest or difference onto the model. The fact that a bloc of sensation is able to endure does not mean that a bloc of sensation receives a fixed shape; to endure means not 'to be so' – 'to be lips, to be teeth, to be tongue'. What enduring requires at the very least is to be able to re-create the movement that first allowed the appearance of a mouth. The Figure traps movement as a fact – the fact that a mouth moves. A mouth becomes a scream – a mouth screams. And a scream becomes an ear – the ear that listens to the scream. Deleuze speaks of a metamorphosis that does not dissolve the mouth into a sound, and the sound into its listener: 'sensory becoming is the action by which something or someone is ceaselessly becoming-other (while continuing to be what they are), sunflower or Ahab' (Deleuze and Guattari 1994: 117). Thus, Deleuze's idea is not that the artistic product is a visible portion of an invisible chain in metamorphosis.

Art does not need an object as we commonly see it (like what happens with photography), because art can deal with its invisible becoming and produce the schema of a new possible appearance of 'it'. With the notion of diagram, Deleuze reformulates the concept of flux in terms of what allows invisible movements to make an object appear. The diagram, being an operative set, balances itself between probability and obscurity; it gives access to new areas of sensation. It is true that art needs contours (just as appearance needs 'something' to be seen), thus it necessarily 'stops' movement, as Deleuze acknowledges – 'and above all, a new figuration, that of the Figure, should emerge from the diagram and make the sensation clear and precise' (Deleuze [2003] 2004: 110).

IV. The Logic of Sensation

How does a mouth become *this* mouth? This is an ontological question. A similar question, posed along aesthetic lines, seems to be the one Deleuze is after: how does a painter paint a mouth with his brushes, and how does that mouth on the canvas create the painter's actual mouth, out of the brushes' reach?

We shall hereafter read Deleuze's *Francis Bacon, The Logic of Sensation*, in particular chapters 1–11, starting from the last ones: we shall read it as a *phenomenology of sensation*. Indeed, our aim is to understand how in each chapter movement – inhalation and exhalation, compression and expansion – gives rise to a lasting figure of Bacon's art. We have to go through several 'levels of complexity' of motion: every chapter develops one or more phenomenological steps that describe the artistic co-creation of the real. One instance of the levels or steps might work as an example. In *Francis Bacon* terms like 'human meat' and 'animal meat' (dog), are terms of a perpetual becoming opposite of the opposite. A dog easily becomes a man in Bacon, and vice versa. However – and here is the idea of an aesthetical answer to Heraclitus – the incessant flux between the two poles of the movement is the starting point, both for Bacon and for Deleuze, for the search of the *being* of the flux, that is, for something stable in the flux – its measure and source. In the context of this example, there is something invisibly at work: the Figure-spirit. The spirit is neither human nor animal: it is their zone of indiscernibility. It is the unapparent that sustains the apparent, an approximation to the notion of a bloc of sensation. Hence, in the Deleuzian lexicon there are not only terms for the flux, but, prior to those, there are terms for a durable entity, Figure-ness, that is, a fact of nature.

Most of the chapters from 1–11 in *Francis Bacon* reproduce the schema of the Heraclitean flux-movement whilst offering the aesthetical answer Bacon put forward – a fact, or stable reality. Thus, we now read the work by Deleuze aiming at grasping both the terms of the metamorphoses, and a stable fact that sustains those opposites. That is, those terms of a logic of sensation that, underneath the range of visibility of the naked eye, grants our worldly sensation.

Preliminary Movement: The Painter Jumps into the Canvas and the Canvas Offers Him a Chance to Escape – Chapter 11

A canvas is never blank, not even before the artist paints on it. It is an imposition: our sight is dominated by historical clichés, and the less visible they are, the more powerful they are. Bacon's cleaning woman would not 'see' these clichés; she would think that the canvas was empty. On the contrary, Bacon knows in advance that that which is in his head or around him in his studio represents the most probable, that is, the image which is already given on the canvas. The blank canvas is not a mirror, but it contains virtually – with high probability – what is usually seen around. There is already a flowing of appearances that reaches the canvas from the head of the painter, or from his room. In addition, a response of the canvas is already there, and this is a less probable mirroring of that which is around – a distortion. An artist sees those invisible movements that support both probable figuration and its distortion. He 'apprehends' – Bacon says – the presence of pre-pictorial connections between the movements of his brushes and the emergence of an actual object. A Figure emerges: the Heraclitean flux (the movement that takes the man and the canvas closer) has found the first measure of its own motion. Between figuration and chaos an artist makes an object again, a pictorial Figure.

Invisible Movements of the Figure An Acrobat Balanced between Fame and Death – Chapter 6

The Figure in Bacon is the result of movements of invisible forces, and indeed it is itself in constant movement: how can it be durable, then? Its movement, insofar as the artistic work has achieved its task, is itself invisible, internal and external to time and space. The movement of the Figure is not spatiotemporal (Deleuze often states that the Figure *is time*). The Figure in Bacon actually seems to have honoured the first and only rule of Deleuze's ontology of creation, because it excludes

figuration and avoids narration. There is no narration in Bacon: Deleuze insists on the capability of the artist to leave historical time out of his paintings. But the lack of narration is not the stillness of a heavy stone, but the equilibrium of an acrobat, suspended between probable death and fame. He vibrates internally, he wants to live but his life is consigned to immobility, balancing between the forces of gravity and death. The portraits, the Figures, the acrobats, every object of Baconian creation 'moves "in-place"', a spasm towards life facing the forces of fear (see Deleuze [2003] 2004: 61–2). All of this movement, which is actually the will of an object to emerge over chaos, is not for nothing, but in fact approaches eternity. The Figure exists, so to speak, more than ordinary objects themselves.

What Comes to Pass at the Heart of a Figure: Both Force and Sensation – Chapter 8, or the Rebirth of Existence in Pure Sensation

One unsettled issue in Deleuze's *Logic of Sensation* is the relation between 'force' and 'sensation'. Is the Figure the result of unapparent chaotic forces or is it the artificial bloc of sensation? Definitions do not help. Consider for instance the confrontation of the two expressions that Deleuze uses: 'paint the sensation' and 'painting forces'. What is painting, the capturing of forces or the rendering of pure sensation? The following hint provides some guidance: sensation 'remains at the basis of perception, perception in turn being what brings about the creation of events' (Conley 2005: 244). Perhaps the Figure is not everything in the Deleuzian aesthetic universe, but there is still room (and there must be) for a perceiver. The perceiver distinguishes forces that constitute, in their play of visible and invisible, organic Figures and definite shapes. The Figure reciprocates by emanating sensations, so that the perceiver is once again hit by forces which have now acquired the artistic nature of a bloc of sensation: 'some paint comes across directly onto the nervous system' (Deleuze [2003] 2004: 35). This 'outcome' has eternally already gone back from the perceiver onto the body of the Figure, and it *makes* its reality (as if the cosmic forces could in fact subtract from the perceiver some of its reality with the scope of increasing the reality of the object on the canvas). A sensation, through the organs, strikes a body, then organs dissolve again, but the wave is the real as such. It immediately hits the perceiver (there is no time in-between its production and its effect) and 'when sensation is linked to a body in this way it ceases to be representative and becomes real'. The perceiver hit by the sensation *develops another organ*, the organ that was dissolved in figuration by

the intensity of the sensation (Deleuze [2003] 2004: 45). The exchange occurring between the Figure and the Figure's perceiver is the becoming real of the sensation itself, its bypassing of the perceiver's subjectivity and its formation as a bloc of sensation. This is the Figure then: defined by the income of directed forces while emanating filtered sensations. This is its equilibrium, this is the flux of which the Figure is the filter; this is the eternal pulsation of opposites and the emergence of the acrobat. Bacon has obtained the subject of what Merleau-Ponty calls the 'continual rebirth of existence': the Figure.

In the remaining part of the book that we will focus on (chapters 1–11, excluding those already analysed, namely 6, 8 and 11), Deleuze explores the logic of the Figure's movements; that is, its logic of sensation. From now on the terms of these movements will be eminently 'Baconian': 'animal', 'hysteria', and so on. These terms introduce levels of complexity of the Figure's movement within Bacon's work alone, therefore they cannot really be used to refer to the work of any other artist. *The Logic of Sensation* is an aesthetical answer to the problem of the Heraclitean flux: everything is in motion, yet some reality makes its way towards being, passing from the realm of invisible forces towards the surface of a canvas. What follows is precisely the exemplification of this rule of motion in Deleuze's *Logic of Sensation*. Deleuze's work is the analysis of the levels of complexity through which the artistic object passes. Every chapter corresponds to a certain level of complexity. In order for the birth of the artistic object to take place – this is where Deleuze responds to the problem of the Heraclitean chaos – we must read through Deleuze's presentation in reverse order. The reason for this is that Deleuze's presentation proceeds by unfolding the logic of sensation, while another task is pursued: the concentration of all movements onto one single coagulation of reality.

From the Fall to the Figure – Chapter 10, Considering the Case of a Triptych

A sensation, being defined by different levels of intensity, circulates throughout the painting (Deleuze [2003] 2004: 76). This is already – Deleuze says – a third level of complexity, with the third level corresponding to a movement that, step by step, will eventually lead to an artistic answer – a real permanence on the canvas. Different objects stand for active and passive rhythms (no doubt 'activity' and 'passivity' represent relational notions, as the definition of rhythm suggests), and

their difference is produced by random spurts of paint, which Bacon likes to utilise. The active and the passive interact with each other and correspond to a restless, invisible movement, like the water in a river, which is relatively still and inexplicably ever changing. Let us take a step back to what Deleuze calls a second level of complexity: the passive and the active rhythms form a body or a materiality on the canvas. These are attendants of the movement.[6] They become the visible attendant and the rhythmic attendant. A last step back (to the first level): before, the two attendants were standing only for an attendant-function, depending on the moment of the viewer's perception. The mere function now indeed receives a body of its own, and in fact it is painted: an explicit attendant really observes another attendant, the rhythmic one, who is not observing, but is being observed. The co-presence of two opposite, yet complementary, functions is the cause of the multiplication of the three levels analysed above.

From Resonance to the Figure/Fact – Chapter 9, on Bacon's Bodies

The two attendants (it can also be just one) are in fact the outcome of a more superficial movement: the movement of sensation that involves a subject of sensation, the Figure, and a perceiver of it (the attendant or attendants). 'Rhythm itself would become the Figure.' The vibration between Figure and attendant(s) is a rhythm without narration: this is Bacon's challenge – to paint time without narration. The two must be one *fact*, immediately connected, 'coupled together like "wrestlers"' (Deleuze [2003] 2004: 68) in a single body struggling within itself because of the presence of deeper energies, and never telling a story. From the multiple rhythms dealt with in chapter 10 Bacon obtains a concentration of rhythms, united in a single fact, and led by the Figure: rhythms 'constitute the Figure' (71). Art produces a new reality as the emergence of dark movements under its surface: the Figure's body, or body-vibration.

From the Discovery of 'the material reality of bodies'[7] to the Body without Organs – Chapter 7, the Hysteric Body

The body previously created is mainly the body of a Figure, or, so to speak, the leader of the painting – a human body. The human body is an organism, but the living body is not (for the organism is not life; it is what imprisons life, as Deleuze states). The living body (what we are going to discover on top of the invisible movements which any

materiality is subjected to) is the body of those forces that escape the organised-body and can do without it. The real body is the body without organs, that is, a hysteric body that 'makes' present. Within any body there are the intensities of a sensation, which, when encountered, create an organ: that is our body, or what one easily claims to be a fixed, or given, state. The organ is nothing but a hysteric *adjustment* (Deleuze [2003] 2004: 47) for a provisional liberation of tension. In that point, at that time, painting discovers the pure presence of which it is made: movement, the hysterical movement of a body. Hysteria is the new *figure*, the new aesthetic discovery that derives from the vibration of a body without organs and the organism through which to escape.

From a Hysteric Body to the Real Body – Chapter 4, the Corporeal Spirit

The body without organs is a potential body, or a molecular body, that contains every relation of movement and rest required for the creation of a molar entity. This woman, that girl, this dog, that Christ: these all have an indiscernible basic nature of meat. Meat is true. It is that in which Bacon finds his faith (Sylvester 2008: 23, 46) – though he was not a believer – and what compels him to paint a becoming-animal 'not without the animal becoming spirit at the same time' (Deleuze [2003] 2004: 21). Meat is true because it is the ground of indiscernibility of the ever-becoming (of the hysteric body): there is not a mere analogical correspondence between man and dog, they are not simply 'alike'. However, if the painter is religious enough, then he can see a spirit struggling between man's metamorphosis into a beast, suffering, and at the same time see a beast's metamorphosis into a man, suffering. *This is the reality of becoming*: an animal spirit, or a Christ, whose vital breath tends to resurrection, but which is concealed by a corporeal nature (20) – its destiny is to remain part of *this* movement, and never to ascend.

From the Spirit, through the Material Structure, and to the Fact – Chapters 3 and 1, the Last Shape

The spirit is not the conclusion, because Bacon believes that there is no longer religious possibility, but just 'game' (Sylvester 2008: 29). According to Bacon, Christ and other religious subjects are incapable of transcendence. The only movement they undergo is the same movement every piece of meat undergoes. Chapter 10 deals with the flow of active and passive; chapter 9 discusses the vibration of the attendants.

Every chapter points to a certain level of the Heraclitean flux, and names two opposite constituents; chapter 7, for instance, names the body as given, and the hysteric body without organs. Every chapter represents a level of complexity of the flow. However, there is never mere 'flow', but 'Figure-ness' too: the perceiver of the flow, its *measure* and its *filter*. 'After all, the human body, is in a sense a filter' (Sylvester 2008: 199). For instance, in chapter 4, the flow is represented by the coupling of Bacon's human and animal body. They become, restlessly turning into their opposite, man into dog, dog into man. Yet the canvas grasps hold of these forces of chaos, which, without this grasping hold, would lead to a vanishing of humanity and animality in their meaningless narration. In this way, Bacon paints the Figure-spirit. This is precisely what both emerges from and resists the flux. Heraclitus is challenged by the presence of attendants: *they experience the flux and measure the sensation it emanates, upon their body*. The spirit is not the end. The flow leads back towards its opposite. The Figure-spirit is then the subject of a renewed motion, more superficial than the others: athleticism. At the same time the Figure 'wants to pass to a vanishing point to the contour in order to dissipate into the material structure' (Deleuze [2003] 2004: 17); and 'the material structure curls around the contour in order to imprison the Figure' (14). Eventually, the pulsation between the Figure and the material structure allows the last shape of the Baconian universe to emerge: the matter of fact. This is precisely the event occurring between the Figure and the material structure, via the round contour. The fact, or the matter of fact, rules out figuration because its movement is capable of being without distance and duration. The fact is the bloc of sensation.

V. The Aesthetical Answer to Heraclitus

It remains true: 'Cold things warm themselves, warm cools, moist dries, parched is made wet' (Krik [1954] 2010: 149). It is as if the Heraclitean universe is reshaped. The Obscure used a 'naturalistic' vocabulary – the wet and the dry, the day and the night, the rivers, the fire, and so on. But Deleuze, still maintaining the logic of the Heraclitean movement, pushes Heraclitus's naturalism towards an aesthetical understanding. The dry and the wet become the Figure and the Material structure, or the Figure and the Attendant, or even the Human and the Animal, which forever face off against each other, becoming each other, and vanishing in a moment of indiscernibility.

Bacon wanted to paint something real, but lived in chaos – his studios, too, were extremely chaotic. The real emerges from chaos – from the

game of an incessant movement from the invisible to the visible and again into the invisible – and not 'from nothing' and into 'nothing'. The aesthetical creation does not proceed *ex nihilo* (like God's creation). It requires an unformed material. Indeed, art co-creates the real – and co-creation is a form of re-creation.[8] In chaos there is matter (the meat that Bacon has to shape); while in the void there is nothing, not even the invisible. The chaos that the artist starts from is unintelligible, mysterious, yet it can be grasped in a schema: the becoming opposite of each opposite. The Obscure confronted the problem of becoming: everything is just what it is as long as it becomes its opposite. He called this 'river' and 'flux'. Thus, flux is not simply pure chaos, for pure chaos is beyond representation – how can the pure metamorphosis be painted, or described? Heraclitus gave the schema of chaos, the river, and described it as the hidden flowing of 'every piece of meat' into its opposite.

What does not emerge in Ancient Greece, however, is an account of how something becomes *something*, for Heraclitus seems to have stopped before this problem. For him, indeed, things simply become. In Heraclitus's notion of becoming we also find the problem of endangering its nature, that is, providing a proof that a multitude is not simply one – as in the example of the wise man, who fails to distinguish the day and the night, for they are one (Krik [1954] 2010: 155). But how, then, does something become *that* something? The original intuition of an aesthetics that creates, like Deleuze's, is precisely this: 'unity is multiplicity' (Deleuze [1983] 2002: 24), the opposites never melt into *one*. A man becomes an animal, but not even the deepest sorrow can fuse together man and dog. We can still sense the difference. To sense is to affirm a difference. For difference, rather than being the static opposition of a double identity (subject and object) is the dynamic instance 'at the origin of individuation' (the self individualises and the indeterminate assumes contours). The affirmation of a difference is the superficial effect of a spirit's becoming *something*.

It is here that Deleuze intervenes. His idea is that art has something to say to chaos. Deleuze shares with Heraclitus the view that the cosmos is a compound of terrific invisible forces (chaos). However, the case is not true that chaos is pure darkness, because darkness, like void, allows no flesh: something rises towards the surface and becomes visible. Thus, if there is chaos, there is flesh, hence there is something; and whatever it is (dust, apples or heads), it is able to endure in the life of the universe. Deleuze is still in agreement with Heraclitus when he claims that what endures is unseen by most. The colour changes, the object changes, the

apple changes . . . but *art has something to say to the river of becoming* because there are apples that render themselves independent from the flow of becoming-something-else. They exit the circle of the 'model', stand up on their own, and become themselves the forces that allow any material to express its sense (and the sensation turns *colouring* – see Deleuze and Guattari 1994: 167). There are things which move faster than the movements of the cosmos, and these things are artistic products, blocs of sensations. The *Verbum* creates reality, but does not *refer* to anything; it just makes things come into being by naming them. Thus, it does not express any opinion, contrary to what most think. Ordinary language, perhaps, expresses opinion, but not the *Verbum*. Art co-creates reality; it compels its object to run faster than any possible referent, and to germinate in time even without a perceiver. All art needs is a support or material; aside from that it is autonomous or sufficient – it is a 'sacred source' (Deleuze and Guattari 1994: 172). Apples and smiles are preserved untouched, and so are organs and mouths. These are terms of an aesthetic language that, without giving opinions, re-makes the real. (Not only different affirmations, but also affirmations of differences.)

Notes

1. I refer to Bacon's Study after Velázquez's Portrait of Pope Innocent X, 1953. Every molecular region of the Figure's model (by Velázquez) is faithfully 're-made', just with the exception of the irrational and hysteric presences of his body which are liberated (Sylvester 2008: 26).
2. To be at once at various levels – to be force and to be effect, like the motive power that takes the form of the displaced foot on the path – is to be the artistic Figure. Aesthetics, for Deleuze, can let this possibility become real; that is, art can create a Figure. The artist and the spectator belong to the movement of creation: they are one of the aspects of becoming. The other aspect of becoming is the work of art. If, on the one hand, there are the creator-artist and the creature-work, on the other hand, there is the one who sees and that which is seen. In the aesthetic experience 'sensation' depends on 'creation'. But here, where the creativity of the artist shapes a bloc of sensation, a turn occurs. The dominion of the objective images of the artist's world gains life, the Figure senses. We have the impression that it is the work of art that watches the spectator, as in the case of the forest and Paul Klee (Merleau-Ponty 1964b: 167). Becoming undergoes an inversion of dependence of viewer and viewed. Creation occurs not more on the canvas than on the organs of the spectator. Sensation creates (the artist paints what he sees) because creatures sense (the Figure is like the organ of sight through which the spectator sees a new world). To be at various levels means to be already 'inside the painting', almost be the Figure. It means to be not more sensation or creation, than it means to be their becoming.
3. The words by Bacon are: 'an illustrational form tells you through the intelligence immediately what the form is about, whereas a non-illustrational form works first upon sensation and then slowly leaks back into the fact. Now why this should be, we don't know. This may have to do with how facts themselves

are ambiguous, how appearances are ambiguous, and therefore this way of recording form is nearer to the fact by its ambiguity of recording' (Sylvester 2008: 56–7).

4. Understanding what the artistic work is about is to take into account its power as an artistic product: rendering visible (according to Klee's remark) is more than merely rendering the visible. And this, far from simply being the artist's concern, also has philosophical implications. Two different kinds of notions of visibility are contrasted at present: Deleuze's and Merleau-Ponty's. While the latter believes that visibility concerns a question of vision ('appearances'), Deleuze transforms visibility into an ontological issue. For Deleuze, the artist does not only contribute to the education of our natural vision (see Merleau-Ponty 1964a: 14), but also presides over the coming into being of the thing as such. While Merleau-Ponty believes that art reinforces the capability of vision that lies beyond what is seen, Deleuze puts forward the idea that art reproduces the materialisation of the thing as such. Merleau-Ponty, in contrast, is concerned with 'the exact study of appearances' (Merleau-Ponty 1964a: 11).
5. Bacon ascribes to every organ a certain function, and actually he seems to make the creation of an organ dependent on its function (Deleuze [2003] 2004: 48, 51–2). But one has to contrast between an organic function and an inorganic one. An organic function, such as eating for survival, is ascribed to the mouth by someone that takes the existence of a mouth (and the life of an organism) for granted (a biologist). An inorganic function, in contrast, has nothing to do with the vital activity of an organism. In Bacon, for instance, the mouth takes on another function entirely: it becomes a hole through which an affect escapes. With Bacon and Deleuze, then, one has the chance to question the organic being of the mouth itself (rather than its biological use), both its emergence into the realm of being and its disappearance. While in biology, for example, a vital function serves as the teleological aim of an organ's existence, in Bacon's painting, and in Deleuze's ontology, the function sustains the being of the organ as such, giving it a consistency, or a shape, independent of an organic, teleological aim. Deleuze's notion of function is found prior to the one of organic function: it is the organ-isation of the (organic) function.
6. How can anything create and be created? An object painted on a canvas is 'created': apples. However, Cézanne's apples are illuminated from within (Merleau-Ponty 1964a: 12). Bacon's heads are similar to Cézanne's apples: they are solid bodies with a solidity that is self-creating; or again, they are sensations that are thickened into meat. Thus apples and heads can create: they create themselves. But not *ex nihilo* because then it is a matter of belief; they create themselves for a viewer. Bacon's attendants are signs of viewers. In front of an attendant a head, or a Figure, or an apple, deploys its meat. An attendant is a 'constant or point of reference in relation to which a variation is assessed' (Deleuze [2003] 2004: 13). In Bacon there is not only the function-Figure but the function-Perceiver, too (but they can be united into one).
7. Deleuze [2003] 2004: 55.
8. Bacon seems to maintain that art does not make the real in the same way that a god creates things. For when God produces something, his creature is 'nature'. Bacon, however, thinks that the product of men, and of the artist himself, is artificial. Every production, in other words, is a form of re-production; thus even art, while co-producing the real, is actually re-producing something real. This, nevertheless, should not be confused with the fact that the artificial reproduction of the real is a second-hand reproduction. On the contrary, he believes that 'reality in art is something profoundly artificial and that it has to be recreated' (Sylvester 2008: 172).

Another Use of the Concept of the Simulacrum: Deleuze, Lucretius and the Practical Critique of Demystification

Ryan J. Johnson Duquesne University

Abstract

While many of the most important figures in the history of philosophy have employed the concept of the simulacrum in one way or another, a detailed study of this usage has yet to be written. In this essay, I will attempt to tell the story of a sequence in that history of that usage, by focusing on one of Deleuze's case studies of the concept of the simulacrum. To do so, I will focus primarily on one the appendices to *The Logic of Sense*: 'Lucretius and the Simulacrum'. In order to understand what I will call the Deleuze–Lucretius encounter, I will proceed as follows. After a few initial guiding remarks regarding the general project of the 'inversion of Platonism', we will outline some of the most fundamental features of atomistic physics. This will allow us to discuss Lucretius' thoughts on the clinamen, the swerve. This, in turn, leads directly to the concept of the simulacrum. With such a picture of Lucretian physics in hand, I will pivot to a discussion of Lucretius' ethics. The ethics consists of a critique of superstition in terms of a general project of demystification. Although this sequence will concentrate mostly on what became one of the appendices to *The Logic of Sense*, I will end by looking at the more general usage of Lucretian atomism, especially as it functions in *Difference and Repetition* and *The Logic of Sense*.

I. Introduction

While many of the most important figures in the history of philosophy have employed the concept of the simulacrum in one way or another, a detailed study of this usage has yet to be written. In this essay, I will attempt to offer a second sequence in the history of that usage, by focusing on one of Deleuze's case studies of the concept of the simulacrum.[1] In the appendices to *The Logic of Sense*, Deleuze locates two uses of the simulacrum in the ancient world: 'Plato and the Simulacrum', and 'Lucretius and the Simulacrum'. I will focus primarily on the latter. In order to understand Deleuze's encounter with Lucretius, I will proceed as follows. After a few initial guiding remarks regarding the general project of the 'inversion of Platonism', we will outline some of the most fundamental features of atomistic physics. This will allow us to begin a discussion of Lucretius' thoughts on the clinamen, the swerve. This will, in turn, lead directly to the concept of the simulacrum. With such a picture of Lucretian physics in hand, I will pivot to a discussion of Lucretius' ethics. The ethics consists of a critique of superstition in terms of a general project of demystification. Although this sequence will concentrate mostly on what became one of the appendices to *The Logic of Sense*, I will end by looking at the more general usage of Lucretian atomism, especially as it functions in *Difference and Repetition* and *The Logic of Sense*.[2] In sum, this project is important because the Deleuzian engagement with ancient and Hellenistic philosophy is both a rich and relatively unexplored area of Deleuze studies. I thus hope that this short article acts as one of the early precursors to the beginning of the study of Deleuze's encounters with ancient and medieval philosophy.

II. The Subversion of Transcendence

In 'Plato and the Simulacrum', Deleuze examines Plato's use of the concept of the simulacrum in terms of the context of a larger Nietzschean project: the reversion or inversion of Platonism. The early Nietzsche, in fact, describes his entire philosophical project as 'an *inverted Platonism*: the farther removed from true being, the purer, the finer, the better it is' (Heidegger [1979] 1984: 151–2).[3] Such a reversion does not simply imply a reversal of the order of supplementarity, in which materiality or appearance displaces essence or Platonic forms as the primary term in a strict ontological dualism; it is, instead, an uncovering of the very motivation for establishing the distinction between essence and appearance in the first place. We will address this motivation in a moment.

In 'Lucretius and the Simulacrum', however, Deleuze does not simply continue the project of reversing Platonism. For Deleuze does not oppose himself to Lucretius as he opposes himself to Plato. Instead, Deleuze takes up Lucretius as one of his many 'conceptual personae' (Deleuze and Guattari 1994).[4] To take up a conceptual persona is not merely to think like or imitate a thinker, for thinking, according to Deleuze, is not subjective. Rather, it is an act of immersion in a 'biology of intellectual action' (Alliez 2004: 83). Such an immersion is then not a grounding on a fixed plane, but more of an immersion in a collectivity of coordinated forces and movements, such as the force of the clinamen or the movement of collections of atoms. The point is not to assume a final resting place or complete picture beforehand. Instead, taking up a conceptual persona is more akin to becoming a part of a dynamic world already in motion. In this way, Lucretius – along with Hume, Spinoza, Nietzsche, and so on – is one among many of the conceptual personae that Deleuze takes up. Deleuze, then, takes up the Lucretian atomistic world as it is already in motion. This is why such a project is more of a subversion or diversion of mythic or transcendent philosophies, and, in some important sense, Lucretius is already a subversion of mythic/transcendent philosophies because atoms and movement are immanent. It is a subversion because it is a turn (*vertere*) under or below (*sub*), a turn to the dynamic movement of atoms of below, and it is a diversion because it is a task of 'think[ing] the diverse as diverse [. . .] the production of diversity' (Deleuze 1990a: 266).

III. The Diversity of Nature in Lucretian Physics

According to Deleuze, the main principle of Lucretian physics is diversity. Diversity is a combination of difference and multiplicity, of heterogeneity and composition. In such a naturalist philosophy, diversity is inseparable from nature and the products of nature. Nature is, in short, 'the production of the diverse', it is the system of 'differential relations of the diverse to the diverse (Deleuze 1990a: 266). Thus, the project of Lucretian naturalism is not to subsume nature under a single governing concept or relate it to an incomparably transcendent Idea, but 'to think the diverse as diverse' (266). In Nature, 'diversity appears in three intertwined aspects [. . .] [s]pecificity, individuality, and heterogeneity' (266). Every species is a collection of diverse individuals; every individual is different from every other; every individual is composed of heterogeneous parts. Each species, individual or atom is differentially related to each other.[5] Thus, the products of nature are diversities of

multiplicities that differentially relate to each other through the mere fact of diversity.

Perhaps the most important implication of the principle of diversity in Lucretian naturalism is the impossibility of totalisation. As Deleuze says, '[t]here is no combination capable of encompassing all the elements of nature at once, there is no [...] total universe' (Deleuze 1990a: 267). The denial of a totalising one is the affirmation of immanence and the denial of transcendence. This is one way in which Lucretius differentiates himself from Epicurus' predecessors: the older thinkers 'identified the principles with the One or the Whole'; they postulated a One, such as the Heraclitean fire, and then 'worked top-down', so to speak.[6] In the other direction, Lucretius postulates the elements at the base of nature and 'works bottom-up', forcing his philosophy to generate the diverse products of nature rather than assume them as already given, either explicitly or implicitly. Lucretius, then, recognises that diversity cannot be thought under the over-determining power of the concept of the One. That is, the One cannot generate the diverse without breaking some of the fundamental laws of atomism – nothing comes from nothing, something only comes from something, and so on (Lucretius 2001: I, 157–265). Unlike his pre-Epicurean predecessors, Lucretius did not fall prey to the temptation to totalise, to draw a closed picture of nature. Thus, while Lucretius does exhibit fundamentally pre-Epicurean and modern scientific drives – to display the fundamental structures of matter – he is simultaneously distinct from both. To be specific, Lucretius is not under the illusion, as is the case with much of modern science since the postulation of the Einsteinian divine ideal, that a unified theory is possible.[7] Deleuze calls this kind of science, a 'minor or [...] eccentric science', a mad science (Deleuze and Guattari 1987: 361).[8] As we will see, the clinamen and the simulacrum are the principles of the impossibility of the determination of the whole of nature.

Given that nature is diversity itself, and given that this diversity is non-totalising, it is evident that nature is 'not collective, but rather distributive [...] not attributive, but rather conjunctive: it expresses itself through "and", and not through "is"' (Deleuze 1990a: 267). Nature is distributive in that it is a nonlinear, dynamic, open-ended system; it is an interwoven knot of becoming; it is an incalculable, forming and deforming swarm of atoms. As Deleuze says of the Leibnizian monadic world, the world is a '*pure emission of singularities*' (Deleuze 1993: 60). In short, moving bodies are distributed according to a non-totalising logic of diversity rather than unification under a concept. Following the contour of this logic of diversity, nature is conjunctive in that it

is produced out of diversity, rather than assumed beforehand. Nature is composed of this *and* this *and* this *and* this, ad infinitum. Lacking predetermined order or *telos*, atoms are able to connect with other atoms in almost an infinite number of ways. Each species, each individual, each world is capable of ever-new conjunctions, conjugations, combinations and compositions. 'Everything is formed out of connections, densities, shocks, encounters, concurrences, and motions' (Lucretius 2001: I, 633–4). The Lucretian atomistic world rests of the edge of many infinites: it is the site of the infinite collisions of infinite atoms in an infinite number of combinations in an infinite space over an infinite amount of time.

This is not to say that nature does not produce local unities, for there are certainly organised bodies and worlds. Rather, it is just that there is no unifying whole that completely enframes the world. This is an important example of 'philosophical pluralism [. . .] Nature is indeed a sum, but not a whole' (Deleuze 1990a: 267). Unlike the popular expression that explains the magic of organic wholes, 'the whole is more than the sum of its parts', in Lucretian naturalist physics, the whole is actually less than the sum of its parts. As Deleuze and Guattari might say it, where n is the number of dimensions in a world, the following expression conveys the sum of the Lucretian world: n - 1. The whole is never an assumed principle but merely a mythological or transcendent postulation that results from the confusion of kinds of infinites.[9] Individual bodies are not defined by an overarching unifying concept or even the centre of the body, but by the limits or borders where bodies come into contact with other bodies. In short, rather than the One, the diverse is celebrated. With this general picture of the Lucretian world at hand, it is now possible to address some of the specific details that Deleuze finds in this world.

IV. The Principles of Naturalism: The Clinamen and the Simulacrum

Perhaps the most easily identifiable character of Lucretian physics is atomism. As a naturalist, Lucretius starts from the bottom up, producing the great complexity of the universe from simple parts. This is one meaning of the subversion of transcendence. Starting at the bottom, there are two basic components of the world: atoms (*atomos*) and void (*inane*). Everything is produced from these two basic elements. Since they are sub-sensible, atoms are strictly thought objects, not sensible in themselves. Atoms then constitute the limit of the thought of matter,

the minima of thought: they are that level below which thought cannot venture. It is not possible to think anything smaller than the atom. Just as there is a minimum of sensation, a level below which sensation is not possible (which, as we will see, is the simulacrum), the atom is the minimum of thought. So, as sensible objects are given to the senses, thought objects are given to thought. Through a method of analogy,[10] Epicureanism passes 'from the sensible to the thought and the thought to the sensible by means of transitions' (Deleuze 1990a: 268).

The sum of atoms is infinite in number, as is void or space. Void is the pure, smooth space traversed by cascades of atoms. Atoms and space 'are interlaced in such a manner that the sum of the void and the atoms is itself infinite' (Deleuze 1990a: 269). Despite these three infinites, Lucretius does not abuse the concept. In fact, discerning true from false infinites, as we will see, is an important feature of Lucretianism. While there are an infinite number of atoms of the same shape and size, the shapes and sizes of atoms are not infinite. There is thus some limitation to the combination of atoms, and this limitation is necessary in order to maintain the appearance of order out of the seemingly chaotic movement of atoms in the void. This is not to say that atoms only combine interspecially, for every individual body is composed of different atoms, every body is heterogeneous. Speaking of animal bodies, for example, Lucretius says, 'each individual animal is composed of bones, blood, veins, heat, fluid, flesh, and sinews, and these too have differences [. . .] corresponding to differences in the shapes' (Lucretius 2001: II, 670). Again, the natural world is fundamentally diverse.

Resemblance does, of course, exist, but it is produced by the power of the diverse. The ancient order of being is thus reversed, or subverted. Deleuze notices two powers in the Lucretian world, the power of the diverse and the power of resemblance or identity: 'the power of the diverse and its production, but there is the power of the *re*production of the diverse' (Deleuze 1990a: 271; my emphasis). This second power is a consequent of the first. An individual body is made of a heterogeneous constellation of particles moving at various speeds. Constituted as and by this diversity, the body sheds some atoms and gains others. The point is to maintain the integrity of the composition of the body. The atoms that are shed from the body can then drift off and combine with other atoms in a similar combination, and this other constellation might resemble the first body. In this way, the power of resemblance or identity, the power to reproduce the diverse, is derived from diversity itself. This is a departure from his Platonist and Aristotelian predecessors who thought that diversity was a degeneration from a prior identity.

Bodies, then, are heterogeneous complexities 'born, in fact, into already complex settings' (Deleuze 1990a: 271). A body is constantly losing and gaining constitutive parts, new atoms are continuously swapped for old atoms, and the body's setting allows it to remain temporarily composed. That is, a body appears amidst an environment that receives the atoms sloughed off of the body, and that same environment also replenishes the body with new atoms over the span of the life of the body.

Amidst all of these swirling clouds of atoms constantly clanging and clattering off of each other, a stochastic organisation emerges. This is not to say that order is imposed from some outside, transcendent position. Instead, order, of whatever degree, emerges from the interaction of matter with itself. Matter flows into and out of itself; it folds and unfolds itself with greater and greater intensity. This intensity increases until it reaches a certain point, a threshold. Upon crossing this threshold matter self-organises. Out of the churning ripples and currents of matter, due among other things to the increasing intensity among the atoms, distinct patterns of behaviour emerge. Take, for example, a hurricane. Prior to the formation of the familiar swirling patterning of a hurricane, there are a number of intensive processes – fluctuating temperatures, wind speeds, changes in pressure, and so on. These processes increase in intensity until they reach a certain point at which the familiar cyclonic shape of the hurricane emerges. Order has emerged out of seeming chaos; matter has organised itself. The patterns of emergent behaviour then constitute an individual – a hurricane, a rock, a river, an organism, and so on. The individual, however, is only temporary. In the case of a hurricane, the cyclonic pattern lasts just long enough for meteorologists to name it. At any point, however, the individual is susceptible to a shock to the system that interrupts the coordinated behaviour and disperses the constituent parts. This is the death of the individual, the end of a hurricane.

All of this, however, presupposes a means of sparking this self-organisation. In order to offer a more compelling picture of the power of matter to self-organise by means of the behaviour of matter itself, Lucretius posits the famous notion of the clinamen.

The Clinamen

The history of the reception of the clinamen is quite mixed. Many have considered the clinamen an embarrassing weakness, if not a downright absurdity, in atomism. In ancient Rome, for example, Cicero called it 'a childish fiction', an 'arbitrary invention', even 'unscientific' (Cicero 2001: 19–20). Later, in a post-Newtonian world in which mechanical

causation and physical determinism reigned supreme, the clinamen was considered simply an unfortunate misstep of early science. In contemporary times, however, especially considering the popularity of such scientific ideas as quantum mechanics and hydrodynamics, the swerve found a more receptive audience.[11] However history has treated the clinamen, even Lucretius himself was nervous about putting forward such a controversial thesis. As he broaches the topic he says, 'I am anxious that you should grasp a further point [. . .] the swerve' (Lucretius 2001: II, 217–21). Yet to explain away the clinamen as merely an act of epistemological immaturity misses the power of the figure of the clinamen. For Lucretius, unlike some sciences of the modern era, confronted an undisplayable, ungraspable feature of the structure of matter. As we will see, the figure of the clinamen, like the simulacrum, functions as that which prevents the closure of metaphysics.

One common mistake is to consider the clinamen simply a cause. This is an unfortunate misreading that likely results from the domination of the popular model of mechanical and linear causation as it has appeared in the history of the physical sciences. The clinamen, though, is not simply a mechanical cause. Instead, due partly to its fundamentally sub-minimal nature, it cannot be determined or isolated as simply another linear cause. Instead, the clinamen is the difference that makes a difference, 'a generative differential element', 'a fluxion' (Deleuze and Guattari 1987: 489; Serres 2001: 4). It is the 'self-different which relates different to different by itself' (Deleuze 1994: 119). It is the smallest possible degree, not even an identifiable degree but merely a difference in degree; it is the smallest possible difference between degrees, 'an infinitesimal degree', '*nec plus quam minimum*', literally, 'no more than the minimum' (Lucretius 2001: II, 223–4).

While the clinamen is not itself reducible to yet another mechanical cause, it is still related to causality and causal series. Deleuze might call it a 'quasi-cause' (Deleuze 1990a: 6, *passim*). While such an unfamiliar phrase is not immediately clarifying, it is meant to open up enough space to introduce alternative forms of causality, such as nonlinear or non-deterministic causality. That is, unlike the standard model of mechanical causation, nonlinear causation does not communicate determinate effects upon atoms or compounds. Instead, a quasi-cause establishes certain conditions for the eventual self-organisation of atoms. The clinamen is a quasi-cause in that, in itself, it is undetermined, but it serves as the ground for atomistic determination; it is determinability as such. As a quasi-cause, the clinamen is the figure of the 'irreducible plurality of causes or causal series, and the impossibility of bringing causes together

into a whole' (Deleuze 1990a: 270). Causation is thus inherently divergent, as is nature; this means that causation is never complete. Since causation is never complete, there is always an excess to the system; this excess is the gap or tear in being, it is the clinamen. Thus, the clinamen is, in itself, not thinkable as a determinate cause. Instead, it is concealed below the plurality of causes and causal series. Lucretius himself describes the clinamen as nothing more than a 'shift of movement', a change, a difference (Lucretius 2001: II, 221). It is an ontological interruption, the destabilisation of conceptual determinacy, an ever-so-slight divergence in order that relates the diverse to the diverse.

Since it is not of the order of determinate and linear causality, it does not take place in a specific space and time, but is below sensible and thinkable spatiality and temporality. It is the slightest, undetectably slight, declination from rectilinear motion. As Lucretius says, 'at times quite uncertain and uncertain places, they [the atoms] swerve a little from their course, just so much as you might call a change of motion' (Lucretius 2001: II, 219). The clinamen cannot be causally, temporally or spatially determined because it conceals itself, because the sensible phenomenon covers it up. '[I]t has no place other than that which it lacks [...] because of the way it perpetually displaces itself under its own effects' (Deleuze 1994: 120). The swerve is so slight that its time and place are thus indefinite or uncertain, *incerto tempore ferme incertisque locis* (at times quite uncertain times and places). Given such uncertainty, we might call it a different time and place altogether. This does not mean, however, that the clinamen is simply a chance or random occurrence, simply a mistake that breaches natural laws. For, as Deleuze says, 'the clinamen or swerve has nothing to do with an oblique movement which would come accidentally to modify a vertical fall' (Deleuze 1990a: 269). Instead, the clinamen is an indication of a non-localisable dynamism that is irreducible to an isolable space, time, concept or cause. Thus, at the heart of being is a tear, an aberration, a warp that undergirds, without grounding, matter. It is that which prevents unification by maintaining the diverse in nature. The clinamen maintains this diversity in that it prevents closure, unification or totalisation. It is the maintenance of this diversity that offers the powers of self-organisation to matter.

This is what is meant by the impossibility of subsuming nature under the Whole or the One. Through the figure of the clinamen, the infinitesimal declination, nature remains open-ended. The clinamen is that which subtracts from the Whole, it is that which precludes the completion of causal series, it is that which prevents the closer of metaphysics by means of the unification of a totalising picture, a One.

Simulacrum

Although this paper is about the use of the concept of the simulacrum in Lucretius, the two concepts of the clinamen and the simulacrum are inextricably linked, so much of what Deleuze says about the one will apply to the other. Accordingly, similar to the clinamen, Lucretius' account of the simulacrum, especially in its role in a theory of perception, is much maligned; simply considered as an account of perception, Lucretius' use of the simulacrum is not very convincing. The confusion that surrounds this discussion might have something to do with the corruption of the text.[12] Deleuze, however, while conceding the obscurity of the account, argues that it is actually the 'invention of a brilliant, though difficult, Epicurean theory' (Deleuze 1990a: 273). If we turn to Deleuze's interpretation of the concept of the simulacrum as it appears in *De Rerum Natura*, an intriguing picture emerges, one that has a distinct philosophical target. To be specific, Lucretius' target is the Platonist-style transcendent turn and the distinction between model and copy such a turn implies.

On a very general interpretation of the Platonist theory of perception, the truth of any material object in the world, such as an urn, is not the organisation of matter itself, but the transcendent ideal Form in which the urn participates. According to Platonism, rather than directly addressing the object of this world, understanding the truth of the materially instantiated urn requires a turning away from nature and towards the Form. Upon grasping the Form of the urn, knowledge is gained, but at the price of denying the power of nature. As said earlier, by means of such a reference to a transcendent norm, Plato discerns true from false claimants to wisdom. This is why the general form of the Platonic question is: 'what is [*ti estin*] [. . .] *x*?' and not 'Who? How many? Whence? How? Where?' and so on. False claimants answer the 'what is it?' question by reference to objects in this world rather than articulate an essential transcendent identity. Truth is otherworldly; falsity is thiswordly.

As said, such an interpretation is overly general and possibly unfair to Plato's texts, and Deleuze himself is sometimes guilty of ignoring certain passages that construe Forms as quite nuanced and dynamic rather than static essences that nature imperfectly instantiates. The *Timaeus*, for example, in which there is a theory of geometrical atoms, complicates the overly simplified Platonist story just given. In that dialogue, there is a long and nuanced tale that involves not just ideal Forms and defective copies but also a demiurge, the *khora* or receptacle, two kinds of atomic

triangles, and so on. Since the main motivation for this paper is to explore Deleuze's engagement with ancient philosophy, it is important to recognise some of the shortcomings of Deleuze's account of Plato. Still, while it is true that Deleuze sometimes ignores nuances of Platonism, it is important to remember that the Nietzschean–Deleuzian inversion of Platonism is not simply an anti-Platonism but more of a 'rejuvenated Platonism' (Smith 2006: 108). This is why Deleuze locates what he calls 'the most extraordinary adventure of Platonism' near the end of Plato's *Sophist* (Deleuze 1990a: 256). There, Platonism was pushed to the extreme, to the edge of irony, where Plato discovered 'that the simulacrum is not simply a false copy, but that it places in question the very notions of copy and model' (256). This leads Deleuze to ask: '[w]as it not Plato himself who indicated out the direction for this reversal of Platonism?' (Deleuze 1994: 68). In the end, whether or not Deleuze perfectly depicts Platonic texts, it is enough for our purposes to recognise the important role transcendent objects, however dynamic or static they may be, play in atomism's bitter rival, Plato.[13]

According to Lucretian naturalism, atomic compounds constantly emit a 'sort of membrane [. . .] bark', 'filmy form, or images [*simulacra*]' (Lucretius 2001: IV, 42–52.)[14] Such a claim again depends on the method of natural analogy: as cicadas shed sleek coats, as calves shed superficial membranes, as serpents shed skins, atomic compounds shed 'visible discharges' (Lucretius 2001: IV, 58–64). These sloughed-off simulacra, then, 'float this way and that through the air', crossing great distances, sometimes encountering thick obstacles (Lucretius 2001: IV, 33). Sometimes, these flitting simulacra reach and pass through sensory organs. Our access to objects, then, is dependent on the movement of these simulacra. This is the key point: though perception is dependent on simulacra, simulacra are not, in themselves, perceivable. This, for two reasons, size and speed: simulacral 'texture is so fine that they cannot be seen individually', and 'the images [*simulacra*] move at an extraordinary speed' (Lucretius 2001: IV, 89, 214). While 'the simulacrum is [. . .] imperceptible', it produces sensible images (Deleuze 1990a: 274). The perceived 'image bears witness to the succession and summation of simulacra' (277). Simulacra are thus the imperceptible spark of sensation, the inaccessible although necessary 'differentials of diverse orders' (275). They are the differences that make the difference in a fully haptic universe.

While there is no recourse to a transcendent formalist norm, simulacra, like the clinamen, are not perceived because they occur below a certain minimum. That is, while the clinamen occurred below the

minima of thinkable space and time, simulacra occur below the minima of sensible space and time. Simulacra are so slight, so lithe, so swift that they are not really complete entities unto themselves. 'That is why at any time in any place all kinds of images are ready at hand [. . .] so immense is their velocity, and so immense is the store of them' (Lucretius 2001: IV, 798–800). A simulacrum is more like speed itself, the speed of light, a pure instant of time, an absolute point, a temporal singularity, an infinitesimal. It moves at a time faster than sensible time, *puncto tempore*, for a point has no dimensions. Still, such an explanation finds no recourse to other worlds. In this way, simulacra are more like collections of speeds, themselves the measure of difference, that do not relate to any transcendent original. This is why simulacra are not imperfect copies of formal originals, but copies of copies, copies without originals. In fact, they are not really copies at all. As the bodies that cast off the simulacra are heterogeneous, collections of different parts, simulacra are equally heterogeneous, equally differential. Nature then is a texture of difference, a heterogeneous diversity of differences, and perception is generated out of this natural texture of differentiality.

Amidst all the clouds of simulacra constantly swimming about the world at different speeds and thicknesses, constantly bombarding bodies, simulacra intersect themselves and sometimes get caught up in each other. This explains the appearance of mythic creatures, fantastical dreams and erotic fantasies. The perception of a centaur, for example, is the result of the intersection of the images of a horse and a man. The problem is when the received image of the centaur, which is only the effect of simulacra and not simulacra themselves, is taken as representative of the object itself. 'In virtue of their speed, which causes them to be and to act below the sensible minimum, *simulacra produce the mirage of a false infinite in the images which they form*' (Deleuze 1990a: 277; original emphasis). Moving at the speed of light, false infinites – mythic creatures, jealous gods, obscure objects of desire – are illusions produced from the impact of the dance of simulacra. Before going further, let us situate this discussion of true and false infinites and the illusions produced by simulacra.

V. True and False Infinites: Critique of Superstition

The theory of infinites is found in the first two books of *De Rerum Natura*, and Deleuze contends that his theory of the infinite is an essential feature of Lucretius' naturalist physics. As we have seen, such an atomistic universe is filled with many infinites, but the number of

infinites is not infinite. This theory, Deleuze argues, 'conforms to the fundamental object of physics: *to determine what is really infinite and what is not*, and to distinguish the true from the false infinite' (Deleuze 1990a: 272; original emphasis). What are the true and false infinites?

First, the true infinites: 'the sum of atoms, the void, the sum of atoms and the void, the number of atoms of the same shape and size, and the number of combinations or worlds' (Deleuze 1990a: 272). We have already seen how these infinites work and combine. Second, the false infinites: 'parts of the body and of the atoms, the sizes and shapes of the atom, and above all, every worldly or intra-worldly combination' (272). We have also seen how these elements are not infinite, but limited. The point of all of this is to notice almost a Platonic method of selection, albeit a fully immanent and thiswordly one: to select the true infinite from the false infinite. Lucretian physics thus offers an immanent method of selection that can apply to the diseases of the soul that were running rampant amidst the Greco-Roman people. Let us return to the beginning of *De Rerum Natura* in order to see how this theory of the infinite and the method of selection play out.

At the beginning of Book I, Lucretius sets out two main goals of his work: to give an account of the basic principles of nature and the nature of simulacra. As he says,

> it is imperative that I give a correct account of celestial phenomena, explaining what principle governs the courses of the sun and the moon, and also what force is responsible for all that happens on earth [...] and disclose what it is that visits us when we are buried in sleep or lie awake in the grip of sickness and gives us the terrifying illusion of hearing and seeing face to face people who are dead, and whose bones are embosomed in the earth. (Lucretius 2001: I, 127–36)

Two things are immediately apparent. First, notice that although Lucretius claims he is giving a correct account of the behaviour of the atomistic universe, he does not claim to give a completed picture of a closed universe. Rather, he has merely located principles, forces and features of the matter of the natural world. This account thus produces a non-completed, open-ended world of diversity and multiplicity. Second, these two things, the principle governing movement and that which causes illusions, are, respectively, the clinamen and the simulacrum. This is where the theory of infinites comes in.

According to Deleuze, the clinamen and the simulacrum 'give birth to the double illusion of infinite capacity for pleasure and an infinite capacity of torment' (Deleuze 1990a: 277). At first, such a claim might

seem to cast the clinamen and the simulacrum in a bad light in that they are the responsible parties for the sense of disturbance and pain that virally spread through the Greco-Roman people. Yet such an interpretation misses the greater picture. The point of the Lucretian theory of the infinite is to discern true from false infinites, and this principle would then draw the Epicureans to these two sub-minima – the clinamen and the simulacrum. Yet this move does not mean that these sub-minima are, in some sense, to be denied; instead, they are the location of the minima of thought, that below which thought and sensation cannot venture. For the

> movement of the atom in a minimum continuous thinkable time bears witness to the declination [the clinamen], which nevertheless occurs in a time smaller than this minimum. Similarly, the image bears witness to the succession and summation of simulacra, which occur in a time smaller than the minimum of continuous sensible time. (Deleuze 1990a: 277)

Thus, the clinamen occurs in a time below thinkable time, a time that cannot, in itself, be thought, and the simulacra occur in a time below sensible time, a time that cannot, in itself, be sensed. As Lucretius says, the clinamen occurs at 'no more than the minimum' (*nec plus quam minimum*), and the simulacra 'are only just too small [and fast] for our eyes to discern' (Lucretius 2001: II, 244; IV, 112–13). The very attempt to think, and thus conceptually determine, anything occurring in this sub-conceptual time is to break the goal of the project of philosophy as naturalism. To recall, the goal of naturalism is 'to think the diverse as diverse' (Deleuze 1990a: 226). Thus, to try to think below the minima of thinkable time risks dissolving the diverse and importing the notion of the Whole or the One. To conceptualise the clinamen or the simulacrum is to subject such subversive features of nature to the governance of a concept. Such a temptation implies a closed picture of nature, and Lucretianism warns against this temptation. For to fall prey to this temptation is to conflate true and false infinites. Religion and myth do not heed this warning, and thus insert mythological tales of monsters and vengeful gods. That is, mythology tries to think below the minima of thinkable time; religion tries to explain nature through chimerical concepts. In this way, through the insertion of unifying concepts below the minima, religion and myth do not distinguish the true infinite from the false infinite. In fact, they abuse this distinction. This leads to the abuse of life.

Naturalist physics, by contrast, merely locates two differentials – the clinamen, the minimum of thought, and simulacra, the minima of

sense – as the sources of false infinites. Through such a location, Lucretianism fulfils its two clearly stated goals: 'to give the correct account of celestial phenomena [. . .] and what force is responsible for all that happens on earth [. . .] and disclose what it is that [. . .] gives us the terrifying illusion' (Lucretius 2001: I, 127–36). Celestial and terrestrial phenomena find their governing principle in the clinamen and the source of terrifying illusion is simulacra.

VI. The Critique of Superstition and the Project of Demystification

This is not to say that the Lucretian physical worldview is finished, for it clearly involves many inconsistencies, contradictions and implausibilities. The project succeeds, however, on many accounts.

First, by withstanding the temptation for recourse to transcendent explanations, Lucretius offers a completely immanent physics/metaphysics. Yes, he was not able to offer a completely correct account of the behaviour of nature, but no subsequent science has. Every science – from Aristotelianism to Newtonianism to quantum mechanics – is fundamentally incomplete. In fact, the open-ended, nonlinear, dynamic character of Lucretian naturalism actually accords well with many of the scientific developments in such sciences as hydrodynamics and thermodynamics. One of the problems with transcendent explanation is the depiction of nature as incomplete and imperfect, as a mere copy, as a lack, as a failure. Nature, for such a position, is false and distortive of truth because it is materially and constantly in flux. By locating truth beyond the material world, nature is always-already false, which is why it is no wonder that sadness, pain and anxiety ruled the Greco-Roman soul. Again, this is the abuse of life. Lucretius, however, acting as a good Epicurean symptomologist, eliminated every possible hint of transcendence, he 'denounce[d] everything that is sadness, everything that is the cause of sadness, [. . .] [he] deprived the negative of all its power' by affirming the 'positivity of Nature' (Deleuze 1990a: 279).

Second, and this follows from the fully immanent character of Lucretianism, the turn to transcendent and mythic explanations was diagnosed as one of the most pernicious symptoms of the Greco-Roman disease. By locating the source of myths and illusions, false infinites, through the figures of the clinamen and the simulacrum, Lucretianism was also able to announce the affirmation of the diversity of this world. Since nature is fundamentally diverse, Lucretius offers us '[n]aturalism as the philosophy of affirmation; pluralism linked with multiple affirmation'

(Deleuze 1990a: 279). This is why one of the first atomistic moves is a making-false or becoming-simulacrum of the event. As a simulacrum, the event is neither a copy nor an original, but 'contests *both* model *and* copy at once' (2; original emphasis). The very motivation for such a distinction disappears by making nature simulacral. What is left is the natural world not as a derivative copy of some more primary perfection but as a site of the production and generation.

Third, Lucretian physics and ethics also inaugurates the 'enterprise of "demystification"' (Deleuze 1990a: 279). Religion constantly denies the power of the material world by spreading myths about divine activity and transcendent truths. In this way, nature becomes an overly enchanted place of uncontrollable and disorderly behaviour subject to the whim of fickle gods. Naturalism, however, affirms the power of nature to generate everything that is seen, felt and thought. Lucretian naturalism is thus also 'the practical critique of all mystifications' (279). This is why the project of practical demystification is another version of the art of counter-actualisation. As we saw above, the first two steps in this process are the aetiology or classification of desires and the prognostication about the diseased status of Greco-Roman society. These two steps constitute the movement of flattening – the move from depth to surface, where '*everything now returns to the surface*' (7; original emphasis). As Deleuze says of Spinoza, this is an art of organising encounters on an atomic surface of infinite variation. The final step, the ethical deployment of the Epicurean treatment, is the practice of counter-actualisation. This involves two phases. On the one hand, after extraction from a state of affairs in which some life or atomic assemblage is embedded, there is the specification of adjunct fields. That is, the possibilities for interaction among atomic assemblages are opened up once everything is placed on a single plane. Now, since there is no transcendent hierarchy striated and thus preventing communication among all other atoms and compounds, everything can communicate with everything else. This is the movement from a fully actualised state of affairs to a virtual plane of communication. On the other hand, there is the 'condensation of singularities [. . .] the ultimate sense of counter-actualization' (178). This involves the realisation of the truth of atoms and void beneath all phenomenological experience. The healthy Epicurean 'strains his entire personality in a moment that is always further divisible', at least to the atomic register, 'in order to open himself up to the impersonal and pre-individual' (150). In this way, there are two sides to each natural event: there is the part of an assemblage that is the actualisation of some potential for atomic combination

and the part of that assemblage that cannot be actualised – the first is actualisation and the second is counter-actualisation. This is how the art of counter-actualisation inserts conjunctions – this atom *and* this atom *and* this atom *and* so on – that make different assemblages and atomic series resonate so as to spark variations that open up space for new possibilities for life. Such an ethical programme involves giving aesthetic consideration for new forms of life. Even stronger, it involves the Nietzschean impulse to turn morality into an aesthetic practice, the practice of selecting affects. In a different language, such a practice of making ethics into a practice for living as art (from ethics to aesth-ethics) is akin to 'making oneself a body without organs', a variable surface opened up to streams of affects, sensations or simulacra that can alter the structure of an atomic compound in different ways. This is how the atomistic critique of demystification leads to the positive project of the Epicurean version of the 'great health'.

VII. The Conclusion is Nothing to Us: Atomic Deleuze

On the face of it, the story of the Deleuze–Lucretius encounter might seem out of place in Deleuze studies, for a quick glance throughout Deleuze's texts does not reveal anywhere near as many references to Lucretius as it does, for example, to Spinoza, Kant or Nietzsche. If Deleuze's engagement with Lucretian atomism was so important, one might contend, then surely he would have written much more explicitly on the topic, if not devote a book-length study to Lucretius, as he was wont to do with philosophers he took as essential to his own work. Still, while Deleuze does not spend much time explicitly addressing Lucretius and atomism, he does engage this ancient tradition, more implicitly than explicitly, in almost all of his texts. It is thus my hope that this small essay helps begin to pull out the full shape of this encounter. As Deleuze says, '[p]hilosophers introduce new concepts, they explain them, but they do not tell us, not completely anyway, the problems to which those concepts are a response' (Deleuze 1990b: 136), and this applies to Deleuze himself. It is thus the task of contemporary Deleuze studies to uncover or de-solve texts 'in his own name' so as to extract the problems to which Deleuzianism responds. It is clear to me that some of the most important problems to which Deleuze responds are found in *De Rerum Natura*.

As further motivation, there is also a historical reason for import of the Deleuze–Lucretius encounter to Deleuze studies. Given that the conceptual foreground to Deleuzian philosophy is highly influenced by

early modern philosophy, science and mathematics (Leibniz, Hume, Spinoza, and others), and given that the re-emergence of atomism upon the rediscovery of *De Rerum Natura* is the conceptual background for much of the development in that early modern period, it follows that atomism has a strong, albeit possibly indirect, influence on Deleuzian thought. In the hopes of further clarifying such a conceptual background, I argue for the importance of exploring this conceptual background (atomism) to a conceptual foreground (early modern philosophy) of Deleuzian philosophy.

Still, while it is important to engage *De Rerum Natura* directly, as this paper has done, in order to negotiate Deleuze's encounter with Lucretius, it is equally important to stress the ways in which Lucretius functions in Deleuze's own texts. In order to see some of the more significant ways in which Lucretian atomism influences or functions in Deleuze's text, I will conclude by making two broad gestures towards some areas in Deleuze's texts in which Lucretius plays an important role. These are certainly not the only ways in which Deleuze encounters Lucretius, but they are the two most directly relevant to what appears above. The complete account of the Deleuze–Lucretius encounter must be delayed for another day.

First Gesture

One of the most direct uses of atomism appears in chapter four of *Difference and Repetition*. This is where Deleuze most explicitly explains one of the most important concepts of his own philosophy: Ideas. This concept appears throughout Deleuze's works, although it often appears under many different guises, including: 'structure', 'multiplicity' and 'problem'. After developing an account of what he means by 'Idea', Deleuze offers a few examples of Ideas in different domains so as to further illustrate this concept. Although he says that these examples were 'chosen almost at random', I do not think it is any coincidence that he chose atomism as the first example of an Idea (Deleuze 1994: 184).

Just as Deleuzian Ideas are the objective structures of thought, atoms, for Lucretius, are the 'objective elements of thought' (Deleuze 1994: 184). This is not to say that the thought of atoms is the thought of a single ontological element that subsists without reference to other virtual elements. Instead, the thought of the structural variations of multiplicities of atoms is nothing more than an early attempt to think the ontological genetic structures differentiated in a virtual dimension. Thus, 'it is indeed essential that atoms be related to other atoms at the heart of structures that are actualized in sensible composites' (184).

This is why the thought of atoms is the thought of virtual multiplicities. Further, the thought of the relations among atoms is an early thinking of the kind of relationality that Deleuze locates as functioning in the differential relations that populate Deleuzian Idea. What brings these multiplicities of atoms together is the clinamen: 'the clinamen is the reciprocal determination that [. . .] produce[s] [. . .] a relation between the differentials of atoms in movement' (184). In the very thought of atomism, then, we see an early formulation of some of the fundamental features of Deleuze's ontology. Besides claiming atoms as objective elements of thought and the clinamen as the spark for reciprocal determinations, atomism sets out some early features of a philosophy that is both immanent and materialist. For the postulation of atoms focused thought on a genetic virtual dimension that is fully immanent yet not reducible to any actualised empirical configuration. Like the nature of the virtual/actual relation, sensible assemblages do not resemble the multiplicities of atoms that produce them.

In this sense, talking of the Deleuzian theory of problems or Ideas seems particularly Lucretian when we consider the essentially genetic and productive nature of Lucretian atomism. For neither Deleuze nor Lucretius traces the ontological structure of the world from the empirical manifold of phenomenal experience; nor do they postulate a final form existing or subsisting beyond the world towards which everything is tending or striving. Instead, they both argue for particular conceptions of the genetic ontological structures of the world and then try to produce the world out of them. That is, the world is a divergent solution to the main problem: how do we produce the world given that everything is, for Lucretius, atoms and void or, for Deleuze, differential elements, differential relations and singularities corresponding to those relations? The real world through which we have experience, about which we think and in which we act is a diverse set of solutions to this problem. And the evaluation is not in terms of the truth or falsity of the solution but in terms of the ordinary or remarkable solutions determining the problem. For philosophy, Deleuze says,

> does not consist in knowing and is not inspired by truth. Rather, it is categories like Interesting, Remarkable, or Important that determine success or failure. Now, this cannot be known before being constructed. We will not say of many books of philosophy that they are false, for that is to say nothing, but rather that they lack importance or interest, precisely because they do not create any concept or contribute an image of thought or beget a persona [or produce a problem] worth the effort. (Deleuze and Guattari 1994: 82)

The point is to evaluate the problem itself, is to affirm the endless production, creation or becoming of this world and its solutions in the very process of their becoming. The state of the Deleuzian or Lucretian world remains problematic, and this should not make us worry, cower in fear or feel guilty, but to affirm it and to live joyfully, guided by the joyful affirmation of a life of pleasure. Lucretian atomism affirms this world not because it stays the same, but because it differs, because it continues to make a difference. Deleuzianism clearly resonates with such principles.

Second Gesture

There are more important features of this Deleuze–Lucretius encounter. Lucretius' account of the emergence of thought through the encounter with simulacra in perception resonates in Deleuze's story of the violent, seemingly paradoxical, encounter with the being of the sensible, the *sentiendum*, and its relation to *cogitandum*. The central Lucretian element of this encounter is the role of the simulacrum in sensation. Since simulacra are not perceived, in that they occur below a certain minimum, they function as what Deleuze calls the *sentiendum*, that which must be sensed (in terms of the transcendental sensibility) but cannot be sensed (in terms of empirical intuition). As Lucretius says, 'we may be sure that sensation can be produced from the insensible' (Lucretius 2001: I, 929–30). So, when Epicurus says that all sensations are true, he means a real event takes place in the sensory encounter, that is, there is a real affective encounter, a real change in bodily disposition (Rist 1972: 19–20). All sensations are then true not in the sense of accurately resembling some prior identity but in the sense of being the real location where a difference is made. Lacking resemblance to a model, it is a difference without an original or model that determines what kind of thing it is, a common definition of a simulacrum. Out of this violent encounter with simulacra, thought erupts. The encounter with variable contour of such a heterogeneously and differentially composed natural world is how the Epicurean subject emerges, that is, how it first becomes the site of a certain pattern of moving collections of sensations and, eventually, gains knowledge of this very process. Another name for this is 'learning'.

Learning, then, involves an encounter with problems that does not make us merely reconfirm what we already think, feel, believe and opine, but that disrupts our thoughts, feelings, beliefs and opinions. We are forced, in a way, to confront something nonsensical and to make sense

of it. In the end, once sense holds sway and the faculties have returned to a sense of stability, knowledge arises (Hughes 2009: 85).[15] Gaining knowledge, then, is not a process of reading or tracing the process of the production of sense of the product (such as knowledge), but of a direct, violent and disruptive encounter with the problem or Idea. Deleuze calls this process of reaching the problematic conditions an 'apprenticeship' (Deleuze 1994: 166). The production of thought and knowledge is then another instance of actualisation, albeit this time the result is thinking. And just like any other process of actualisation, the product is never finished, actualisation is never completed, learning is never over. For 'learning is, after all, an infinite task' (166).

In the end, the telling of the story of the Deleuze–Lucretius encounter not only contributes to the expansion and improvement of Deleuze studies but is essential to a fuller appreciation of all things Deleuzian. As of now, there is very little written on this exact subject, which means that this small story will be almost the first of its kind on the atomism/Deleuze relationship.[16] It is thus my hope that this article will be considered one of the earliest movements in the elaboration of Deleuze's encounter with ancient and medieval philosophy. While I have told the story of the Deleuze–Lucretius encounter, I must leave it to others to pick up this narrative and tell the story of, for example, the Deleuze–Aristotle, Deleuze–Stoicism[17] or Deleuze–Scotus (Kaufman 2012) encounters. In a Deleuzian sense, I hope that any future story about Deleuze's encounters with ancient and medieval thinkers does not take the form of simple analogies. For merely pointing to similarities across time is certainly not a very Deleuzian project. Even more, these early thinkers constitute more than a background condition for the possibility of Deleuzianism. Instead, such thinkers, I contend, constitute the genetic conditions for the production of real Deleuze studies.

Notes

1. This is the second sequence in the history of the use of the concept of the simulacrum because Daniel W. Smith has written the first sequence. See Smith (2006) for his sequence.
2. The Deleuze essay on which this paper concentrates was originally published as 'Lucretius and Naturalism', *Études Philosophiques*, 1961.
3. Heidegger quotes from an early sketch from Nietzsche's first treatise (1870–1).
4. See chapter 3 of *What Is Philosophy?* for a complete account of conceptual personae.
5. Lucretius speaks of the diverse quite explicitly in many places. For example, 'no object whose substance is plainly visible consists only of one class of atoms; each is composed of a mixture of different seeds' (Lucretius 2001: II, 585).

6. See Lucretius 2001: I, 635–920 for more on Lucretius' critique of Heraclitus, Empedocles and Anaxagoras.
7. As is well known, Einstein popularly critiqued quantum mechanics by saying that 'God does not play dice.' However metaphorical it may have been, Einstein's statement supposes that the chaotic thesis of quantum mechanics was impossible because nature was inherently ordered, perhaps by a transcendent God.
8. As for Lucretius' relations to science, Michel Serres, for one, has identified some important principles – such as turbulence and fluid mechanics – that have become some of the hallmarks of what Serres calls postmodern science. See Serres' book *The Birth of Physics* for more on this claim. Ilya Prigogine, the Nobel Prize-winning physical chemist, and Isabelle Stengers, a popular philosopher of science, celebrate the link between Lucretius and postmodern science in their famous book *Order Out of Chaos*. See Prigogine and Stengers 1994: 141.
9. The theory of infinites will be explained below.
10. Lucretius' method of analogy is used to persuade the reader via everyday experience and examples. Such a scientific form of argumentation does not appeal to myth and mystery. Rather than blindly adhering to a particular pre-established doctrine, Lucretianism is science as a social method. Claims made on nature must pass the test of debate, verification through personal experience, and so on. Thus, Lucretian naturalism approaches the world as an arena of experimentation rather than merely searching for corroboration in what one already believes.
11. In a text recently translated into English, Michel Serres takes up Lucretian physics/metaphysics as an important contribution to the science of hydrodynamics. For Serres, one of the problems with many interpretations of Lucretius stems from an improper choice of model. Typically, one thinks of atoms as completely independent and static entities that merely aggregate. While such an interpretation is not completely incorrect, it misses something important: the importance of conceiving of atoms as in motion. In order to remedy this misapprehension, Serres turns to the study of fluids and the behaviour of fluids in order to grasp the atomic world as one of constant flux and motion. For Serres, then, atomic motion is more akin to hydrodynamic behaviour than static atomism. See Serres 2001.
12. Some sections of Book IV are either corrupt, and thus illegible, or simply lost. At IV: 45–56, for example, a section that most likely was originally part of Book II is inserted. Also, at IV: 80, there is a confusing lacuna.
13. According to Diogenes Laertius' *The Lives of Eminent Philosophers*, 'Aristoxenus, in his Historic Commentaries, says that Plato wished to burn all the writings of Democritus that he was able to collect; but that Amyclas and Cleinias, the Pythagoreans, prevented him, as it would do no good; for that copies of his books were already in many hands. And it is plain that that was the case; for Plato, who mentions nearly all the ancient philosophers, nowhere speaks of Democritus; not even in those passages where he has occasion to contradict his theories, evidently, because he said that if he did, he would be showing his disagreement with the best of all philosophers.'
14. There are actually two forms of emissions – deep emanations, such as 'smell, smoke, heat', and so on, and surface emissions, simulacra. I have not made this distinction because it is not directly salient to Deleuze's discussion. See Lucretius 2001: IV, 70–97 for more.
15. Hughes says, 'learning is the progressive determination of the Idea which will give rise to knowledge'.

16. In fact, there is only one published article dedicated solely to this topic. Brooke Holmes, the excellent classics professor at Princeton, has written a well-crafted article on Deleuze's '*Lucrèce et le simulacra*', which appears in her recently published edited collection *Dynamic Reading: Studies in the Reception of Epicureanism* (2012). While this is the first and only piece dedicated solely to this Lucretian–Deleuzian encounter, it remains a highly classicist piece, and so it trades particular philosophical nuances in order to focus more on explication and terminology clarification. Hanjo Berressem published an article on Michel Serres' text on Lucretius and hydrodynamics, which mentions Deleuze's reading of the clinamen in '*Lucrèce et le simulacra*'. Still, this article, while rewarding in itself and admirably historically informed, focuses more on Serres' own work and so is only interested in Deleuze insofar as it relates to Serres. (See Berressem 2005.) Warren Montag also recently presented a wonderful paper on the clinamen and conatus in Lucretius, Spinoza and Deleuze, although this is yet to appear in print. Besides these three, there is nothing written on this exact subject.
17. Such as Sellars 2006.

Deleuze and Kuki: The Temporality of Eternal Return and '*un coup de dés*'

Tatsuya Higaki Osaka University

Abstract

Shuzo Kuki is a Japanese philosopher, belonging to the Kyoto school, who lived about a hundred years ago. He learned philosophy in Europe and developed an original theory of contingency, by accommodating the Asiatic way of thinking on the one hand, and Western philosophy (Bergson, Heidegger and neo-Kantianism) on the other. In this article, I show that we can find similarities between his theory of contingency and the philosophy of Deleuze, especially in regard to the subject of temporality and eternal return. Needless to say, the theory of the third time is a crucial theme in *Difference and Repetition*, and is closely related to the time of eternity, and the original or primitive contingency. Taking into consideration these aspects of time is indispensable in examining in depth the concepts of difference and virtuality. Kuki's theory of contingency, which incorporates early twentieth-century European philosophy, elucidates these concepts in an unexpected way. Therefore, my aim in this article is not to attempt a comparison between Eastern and Western thought by quoting Deleuze, but to illustrate a hidden lineage of thought, which runs from the nineteenth century (neo-Kantianism, Bergsonism, and so on) into the philosophy of virtuality of the twentieth century. This same lineage appears in Japan in Kuki's theory, and Deleuze's thought is, at least in one aspect, a modern manifestation of the same roots.

Keywords: contingency, temporality, eternal return, Kyoto school, Eastern thought

I. Introduction

There was a Japanese philosopher who developed a philosophy very similar to that of Gilles Deleuze about forty years before him. His name was Shuzo Kuki. He was born in Tokyo in 1888 and died in 1941, so he did not have any relationship with Deleuze; however, as the descendant of a noble, he stayed for a long time in Europe where he learned philosophy from Heidegger in Germany and from Bergson in France, and also taught phenomenology to Sartre. Therefore, it is not so strange that he has an affinity with Deleuze. I believe that this correspondence has many significant implications for understanding the foundations of Deleuzian philosophy in its transcultural expanse. Thus, what is important when comparing these two philosophers is not the difference between their cultural backgrounds, but to discover a latent relation between their logic per se.[1]

Kuki's most important work is *Gūzensei no Mondai* (*The Problem of Contingency*, 1935) (Kuki 2011b),[2] which is also a very metaphysical work. In this book he gives a detailed classification of types of contingencies. Interestingly, the main themes in this work are gambling (*kake*) and disjunctive contingency (*risetsuteki gūzen*) – the latter being a concept that closely resembles Schelling's 'original contingency'.[3] In this context, Kuki also discusses the temporality of Eternal Return. '*La notion du temps et la reprise sur le temps en orient*' (Kuki 2011a: 284–93), a French lecture that Kuki gave at the conference in Pontigny, formed the groundwork for this theme.

This lecture was delivered in 1928, and is one of Kuki's very first works. In this lecture he depicts oriental time not only as transmigration, but also as a 'vertical time' as opposed to 'horizontal time' and as '*extase métaphysique-mystique*' as opposed to '*extase ontologique-phénoménologique*' (Kuki 2011a: 291). In other words, he depicts oriental time as a vertical ekstasis. Furthermore, he does not deal with time's continuity or its *réel* (actual) aspect, but instead deals with time's discontinuity and its *imaginaire* (fictive) aspect (290). The word *imaginaire* bears a close affinity to Deleuze's thought, especially his discussion in *The Logic of Sense* where he claims that the actual is supported by a shadow-like double, and that the virtual is a kind of *contre-effectuation* (counter-actualisation). While it is impossible to discuss time without contemplating a vertical ekstasis, vertical ekstasis cannot be experienced within actual time; it can only be imagined.[4] Thus, it is not surprising that Kuki quotes in his illustration of contingency the exact same phrase of Marcel Proust that Deleuze uses

as the definition for 'Idea': 'It is not actual but real, not abstract but ideal.'[5]

The similarity between Deleuze and Kuki on these subjects is noteworthy. Deleuze quotes Mallarmé's expression '*un coup de dés*' in both *Difference and Repetition* and *The Logic of Sense* as the key phrase of these books. Furthermore, he gives the theme of 'gambling' the status of 'radical origin' in chapter 4 of *Difference and Repetition*. This discussion has a deep relation with 'the third synthesis of time' – the temporality of Eternal Return. In the temporality of Eternal Return, the formation of singularities that generates individuals is described as *point aléatoire*, that is, as points randomly extracted as in a game of roulette. Accordingly, as it is the distribution of singularities that comes into question, the gambling indicated as '*un coup de dés*' can be considered to be embodied within every instant across time. In other words, because every instant is included within the temporality of Eternal Return, it exists as a gamble – an absolute contingency lacking any necessity of occupying a particular location. This sort of conception shows very well the significance of Deleuze's depiction of the third synthesis as a time of ungrounding. Contingency, then, is one of the most critical ideas in his philosophy. By focusing on the problem of contingency and by interweaving the discussion of vertical time, this paper aims not only to explicate the philosophical relation between Deleuze and Kuki, but also to suggest a direction of development for Deleuzian philosophy.[6]

II. Kuki's Theory of Contingencies

I shall start by giving an outline of *Gūzensei no Mondai*. This work, which was submitted to Kyoto University as Kuki's doctoral dissertation, was written after a long study in Europe under the influence of *la philosophie de la vie*. The core of this work is Kuki's classification of contingencies. Kuki considers contingency, as contrasted with necessity, to be extremely important in the discussion of modality. He therefore emphasises the significance of the 'present' as the point where 'events' take place. This view runs counter to Bergson and Heidegger, who consider the past and future to be significant respectively. What is important for Kuki is the 'now and here [*ima koko*]' – the 'this present'-ness characterised by a severance in the flow of time. This present is not something, as Heidegger assumes, that is authenticated by a forerunning future while it itself can only be grasped as corruption (*Verfallen*). Neither is it merely a single limit of the past as Bergson assumed. For

Bergson, the past is what guarantees the continuity of time's flow and is the only thing that is real. On the contrary, Kuki is interested in the present as something that is on the one hand an instant in a flow but on the other a reality in itself – a point where being comes into contact with nothingness. As he writes, 'The temporality of possibility is the future; the temporality of necessity is the past. In contrast, the temporality of contingency is the *present*, symbolised as "now"' (Kuki 2011b: 209).

The 'present' Kuki is dealing with here is neither a mere physical point in time nor the so-called '*présent vivant*', but an 'event-ness' which acts as the precondition for both the physical present and *le présent vivant*. Kuki in fact uses such phrases as '*punctum saliens*' and 'differential emission'. Consider his following illustration: 'Contingency is at the same time reality and nothingness. The vertex *nihilum sive esse* bears the power, as a point of production, for the existence of the entire triangle' (Kuki 2011b: 187–8). (In Kuki's schematization, an upside-down triangle comprises the necessary, the possible, and the contingent, and the whole triangle exists above the line of impossibility, which runs through the vertex signifying the contingent.) He continues: 'Though contingency is in the adjacent relation of subalternate opposition to impossibility, and is grasped within the dimension of nihilism, it has been understood to be that which gives birth to *reality* and chants the actuality of the self' (Kuki 2011b: 213). We can see that the point of production (*punctum saliens*) is what displays the 'now and here' as a contingent reality.

Furthermore, the fact that Kuki expresses the emotivity of the present as 'surprise [*odoroki*]' also bears important implications. This is because surprise, unlike Heidegger's anxiety or Bergson's nostalgia, is an emotion that arises from a 'present' event.

> What is the emotion that corresponds to contingency? Just as the words *kigū* (fortuitousness) and *kien* (a strange coincidence) suggest, the emotion that corresponds to contingency is *surprise* [...] Contingency evokes the excited feeling of surprise because a problem is thrown out *before one's eyes* unsolved. The emotion of surprise is based on present-ness, the temporality which characterises contingency [...] Contingency is a modality in which being embraces the present while witnessing nothingness. (Kuki 2011b: 215; original emphasis)

The emotion of surprise Kuki is dealing with here can be said to be an emotion related to the occurrence of existence itself, and the fundamental contingency of this existence.

That Kuki perceives the 'present' as a sort of 'event-ness' or 'happening-ness' is clear also from his ensuing account, where he

interweaves 'exception and individuality [*reigai*, *kobutsu*]', 'unexpected meeting [*kaikō*]' and 'destiny = original contingency [*unmei*]' into the aspect of 'present'. It seems that Kuki here is discerning, in the vertical depth of the 'present', the temporality of Eternal Return, just as Deleuze does. While it is true that Kuki does not explicitly use the term Eternal Return here as he does in '*Propos sur le temps*', considering that his discussion of contingency takes place in the realm of 'metaphysics' and that it deals with the aspect of disjunction 'thrown out like a cast of the die', it is clear that Kuki's conception of contingency is deeply connected with Deleuze's conception of the third synthesis of time.

To get a fuller understanding of this connection, we need to move on to Kuki's classification of contingencies. Kuki simply divides contingency into three realms. The first is called the 'categorical contingency [*teigenteki gūzen*]', the second 'hypothetical contingency [*kasetsuteki gūzen*]' and the third 'disjunctive contingency [*risetsuteki gūzen*]'. A possible interpretation would be that the first contingency, which is a logical state, is supported by the second contingency, which has a strong 'event-ness', and that at the foundation of these two contingencies the third contingency is interwoven, which is the realm of a metaphysical original contingency.

The first contingency deals with exception-ness. It defines contingency as the deviation from a law. The examples Kuki gives on this aspect are four-leaf clovers and cold summers. Both of these instances inevitably provoke the feeling of strangeness. It is this sort of 'exception-ness' that Kuki refers to as 'contingency'. Nonetheless, what should be noted here is that Kuki designates to this sort of exceptional contingency the aspect of 'individuality'. Individuality should not be confused with subjectivity. In each instance, an individual stands out by its particularity and its difference from others. Here, Kuki is clearly rejecting the sort of individuality that is defined by the hierarchical structure proper to an Aristotelian genus–species relation.

The above outlook markedly overlaps with that of Deleuze. In chapter 1 of *Difference and Repetition*, Deleuze states that the Aristotelian genus-differentia definition of species, in which individuals are depicted within a hierarchical system of negation, is none other than the doxastic conception of representation. In this section, Deleuze illustrates the Hegelian concept of infinity and the Leibnizian concept of infinitesimal as something that intoxicates the identity of representations. Though Deleuze does not accept these concepts in this argument after all, he does invoke the Leibnizian apparatus of differentiation in his theory of individuals. In the sixteenth series of *The Logic of Sense*,

he illustrates how a singular point forms an individual, by rereading Leibniz's concept of compossibility (which matches his doctrine of pre-established harmony) as incompossibility. While Deleuze does not associate 'exception-ness' with 'individuality' as Kuki does, he does accord with Kuki in trying to grasp the reality of things as a sort of inessentiality, or as an extra-essential affair. An individual is a one-time occurrence and is particular in itself. It is this aspect that Kuki refers to as the contingent exception.

Kuki depicts the second contingency as a complement to the first. Let us return to the example above. A four-leaf clover is certainly an exception. Yet, there must be some reason to this exceptionality. For instance, the clover might have been injured during its embryonic phase, or there might have been some influence from the soil. In the instance of the cold summer, the phenomenon may be roughly explained by distributions of high atmospheric pressure and other global weather conditions. In either case, it is possible to find a reason that explains the exceptionality. However, there is still a problem here. It may certainly be possible to find a reason for the occurrence of an exception, but the reason this exception provokes the feeling of 'surprise' is that it is manifested in the present as 'now and here'. This must have some connection with the concept of 'unexpected meeting'. In this context, Kuki gives the example of a falling brick that hits a balloon that is hovering along a street. People would be surprised if the balloon breaks. Why is this? Of course, it is because the event of a brick falling and breaking a balloon that happens to be hovering along the street seems to be an extremely contingent happening. Nonetheless, it should be possible to physically explain why the brick fell; for example, because the cement that was sustaining it might have crumbled with age or perhaps because it had lost its strength via the influence of earthquakes or storms. The same goes for the balloon. There is nothing irrational in the motion of these objects. In spite of this, people are surprised if these two series of events happen to meet 'now and here'. This is because these two series are 'independent'; what provokes surprise is the fact that they happen to 'come across' at this place 'now and here'. In other words, 'individuals' and 'events' are all 'unexpected meetings' of various series at this place 'now and here'. It is in regard to this that Kuki takes up the problem of the second contingency.

Let me say in passing that the Japanese expression for 'hit [*ataru*]' (as in the brick falling and hitting the balloon) is in an extremely obscure voice. It is in neither the passive nor the active, but rather stirs up something in the area in-between. When I win a bet, for example, in

horse racing – the word for 'win [*ataru*]' in Japanese is the same as the word for 'hit [*ataru*]', and can be expressed in both the active and passive voice – I inquire into whether 'I made it win [*ateru* – active voice]' or 'it simply won by chance [*ataru* – passive voice]'. The Japanese terms '*ateru*' and '*ataru*' are very ambiguous. While '*ateru*' is active and '*ataru*' somewhat passive (in contrast with '*ateru*'), the past perfect tense '*atatta*', normally uttered when one wins a bet, is in a voice that can only be described as being in the middle of the active and passive voices. This word shows clearly a situation in which, though one certainly exists in this place, and his activeness can be exercised only in this moment in time, he (the subject) can normally do nothing to control what happens in that instant. Gambling is a typical example of such a situation.

In connection with this kind of middle voice, the psychiatrist Bin Kimura has emphasised the significance of the realm of '*aida* [between-ness]' in Japanese. For Kimura, there is a dynamic space of 'between-ness' in between the subject and object that cannot be distinguished as either self or other, and the subject is carved out of this dynamic space. This 'between-ness', while containing the germ of the self, cannot be said to be within the domain of the self. In 'Timing and Self' (Kimura 2003), in which Kimura illustrates relations with others through the example of timing, he explains this affair thus: if the self attempts to do something in this realm of 'between-ness', every action becomes somewhat like a gamble. Kimura has pointed out that the middle voice can be found in archaic languages such as ancient Greek. The middle voice has also been taken up in Benveniste's language theory,[7] and has connections with Michel Henry's discussion of *videre videor*.[8] All the same, I believe that this middle voice is distinctly close to Deleuze's membrane-surface-like realm of 'event-ness', as it is neither in the passive nor the active, but displays the extreme where the active is able to form upon the foundation of a passive Nature.[9]

Finally, in the third contingency, a metaphysical 'overlooking' viewpoint (precisely in the Deleuzian '*survol* = survey' sense) is proposed. This is a viewpoint which surveys the independent series of the second contingency. In the eyes of a finite existence, the unexpected meeting of such series may appear to be a mere coincidence. Yet from the viewpoint of an existence that can oversee every event in the world, the unexpected meeting of such independent series may have been decided a long time ago: Kuki refers to this as 'destiny'. His argument could be put this way: even if the fact that 'I am human' is predetermined, I can ask 'why am I not Egyptian or Chinese?' and 'why wasn't I born in some other period in time?' Furthermore I can ask, 'even if "I am a

living thing", why am I a human and not a bird or a bug?' It may be that each disjunctive member, when it is realised, is prescribed a specific quality. Individuality can be understood as having various states of such potential disjunctive elements within it, and in turn these elements form an individual by acting as a self-limitation for the individual.

From this point onwards, Kuki's discussion begins to resemble the Buddhist circle of transmigration. The theme he is discerning here can be understood as that of 'destiny' determined by an original contingency, namely, that there exists something like an original thrust (*un coup de dés*), and that if such a stroke started the motion of different/ciation, then it is absolutely impossible for us to intervene into such a domain of radical gambling – an area displayed specifically as the original contingency. Nonetheless, it is because there exists such a domain in which everything must be passive that it is possible for me to exist 'now and here', and for 'this thing' (*haecceitas*) to 'be' while at the same time being contingent. Kuki gives a very gripping illustration of this extreme contingency in the last part of his book.

> Contingency is non-conceptual. It is non-relational. It is law-less, order-less, unconcerned, and indifferent. Contingency has no purpose. It has no intention. It has no connections. It cannot be relied upon. It is blind; it has no eyes. As Shakespeare writes, contingency has 'no bottom'. As Hegel writes, it has 'no reason'. In contingency, nothingness deeply encroaches being. Insofar as this is so, contingency is a fragile existence. Contingency merely ties to 'this place' and 'this instance' an acute and fragile existence. (Kuki 2011b: 249)

I would like to point out that in Kuki's original Japanese text, the expressions of negation all include the character '*mu*', which means 'nothingness'. Also in Kuki's quotation of Shakespeare, it may be possible to discern the same state of affairs that Deleuze does when he describes the third synthesis as a time 'out of joint'. For Kuki, the root of contingency is the spearhead of 'being' that touches 'nothingness' itself, and it is none other than this contingency that forges the 'present'.

III. Kuki and Deleuze on Contingency

Kuki's three contingencies can be said to correspond to the three passive syntheses in the theory of temporality of *Difference and Repetition* (although there are of course some divergences). The first contingency, which deals with the 'individual', is none other than the synthesis of *le présent vivant*, where the active self is formed. This falls under what Deleuze calls *le fondement*. Both Kuki's first contingency and Deleuze's

first time deal with the concrete formation of something real against the backdrop of the virtual. Kuki's second contingency, which deals with the 'unexpected meeting', does not have any direct correspondence with Deleuze. However, if the series of causes Kuki discusses are understood in some sense as the reality of the past, then this precisely evokes the paradoxical situation portrayed by Deleuze, in which the past influences the present. For Deleuze, the temporality of events is extracted within *le circuit indiscernable*, where the past and present circulate. In addition, the time of the past is indicated as the time of *la fondation*. These factors connect with Kuki's regarding this affair as the grounds for exceptionness.[10]

Finally, the third contingency deals with something very akin to the third synthesis as *l'effondement* and the temporality of Eternal Return in Deleuze. This is no longer a domain in which the past and the present sustain each other – or in other words, a domain in which the wonder of individuals and events 'now and here' are explained by the past – but is rather something that can be understood only as a metaphysical, inexperimentable realm. This is not a normal temporality, but a temporality which, by virtue of being a temporality of infinite repetition, vertically cleaves the present. Kuki states in his Pontigny lecture '*Propos sur le temps*' that this temporality, in contrast with the horizontal phenomenological temporality which focuses on the present, is a mystical, metaphysical temporality.

> In this sense [Heideggerian sense] ekstasis is *horizontal*, so to speak. Nevertheless, regarding transmigration, we can say that there also exists a *vertical* ekstasis. Each present countlessly encompasses an identical time – in the future on the one hand, and in the past on the other. This implies a present possessing a thickness of infinite depth. This ekstasis is no longer phenomenological. It is rather mystical. Hence the word ekstasis regains to some extent its conventional meaning. (Kuki 2011a: 404)

Kuki's description of this sort parallels Deleuze's depiction of the temporality of Eternal Return as a time of ungrounding. Since there is no present that has a necessity of being *that* present in the temporality of Eternal Return, this temporality can relate with the present only as a randomly extracted point (*point aléatoire*). Thus, this temporality, in contrast with the phenomenological temporality, expresses itself to be completely groundless, its manifestation being related to the realm of radical contingency '*un coup de dés*'. Normally, one may think that the temporality of Eternal Return is a world of absolute necessity. However, the aspect of infinite repetition and the discussion of '*un coup de dés*' as

an absolute originality indicates that this temporality is something that destroys such a contingency–necessity framework. This overlaps with Kuki's discussion, in that it is extracting a realm involving an 'absolute gamble'.

Of course, we must not overlook the divergences between Kuki and Deleuze, as they are, after all, separated by a long time span. There remain until the end in Kuki's argument the conceptions of 'subject' and 'self', which Deleuze probably would have dismantled at one point or another. This is perhaps because Kuki was then under the influence of existentialist thought. Also, in contrast with Deleuze who, while following to some degree a Bergsonian style of thinking, develops a synthesis of time, Kuki is interested particularly in the aspect of 'now and here' in the 'unexpected meeting'. Kuki's 'disjunctive contingency' that corresponds with the third synthesis is certainly important, as it has connections with Deleuze's disjunctive synthesis, but he does not pursue this idea any further by investigating the aspects of existence such as virtuality and difference. What is important for Kuki is the 'surprise' of the 'present'. While he does discuss evading the 'present', it may safely be said that what Kuki has in mind is rather the non-present-ness implied within the present.

Nevertheless, keeping Kuki's argument in mind should be beneficial in interpreting Deleuze's arguments. The problem is how the realm of the third synthesis is related to the domain of genesis dealt with in *Difference and Repetition* and *The Logic of Sense*. When Deleuze speaks of the temporality of Eternal Return and the intervention of eternal time into the present, he is speaking of a paradoxical realm which makes possible the formation of event-ness by dismantling it at the same time. For Deleuze, it is assumed that the repetition indicated within Eternal Return is the 'absolute difference'. The infinite linearity of this absolute difference possesses '*la cohésion secrète*' (Hölderlin) within 'the ordinal number' – a recurrence with no recurring. What we must consider here is that this temporality, while being a sort of insane temporality, is none other than the temporality where an event denotes its particularity, as '*toutes les fois* [each time]' and '*une fois pour toutes* [once and for all]'. The overlapping of the expressions 'each time' and 'once and for all' indicates, firstly, that while the present is merely a *point aléatoire* in Eternal Return – or in Kuki's terminology, that the present is only *l'imaginaire* of a vertical ekstasis,[11] meaning that it can be an object of thought but cannot be experienced – it is at the same time displayed 'once and for all' as a 'here and now-ness'; and secondly, that there is no contradiction between these two aspects. The present exists between

reality and non-reality. The question here is whether one emphasises the non-reality implied within the vertical directionality or the construction of the present as 'surprise'. However, these two are in fact opposite expressions of the same matter. The seemingly contradictory state of being identical with every other moment in time, while at the same time being a moment which can be expressed only as this moment, is what constitutes the enigma of here and now. This is illustrated in *Difference and Repetition* as follows:

> The order of time has broken the circle of the Same and arranged time in a series only in order to re-form a circle of the Other at the end of the series. The 'once and for all' of the order is there only for the 'every time' of the final esoteric circle. (Deleuze 1995: 114)

This description is stated more explicitly, in relation to the subject of gambling, in *The Logic of Sense* as follows:

> (one long thought) [. . .] everywhere insinuating chance and ramifying each thought, linking the 'once and for all' to 'each time' for the sake of 'all time'. For only thought finds it possible *to affirm all chance and to make chance into an object of affirmation.* (Deleuze 1990a: 71; original emphasis)

Particularly, Deleuze deals with the subject of infinite time (which corresponds with the third time in *Difference and Repetition*) in connection with gambling and the game (*le jeu*).

> In reality, *the number of drawings is infinite. No decision is final, all diverge into others. The ignorant suppose that an infinite number of drawings requires an infinite amount of time; in reality, it suffices that time be infinitely subdivisible.* (J. L. Borges, quoted in Deleuze 1990a: 72; original emphasis)

Deleuze states that this sort of time is the *Aîon* (the third synthesis indicated within eternal time).

A game that decides on victory or defeat is meaningless. When Deleuze probes gambling and contingency to the bottom, he criticises the ideas of victory and defeat. He rejects Pascal's game and Leibniz's game, and instead emphasises a Mallarméian world of playing. This is precisely the point where the theory of the third synthesis, the 'radical origin' and 'events' intertwine (events should in this context be perceived as an absolute playing). This game, which has no winners or losers, is related to the problem of activity and passivity in gambling, not to mention the indeterminacy of the sphere of the subject.[12]

'*Un coup de dés*', the original stroke of the cue, the playing that started this world, is implied in some sense as a 'distant resonance' within the present, in the aspect of being 'each time' and 'once and for all'.

What Kuki perceives within the 'unexpected meeting' in this place 'now and here' is the self as a contingency connected with eternity. In the same way, Deleuze sees within the present the resonance of an original repetition.

IV. Towards a Philosophy of Contingency and Event-ness

What Kuki calls the vertical present in contrast to the horizontal present may, in Deleuze's expression, certainly be something that evades the present. This is clearly indicated from a different perspective in *What Is Philosophy?*, especially in chapters 5 and 6, where Deleuze defines science as the actualisation of the virtual, and in contrast identifies the endeavour of philosophy as counter-actualisation. The question we must consider is: would it be possible, in line with this direction, to import into the philosophical stage the discussions on contingency and event-ness outlined above?

Yet there is still a problem here, because the way in which Deleuze (Deleuze and Guattari) treats philosophy as counter-actualisation in his later period work *What Is Philosophy?* contains some obscurity. Although in retrospect, if we are to take his characterisation seriously, would not chapters 4 and 5 of *Difference and Repetition*, where Deleuze discusses actualisation, become science?[13] Also, what would happen to the significance of Deleuze's prudently limiting counter-actualisation to the arts related to the body (pantomime, the performing arts) in *The Logic of Sense*?

Counter-actualisation, a term used in *The Logic of Sense*, is depicted, in relation with the event-ness of the surface, as something closely connected with a sort of fictionality, especially in the twenty-first series of this book. Deleuze's taking up as an example arts related to the body (pantomime and the performing arts) clearly accentuates the unreality of the body's double, the body itself being an actualised concrete reality. This must have some connection with the fact that both Deleuze and Kuki emphasise contingency in their discussions of the arts (see note 12). However, in *What Is Philosophy?*, the 'restriction' that was present in *The Logic of Sense* is removed. Here, counter-actualisation can be read as a term ascribed to 'philosophy' in general. If philosophy is conceived as counter-actualisation, then which part of Deleuze's own philosophical practice should be expressed as counter-actualisation? An elucidation of this problem is a task yet to be undertaken. Furthermore, art is established in *What Is Philosophy?* as the third domain alongside philosophy and science. It seems as if the Deleuze in *What Is Philosophy?*

is removing from the domain of philosophy the various elements that he originally interwove into it. In contrast, the Deleuze in *The Logic of Sense* presents art – depicted as performances using the body, that is, counter-actualisation – as a domain completely different from philosophy, precisely as something that discovers the very *percept* and *affect*. If so, then this leads to another problem. Namely, should the description of event-ness in *The Logic of Sense* be classified only as art? In connection with the aspect of art presented in *What Is Philosophy?* on the one hand, and the concept of philosophy itself on the other, I believe it is possible to pursue a different direction, by developing the ideas of 'contingency' and 'event-ness' outlined in this paper.

The transition of the idea of counter-actualisation in Deleuze has significant implications for our interpretation of this concept. Defining counter-actualisation as philosophy seems like limiting oneself to a sort of practice in the area of virtuality. We can see this from the fact that although the early Deleuze dealt with the problem of genesis (whether it be dynamic genesis or static genesis) and placed emphasis in drawing a line of actualisation from the space-time of the Ideal, the later Deleuze, in his collaboration with Guattari, *A Thousand Plateaus*, develops these ideas into *espace lisse* (smooth space), or as the problem of *agencement* (assemblage).

However, if we consider the fact that Kuki always understood 'event' within the horizontal–vertical relation, we should be able to find another direction. For example, it is necessary to examine not only Deleuze and Guattari's emphasis of 'minor science' as opposed to royal science in *A Thousand Plateaus*, but also their portrayal of metallurgy and metallic handicraft as instances of this minor science. Metallurgy is certainly a form of science. Yet, it is science as a war machine – a minor science which stands in opposition to royal science, namely, science that connects with striated space and becomes hierarchised within the state. This is clear from the fact that, firstly, the metal dealt with in metallurgy is something that escapes the Aristotelian genus/species classification (which employs the idea of phylum), and secondly, that metallurgy is executed by the band, a nomadic subject. Mine development, which metallurgy presupposes, involves from the outset the element of gambling (consider the gold diggers). It can be said that metallurgy is a science of event-ness itself, a science which embraces a sort of counter-actualisation.[14] This topic becomes increasingly important, insofar as this kind of science is related to non-organic life (which the later Deleuze emphasises) and the living of this sort of life itself.

In this connection, it is necessary to consider various forms of minor science, such as the science of fractals, neuroscience, the Tardeian science of groups and the biology of morphogenesis. While these are certainly sciences, they are concrete endeavours of counter-actualisation. In this sense, these sciences can be considered to be highly metaphysical, just as Kuki contemplated the conjugation of the vertical and the horizontal, and attempted to grasp everything within the instant of contingency.

To conclude, we have examined two points in this paper. We have seen, firstly, that Kuki's discussion of contingency has close affinities with Deleuze's theory of temporality and his discussion of genesis in time, and secondly, that it is rooted in the ideas of vertical time and Eternal Return – ideas which constitute the essence of both philosophers' ontologies. What we have discussed is not a mere comparison between Eastern and Western philosophy, but a possible direction of development for thought after the twentieth century. I believe these themes indicate the contour of a new philosophy to come.

Notes

1. After a long study in Europe, Kuki became a professor at Kyoto University and established the first French philosophy course in Japan. However, he did more than merely introduce European thought. One of his main works, entitled *'Iki' no Kozō* (Kuki 2011a), makes use of hermeneutic methods to illustrate the aesthetic sensitivity proper to Japanese culture. This book has been translated into many languages and is probably Kuki's most read work. *'Iki' no Kozō* contains, form an aesthetic point of view, extremely illuminating implications, and is an important work in Japanese aesthetics. However, the concept of 'Iki' presented in this work can be characterised as a development, along the lines of emotivity, of the notion of personality, pertaining to the contingency expressed by two objects meeting unexpectedly, which was dealt with in *Gūzensei no Mondai*. I shall expound on the connections between *Gūzensei no Mondai* and *'Iki' no Kozō*, and the discussions on art in the latter, on another occasion. For English translations of *'Iki' no Kozō*, see Kuki (1997) and Kuki (2004a). For a French translation see Kuki (2004b). For a German translation see Kuki (1999).
2. *Gūzensei no Mondai* has been translated into French (Kuki 1966).
3. On this concept, see the later Schelling's *Philosophische Untersuchungen über das Wesen der menschlichen Freiheit und die damit zusammenhängenden Gegenstände* (Schelling 1997) and *Philosophie der Mythologie: Nachschrift der letzten Münchener Vorlesungen 1841* (Schelling 1996).
4. Of course, it is true that Kuki's discussions are grounded on Heidegger and Bergson's theories of time. However, we must consider the fact that, already at this stage, not only did Kuki postulate the time of Eternal Return (which is connected with his discussion of contingency), but his claims also parallel those of Deleuze, who propounds time as ungrounding (that is, as the third synthesis of time) while criticising the Bergsonian notion of continuous time. Accordingly, Kuki's idea of vertical time should not be regarded as a contrast between the Orient and the Occident, but rather as an original development of Heidegger and

Bergson's theories of time, completely independent from Deleuze. This seems to suggest that Deleuze's theory may be a sort of inevitable display of what would happen if one expands Bergson's ideas upon a backdrop of nineteenth-century philosophy.

5. In his discussion of hypothetical contingency in *Gūzensei no Mondai*, Kuki quotes Proust's *In Search of Lost Time* (Kuki 2011b: 131). The phrase he quotes is the same phrase Deleuze considers to be fundamental in illustrating the 'Idea' (Deleuze 1995: 269). This must have some significant meaning.
6. In this connection, we must also consider the philosophical background of Deleuze and Kuki's relationship. Both Deleuze and Kuki base their thought on late nineteenth-century philosophy: both have direct or indirect connections with Neo-Kantianism, Bergson and Peirce, and both are heirs of what Pierre Montebello calls 'the other metaphysics', that is, the genealogy of natural philosophy (Montebello 2003). Though this is an important subject that is yet to be discussed, I shall expound on this on another occasion.
7. On the meaning of the middle voice in ancient Greek, see Benveniste (1973).
8. On this, see Michel Henry's *The Genealogy of Psychoanalysis* (Henry 1993). Henry's discussions involve a dimension which lies in-between the passive and the active. I believe that this dimension forms the boundary separating the natural, passive self, on the one hand, and the active self which itself emerges from this dimension, on the other.
9. A theme similar to the middle voice can be found in Deleuze's joint works with Guattari, namely the concept of 'free indirect discourse'. 'Free indirect discourse' was emphasised by Bakhtin as the example of a discourse by a multi-voice subject, in which the enunciated sentence is displayed by the indirect discourse-like quotation of a direct discourse. Deleuze and Guattari emphasise the free indirect discourse in *A Thousand Plateaus*, where they illustrate language as pragmatics. Furthermore, in the section where he discusses 'perception image' in *Cinema 1* (Deleuze 1986), Deleuze takes up the 'free indirect discourse' of P. Pasolini's film theory. In this section he writes of a 'semi-subjectivity'. Semi-subjectivity is none other than Deleuze's conception of impersonal perception.
10. Actually, Kuki further classifies the second contingency into various subcategories. However, the subcategory particularly relevant in this context is the 'causal positive contingency [*sekkyokuteki gen-inteki gūzen*]'. The crux of this idea is the witnessing of two causal series converging 'without purpose'. The emotion of surprise that this circumstance generates forms the basis for the existence of an 'individual'. Therefore, this surprise, rather than itself being something subjective, can be said to be an emotion related to the individual events of the world itself. One cannot avoid being surprised by the present.
11. Whenever Kuki uses the term 'ekstasis', he is basically alluding to Heidegger's discussion of time. However, when he speaks of Eternal Return as a vertical ekstasis and depicts its actualisation as *l'imaginaire*, he is using his own terminology.
12. Contingency and probability are also important topics for the later Deleuze, who deals with works of art. For example, in chapter 11 of *Francis Bacon: The Logic of Sensation* (2003) where he deals with the paintings of Francis Bacon, he discusses the problem of contingency, while taking up the theme of game as he did in *The Logic of Sense* (1990a). In this section he emphasises 'the mark of chance', which does not indicate probability whatsoever. The same can be said of his discussions in *Cinema 2* (1990b), where he takes up the image crystal – a sort of metamorphosis of the third synthesis of time which already refuses to obey the sequence of time – and also where he proceeds to discuss the body and brain (especially chapter 8, where he discusses the 'Markov chain' in the notes).

The problem of contingency in the arts also has strong bearings on the last chapter of *What Is Philosophy?*, where he inquires into philosophy and eventness.

13. Although *What Is Philosophy?* is published as a joint work with Guattari, it has been said that it was actually Deleuze who wrote almost the entire book. From the outset, it cannot be denied that this book, which bears the title *What Is Philosophy?* and develops an account that looks as if Deleuze has returned to the ideas of his early philosophy, seems like a regression from Deleuze's collaborations with Guattari, who brought to the fore a radical form of praxis. However, it should not be overlooked that in this work, which is composed mainly of Guattarian themes such as the *plan de consistance* and *géo-philosophie*, the definition of 'philosophy' has undergone a transformation. How does Deleuze describe in this book the process of 'individuation' from his early work? Is there not a problem after all in asserting that this kind of inquiry is science? I believe these topics are significant in the examination of the later Deleuze's 'philosophy'. Deleuze does not seem to be clear on these points.
14. It can be interpreted that Deleuze and Guattari's adoration of metal and their topicalisation of metallurgists is a discussion directed completely against Heidegger, who based his contemplation of earth on agriculture and the lives of the peasants. In contrast with Heidegger's earth and peasants, which are easily absorbed into the state, Deleuze and Guattari's band always escapes outside the state, although it may make deals with the state.

Images of Time in Deleuze

Deleuze's major theses on time reappear in a dramatised manner in his books on cinema, where they conquer an aesthetic operationality that illuminates them as a whole. Take the most enigmatic idea that organises these books, the emancipation of time. *Time is out of joint*, exclaims Hamlet. Time is off its hinges! What does it mean for time to have left its axes, returned to itself, pure time? Deleuze alludes to a time freed from the tyranny of the present that previously it bent, and available, henceforth, to the most eccentric adventures. Bruno Schulz says, in another context, that time is a disordered element that is only kept in check thanks to an incessant cultivation, a care, a control, a correction of its excesses. 'Free of this vigilance, it immediately begins to do tricks, run wild, play irresponsible practical jokes, and indulge in crazy clowning' (Schulz 1980: 283). Schulz recalls that we carry a supernumerary load that does not fit on the train of events nor on the two-track time that supports it. For this precious contraband that he calls Event, there are those lateral tracks of time, blind detours, which stay 'suspended in the air, errant, homeless', in a multilinear streak, no 'before' nor 'after', neither 'simultaneously' nor 'consequently', the most remote murmur and the furthest future communicating at a virginal beginning. Thus, in the continuous time of linked presents (Chronos) the time of the Event (Aeon) is constantly insinuated, in its non-dialectical, impersonal, impassable, incorporeal logic: 'the pure *reserve*', pure virtuality that never stops supervening.

To this, Deleuze stresses a cinematographic procedure that consists of unlinking the peaks of present from their very actuality, subordinating

Deleuze Studies 8.1 (2014): 111–140
DOI: 10.3366/dls.2014.0136
© Edinburgh University Press
www.euppublishing.com/dls

this present to a flow that crosses it and overflows, in which precisely there is no more past, present or future, rolled up into a 'simultaneous, inexplicable' event. In the Event, the peaks of de-actualised present coexist, or yet one single event is distributed in distinct worlds according to different times, in such a way that what for one is past, for another is present, for a third is future – but it is the same event (as illustrated in Alain Resnais's 1961 film *Last Year at Marienbad*). Sidereal time or a system of relativity, says Deleuze, because it includes a pluralist cosmology, in which one single event is distributed as incompatible versions in a plurality of worlds. This is not a god that chooses the best of possible worlds, but a Process that passes through all of them, 'simultaneously' affirming them. It is a system of variation: given an event, not hitting it against a present that actualises it, but making it vary in diverse presents that belong to distinct worlds, although in a certain, more generic sense, they belong to a single shattered world. Or, given a present, not exhausting it within itself, but rather finding the event in it through which it communicates with other presents in other worlds, swimming upstream in the common event in which all are implicated: the Virtual Tangle.

Suppose there is a gigantic ontological Memory, made up of sheets or deposits of the past, kinds of strata, that communicate amongst themselves in order to be funnelled and exert pressure on a peak of present. Some of Resnais's characters, for instance, go from one stratum to another, stroll between levels, cross ages of the world, transversalise Time, or every time they recreate the distances and proximities between the diverse singular points of their lives. Let us stick to a comfortable image, time as a handkerchief: each time we blow our nose, we slip it into our pocket, crumple it in a distinct way, so that two points of the handkerchief that were previously distant and did not touch (like two distant moments of life according to a timeline) have now become contiguous, or they even coincide, or contrarily, two points that were next to each other have now irremediably been separated. As if time were a big mass of clay, every time it is moulded the distances between the marked points within it are rearranged. This is a curious topology where we witness an incessant transformation, modulation, that reinvents and causes to vary the relationships between the many sheets and their scintillating points, each rearrangement creating something new, plastic memory, always remade, always to come; mouldable mass of time, or better, able to be modulated, and about which Deleuze comes to exclaim, like a Christopher Columbus: it is Land, muddy vital means! When cinema is embroiled in this order of virtual coexistence

it invents its paradoxical, hypnotic, hallucinatory, indecisive sheets. In this Bergsonian line, the memory stops being a faculty inside of man; it is man that inhabits the inside of a vast Memory, World-Memory, gigantic inverted cone, virtual multiplicity of which we are a determined degree of distension or contraction. Even the philosopher and the pig, as in a metempsychosis, take up the same cone, the same life at distinct levels, jokes Deleuze.

Time comes to be conceived no longer as a line, but rather as a tangle, not like a river, but like land, not flow, but mass, not succession, rather coexistence, not a circle, but a whirl, not order – infinite variation. Instead of referring to a consciousness of time, it seems befitting to bring it closer to hallucination: going mad from this time off its axes, not without relation to the temporality of those that, off their axes, are designated as crazy.

Time and Madness

Always speaking of time, Deleuze evokes an absurdity: time which is decentred, aberrant, wild, paradoxical, floating or even sunk. It does not seem abusive to consider that time's going mad, as Deleuze works with it, communicates directly with the temporality of so-called 'clinical' madness. Meanwhile, on the other hand, a good part of the literature on psychoses is entirely unarmed when facing the multiple temporal figures that proliferate before one's very eyes in the clinic, and that 'psychological' theories find difficult to embrace, keeping in mind a temporal normalcy to which they are habitually prisoners. It is very rare to think about the temporality of psychosis in any other way besides under a privative mode. Even in a phenomenological or existential approach to psychoses, from Minkowski to Maldiney, in Binswanger or Jaspers, despite the undeniable descriptive interest that they present, verified multiplicity ends up being referred to a modality presupposed as an ideal, prioritising, for example, certain structures of being-in-the-world, transcendence, anticipation, the project, starting from an originary present, and so on. But also within strictly psychoanalytic literature, with rare exceptions, the non-unity of the psychotic temporal experience is subsumed to its failed futuration, in the form of timeless representations, in such a way that there is a chaotic immanence that is refused in the name of a significant elsewhere precisely not assumable by the psychotic. Ultimately, it is entirely an apology for historicising, whose fulcrum is the I historian, as Piera Aulagnier would say. Thus, somehow temporality ends up being identified with historicising. With

everything that this perspective can present as interesting, or useful, and even necessary in the clinic, it has the inconvenience of hindering the reception of becomings in psychosis. Deleuze and Guattari's reflection, in opposing becomings to history, could help to rethink this temporal heterogeneity of psychosis that so defies the time of reason, even psychoanalytical reason.

Deleuze says it clearly: History is a temporal marker of Power (Bene and Deleuze 1979: 103). People dream about starting or restarting from scratch, and also fear where they will arrive, or fall. We always seek the origin or outcome of a lifetime, as a cartographic addiction, but we scorn the middle, which is an anti-memory. That is when it hits the highest speed, where the most different times communicate and cross one another, where there is the movement, becoming, whirl, as Deleuze says literally (pp. 95–6). And the question to be answered is simple: what temporal figure do we create in order to think such a turbulent medium, such a virtual multiplicity? In any case, what should not fail to intrigue us is the fact that certain phenomena of psychic disturbance expose, more than any other, pure virtuality *as* virtuality, precisely detached from any centred or oriented actualisation. The temporal incongruences that appear in determined subjective configurations, and that also have marked cinema since its inception, strike, as is seen, at the very philosophical matter.

The Philosopher and the Schizophrenic

But what would it serve to converge Deleuze's times and the temporality of madness? Not, in fact, to suggest that the philosopher be in possession of a theory of time that the psychological domain has had trouble elaborating – a pretension that would come to contradict the same idea that Deleuze has made of the relationship between philosophy and non-philosophy, since the role of philosophy is not to legislate over other domains, nor that of these domains to apply philosophical concepts, insofar as each discipline constructs its instruments 'with its own means'.

It would be necessary to start at Deleuze's relationship with schizophrenia, or better, the intrinsic relationship that entertains the philosopher *and the schizophrenic that inhabits him*, this schizophrenic, 'who lives intensely within the thinker and forces him to think' (Deleuze and Guattari 1994: 70), initiating an 'event that is too intense', of a distinct nature, however, different from 'a lived condition that is too hard to bear' that attacks the clinical schizophrenic-entity, the psychosocial type. What temporal disturbances does this produce, that

is, *the schizophrenic on the inside of the philosopher*? Or rather, which times engender this conceptual character in him? What thought of time is the philosopher impelled to forge, starting from there, and what 'maddened' images of time is he tempted to liberate? And, lastly, how does he see his philosophy being harassed, from end to end, by these images?

To say it in the most simple way: several images of time collected in the previous section from a problematic of madness, although they contrast with the gathered images of time in Deleuze such as those that we briefly referred to, can go into free play with them, made of distance and proximity, contrasts and interferences, overlays, transvariations, remissions, abductions and talents. The potential for investigation that is inferred in this discordant accord, as much in relation to the *times of philosophy* with its own rationalities, as to the *times of madness* with its unreasoning, should not be underestimated.

Time and Thought

Cinema would have served Deleuze for revealing some of these conducts of time, giving off images that are diverse, evolutionary, circular, spiral, declining, broken, saving, fleeting, illocalised and multi-vectoral – time as bifurcation, discrepancy, gushing, oscillation, split, modulation, and so on. It is plausible to assume that the interest that Deleuze dedicated to them comes from a more radical determination than he lets us glimpse, in stressing the ambition of cinema to penetrate, apprehend and reproduce thought itself. Thought and time would thus be, immediately, in a relation of indissoluble co-belonging. Indeed, what is inferred from Deleuze's writings on time is that the very thought could not remain foreign to the project of freeing itself of a certain idea of time that formatted it, or from the axis that bends it. In this sense, Hamlet's enigmatic exclamation about time that leaves its axes is coupled with the exigency of a thought off its axes, that is, of a thought that has finally stopped spinning around the Same.

As well as criticising the sameness of a so-called dogmatic image of thought, Deleuze fustigates a hegemonic image of time. In asserting a thought without image, so that other images may come towards thought, Deleuze also calls for time with no image in order to liberate more or other images of time. The so-called dogmatic image of thought is well known: it is explored from *Nietzscheand Philosophy* to *What is Philosophy?* But what would it be, this image of hegemonic time refused by Deleuze? Briefly, we say: it is time as a circle. This is not

exactly circular time, but the circle as a profound structure, in which time is reconciled with itself, in which beginning and end rhyme, as Hölderlin says. What characterises the circle is its monocentring around the Present, its chained and oriented Movement, as well as its underlying totalisation. The circle with its centre is a metaphor of the Same. And even if the Present is in a remote and nostalgic past, or an eschatological future, neither for that reason does it discontinue functioning as an axis that bends time, around which it spins, redesigning the circle which we thought we had just escaped. It is there, ultimately, again and again, the time of Re-presentation.

To time as a Circle, Deleuze opposes time as Rhizome; no longer rediscovered Identity, but open Multiplicity. The logic of multiplicity was exposed and worked on, among other texts, in the description of the rhizome in *A Thousand Plateaus*. A rhizome can be entered from any side, each point connects with any other, it is made of movable directions, no beginning nor end, but just a means, through which it grows and overflows, without referring to a unity or derivation from one, neither subject nor object. What does time become, therefore, when it comes to be thought of as pure multiplicity or operating within a pure multiplicity? The rhizome has no temporal sense or direction (the direction of the arrow of time, good sense, the sense of common sense, ranging from less differentiated to more differentiated), nor does it rediscover a prior totality that it would be in charge of, abolishing itself, making it explicit in the concept. It possesses no sense or direction and is unrelated to any teleology.

But is this Deleuze's last word with regard to time? For this virtual multiplicity is as if it were ploughed and stirred at every point, along its entire length, no longer by a circle, which the author refuses, but by what might be called – and the expression is already in Plato's *Timaeus* – a Circle of the Other. A circle whose centre is the Other, this other that can never be the centre precisely because it is always other: a decentred circle. It is the figure that best suits Deleuze's original reading of Nietzsche: in the repetition there returns only the non-Same, the Unequal, the Other – Being of Becoming, Eternal Return of Difference.

You can call this Other the Future (the regal repetition is that of the future, says *Difference and Repetition*). But if there is in Deleuze, as in Heidegger, a privilege of the future, it is not deductible from a problematic of Finitude, but rather from the Work, which rejects its supports, Habit, Memory, Agent. The future is not, for man, an anticipation of his own end, his own death, the extreme possibility of his being, nothing presents it as a being-for-death, since it is not from

the ipseity that it can be thought, but a proto-ontic flow. If in Deleuze's elaboration of this future the Open is an important benchmark, it then refers to the outside, more than to Being. Let us say that the Open for Deleuze is closer to Blanchot than it is to Heidegger. It is under the sign of an Exteriority, then, that thought can gain a determination of future.

Time of Creation

As already mentioned, Deleuze's criticism of a so-called dogmatic image of thought is made on behalf of a thought without image. Now, this means that thought, without a prior Model of how to think (for example: thinking is to seek the truth) opens up for other adventures (for example: thinking is to create). Everything changes from one to another. Deleuze says that they are two different planes of immanence, classic and modern, that of the will to truth, on the one hand, and that of creation, on the other. And each is inseparable from a certain concept of time that fills it. Should we not suppose that a philosophy of difference, like that of Deleuze, has set itself the task to fill this modern plane of immanence with a concept of time belonging to thought defined as creation, and no longer as the will to truth?

The theorisation of Deleuzian time, despite its many obscurities, would be to then think of a time consentaneous to the force of the new. If there is a profound fidelity to the Bergsonian project, it can only be carried out successfully when, with Nietzsche, time is elevated to its ultimate potential, to making return to… difference. Only the selective eternal return, affecting the new, equalling the Unequal itself, only Time as Difference can inaugurate with the Future, discontinuous and disruptive, a relation of excess, such as the Work or the Beyond-Man, for which Zarathustra is not mature enough and yet he announces it. The future as the unconditioned that the instant affirms, is what Nietzsche would have called Untimely and whose importance Deleuze never stops emphasising.

If Michel Serres is correct in attributing to philosophy the function of 'inventing the conditions for invention', we must add that, in the context which concerns us, this would also, and above all, mean reinventing the conditions for the invention of other times that are not those already consecrated by history. It deals with, ultimately, undoing the solidarity between Time and History, with all the ethical, political and strategic implications of such an ambition. In thinking the substantive multiplicities and processes operating within it, driving out the most unusual temporalities, in the arc that goes from the Untimely to the

Event, will Deleuze not have given voice to those who, as he says in a Benjaminian echo, 'History does not take into account'? It is not, evidently, only the oppressed or minorities, though it always deals with them as well, but the minority-becomings of each and every one: not exactly the people, but the 'people who lack', the people to come.

***

Naked Life, Dumb Life, A Life

Musulman

I would like to begin with the most extreme – the *musulman* – and do so by returning briefly to Giorgio Agamben's description of those who, in concentration camps, received this terminal designation (Agamben 1999). The *musulman* was the vagrant corpse, a bundle of physical functions in their final gasps (Améry 1995). Curved upon himself, this vile being, without will, had an opaque gaze, an indifferent expression, a pale grey skin that was both thin and as hard as peeled paper, a slow respiration, a very low-pitched speech, undertaken at great cost... The *musulman* was the detained one who had given up, indifferent to everything that surrounded him, too exhausted to understand that which awaited him shortly: death. This non-human life was already excessively emptied of the ability to suffer (Levi 2000). But why *musulman*, if what was at stake were mainly Jews? Because the *musulman* handed his life over to destiny, in line with the banal, prejudiced and certainly unjust image of a supposed Islamic fatalism: the Muslim is the one who submits without reserve to divine will. In any case, when life is reduced to the contour of a mere silhouette, as the Nazis would themselves say in referring to prisoners as *Figuren* (figures, mannequins), what appears is the perversion of a power which does not eliminate the body, but maintains it in the intermediary zone between life and death, between the human and the inhuman: the survivor. Contemporary biopower, Agamben concludes while twisting Foucault's conception, reduces life to a biological afterlife, *produces survivors*. From Guantánamo to Africa, this is confirmed every day. The incumbency of contemporary biopower is no longer to produce death, as in the regime of sovereignty, or to make live as in the regime of biopower, but *to produce survivors*. It does not bestow death, nor life, but produces and manages *survivors*. And with them, the *afterlife* (Agamben 1995: 205). Let us remain for the moment with this odd postulate. Power makes survivors, produces the state of a biological afterlife, reduces man to a residual, non-human dimension,

which the *musulman* in the camp on the one hand and the neo-dead of intensive therapy rooms on the other, incarnate in two opposed yet complementary extremes. The afterlife is a human life reduced to its biological minimum, to its ultimate nudity, to a life without form, to the mere fact of life, to what Agamben calls *naked life*. But those who see naked life merely in the extreme figure of the concentration camp *musulman*, or the refugees in Rwanda, are misled without understanding what is most terrifying: that in a certain way *we are all in this terminal condition*. Even Bruno Bettelheim, a survivor of Dachau, in describing the camp's chieftain, qualifies him as a species of '*musulman*', 'well fed and well dressed'. The executioner is equally a live corpse, living that intermediary zone between the human and the inhuman, the biological machine deprived of sensibility and nervous excitation. The condition of survivor, of *musulman*, is a generalised effect of contemporary biopower, not being restricted to totalitarian regimes, and fully including Western democracies, the society of consumption, of mass hedonism, of medicalised existence, that is, of the biological approach to life in an all-encompassing scale, even in a context of luxury and biotechnological sophistication.

The Body

Let us take as an example the over-investment of the body which characterises our actuality. For a few decades, the focus on the subject has been dislocated to the psychic intimacy of the body itself. Today, the I is the body. Subjectivity has been reduced to the body, to its appearance, its image, its performance, its health, its longevity. The predominance of the bodily dimension in the constitution of identity allows for talk of a bio-identity. It is true, as it occurred a hundred years ago, that we no longer face a body made docile by disciplinary institutions, a body striated by the panoptical machine, the body of the factory, the army, the school. Today everyone voluntarily submits themselves to an ascesis following the scientific and aesthetic precept in gyms or in cosmetic surgery clinics (Sant'Anna 1995, 2001). This is also what Francisco Ortega, following Foucault, call bioascesis. We find the adequation of the body to the norms of show business, along the celebrity-type format. Given infinite possibilities of bodily transformation announced by genetic, chemical, electronic and mechanical prostheses (Costa 2004), the obsession for physical perfection under the compulsion of the I to cause desire in the other and the idealisation of the body's image, substitute the self-imposed

mortification (bodily mutilation even at the cost of well-being) with a promised erotic satisfaction. The fact is that we embrace voluntarily the tyranny of a perfect body in favour of a sensorial enjoyment whose immediacy makes the suffering undergone even more surprising. The bioascesis is a care of the self, but differently from the ancients, whose care aimed at the good life – something which Foucault also called an aesthetic of existence – our care aims at the body itself, its longevity, health, beauty, good shape, scientific and aesthetic happiness, or what Deleuze would call fat-dominant health. We shall not hesitate in calling it, even under the modulating conditions of contemporary coercion, a fascist body – in the face of such an unattainable model, a good chunk of the population is placed in a condition of subhuman inferiority. Moreover, in the domain of biosociality the body becomes an information packet, a genetic reservoir, a statistical dividual (I belong to the group of the hypertense, of HIV-AIDS, and so on), which only strengthens the risks of eugenics. Any weekly magazine with its health, beauty, sex and nutrition slogans which are adopted happily as scientific precepts, and therefore, as imperatives, only illustrates this context. We are, in any case, surrounded by the register of a biologised life … (Sibília 2002). While reduced to the mere body, to the excitable and manipulable body, from show business to the mouldable body, it is to the domain of naked life that we are reduced. We continue in the domain of the afterlife, of the mass production of 'survivors' in the broad sense of the term.

Survivalism

Allow me to broaden the notion of survivor. In his analysis of 9/11, Slavoj Žižek contested the use of the adjective coward to describe the terrorists. After all, they were not afraid of death, contrary to the Westerners who not only praise life but want to preserve and prolong it at all costs. We are slaves of survival, even in a Hegelian sense; we do not risk our lives. Our culture aims above all at this: survivalism, no matter at what cost. We are Nietzsche's Last Men, who do not want to perish, and prolong their agony 'immersed in the stupidity of daily pleasures' – *Homo suckerius*. Žižek's question is also Saint Paul's:

> Who is really alive today? … What if we are 'really alive' only if we commit ourselves with an excessive intensity which puts us beyond '[bare] life'? What if, when we focus on mere survival, even if it is qualified as 'having a good time', what we ultimately lose is life itself? What if the Palestinian suicide bomber on the point of blowing him- or herself (and others) up is, in an

> emphatic sense, 'more alive' . . . ? What if a hysteric is truly alive in his or her permanent excessive questioning of his or her existence, while an obsessional is the very model of choosing a 'life in death' [. . .] to prevent [some] 'thing' from happening? (Žižek 2002: 88–9)

Obviously, at stake here is not any incitement of terrorism, but a caustic criticism of what Žižek calls the 'post-metaphysical' survivalist posture of the Last Men, and the anaemic spectacle of life dragging itself as a shadow of itself, where an aseptic, painless existence is prolonged to the fullest in a biopolitical context. Even pleasures are controlled and artificial: coffee without caffeine, beer without alcohol, sex without sex, war without casualties, politics without politics – a virtualised reality. For Žižek, death and life do not designate objective facts but subjective existential positions, and in this sense he plays with the provocative idea that there would be more life on the side of those who, without concessions, and in an explosion of enjoyment, reintroduced the dimension of absolute negativity into our daily lives with 9/11 than on the side of the Last Men, which include all those who drag their shadows of life as living dead, postmodern zombies. It is against the backdrop of this desolation that the terrorist act inscribes itself, giving the appearance that vitality has migrated to the side of those who, in a lust for death, managed to defy our cadaverous survivalism. Baudrillard too calls attention to the contrast between systems such as our own, which are 'disenchanted', 'without intensity', and include 'protected existences' and 'captive lives', and cultures of 'high intensity', even in their sacrificial aspects. What we detest in ourselves, Baudrillard reminds us, is that which Dostoyevsky's Great Inquisitor promises domesticated masses: an excess of reality, of comfort, of accomplishment, the kingdom of God in earth. All of which Nietzsche, moreover, would judge, in the historical process of *décadence* he analysed insistently, as a gregarious abasement of humanity. In any case, if the present context in the West for Žižek is fertile for the evocation of the Last Men's passive nihilism, or even to detect among us the fulfilment of the capitalistic and biopolitical belief in the Great Inquisitor, where bread, servitude and tepid happiness would free us from disquiet and revolt, any association of 9/11-type terrorism with nihilism is a perfect countersense. The death of man claimed by Nietzsche, on the wake of the death of God, has no any relation to genocidal or suicidal onslaughts. Overcoming nihilism, the beyond-man, in its turn, points to a new way of feeling, thinking and evaluating, to a new way of life and even to a new type of subjectivity,

a transmutation of all values that is the opposite extreme of sacrificial faith and the doctrines which support it.

We can say that in the post-political spectacle, and with the respective abduction of social vitality, we are all reduced to biological survivalism, at the mercy of biopolitical management, worshipping low-intensity forms of life, submitted to a tepid hypnosis, even when the sensorial anaesthesia is transvestied as hyperexcitation. As Gilles Châtelet put it in *Vivre et penser comme des porcs*, we face the existence of cyberzombies, grazing indolently between services and commodities. It is *beastly life* as a global abasement of existence, a depreciation of life, its reduction to naked life, to an afterlife, the final stage of contemporary nihilism.

Giorgio Agamben retrieved the roman notion of *Homo sacer* to indicate those who were excluded from the sphere of human rights, but also from the divine, banished from political community and exposed to a relation of exception with sovereign power, even in death, without any of this constituting a crime (Agamben 2002). If this notion allows us to not only think the logic of the concentration camp, now made a political paradigm of the present, but also the zones in which this state of exception has become a commonplace, in a deeper sense, and as democracies themselves have their political space abducted and emptied with politics restricted to administrative policies, we would all be *Homo sacer*, reduced to biological survivalism, to naked life, at the mercy of biopolitical management and its strategic contrivances. When life is reduced to beastly life on a planetary scale, when nihilism becomes itself so visible in our own laxity, in the consuming hypnosis of *Homo suckerius* or in a dominant good health, it is worth asking first, what could still shake off this state of lethargy from us, and second, whether catastrophe is not installed in our everyday ('the most sinister of guests') rather than in the sudden irruption of the spectacular event of a terrorist attack against the Empire's capital.

Bloom: this is the name the magazine *Tiqqun* gave, in today's nihilism, to life without the form of common man (Tiqqun 2000; also in the magazine *Tiqqun* 2001). Inspired by one of Joyce's characters, it would be a human type that appeared recently on the planet, and which designates the pale, thin existence of common, anonymous man, although perhaps a man agitated with the illusion that his existence may be overshadowed with boredom, solitude, separation, incompleteness, contingency – nothingness. Bloom designates this affective tonality which characterises our age of nihilistic decomposition, the moment in which it rises to the surface, and this because it fulfils a pure state, the metaphysical fact of our strangeness and inoperativeness, beyond

or below the social problems of misery, precariousness, unemployment, and so on. Bloom is the figure with represents the death of the subject and its world, where everything fluctuates in an indifference without qualities, where no one recognises themselves in the triviality of a world of infinitely exchangeable and replaceable commodities. It matters little how the contents of life, which we visit in our existential tourism, alternate; Bloom is already incapable of joy as well as suffering, in an illiteracy to emotions of which he only collects diffracted echoes.

The Body that Can't Go On

What could shake off this state of lethargy, laxity, exhaustion from us? David Lapoujade gives an inviting Beckettian definition of the body: 'The body is that that can't go on' (Lapoujade 2002: 82ff.) But what is a body that can't go on? It can no longer take that which coerces it, from both without and within. In the first place, the civilisational sterilisation which fell upon it, as shown by Nietzsche in exemplary fashion in *The Genealogy of Morals*, or more recently by Norbert Elias (2012) as he describes the way in which what we call civilisation is a result of a progressive silencing of the body, of its clattering, its impulses and movements. Secondly, the body that can't go on is the deference which has been imposed upon it by disciplinary society, by the panoptical machine in schools, the army, prisons and hospitals. And finally, we add the following, while bearing in mind what we said before: the body that can't go on is the biopolitical mutilation, the biotechnological intervention, the aesthetic modulation, the bioinformatic digitalisation of the body, the sensorial numbness that this anaesthesia-inflicted context has laid down upon it... In sum, and in a broader sense, the body that can't go on is a survivalist mortification, be it in the state of exception or in everyday banality. The '*musulman*', the 'cyberzombie', the 'show business body', 'fat-dominant health', the *Homo suckerius* and 'Bloom', however extreme their differences appear, resonate in the anaesthetic and narcotic effect, configuring, in the context of a terminal nihilism, the impermeability of an 'armored body' (Pessanha 2002).

In the face of this, it would be necessary to retrieve that which is most proper to the body, its pain in the encounter with exteriority, its condition of a body affected by the forces of the world and its capacity to be affected by them: its affectability. At stake here is the introduction of another relation with life, with life 'before' it has received a form, or as it frees itself from these forms, or even, with a dimension of life below or beyond the form which it tends to acquire. This is what, in

my view, Deleuze called *a life*. *A life* is not at all abstract; it is the most elementary, life in its immanence and positivity, stripped of all that which wants to represent or contain it. The entire problematic of the body without organs is pre-eminently a variation around this biopolitical theme, life unmaking itself from what imprisons it, from the organism, the organs, the inscription of diverse powers upon the body. *A life* is all the contrary to naked, dead, mummified, shelled life. If life has to free itself from social, historical and political moorings, is not that to re-encounter something of its denudified, dispossessed animality? No one better than Artaud saw this. Kuniichi Uno, Artaud's, Deleuze's and Guattari's translator to Japanese, put it like this:

> But he [Artaud] never lost the intense sense of life and of the body as a genesis, or auto-genesis, as an intense force, impermeable, a mobility without limits which doesn't let itself be determined even by the terms bios or zoe (two names for life given by the Greeks, one which designates the form of life, the other the very fact of life). Life for Artaud is undeterminable, in all senses, while society is made up of infamy, bootlegging, commerce, which don't cease to satiate life and, above anything else, the body.[1]

It would be enough to meditate on Artaud's enigmatic phrase:

> I am innately genital, and if we examine closely what that means, it means that I have never made the most of myself. There are some fools who think of themselves as beings, as innately being. I am he who, in order to be, must whip his innateness. (Artaud 1970: 9)

Uno says that someone innately genital is someone who tries to be born through himself, who creates a second birth, beyond given biological nature. We could say, with Artaud, that we are innate but that we have not yet been born, in the strong sense of the term. Let us listen to what Beckett heard Jung say of one his patients: the fact is that she has never been born. Transporting this sentence to his work, Beckett creates an I which has not been born, and it is precisely this I that writes about the other I which has already been given, been born. This refusal of biological birth is not one arising from a being which does not want to live, but of a being which demands to be born again, always, at all times. The innately genital is the story of a body which puts in question its body as something which has been born, with its functions and all its organs as representatives of orders, institutions, visible or invisible technologies, all of which aim at managing the body. It is a body which has the courage to challenge that socio-political complex which Artaud called the judgement of God, and which we call biopower, a power which falls upon our body. This refusal of birth in favour of a self-birth

does not mean the desire to dominate one's own beginning, but, as Uno says, to recreate the body which has in it the power to begin. The life of this body, he insists – as long as it, on the one hand, discovers in the body the power of genesis, and on the other, liberates itself from the determination which weighs upon it – means war on biopolitics. Perhaps this is one of the few points where we agree with Badiou, as he affirms that for Deleuze the name of being is life itself, but not life understood as a gift or treasure, or as an afterlife, but instead as a neuter which rejects all categories. As he puts it:

> All life is naked. All life is a becoming naked, the abandoning of garments, of codes and organs; not that we are headed to a nihilist black hole, on the contrary, all this is in order to sustain the point where actualization and virtualization interchange, in order to become creators. (Badiou 1998: 32)

But is Badiou right in designating this life as naked? The life to which he refers cannot be, as Uno had already noted, *zoe*, the name given by the Greeks to designate the fact of life, as a mere biological or animal fact, or as a life reduced to biological nudity by the state of exception's juridical order, or even, as the techno-scientific manipulation of nihilist movement brought about by capital. *A life*, as Deleuze conceives it, is life as virtuality, difference, invention of form, impersonal potency and beatitude. *Naked life*, on the contrary, as Agamben has already made evident, is life reduced to its state of mere actuality, indifference, deformity, impotence and biological banality. And this not to speak of *beastly life*, as the entropic exacerbation and dissemination of naked life in its nihilist limit. If these lives are so opposed, and at the same time so overlapping, it is because in the biopolitical context it is life itself which is at stake, life itself as a battlefield. In any case, as Foucault said, it is at the point, in life, where power concentrates with greatest force that from now resistance will be anchored, but this to the extent that the signals are changed; in other words, at times it is in the extreme of *naked life* that *a life* is found, as well as virtuality, immanence, pure potency, beatitude, on the extreme of manipulation and the decomposition of the body.

If, from Nietzsche and Artaud to present-day youth, with their experimentations and researches, a diagnosis of beastly life has been generated, where the body retrieves its affectability and even its power to begin, is it not because in them beastly life has become intolerable? Maybe there is something in the extortion of life that should happen so that this life may surge altogether differently... Something must be exhausted, as Deleuze sensed in *The Exhausted*, so that a different game may be conceivable...

***

How to Live Alone

In the early 1980s, in a class about cinema, if I remember correctly, Deleuze was interrupted by a student, a little psychotic, like many who attended his courses; some were even Guattari's patients, or former inmates of La Borde, and composed such a heterogeneous audience, made up of philosophers, architects, painters, drug addicts, vagrants... The guy asked Deleuze why people were left so alone, why there was such a lack of communication nowadays, and unravelled his sad story about how we are victims of abandonment and helplessness. And Deleuze, sensing that his class was being driven off track, replied gently, before proposing a small break: the problem is not that we are left alone, the problem is that we are not left alone enough. Indeed, Deleuze never tired of writing that we suffer from an excess of communication that we are 'riddled with pointless talk, insane quantities of words and images', so that the problem is no longer getting 'people to express themselves, but of providing little gaps of solitude and silence in which they might eventually find something to say'. And to invoke the smoothness and the right not to have anything to say, this condition 'so that one might frame the rare, or even rarer, thing that might be worth saying' (Deleuze 2005: 129).

But what is this solitude that Deleuze called for, one that he came to qualify as 'absolute solitude' when referring to the creator, a condition that he detects in Nietzsche, Kafka, Melville, Godard and so many others? It is the world's most populous solitude. 'Populated not with dreams, phantasms or plans, but with encounters' (Deleuze and Parnet 1987: 6). Because what matters is that at the bottom of that solitude we can meet people without even knowing them, movements, ideas, events, entities. As he says:

> We are deserts, but populated by tribes, flora and fauna. We pass our time in ordering these tribes, arranging them in other ways, getting rid of some and encouraging others to prosper. And all these clans, all these crowds, do not undermine the desert, which is our very own ascesis; on the contrary they inhabit it, they pass through it, over it [...] The desert, experimentation on oneself, is our only identity, our single chance for all combinations that inhabit us. (Deleuze and Parnet 1987: 11)

What fascination they exercised over him, these hybrid types, solitary, desert, while men of the group, the gang, like Lawrence of

Arabia . . . Deserts populated by becomings, encounters, traversed by movements of deterritorialisation and depersonalisation . . . Even when they took a name, this name designated foremost an event rather than a subject, more a collective assemblage than an individual, foremost an intensity than a form. In short, a most singular point, opening for the largest multiplicity: rhizome. As the philosopher says, leave the 'black hole of our Ego' where we lodge with our feelings and passions, to unmake the face, become imperceptible, and paint ourselves in the colours of the world (Deleuze and Parnet 1987: 45–6, after D. H. Lawrence) . . . The most absolute solitude, in favour of more radical depersonalisation, for a different conjugation with the flows of the world . . . Become a molecule, becoming-imperceptible, meddle in the course of things and there proliferate, propagate everywhere . . . It is the becoming-viral of thought, whose other name is desire. 'The epitome of desiring solitude and the epitome of the socius', as Guattari wrote in his notes (Guattari 2006: 367). Or as in Godard: being alone to be part of a criminal conspiracy, or a production studio, and turn into a gang; in any case, desertion, betrayal itself (family, class, nation, the status of author), being served by solitude as a means for encounter, in a creative line of flight.

Thus, it is anything but a solipsism, solitude is the means by which one deserts the form of the Ego and its infamous commitments with a determined totality in favour of a different combination with the flows of the socius and the cosmos in such a way that the challenge of the solitary, as opposed to any autistic reclusion, is always to find or recover a maximum of connections (Deleuze 1997: 52). Call for a people to come. Make possible another community. Establish a different interaction between the singular and common.

Take the figure of Bartleby, the scrivener described by Melville, who replies to every order of his boss: 'I would prefer not to.' The lawyer oscillates between fraternal compassion and indignation, between pity and repulsion, with this employee planted behind the screen, who barely speaks, barely eats, pale and thin like a lost soul unable to be gotten rid of. With such passivity, he empties of meaning the impulse that previously turned the gears of the world, and makes everything run, in a deterritorialisation of language, places, functions and habits. And makes everything slide in a wild escape. From the depths of their solitude, these individuals do not only reveal the refusal of a poisoned sociability, but are the calling for a kind of new solidarity, the plea for a community to come. Not a community based on hierarchy, paternalism and compassion, as his employer would like to offer, but

the community of celibates, the society of brothers, a federation of men and goods, a community of anarchist individuals, that Deleuze often finds in American literature, as opposed to the inquisitorial utopia of the collective soul. And he asks: what remains of souls once they no longer cling to an identity, but also refuse to melt into a universal totality? What remains is precisely their 'originality', that is, a sound that each one *produces* when it takes to the open road, when it leads its life without seeking salvation, when it embarks upon its incarnate voyage, without any particular aim, and then encounters other voyagers, whom it recognises by their sound. Against the European morality of salvation and charity, a morality of life in which the soul is fulfilled only by taking to the road, open to all contacts, never trying to save other souls, turning away from those that produce an overly authoritarian or groaning sound, forming even fleeting and unresolved chords and accords. The community of the celibates is that of whichever man and his singularities that cross one another: neither individualism nor communionalism.

In light of these remarks, let me mention a course given by Roland Barthes many years ago on the subject of *How to live together*, when he confessed that the title resulted from a kind of obsession, and his research on the subject, therefore, was the fruit of a fantasy that had long been haunting him. Interestingly, he only states this fantasy of living together, and Barthes already discards collectivist utopias where everything is meticulously regulated and shared. The idea of a common life is immediately cleared of several hellish images of coexistence, from the Phalanstère to unpalatable company, from the family to the restaurant. It seems impossible to wrap up the fantasy of living together without its counterbalance, a guarantee of solitude, times of isolation, spaces of imprisonment, mechanisms for escape and distancing. Barthes's original fantasy appears clearly: a human agglomeration where everyone can, at the same time, live their own rhythm. Even if power tends to impose a homogenous rhythm on the life of a collective, as in a monastery, prayer time, meal time, rest time, each would have the right to their own rhythm, a *ruthmos*, a temporal form that is flexible, mobile and transient. Against the power of a single rhythm, the call for the idiorrhythm. But is not an idiorrhythmic community an insane utopia? From *The Magic Mountain* to Robinson Crusoe, the life of Spinoza (who rents a room in a boarding house and occasionally goes down to talk with his hosts – a true hermit, says Barthes) to the most burning actuality, the question that returns is this: how to create a structure of life that is not an apparatus of life? How to live together and escape the tyrannical gregariousness? How to reject the

forms of living together that suffocate singularity? Maybe by inventing a game made of distances and differences . . . A 'socialism of distances', where what is shared is the asymmetry . . . But another note creeps in at the end of the course, without which this panorama could not be complete: the experience of *dépaysement*, of expatriation, the voluntary exile. Drop everything, escape, leave, even if this movement's nature is internal, spiritual, imperceptible, made without ostentation or vanity. As if any collective were unthinkable without a line of flight. Perhaps the community itself, in the strong sense of the term – and history is full of examples – can only be born from a desertion, an exodus, however solitary, mystical or psychotic it may seem.

In a more clinical context, psychoanalyst Nathalie Zaltzman evokes the anarchist drive of the 'irreducibles', beings whose lives are punctuated by dramatic ruptures, and fight fiercely against 'imprisoning organizations of life'. If these lives can give off an almost epic image, we must remember that these people are caught in a 'solitude that cannot be shared nor alleviated', they are devoid of what we habitually surround ourselves with in order to protect ourselves from solitude and death (Zaltzman 1994: 34–5). What matters above all is

> to ascertain the extent to which they do not attach to anyone or anything, to what extent they remain free to abandon everything, to spoil everything . . . to give everything. They are not concerned with protecting the reasons that bind them to life; what keeps them busy is making sure they are free of any ties. Because they do not go into exile from themselves, they expatriate themselves in all of their lives. (Zaltzman 1994)

Such is attested by the anarchist geographer Élisée Reclus, who was repeatedly deported, exiled and imprisoned: 'I'm tired of eating and drinking, sleeping in a bed and going around with full pockets. *I need to die a little from hunger, to sleep on the gravel . . .* ' (quoted in Zaltzman 1994). Here there is, by tortuous paths, an urgency in the demonstration that one is alive, even at the price of constantly being exposed to death. The anarchist drive is that which fights the binding intention of Eros, which is annexation, ownership, annulment of alterity – gregariousness. The libertarian impetus, with its antisocial load, has a demoniacal, or even terroristic, halo. But what is at stake, even here, is a resistance against the 'unifying domain, deceptively idyllic, sweetening and leveling of ideological love' (Zaltzman 1994: 66), an impulse to make the whole structure of power, authority, connection and their sacred ghosts fly through the air. To relieve yourself from the love that everything embraces and paralyses, is not Thanatos, but rather

a vital struggle against death. I think that many characters of Dostoevsky are this type: they test out their leeway, mobility and vitality, even if they need to flirt with the demonic. Against the Grand Inquisitor from Dostoyevsky, who guarantees the herd with pacified happiness by buying their docility, the Underground Man is unwillingness personified, the refusal of the promise of narcotic quietude, the frenetic rejection of all truth, divine or scientific, in favour of an impatient freedom. Remember that the Grand Inquisitor got his biotechnocapitalistic and planetary version – what remains is knowing who are the underground men of today.

Like Thomas Bernhard, Juliano Pessanha, in his beautiful trilogy, gives himself the task of denouncing the pact of universal hypocrisy that ensures such daily existence, and reveals the metaphysical cement that, at every instant, prevents us from *collapsing*. But, paradoxically, in these books we see crumble one by one all the competent characters that guarantee the 'business of the administration of life', parents, educators, psychiatrists, socialisers, men of culture – all of which sometimes play the part of jailors of life. From the autobiography of the character Gombro (no doubt inspired by the writer Witold Gombrowicz), we have access to the survival strategies that a child invents in order to challenge all those who prostitute the word and make it the instrument of a generalised pretence. How to avoid the assassination that is proposed to us since the most tender age, how to get around the obliteration of one's own face, how to escape the narrative of oneself which has always already been outsourced by those who 'care' for us or 'love' us? The author offers a poetic answer. Only by returning on his own to the suffocation and retaliations ('I spent most of my life screaming in tunnels, windows, and alleys'), laying out in writing his early perception of death and pain. Only then is the factual linearity of a life broken, and it can be punctured by the series of questions that have characterised it:

> Is anyone there? Is there some true life on the planet? Why do the so-called family life, and the so-called scholastic life, and the so-called social life crush the possible child? Why is it that only the frauds survive, those who identify with the dead child? (Pessanha 2002)

In times of 'total mobilization', of 'existential alcoholism', there is a voice that introduces a word of hesitation, of waiting and presentiment. It resonates with Bartleby, but also with Saint Paul's question taken up by Žižek. From the bottom of his break, Gombro asks for other places for visiting, where living-together and living alone are articulated in a different manner.

How many have not tried it, and taking more torturous paths? Since Barthes had disclosed his personal fantasy of living together, namely, the monastery on Mount Athos, I will also allow myself to take one example, a little out of fashion, coming from the psychiatric field. Enclosure by enclosure, everyone has their fantasy. Well, Jean Oury, who, along with Félix Guattari, directed the La Borde clinic, practically committed himself into the clinic along with his patients in this old, decadent castle. The question that bothered him for the rest of his life, although in a specific clinical context, is similar to that of Barthes in the monastic setting, and certainly not unlike the fate of the Gombros, Bartlebys and Blooms whom we run into on every corner of this postmodern asylum that is ours: how to sustain a collective and at the same time preserve the dimension of singularity for each and every one? How to create heterogeneous spaces, with their own tonalities, distinct atmospheres, allowing each to connect in his or her own way? How to maintain an availability that facilitates encounters, but does not impose them, an attention that allows for contact and preserves alterity? How to make room for chance, without programming it? How to sustain a 'kindness', and allowing the emergence of a speaking from which there grows the affective desert (Oury 1980: 83)? When she described La Borde, Marie Depussé referred to a community made up of smoothness, because it was softened from being rubbed with pain. For example, these people need a bit of dust that protects them from the violence of the day. Even when sweeping, it must be done slowly: 'It's while you revolve around their beds, collect their crumbs, touch their blankets, their bodies, when the smoothest dialogues occur, the infinite conversation of those who fear the light with those who take upon themselves the misery of the night' (Depussé 1993: 105). Not an aseptic utopia, perhaps because the psychotic is there, fortunately or unfortunately, to remind us that there is something in the empirical world that is falsely spinning.[2] It is true that it all seems to belong to an almost Proustian past. But even Guattari never failed to acknowledge his debt to this experience of collective life in which he also delved deeply, and the effort he invested in checking the 'mark of singularity for the smallest gestures and encounters'. He confesses that out of that he could 'dream about what life could become in the urban conglomerates, in schools, in hospitals', if the collective Assemblages were subjected to such a 'baroque treatment' (Guattari 1992: 189). But currently we are far from following such a direction even and especially in a networked capitalism, which highly celebrates connections and monitors them for different ends. Besides this, what is seen is that in parallel to the absolute

connectivity a new anguish is intensified – that of the disconnection. Not only the anguish of being disconnected from digital networks, but also the networks of life, access to which is increasingly mediated by commercial tolls, unaffordable for a large majority. Still, we should be able to distinguish this socially produced 'negative solitude', what Katz called 'positive solitude', namely, that which consists of resisting a despotic socialitarianism, and challenging the tyranny of productive exchanges and social circulation. In these disengagements, sometimes, partial subjectivities are outlined, celibate machines that are resistant to a compulsory social re-enlisting. I will allow myself to mention an extravagant example, about a theatre company that I have coordinated for almost ten years, consisting mainly of users of mental health services. Some years ago we were invited to the prestigious International Theatre Festival in Curitiba. To our surprise, we stayed in a first-class hotel. Installed on the spinning sofa in the lobby, one of our actors places his coffee on the table, opens a newspaper, lights a cigarette. He is thin, white hair, very blue eyes. I watch from afar and tell myself: that could be Artaud, or some Polish actor reading the reviews in the newspaper about his play. Then I look down and see these big twisted yellow toenails sticking out from a pair of beach sandals... As if to say, not even close. Perhaps Deleuze and Guattari's beautiful saying fits here: territory is primarily the critical distance between two beings of the same species; marking their distances. What is mine is primarily my distance, I possess nothing if not distances... The animal and monstrous bloc, the indomitable toenail, a sign of inhumanity, that is one's distance, one's solitude, but also one's signature.

The Argentinian playwright Eduardo Pavlovsku created a character that humorously shows this claim by another type of surrounding. Let us take his character Poroto, which means bean. His most constant concern is to figure out how to escape situations that arise. Where is he going to sit at a party so he can escape at any moment? What excuse will he come up with when he runs into someone on the street, like Kafka, in his diaries, tells of how to get rid of a fat Jewish lawyer? How will he get out of such and such a commitment? And he comes to exclaim a sentence that is a punch in the stomach for many psychoanalysts, enough with connections, just contiguity of velocities. Would we not have here the outline of something peculiar to this universe of ours, so far from the time when no one stopped 'discussing the relationship'? A subjectivity that is more schizo, flowing, rhizomatic, having more to do with surroundings and resonances, or distances and encounters, than ties? Would it be possible to read in this perspective some contemporary

attitudes, no longer dissidence with respect to a disciplinary society and its rigid logic of belonging and affiliation, but rather to a surveillance society, with its flexible mechanisms for monitoring and the conjugation of flows?

In a small book titled *The Coming Community* (2007), Agamben evokes a resistance, not like before, that of a class, a party, a union, a group, a minority, but rather that of a whatever singularity, of the whatever one, which precisely is not any one, because it is 'amiable' in the singularity that belongs to it. For example, that anonymous man who stood up to a tank in Tiananmen Square, who is no longer defined by his belonging to a particular identity, whether of a political group or a social movement. Or the Arab revolt, that sort of ubiquity and multitudinous resistance, without a party flag, not delegating to any leader or institutionalised movement the leadership or the power of representing, hence the strength of such anonymity. This is what the state cannot tolerate, the whatever singularity that refuses it without constituting a mirrored replica of the state itself, in the figure of a recognisable identitarian formation, like a party, an ideology, and so on. Whatever singularity, which does not claim an identity, which fails to assert a social bond, which denies all belonging, but manifests its common being – this is the condition, as Agamben said several years ago, of all future politics.

In describing the May 1968 movement, Blanchot might have evoked some inaugural traces of a sociability to come, in referring to this mix of presence and absence, the gathering and dispersion, of no plan and refusal to take power to which something would be delegated:

> That is what makes them formidable for the holders of power that does not acknowledge them: not letting themselves be grasped, being as much the dissolution of the social fact as the stubborn obstinacy to reinvent the latter in a sovereignty the law cannot circumscribe, as it challenges it. (Blanchot 1988: 33)

It is an impotent potential, a-social society, association that is always ready to dissociate, 'always imminent dispersal of a presence momentarily occupying the whole space and nevertheless without a place (utopia), a kind of messianism announcing nothing but its autonomy and its *inoperativeness*' (Blanchot 1988: 33). If there is the sneaky loosening of the social bond, it is because at the same time it affirms the inclination to that which is shown to be as impossible as it is inevitable – the community.

This is one of today's challenges, to rethink the idea of community, mainly facing an emptied sociality, when nostalgia resurges from the community like that space of intimacy, sharing and unity. As Jean-Luc Nancy has shown, one should suspect that phantom of the lost community, by all means Christian, as well as that of the prospective ideal that such nostalgia produces. Because according to him, the community has not taken place. 'Nothing was lost, and for this reason nothing is lost. We alone are lost, we upon whom the "social bond" (relations, communication), our own invention, now descends heavily' (Nancy 1991: 11). That is, and from a more paradoxical approach, Nancy suggests that the community today is only thinkable if it is taken away from fusion, homogeneity and identity with itself. As necessary conditions, community has heterogeneity, plurality and distance, as opposed to all communional metaphysics. Instead of modelling a communitarian essence, it deals with thinking the insistent and unusual exigency, for community is made of interruption, fragmentation and suspense, composed of singular beings and their encounters. Hence, because the very idea of social bond that is insinuated in the reflection on community is crafty, because it precisely omits this *between* without which we slip into identitarian fusionality. Thus, if community is the opposite of society, it is not because it would be the space of an intimacy that society has destroyed, but almost the opposite, because it is the space of distance that society, in its movement of totalisation, never stops evoking. The community as the sharing of a separation given by singularity, in the relationship of the Other with the Other, while society would be the relationship of the Same with the Same.

But this metaphysics of alterity is perhaps no longer enough for us. We should be situated in the full contemporaneity, and its positive processes, accompanying Maurizio Lazzarato, for example, when he defines our present day not so much by the hegemony of immaterial labour, but rather by diffusion, by the contamination of minority behaviours, and practices of counter-conduct; what engenders bifurcation processes in relation to dominant subjectivity, unprecedented singularisations and unusual assemblages, as much in the network outside of it. The nature of contemporary productive cooperation, both in its dissident and constructive dimensions, would be indissociable from the propensity for collective life today. Accordingly, Sloterdijk may be right in suggesting that we no longer revolve around the terms of solitude and engagement, like several decades ago, but of cooperation and communication. It is unfortunate that when he questioned our anthropological solipsism with his theory of spheres, in order to contest the primacy of

ontological individualism, he resorted to dual metaphysics, of being-two. At least Barthes left his reflection in a more suspended state, although dichotomous. When he evokes the living-together, he resorts to the living-alone that would save it from communitarian oppression. And when he thinks about the being-alone, he evokes the collective as a compensating protection: 'Being a foreigner, it is inevitable, necessary, [desirable], except when night falls.' As if living-together would only serve 'to confront together the sadness of the night' (Barthes 2002: 176).

Perhaps what is lacking here, in this still dual logic, made of dichotomy and compensation, reciprocal between solitude and the collective, evoking what today constitutes the common backdrop, is precisely the 'common'. The contemporary mutation brought to the surface, in an unprecedented way, because of its economic and biopolitical core, the prevalence of the 'common'. Today, the common is not only language, but intelligence, knowledge and its corresponding ingenuity, but also a widened sensoriality, the uninterrupted circulation of flows, collective synergy, of affective plurality and of the resulting collective subjectivity. In short: the common is the social *bios*, the potential of life from the multitude. If that is the case, if the common can be conceived as a vital and virtual backdrop, a heterogeneous reservoir in continual variation, we must add two things. On the one hand, in a control society like ours, this 'common' tends to be blocked, privatised and expropriated, whether by mechanisms of subjective lamination, or by the procedures of hierarchical centralisation, whether from the marketing use of differentiations (transformation of individuals into dividuals). No one talks about the monitoring of perception, sexuality, health and sociability. On the other hand, the extraordinary polyphony of the multitude virtually overflows command systems and their strangulations. It is an entire pluriverse which deserves the greatest attention, with its diverse, punctual and ephemeral modes of association directed toward action, social hazing and political satire. From the group of motorcycle couriers in São Paulo who use their phones as indiscreet cameras and put their movies directly on the Internet, bypassing the mediatic watch over the city, with over 100,000 visits a day to their site, to that one solitary performer who is one of the first to arrive at the crash site of the TAM airline at the São Paulo airport and with his cell phone becomes the outspoken representative of the Brazilian secret service amid the police and firefighters, denying or allowing the landing of helicopters and simulating that he is the one who monitors the landing area, while with his other ear capturing the CNN news report

that, among other things, informs him of the imminent arrival of the governor of São Paulo by helicopter, helping him in his 'performance', I see small war machines everywhere, introducing a chaos factor or spreading germs to a new sensibility. Madmen, illegals, people in favelas, poets, musicians, the unemployed, the poor, invisibles of all types who roam our cities and claim something else, for which we do not yet have a name. All of them are aware of the disproportion present in the relation of forces, current biopowers and its hegemonic and enslaving racism, in the words of Giuseppe Cocco and Toni Negri in their analysis of Latin America, the perversion of incentive laws and the manipulation of large capital, the mafia that dominates our congress, the machinic servitude, the capitalistic semiotics that go directly to the affects; however, none of this seems to demobilise them, on the contrary... And in refusing the designation of the periphery, or the excluded, or even minorities, in rejecting the position of the worthless in this unequal war, in avoiding a frontal war or the militarisation of the fight or whining resentment or the social assistance call for social inclusion, without neglecting the effort to reach, by increasing pressure, the proper current legislation, they simply reiterate the statement of what they hold, emitting torpedoes of affect, insisting on the constitution of the common and in the game of singularities that seems to be its most obstinate conviction, even if out of their mouths it takes on other names, less noble, or philosophically incipient. All of them are, in my opinion, war machines that, according to Deleuze and Guattari's definition, do not have the objective of war, but that of creation.

But why, in a context where we do not have any given or prior exteriority that would anchor our resistance, as decades ago could have been the case of the proletariat, the marginal, the madman or the artist, in a context in which all these figures were devoured, in a moment of such planetary homogenisation, in which there is no longer any outside whatsoever and we are all inside a megamachine, whose mechanisms increasingly are capillaries of the calibration of affects, including the calibration of fear and threat, to talk like Brian Massumi; why precisely there, at this moment when apparently the totality of the planet, space, time, existence, the body and subjectivity are taken by assault; why precisely is it in the midst of such an atmosphere of machinic control, with their nihilistic effects, that we have seen these improbable and uncommon retaliations coming from the most unexpected places, re-encountering in the *chandalas* (the 'excluded' from India, those without caste, banned from all social commerce), biopolitical imagination and collective intelligence that entirely deserted

the spaces of political or aesthetic representation and their sterile perversion? One thing is certain: challenging the kidnapping of the common, disseminating its autopoietic focuses, focuses of irradiation, contagion and propagation, that are intensive, under-represented, pre-individual, a-significant, they reconfigure the collective subjectivity and its potential for affectation... They have no name, no power, do not dominate the institutions, we hardly know if they exist or where they are, but from that fluctuating threshold that constructs its plane of consistency. I do not want to idealise them, and if I use them in a somewhat similar way to how Nietzsche used the Jews of his time (in whom he saw a 'promise' of another Europe), or Deleuze used the schizos (in order to think about a deterritorialisation of the social), it is just to say this: perhaps they are one among the many war machines of the present time, that infiltrate and deviate and shift the brutal logic of the economic and militaristic and cultural war carried out by the established powers, enforcing their states of potential and their constituent strength, precisely refusing the will for power.

There is something, moreover, that should draw our attention throughout this journey – more so than the theme of solitude, this persistence of the theme of flight... But it is as if its relationship with the problem of the collective was still too extrinsic. Sometimes the collective is thought of as preserving the margin of escape that would compensate for its oppression (being able to flee from it), sometimes the very collective is thought of as a compensation for an all too solitary escape. The community, as is seen in this digression, would have a function of relief, balm and compensation, almost as a protection against unbearable solitude, while at the same time, solitude as a protection against the unbearable weight of the collective. Maybe what is most difficult is to think about escape and the collective together, the collective itself as a line of flight, the line of flight as a collective. In other words, between living-together and living-alone there is no pacifying dialectic, but a complex game, without synthesis: the disjunctive collective (Borges 2010).

Maybe it all depends, at bottom, on a strange theory of the encounter, in which the relation precedes its terms. To encounter is to affect and be affected, infect and be infected, envelop and be enveloped. Even in the extreme of solitude, encountering is not extrinsically colliding with someone else, but experimenting with the distance that separates us from them, and flying over this distance in a crazy back-and-forth pattern. Nijinsky says:

> I am Apis, I am an Egyptian. I am a Red Indian. I am a Negro. I am a Chinaman. I am a Japanese. I am a foreigner, a stranger. I am a sea bird. I am a land bird. I am the tree of Tolstoy. I am the roots of Tolstoy. (Nijinsky 1971: 20)

The heterogeneous contaminate and communicate, but each also envelops this or that which is encountered, takes possession of its strength, but without destroying it. Thus, out of this distance that Deleuze has called 'politeness' (Oury 'kindness', Barthes 'delicacy', Guattari 'softness'), at the same time there is separation, back-and-forth, flying over, contamination, mutual enveloping and reciprocal becoming. It is an overall weird connection, because it disconnects where powers want connections, and connects where we want disconnections. As in the schizo. One could also call it sympathy: an action at a distance, reverberation in the virtuality from what we differ (and not identity), the action of one force on another, constitutive potential. Neither fusion, nor intersubjective dialectic, nor metaphysics of alterity, but enveloping composition, disjunctive synthesis, polyphonic game. Hence Deleuze's question, of a Spinozist nature: 'How can a being take another being into its world, but while preserving or respecting the other's own relations and world?' (Deleuze 1988: 126). With this, Deleuze relaunches, in an inseparable and mixed-up manner, living-together and living-alone on a large scale, pointing to another sociability, and even to a community to come. A subjective ecology would need to sustain the disparity of worlds, forms of life, points of view, rhythms, gestures, intonations and sensations, and encourage its proliferation rather than kidnap it in a universal modulation, such that each singularity preserves, not its identity, but its power of affectation and envelopment in the immense game of the world. Without that, every being sinks into the black hole of its solitude, deprived of its connections and the sympathy that makes it live.

It would be necessary to depart from the precarious lives, anonymous deserters, people suicided by society, not only to thematise the meaning of these solitudes, but also that of the evanescent gestures that reinvent sympathy, and even a solidarity in the contemporary biopolitical context. Among a Gombro, a Poroto, a Bartleby, a Walser, even a Bloom, but also among the performer at the airport, a Bradley Manning, the dissident analyst of the intelligence service for the US military, or an actor in our schizoscenic theatre company, I see, at times, the outline of what might be called an uncertain community, not unconnected with that which has obsessed the second half of the twentieth century,

from Bataille to Agamben, namely: the community of those who do have community, the community of the celibates, the inoperative community, the impossible community, the gaming community, the coming community, or even a socialism of distances. One thing is certain: facing the terrible community that has spread across the planet, made of reciprocal monitoring and frivolity, these beings (but will it just be them?) needed their solitude in order to give rise to their crazy bifurcation, and conquer the place of their sympathies.

Book Reviews

Petr Kouba and Tomáš Pivoda (eds) (2011) *Franz Kafka: Minority Report*, Prague: Litteraria Pragensia.

This slim and elegant volume collects some of the lectures given in Prague at the Deleuze and Guattari summer school 'Franz Kafka and the Perspective of Minority' in July 2010. The volume appeared only a few months after the event, and this rapidity in the publication process is perhaps the first problem we encounter. The book gives in fact the impression of a certain haste in the editing and publishing and also in the general concept, beginning with the fact that there is no proper introduction. The two-page-long introduction by Petr Kouba is limited to a few basic remarks: it specifies that the book is not about Kafka and his work (something that perhaps a different title or subtitle could – or should – have made clear), but rather about Deleuze and Guattari's reading of Kafka, and more precisely about the 'notion of minority'; and provides a very short definition of 'majority' and 'minority', and of 'major' and 'minor language'. Kouba, however, does not dwell on the difference between the use of the noun and of the adjective, and more specifically on the problems that the use of the term 'minority' generates in the current debate. I will return on this point later. A proper introduction could have provided a stronger concept and rationale for the volume.

To my knowledge, in fact, there is no monograph or collection of essays focusing specifically on Deleuze and Guattari's take on Kafka. There are of course plenty of journal articles and book chapters, and the Kafka connection is in part explored also in a number of volumes focusing on Deleuze and literature. Kouba and Pivoda's volume, therefore, fills a gap in the literature, but it could have done it in a much more articulate and conscious way. What the introduction might have done, for example, is to discuss and clarify some issues arising from the title, which of course playfully combines the subtitle – and central

Deleuze Studies 8.1 (2014): 141–156

concept – of Deleuze and Guattari's book, 'Toward a Minor Literature', with the title of the 2002 Steven Spielberg movie, *Minority Report* (the arty cover is also a still from the film), but falls (or leads the reader to fall) into the trap of confusing and equating 'minor literature' with 'minority literature'. When they define 'minor literature' in chapter 3 of the Kafka book, Deleuze and Guattari do not speak of the notion of 'majority' and 'minority', but rather of 'major' and 'minor' literatures and uses of language. They do indeed briefly analyse the notions of 'majority' and 'minority' in 'Postulates of Linguistics', the second plateau of *A Thousand Plateaus*, quoted by Kouba in the introduction; however, they emphasise that what they are interested in is the major or minor 'mode' or 'use' of the language. This is no secondary issue, especially today, with the proliferation of, and an increasing interest in, the so-called 'minority literatures' or literatures of the minorities. Ronald Bogue briefly touches on this problem in a footnote of his excellent contribution to the volume: in appropriations of the concept of 'minor literature' by recent critics, he writes:

> all too often the term is used as a synonym for 'minority literatures,' and through that term, Deleuze and Guattari are recruited for the defence of identity politics, which, of course, is antithetical to Deleuze and Guattari's conception of minor writing. (64)

The issue is not mentioned elsewhere in the book, with the exception, implicitly and in passim, of Gregg Lambert's essay, which however does not dwell on it. Kouba and Pivoda missed indeed the opportunity to situate this volume – and the notion of 'minor literature' – within the contemporary debate.

Another sign of this haste in the publication is Miroslav Petříček's contribution, which is the simple transcript of the lecture he gave at the 2010 summer school; the lecture has not been reworked or expanded (it covers fewer than five pages), and not even the rhetorical mannerisms of the spoken address have been edited out. The short essay does not lack in interest: starting off from an analysis of the 'literary machine' in the Kafka book, Petříček connects the notion of 'machine' with that of 'structure' and investigates the similarities and differences between the two, with the help of Deleuze's 1973 essay 'How Do We Recognize Structuralism?' The argument is that the notion of 'machine' is a sort of evolution of that of 'structure', an evolution which 'retains, develops and intensifies its implications' (59). Of particular interest is the (brief) reference to the Prague structuralist school (better known as the Prague Linguistic Circle or Prague School, 1928–39), which developed a notion

of structure as open, or rather as an 'opening', and thus akin to the Deleuzian notion of 'productivity'. However, these interesting insights are not developed into an articulate analysis and remain at the level of fragments or suggestions.

The same applies to Catarina Pombo Nabais's contribution. Pombo Nabais is the only contributor who was not a speaker at the 2010 summer school, and her brief essay puts forwards a very interesting argument: from the Kafka book onwards, she writes, Deleuze subverts his own previous interpretation of Kafka, which still relied on a traditional, psychoanalytical notion of literature and literary interpretation, and embraces a 'new joy' which liberates him from the psychoanalytical understanding of literature. She points out that Deleuze's previous interpretation of Kafka, contained in the second part of *Proust and Signs* (added in 1970 to the 1964 first edition), uses a Lacanian notion of law grounded in the tripartition symbolic/imaginary/real within desire. Here the consciousness of the law as identified in Kafka is called 'depressive', as opposed to the 'schizoid' consciousness identified in Proust. The radical turn brought about by the publication of *Anti-Oedipus*, Pombo Nabais argues, is not entirely acknowledged and never explicitly discussed by Deleuze, and thus his new programme in the understanding of literature, as proposed in the Kafka book, is 'not completely honest' (33). This is indeed a big claim, which should be extensively articulated and supported by a much more thorough analysis of the texts. Pombo Nabais instead drops the discussion precisely where she should have gone deeper. Moreover, in my view, she mistakenly underplays the role of Félix Guattari in Deleuze's 'fundamental theoretical transformation' (41), a point that, again, the essay should have explored at length.

Despite their limits, however, Petříček's and Pombo Nabais's texts also testify to one of the strengths of Kouba and Pivoda's collection: the volume puts together a number of perspectives coming from different cultural and philosophical traditions, enriching thereby the discussion and the analysis. Besides Petříček, who was a student of Czech philosopher Jan Patočka, and Pombo Nabais, who comes from Portugal and works in France, Kouba's own contribution also opens to inputs overcoming the 'traditional' circle of (anglophone) Deleuze studies, as does the essay by Nick Nesbitt, who, though coming from the American tradition of French studies, has lived and worked in Prague and is thus receptive to some different inputs. If these cultural and also stylistic differences do occasion a certain disharmony in the whole, they certainly – and more importantly – provide interesting

stimuli. Moreover, the above criticisms do not imply a negative judgement on the project as a whole, and do not intend to dismiss its undeniable qualities: some of the contributions are indeed outstanding, and many of the ideas and concepts put forwards are original and worth pursuing.

Together with Ronald Bogue's, an excellent contribution is certainly that by Gregg Lambert, which deservedly opens the volume. In a way, Lambert's essay substitutes for the missing introduction, since it focuses on 'Kafka and the Question of a Minor Literature' and attempts to situate the notion of minor literature within the contemporary debate. The essay is not limited to a mere exposition of the concept of minor literature, but rather extends the discussion to the questions 'what is writing?', 'why write?', and 'for whom does one write?', with reference to Kafka's status as 'modernist' writer (and thus to the 'modernist ideology' or clichés about the writer) and to the contemporary politics of writing. Lambert's starting point is the observation that today 'the project of becoming a writer has a meaning even before it is actually a project of writing, or before the question of whether the particular work has merit is even raised' (9). That is to say, the project of writing is today always already framed by the ideology of globalised markets. This is the thesis put forward by Peter Hallward in *Absolutely Postcolonial* (2001), which updates and revises Jameson's famous theses about postmodernism, and is therefore the constant referent of Lambert's argument. Against Hallward's thesis, Lambert attempts to wrest the political value of the project of writing from this ideological framework, focusing on Deleuze and Guattari's notion of 'bachelor machine', which describes a 'social' process, a 'social' desire, and thus contrasts the 'logic of singularisation' that Hallward identifies within modernist (and postmodernist, postcolonial) ideology. The importance and actuality of Deleuze and Guattari's book on Kafka resides precisely in the attempt of 'wrestling' Kafka's work – and more generally the project of writing – from the 'always already' of the ideologies of both the 'Kafka-myth' and of the myth of the modernist writer.

This scenario also constitutes – implicitly – the background against which to read Petr Kouba's contribution. Kouba focuses on the 'perspectives from the outside' and starts off by reading Kafka's story 'The Burrow' through the concepts of *Umwelt* (biological environment) and *Umbegung* (the totality of all *Umwelten*) developed by the biologist Jacob von Uexküll in his studies about animal and human worlds. The sound the animal in 'The Burrow' hears

is read as coming from an 'absolute outside' and, as such, as that asignifying and thus deterritorialising 'sonority' Deleuze and Guattari analyse in the first chapter of the Kafka book. Kouba links then this asignifying, deterritorialising sonority to the 'perspectives from the outside' developed by the ethnological method, whose origins he seeks in Montesquieu's *Persian Letters* (1721) and Voltaire's *Mocrom*é*gas* (1752). Kouba certainly could have explored more in depth the link between Deleuze and Guattari and Uexküll, whose theories are mentioned in the discussion about '*Territoire*' and 'animal music' in *A Thousands Plateaus*' twelfth plateau, 'Of the Refrain'; moreover, on this connection, and on the notion of 'sonority', there exists a bibliography which should perhaps have been discussed. However, what strikes me most is the contrast between the notion of the writer as an 'outsider' that Kouba proposes, and Lambert's long critique of the 'modernist ideology' which pictures the artist 'as foreigner, as stranger, as criminal, as outcast or class-traitor' and so on (21). Is a 'bachelor' (in Deleuze and Guattari's view) the same thing as an outsider? Is there not an opposition between the bachelor's – or even the nomad's – deterritorialisation, which operates from within, and the gaze from the outside? That is, I have the impression that the all too 'traditional' notion of the artist as 'outsider' ends up 'reterritorialising' Kafka and Deleuze and Guattari's interpretation into that modernist ideology that they attempted to dismantle.

A different connection, that between Deleuze and Guattari's Kafka and Heinrich von Kleist, is thoroughly and masterfully explored by Ronald Bogue. Kafka notoriously considered Kleist one of his masters, and in the Kafka book Deleuze and Guattari draw a parallel – and a distinction – between Kafka's 'minor literature' and Kleist's 'literature of war'; in *A Thousand Plateaus* (1987), they further explore the meaning of a 'war machine' (plateau 'Treatise of Nomadology: The War Machine') as related to, but distinguished from, Kafka's 'bureaucratic machine'. Bogue, with the help of a little book strongly influenced by Deleuze and Guattari's philosophy, Mathieu Carrière's *Für eine Literatur des Krieges, Kleist* (*For a Literature of War, Kleist*, 1981) – a true companion piece to Deleuze and Guattari's *Kafka* – articulates the concept of a 'literature of war' to show that Kleist provided Deleuze and Guattari with an important means of extending the notion of the literary in their subsequent works. The differences between Kafka and Kleist, Bogue argues, should be viewed not in terms of an opposition of minor literature and a literature of war, but rather 'in terms of

literature's immediate relationship with a war machine in Kleist and with a bureaucratic machine in Kafka' (64).

The final contribution by Nick Nesbitt could have provided a companion piece to Bogue's thorough analysis: like Bogue, Nesbitt aims at developing an insight which is briefly mentioned in the Kafka book – a connection between Kafka and masochism enclosed in a long parenthesis in chapter 7 – but which remains unexplored. He thus links Deleuze's definition of masochism in 'Coldness and Cruelty' (his 1966 introduction to Sacher-Masoch's *Venus in Furs*) – 'the enactment of a systematic subversion of the law via dissidence' (91) – to the experiment in emancipation undertaken by the bachelor machine of the Kafka book. He then extends the analysis of dissidence to an (all too brief) reading of Jan Patočka and Václav Havel, who, unlike Deleuze and Guattari, emphasise the necessity of a dissident politics of 'truth' to be counterpoised to the state's politics of lie. The idea is extremely interesting, and it is a pity therefore that Nesbitt proceeds tentatively and without articulating in depth the connections and the differences between the Sacher-Masoch essay and the Kafka book (and between Deleuze/Guattari and Patočka/Havel). Moreover, he takes a surprising text as an example of Kafka's emancipative/dissident strategy: the 'Letter to His Father'. This letter, Nesbitt argues, expresses Kafka's masochistic politics of dissidence, in which, like Sacher-Masoch, he signs a contract with the Mother to escape from the Law of the Father. In short, Nesbitt attributes a sort of 'truth-value' to the letter, and this stridently contrasts with Deleuze and Guattari's reading in the first few pages of chapter 2 of the Kafka book, where they write right at the beginning: 'Kafka knows quite well that nothing in it [the 'Letter to His Father'] is true' (Deleuze and Guattari 1986: 9). And right after the parenthesis on masochism in chapter 7, they emphasise that the 'pact with the Mother' (Oedipal incest) entails 'reterritorialisation', and that a true deterritorialising 'pact' (schizo-incest) happens only with sisters, maids and whores (Deleuze and Guattari 1986: 67). Nesbitt risks here therefore to re-Oedipalise the bachelor machine and the masochistic pact. This is not the place to explore these issues and problems, which must however be pointed out to the reader.

Though the last contribution to the volume perhaps leaves the reader a bit disappointed, Kouba and Pivoda's collection is finally to be welcomed. It fills a gap in the literature, contains some excellent essays and proposes original and interesting ideas and insights, which hopefully will be pursued in future publications. Moreover, it emphasises the interest and the importance of Deleuze and Guattari's interpretation of

Kafka, which must be explored further. The reader is left asking for more, and this little book could work as stimulus for new research. On the other hand, Kouba and Pivoda's volume is a missed occasion because it keeps its ambitions too low: certainly, it defines itself as a collection of 'reports', which besides originate (though this is not specified anywhere in the book) from a punctual and limited experience, the 2010 summer school in Prague. However, even within the limits of this 'modesty', there were the premises for a stronger contribution to both the Kafka and the Deleuze and Guattari scholarship.

Patricia Pisters (2012) *The Neuro-Image: A Deleuzian Film-Philosophy of Digital Screen Culture*, Stanford: Stanford University Press.

The history of science is populated with magical entities: phlogiston, the ether and animal spirits, as well as borderline beings that migrate from magic to legitimate consecration. The God particle, atoms, planets, the gay gene and perhaps the brain are undecidably poised between fanciful fictions that might close down inquiry by operating as a black box, or that might be genuinely 'real' insofar as their posited existence allows for more explanation and richer worldly engagement than other possible objects. What happens when an entity is poised between philosophical creation and scientific function? One might say that atoms are at once philosophical concepts, allowing us to imagine life *as if* it were composed of basic irreducible units, at the same time that atoms are also functions,

allowing for the creation of new forms of energy, destruction and physical prediction.

Gilles Deleuze and Félix Guattari, who provide the theoretical ballast for Patricia Pisters's magisterial work on the neuro-image, offered one of the most practical and *im*practical ways of distinguishing concepts from functions. Concepts are created by philosophy, are intensive and open new orientations that reconfigure the plane of thought upon which they are composed. Concepts do not label what is already there, but bring new modes of inquiry and being into existence. The brain is, therefore, strictly speaking a concept. If we employ much of the work that Pisters draws upon – theories of a mind that is extended, enactive, embodied, embedded and affective – then the brain is not simply a thing within the world (something that has extension), but is genuinely conceptual insofar as it reconfigures the problems we pose about almost anything. The brain is not an organ housed within the body that then enables cognition, processing and judgement of the world. To create a *concept* of the brain is to look at how relations among forces are altered, creating new speeds, responses, desires and new worlds. Just as every painting alters the history of painting, so the formation of a philosophical concept transforms the very possibility of philosophy. It makes sense – if we think of the brain as a dynamic and plastic network that becomes what it is always in relation to encounters that are at once felt in the body, but also extend beyond the skin to the light, sound and smell of the world – that philosophy would no longer be concerned solely with judgement, analysis, universal foundations or even truth in general. It would also make sense that philosophy might need to confront cinema: not because cinema tells stories or offers examples about which we philosophise, but because cinema as the composition and variation of images might also be akin to the brain, akin to a new style of philosophy. If the brain is not an organic but a dynamic and plastic and interactive network, then it makes sense not only to extend the mind beyond the body, but also to extend the neural paradigm to the non-human and not necessarily organic relays of images that make up the world. The brain would be a dynamic creative network composed of images, where the image includes sensations and affects that go beyond visual perception. Similarly, the cinema would not be realistic or representational but an exploration and reconfiguration of thinking – where thinking is now understood *not* solely as logical, theoretical or assertoric, but emotional, sensational and affective.

Key to Pisters's argument is a reconfiguration of film theory that goes back to a lost moment in cinema studies when it may have

been legitimate to consider the screen in relation to perceiving and feeling bodies. For Pisters this potential for considering the screen in its dynamic relation with the human body as a sensory-motor apparatus was quashed by an ideological resistance to seeing film as anything other than a text that might be analysed rigorously and semiotically. If, however, we consider recent work in neuroscience – both theories of schizophrenia that indicate a dominance of affective rather than bounded or logical thought, and theories of the extended mind – then the screen and cinema become philosophical scenes in which the very composition and synthesis of the world come into view:

> The way neural activity here is embedded in a sensorymotor dynamic is an example of a 4EA position compatible with a Deleuzian framework. [...] If externalism means [...] that neurological processes are fundamentally connected to the brain, incorporate bodily and external processes, and thus maintain a relation between the inside and the outside, then the 'strange encounter' between Deleuze and cognitivism becomes quite plausible. Their meeting is in fact an exploration of the implications of the brain as screen, halfway between the external world and internal brain processes. (77)

Pisters begins her journey, however, less concerned with the brain as a philosophical concept than as the other possibility articulated by Deleuze and Guattari: the functions of science. The brain is also something that can be the object of a theory that would explain the world's states of affairs. The brain, here, is less of a paradigm shift in the posing of problems than it is the opening of a new terrain of inquiry: fMRI images and new diagnostics allow for the new ways of approaching clinical problems such as schizophrenia and delirium. Pisters ties Deleuze and Guattari's seemingly vague and figural accounts of schizophrenia to specific findings and case studies: 'Recalling Jill Bolte Taylor's story, we could argue that Deleuze and Guattari's concern for schizophrenia relates to a similar desire to create more awareness for the "world of the right hemisphere" in a dominantly left hemisphere culture' (46). It is this side of the brain – the brain as a function of science, as a way of considering the ways in which the mind perceives and composes its world – that Pisters explores in an early chapter on cinema and delirium. Here, the book is less concerned with the brain as a concept – the creation of a new orientation for thinking – and more with the brain as an object that, studied in its pathology, allows us to think of cognitive and neural processes more generally. So the states of delirium, fragmentation and disorder explored in films such as *The Butterfly Effect* (2004) are for Pisters ways of opening out onto broader

problems of the socio-political field. She even cites a study that concludes that mental disorders among Moroccan immigrants to The Netherlands are higher than among Dutch natives, indicating that, 'Environmental factors thus seem to be important as potential triggers of schizophrenia, which is confirmed by recent neuroscientific findings. [...] In sum, modern neuroscientific findings consider schizophrenia a brain disorder that can be related to abnormal synaptic connections and plasticity' (43).

The key manoeuvre occurs when Pisters does not allow this functional dimension to dominate the book's trajectory and instead makes two decisive methodological shifts. First, the supposed pathology of schizophrenia indicates something about mind in general, so that 'abnormal synaptic connections' might perhaps be better thought of as counter-normative synaptic connections, and would then include the cinematic creation of new image machines as well as the philosophical creation of aberrant syntheses: what if we imagined an image's or thing's power to think? Second, she shifts from considering delirium as depicted in film, to film itself as a mode of delirium, delusion or power of the false. Ostensibly examining films about magic, such as *The Prestige* and *The Illusionist* (both from 2006), Pisters develops a notion of film, perception (and then imagining more broadly) as illusion, *which cannot be placed as secondary to or distinct from cognition*:

> Visual illusions (such as the Necker cube, and the spectacle on a film screen) demonstrate that perception in itself can be ambiguous, alternating between different interpretations of illusions that are both real on our brain-screen. Film viewing is such an illusion, which nevertheless triggers the activation of information within the neocortex, allowing us not only to see but also to understand, learn from, and interpret visual information. The workings of perception of reality and illusory perceptions of reality (like cinema) are quite similar. (82)

Here, Pisters's text and ongoing method is poised between two possibilities. The brain may be considered as a function – as a thing within the world that composes and recomposes images, and that in turn allows us to theorise other phenomena, such as the cinema and the mind and a general approach towards perception. On such a reading art can be studied for what it discloses about human organisms as sensory-motor apparatuses. Like certain pathologies, the illusions and delusions of cinema give us an intensified version of what occurs in thinking and cognition more generally. On the other hand, if cinema and the brain are screens that similarly compose and recompose images, then neither can be seen as like or explicative of the other; instead, one might think

of the world – beyond cinema and the brain – as a plane of interacting and mutually recreating images. The first approach, where the brain is a function, places art and the image within explanation, and allows us to perhaps form a Deleuzian rapprochement between cinema and science. We could refer to this as the neural or cognitive paradigm, where what we now know about the brain allows us to think differently about cinema and television. On the other hand, it may be that the science of the brain requires new philosophical concepts, and this is where Pisters takes her analysis with her notion of the 'neuro-image'. If, for Deleuze, there is the movement-image, where cinema confronts the world's composition through the interplay of movements, and the time-image, where cinema can fold different layers of time *not connected by a common space or movement*, then there should also be a neuro-image. Here, Pisters opens the neural beyond perception and synthesis of the world, to the cinematic power to present the history, politics, intensity and ethnicity of the world via the conjunction of images. If the brain is plastic, and *not* housed in the human organism, then it makes sense to consider our increasingly cinematic and televised milieu as an extended and intense domain of images that are at once thoroughly global and neural. This is not so much a neural paradigm, where the brain explains other entities, as it is a neuro-imaginary, where the thought of the political field as a war of images shifts the very mode of analysis and critique. The War on Terror is a war of images, a 'new regime of images':

> it was not until the second historical moment [after 1989 and the fall of the Berlin wall], 9/11 – the attack on the twin towers and their dramatic collapse in 2001, caught on countless professional and amateur cameras and distributed in a dense global network across different media – that the conditions of the large-scale emergence of the neuro-image were amplified, its qualities having already been signaled in the preceding decade. This crisis marked the end of (relative) post-Cold War euphoria, during which time even war had seemed to become 'nonwar' in a disappeared or faded political present. The violent attack by Islamic fundamentalists definitively transitioned US power toward the era of the War on Terror, with the war(s) in Iraq and Afghanistan as its most visible and dire consequences. With every attack, or seemingly apparent threat, increased measures of control and surveillance became more severe and invasive – ranging from the proliferation of CCTV cameras to full-body scans at airports and hyperinvasive and expanded data-mining by governments and companies. (301)

Like all books worth reading, Pisters's work on the neuro-image raises more questions than it answers. How do we understand the very

notion of the 'neuro'? Is the brain and its neuro-paradigm a scientific lever for thinking critically about the politics of images, such that it becomes increasingly important (by way of science) to recognise the brain as plastic and tied to illusion? If this were so, then there would be some privilege attached to the science of the brain that would help to explain the functioning of images in philosophy and art. In part, such a use of scientific functions to make a claim about cinema is precisely the method that Pisters pursues. One might then criticise her project for its convergence of science with art, creating an equivocal relation whereby science is of a higher order of being and reality in its capacity to explain art. But to do so might require remaining unfaithfully faithful to Deleuze: for is not the claim of the cinema books that an event outside of philosophy requires a new mode of philosophy and not just the incorporation of new themes or objects? If that is so, then the 'neural' (like cinema) might signal a way of thinking the neural *outside the brain*, such that the notions of plasticity might not be borrowed from neuroscience to apply to other domains but might require a rethinking of the very notion of domains, and even of sites or modes of thinking. Just as Pisters refers to the ways in which surveillance culture has off-loaded the tasks of imaging and the politics of imaging to a zone that no longer has the form of a polity, perhaps we also need to think of the neural as a form of plastic, decentred but also fractal and explosive mode of relations that takes place outside what has come to be thought of as life.

Jeffrey A. Bell (2009) *Deleuze's Hume: Philosophy, Culture and the Scottish Enlightenment*, Edinburgh: Edinburgh University Press.

Two questions guide Deleuze's reading of Hume's philosophy in *Empiricism and Subjectivity*: first, 'how does the multiplicity of ideas in the imagination become a system?' and second, 'how can a subject transcending the given be constituted in the given?' Jeffrey A. Bell shows how, with these questions, Deleuze extends Hume's empiricism to develop his own transcendental empiricism. Although a great deal has been written on Deleuze's transcendental empiricism, surprisingly little has been written on his relationship to Hume, and Bell's *Deleuze's Hume* is the first book-length study of this relationship published in the English language.

In part, *Deleuze's Hume* appears to have been formulated as a response to Alain Badiou's criticism, in *Deleuze: The Clamor of Being*, of Deleuze's theory of the virtual. Bell discusses this criticism at length in chapter 1 and returns to it throughout the book, making his point most explicitly towards the end: 'That Deleuze has "no way of thinking singularity" is evidenced, for Badiou, by Deleuze's continued adherence to empiricism, even his Humean transcendental empiricism' (131). According to Badiou, Deleuze's empiricism makes him incapable of thinking the new as a rupture with what is, because he secures the primacy of the one over the multiple; what Deleuze considers to be creative and new is simply a continuous folding and refolding of the given. Bell rejects this criticism by constructing a defence of Deleuze on the basis that Deleuze is able to think singularity precisely *because* of his Humean transcendental empiricism.

Key to the construction of this defence is discovering what Bell calls a process of 'historical ontology' in both Hume's and Deleuze's philosophies. Considering the importance of historical ontology for Bell, it is surprising that so little is said to introduce it at the outset (a brief footnote on Ian Hacking's use of the term is the only context provided). Bell uses it to draw attention to the heterogeneous multiplicity of the (human and non-human) given that precedes the constitution of identities. Within the context of Bruno Latour's notion of 'relative existence', he argues that there is not an ahistorical and autonomous reality waiting to be discovered and constructed according to historical, human practices; rather, 'construction' and 'autonomous reality' are synonymous and we should think instead in terms of relative existence, whereby what *is* acquires relative existence as singularities acquire greater or fewer connections with other singularities. Whether discussing the actualisation of the virtual or beginning with the actual in order to release the virtual that is inseparable from it, historical ontology underlines the creativity of this process: what is creative and new is not simply a folding or refolding of a multiplicity. In taking this approach, Bell's aims are far more ambitious than presenting a straightforward exegesis of Deleuze's reading of Hume; his overall aim is experimental: to explore the power of empiricism, and demonstrate what it means to think 'and' instead of 'is'.

The book is divided into six chapters. The first two specifically address Deleuze's sympathetic reading of Hume, in particular how the importance Deleuze gives to the associationism in Hume's philosophy defends Hume from other, critical readings which focus on his atomism and regard the multiplicity of impressions and ideas as independent

identities. The concepts of the virtual and the actual, though used neither by Hume nor by Deleuze in *Empiricism and Subjectivity*, are central to Bell's interpretation and the relationship between them is at the heart of every chapter: the virtual–actual distinction is the dualism that defines Deleuze's transcendental empiricism, and the multiplicity of impressions and ideas in the mind is a virtuality out of which an actual subject is constituted. Bell justifies this approach in two ways: first, by showing how it is possible to apply these concepts in a way that 'is not unreasonably stretching Hume's thought in directions unwarranted by the questions at the heart of Hume's project' (46); and second, because his analysis of Deleuze's thought is not restricted to *Empiricism and Subjectivity*.

In general terms, whereas the first two chapters centre mostly on Deleuze's reading of Hume, the rest of the book is an inquiry into the historical and political implications of thinking Deleuze and Hume. Chapter 3, which examines the relation between what is new and the historical conditions out of which the new emerges, focuses on Deleuze's very difficult concept of 'counter-actualisation'. The movement of counter-actualisation accesses the pre-individual singularities (the virtual multiplicity) that are inseparable from individuated actualities. Principally, and in anticipation of chapter 4, Bell analyses what he refers to as a 'problematising' approach to history, which he argues is common to both Deleuze and Hume. In contrast to those historical accounts which seek to understand what actually happened and to give as accurate an account of it as possible (or, we might say, how actualities became actual), Deleuze and Hume problematise the actual in order to bring about its transformation. An example of this, which Bell uses to contrast Badiouian and Deleuzian readings, is Haydn's music and its break with the Baroque style. According to a Badiouian reading, the event of Haydn's music was the void of Baroque music, a completely new beginning that later became naturalised as the classical style. Bell's usual method when opposing the Badiouian reading is to carry out a reading of the event that draws attention both to the conditions of its creation (in this case, the circumstances that fostered experimentation in Haydn's musical education) and also to how the event is irreducible to these conditions. Bell's discussion of counter-actualisation is further developed through a study of the event of 22 September 1912, when Kafka wrote his first properly 'Kafkaesque' work, 'The Judgment'; as with a problematising history, a writer moves beyond the actualities of what is written to the impersonal power of the virtual. In the examples of Haydn and Kafka, counter-actualisation moves beyond actualities to the

impersonal power of the virtual and reveals the transformative powers that are inseparable from actualities.

This analysis of counter-actualisation is continued in terms of the role of the intellectual in society (chapter 4) and, more specifically, Hume's role in the Scottish Enlightenment (chapter 5). For Hume, the innovative and abstruse thoughts of geniuses had a destabilising effect on commonly accepted beliefs (deterritorialisation), but only when these innovative thoughts were themselves accepted (reterritorialisation). For Deleuze, the intellectual is not one who represents established discourses, but one who counter-actualises or problematises an intellectual field. The political implications of Deleuze's problematising or counter-actualising approach to history are raised in these chapters, and enable Bell to draw a sharp contrast between Hume and Deleuze's Hume: namely, that whereas Hume's conservative tendencies establish him as a reformer, Deleuze's Hume, being far more experimental insofar as he is able to counter-actualise the actualities of state power, is argued to be revolutionary.

What is emphasised most of all throughout Bell's study is the creativity of Deleuze's Humean empiricism: whether it is Hume's role in the Scottish Enlightenment, Kafka's literary genius or David Sudnow's improvisational jazz, the power of the virtual is tapped into when conditions allow for an imperceptibility in which experimentation is possible. The political implications of this are addressed extensively in the sixth and final chapter. It is also in these terms that Bell makes his final rebuff to Badiou's criticism of Deleuze by affirming the creative multiplicity. This discussion centres on allowing for a social multiplicity to become effective in expressing itself. That is, a multiplicity that expresses its diversity rather than differentiating itself according to the niches that capitalism carves out to make consumers predictable. In this context, Bell discusses societies of continuous control and instantaneous communication, in which creative energies are placed in the service of the market. Bell's concluding argument draws on the need for becoming-imperceptible to a becoming-revolutionary. Since creativity occurs away from the market place, a becoming-revolutionary politics advocates 'a self-imposed leave of absence' (153) or break with the flow of communication. For it is only then that a problem may emerge with a transformative potential that affirms the power of the social multiplicity.

Writing in a very clear and engaging style, Bell succeeds in rightly emphasising the importance of Deleuze's Humean transcendental empiricism as a way of refuting Badiou's criticism. Just as Hume sought

to account, within the given, for that which is irreducible to the given, so too is Deleuze shown to affirm multiplicities and facilitate the creation of that which is irreducible to anything actual. This book does not fall short of its ambitions, and Bell's embrace of the multiplicity that precedes the identities of Deleuze and Hume persuasively demonstrates the transformative power of thinking Deleuze's Hume.

Gilles Deleuze and the Missing Architecture

Marko Jobst Greenwich University

Abstract

This essay combines experiential writing, quotes from Virginia Woolf's novel *The Waves* and Gilles Deleuze's philosophy in order to indicate that architecture remains a largely overlooked instance of the world. This is particularly problematic in the context of the question of immanence, which can be understood to lie at the core of Deleuze's philosophy. Architecture's relation to thought is discussed here via Deleuze's writing in *Difference and Repetition* and pursued in conjunction with Simone Brott's notion of architectural 'effects'. Rather than seeing encounters with architecture as the site of recognition of the habitual and routine, our experience of architecture-as-world should be understood to ceaselessly contribute to the emergence of thought. Brian Massumi's writing offers one potential direction to pursue, via the notion of the diagram tied to experience before it is fed into the loop of architectural design and its accompanying representational techniques.

Keywords: architecture, experience, sensation, thought, immanence

Prologue 1: Belgrade 1990

> The light struck upon the trees in the garden, making one leaf transparent and then another. One bird chirped high up; there was a pause; another chirped lower down. The sun sharpened the walls of the house, and rested like the tip of a fan upon a white blind and made a blue fingerprint of shadow under the leaf by the bedroom window. The blind stirred slightly, but all within was dim and unsubstantial. The birds sang their blank melody outside.

This is the memory then, the false memory of the event. The year is 1990, 1991 and I am sitting inside a room that appears to be a simple white cube. The walls are on a grid (as far as the eye can tell) except in one of the corners behind the door, where the white surface juts out by exactly 97 mm. There is a single, tall window opposite and the view opens onto Kalemegdan. But what is known of the outside, what matters, is the light and the trees, the ceaseless pattern of movement cutting across individual leaves. The window is as old as the building and doesn't close properly. The paint that coats it is peeling. If you stand close enough, you can see the small, sharp flakes that drop off if you shut the window too vigorously.

The year and the location might speak of a different kind of events to you and there will definitely be violence in this story, only not the kind you might expect. Meanwhile, consider the room closely, every object and every variation in it, every fragment that presents itself and the conjunctions the fragments form unexpectedly. Observe carefully. The point is that even if you don't, you will keep perceiving. And so will the room.

There is a desk, long and white. There are two bookcases. A bed. There is a large box on the floor, made of iron, its interior lined with felt. You are aware of its feel even when the box is closed and you are thinking something else. There are several lamps in the room; no light issues from them currently. Blue patterns chase each other across the carpet, two shades of blue alternating at the periphery of your vision. They are always present, even when the eyes are trained on the desk's white surface, on the open book, on the marks that cover the page. The edge of the table, the turning point: made of brushed steel, it cuts a thin, crisp line and reflects the light that moves with the smallest shifts in the position of your body. Your body that is never perfectly still.

It is at this desk that I spent afternoons reading (I am still there, in that room, even if it looks nothing like this today.) It was 1991, 1990. I was reading a novel and would occasionally lift my eyes to look at the view outside (light-movement-leaves). The room was imperceptibly contracting and not all of it had to do with my breathing.

Prologue 2: London 2012

> The sun laid broader blades upon the house. The light touched something green in the window corner and made it a lump of emerald, a cave of pure green like stoneless fruit. It sharpened the edges of chairs and tables and stitched white table-cloths with fine gold wires.
>
> Woolf 1994: 24

Last night, in this flat on Bermondsey Street, I dreamed of having written all this before. I dreamed that Deleuze and Guattari claimed that art begins with the house, not with flesh; that architecture should be understood as the first of the arts (not the last, as some others might have it); that architecture is, above all, about frames, the way in which frames interlock, and that this would appear again in other arts, in painting as well as film (Deleuze and Guattari 1994: 186–7). I dream of having written that they claimed the frames to hold compounds of sensations; sensations, compounds, that is exactly what they write.

And then, there was the Australian philosopher, one of the first to write about architecture and invoke Deleuze's name. She claimed that art was the extension of the architectural imperative to organise earth, its space. Architecture binds forces, allows qualities to live 'their own life' (that is exactly what she writes), constituting territory, allowing sensations to emerge and resonate, 'for the sake of intensity alone' (Grosz 2008: 12). It is the question of pure beings of sensation, I remembered reading (Deleuze and Guattari 1994: 167). The phrase remained.

I dream that the most important thing was the role sensations are given in architecture and that it was the first of the arts, always the first. In the dream, I seem to be trying to convince anyone who would listen that philosophy keeps missing the point, that no one can see what can be seen so clearly.

I.

> The sun fell in sharp wedges inside the room. Whatever the light touched became dowered with a fanatical existence. A plate was like a white lake. A knife looked like a dagger of ice. Suddenly tumblers revealed themselves upheld by streaks of light. Tables and chairs rose to the surface as if they had been sunk under water and rose, filmed with red, orange, purple like bloom on the skin of ripe fruit. The veins on the glaze of the china, the grain of the wood, the fibres of the matting became more and more finely engraved. Everything was without shadow. A jar was so green that the eye seemed sucked up through a funnel by its intensity and stuck to it like a limpet. Then shapes took on mass and edge. Here was the boss of a chair; here the bulk of a cupboard. And as the light increased, flocks of shadow were driven before it and conglomerated and hung in many-pleated folds in the background.
>
> Woolf 1994: 87–8

I have written elsewhere about the relationship between architectural theory and the uptake of Deleuze's philosophy since the 1980s, and

the current position of Deleuze and Guattari's thought in architecture (Jobst 2013). In short, the uses of Deleuze in architectural discourse have been confined to a handful of concepts, primarily derived from *The Fold: Leibniz and the Baroque*, and closely related to the rise of the digital. Apart from being a severe reduction of the scope of Deleuze's philosophical project, this is also a case of marked oversight of the consequences of architecture's positioning as 'the first of the arts'. The stress on the question of sensation is in architectural theory still seen to be associated with architectural phenomenology, rather than Deleuze's philosophy – with all the problems the phenomenological context poses.

Meanwhile, the writing on contemporary and conceptual arts, including performance and dance, is edging ever closer to acknowledging architecture as that ever-present context of all creation and the inevitable aspect of the insertion of art into everyday life, which Deleuze qualified in *Difference and Repetition* as the key question (Deleuze 1994: 293).

It is in this context that the publication of Simone Brott's *Architecture for a Free Subjectivity: Deleuze and Guattari at the Horizon of the Real* in 2011 offered a much needed reorienting of Deleuzian thought within the discourse of architecture. Brott's is a project of reinscribing the question of the production of subjects into the uptake of Deleuze's philosophy forged in architecture in the 1990s, when it was largely emptied of its political connotations. Throughout the book, Brott shows that more is to be had from Deleuze when redressing the period of what is today understood as the discourse of post-World War II architectural theory, with all its subsequent crises and transformations. Brott's aim, to elucidate the relation between subject and object in a radically novel way (a question that keeps resurfacing in architecture in various guises despite – or precisely because of – the strong push in the direction of textual analysis that coloured architectural theory in the wake of Derrida's philosophy), is a valiant and important one. But, as clearly shown in her own conclusion, to pose the question of the subject might also lead to the recurrence of the problems the question of subjectivity encountered at every turn in the development of architectural theory (Brott 2011: 120–1).

There is another, affiliated question to be posed here, which covers a similar territory in ways in which architecture hasn't yet engaged, let alone architectural theories based on Deleuze's philosophy, and this is the question of architecture's relation to thought. Underlying this is the question of immanence, which should be key when addressing Deleuze with architecture in mind. What is the sequence leading from

'built environments' to thought and back, and how does this reflect on Deleuze's philosophy?

II.

> The sun struck straight upon the house, making the white walls glare between the dark windows. Their panes, woven thickly with green branches, held circles of impenetrable darkness. Sharp-edged wedges of light lay upon the window-sill and showed inside the room plates with blue rings, cups with curved handles, the bulge of a great bowl, the crisscross pattern in the rug, and the formidable corners and lines of cabinets and bookcases. Behind their conglomeration hung a zone of shadow in which might be a further shape to be disencumbered of shadow or still denser depths of darkness.
>
> Woolf 1994: 118

In *Immanence: Deleuze and Philosophy* Miguel de Beistegui writes that the question of immanence should be understood as the key notion orienting Deleuze's work, culminating in his collaboration with Guattari in *What Is Philosophy?* Importantly, it is here that we encounter the link between thought and the sensible, in ways that need addressing both in architecture and the arts – let alone philosophy in the field of Deleuze studies, which has so far been largely blind to the overwhelming presence of architecture as an inescapable instance of the 'world'.

De Beistegui writes that the creation of concepts

> is not a creation *ex nihilo*, but an effort to extract from the sensible the singular points at which the constitution of a phenomenon, whatever its nature, is being decided. In that respect, whilst created, concepts are the concepts of the sensible itself. (De Beistegui 2010: 6)

Furthermore, concepts are

> produced in response to specific events that take place in the empirical world. If this understanding of concepts as originating in the sensible itself amounts to a form of empiricism, Deleuze immediately goes on to characterise it as a 'superior' form of empiricism, or as a *transcendental* empiricism, thus doing away with the very opposition between empiricism and idealism. (De Beistegui 2010: 6)

De Beistegui is keen to show that the consequence of this conception of philosophy vis-à-vis the real is that the 'horizon' that precedes concepts (and orients their formation – plane as plan) and from which concepts emerge – what Deleuze will repeatedly address as the *image of thought* in his work on Nietzsche and Proust, in *Difference and Repetition* as well

as in *What Is Philosophy?* – implies that 'non-philosophy figures (quite literally) at the heart of philosophy' (De Beistegui 2010: 10).

The notion of immanence, traced in Deleuze's work in such a way, De Beistegui claims to be something other than a straightforward Deleuzian concept. Immanence is not a concept, he writes, or if it is, it should be understood as a concept of a radically different kind. 'It is an image, precisely: the plane of immanence is "the image of thought, the image thought gives itself of what it means to think, to make use of thought, to find one's bearings in thought [. . .]" ' (De Beistegui 2010: 12). Importantly for a discussion on architecture, the focus here should be on what the notion of immanence implies with regard to sensation and that which is in architecture broadly discussed under the banner of experience.

'Thought happens', De Beistegui further writes,

> as a result of an *encounter* with the outside. It is a response – a creative response – to something that has taken hold of us. What does this mean? It means [. . .] that the conditions of thought are not within thought itself, that thought is not its own ground, and so certainly not that of the intelligibility of the real. This is the extent to which Deleuze is an empiricist: our concepts are generated from our encounter with the external world; the external, sensible reality is where they originate. (De Beistegui 2010: 13)

Immanence, in other words, 'preserves the world, and the possibility of its meaningfulness, from being assigned to an origin that is not inner worldly. It turns thought itself into a worldly event' (De Beistegui 2010: 16) – one in which architecture is yet to be properly accounted for.

> As a result, to think immanently is to render thought immanent to reality, to its chaotic becoming, its variations, and its vibrations. It amounts to constructing an image of thought that is not posited in advance, independently of the real itself, and orienting it from the start, but that grown from within the real, or Being. Throughout, immanence designated the method as well as the content of thought, the manner in which thought must unfold as well as the matter from which it unfolds. (De Beistegui 2010: 192)

This 'matter' from which thought unfolds is where architecture should be brought into focus in the writing on Deleuze in ways overlooked so far, no doubt due in part to the cursory discussion of architecture in Deleuze's writing itself, as well as his work with Guattari (whose engagement with architecture, as Simone Brott shows, was more extensive (Brott 2011: 75–96)).

Unlike in the case of cinema, literature or painting, Deleuze and Guattari's writing on architecture (in particular in its broadest sense, as

the *built environment*, or what could tentatively be termed 'organised matter') is woefully cursory. That this shouldn't deter us from drawing out ways in which their work opens an incredibly rich territory for it nevertheless is clear, for instance, in the way Laura Cull indicates performance might need to be taken (Cull 2009: 1–21), or Simon O'Sullivan and Stephen Zepke approach contemporary art (Zepke and O'Sullivan 2010: 1–11). The simple starting point for this is the following: if thought unfolds from matter, what difference does it make that so much of the matter already comes 'designed' in a very particular way? And where does this organised matter resist the purpose assigned it?

III.

> The windows showed erratically spots of burning fire, the elbow of one branch, and then some tranquil space of pure clarity. The blind hung red at the window's edge and within the room daggers of light fell upon chairs and tables making cracks across their lacquer and polish. The green pot bulged enormously, with its white window elongated in its side. Light driving darkness before it split itself profusely upon the corners and bosses; and yet heaped up darkness in mounds of unmoulded shape.
>
> Woolf 1994: 131

Simone Brott writes in *Architecture for a Free Subjectivity: Deleuze and Guattari at the Horizon of the Real* of the subject/object problem of architecture, and proposes that architecture should be approached through the concept of 'impersonal effects':

> What I call the impersonal effects, are the inchoate, not-yet-determined fragments of architectural encounter, as opposed to the personal effects of identity, individuality or the constituted collective. Effect is not, in Deleuze's sense, ephemeral – an effect *of* something more primary; but rather, like a 'magnetic effect,' it is a productive force, an effect that works and creates. By extension, the project here is to find and express, by architectural means, the image of effects. (Brott 2011: 1)

The architectural encounter on which the conception of impersonal effects relies

> does not signal an in-between, a space between persons and concrete forms, as troubled for decades by architectural criticism [...] Rather, it is an event that comes before the crystallization of all things, it is the abstract surface of all singularities coming into being. (Brott 2011: 2)

This is a redefinition of what has, in architectural theory, been the question of experience, as considered in architecture throughout the

twentieth century from the side of function, use, programme, or indeed the architectural event.[1]

> As such, there hovers a cloud of architectural effects which constitute what might be called the architectural *real*, or that from which every particular series is crystallized. Walls, objects, and other components clustering around us are teeming with loose effects, and what emerges is an ongoing accumulation of a particular selection, or arrangement. Architectural effects are 'mobile,' displaced as a 'nomadic distribution' within an indeterminate pool of possible experiences. Every encounter is born via a complex selection procedure which renders it unique for each person, even if it replicates an authorized reading, reiterating the same effects for anyone, anytime. If 'I' have a subjectivity, it is a general and anonymous power to attract perceptual arrangements, to envelop a series of aesthetic, social and other effects, like anyone else. But it is also the phenomenon of having been selected, of an unconscious leaning for this set of effects. (Brott 2011: 43)

These architectural encounters should ultimately be understood in the light of the role of perception in Deleuze's project. As Brott writes, '[i]t is precisely the early theory of perception that clarifies the sense in which the personological subject is derivative for Deleuze. In his early conceptual apparatus, perceptions are conceived of as unique material powers that come before the subject' (Brott 2011: 38). This is the result of the fact that 'perceptions in Deleuze's thinking operate at the level of presence' (39). Differently put, 'perceptions and impressions do not represent something more real or original "outside" themselves, but are continuous with matter' (39).

Such a strong stress on experience and perception will ultimately reorient the understanding of architecture when it comes to locating 'creation' in it and, as a consequence, this will reorient the role of 'design'.

IV.

> The red curtains and the white blinds blew in and out, flapping against the edge of the window, and the light which entered by flaps and breadths unequally had in it some brown tinge, and some abandonment as it blew through the blowing curtains in gusts. Here it browned a cabinet, there reddened a chair, here it made the window waver in the side of the green jar. All for a moment wavered and bent in uncertainty and ambiguity, as if a great moth sailing through the room had shadowed the immense solidity of chairs and tables with floating wings.
>
> Woolf 1994: 144–5

It is at this point that I would like to take a slightly different route, and with a slightly different aim in mind, from Brott's. While the discussion regarding subjectivity in architecture is one of great importance – if nothing else because of the long history of the subject/object dichotomy plaguing architectural discourse – what Deleuze's philosophy helps think is the very relationship between architecture and the 'emergence' of thought. Rather than ask how the subject is constructed through the architectural encounter, I would like to question the importance of the emergence of thought within what Brott has outlined, since this will be the key not only to understanding the 'use' of Deleuze's philosophy in architecture but also in helping architecture address a philosophy in which immanence is assigned such a central role.

The potential problem with the way architecture is defined in *What Is Philosophy?* – as the formation of blocs of sensation through acts of framing – is that the definition implicitly still considers architecture from the side of its 'obvious' creation, namely design, even if the side of experience is clearly implicated. If we consider the 'worldly' event of thought through the conceptual vocabulary of the kind that Brott offers (that is, the architectural encounter as brought forward through impersonal effects), it becomes clear that architecture remains a fairly unaccounted instance of the 'world', which we keep encountering, increasingly so if we consider that as of 2007 it is estimated that there are more inhabitants living in urban environments than anywhere else on the planet.

Architecture-as-world, understood to give rise to thought in its own way, would in turn help rethink architectural creation, that is, its obvious *praxis*, precisely from the side of thought's emergence from that which is present in and as the world, that is, immanently. So what does it mean to 'think' in Deleuze's philosophy?

V.

> The evening sun, whose heat had gone out of it and whose burning spot of intensity had been diffused, made chairs and tables mellower and inlaid them with lozenges of brown and yellow. Lined with shadows their weight seemed more ponderous, as if colour, tilted, had run to one side. Here lay knife, fork and glass, but lengthened, swollen, and made portentous. Rimmed in a gold circle the looking-glass held the scene immobile as if everlasting in its eye.
>
> Woolf 1994: 164–5

In *Difference and Repetition* Deleuze writes in relation to Plato's *The Republic* that the text

> distinguishes two kinds of things: those which do not disturb thought and (as Plato will later say) those which *force* us to think. The first are objects of recognition: [. . .] this is a finger, this is a table, Good morning Theaetetus. (Deleuze 1994: 138)

The inclusion of a piece of furniture is a telling proclamation regarding architecture and its potential, or lack thereof, to provoke thought.

Deleuze writes that:

> concepts only ever designate possibilities. They lack the claws of absolute necessity – in other words, of an original violence inflicted upon thought; the claws of a strangeness or an enmity which alone would awaken thought from its original stupor or eternal possibility: there is only involuntary thought, aroused but constrained within thought, and all the more absolutely necessary for being born, illegitimately, of fortuitousness of the world. (Deleuze 1994: 139)

It is hard not to see in this description of the violence necessary for the emergence of thought, as opposed to recognition, an echo of Brott's description of the architectural encounter:

> There is, in the architectural encounter, an unmistakable *agencement* that pre-exists all personal agents navigating space; the most apt translation of this Deleuzian term might be 'arrangement.' In this capacity, it is an anonymous architecture as pure indifference that seizes us, and not the reverse, a subjectivizing agency prior to the constitution of any building or subject. The selection of effects is accomplished by a certain savagery that transcends personal choice or personality. (Brott 2011: 43)

While the 'savagery' spoken of here relates to the way the arrangement of effects rearranges the seemingly immutable unities of architecture as well as those of the subject, it is nevertheless indicative of what needs to be regarded carefully if the approach to the relation of architecture and thought is to be investigated from the other end – the violence of the encounter that gives rise to thought itself.

Deleuze writes:

> Something in the world forces us to think. This something is an object not of recognition but of a fundamental *encounter*. What is encountered may be Socrates, or a temple [!] or a demon. It may be grasped in a range of affective tones: wonder, love, hatred, suffering. In whichever tone, its primary characteristic is that it can only be sensed. In this sense, it is opposed to recognition. In recognition, the sensible is not at all that which can only be

> sensed, but that which bears directly upon the senses in an object which can be recalled, imagined and conceived. The sensible is referred to an object which may not only be experienced other than by sense, but may itself be attained by other faculties. It therefore presupposes the exercise of the senses and the exercise of the other faculties in a common sense. The object of encounter, on the other hand, really gives rise to sensibility with regard to a given sense. (Deleuze 1994: 139)

This proposition is yet to be properly confronted with the question of architecture and its position in the 'world', with all its immanent relations to thought. Differently put: if architecture is to be understood as an instance of the world and therefore via the sensible as constant potential 'food for thought', what are the conditions under which simple recognition is replaced by thought as creation? The built environment is 'teeming with loose effects' (Brott 2011: 43) and they have the power to trigger thought – and not just to lead to recognition as in 'this is a table'.

VI.

> All the colours in the room had overflown their banks. The precise brush stroke was swollen and lop-sided; cupboards and chairs melted their brown masses into one huge obscurity. The height from floor to ceiling was hung with vast curtains of shaking darkness. The looking-glass was pale as the mouth of a cave shadowed by hanging creepers.
>
> Woolf 1994: 186

It is from the direction of Brian Massumi's tangential engagements with architecture and his expansion of the Deleuzian frame through the utilisation of A. N. Whitehead and William James (as well as Massumi's collaborative work with Erin Manning) that this question is likely to be addressed with more specificity. In *Semblance and Event: Activist Philosophy and the Occurrent Arts* Massumi writes (in the context of process philosophy and its 'activist' incarnation) that his concern is with 'the question of how the makeup of an occasion of experience effectively and constructively includes its own beyond' (Massumi 2011: 14). This he approaches 'through the concept of *techniques of existence*', whereby a technique of existence is 'a technique that takes as its "object" process itself, as the speculative-pragmatic production of oriented events of change' (14).

In order to question what these techniques of existence 'do pragmatically-speculatively', Massumi uses the concept of the diagram, as adopted from Deleuze and Peirce. According to this, techniques of existence 'abstract'; and to

> abstract in this fuller sense is a technique of extracting the relational-qualitative arc of one occasion of experience – its subjective form – and systematically depositing it in the world for the next occasion to find, and to potentially take up into its own formation. (Massumi 2011: 14–15)

As a 'technique of existence' the diagram is therefore 'a way of informing the next occasion of these potentials for self-formation' (Massumi 2011: 15). It is important to note, however – as this will be crucial for the discussion on where to 'look' for creation in architecture before the rather obvious stage of 'design' commences – that 'all of this concerns experience. In experience is to be found the *genesis of things*' (15).

The concept of the diagram has, by now, an established place in architectural theory: it was to be found in the special issue of *ANY: Diagram Work* (No. 23, 1998) (where a version of one of the chapters in Massumi's book first appeared); it was key to Peter Eisenman's *Diagram Diaries* in 1999, and in the more recent AD Reader *The Diagrams of Architecture* (2010) edited by Mark Garcia, to name but the more visible sources. Largely, though, the diagrams spoken of in architecture are still thought in relation to the acts of design and the 'representational' paradigms they involve (drawing, modelling), and do not necessarily focus on the question of experience first and foremost – even when experience is implied.

> The diagram, as explained above, is a word that activist philosophy uses to name a speculative-pragmatic procedure for navigating the complexity of experience's passing, taking special aim on the 'critical' moments. These are the junctures where one moment of experience's passing passes into another, informing it of (in-forming it with) the potential to become again: techniques of existence. (Massumi 2011: 25)

How does architecture relate to these 'critical moments' that mark the passing of experience and allow for an understanding of techniques of existence that are finely attuned to architecture's (omni)presence? Part of the answer lies in the stress on the experiential side of architecture, where the 'genesis of things' is to be found. As is the case with Brott's approach, Massumi's careful 'unfolding' of the question of experience indicates that only an understanding of thought as finely attuned to the milieus in which it arises will offer a sufficiently nuanced understanding of our material environment. Without shifting the emphasis towards experience, and its role in the emergence of thought, architecture will remain locked in the realm of recognition ('this is a table').

VII.

> As if there were waves of darkness in the air, darkness moved on, covering houses, hills, trees, as waves of water washed down streets, eddying round single figures, engulfing them; blotting out couples clasped under the showery darkness of elm trees in full summer foliage. Darkness rolled its waves along grassy rides and over the wrinkled skin of the turf, enveloping the solitary thorn tree and the empty snail-shells at its foot. Mounting higher, darkness blew along the bare upland slopes, and met the fretted and abraded pinnacles of the mountain where the snow lodges for ever on the hard rock even when the valleys are full of running streams and yellow vine leaves, and girls, sitting on verandahs, look up at the snow, shading their faces with their fans. Them, too, darkness covered.
>
> Woolf 1994: 187

Further elaborating on experience via the concept of the diagram, Massumi writes that the diagram brings about the 'final' question, that of 'experience in nonhuman forms of life, and in nonliving matter itself' (Massumi 2011: 25). The world is made of expression, he writes, which means that it is made of experience; as a result, perception can be said to be everywhere in the world. He writes:

> the question of the nonhuman revolves around the question of nonhuman perception. In what way can we say that what we have the tendency to separate out as 'dumb matter' in fact perceives and is therefore, by the precepts of activist philosophy, experientially self-creative? (Massumi 2011: 25)

And even more pointedly when it comes to the question of the missing architecture:

> even outside any encounter with human perception, the electron, the mountains, the tree involve perceptions. They *are* perceptions in themselves: they *are* how they take account, in their own self-formative activity, of the world of activity always and already going on around. (Massumi 2011: 26)

How is this not to be said of architecture? And how do we account for the fact that architecture is matter already organised, by the human, in a very particular way?

> Whenever we see, whenever we perceptually feel, whenever we live abstraction, we are taking in nonhuman occasions of experience. We are inheriting their activity, taking it into our own special activity as a *human* form of life: as a society of occasions of experience contributing to a continuing growth pattern it pleases us to call our human self. (Massumi 2011: 26)

As Simone Brott writes, the constant process of subjectivisation is inevitably influenced by architectural encounters and our experience perpetually coloured by the impersonal effects of architecture. To deny its presence – to pretend that all architecture can ever be is *recognised* – is simply an oversight, an error.

For Massumi though, the important stress will fall on the side of the (human) body. He writes that '[l]ike all animal forms of life, the human has a technique of existence whose role is to selectively channel the nonhuman activity always going on all around into its own special activity' and this technique 'is the body itself' (Massumi 2011: 26–7). He also writes that:

> The senses are procedures of the body as technique of existence. The body is the seat of bare activity: the region of indistinction between the human and matter where something doing is always already just stirring, before it starts to take definitive experiential form. (Massumi 2011: 26–7)

This is then the key place from which to go back to art (and the imperative to probe its insertion into life) and consider Deleuze and Guattari's proposition that architecture is the first of the arts. It is not with flesh that art begins, but with architecture, they write (1994: 186); this should not be discounted, as it establishes a very clear imperative to regard experience – and all of perception, human or other – as already in the 'region of indistinction' between *architecture as matter* and the human.

That is why I would suggest that the link to ecology that Massumi is keen to make towards the end of his introduction to the book should be taken with a crucial caveat in mind: body and nature as always already *of, in and through* architecture. 'The one-word summary of its relational-qualitative goings on: *ecology*', he writes. 'Activist philosophy concerns the ecology of powers of existence. Becoming in the midst. Creative change taking place, self-enjoying, humanly or no, humanly and more' (Massumi 2011: 28). Note the 'more' that goes by the name of architecture.

Coda: Belgrade to London, Pivot 1999

> The waves broke on the shore.
>
> Woolf 1994: 234

During the day, this flat in London is filled with light, whatever the weather outside; the walls are white and the rooms appear as cubes. But they never are; they are never perfect, never ideal forms, however

simply you dress them. If you look more closely, the walls are not straight; the ceiling is covered with cracks and there are incredibly small fissures spreading out from the top corners of the windows made of aluminium and plastic, like something tectonic. You need to observe, spend time. The more closely you (proprioceptively) look, the more becomes revealed of this environment that accompanies every word you read.

The table is made of oak, composed of two pieces. If you feel under its surface you will find a latch that releases the mechanism: the table can be transformed, extended. It indicates the possibility of more bodies around it than might be initially conceived. But this is what you already recognise; it is the question of use. Right now there is only one body seated, and the line, the controlled crack in the surface, is undisturbed, closed; just a narrow slit to the right of your hand as you hold the book you are reading, as you type the words that emerge. Only the smallest grains of grit find their way inside. You leave them where they are but remain aware of their presence. You don't have to watch them to know that they are there.

There is no bed in this room; the beds are upstairs. The ceiling creaks even when no one is on the level above. The sounds from the street below are different at night, or when it rains. And underneath this flat there is another, and all the other rooms you have never been in, none of them the same.

You are reading (I was reading in Belgrade) and something jolts your thought (my thought within the images Virginia created) and you cannot separate it from the violence of the seemingly controlled crack in the surface of the table (the gleam on the edge of my table in Belgrade) that has lodged itself at the periphery of your vision, almost present, never perfectly graspable, somewhere behind your eyes.

Note

Deleuze and Beckett: An Immanent Encounter

Magdalena Wisniowska Royal Academy Schools, London

Abstract

Understanding the exact nature of Deleuze's debt to Kant forms a large part of contemporary Deleuzian scholarship, a project made all the more urgent since the publication of Meillassoux's critique of correlationism in 2007. These Kantian readings present Deleuze as someone who continues Kant's transcendental project by reconsidering the nature of 'immanent critique'. Immanent critique is no longer seen here as part of the critical enquiry into the possible conditions of experience, but as a staging of an encounter with the genetic principle constituting these conditions, the real condition common to both the human subject and the world in which he or she lives. Such is the implicit demand of genetic recasting: that critique in its immanent form is something we can experience and learn. Presented with this demand, this essay addresses the problem of staging this immanent form of critique. It looks to Deleuze's essay on the work of Samuel Beckett, 'The Exhausted', to suggest a possible site for such an encounter with constitutive principle. Specifically, in Deleuze's discussion of … *but the clouds* … it finds a theory of the image, which can be understood in genetic terms, as a theory of the virtual. Thus the essay puts forward the thesis that Beckett, in constructing the image through the exhaustive process, recreates the virtual plane, in its openness and flux.

Keywords: Beckett, Kant, exhaustion, the virtual, the image

I. Immanence

The starting point for this essay lies with a claim made by Christian Kerslake in his 2009 study on immanence, *Immanence and the Vertigo of Philosophy: From Kant to Deleuze*. When negotiating between Deleuze, Spinoza and Hegel, he suggests that imagination, in its transcendental form, is something we can encounter, empirically speaking, in the here and now. More so, he argues that for Deleuze, immanent critique consists precisely of such an encounter. He writes:

> It is the transcendental imagination, which is ultimately constitutive for human experience, and unless we learn the 'hidden art' of the imagination to which Kant alluded in his remarks on the Schematism, the human being is destined to remain enclosed in the *constituted* frameworks of its finitude. (Kerslake 2009: 20)

In Kant's *Critique of Pure Reason*, the transcendental imagination is capable of a 'hidden' or, according to Pluhar's translation 'secret', art (Kant 1996: 213). It is able to mediate between the pure categories of understanding (as derived from Aristotelian logical judgements) and the pure forms of intuition (space and time) by producing 'schemas' of sensible concepts, rules according to which our intuitions are determined by concepts. Though, as one of the conditions of possible experience, transcendental imagination is essential for cognition, it itself cannot be known, as in, it is not something we can 'divine from nature' and 'lay bare before ourselves' (213). Yet Kerslake seems to suggest that this 'hidden art' – this spontaneous productive capacity for schema – might be something we can 'learn'. Indeed, if we do not acquire this kind of talent, we are not performing Kant's critical project correctly.

To understand more of the nature of Kerslake's claim, we must further consider the context in which it is written. Despite Deleuze's anti-Kantian position being well known, Kerslake's account belongs to a strand in contemporary Deleuzian scholarship which seeks to unfold the exact nature of Deleuze's debt to Kant, a task all the more urgent since the publication of Quentin Meillassoux's critique of correlationism in 2007.[1] Kerslake together with Daniel Smith (1996), Joe Hughes (2008, 2009) Levi Bryant (2008, 2009) and Edward Willatt (2009) sees Deleuze as inheriting Kant's critical project, to the extent that, like Kant, Deleuze wishes to perform 'a critique of values upon which critique is founded' (Bryant 2009: 32–3). However, for Deleuze, these founding values are not the kind described in the *Critique of Pure Reason*, comprising the a priori forms of intuition, categories of the understanding and ideas

of reason. Instead, he finds an alternative set of principles elsewhere, with an altogether different character. Hughes repeatedly quotes from Deleuze's 'The Idea of Genesis in Kant's Esthetics' (Hughes 2008: 17–18; 2009: 4):

> The first two Critiques indeed invoke facts, seek out the conditions from these facts and find them in ready-made faculties. It follows that the first two critiques point to a genesis, which they are incapable of securing on their own. But in the aesthetic *Critique of Judgement* Kant poses the problem of the genesis of the faculties in their original free agreement. Thus he discovers a ground still lacking in the first two critiques. (Deleuze 2004a: 61)

The reference now is to the way in which Kant describes transcendental imagination in the early chapters of the third critique, the second moment of the judgement of taste. Here the pleasure of beauty is different from the pleasure associated with the agreeable as it derives from 'a state of mind' in which the faculties of imagination and understanding are in 'free play' (Kant 1987: 217–19). In *Desert Islands* (Deleuze 2004a: 63–4), but also in *Difference and Repetition* (Deleuze 2004b: 180, 183, 210) and other work on Kant (Deleuze 2008: 42–5), Deleuze emphasises how this free play of the faculties produces a 'quickening' or 'furthering' of powers. When free, imagination is that which 'arouses' understanding, and understanding in turn is that which 'puts' imagination into 'play' (Kant 1987: 296). Such arousal is even more apparent in Kant's discussion of the sublime, in which imagination's confrontation with its limit is directly responsible for the 'outpouring' feeling of the suprasensible power of reason (Kant 1987: 226). Hughes, but also Kerslake, shows how Deleuze rewrites this kind of productive confrontation as genetic principle, not simply responsible for arousing feelings of the suprasensible, but responsible for the very constitution of our subjectivity, with all its associated faculties.[2]

Setting Kerslake's argument into the above context, we begin to understand why he might consider transcendental imagination to be constitutive for human experience. He subscribes to the view of Deleuze as a post-Kantian thinker, someone who responds to the demand for the 'unconditioned self-grounding principle that must lie at the basis of knowledge' (Kerslake 2009: 18). This he finds in Kant's concept of the transcendental imagination, providing imagination is not reduced here to its function in the *Critique of Pure Reason*, as the mere schematic 'transcendent application of its synthesis', but is seen at its most productive, whether in Heidegger's existential ontology of constitutive finitude or in the post-Romantics' philosophy of the imagination.

For Kerslake, imagination in this constitutive sense takes over the role usually granted to the Spinozian model of immanence, in which the world is seen to be the 'expression of God' and God's 'divine infinity' is that in which the entire world participates (Deleuze 1992a: 176; Kerslake 2009: 34–6). We can also see why, if Kant's critical project is to be continued correctly, it must uncover this kind of self-grounding principle. Without learning more about the nature of transcendental imagination's 'hidden art', Kant's critical enquiry remains incomplete and we are destined to remain with the 'simple conditioning' of fact in 'ready-made faculties', rather than sure to discover the genetic ground of these faculties (Deleuze 2004b: 192). However, this kind of recasting of Kant's transcendental project still leaves the question of immanent critique unanswered. What we cannot understand is how – how is such a principle to be uncovered? How is this hidden art of the imagination to be uncovered, encountered and learnt?

This is the point at which my essay begins. I would like to suggest that Deleuze does indeed stage his immanent critique as an encounter with an unconditioned principle – in Kerslake's terms, an encounter with a productive sense of Kant's transcendental imagination – and he does so most profoundly in his late essay on the work of Samuel Beckett. I would like to propose 'The Exhausted' as a site for this kind of immanent critique (Deleuze 1998).

II. 'The Exhausted'

At first glance, Deleuze's essay might not seem the best site for such an encounter. 'The Exhausted' makes no direct reference to the concept of immanence and only broaches the question of the genetic principle indirectly, through the concept of 'birth'. We learn, for instance, that to be exhausted is to be exhausted 'before birth' (Deleuze 1998: 152). Similarly, Deleuze describes the one who is exhausted – seated in darkness, 'head sunk in crippled hands' – as an original witness, present 'before being born' (155–6). However, the essay does not expand on these few comments and these comments taken by themselves should not be seen as evidence of immanent critique, though they remain quietly suggestive. Primarily, the essay is meant to serve as a postscript to the first French translation of Deleuze's television plays and as such, represents Deleuze's first serious discussion of these works. Although Deleuze had referred to Beckett prior to the publication of 'The Exhausted' – notably in *Difference and Repetition* (Deleuze 2004b: 100) and in *Cinema I* (Deleuze 2005: 68–70) – it is only here and in the essay

'The Greatest Irish Film (Beckett's "Film")' (1998) that he examines the work in depth.

Yet to see the essay as a piece of art criticism providing a necessary introduction to *Quad*, *Ghost Trio*, *... but the clouds ...* or *Nacht und Träume* is equally problematic. For one, we learn very little about the context of these works – nothing about where and when they were first staged, nothing of their actual staging, their complicated scripts and exacting camera work, nothing of their historical or critical backgrounds and nothing of their critical significance. Indeed, we learn very little about them at all, except how they might pursue the concept of exhaustion. In this sense Deleuze's essay is closest to how Levi Bryant describes Deleuze's engagement with artwork in terms of a 'new theory of aesthetics' (Bryant 2009: 33). According to Bryant, Deleuze looks to different artists (as well as novels and, of course, film) in order to show how these might be seen as 'producing' or 'individuating' different forms of sensibility (33). Taking his cue from Deleuze's work in *What Is Philosophy?*, Bryant writes: 'The aim is not to represent these artists or determine what they meant, but to analyse the percepts they invented, and uncover the capacities for affecting and being affected they have brought into the world' (33). Bryant's interpretation would be convincing were it not for the fact that 'The Exhausted' does not uncover any such percepts or affects. It does not develop a theory of aesthetics any more than a theory of art, and makes no reference to sensation, perception or experience of any kind. Instead, we are simply presented with a concept of exhaustion and then shown how this functions in Beckett's work generally and in the television plays specifically.

Thus the essay follows a very rigid structure and can be easily divided into three parts. In the first third, Deleuze identifies his central concept of exhaustion through contrast and comparison with the concept of realisation. He then shows how Beckett enacts this concept of exhaustion through the particular way he uses language in his novels, plays, and radio and television pieces. In this second third of his argument, Deleuze attributes to Beckett a kind of meta-approach, a manipulation of the possibilities inherent in language. Finally, in the last third, he outlines the role of exhaustion in each of the television plays individually. Only in this sense can we see 'The Exhausted' as staging a kind of immanent enquiry, in that it provides an analysis of the principle of exhaustion first put forward or 'contributed' by Beckett (Deleuze 1998: 154).

What then is exhaustion, this principle to which most of Beckett's work is seen to adhere? For Deleuze, exhaustion is one way in which we can approach the possible. Whereas in our everyday activity we tend

to realise the possible by pursuing certain 'goals, aims and plans', in exhaustion these are renounced and all of possibility is affirmed (Deleuze 1998: 152). Deleuze also stipulates that only a truly exhausted person can perform this kind of logical exhaustion, as only someone truly exhausted can renounce all aims and plans. Thus logical exhaustiveness and physiological fatigue are closely linked (154–5).

We can see how this principle might be relevant to Beckett's work, if we think of Beckett as performing this kind of double exhaustion through his use of language. Once again, the same kind of distinction applies: whereas under normal circumstances we use language to name the various projects we wish to realise, Beckett renounces such familiar grammatical and syntactical structures precisely in order to affirm all possible permutations. This kind of meta-construction Deleuze calls language one, and he associates it most closely with the earlier novels and theatre pieces. And just as logical exhaustiveness is dependent on the person's physiological fatigue, so it is that we cannot consider the exhaustion of words without the accompanying exhaustion of the voices that utter them, including, necessarily and problematically, the writer's own. This kind of self-silencing Deleuze calls language two, and he sees it as a feature of Beckett's work from *The Unnamable* onwards.

More directly, we can also see how this same exhaustive principle might apply to *Quad*, *Ghost Trio*, *... but the clouds ...* or *Nacht und Träume*, though in a somewhat different shape and form. All of these later works pursue what Deleuze describes as the third language of exhaustion, the exhaustive language of spaces and images. It is as if we had reached a point at which the previous exhaustions of languages one and two opened up a space for the extra-linguistic, which can only now be adequately explored. In all cases, we are presented with either a space (*Quad*, *Ghost Trio* and *... but the clouds ...*) or an image (*... but the clouds ...* and *Nacht und Träume*) that is indeterminate in nature – that is not one realised possibility, but seems to affirm them all. So, for instance, in *Ghost Trio* the protagonist does not sit in a particular room but in a grey rectangular space. When the camera zooms in, in order to present the bed, the window or the door, they all appear as the same grey rectangle. Similarly, the face of the woman who appears to the protagonist of *... but the clouds ...* is not the face of any particular female character but a blurred close-up. Furthermore, Beckett often seems to accentuate this 'any-space-whatever' and 'indefinite' image: in *Quad* the four actors get to traverse all sides and diagonals of the square; in *Ghost Trio* the protagonist opens the door, opens the window and looks under the bed in successive order; and in *... but the clouds ...*

he lists all possible ways in which the woman had previously appeared to him. And it must also be added, that like with the exhaustions of languages one and two, this kind of more logical side of exhaustion is accompanied by physiological fatigue. In … *but the clouds* … and in *Nacht und Träume* we actually see the silent protagonist, sitting in the dark, head down on 'crippled hands' (Deleuze 1998: 155).

III. Immanent Readings

But what then of the concept of immanence, with which I introduced this essay? How is this concept relevant to 'The Exhausted', when all that seems to be discussed is the question of exhaustion and the way in which this concept is played out in literature, theatre and television plays? Where can we find the transcendental concept of imagination, and with it, the staging of an immanent critique, in which the nature of this transcendental imagination is learnt?

First of all, it must be said that in 'The Exhausted' Deleuze's debt to Spinoza is very much apparent. When Deleuze first distinguishes between the exhaustion and the realisation of the possible, he makes the following remark on the exhausted person and his state of exhaustion: "'That the impossible should be asked of me, good, what else could be asked of me." There is no longer any possible: a relentless Spinozism' (Deleuze 1998: 152) From this we learn that the point at which we can no longer come up with further possibilities is the point of 'Spinozism'. Whatever exhaustion may or may not be, it remains Spinozian in character. But to begin reading 'The Exhausted' in such a way is somewhat problematic, because it involves us taking into account a reversal of terms.

To understand more of this reversal, we need to return to Kerslake and the problem of immanent critique. Other than unfolding the exact nature of Deleuze's debt to Kant, Kerslake is very good at showing how for Deleuze, Spinoza's ontology foreshadows post-Kantian attempts to ground philosophy in genesis. According to Kerslake, Deleuze finds an equivalent to the kind of unconditioned self-grounding principle demanded by the post-Kantians, in Spinoza's idea of expression. Because Spinoza's God is that which 'expresses itself in the world' and the world in turn is the 'expression' of this God, we can construe the expressive nature of this divine being as a prototypical immanent principle (Deleuze 1992a: 176).

Providing we keep to Kerslake's post-Kantian discussion of immanence, the terms here are of the 'real' rather than the 'possible'. The question is not of those conditions – what Deleuze identifies as

the Kantian ready-made faculties of intuition, understanding and reason – which allow for the possibility of experience. These he dismisses as mere conditioning (Deleuze 2004b: 192, 201, 216). Rather, Deleuze always aims to uncover the genetic ground of the world shaped by these faculties, the 'real' ground that underlies our already constituted experience. Kerslake (2009: 18, 83) but also to an extent Hughes (2008: 17–18; 2009: 3–4) and Smith (1996: 29) point to the well-known passage from *Difference and Repetition*: 'In fact, the condition must be a condition of real experience and not possible experience. It forms an intrinsic genesis, not an extrinsic conditioning' (Deleuze 2004b: 192). It might therefore seem strange that Deleuze alludes to Spinoza when identifying exhaustion with the exhaustion of possibility. 'The Exhausted' clearly states that relentless Spinozism is the 'impossible' moment at which the exhausted person exhausts the possibility as a whole. However, as Asja Szafraniec points out in her study of Beckett, Deleuze's late essay calls for a reversal of these two terms (Szafraniec 2007: 120–1). The 'possible' here is not the same as the Kantian 'possible', that Kantian world experienced under the conditions of the transcendental subject. In fact, it is closer to the original self-grounding principle associated with Spinoza, demanded by the post-Kantians and described by Kerslake. Or as Deleuze writes, 'God is the originary, the sum total of possibility. The possible is realised only in the derivative, in tiredness, whereas one is exhausted before birth, before realising oneself, or realising anything whatsoever (I gave up before birth)' (Deleuze 1998: 152). We have encountered this concept of birth before, when first introducing 'The Exhausted'. I have described it as quietly suggestive. We can now see how it might signify a great deal more, dealing with that originary state which lies at the heart of any philosophical model seeking a genetic approach to the problem of immanence.

Following on from this reversal of terms, we can also see how immanent critique might be staged as an encounter with this originary state. To pursue a course of relentless Spinozism – both logical and physiological exhaustion – to the point at which there is no further possibility, is to assume a state that in the Spinozian model is God's only. This, in a sense, is what Beckett achieves in his work, a certain God-like presence. According to Szafraniec, just as Spinoza's God exhausts himself to become everything he understands, the writer exhausts himself in the process of writing, 'to be a flux, which combines with all other fluxes' (Szafraniec 2007: 120). Anthony Uhlmann argues something very similar in his 1999 study, although in this case, God does not represent 'Absolutely everything' but negatively, 'Absolutely nothing' (Uhlmann

1999: 14). Taking into account the three levels of Spinoza's ontology, he suggests that Beckett's exhaustion is the exhaustion of modes or individuated things, both in the attribute of extension and the attribute of thought. It is this exhaustion of modes that requires the merging with the plane of immanence, the univocity of Being or Spinoza's substance or God.

However, it must also be said that to read 'The Exhausted' in this Spinozian fashion is to follow a strand in Deleuzian scholarship which tends to neglects its more Kantian aspects. Here I would like to turn to Audrey Wasser's recent essay on 'The Exhausted', 'A Relentless Spinozism: Deleuze's Encounter with Beckett' (2012). Like Szafraniec, Uhlmann and others, Wasser begins by pointing out the Spinozian element of 'The Exhausted'. However, unlike other commentators, she emphasises the carnal or passional nature of Spinoza's thought in the ontology of 'sense' rather than 'essence' or 'substance'.[3] For Wasser, it is not Spinozian God that is key to understanding Deleuze's essay, but rather Spinoza's definition of affect as indicating a bodily change of state. Specifically, she is interested in how such a definition of affect impacts our understanding of thought, as also capable of being affected.

In her interpretation of Deleuzian transcendental empiricism, thought changes with every 'sensible encounter'. She uses the term 'encounter' in a post-Kantian fashion, to describe thought's confrontation with a sensible limit, familiar from the discussion of the sublime, especially of the generative role it plays in Deleuze's recasting of Kant's transcendental project. For Wasser, every time something is sensed, thought is forced to think, precisely because it is confronted with something exterior and independent of it. Such a 'midpoint' of thought is useful when considering the double concept of exhaustion, because the point of exhaustion – the point at which we no longer have any further possibility at our disposal – might also be construed as a confrontation with a limit. More so, it is a confrontation with a limit that has a bodily aspect. Just as in *Difference and Repetition* Deleuze might be seen as holding the respective 'fatiguing' of the faculties responsible for the transmission of shock to the final faculty of thought, in 'The Exhausted' physiological exhaustion is very much part and parcel of the exhaustive process.[4] As Deleuze emphasises, it is only when we are 'sufficiently disinterested' to pursue our goals, aims and plans that we can arrive at the point of exhaustion (Deleuze 1998: 154). Thus for Wasser, Beckett's is not so much a 'relentless' but a 'relenting' Spinozism, which in orienting Spinoza towards the corporeal, serves to make this most abstract of universes a little more concrete (Wasser 2012: 128–9).

This allows us to make the tentative conclusion that the constitutive principle invoked in 'The Exhausted' might be construed as a kind of productive confrontation with a limit, familiar from Kantian discussions of the sublime but also clearly at work in the exhaustive process. In this sense, we can understand his as an immanent critique in the Kantian tradition as 'the critique of the values upon which critique is founded', in that this confrontation with limit is central to thought. Beckett, by engaging with the exhaustive process, presents such a principle directly. *Quad*, which Wasser discusses in detail, would be one such instance of an immanent critique. *Quad* illustrates the constructive function of the exhaustive process, its players tiring at the four corners but exhausting the space in the middle (Wasser 2012: 129–30).

Yet in light of the recent research carried out by Smith, Hughes, Bryant and others, Wasser's interpretation is also incomplete. To further expand on how this might be the case requires a far more detailed account of the genetic line that begins with sensibility and the material impression, and proceeds via the creation of faculties to thought, and ultimately representation. To do so, I would like to turn to Joe Hughes, whose work on this problem of genesis in a Kantian context is exemplary.

Both in *Deleuze and the Genesis of Representation* (2008) and in his introduction to *Difference and Repetition* (2009), Joe Hughes convincingly argues that the midpoint of Deleuzian epistemology lies not with the violence of the sensible encounter but with the creation of the virtual. This is not to say that he dismisses Wasser's kind of genetic account entirely. According to Hughes, in *Difference and Repetition* Deleuze does trace the principles of thought back to the initial violent meeting between the subject and the unrecognisable, fragmented object. Hughes would also agree that this shock results in the creation of thought appropriate to this wounding difference (and, of course, the entire series of faculties, sensibility, imagination and memory, each dealing with the violence in its own way). However, for Hughes, it is important that the process Wasser describes culminates in the establishment of a future and open state of 'determinability', more familiar to readers of *Difference and Repetition* as the 'virtual' realm of 'multiplicity' (Deleuze 2004b: 214–79).

From Hughes we learn that Deleuze's epistemology is always the story of two asymmetrical halves. In the first, we get to see how the virtual is established and the idea progressively determined. According to the terms of *Difference and Repetition*, this process involves larval subjects, repetitions and passive synthesis, and Wasser's account is useful insofar as it shows how the force of the encounter both constitutes

a series of 'passive selves' or 'larval subjects' and causes these genetic elements of unconscious subjecthood to be exceeded (Wasser 2012: 130–3). However, to complete this trajectory of thought, the idea must be brought back from its futuristic virtual horizon and actualised in the present. Otherwise, it is very clear how the violence of the sensible encounter might be seen to be disruptive of thought – indeed, responsible for its 'mutation' – but not how this violence might allow for determination. While this shift of midpoint might seem overly technical, it bears on the problem of unconditioned principle, in that it is the virtual and not the encounter, which ultimately determines our knowledge of the object.

Furthermore, such a shift of midpoint also has an impact on the ontological aspect of Deleuze's argument, especially as presented by Kerslake. Kerslake shows that Deleuze builds his concept of imagination on Spinozian ideas of God and his expression. Imagination in its productive form takes over the role previously granted to Spinoza's concept of God, as the one self-grounding principle. If there is a Spinozian aspect here, in Hughes's argument, it can also be found in this discussion of virtual midpoint. We can rewrite the path that begins with the encounter and leads via the idea back to determination, as the story of how Being is 'wrestled' from unindividuated beings so that it may be restored to them as individuated.[5] It takes place within the Nietzschean world of the will to power, in which the only difference is the difference in intensity. In such an intensive world, the point of determination occurs with the thought of the eternal return, this defined as the moment of awareness equal to the bodily experience of the world of intensity and violence.[6] While Hughes draws comparisons with Spinoza's idea of substance as 'that which is in itself and conceived through itself' (Hughes 2009: 64), we might see how the figure God also meets these criteria.

Does this, however, impact our understanding of 'The Exhausted'? Can we still see it as an immanent encounter, in the sense of Kantian immanent critique? If so, is it a pre-critical, metaphysical encounter with a Spinozian God? Or rather, do we come here face to face with the violence of the sensible encounter between body and material impression? And where, in these very different accounts, can we find a place for the virtual?

IV. The Virtual Image

Before answering, I would like to move away from these ontological interpretations to consider one aspect of 'The Exhausted' that these tend

to overlook. Wasser but also Bryden and Szafraniec all seem to ignore the fact that Deleuze's essay culminates with the theory of the image. As we have already seen, in the second part of his essay Deleuze shows how Beckett uses language to reach a state of exhaustion. Deleuze identifies the construction of three different successive meta-languages: the first consisting of the exhaustion of words, the second of voices, and the third of the extra-linguistic elements of space and image. Suggestively for our consideration of immanent critique, he describes the final state of exhaustion as 'the point of "Imagination Dead Imagine"' (Deleuze 1998: 158). When Beckett does manage to exhaust words so that it no longer is a question of 'a combinatorial imagination' imagining a whole of a series, and when Beckett does manage to exhaust voices, so that the 'imagination sullied by memory' is no longer pierced with 'unbearable memories, absurd stories or undesirable company', then he achieves this most difficult of points (158). At this 'immanent limit of language' appears the visual or aural image (158). It would seem, then, if we wish to learn more about Deleuze's concept of the transcendental imagination and how it may be encountered, we must examine the nature of this unsullied image more closely.

The problem, however, is that the nature of this visual or aural image is poorly understood. Many of the Spinozian accounts I have referred to tend to overlook the concept of the image in favour of the other extra-linguistic element mentioned in 'The Exhausted' and found in Beckett's work, namely, the concept of space. We have seen how Wasser, for example, focuses her discussion on *Quad*, in which Beckett's exhaustion of space is most apparent (Wasser 2012: 129–30). Mary Bryden also ends both of her essays on 'The Exhausted' with a discussion of this work (Bryden 1996: 90–1; 2002: 89–91). Other commentators simply shift our attention to other texts. Szafraniec (2007) draws on Deleuze's *Cinema* books while Uhlmann in his essay 'Image and Intuition in Beckett's Film' (2004) prefers a more Bergsonian approach. The situation is not helped by the fact that Deleuze himself is very vague at this stage of the argument. Or rather, the image presents itself as vague.

If we look briefly at Deleuze's treatment of the image in the second part of 'The Exhausted', we can see why the image might be accompanied by a sense of confusion. On the one hand, Deleuze presents the image as something 'singular', nothing more than 'a woman, a hand, a mouth, some eyes' (Deleuze 1998: 158). As the image is considered to be free of both words and voices, this kind of sense of singularity feels appropriate. On the other hand, Deleuze also describes the image as a

'process', something very much emphasised by Mary Bryden (Bryden 2002: 86). These women, hands, mouths and eyes that appear after the exhaustions of languages one and two are not 'objects' (though they might appear this way from 'the object's point of view') but 'a process' (Deleuze 1998: 159). However, Deleuze seems to be unclear as to what kind of a process the image is. At first, he describes the image as a 'ritornello', something that comes and goes, like the patch of sky in *First Love* (159). Once again we can see how such a definition of the image is appropriate to Beckett's work, evoking, for instance, the way in which the face of the woman appears and disappears in … *but the clouds* …. But then Deleuze also argues that the nature of the image is 'self-dissipating' (160). Thus the image is also known for its short-lasting, explosive character. It does not return but ends, quite suddenly, in an explosion that 'captures all the possible' (161).

If we consider this vague concept of the image in relation to the virtual, however, then many characteristics of the image become clear. Before engaging in such a comparison, let us first return to Hughes and his account of Deleuze's genetic alternative to Kantian epistemology. So far, I have shown how the genesis of thought can be traced back to an initial encounter between the body and material object. The shock of this initial encounter is then transmitted through the various faculties in an attempt at interpreting this violence, and here Wasser's account (2012) is useful to understand more of this process. However, despite acknowledging the virtual's constitutive role in the determination of the object, I have not yet described how this violence constitutes the virtual. In order to show the relation between the two – the image of 'The Exhausted' and the virtual of *Difference and Repetition* – we need to establish what happens after the moment at which all the attempts at interpreting the violence leading up to this breaking point are cast aside, together with all the passive selves and larval subjects.

In *Difference and Repetition* Deleuze describes this virtual platform in the following way:

> The system of the future by contrast must be called a divine game since there is no pre-existing rule, since the game bears already upon its own rules and since the child player can only win, all of chance being affirmed each time. (Deleuze 2004b: 142)

From this we learn that the virtual has two main characteristics. First of all, the system of the future has no pre-existing rule. A Kantian enquiry into conditions that allow for the possibility of experience will not discover in this Nietzschean world a priori forms

of intuition, categories of understanding or idea of reason. The genetic set of principles – what in *Difference and Repetition*, Deleuze terms 'ideas' – must be constituted, each time anew.[7] However, these are nothing more than mere 'differentials', valueless in themselves and only acquiring a value when they enter a reciprocal relation with one another (Deleuze 2004b: 216–19).

Second, this system of the future has no subject, or at least, not the kind of subject familiar from Kantian philosophy. Instead, the subject of the future is appropriate to a system without pre-existing rules, a contingent or 'aleatory' point to the idea's valueless differential (Deleuze 2004b: 247–51). The point at which the child player affirms all of chance and throws the pair of dice is the aleatory point at which differential ideas are placed in a reciprocal relation with each other. While it might seem that this point takes on the role of Kantian apperception in that it lends thought the kind of unity comparable to the 'I think', we must remember that there is no unified consciousness in Deleuzian epistemology. Here within the system of a 'dissolved self', the 'I' is always 'fractured' (108–10).

Keeping these characteristics of the virtual in mind, let us return to Deleuze's theory of the image. The first characteristic of the image is its singularity. After the respective exhaustions of words and voices, Beckett leaves us with no more than 'a woman, a hand, a mouth' (Deleuze 1998: 158). These singularities might be understood as 'indefinite' because in becoming free of both voices and words, they retain nothing of the 'personal' of the imagination sullied by memory and nothing of the 'rational' of the combinatorial imagination sullied by reason (158). Interestingly enough for our comparison with the virtual, while these singularities can be described as indefinite (we do not know, for instance, what woman, whose face, what mouth is being referred to here), Deleuze also describes them as 'determinate' (160).

The indefinite/determinate state of image also helps us understand why Deleuze describes it as a 'process' and not an 'object'. It is important to remember here that at stake in Deleuze's essay is an exhaustive process taking place on two different levels. This process is not easy; it is exhaustive; it is draining. As Deleuze writes, to reach this point of the image is 'extremely' difficult and very few painters, musicians, writers have managed to achieve it (Deleuze 1998: 158–9). Once it is achieved, however, this state is almost impossible to maintain. The effort required to keep the image free from all associations is simply too great. This is why the image tends to appear and disappear and eventually, to explode in an act of self-dissipation.

Indeed, it is this image's act of self-dissipation which binds the third language of exhaustion most closely with the virtual sphere. As we have already learnt, the process of exhaustion takes place on two different levels. On the one hand, it consists of the logical exhaustiveness and we can see how its affirmation of chance echoes the description of the child player with its throw of dice found in *Difference and Repetition*. On the other hand, the affirmation of chance in logical exhaustiveness is dependent on the fatigue of the one who exhausts. As Deleuze argues, only someone who is 'sufficiently disinterested' can exhaust possibility in this way (Deleuze 1998:154). Therefore, we can see Beckett's constructions of languages one, two and three as his successive attempts at reaching that state of fatigue which would allow for logical exhaustiveness. While in the language one of words we might still encounter characters responsible for the construction of 'inclusive disjunctions', the silencing of voices of language two has a direct impact on subjectivity. Again, as we have already seen, the narrator's voice is one of the many voices necessarily included in the exhaustive process. In the language three of image, however, Beckett dispenses with the kind of agency associated with languages one and two. No one exhausts the image; the image exhausts itself.

V. … *but the clouds* …

Without making any claims at this early stage, it is worth noting a couple of points. The concept of the virtual and the concept of the image seem to share some important characteristics. For one, both can be understood as a 'principle' (though the exact nature of this principle is yet unclear). The state of exhaustion in which the image participates – more than that, achieves – is described by Deleuze as 'originary', as the sum of all possibility. Realisation of determinate goals is, in this case, only the 'derivative' (Deleuze 1998: 152). Likewise, the virtual is that which ultimately allows for the determination of the object. Both the virtual and the image are characterised as 'indeterminate', either as 'indefinite' or 'without pre-existing rule' (Deleuze 1998: 158; 2004b: 142). Both also achieve such an indeterminate state in a similar way, by dispensing with a certain kind of established subjective agency. The virtual subject is no more than an aleatory point – the exhausted person, 'disinterested' (Deleuze 1998: 154). We can, however, learn more.

The best example of this relation between the image and the virtual can be found in the third part of 'The Exhausted', in Deleuze's discussion of … *but the clouds* …, a short television play, first screened by the

BBC in 1976 as part of a longer programme dedicated to the work of Samuel Beckett. The play follows the central character's attempts at the recollection of a woman's face. We see how he shuffles across a centrally lit stage, east to west and west to east, changes his clothes off-screen and eventually ends up in the 'mental sanctum' in the north, where the image had previously been seen.[8] There, head in hands, he recalls how on other nights 'she' had appeared to him, to stay briefly, to linger and to mouth the words of *The Tower* by W. B. Yeats, 'but the clouds in the sky' (Beckett 1984: 261). As we hear the protagonist's account, the image of a woman's face 'invades' our screen (Deleuze 1998: 170).

As this kind of 'sentimental' examination of 'lost love' (Ackerley and Gontarski 2004: 77), it is not immediately apparent how … *but the clouds* … engages with the more theoretical questions of the virtual. However, it is worth noting that Deleuze introduces the play by suggesting that in this work, Beckett returns to the 'post-Cartesian' theories found in his earlier novel, *Murphy* (Deleuze 1998: 169). Specifically, he refers to chapter 6 of the novel, in which Beckett distinguishes between the various zones of Murphy's mind. From the 'riotous potpourri of many metaphysical systems' that this chapter evokes (Fletcher 1965: 54), we learn that within the hollow sphere of Murphy's mind the universe assumes three distinct forms. Beckett identifies the first form as the 'actual', the second as 'virtual' and the third as 'virtual rising to actual' or 'actual falling to virtual' (Beckett 2011: 107). Already here we gain an initial insight. There is a virtual at work in … *but the clouds* …, and this virtual belongs to its protagonist's earlier counterpart, Murphy. There is also a second point to be gained. Whereas Murphy has both mental and physical experience of the actual, the virtual is mental only. Though Murphy enjoys all three forms of his universe, if he wants to move from one zone to another – indeed, if he wishes to invoke the virtual state – he can only do so according to the 'law of inversion' (Deleuze 1998: 169), by keeping his body at rest.

Indeed, I would like to argue that Deleuze uses this reference to Murphy to map the virtual/actual distinction onto the logical/physiological distinction of exhaustion he has developed so far. For Deleuze, the image is 'virtual' in that, like Murphy's virtual universal, it is 'mental' in nature. This is the one aspect of the image that Deleuze emphasises in a particular section of the essay that has no equivalent elsewhere. The sanctum in which the protagonist sits when invoking the image 'has only a mental existence; it is a mental chamber' (Deleuze 1998: 169). Similarly, what 'matters' here is no longer the exhaustion of

space, 'but the mental image to which it leads' (169). We can therefore conclude that the process of exhaustion is also such a mental activity. At the very least, both the logic of exhaustion and Murphy's mental acrobatics conform to the same law of inversion. Both require a physical or physiological exhaustion on the protagonist's part.

Such a mapping of one distinction onto the other becomes even more obvious in the following section, where Deleuze repeats many of his former claims about the image, but this time keeping to his newly established mental framework. He still insists that the image of … *but the clouds* … raises 'the thing or the person' to the state of 'an indefinite' (Deleuze 1998: 170). He also argues that the image 'cannot be separated from the process of its own disappearance' because 'the energy' that the image carries results in its 'self-dissipation' (170). However, in this case he presents the characteristics of the image as part of a mental activity. When we first see the protagonist sitting at his desk, he states, 'When I thought of her, it was always night. I came in –'(Beckett 1984: 259). But then immediately, he corrects himself, 'No that is not right. When she appeared it was always night. I came in –' (259). 'To raise something or someone to the state of the indefinite is to "call to the eye of the mind"' (Deleuze 1998: 170).

The exhaustion of the image then, insofar as the image achieves a state that is both 'indefinite' and 'self-dissipative' (Deleuze 1998: 170), constitutes a mental process, which can be understood in virtual terms. When the protagonist 'stops thinking' and begins to "'call to the eye of the mind"', he begins to engage with this kind of virtual mental process (170). However, we must also note that Deleuze evokes the virtual indirectly, through a reference to Beckett's earlier novel, *Murphy*. It is still unclear how Murphy's virtual relates to the virtual of *Difference and Repetition*. This relation between the two different forms of virtuality Deleuze only establishes later, in the final stage of his analysis, where he explains, first, more about the kind of mental activity that Murphy engages in when he puts the law of inversion into action; and second, the consequences for the protagonist, whose call to the eye of the mind is rewarded by the appearance and subsequent disappearance of a woman's face.

Regarding the state of exhaustion required of dissipating image, Deleuze writes:

> [The image] announces that the end of the possible is at hand for the protagonist of … *but the clouds* … [. . .]. There is no longer an image, anymore than there is a space: beyond the possible there is only darkness,

> as in Murphy's third and final state, where the protagonist no longer moves in spirit, but has become an indiscernible atom, abulic, "in the dark … of … absolute freedom". (Deleuze 1998: 170)

Once again Deleuze refers to the hollow sphere of Murphy's mind to make his point, but this time, to the experience Murphy has of its actual, virtual and in-between forms. When Murphy first lies to rest, in order to travel through the different zones of his mind, he initially encounters a world that is very similar to our own, for which it acts as a kind of parallel. In this zone of 'light' Murphy can, for instance, enjoy mentally reciprocating a kick that he had received physically, when in the physical world. Providing he rests further, Murphy can then enter the second zone of 'half-light', comprising 'forms without parallel' (Beckett 2011: 110). This second, more unfamiliar world he can only enjoy through contemplation, in the manner of Dante's Belaqua.[9] But Murphy's 'third and final state' belongs to the third zone of 'darkness' in which there are no forms, whether parallel or otherwise. Beckett describes it as 'a flux of forms, a perpetual coming together and falling asunder of forms' (112). There are 'no elements or states, nothing but forms becoming and crumbling into fragments of a new becoming' (112). To engage in the mental activity productive of the image – to call something to the eye of the mind – is to therefore participate in this kind of state of flux.

If we now compare the two different forms of virtuality – that belonging to Murphy and that of *Difference and Repetition* – their mutual resemblance becomes clear. When Beckett describes the third zone of darkness as a world 'without element or states', he also explains that these forms become and crumble into fragments of a new becoming 'without love or hate or any intelligible principle of change' (Beckett 2011: 112). While a Spinozian aspect cannot be entirely dismissed, it is difficult not to see this world as resembling the Deleuzian virtual realm of multiplicity.[10] Like the open system of the future, it has no pre-existing rule. And furthermore, like this system, it has a mathematical equivalent. Deleuze likens the idea to the reciprocally determined differential; Beckett, the flux of forms, to a 'matrix of surds' (113).

Similarly, Beckett's description of Murphy evokes the kind of subjecthood Deleuze associates with the open system of the future and the progressive determination of the Idea. We have seen how the child player, free of any prior associations, rules the open system of the future. We have also seen how Ideas are progressively determined at a contingent or aleatory point. In Nietzschean terms, the thought of the eternal return is the moment of awareness equal to the bodily

experience of the world of intensities. It is the 'blind', 'acephalic' (headless) and 'aphasic' (speechless) point, at which 'powerlessness is turned into power' (Deleuze 2004b: 249–50). Consider then the following description of Murphy at this point: 'Here he was not free, but a mote in the dark of absolute freedom. He did not move but was a point in the ceaseless unconditioned generation and passing away of line' (Beckett 2011: 112). In the third zone of darkness, Murphy loses the degree of sovereignty and freedom he found in zones one and two. He can no longer reciprocate kicks or contemplate beatitudes. This last zone is also not a zone through which Murphy can mentally traverse. Whatever its treasures, they are not the kind among which he can 'move'. Rather, he becomes a point within the overall movement, reduced to a mote within the general freedom.

VI. Birthplace

From our comparison it would seem that the relation between the two concepts, the image of the third language of exhaustion and the virtual of *Difference and Repetition*, is quite strong. Both involve the construction of a mobile and fluctuating mental state in which the individual or the subject responsible loses a sense of agency. So much we learn from Deleuze's reference to Murphy and his third and dark state, described by Beckett in terms of the virtual. Nevertheless, this still leaves one question unanswered, the question with which I began this exploration of 'The Exhausted'. Does it follow that Deleuze's is an immanent critique in the post-Kantian sense? Can we find in 'The Exhausted' an encounter with what Kerslake describes as the unconditioned self-grounding principle that lies at the basis of knowledge? Is this what Beckett manages to achieve with the making of the elusive image, the learning of Kant's transcendental imagination, understood by Deleuze as a constitutive, genetic ground?

In Kerslake's Kantian terms, immanent critique would necessarily encounter self-grounding principle in the guise of Kant's transcendental imagination, the hidden power, which in Deleuze's rewriting of Kant's transcendental project assumes a major constitutive role. In 'The Exhausted' we encounter such real conditions in the concept of the self-dissipating image. For what else is the virtual with which Deleuze introduces … *but the clouds* …? This is Murphy's virtual as presented in Beckett's early novel, the third form assumed by the hollow sphere of Murphy's mind, experienced as a mobile and dark world of continuous becomings. We can conceive this virtual as a Spinozian world, the flux,

which combines all other fluxes, as described by Szafraniec (Szafraniec 2007: 120). We can also, by following Hughes's interpretation, present it as the midpoint of a trajectory that begins with the violence of the sensible encounter and ends with the determination of the object. As such, the virtual is constitutive of the actual world, an actual world that the Kantian would recognise as his or her own, the world of distinct objects, experienced by the individual subject.

We can see how the virtual of the self-dissipating image might be construed as such a constitutive ground if we once more consider Deleuze's remarks on God and origin. As we already know, Deleuze introduces the distinction between exhaustion and realisation by writing: 'God is the originary, the sum total of possibility. The possible is realised only in the derivative, in tiredness, whereas one is exhausted before birth, before realising oneself, or realising anything whatsoever (I gave up before birth)' (Deleuze 1998: 152). According to Spinozian interpretations of 'The Exhausted', this one original God, the sum of all possibility, is a Spinozian God, the one substance from which all emerges. Equally, however, we can construe this originary God-like state as the virtual realm of *Difference and Repetition*. The virtual too is there 'before birth', in that it is before the determination of the world of distinct objects and individual subjects.

Indeed, Hughes's account shows how this world of extension and quality must presuppose an altogether different world of intensities, without such extensions and qualities. However, it needs to be noted that this priority of the God-like state of the virtual – the exhaustion before birth – is constitutive, in that it lies at the 'origin' of such an objective world. While ultimately all representation can be traced backed to the initial material encounter in sensibility, Hughes's account has shown how this of itself is not sufficient for determination. Determination only occurs in that moment when violence erupts to establish the Nietzschean system of the future and with it, those ideas which give rise to the principles of actualisation.

We can also see how Deleuze's discussion of the self-dissipating image might answer the post-Kantian demand for a self-grounding principle of subjectivity. When making the distinction between exhaustion and realisation, Deleuze defines the time and place prior to birth as both before 'realising anything whatsoever' and before 'realising oneself' (Deleuze 1998: 152). In Kantian terms, the one who actively realises different goals, aims and plans is nothing other than the individual subject, negotiating the world of distinct objects; whereas the one who is exhausted exists prior to the realisation and thereby prior to such

subjectivity. In section II of this essay, I have mentioned two instances in which Deleuze refers to 'birth'. In the first instance Deleuze makes his reference to the Spinozian God; in the second he writes:

> Tiredness affects action in all its states, whereas exhaustion only concerns an amnesiac witness. The seated person is the witness around which the other revolves while developing all degrees of tiredness. He is there before birth and before the other begins. (Deleuze 1998: 155–6)

Prior to such subjectivity is the 'amnesiac', who is witness to the 'other' and this other's endlessly tiring activity. A very specific kind of subjecthood is at stake.

It is this very specific subjecthood of the seated person that embodies self-grounding principle. If we return to our discussion of the Deleuzian epistemology, this has shown that, just as the world of objects presupposes the world of intensities, the world of a unified, conscious subject presupposes passive and unconscious subjecthood. I have referred to Wasser's essay as a particularly good account of the series of 'larval subjects' and 'passive selves' that form the first half of Deleuze's epistemological trajectory. Yet I have also argued that the type of figures dominating Beckett's late work, notably the seated protagonists of … *but the clouds* … or *Nacht und Träume*, resemble the fractured subjects and passive selves of Wasser's account no more than they resemble the single unified consciousness of the Kantian subject. Instead, Beckett's figures are appropriate to the mobile, fluctuating world to which they belong. 'Before birth' and 'before the other begins' is the child player who throws the pair of dice, the aleatory point at which differentials enter a reciprocal relation with each other. Like Murphy in his third and final state, these subjectivities embody a Nietzschean kind of intense self-awareness, their power of determination arising from their seeming powerless. This is how we ought to understand the seated protagonists of … *but the clouds* … or *Nacht und Träume*: as those subjectivities sitting at the origin of determination, presiding over the virtual platform.

Finally, we are in a position to discuss how 'The Exhausted' might stage its specific kind of immanent critique. Providing that we accept the virtual of 'The Exhausted' as the kind of self-grounding principle found in Kantian readings of *Difference and Repetition*, we can reconstruct Deleuze's essay as an encounter with such a principle. Going through Deleuze's argument systematically and beginning with the between exhaustion and realisation, we know that the possible is either something we realise by setting goals, aims and plans, or it is something we exhaust,

precisely by renouncing these kinds of aims. Exhaustion incorporates 'the sum total of possibility', whereas realisation is only 'derivative' (Deleuze 1998: 152). Mapping then the one distinction onto the other, the possible corresponds to principle or condition, and the real to that which is conditioned by this principle. In our terms, as derived from Hughes's reading of *Difference and Repetition*, the affirmation of the possible as a whole corresponds to establishment of the virtual and, in the same way, the process of realisation to the actualisation of the virtual in the world of objects and subjects. Beckett, by renouncing the aims associated with realisation, in fact renounces the conditioned. The double exhaustion of logic and fatigue allows him to uncover what in normal circumstances is obscured: the principle of the conditioned. For Kerslake, this was the hidden power of Kant's transcendental imagination; in our case, this is the virtual realm of multiplicity. Through this exhaustive process, Beckett uncovers that generative mixture of openness and flux, hidden by the qualities and extension of the object it actualises.

Continuing our systematic analysis, we can see the construction of the three languages of exhaustion as Beckett's way of staging his immanent critique. The distinction with which Deleuze began his essay once again applies. Just as Deleuze opposes the process of realisation to the process of exhaustion, he opposes the language associated with realisation with the type of language characteristic of Beckett's late work. Under normal circumstances we use language to help establish the aims of realisation, to name these aims and to voice them. In other words, we use language to construct our actual world. Beckett on the other hand, first by exhausting words, then voices, and then finally those extra-linguistic elements which appear in the absence of both word and voice, disrupts the realising function of language to manifest the virtual. The protagonist of … *but the clouds* … and the female face, the series of television plays which includes … *but the clouds* … but also *Quad*, *Ghost Trio* and *Nacht und Träume*, the third language of images and spaces: all can be seen as Beckett's way of recreating the conditions of the virtual plane, without the actual that is conditioned by it. The following remark only seems to confirm such an interpretation:

> But the image is more profound because it frees itself from its object in order to become a process itself, that is, an event as a 'possible' that no longer needs to be realised in a body or object, somewhat like a smile without the cat in Lewis Carroll. (Deleuze 1998: 168)

We can therefore conclude that to encounter self-grounding principle is to encounter such a 'smile without the cat'. Or rather, 'The Exhausted' places a demand on us: not to realise; not to name and voice; not even to think (as the protagonist of … *but the clouds* … makes clear, the woman appears not because she is thought, but only when invoked). We must renounce all that has to do with the realisation of possibility, and with this, a little of ourselves. If we loosen the grip of subjectivity sufficiently to achieve that impossible tension of the image, an image no longer bound by reason or memory, then we are free, like Murphy, to move among our mind's treasures.

VII. Conclusion

In the *Critique of Judgment*, Kant brings to the concept of transcendental imagination a new aspect. Whereas the first critique presents imagination as nothing more than a 'hidden power', a spontaneous synthetic capacity thought necessary for cognition but ultimately unknowable, in the third critique imagination assumes a more active role. In its free play with the faculty of understanding, it 'quickens' this power, and their mutual 'arousal' is something that can be felt. In 'The Exhausted' Deleuze shows how Beckett, in the exhaustion of the image, reaches a state comparable to that of Kantian imagination (imagination here reassuming its productive 'arousing' role) in that Deleuze associates the exhaustion of the image with a certain kind of freedom. Just as there is freedom when imagination is no longer restricted by the determination in concept, there is freedom to be found in the virtual state, in the darkness of Murphy's mind. Insofar as Beckett's late television plays achieve the remaking of this virtual state, the productive imagination becomes something 'learnt'.

Thus we can conclude that 'The Exhausted' stages an immanent critique, in that we uncover something of a hidden constitutive power and we learn more about the nature of self-grounding principle; however, we need to account for our own reversal of terms. That *Difference and Repetition* is a rewriting of the first critique from the point of view of the third is by now a well-rehearsed argument. In contrast, I have read the 'The Exhausted' in light of *Difference and Repetition* – Deleuze's third critique from the point of view of the first – to show how it adds to our understanding of the virtual in the genesis of knowledge. In this sense, 'The Exhausted' performs its own kind of immanent criticism.

Notes

1. See especially the first chapter of Meillassoux's *After Finitude* (2008: 1–27), where the critique of Kant is first laid out and is at its most explicit.
2. We can also include Bryant in this list, who refers to Deleuze's *Nietzsche and Philosophy* (1992b) to argue Kant's critique is incomplete. Despite denouncing the transcendent, Kant does not show how the categories are a 'result of a genesis' (Bryant 2009: 32–3). What we require is a 'genesis of reason itself' as well as a 'genesis of the understanding and its categories' (Deleuze 1992b: 85).
3. That Deleuze's is a philosophy of 'sense' rather than 'essence' or 'substance' is a central claim of his Kantian interpreters. See, for instance, how Hughes introduces his phenomenological argument in *Deleuze and the Genesis of Representation* (Hughes 2008: 16–17).
4. Wasser draws on the account given in *Difference and Repetition* pp. 98–100. This is particularly appropriate, as Deleuze happens to refer to Beckett directly when defining fatigue's role in passive synthesis and the constitution of time as a living present.
5. The epistemological slant of my essay prevents me from a more in-depth discussion of ontological difference. For further reading of the ontological argument in *Difference and Repetition* and the Deleuzian drawn trajectory of Duns Scotus, Spinoza and Nietzsche see Hughes 2009: 53, 62–4. Badiou 1999 is another key interpreter.
6. Deleuze refers to the concept of the eternal return at various points in *Difference and Repetition*. See especially pp. 304–5 for the distinction he draws between the 'thought' of the eternal return and the 'feeling' of the will to power.
7. Deleuze shows how the 'idea' is constituted in chapter IV of *Difference and Repetition* (Deleuze 2004b: 214–79). He introduces the idea as a Kantian 'problem', proceeds through a discussion of modern calculus and develops the concept by referring to other mathematical, biological, Marxist examples. In this rather complex way, Deleuze aims to explain the precise nature of the new 'ideal' synthesis of difference.
8. Deleuze uses the term 'mental chamber' to describe the dark space in which the protagonist sits and evokes the image (Deleuze 1998: 169). In the play, the protagonist simply states 'vanished in my little sanctum and crouched, where none could see me, in the dark' (Beckett 1984: 259).
9. Belaqua of Dante's *Divine Comedy* acts as a prototype, not only for Beckett in his characterisation of Murphy, but also for Deleuze. Szafraniec notes the similarities between the exhausted person and his 'predecessor' Murphy, who both, like Dante's Belaqua, do 'nothing' that can be 'discerned' (Szafraniec 2007: 122).
10. See P. J. Murphy's essay for an explicitly Spinozian interpretation (Murphy 1994: 225–7).

In the Still of the Moment: Deleuze's Phenomena of Motionless Time

Corry Shores Bilkent University

Abstract

A process philosophical interpretation of Deleuze's theories of time encounters problems when formulating an account of Deleuze's portrayal of temporality in *The Time-Image*, where time is understood as having the structure of instantaneity and simultaneity. I remedy this shortcoming of process philosophical readings by formulating a phenomenological interpretation of Deleuze's second synthesis of time. By employing Deleuze's logic of affirmative synthetic disjunction in combination with his differential calculus interpretation of Spinoza's and Bergson's duration, this phenomenological interpretation portrays time as given to our awareness in immediacy rather than through a continuous process of unfolding. The viability of this alternate approach calls into question the claims that Deleuze is strictly a process philosopher and anti-phenomenologist.

Keywords: Deleuze, time consciousness, phenomenology, Bergson, cinema

I. Introduction

Husserl's and Merleau-Ponty's analyses of time-consciousness portray phenomenal time as flowing continuously on account of a progressing synthesis that blends the moments of our awareness.[1] Their accounts are suited for a description of temporality as it appears to us as a flowing succession, for instance when time seems to drag on slowly while we are bored waiting for a bus or train. Yet, does time always appear to

Deleuze Studies 8.2 (2014): 199–229

us as an extending, continuous flux? Consider for example when we look in the mirror and for the first time suddenly notice signs of our aging. In that shocking instant, we do not feel the gradual passage of some number of years; rather, we are given those years all at once in a phenomenal flash. So, it seems temporal phenomena are not always continuous, and thus our phenomenological analyses of time would benefit from a description of non-flowing temporal appearings. We will examine how Deleuze's cinematic examples of motionless temporality illustrate the disjunctive synthesis of virtually simultaneous moments that are given instantaneously. Our account runs contrary to process readings of Deleuze's time syntheses, as for example the one we find in James Williams's recent book *Deleuze's Philosophy of Time: A Critical Introduction and Guide*. According to such a process-philosophical reading, Deleuze's time syntheses cannot be instantaneous; for, processes require more than one moment to transpire. So, one of the reasons Williams excludes Deleuze's second cinema book *The Time-Image* from his account is because it says the past and present synthesise each *instant* (Williams 2011: 162).

Nonetheless, *The Time-Image* is quite useful for phenomenologists who wish to analyse temporal appearings, because cinematic experiences are uniquely able to present to our awareness 'a little time in its pure state'. So, by first examining Deleuze's notion of instantaneous becoming, we will find that *The Time-Image* builds upon Deleuze's earlier treatment of the second synthesis in *Difference and Repetition*, rather than contradicting it as the process interpretation would argue. Thus, a danger we risk by reading Deleuze's temporal synthesis solely in process terms is that it limits our ability to obtain the phenomenological value of Deleuze's philosophy of time.

II. Motionless Becoming: The Logic of Intensive Temporality

To explore the basic logic of Deleuze's motionless temporal synthesis, we will first follow his treatment of Lewis Carroll's *Alice in Wonderland* at the very beginning of *The Logic of Sense*. Deleuze refers us here to the scenes when Alice's size increases, so that he may illustrate the 'pure event' of becoming. As Alice becomes larger, she of course becomes larger than the size she just was. But in that same stroke, she is as well 'growing' smaller than the size she is now becoming: as she 'moves-toward' a larger size, this motion is a movement into another relation, in this case, a relation with an even larger size. In this way, the pure event of becoming places 'before' and 'after' – past and future – together as two

Figure 1. Alice becoming larger and smaller simultaneously. (Source: adapted from Carroll and Tenniel 1866.)

incompatible but coincident states of affairs. 'Before' and 'after', in this way, become simultaneous (Figure 1):

> When I say 'Alice becomes larger', I mean that she becomes larger than she was. By the same token, however, she becomes smaller than she is now. Certainly, she is not bigger and smaller at the same time. She is larger now; she was smaller before. But it is at the same moment that one becomes larger than one was and smaller than one becomes. This is the simultaneity of a becoming whose characteristic is to elude the present. Insofar as it eludes the present, becoming does not tolerate the separation or the distinction of before and after, or of past and future. It pertains to the essence of becoming to move and to pull in both directions at once. (Deleuze 1990a: 3/9)[2]

In a strange way, the pure event occurs between 'before' and 'after', yet also somehow the two are simultaneous. We will explain this through Deleuze's distinctions between intensity and extensity. Note that when Deleuze discusses Spinoza's duration and affect in a class lecture from 1981, he offers a description similar to his account of pure becoming. In this Spinozistic context, an affection is 'the instantaneous effect of an image of a thing on me' (Deleuze 1981). So, consider if we first see our enemy Peter and then turn our head and notice our charming friend Paul. Here we are affected by a succession of images that with each instant increases our power of acting (Deleuze 1978). Our affections are always varying continuously in this way like waves or curves, but at any

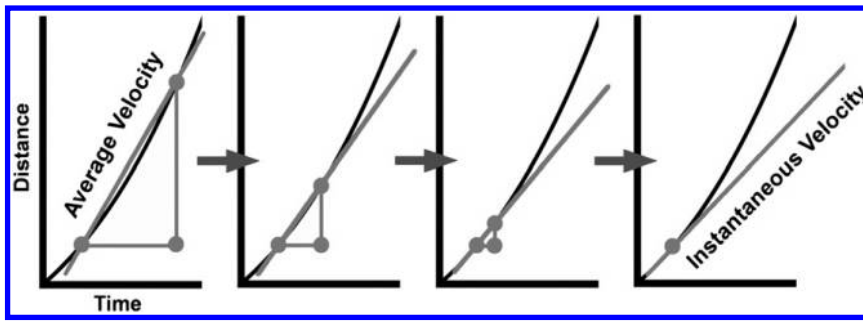

Figure 2. Finding instantaneous velocity.

one given moment, we experience an instantaneous affection, which is the degree to which we are tending to increase or decrease in power. Deleuze, building from his calculus interpretation of Spinoza's diagram of infinity, portrays the instantaneous affection as being something like a curve's tangent that has been found by using the infinitesimal analysis of Leibniz's early calculus techniques (Deleuze 1981).[3] So let's first consider how we may use differential calculus to determine instantaneous velocities, because this will aid us in understanding what Deleuze means by instantaneous affection. We could graph a curve showing an accelerating increase in velocity (the change in distance per the change in time). We can then determine the average velocity within an extent of time by drawing a line that connects the points on the curve at the beginning and at the end of the delineated time interval. Now, by using a technique from infinitesimal calculus, we can bring together the distant points along the curve – keeping in mind the degree of change between them – until they are infinitely close, that is, until only an infinitely small amount of distance lies between them (Figure 2). The line that the infinitely close points now draw is the tangent, which tells us how fast the object was tending to go in that instant. This is its instantaneous velocity at that moment along its motion.

To explain the duration involved in instantaneous affection, Deleuze turns to 'the phenomenon of passage' in Bergson's duration:

> you can consider psychic states as close together as you want in time, you can consider the state A and the state A′, as separated by a minute, but just as well by a second, by a thousandth of a second, that is you can make more and more cuts, increasingly tight, increasingly close to one another. You may well go to the infinite, says Bergson, in your decomposition of time, by establishing cuts with increasing rapidity, but you will only ever reach states. (Deleuze 1981)

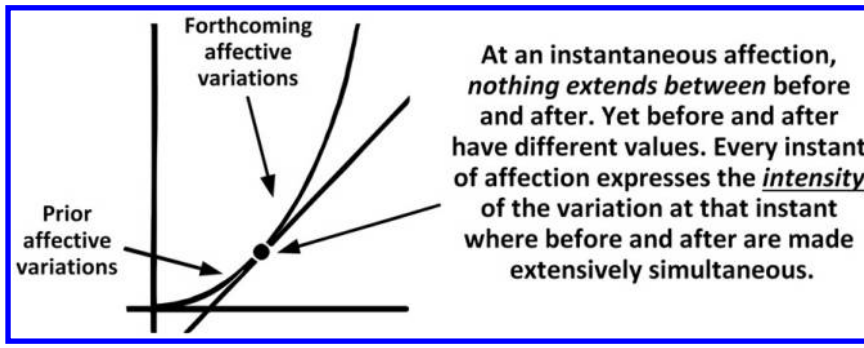

Figure 3. Using infinitesimal calculus to find instantaneous affection.

Deleuze draws a parallel between Bergson's psychic states and Spinoza's levels of affection. As we noted, things affect us in ways that either increase or decrease our power, and these changes are continuously varying. At an instant of our affection, we are at some level of power. But from one instant to its immediate successor, there is no temporal gap extending between them; however, there is an intensity of change that we experience as the phenomenon of passage. Bergson's and Spinoza's duration, according to Deleuze, is found between instants brought infinitely close together. He explains:

> duration is always behind our backs, it is at our backs that it happens. It is between two blinks of the eye. If you want an approximation of duration: I look at someone, I look at someone, duration is neither here nor there. Duration is: what has happened between the two? Even if I would have gone as quickly as I would like, duration goes even more quickly, by definition, as if it was affected by a variable coefficient of speed: as quickly as I go, my duration goes more quickly. [...] A′, A, A″; A is the instantaneous affection, of the present moment, A′ is that of a little while ago, A″ is what is going to come. Even though I have brought them together as close as possible, there is always something which separates them, namely the phenomenon of passage. This phenomenon of passage, insofar as it is a lived phenomenon, is duration.[4] (Deleuze 1981)

Deleuze interprets the continuous variation between the curves in Spinoza's circle diagram in his 12th letter, 'The Letter on Infinity', to be like an infinite series of instantaneous affections. So, we might depict this using a curve and tangent like we did when finding instantaneous velocity (Figure 3).

Thus, duration here is not merely something occurring over the course of a series of moments but can rather be what happens between moments

brought infinitely close together such that no time extends between them. Duration in this sense is a matter of the *extensive simultaneity* of a 'before' and an 'after', whose differential relation implies an *intensive succession*, an 'intending' or inner tension from the incompatibilities between 'before' and 'after'. Because no extent of time separates 'before' and 'after', they temporally coincide, extensively speaking; however, 'after' *intends* or is *striving to extend* past 'before' with a certain degree of *intensity*, just as the moving body is tending to go at a certain velocity in that instant.

Deleuze's logic of synthesis, then, will allow for the temporal convergence of 'before' and 'after' without their assimilation. We call it 'logic' here, because it makes use of the logic of exclusive disjunction; yet, also involved are what he considers Leibniz's 'alogical' concepts, *compossibility* and *incompossibility*. They are alogical, because they are not matters of identity and contradiction, which apply only to what is possible and impossible (Deleuze 1990a: 196/201). Yet unlike Leibniz, for Deleuze the incompatibility or incompossibility of states of affairs is the condition for events to occur. If at any instant all the states of affairs in the world were compatible or compossible, then there are no conditions in the world calling for resolution, and hence everything might be at rest or in redundant motion. Or as for Leibniz, all events would be precalculated in advance by God on the basis of the compossibility of monads' predicates. Yet as Bergson notes when discussing mathematical predictions of future eclipses, this strips the series of events of their temporal character by placing all forthcoming occurrences together simultaneously in that single calculation (Bergson 2001b: 194–7/149–50). So, compossibility does not account for how events unfold through time. But if time and becoming are real, then every instant would need to contain incompossible states of affairs whose incompatibilities on the one hand provide the motive force for bringing about alterations in the succeeding moment while also on the other hand leave indeterminate and un-precalculable these future events.

So recall the prior example: as Alice's size increases, she *becomes* larger and smaller than herself. But, it is logically impossible that she *be* larger and smaller than herself. Her largerness and her smallerness can only coincide in the case when she is caught in the act of changing, when her growth is the intensive degree of variation between infinitely close moments. So the combined states of affairs, 'Alice is larger than herself' and 'also she is smaller than herself', is a logical impossibility and can never actually be so. Yet, 'Alice becomes larger than herself' and 'in the same stroke she becomes smaller than herself' are not so

much impossible when combined as they are incompossible, meaning that throughout her continuous growing, these states of affairs really do coincide, but they cannot stay that way for longer than a fleeting instant. If they remained so for longer than an infinitely short moment, the *becomes* of 'becomes larger and smaller' turns into the *is* of 'is larger and smaller', which we said was impossible. Thus, for as long as her largerness coincides with her smallerness, there will necessarily be a forthcoming successive moment when either she keeps growing (transforming her given largerness into a smallerness related to a new largerness) or she stops growing (causing her smallerness to cease being smaller than another larger size, because there will be no larger size that she is attaining to).

For Deleuze, incompossible states of affairs are combinable on account of a synthesis, namely, what he calls 'affirmative synthetic disjunction'. In an exclusive disjunction, either *A* or *B* can be true, but not both. However, in Deleuze's synthetic disjunction, *A* and *B* are not compatible states of affairs, yet both are affirmed and coincident. There is a classic example in the field of intensional logic and semantics that will illustrate. Oedipus had every reason to believe he was not the criminal bringing the curse upon Thebes. Yet, there arrived a moment when it became undeniable that he was the man who killed his father and married his mother. In that transitional moment, Oedipus affirms two incompatible states of affairs: that (1) *he could not possibly be his wife's son* and yet nonetheless that (2) *he did indeed marry his mother*.[5] And also, at this moment in the tale, Oedipus undergoes an instantaneous alteration, an intense moment of becoming, changing from great king to blind vagrant. Just as his both being the son and not the son of Jocasta are simultaneously affirmed in the moment of transition, so too is his being both the king and an exile of Thebes. The logic of affirmative synthetic disjunction, then, allows for the coincidence of 'before' and 'after' in pure becoming.

III. The Second Synthesis of Time

Mementos can cause our minds to 'flash back' to an earlier time. These moments, which have fallen away to the past, appear now to our current awareness. And yet we do not mistake them for the present; in fact, we might even be charmed or perhaps shocked by how different things once were. What we notice, then, is not merely the past state of affairs; we are aware as well of the temporal differences that make them so foreign to the present. Thus, flashbacks can serve as a fertile source for

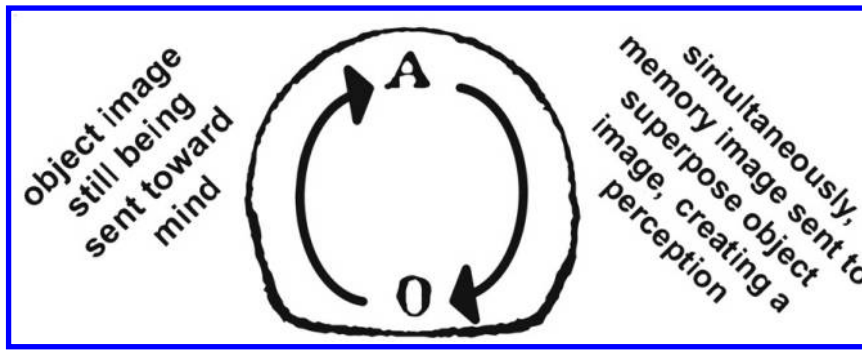

Figure 4. Innermost circuit of Bergson's memory circuit diagram. (Source: adapted from Bergson 1911: 128.)

the investigation of time as a phenomenon, that is, for when time *its very self* appears to our awareness. We now explore the way Deleuze explains Bergson's pure past through cinematic flashbacks. This will allow us to characterise the second synthesis of time in *Difference and Repetition* as being the 'then' of the past combined with the 'now' of the present; the intensive temporal difference between them is a phenomenon of time.

Deleuze turns our attention to Bergson's expanding circuits diagrams to help explain the contemporaneity of the past and the present in flashback recollections. Bergson first has us consider what he calls an 'after image' (*image consécutive*). It is always a part of our perception. We look at some object, then abruptly avert our gaze to another place. For a split second, the image of the initial object will carry into and overlay upon the new scene we see (Bergson 2001a: 125/105). The prior object remains in our field of perception, even though it is actually no longer there. Instead, it is virtually there. The virtual past image inserts itself so thoroughly into the new actual image that 'we are no longer able to discern what is perception and what is memory' (125/106). Perhaps this is why fast moving objects leave a blurry trail behind them. For example, as David Hume notes, when we rapidly swing around a burning coal in the dark, we perceive a full red circle (Hume 2007: 28). According to Bergson, just while the perceived image is sent to our brain, the most recent image in our memory has already arrived upon and overlaid our current perception, with both moving lightning fast in a continuous circuit (Figure 4) (Bergson 2001a: 127/107).

So when we are looking at something, already mixed into this perception are the remnants from the prior perception. This is the tight *O–A* circuit in Bergson's diagram. Keep in mind how time is

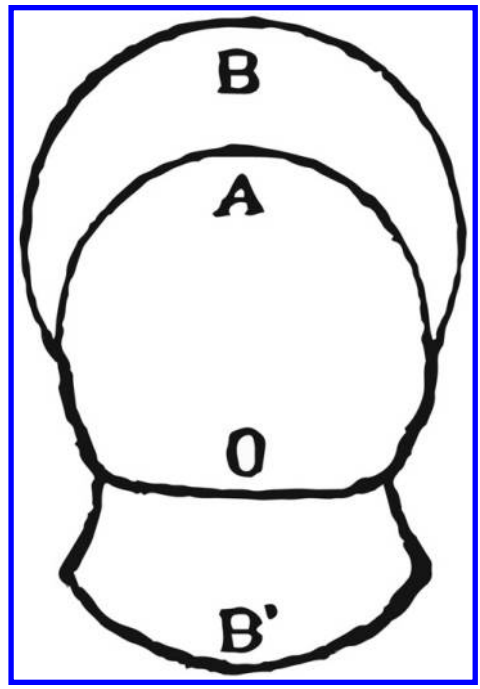

Figure 5. A successive memory-perception circuit. (Source: adapted from Bergson 1911: 128.)

ever-passing, so even if what we perceive seemingly remains unchanged, it will still differ from what we just saw. The flow of time leaves its mark on the prior image, giving it the character of having-passed (Bergson 1922: 2/2). A new *O–A* circuit always arises each instant of our perception, no matter how noticeable the variations are in what we see. But then, we might wonder, what happens to the even older images as the new ones continue entering our memory? Bergson says they get pushed out into wider and more encompassing circuits (Figure 5).

When we turn away our gaze, what was previously object *O* now becomes what we call past-object *B′*. (Former object *O* is not actually there, but it is a part of the past that is implied in what is actually present.) All the while, memory-image *A* has become what we now call memory-image *B*, which corresponds to the past-object *B′* that it is an image of. This is all because a new object *O* and its new memory *A* have entered our perceptual awareness. But note how in the diagram, the wider *B* circuit channels into the new *O–A* circuit. This is because both the most recent memory-image and the *next* most recent one together

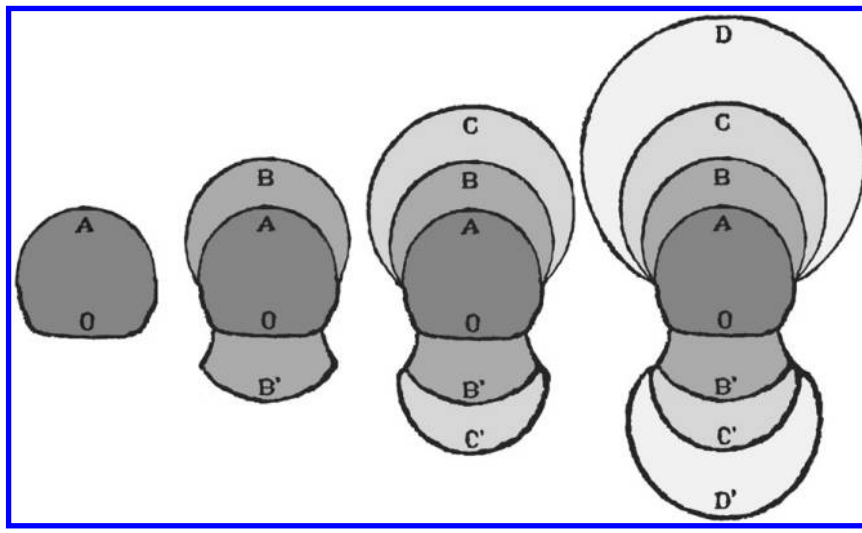

Figure 6. Growing memory-perception circuits. (Source: adapted from Bergson 1911: 128.)

overlay upon our field of perception, even though we might not notice the two. In a way, our older memories still keep contracting with the present, but only in an implicit manner. So even if the previous after-image is no longer vibrantly apparent to our perception, it still is helping to shape the way we see the current image. This is important for Bergson, because the whole of our past is at least implicitly superposed into our present experience. 'In truth', writes Bergson, 'every perception is already memory. *Practically we perceive only the past*, the pure present being the invisible progress of the past gnawing into the future' (Bergson 2001a: 194/163; original emphasis).

With this in mind, we might imagine how the circuits of our perception continue billowing outward as time passes on. The older circuits keep enlarging as our perception alters perpetually (Figure 6).

Yet even though all of our past is always interposed in the present in an implicit way, sometimes what we see causes one recollection to stand out more explicitly among the rest. Often we observe something in our daily life that causes certain prior memories to flare out before our 'mind's eye' (Figure 7). And sometimes our flashbacks can be so vivid that they drown out the actual things we see. We then begin to feel as though we are reliving that past experience.

Deleuze illustrates these recollection circuits with the cinematic flashbacks in Marcel Carné's movie *Daybreak* (*Le Jour se lève*, 1939)

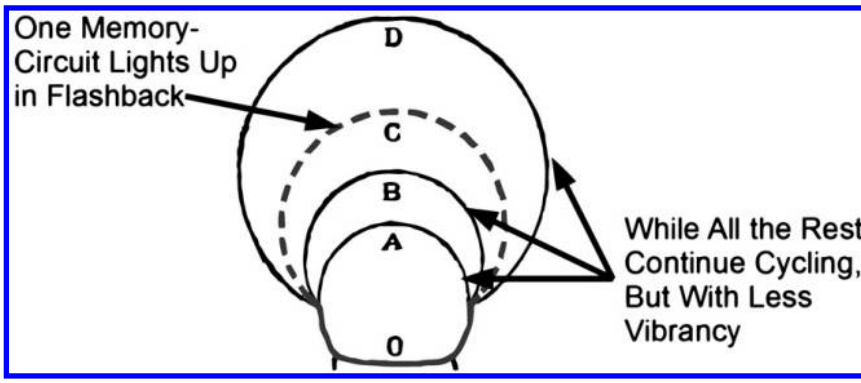

Figure 7. Flashback as not excluding other layers of memory. (Source: adapted from Bergson 1911: 128.)

(Deleuze 1989: 48/46/67–8). The film follows events happening from sundown to dawn. During this short period, a murderer flashes back into his past. The movie begins with a man being shot and falling down a flight of stairs in an apartment building. The murderer barricades himself in his room so that the police cannot force their way in. Throughout the night he has three flashbacks, each one triggered by some visual reminder. This first one takes us back to him meeting a young woman he falls in love with. This flashback loop draws us the deepest into the past, so it would correspond to one of the widest circles in Bergson's circuit diagram. But, whenever we return to the present, we hear a heavy doom-filled bass and drum beat. It gives us the feeling we are moving inevitably toward a fatal end. So during the flashbacks, the past is so vibrant that it completely covers over the actual present things standing before him in his room. As viewers, we only see what he is remembering and not the events still carrying on in the present while he dreams. But, because upon returning we hear that fatal march toward the end, we are reminded that even while reminiscing, we never escaped the current doomed situation. Throughout our own lives, we are always experiencing the combination of the past and present, no matter how attentive we are to the present or how vibrantly the past flashes into our mind. The events of the murderer's next flashback, then, continue after those of the prior one, so it is a smaller circuit closer to the current inner loop. Here we learn more about the rivalry he has with an older man over the young woman. When we return from this flashback, day breaks, and his building is surrounded by police and a crowd of spectators. He rages at them from his window high above, furious that they would treat him like a freak.

This outburst triggers him to recall his explosion of anger that led to the murder he just committed last night. In this final flashback, we now see him shoot the love rival in his room. The victim falls down the stairs, just as we saw when the film began. This is the tightest recollection circuit so far. It brings us to his final act, in the present: he shoots himself in the heart. In a way, this is like all the painful events of his life contracted into his current action.

Now, consider if we were to memorise a series of spoken lines for a play. Each time we practise it, we create a new individual memory. When it comes time to perform, we merely begin with the first word, and the rest seem to follow automatically, without our needing to recall any single rehearsal. All the previous times were contracted into that present moment of automatic habitual bodily performance. But after the show, someone might ask us about how we memorised the lines. Then we could relax and daydream about those moments, seeing them in their vivid detail (Bergson 2001a: 89–92/75–8).

Bergson illustrates this with his famous cone diagram. As new things enter our memory, they add to a cone (Bergson 2001a: 196–7/162–3). If we are acting automatically, like when performing something we rehearsed, then we are down closer to the *S* point. Being near this tip does not mean our memories have gone away. Rather, they are all contracted into our physical actions, like how a performance expresses physically all our memories of past recitals. When instead we daydream about the past, the images expand out in our minds, as during a flashback. In these moments, we reside at a higher layer of the cone. Always we are varying somewhere between automatic action and dreamful reflection, so we might be at any of the many possible layers of expansion or contraction of our memory (Figure 8) (Bergson 2001a: 210–12/176–8).

So during flashback scenes, the character's memory leaps up to a higher level. But during an action scene where she acts automatically, her memory is contracted into the present moment, down at the cone's tip. We are always changing level, varying 'melodically' between our intense physical engagement in the present moment and our drifting somewhere in dreamland (Deleuze 1994: 83–4/113–14). So the larger circuits are more distant memories, and the higher cone levels are increased degrees of expansion of one part of those memories.

The cone levels and the circuits are not equivalent, but we might place them in correspondence by noting that when moving to a distant circuit, we are also expanding our memories. To illustrate this, we first observe one of Deleuze's references: Bazin's explanation of Carné's flashback techniques. Bazin notes how in literature, action happening in the past

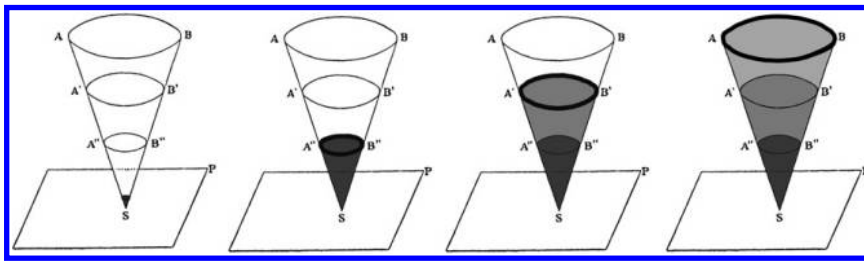

Figure 8. Varying layers of memory expansions that are contemporaneous with the present. (Source: adapted from Bergson 1911: 211.)

can be described by using past tenses of a verb. However, in film there is no easy way to clearly demarcate past and present events, especially ones happening in the same locations, because they will look about the same when projected on the screen. In *Daybreak*, for example, the hero has his final flashback while sitting in his room, and it takes him back to the events the day before also happening in that very place. The table – as it is there now – appeared about the same the day prior. So Carné must convince our eyes that the story is moving in and out of the past even though the scene looks nearly identical in both cases. Bazin observes that when a scene shifts between the present and the past events recalled in the mind of the hero, Carné uses an exceptionally long dissolve where the image of the previous scene fades out little by little so as to allow the next image to gradually fade into clarity. The dissolve has the effect of recreating the way we physiologically experience a transition to recollective daydream: our eyes become fixed, our pupils enlarge, and the images we see become blurred as our imagination grows more vibrant (Figure 9) (Bazin 1998: 78–80).

The other sort of flashback Deleuze discusses is Mankiewicz's 'forking' or 'bifurcation' (Deleuze 1989: 48–9/47/68). We noted before how incompossibility for Deleuze is prerequisite for an event to occur. In terms of forking, this means that events take place when they veer off down an unforeseen path, yet as we will see, this also means that at the moment of divergence, circumstances have multiple virtual tendencies of development that were incompossible with one another. Such forkings for Deleuze also correspond to a sort of flashback that unites past, present and future into a single instant. Thus, bifurcations not only introduce newness into our lives, they also are partly responsible for the continual coexistence of the 'before' and 'after' in our experiences. When there is an unforeseen forking, this event is momentous; it is memorable even while it is still happening. We can tell already that we

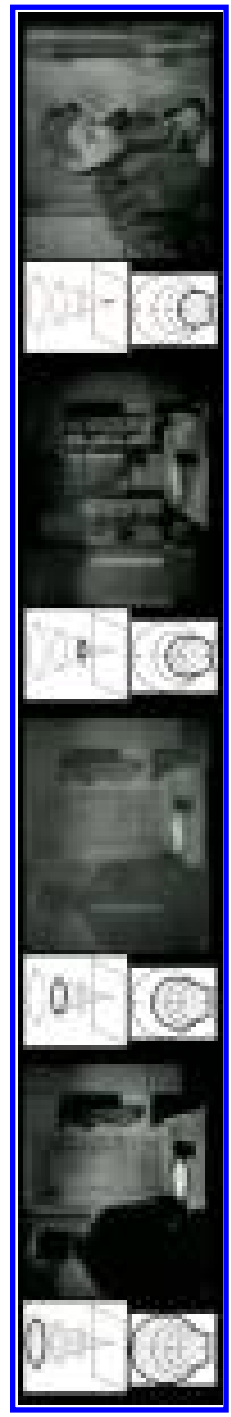

Figure 9. Transitioning vibrancy from flashback memory-images to perception-images in Carné's *Daybreak* (1939). (Source: images on the left of each still adapted from Bergson 1911: 128, 211.)

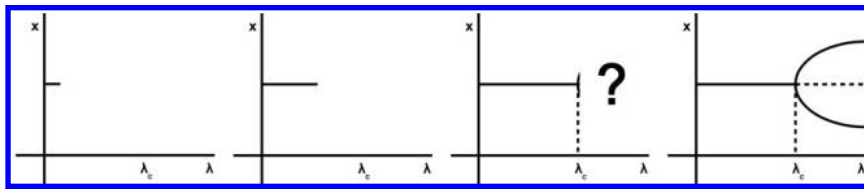

Figure 10. The indeterminacy of variation at a birfucation point. (Source: based on a figure in Prigogine and Stengers 1984: 161.)

will recall it often in the future. So from the beginning it appears to us as a memory for future recollections. But also, these events are momentous for another reason. They cause us to recall another event in the past, lighting up one of the various 'circuits' in our memory.

The two senses of bifurcation are tightly bound together. To illustrate, Deleuze refers us to a scientific model from Prigogine and Stengers's *Order Out of Chaos* (1984) (Deleuze 1989: 49/47/69). Imagine that we are running a faucet at a low enough level of flow that the water falls in a straight column. We then very gradually increase the flow until suddenly, when we reach a critical moment in the increase, the smooth column becomes chaotically turbulent. To further describe these sensitive transition points in complex systems, Prigogine and Stengers quote J. C. Maxwell:

> the system has the quantity of potential energy, [. . .] which cannot begin to be so transformed till the system has reached a certain configuration, to attain which requires an expenditure of work, which in certain cases may be infinitesimally small, and in general bears no definite proportion to the energy developed in consequence thereof. For example, [. . .] the little spark which kindles the great forest, the little word which sets the world a fighting, [. . .] the little spore which blights all the potatoes [. . .]. (Maxwell, quoted in Prigogine and Stengers 1984: 73)

But, there are systems that when reaching such a 'singular point' can develop in one of two different directions of qualitative evolution. For example, in certain chemical systems, if you increase one parameter, such as the concentration of one chemical, the system is pushed further and further away from a state of equilibrium. If pushed far enough, it reaches a 'bifurcation point' where, for instance, the spatial distribution of that chemical can follow one or another opposite path of configuration, with the choice being entirely unpredictable (Prigogine and Stengers 1984: 161–2) (Figure 10).

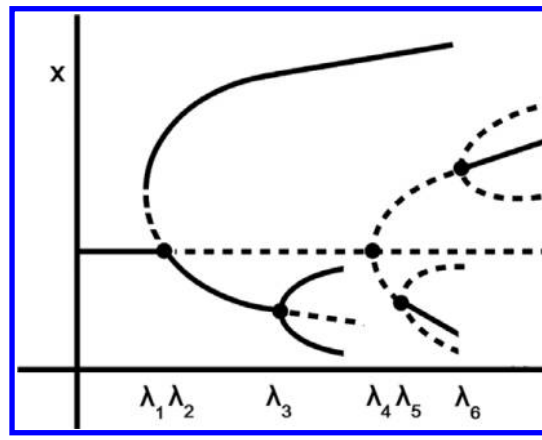

Figure 11. Multiple indeterminate branching variations. (Source: based on a figure in Prigogine and Stengers 1984: 170.)

In fact, in some complex systems, there can be bifurcations of bifurcations. As Deleuze writes, each of the forkings 'constantly split up any state of equilibrium and each time impose a new "meander", a new break in causality, which itself forks from the previous one, in a collection of non-linear relations' (Deleuze 1989: 49/47/69). Prigogine and Stengers explain that

> the 'historical' path along which the system evolves as the control parameter grows is characterized by a succession of stable regions, where deterministic laws dominate, and of instable ones, near the bifurcation points, where the system can 'choose' between or among more than one possible future. (Prigogine and Stengers 1984: 169–70) (Figure 11)

Deleuze further elaborates on the structure of simultaneously branching paths with Borges's short story, 'The Garden of Forking Paths' (1962) (Deleuze 1989: 49/47/68). It describes a Chinese monk's unfinished manuscripts for a novel with this same title. The novel went unpublished because it was incomprehensible. The chapters did not proceed just sequentially. A following chapter would be like an alternate version of the same prior one: 'in the third chapter the hero dies, in the fourth he is alive' (Borges 1962: 24). Each of these variations is like one of the possible paths the chemical system can choose; however, in the case of the novel, the story chooses all possible lines of development at the same time:

> 'the garden of forking paths' was the chaotic novel [...] forking in time, not in space. [...] In all fictional works, each time a man is confronted with several alternatives, he chooses one and eliminates the others; in the fiction of Ts'ui Pên, he chooses – simultaneously – all of them. *He creates*, in this way, diverse futures, diverse times which themselves also proliferate and fork. (Borges 1962: 26)

Thus:

> all possible outcomes occur; each one is the point of departure for other forkings. Sometimes, the paths of this labyrinth converge: for example, you arrive at this house, but in one of the possible pasts you are my enemy, in another, my friend. (Borges 1962: 26)

For this reason, the structure of the novel is

> an infinite series of times, [...] a growing, dizzying net of divergent, convergent and parallel times. This network of times which approached one another, forked, broke off, or were unaware of one another for centuries, embraces all possibilities of time. We do not exist in the majority of these times; in some you exist, and not I; in others I, and not you; in others, both of us. (Borges 1962: 28)

In Mankiewicz's *Barefoot Contessa* (1954), there is a remarkable scene that showcases both senses of bifurcation (the veering off into a new direction and the simultaneity of alternate lines of development) (Deleuze 1989: 49/47/68). The soon-to-be Contessa quite abruptly switches companions, taking her down a drastically different path. But this scene was remembered by two different people, each in their own way and with their own slight variations. Each recollection of the event occurs at a different time in the movie, and they have their own unique camera angles and divergent details, even though the dialogue is the same. What we note especially is the sudden instant of the slap, that crack in the flow of time, when the next moment is completely undetermined, entirely discontinuous with the present. But we also observe the simultaneous forking paths: in one recollection, the slapped man looks longer to the Contessa after the slap, while in the other case, he quickly looks to the Count (Figure 12). So there are two sorts of temporal simultaneity in that dramatic moment: (1) the Contessa's prior course and the new detour converge upon one another at the moment of the slap, bringing 'before' and 'after' together all at once; and also (2), there is a simultaneity of the different perspectival renditions of the same course of action.

Figure 12. Mankiewicz's *Barefoot Contessa* (1954). Top: the Count slaps the soon-to-be Contessa's current lover, causing a fork in the story's development; bottom: the subsequent deviation in the story is remembered with slight variations by different people (left and right).

Now, is it not also the case that when we recall the past, we often fill in missing details that we were previously unsure about, and in that way create bifurcations of the same remembered event? Each time we recall some incident, the recollection seems to vary slightly from the other times when we remembered it. If it were exactly the same with each recollection, then would it not be a sort of automatism on account of the boring redundancy? Perhaps these memories have the character of the past not merely because they differ from the present but also because each recollection differs from the others. That might suggest that when a memorable bifurcation occurs, implied in it are many virtual ways to recall it.

We will keep this in mind while examining another of Deleuze's examples of bifurcating time: Mankiewicz's *A Letter to Three Wives* (1949) (Deleuze 1989: 49/47/68). In this story, there are three married couples. All the husbands share a common female friend, Addie.

One day, she writes a letter to all three wives, which they read together. Addie explains she ran off with one of their husbands. However, she does not specify which man it is. The wives will be unable to find out until later that night when they see if their husband comes home to them. During that day, each wife reflects on her marriage, looking for what might have gone wrong in the past. So the unpredictable forking of receiving the surprising letter spurs each one to flash back to a moment in the past where their relationship seemed to take a turn (or fork) for the worse. A forking in the present, then, recalls a different forking in the past. In one case, a wife, new to her social circle, feels out of place. Then at a dinner event, she suddenly happens upon her husband and Addie chatting privately outside in the dark. We can see in the wife's face that she recognises even back then there is some implicit importance to this event, even though it is not yet evident. So, the present forking event of receiving the letter calls her mind back to the previous forking when she discovered her husband chatting outside in the dark with Addie. But then later in the story, she receives a message that seems to confirm her suspicions, although it is still ambiguous, and she makes that same facial expression again, linking all three moments together. Hence, the present bifurcation is not just a flashback; it also in a way is preparing itself for future recollections, by having implicit and indeterminate significances that might later unfold through another dually recollective and precollective forking. Thus, we see even further how bifurcational flashbacks render 'befores' simultaneous with 'afters' (Figure 13).

Yet, these cinematic examples show the union of *particular* past memories with actual present ones. The second synthesis of time, however, involves an even more basic simultaneity of 'before' and 'after'. But, first we need to observe the danger of seeing time as initially an event happening purely in the present, then secondly moving into the past. The problem is that the past itself has a temporal character that is different from that of the present. Seeing a past event merely as a former present is regarding the past as a modification or as a degree of the present. Yet, if the past and present are different in kind, then the past is not just a former presence; it has a temporal character all its own. *Daybreak* begins in the present, with the hero having just shot his love rival. At the end of the film, that same initial event is recalled with the moments just leading up to it. But throughout the movie, we come to see the hero's loving, calm and patient side. His murder, with all its violent passionate anger, loses its character of actual presence, as moments of calm humanity take its place. It is an act he cannot change, unlike how he is in control of his

Figure 13. A wife in Mankiewicz's *A Letter to Three Wives* (1949) experiences three bifurcational moments, the middle of which being dually both a recollection and a 'precollection'.

current actions, as for example his own willing decision to kill himself at the end. Present moments somehow become radically different sorts of moments in time, not as being 'less present' but as being something real that is recalled in the present as a moment completely different than the present one. The past has something relatively established about it, while the present is more indeterminate.

This poses two problems for explaining memory. One is that the present moment in a way disappears from presence, in that it ceases to be an influenceable and active present, and yet all the while it still exists in another form, with its own unique temporal character and traits that differ in kind and not in degree from the present in passage. So, it is not even a matter of the present fading away, becoming less of a present. The present becomes something it is not, the past. But how can this radical transition be explained if it is not a graduated continuous modification? Yet also, if there is exclusively the present that abruptly becomes past, then we have another similar difficulty in explaining memory. As a present moment goes deeper into the past, if the change is continuous, then it remains tied to the present moment it once was, because in a way, it still is that present, only in a diminished form. But if 'after' succeeds 'before' without any overlap or graduated change

between them, then passing moments have no actual connection to the present they once were. The murder at the beginning of *Daybreak* ceases to be. The viewer and hero are constantly living through a changing present. But, the ending recollection of the murder is presumably tied to a present that we experienced at the film's opening. So, how does the passing present maintain its recollective correspondence to the present it once was, if the transition is abrupt and the former present ceases to exist? According to Deleuze, Bergson's solution to these problems is the 'past in general' (*le passé en général*) (Deleuze 1991: 56–9/51–5; Deleuze 1994: 81–2/110–11). Bergson himself, however, does not frequently use this specific phrase. In one of the rare instances, Bergson writes:

> Whenever we are trying to recover a recollection [...] we detach ourselves from the present in order to replace ourselves, first in the *past in general*, then in a certain region of the past – a work of adjustment, something like the focusing of a camera. But our recollection still remains virtual [...]. Little by little it comes into view like a condensing cloud [...]. (Bergson 2001a: 171/148; my emphasis)

Deleuze and Deleuzian Bergsonists, according to Mathew Kelly, interpret this to mean that there is a general past that is coexistent with the present, as would be suggested by the cone diagram, and that present events have a dual character, being both past and present simultaneously (Kelly 2008: 20). It is important to broaden the analysis from the particular pasts as in the cinema examples to the 'past in general', because the second synthesis is not so much a process of actively overlaying past memories synthetically with present events; rather, the simultaneity of past and present is already inherent to the structure of our immediate temporalised consciousness. It is not just that a present moment passes into the past while its virtual memorial content remains in our consciousness. No moment, not even the first in our lives, is able to pass unless it did not already begin in the 'past in general'. So the general past is a prerequisite for the passage of the present:

> How would any present whatsoever pass, if it were not past *at the same time* as present? The past would never be constituted if it *had not been* constituted first of all, at the same time that it was present. [...] The past is 'contemporaneous' with the present that it *has been*. (Deleuze 1991: 58/54; original emphasis)

Or as Deleuze further puts it, past and present, 'before' and 'after', are 'crystallized' together. Bergson speaks of crystallisation when elaborating on his cone diagram, discussing the general idea, whose essence 'is to be unceasingly going backwards and forwards between

the plane of action and that of pure memory' (Bergson 2001a: 220/180). In the cone diagram, the general idea at point *S* 'would take the clearly defined form of a bodily attitude or of an uttered word', but at the top layer *AB*, 'it would wear the aspect, no less defined, of the thousand individual images into which its fragile unity would break up' (see again Figure 8) (220/180). Yet, the general idea does not remain fixed at either extremity; rather, it 'consists in the double current which goes from the one to the other,–always ready either to crystallize into uttered words or to evaporate into memories' (221/180). Here Bergson is not using 'crystallize' in exactly the same sense as Deleuze uses it. For Bergson, it refers to the condensation of memory down into current bodily expression. Yet, note that this crystallisation happens at the tip of the cone, at the immediacy of action, where the entirety of our memory makes direct contact with the present instant of our actual bodily activity. It is not that some memories are further up in the cone while others are found lower within it. Each layer has every memory; but in the higher cuts, the memories are more expanded into discrete images. Down at the tip, all memories are still being expressed, just none are regarded in their distinction from the others. This is like how when finally performing a practised piece, the musician's fingers do not express each prior recital individually; rather, the movements express all past enactments together at once in the present motion. Deleuze's crystallisation, then, is not so far off from Bergson's meaning of the term, because for Deleuze it is the intensely tight union of the 'past in general' with the immediate present. Deleuze also speaks of this interlocking of the past and present as being two contracted but divergent tendencies, like with Bergson's symmetrical jets of time. Bergson notes that 'the formation of memory is never posterior to the formation of perception; it is contemporaneous with it. Step by step, as perception is created, the memory of it is projected beside it, as the shadow falls beside the body' (Bergson 1920: 157/138). Memory, then, is 'twofold at every moment, its very up-rush being in two jets exactly symmetrical, one of which falls back towards the past whilst the other springs forward towards the future' (Bergson 1920: 160/140). To illustrate, Deleuze suggests his own diagram in *Cinema 2*: *The Time-Image* (Figure 14).

Deleuze writes that this fundamental operation of time is what constitutes the crystal-image:

> since the past is constituted not after the present that it was but at the same time, time has to split itself in two at each moment as present and past, which differ from each other in nature, or, what amounts to the same thing, it has to split the present in two heterogeneous directions, one of which is launched towards the future while the other falls into the past. Time has to split at the

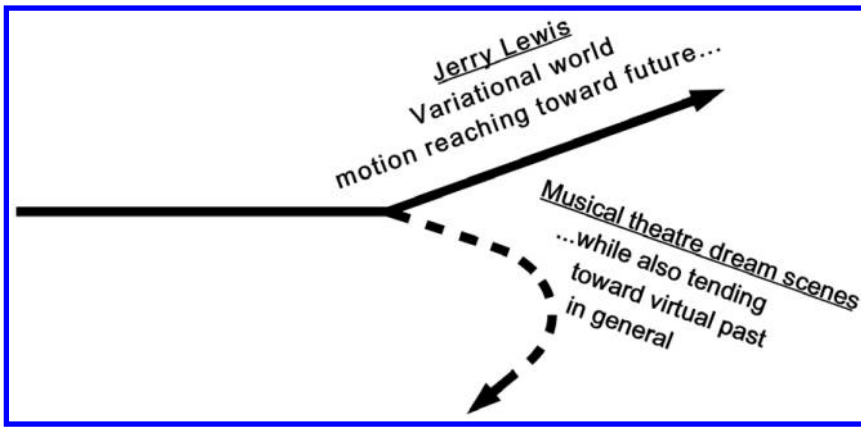

Figure 14. Deleuze's diagram for Bergson's double jets of time, with additional description. (Source: based on a figure in Deleuze 1989: 295/285/109.)

> same time as it sets itself out or unrolls itself: it splits in two dissymmetrical jets, one of which makes all the present pass on, while the other preserves all the past. Time consists of this split, and it is this, it is time, that we *see in the crystal*. [. . .] We see in the crystal the perpetual foundation of time, non-chronological time [. . .]. (Deleuze 1989: 81/79/108–9; original emphasis)

Thus, the present moment immediately *self-distinguishes* itself:

> What we see in the crystal is therefore a dividing in two that the crystal itself constantly causes to turn on itself, that it prevents from reaching completion, because it is a perpetual *self-distinguishing*, a distinction in the process of being produced; which always resumes the distinct terms in itself, in order constantly to relaunch them. (Deleuze 1989: 81–2/79/109; original emphasis)

This self-distinguishing will be important later when we examine Kamler's *Chronopolis* (1983). For now, we note Bergson's example of 'paramnesia' or déjà vu, the illusion of already having been there. As well in this description we find his other rare usage of 'past in general', for he writes that in such a 'false recognition' of paramnesia, 'the illusory memory is never localized in a particular point of the past; it dwells in an indeterminate past, the past in general' (Bergson 1920: 137/119). Deleuze emphasises here that because déjà vu is both a recollection of a presumed past but also a direct perception of the present, 'there is *a recollection of the present*, contemporaneous with the present itself' (Deleuze 1989: 79/77/106; my emphasis). Deleuze then refers us to a number of filmed musicals with dream sequences that resemble déjà vu-like recollections. These 'memories' do not recall real events in the past,

Figure 15. The dreamlike 'past in general'. Left: Minnelli's *Yolanda and the Thief* (1945); right: Minnelli's *The Band Wagon* (1953).

but rather they merely have the feeling of the past as if given presently, although in a dream-like way. The colours are vibrantly bright yet with a pastel softening; and while the scenes depicted are fantastical, they, like dreams, vaguely and indirectly play out the dramatic tensions going on during that part of the story's progress. We see this, for example, in Minnelli's *Yolanda and the Thief* (1945) and *The Band Wagon* (1953) (Figure 15). This unspecified past in the dream scenes, then, illustrates the present memorial facet of Bergson's 'past in general'.

But, if the present moment is unique from the past, then duration also involves injections of radical difference and newness into present action. To help us conceptualise this, Deleuze refers to scenes in works by comedic performer, actor and director Jerry Lewis, where the chaotic forces of variation reverberate through his body and the world around him (Deleuze 1989: 65–6/62–3/88–90). These forceful energies produce new phenomenal data that push duration forward by infusing it with waves of original differential content. Consider, for example, how Lewis's body spasmodically collides with a malfunctioning, catastrophic world around him in *Who's Minding the Store?* (1963), *The Patsy* (1964) and *It's Only Money* (1962) (Figure 16).

Recall how the present instant is always in a state of self-distinction: it is both the moment that it is tending to become while also being the moment that is right on the verge of passing away. Now consider Deleuze's analysis of the creation of temporality in a Polish animated film: 'In [. . .] *Chronopolis*, Piotr Kamler *fashioned* time out of two elements, small balls manipulated with pointed instruments, and supple sheets covering the balls. The two elements formed moments' (Deleuze 1989: 105/101–2/137–8; original emphasis). Notice he speaks here of forming moments, and not a flow of time, and also not an extending

Figure 16. Jerry Lewis and catastrophic world variation. Top: Tashlin's *Who's Minding the Store?* (1963); middle: Lewis's *The Patsy* (1964); bottom: Tashlin's *It's Only Money* (1962).

passage of time. When the two elements make contact, some new variation results in the sheets of clay. The figure, with each contact, becomes something different (Figure 17). But, it does so by changing from what it already was. What it was, and what it is becoming – its 'before' and its 'after' – coincide with each moment of contact, because the figures always seem to be in-between different and unique formations.

The portrayal of time in this scene is not the extending and flowing passage of duration through which the changes happen, like how each frame of the movie-film blurs together with its neighbours. Each moment is a variation; all are bifurcations, because not everything in each moment is explicitly predictable in the prior one. Synthesis is found completely in each single frame alone, where the 'before' is being synthesised simultaneously with its 'after'. So even though there is a steady flow of alteration throughout this sequence, in any one created moment, there is already the temporality of becoming.

Deleuze also offers Ozu's 'still life' scenes as examples of images of the pure form of time:

> The vase in *Late Spring* is interposed between the daughter's half smile and the beginning of her tears. There is becoming, change, passage. But the form of what changes does not itself change, does not pass on. This is time, time itself, 'a little time in its pure state' [...] The still life is time, for everything that changes is in time, but time does not itself change [...] Ozu's still lifes endure, have a duration, over ten seconds of the vase: this duration of the vase is precisely the representation of that which endures, through the succession of changing states. A bicycle may also [...] represent the unchanging form of that which moves, so long as it is at rest, motionless, stood against the wall [...]. The bicycle, the vase and the still lifes are the pure and direct images of time. (Deleuze 1989: 17/16–17/27–8)

The daughter has been reluctant to marry, because this would leave her widowed father all alone, creating too much drastic change in both his and her lives. Yet in this scene, she consents to her father's wishes, and decides in fact that she will marry. However, at that moment of her decision, Ozu shows the still life scene of the vase. This grand climactic moment of the film's narrative is substituted by a pure visual stillness. We feel an intense dramatic change while perceiving a motionless image. The actual events coming before and after are not present in the still life, but they are both implied in the same still image, because this transition point in the story marks the most drastically different 'before' and 'after'. We feel in this moment the coincidence of before and after in their motionless simultaneity (Figure 18).

Figure 17. 'Before' collides each moment with 'after' as ball-tipped sticks mutate sheets of clay in Kamler's *Chronopolis* (1983).

Figure 18. A daughter makes a life-changing decision, but at the peak the drama, Ozu shows a still life image of a vase, in his *Late Spring* (1949).

IV. Conclusion

So contrary to time as an extending process in motion, we have instead a still image of time. James Williams's process interpretation was able to explain the second synthesis of time, Bergson's pure past, as it is in *Difference and Repetition*, but not as it is in *Cinema 2: The Time-Image*, where time is evidently a matter of instantaneity and simultaneity. For Williams the problem is that the cinema books 'fall short of a satisfactory rendition of Deleuze's philosophy of time', and so we should not consider them as a principle source when accounting for Deleuze's notion of temporality (Williams 2011: 161, 163). What we instead propose here is that the process reading alone provides an unsatisfactory account of Deleuze's philosophy of time, because it is unable to bring together Deleuze's major writings on temporality, and also it does not do justice to their phenomenological value. And Deleuze, a life-long cinephile, tells us that when studying philosophy, cinema was a major part of his intellectual endeavours: 'after the war, I started going to the movies again, but this time I was a philosophy student. [. . .] It was not a matter of applying philosophy to cinema. I just went straight from philosophy to cinema and back again' (Deleuze 2006: 283–4/263–4).[6] So, would we be surprised if throughout his life Deleuze developed his ideas on temporality while he watched and studied films, and only later in his career devoted entire books to the art form?[7] There seems to be reason enough to regard Deleuze's *Cinema 2: The Time-Image* as a core resource for investigating his theory of time. And as we have seen, it is in this text that Deleuze gives a 'buggered' reading of Bergson's duration. Deleuze saw his task of reading texts in the history of philosophy as interpreting them in such a way that they give birth to 'monstrous' offspring that are really the product of that philosopher's thought, while at the same time being in some way alien to it (Deleuze 1995: 6/15). In the case of his reading of Bergson, Deleuze uncovers a sort of temporality that is fully given even before there is the motion of succession. Because Deleuze refers us to specific cinema scenes, we can actively experience the collisions of images that give us impressions of still temporality. Also, because we are given these impressions, Deleuze's explication of motionless time is of particular interest to phenomenological analyses. In Carné's *Daybreak*, when the hero returns from a flashback, images of the past collide with those of the present, and the tensions between them give us the viewers the impression of the time in-between. This is time given to our awareness as a phenomenon. And Deleuze provides the theoretical

material for concrete analyses of this sort of motionless time that is intensive, rather than flowing and extensive. Thus, phenomenology could expand its analyses of time consciousness to include a different sort of temporal phenomenon, if it takes note of Deleuze's writings on cinema.

Notes

1. For Husserl's analyses of the consciousness of the flowing succession of time, see for example the lectures from the year 1905 in Husserl 1991/1966a: §§ 7–45 and from this text's Supplement, paragraphs 1–52, 56–7, 239, 252–3, 257–63, 272–4, 313–25. The continuous running-off of retentions – along with the horizontal integration of retentions, intentions and protentions – constitutes time-consciousness in its unbroken flow. For more on the passive synthesis of moments of our awareness combined on the basis of associating similarities, which constitutes the continuity of the flow of phenomena, see Husserl 1974: 370–8; 1966b: 1–35, 65–78, 117–48; 2001: 27–72, 106–21, 162–95. Merleau-Ponty builds from Husserl's horizontal integration model of time-consciousness and characterises the flow of phenomenal time as a thrust of 'transition synthesis' (*synthèse de transition*/*Übergangssynthesis*): 'there is time as [. . .] a fountain: the water changes while the fountain remains [. . .]; each successive wave takes over the functions of its predecessor: from being the thrusting wave in relation to the one in front of it, it becomes, in its turn and in relation to another, the wave that is pushed; [. . .] from the source to the fountain jet, the waves are not separate; there is only one thrust . . .]. Hence the justification for the metaphor of the river' (Merleau-Ponty 1958: 489–90/484).
2. In parenthetical citations, the pages for the English version are given first and the French second, with the exception of Deleuze's *Cinema 2: The Time-Image*, where we give the first English edition first, the second English edition second and the French edition third.
3. The first and second chapters of Simon Duffy's *The Logic of Expression: Quality, Quantity and Intensity in Spinoza, Hegel and Deleuze* (2006) give an excellent, detailed account of Deleuze's calculus reading of Spinoza's 12th Letter.
4. The prime-markings for the *A*s are based on the French transcription by Denis Lemarchand at *La Voix de Gilles Deleuze en ligne* (< http://univ-paris8.fr >) rather than on the one at < http://webdeleuze.com > . See either the *Gallica bibliothèque numérique* (< http://gallica.bnf.fr >) or the *Voix de Gilles Deleuze* recordings, part 2, at around 07.50 minutes.
5. In his *Metalogical Theory of Reference: Realism and Essentialism in Semantics*, Roger Vergauwen offers a formulation of this example. Consider the following inference (1) Oedipus wants to marry Jocasta, (2) Jocasta is the mother of Oedipus, thus (3) Oedipus wants to marry his mother. If we only look at the extensional meanings, the 'normal' denotations of the expressions, this is a valid inference. But, if we consider the intensional meanings that are more context dependent, this is not a valid inference (Vergauwen 1993: 27–8).
6. Michel Ciment describes Deleuze as being a cinephile already in 1956 (Dosse 2010: 105–6).
7. This idea along with numerous others in this article (for example, time as difference, and the non-redundancy of recollection) are the contributions of Roland Breeur of the University of Leuven, Belgium.

Beyond Figuration and Narration: Deleuzian Approaches to Gwen John's Paintings

Maria Tamboukou University of East London

Abstract

In this paper I trace pictorial acts that move beyond figuration and narration, particularly focusing on Gwen John's portraits of women and girls, the work of her maturity as an artist. In doing this I make connections between John's and Cézanne's letters about their painting techniques and direction. The analysis draws on Deleuze and Guattari's approaches to the work of art. I discuss in particular the concept of faciality in the *Thousand Plateaus* and the problem of painting forces in Deleuze's work on Bacon, *The Logic of Sensation*. My argument is that an analysis that goes beyond phenomenology and semiotics opens new ways of seeing and appreciating a modernist woman artist's paintings, and sheds new light on the way her art allows the female figure to emerge as a woman-becoming-imperceptible within a patriarchal regime of signs.

Keywords: Gwen John, Cézanne, faciality, colourism, rhythm, form, painting forces, becoming-imperceptible

> I learnt so much at those two visits. I didn't know how much till now. Some things I had found out but it was satisfactory to have them confirmed and expressed well. For instance, I said 'a cat or a man, it's the same thing', you looked rather surprised. I meant it's an affair of volumes.

at the Slade, Ursula Tyrwhitt, a letter containing a significant albeit strange statement: "'a cat or a man, it's the same thing" [. . .] it's an affair of volumes'. This epistolary extract concentrates in a rather radical and provocative way the artist's ideas around art in general and painting techniques in particular: although John's work was mainly revolving around portraits of women and young girls, her art moved beyond the conventions and constraints of figurative painting. In this paper I trace pictorial acts that move beyond figuration and narration, particularly focusing on John's portraits of women and girls, the work of her maturity as an artist. In doing this, I follow approaches to the work of art informed by Deleuze and Guattari's philosophies. My argument is that an analysis that goes beyond phenomenology and semiotics opens new ways of seeing and appreciating a modernist woman artist's paintings and can shed new light on the way her art allows the female figure to emerge as a woman-becoming-imperceptible within a patriarchal regime of signs.

I. Portraits and Faces

Gwen John was mostly a portrait painter although she also did some still lives, landscapes and in the early phases of her work she drew and painted her cat a lot.[2] Since the early phases of the appraisal of her work, John's portraits have been discussed 'as of feminine gentleness, delicacy and refinement . . . a world of pale spinster passions . . . modest paintings of lone women in domestic interiors' (Tickner 2004: 31–2). John's lonely figures have further invoked strong affects and enthusiastic critical responses; what is recurring in the range of critical appreciations of John's work is the centrality of the face in the discussions that revolve around her portraits. But the face is also central in Deleuze and Guattari's analyses; as Ronald Bogue has noted: 'the human face [is] a key component not only in painting but in the functioning of language and sign systems, the formation of subjectivity and the deployment of power relations' (Bogue 2003: 79).

Bogue discusses language in the context of what Deleuze and Guattari have theorised as 'regimes of signs' (Deleuze and Guattari 1988), wherein body and language are interrelated and thus 'the configuration of the face is inextricably tied to the evolution of the voice' (Bogue 2003: 81). Moreover, language is not seen within the structuralist frame of Saussurean linguistics 'as a self-referential system of acoustic images (signifiers) and mental concepts (signifieds)' (Bogue 2003: 82). For Deleuze and Guattari, language is considered as action and is

charted within larger socio-historical and cultural networks, multi-levelled assemblages of actions:

> We call any specific formalization of expression a regime of signs, at least when the expression is linguistic. A regime of signs constitutes a semiotic system. But it appears difficult to analyse semiotic systems in themselves: there is always a form of content that is simultaneously inseparable from and independent of the form of expression and the two forms pertain to assemblages that are not principally linguistic. (Deleuze and Guattari 1988: 111)

What is the role of the face then within the polyvalent regimes of signs? According to Deleuze and Guattari, the face is central in a process, which they call *faciality*: 'the face crystallises all redundancies, it emits and receives, releases and recaptures signifying signs … the face is the Icon proper to the signifying regime' (Deleuze and Guattari 1988: 115). *Faciality* is then a material process, '[reigning] over that whole constellation of significances and interpretations' (115). *Faciality* further depends on the specific regime of signs it is related to. In Deleuze and Guattari's (1988) analyses there are four semiotic systems or regimes of signs: (1) a presignifying primitive regime; (2) a signifying despotic regime; (3) a postsignifying passional regime; and (4) a countersignifying nomadic regime.[3] These historically conditioned systems have their own principles and characteristics, although they always overlap and interact with each other. The role of the face is crucial within the despotic and the passional regime, but not important in the primitive regime, while the face in the nomadic regime is not really elaborated. In his commentary of the despotic regime, Bogue gives a comprehensive outline of its properties and constitutive elements:

> The biunivocal correlation of signifier and signified, the dominance of the arbitrary signifier over the signified, the identification of the signifier with law and authority … the positioning of signifiers in an infinite chain of self-referential interpretation—all are characteristics of the despotic regime [ultimately associated] with the state form of social organisation. (Bogue 2003: 83)

While 'the despot becomes the unifying source of all signification' (Bogue 2003: 84), there is no central organisation in the passional regime; signs are rather organised 'in relation to an obsessional point of subjectification, an object of fixation from which issue two forms of the subject: the subject of enunciation [the one who speaks] and the subject of the statement [the one who is spoken of]' (Bogue 2003: 84). In this light, the face that is most interesting for Deleuze and Guattari's analyses

is the face that is effectuated by both the despotic and the passional regime, the face 'that brings together a despotic wall of interconnected signifiers and passional black holes of subjective absorption' (Bogue 2003: 90), what Deleuze and Guattari call the *white wall–black hole system* (Deleuze and Guattari 1988: 167).

Indeed, Deleuze and Guattari stress the way language and faces are inextricably linked, and point to the multifarious ways that faces visualise and sustain 'arborescences and dichotomies' (Deleuze and Guattari 1988: 179). What is therefore distinctive about Deleuze and Guattari's approach is the way they link facial expressions to the function of the disciplinary society, particularly stressing the role of the face in processes of subjectification. While charting the codification of the face, Deleuze and Guattari have also considered *lines of flight*: 'how do you get out of the black hole? How do you break through the wall? How do you dismantle the face?' (186). Dismantling the face, becoming imperceptible through colour, flying away towards the realm of the faceless, this is then 'the problem' of painting for Deleuze and Guattari. But, how can you deterritorialise the face when painting portraits? The painter can do that, Deleuze argues, by liberating lines and colours on her canvas (Deleuze 2003: 52).[4] Cézanne, upon whom Deleuze draws, has emphasised the function of lines and colours in painting:

> Lines parallel to the horizon give breadth … lines perpendicular to the horizon give depth. But nature for us [men] is more depth than surface, whence the need to introduce into our light vibrations, represented by the reds and yellows, a sufficient amount of blueness to give the feel of air.[5]

Liberating lines or colours thus becomes crucial: 'it is through colour that you become imperceptible' (Deleuze 2003: 187). Deleuze's work on Bacon has taken this proposition further and it is to artistic actions of dismantling the face and becoming imperceptible through the modulation of colour that I have focused my analysis on John's portraits. Having discussed faces and the concept of faciality in Deleuze and Guattari's vocabulary, my second move will now be to clarify the distinction between the figurative and the figural in Deleuze's thought.

II. On the Figure and the Motif

Deleuze discusses the problem of the figure drawing on Jean-François Lyotard's concept of the *figural*, noting in a footnote how Lyotard uses it 'as a substantive in order to oppose it to the figurative' (Deleuze 2003: 173). Deleuze's footnote is the only reference to Lyotard in his book

on Bacon, since there are differences between his and Lyotard's take on the notion of the figural: while Lyotard makes connections between the figural and the unconscious, Deleuze 'relates the figural to sensation, affect and the play of material forces' (Bogue 2003: 116). Although Bogue acknowledges and discusses these differences, he nevertheless argues that Lyotard's notion is important in understanding Deleuze's analysis.

In Lyotard's (1971) exposition of the concept then, 'language points to a world outside itself and thereby opens itself to the visual' (Bogue 2003: 113). But how can the 'truth' of the visual be disclosed? If it becomes readable and enters the order of language, then its truth is lost. It is only in the event[6] that its truth can emerge; as an event, the figural disrupts temporal and spatial orders and creates conditions of possibility 'for the essential heterogeneity of the visual field [to be] approached' (Lyotard cited in Bogue 2003: 114).

Andrew Gibson has further noted that 'the figural' in Lyotard's thought is an energetic and transgressive force, which violates the rules of discourse, refuses to respect the laws of its invariants and its spacings, and cannot be accommodated within any account of pure forms (Gibson 1996: 61).

Genealogical approaches to the history of painting in general and of portraiture in particular have indeed unveiled significant *events* in the process of artistic creation and reception.[7] More specifically, Cézanne's and Bacon's work have been considered in Deleuze's analysis as critical events in artistic practices of dismantling the face, going beyond the boundaries of illustrative and narrative art and introducing new ideas and techniques in the modulation of colour. In this genealogical line then, John's paintings and particularly her self-portraits and portraits of women will be seen as events in the visualisation of the female figure in its Deleuzian conceptualisation, as a bloc of sensations, affects and percepts, a theme that I will now follow.

In discussing the figural, Lyotard has suggested that 'to learn to see is to unlearn to recognise' (Lyotard 1971: 114). How can painting contribute to this process of *unlearning*? Since the figural is not connected to the unconscious for Deleuze, his suggestion is embedded within the material assemblage of painting practices:

> The Painter has many things in [his] head, or around him, or in his studio. Now everything he has in his head or around him is already in the canvas, more or less virtually, more or less actually, before he begins his work. They are all present in the canvas as so many images, actual or virtual, so that

> the painter does not have to cover a blank surface, but rather would have to empty it out, clear it, clean it. (Deleuze 2003: 86)

For Deleuze, therefore, 'the painter's problem is not how to enter into the canvas, since [he] is already there, but how to get out of it, getting out of clichés, getting out of probability' (Deleuze 2003: 96). Escaping clichés, following lines of flight, create conditions of possibility for the work of art to emerge as 'a bloc of sensations … a compound of percepts and affects … a monument standing up alone' (Deleuze and Guattari 1994: 164). But once the painter has deterritorialised herself from the striated spaces of the canvas, she still needs to return to it, open up smooth spaces and confront the chaos of the world and the infinity of time through creation. 'Perhaps the peculiarity of art is to pass through the finite in order to rediscover, to restore the infinite', Deleuze and Guattari have poetically noted (Deleuze and Guattari 1994: 197). Here, Cézanne's ideas of grasping the moment through painting, opens up a plane of new possibilities: 'A minute of the world goes by. To paint it in its reality! And to forget everything else. To become reality itself' (in Doran 2001: 115). Indeed, Cézanne's idea of 'becoming the minute' is at the heart of Deleuze and Guattari's discussion of the work of art as a compound of sensations, percepts, affects and becomings:

> It is Mrs Dalloway who perceives the town—but because she has passed into the town like 'a knife through everything' and becomes imperceptible herself. *Affects are precisely the nonhuman becomings of man, just as percepts*—including the town—are *non human landscapes of nature*. (Deleuze and Guattari 1994: 169; original emphasis)

But 'to become with the world' (Deleuze and Guattari 1994: 169), painters have to overcome the prejudices, biases and clichés they were nurtured with and face the world and their canvas with fresh eyes and clear minds. Only then, Cézanne argues, can the artist become 'a receptacle of sensations' (in Doran 2001: 111) and can render her mind 'a photographic plate' where the evanescent forces of nature can be recorded and transferred to, 'translated' into the canvas. What is interesting in Cézanne's urge above is the importance of 'forgetting' as a precondition for painting the reality of the fleeting moment.

'Memory plays a small part in art', Deleuze and Guattari have notably argued (Deleuze and Guattari 1994: 167). This anti-memory stance may seem to contradict their idea that the work of art should be conceived as a monument, standing up alone (164). But the monument in Deleuze and Guattari's discussion of art 'is not something commemorating a past, it is a bloc of present sensations that owe their preservation only

to themselves … the monument's action is not memory but fabulation' (168) they write, further explaining that 'creative fabulation has nothing to do with a memory … or with a fantasy' (171).

Fabulation is thus conceived as a creative process through which the artist frees life by recurrent interventions, artistic practices that throw light on the virtual elements and possibilities that surround and condition what has been actualised, 'those visions fixed in time and space', or what Giacometti calls styles (Deleuze and Guattari 1994: 171). Virginia Woolf's literary modalities of expanding a moment into duration can easily be transferred from the plane of writing to the plane of painting, Deleuze and Guattari argue (172), through the channels of creative fabulation.

But here the question arises: how can the artist 'create the syntactical or plastic methods and materials necessary' for creative fabulation? (Deleuze and Guattari 1994: 173–4). If sensations, percepts and affects go beyond consciousness, feelings and memories, exceeding the actual, the lived, the narrated and the remembered, how can they be possibly expressed on the canvas without being dependent on a subject who feels and thinks, or rendered into referents of a symbolic object? How can a painter create a landscape that sees, or a portrait as a percept in the absence of woman? How could the mirror exist without the old woman it reflects?[8] Deleuze notes that the opposition of the figure to the figurative is indeed a very subtle and precarious process. How can pure figures emerge in the canvas without having been contaminated by and restricted within the limitations and constraints of 'academic concerns' and figurative clichés, without having been facialised by despotic and passional regimes of signs?

This is indeed a difficult process, passing through a series of stages that Deleuze carefully delineates. The painter is first trying to clean her head and her canvas from figurative givens and clichés, what Deleuze calls the 'prepictorial figuration'; then she goes through 'the second figuration' when she tries to reconstitute the figure through the pictorial act (Deleuze 2003: 97). There is a thus a fort/da movement in painting: in her first encounter with the canvas, the painter has to step back, clean the canvas and her head, prepare her brain to become, according to Cézanne, 'a recording device, a receptacle of sensations' (in Doran 2001: 111); then she has to become attentive to her image, surrender herself to it, stop thinking and try to see, meditate. Only then will she become able to reconstitute a visual whole, 'a motif' for Cézanne or 'a diagram of forces' for Deleuze out of which a non-figurative figure might emerge. In Cézanne's thought, having a motif is indeed a crucial condition for art

'to be realised' (in Doran 2001: 112). But what is a motif? The motif is a pictorial assemblage of sensations and becomings, the appearance in art of all the changes that continuously happen in the world and which we so often fail to notice. In Cézanne's poetics:

> There must not be even one loose stitch, a gap where emotion, light and truth can escape. Try to understand, I guide my entire painting together all the time. I bring together all the scattered elements with the same energy and the same faith. Everything we see is fleeting, isn't it? Nature is always the same, but nothing about her that we see endures. Our art must convey a glimmer of her endurance with the elements, the appearance of all her changes. It must give us the sense of her eternity. (in Doran 2001: 110)

When Cézanne talks about Nature, he includes, of course, human nature, 'the nature which is out there … and the nature which is in here' (in Doran 2001: 111). The motif is essential whether an artist paints a landscape or a portrait and in attaining her motif, the artist should strive to find harmony: 'we should find general harmony, like that expressed by colours' (in Doran 2001: 112). There is an exquisite moment in Cézanne's discourse on the idea of the motif – a sense of being bathed in colour while painting a portrait – that is reminiscent of John's monochromatic portraits of women:

> Well, when I was painting *Vieille au chapelet* (Old Woman with a Rosary), I saw a tone of Flaubert, an atmosphere, something indefinable, a bluish and russet colour, which emanated, it seemed to me from *Madam Bovary*. In vain I tried reading Apuleius to chase away the obsession, which I feared would be too literary and would hurt my painting. Nothing worked. This great-bluish-red aura descended over me and sang in my soul. I was completely bathed in it. (in Doran 2001: 112)

Maybe when John was painting her own *Young Woman Holding a Rosary*[9] she might have felt being bathed in a blend of grey colours and tones that we can see in this painting as well as in the other three virtually identical paintings: *The Pilgrim*,[10] *Young Woman in a Grey Cloak*[11] and *Woman with Cloak*.[12] Bathed in grey, like her portraits, John must have felt safely confirmed as an artist since, according to Cézanne, 'if a painter has never painted grey, he is not a painter' (in Doran 2001: 118). This feeling must have been reinforced by the enthusiastic letter of her Slade friend Michel Salaman who wrote to her in 1926 about the *Pilgrim*:

> the you I hold tight to is the you of over twenty years ago and I suppose a different being to the one I am writing to; yet not entirely for I have your picture and there is so much of the Gwen I know in it that I love having it and want more. (cited in Langdale 1987: 165)

Cézanne's fear for his painting 'not to be hurt', as expressed above, is also exemplary of the precariousness of moving beyond 'the figurative' that Deleuze's analysis has identified. How can the artist go through this narrow gorge, create conditions of possibility for pure 'figures' to emerge, and what would a move beyond 'the figurative' and the narrative entail? Lyotard (1971) addresses this question by delineating 'two ontologically distinct spaces: a textual space of recognisable coded entities and a figural space of metamorphosing unconscious forces' (cited in Bogue 2003: 115). The figural can thus have various manifestations, but Lyotard chooses Cézanne's paintings as an exemplar of the materialisation of the figural in painting. In doing so, he particularly points out how the Cézannean landscapes disrupt the homogeneity of space and raise an aesthetic awareness of the loss of visible unity. In this context Cézanne's landscapes become events for the manifestation of the figural.

Lyotard is further attentive to the form–figural relation: the figural traverses form without destroying it, but rather it opens form to its other (Gibson 1996: 62). Cézanne has lucidly grounded this rather abstract statement in reflecting on what the art of painting should grasp:

> I mean that in this orange I am peeling, in an apple, a ball, a head, there is a culminating point, you see, and this point, in spite of terrible effects of light, shadow, colour sensations, is always the closest to our eye. The edges of objects fade towards another point on the horizon.[13]

The form of a subject or an object is therefore retained if it can be presented and seen in a single colour: 'in order to paint in the essence of the world, the vast world, one has to have the eyes of a painter who, in a single colour, sees the object, seizes it and relates it to other objects within [himself]' (Cézanne in Doran 2001: 121). Taking this proposition in John's paintings again, it is through the grey that the female figure emerges in *The Pilgrim*. The painting is not about a woman in grey: the grey constitutes the female figure; it becomes the woman that the painter or the viewer seizes and relates to other objects within herself. As Salaman aptly put it in his letter to John above: 'there is so much of the Gwen I know in it'.

Bogue has further noted that the textual/figural opposition should not be conflated with 'the traditional opposition between representational and nonrepresentational art' (Bogue 2003: 115). I would further add that establishing boundaries between the textual and the figural is in itself both problematic and impossible. One should rather try to discern volumes of the textual and the figural – perceived signs and

pure sensation – in the work of art in general and in John's portraits in particular. As John was writing to Tyrwhitt, in August 1936, the object – or subject for that reason – in a painting is of no importance; a painter should only be concerned with what would work towards the harmony of the composition:

> As to your drawing, I hope you will make a picture of it and as you were not satisfied with the fair figure put something else there, a pot of flowers for instance. Personally I thought the fair figure too important for a good composition and should have preferred a smaller object.[14]

John's epistolary advice to her friend on how to handle the problem of the 'fair figure' reminds us of Deleuze's take of the figural as a bloc of sensations, affects and the play of material forces, and therefore it is to the discussion of forces that the third analytical move of this paper will now turn.

III. Forces, Rhythm and Form

Gibson has suggested that the figural for Lyotard is an energetic space of forces and 'the liberation of forces is both an aesthetic and a political project' (Gibson 1996: 59). Lyotard, however, does not show how this liberation can be effectuated. Deleuze does this by drawing on Henri Maldiney's (1973) theory of rhythm and its relation to form. As Bogue notes, there is a distinction between perception and sensation in Maldiney's phenomenological theory of rhythm and form.[15] As a rational organisation, perception comes after sensation, an extra-linguistic realm that humans share with animals and wherein unconscious and unreflective becomings occur. Sensation, Deleuze further notes 'is transmitted directly and avoids the detour and boredom of conveying a story' (Deleuze 2003: 36); it is already beyond narration. Movement is crucial in sensation, although in a spiral form of space/time interchanges. Thus the perceptual space of geography with its maps, systems of coordinates and fixed properties is contrasted to the sensory space of the landscape, 'a perspectival world enclosed by a horizon that constantly moves with us as we move' (117).

Art, therefore, for Maldiney renders visible the invisible realm of sensation and Deleuze takes up this thread when he argues that 'the task of painting is defined as the attempt to render visible forces that are not themselves visible' (Deleuze 2003: 56). Deleuze's argument is critically important in my analysis of John's figurative paintings and particularly her portraits and self-portraits: what I have found most

intriguing in these paintings is the way they engulf the viewer in the sensory realm of forces that they have rendered visible. My interest has therefore moved towards exploring this plane of forces, unveiling more about their material and expressive roles, their form and their rhythm.

In following the above analytical interest in John's paintings, I have been drawn by Maldiney's suggestion that art 'is not a discourse [and thus] it is not made of signs but of forms' (Bogue 2003: 118). Just as signs for Deleuze (2001) are not restricted within the signifier–signified relation – they are not recognisable, but can only be sensed or felt – forms for Maldiney are not taken as 'static shapes or as sets of fixed relations; [they should rather be understood] dynamically as a process of spontaneous emergence and self-shaping' (Bogue 2003: 118). This is how form, as a process of 'autogenesis', is inextricably linked to rhythm, 'the unfolding pattern of the self-shaping activity' (Bogue 2003: 119).

Here again, Maldiney's conceptual couplet of form and rhythm as the style that the aesthetic concern should be about makes connection with the importance of rhythm in Deleuze's philosophy of *difference and repetition*. In the study of rhythm, according to Deleuze (2004), there is a distinction between static and dynamic repetition. Static or cadence-repetition should be perceived as 'an isochronic recurrence of identical elements' (Deleuze 2004: 23). Within dynamic or rhythm-repetition, however, 'tonic and intensive values act by creating inequalities or incommensurabilities between metrically equivalent periods of spaces' (23). Dynamic or rhythm-repetition in Deleuze is thus conceptually close to what is rhythm for Maldiney: 'this sense of form in formation, in perpetual transformation in the return of the same' (cited in Bogue 2003: 119).

The figural in John's paintings actually emerges as an effect of perpetual transformations of the figurative. Art historians and critics have particularly noted the repetition and recurrence of themes, gestures and postures in her paintings and particularly her portraits.[16] These recurrences, however, are never mimetic repetitions. John's portraits create a musical rhythm of differences and repetitions that would fascinate her friends and fellow artists. As Salaman was writing to her after her only retrospective exhibition in 1926 at the Chenil Galleries in London:

> It was indeed a chastening joy to stand there amongst those pale quiet songs of yours—like listening to the still music of the harpsichord—only there is nothing antique or archaistic about your work, they are so intensely modern in all but their peacefulness. (cited in Tickner 2004: 45)

It is therefore to the unfolding of this rhythm in paintings that I will now turn: how does rhythm manifest itself in painting? Maldiney (1973) charts three planes in the unfolding of rhythm: 'a vertiginous disclosure of the chaotic world of sensation; a systolic condensation of element towards definite shapes; and a diastolic eruption of forces that dissolve those shapes' (cited in Bogue 2003: 119). We can have glimpses of these three movements in the manifestation of rhythm in artists' narratives, particularly when they talk about the unique experience of losing themselves in their canvas:

> In order to paint a landscape correctly, first I have to discover the geographic strata. Imagine that the history of the world dates from the day when two atoms met, when two whirlwinds, two chemicals joined together. I can see rising these rainbows, these cosmic prisms, this dawn of ourselves above nothingness. I immerse myself in them when I read Lucretius. I breathe the virginity of the world in this fine rain. A sharp sense of nuances works on me. I feel myself coloured by all the nuances of infinity. At that moment, I am as one with my painting. We are an iridescent chaos. I come before my motif and I lose myself in it. I dream. I wander. Silently the sun penetrates my being, like a faraway friend. It warms my idleness, fertilizes it. We germinate. (Cézanne in Doran 2001: 114)

Cézanne's moment of being 'as one with my painting' becomes Maldiney's exemplar of the rising of the experience of sensation, the first movement in the manifestation of rhythm. John has left similar traces in her letters. As she was writing from Toulouse to her friend Tyrwhitt in the winter of 1903:

> I do wish you were here! You would like this place, it is very artistic—the country round is wonderful especially now—the trees are all colours. I paint my picture on the top of a hill—Toulouse lies below and all round me can see the country for many miles and in the far distance the Phryenees [Pyrenees]. I cannot tell you how wonderful it is when the sun goes down, the last two evenings have had a red sun—livid I think is the word, the scene is sublime then, it looks like Hell or Heaven.[17]

The 'iridescent chaos' for Cézanne, or the sublime scene of the sunset that 'looks like Hell or Heaven' for John create conditions of possibility for the work of art to emerge within the sensory plane; the process of systolic condensations as the second move in the manifestation of rhythm then follows. In the Cézannean world of artistic creation again:

> The next day, a beautiful morning, slowly geographical foundations appear, the layers, the major planes form themselves on my canvas. Mentally I compose the rosy skeleton. I can see the outcropping of stones under the

> water, the sky weighs on me. Everything falls into place. A pale palpitation envelops the linear elements. The red earths rise from an abyss. I begin to separate myself from the landscape, to see it. (Cézanne in Doran 2001: 114)

In John's notebooks, there is a poetic entry on 30 August 1922, marking this moment of systolic condensations when the artist detaches herself from the chaotic wholeness of the sublime and focuses on specific shapes and forms, repossesses things that she thought she had known, tries to see them again, rediscovers their forms:

> 1st thought.
> Turn gently toward your work.
> Instead of this sudden discouragement and sadness take up in your mind a leaf, a flower, a simple little form and find its form, take it into your possessions as it were.
>
> 2nd. Every day you may add to your possessions—every flower and leaf and other things may be taken possession of as it were. You have seen nearly everything vaguely.[18]

By asking her imaginative interlocutor to 'take a simple little form and find its form', John seems to adopt Maldiney's distinction between form as a static shape and form in formation, or rather perpetual transformation as discussed above. We tend to consider forms as static shapes, only because 'we have seen everything vaguely', according to John above. It is the artist's work to repossess things, try to look at them more closely, so that she can create forms of the invisible sensory realms, the virtual worlds that surround us. But in doing so, the artist has already entered the third plane of diastolic eruptions, she has unleashed the forces of the figural that Lyotard's analysis has pointed to, although not sufficiently analysed. This is the moment for Cézanne when painting starts, colours take over and forms and shapes dissolve once again:

> With the first sketch, I detach myself from these geological lines. Geometry measures the earth. A feeling of tenderness comes over me. Some roots of this emotion raise the sap, the colours! An airborne, colourful logic quickly replaces the sombre stubborn geography. Everything becomes organised: trees, fields, houses. I see. By patches: the geographical strata, the preparatory work, the world of drawing all cave in, collapse as in a catastrophe. A cataclysm has carried it away, regenerated it. A new era is born. The true one! The one in which nothing escapes me, where everything is dense and fluid at the same time, natural. All that remains is colour, and in colour, brightness, clarity, the being who imagines them, this ascent from the earth

> towards the sun, this exhalation from the depths towards love … Everything drops. Everything falls into the horizon. From my brain onto my canvas, from my canvas towards the earth. (Cézanne in Doran 2001: 114–15)

On the diastolic plane then, it is colour that matters, unleashing sensory forces but keeping them together in the experience of the aesthetic. John's artistic strength was indeed in the realm of colours; her 'fine sense of tone' was duly noted by her teacher Whistler, as recorded in her brother's autobiography:

> Mr Whistler with great politeness asked me to make Gwen his compliments. I ventured to inquire if he thought well of her progress, adding that I thought her drawings showed a feeling for character. 'Character?' replied Whistler. 'Character? What's that? It's *tone* that matters. Your sister has a fine sense of *tone*.' (John 1954: 45; original emphasis)

John's attention to colours has further been noted by her biographer: 'she revealed that she had begun to work with a colour wheel [which] consisted of several layers of revolving discs of colour charts so that it was possible by turning the different layers, to arrive at compatible tones' (Roe 2002: 255). Her biographer draws here on John's notebooks, which carry traces of how preoccupied she was with thinking around forms, colours and tones. Indeed, John's notebook entries inscribed the phases of *prepictorial figuration* and *second figuration* as discussed by Deleuze above:

> 11 March 1920[19]
> Method of application
>
> 1. On seeing the subject note the form, the colour, the tones.
> 2. Meditation, Decision on the form, the colour, etc
> 3. The painting. (To save time mix the colours beforehand)
>
> April 1921[20]
> Method of observation
>
> 1. the strangeness
> 2. colour
> 3. tones
> 4. personal form

Having gone through the phases of application and observation when the painter has to clean her head and her canvas from pre-given figurations and clichés, she then moves to the phase of second figuration or 'the method of execution' in her own terms:

Method of execution[21]

1. observation of the 4 points
2. mixing of colours
3. lines in pencil for eye training
4. painting of personal forms out of 9f background

As Maldiney (1973) reminds us again, having considered the interchange of systolic condensations and diastolic eruptions emerging from the sensory chaos in the process of creativity, we can now see more clearly how rhythm arises as the time of 'form in formation' as discussed above. Clearly this rhythm cannot be externally regulated, but rather creates 'its own temporal framework, and when we experience the artwork we also enter into the implicated time of its form, a perpetual Now outside commonsense coordinate' (Bogue 2003: 121).

So far in this section, I have looked into the unfolding of the form–rhythm relation within Maldiney's three phases of sense experience, whereby form and matter are inextricably linked. But the matter of form in painting is the canvas and the colours. In the next section I want to focus on the play of colours in the realm of sensation. This will be the fourth move in the rhythm of my analysis of John's later paintings.

IV. On Colours

'The colour system itself is a system of direct action on the nervous system' argues Deleuze (2003: 52). But how do colours intervene in rendering visible forces that are themselves invisible, how do they play around visible bodies and objects in the process of artistic creation and reception? Deleuze is very careful in distancing Cézanne's idea of the role of colours from that of the Impressionists:

> sensation is not in the 'free' or disembodied play of light and colour (impressions); on the contrary it is in the body … Colour is in the body, sensation is in the body and not in the air. Sensation is what is painted. What is painted on the canvas is the body, not insofar as it is represented as an object, but insofar as it is experienced as sustaining this sensation. (Deleuze 2003: 35)

Charting a diagram of forces is Deleuze's suggestion for coming to terms with sensation in painting, and his concept of the diagram runs in parallel with the Cézannean 'motif' as explicated above. 'Painting elevates colours and lines to the state of language' Deleuze notes

(Deleuze 2003: 113), his argument resonating again with Cézanne's idea that 'words and colours have meaning' (cited in Lloyd-Morgan 2004: 127). But the language Deleuze refers to is an 'analogical' language, which is opposed to the 'digital' language of overcoded discursive utterances and 'consists of expressive movements, paralinguistic signs, breaths and screams and so on' (Deleuze 2003: 113). The analogical language can be sensed and felt, but never recognised or learned.

So how does painting work as an analogical language? According to Deleuze, it has three dimensions: planes, colours and bodies (Deleuze 2003: 118). Colour seems to be the most important of the three, since 'analogy finds its highest law in the treatment of colours' (120). Deleuze further discusses the process of modulation, drawing on Gilbert Simondon's (1964) critique of the matter/form opposition and his argument that 'forms are determined through the establishment of a particular regulation of energy' (Bogue 2003: 134). Modulation and mould are inextricably linked in Simondon's analysis: 'to mould is to modulate in a definitive manner, to modulate is to mould in a continuous and variable manner' (cited in Deleuze 2003: 192), and therefore colourism is a process of modulation and moulding.

How then does the modulation of colour participate in the form–rhythm relation that keeps together the three moments of the experience of sensation? Colourism discloses the sensory world of the landscape and intervenes in the systolic moments wherein the forms of subjects and objects are in the process of becoming: colours do not fill in pre-existing forms, but rather liberate lines, figures and objects, unleash forces of continuous transformation of the form and thus create conditions of possibility for the diastolic moment of mingling again subjects and objects with their surrounding world. As has been reported by Joaquim Gasquet, Cézanne thought that 'there is only one route for rendering everything, for translating everything: colour. Colour is biological … Colour is living, all alone it breathes life into things' (in Doran 2001: 120).

Deleuze enumerates the 'practical rules of colourism', particularly stressing the 'broken tones' in Bacon's work. Broken tones emerge when primary and complementary colours are mixed in unequal proportions, 'the addition of a bit of orange to blue [yields] a "broken" muddy blue' (Bogue 2003: 151). 'Colourism' then, Deleuze argues, 'consists of relations of warm and cool, of expansion and contraction' but also of 'regimes of colour, the relations between these regimes and the harmonies between pure tones and broken tones' (Deleuze 2003: 152). Having discussed the importance of colour in Deleuze's analytics,

I will now consider John's particular practices of colour modulation, which create conditions of possibility for forces to be released from her paintings and for her figures to enter the process of *becoming imperceptible*.

V. Colourism, Forces and Figures in John's Portraits

As already discussed, the problem of painting for Deleuze is not to reproduce or even invent forms, but to capture forces. But what does this mean? Force in Deleuze's approach is closely related to sensation. While, however, the play of forces creates conditions of possibility for sensation to be felt, and painting renders the artist's sensations visible through colour, force itself cannot be sensed, felt or experienced, since the sensation 'gives something completely different from the forces that condition it' (Deleuze 2003: 56). Thus the attempt to capture the ever dissolving and disappearing forces, charting, as it were, the conditions of sensation becomes the problem of painting.

Since what can be sensed is the effects of forces, the problem of capturing forces in the history of painting was conflated with the problem of decomposing and recomposing effects, Deleuze notes (2003: 57–8). However, the problem of how invisible forces can be made visible remained largely unaddressed, till it became central in Bacon's work. I want to consider this problem in John's portraits, revisiting the connections between Bacon and Cézanne – as discussed by Deleuze – and Cézanne's notion of sensation.

Cézanne's influence on John has been noted by her biographers and art critics[22] and has been inscribed in her letters. As she was writing to Tyrwhitt on 30 August 1936: 'Oh a sudden thought! Perhaps you would like to read a little book I have about Cézanne. I'll put it in with the others. It is *very* precious to me so please send it back or bring it in October.'[23] Cézanne's notion of sensation would be the epigraph John chose for the only solo exhibition that she had in 1926 at the Chenil Galleries in Chelsea. John had further used Cézanne's notion of realisation of a work of art to talk about the need to 'realise' her little paintings. As she was writing to Tyrwhitt in the same letter above: 'I am tired of not knowing how to realise my little paintings (realise is Cézanne). I think *finish* would be a better word in my case.'[24] But how has such 'realisation' actually occurred?

It has to be noted here that John's art went through a radical transformation after her move to Paris in 1904; by the late 1910s she had abandoned the academic layered technique and had been intensely

working with colour, which she applied directly on the canvas without preparatory drawings, 'in short dabs and flicks from a well-loaded brush [appearing] to skip across the tops of the canvas weave' (Bustin 2004: 196, 198). John's technique of '[dabbing] colour on in a lively mosaic of short strokes' (Tickner 2004: 38) blurred the boundaries between figure and ground. Moreover the interplay of colours and subtle lines was creating a musical effect: 'The subtly irregular contours, ashy colours and minor variations of tone vibrate in the eye, producing something like a visual equivalent to musical resonance' (Tickner 2004: 38).

John's figures therefore emerge through the rhythm of the systolic and diastolic movements of sensation – her colours engender 'rhythmic characters' (Deleuze 2003: 72). Rhythm in her paintings, however, is not attached to her figures. As in Bacon's paintings, in John's later portraits 'it is rhythm itself that would become the Figure, that would constitute the Figure' (Deleuze 2003: 71). The rhythm/figures of John's later paintings are usually two-third or three-quarter length with pyramidal bodies and small heads, often out of proportion, their background is plain, both chromatically and structurally, while the distinction between figure and ground is always blurring. The body posture is equally simple and immobile: arms held close to the body, hands folded or holding a book, a letter, a piece of fabric or a black cat. There are slight changes in the appearance of the figure: their hair can be loose or plaited and they are usually enfolded in dresses or cloaks of broken tones that sometimes give the title of the composition: *Girl in a Blue Dress*,[25] *Girl in a Green Dress*,[26] *Girl in a Mulberry Dress*,[27] *Young Woman in a Grey Cloak*.[28] Sometimes the figures wear hats or very minimal jewellery or other accessories that are again inscribed in the title of the painting: *Young Woman Wearing a Large Hat*,[29] *Woman with a Coral Necklace*,[30] *Portrait of a Young Woman Wearing a Locket*,[31] *Seating Woman Wearing a Blue Bow*,[32] *Young Woman in a Red Shawl*,[33] *Girl with a Blue Scarf*.[34]

It almost seems that the hats, bows, shawls, scarves, necklaces and the colours of the dresses matter much more than the actual figures. If the work of art is a bloc of sensations, 'sensation refers only to its material: it is the percept or affect of the material itself, the smile of oil' (Deleuze and Guattari 1994: 166). Emerging from an assemblage of sensations, percepts and affect, John's female figures sustain the chromatic composition of the picture and animate the play of colours and tones that seem to be the main preoccupation of the artist. After all, the sitter can be no more than 'an affair of volumes' in John's letter that has initiated this paper. Moreover, in many of John's later portraits there

are some deliberately unfinished areas of canvas as in *La Petite Modèle*.[35] Cézanne's influence is striking here: 'colour sensations, which make light in my paintings, create abstractions that keep me from covering my canvas or defining the edges of objects where they delicately touch other objects, with the result that my image or picture is incomplete', Cézanne was writing to Emile Bernard on 23 October 1905 (in Doran 2001: 48). As John's notebooks show, unfinished, elusive and seemingly without details as they are presented, her portraits have nevertheless been carefully thought of, in many more details than we are allowed to perceive:

> 13 March 1932[36]
> The making of the portrait:
> The strange form.
> The pose and proportions.
> The atmosphere and notes, the tones.
> The finding of the forms (the sphere-the hair, the forehead, the cheek, the eye, the nose, the mouth, the neck, the chin, *the torse*).
> Blobbing
> the sculpting with the heads.

John's methodical approach to the realisation of a portrait seems to follow Cézanne's suggestion: 'You have to have a method … People have to play games. That's what I search for in painting. I don't have a doctrine like Bertrand, but you have to have theories, sensations and theories' (in Doran 2001: 94). Art historians and critics have thus characterised John's pictures as a debt to Cézanne. 'The two artists share a detached approach to the figure and both arrange their models in severe, simple poses' (Jenkins and Stephens 2004: 148). In this light, details were not important and when they appeared, they would only function as compositional elements, *colour events*, as I will further suggest.

Like Cézanne then, John's attention was directed to the depth of her portraits not the surface: 'one can alter, decorate, caress the surface, but one can't touch depth without touching truth … I would rather smash my canvas than invent or imagine a detail', Cézanne had written (in Doran 2001: 117). Although indifferent to mundane details, John was, however, very much interested in painting extraordinary details, blots of paint that would irrupt in her canvas to compose the harmony of colours she was attaining to reach. In this light, she would use colour to chart diagrams of what Deleuze has called 'asignifying traits', 'involuntary free marks lining the canvas' (Deleuze 2003: 5); these traits do not carry any

symbolism, they are not metaphors, 'they are devoid of any illustrative or narrative function' (5) and 'mark the emergence of another world' (100). In this light, the tiny bunch of flowers on *Mère Poussepins*' table[37] or the red and blue feathers in *The Japanese Doll*[38] create a fine balance between 'descriptive sign' and 'coloured matter' (Tickner 2004: 29); they become, I suggest, *colour events* that spring from the canvas blurring the boundaries between the figural and the figurative as in Deleuze's analysis above. Colourism lies indeed at the heart of what truth in portraiture should revolve around.

Thus, the painting of a portrait for John – carefully mediated as it was – becomes a Deleuzian diagram or a Cézannean motif, 'something that combines sensation and the solidity of a framework' (Bogue 2003: 132). Cézanne's motif was of course a view of the Mont Saint-Victoire, a great pointed mountain in the area of Aix-en-Provence.[39] As Tickner has pithily commented, the figure of *The Convalescent*[40] painted more than fifty times was John's Mont Saint-Victoire, her *motif* (Tickner 2004: 39).

I have already discussed above John's preoccupation with forms, tones and colours and the way she kept experimenting with her paintings, moving away from the academic conventions of her art education. Her notebooks and contemporary close examination of her paintings have shown that experimentation did not mean contingency and accidental use of colour. In Cézanne's thought, 'the artist can never be too conscientious, or too sincere, or too submissive to nature, but [he] must be more or less master of [his] subject and above all his means of expression [adapting] them to his motif' (in Doran 2001: 121). John's notebooks show indeed that she was adopting an analytical approach that she kept revisiting and reviewing. She was in a way very attentive to the charting of her diagram, following perhaps, as Bustin has commented, Whistler's exhortation to 'distrust everything you have done without understanding it ... You must know how you did it, that the next time you can do it again' (Bustin 2004: 196). John's analytical approach is reflected in her work and has been textualised in her letters since the very early stages of her career.

What I therefore suggest is that there is an interplay of volumes of the textual and the figural – perceived signs and pure sensation – in John's portraits, effectuated through her distinct pictorial acts, her own colourism. But how can we discern the play of forces in these portraits? Drawing on the three fundamental elements that Deleuze identifies in Bacon's paintings, namely Structure, Figure and Contour (Deleuze 2003: 144), I will consider the first two in John's portraits: her structuring monochromatic fields and the sitting female figures.

Indeed, the monochromatic fields of the later portraits are fundamental elements of John's compositions. Static and motionless as these female figures seem to be, they are mapped in a field of invisible forces moving in different directions and with different intensities. Following Deleuze's discussion of Bacon's paintings, I will thus make *a diagram* of the forces that John's portraits render visible.

VI. Charting Forces in John's Portraits

As already discussed, John's portraits follow the rhythm of systolic and diastolic movements in Deleuze's analysis: the systole delineates the figure and goes from the structure – the monochromatic field – to the figure, while the diastole sends out forces that extend the body to the structure of the painting and beyond it to the realm of sensation shared by the viewer. I have already discussed the unfolding of the rhythm of the systolic and diastolic movements in the art of painting. Here, I want to focus on the diastolic phase and particularly the forces unleashed by the work of art and shared by the viewers. What I suggest is that in John's later portraits, the monochromatic fields enveloping the female figures create the stage for forces of solitude to leap out from the canvas and make connections with forces of the Woman-becoming imperceptible.[41]

As most art critics have noted about John's portraits, her sitters appear motionless and impassive; they seem to do nothing more than just looking, maybe reading a book or a letter, holding a rose, a piece of fabric, a rosary or a cat in their lap.[42] Frozen in time and lost in space, the figural image is nevertheless 'the focus of intense concentration [and through] the fine discriminations of tone, the desaturated colour harmonies, [it] requires us to peer fixedly, … to respond to her attentiveness with our own' (Tickner 2004: 40).

Bathed in the colours of the monochromatic field, John's figure gradually dissolves in the bare background and the Woman, who loves and cares and offers her self as a spectacle to the gaze of the other, enters the cycle of becoming imperceptible. Driven by the force of the colours, the face breaks the despotic white wall without disappearing in the passional black hole, following lines of flight from striated regimes of signs. As Tickner has eloquently put it: 'Gwen's broken application and feathered contours dissolve the figure into its surroundings, giving the impression of a slight vibration as though the air was fizzing with dust-motes' (Tickner 2004: 45). Thus the monochromatic fields absorb the figure, making visible the forces of her becoming imperceptible.

Indeed, the female figures of John's portraits, I argue, emerge as events, idealised representations of femininity deterritorialised from domesticity and being connected to the world of absent-mindness; this was the sphere of creativity and pure thinking that John and her friends had experienced during their years at the Slade but had lost after their marriage. Edna Clarke Hall (née Waugh), who had studied at the Slade with John, would mostly fervently express her will for privacy and solitude and the need to be 'absent-minded' in a letter to Ida Nettleship[43] written in the autumn of 1906:

> It is a tremendous tax to have children always at hand for whom one is responsible without feeling an intimate love in their personalities … I never paint now partly because I have very little time and chiefly because I can never allow myself to be absent-minded. (cited in Thomas 2007: 97–8)

It is this existential need for being absent-minded that John's portraits capture, visually expressing a notable phrase from her notebooks entered on 11 July 1922: 'I don't live when I spend time without thought' (cited in Tickner 2004: 41). John's repetitive portraits of absent-minded women should not therefore be seen as a series of attempts to capture the essence of her sitter but as pictorial acts creating a rhythm of difference and repetition, engaging with the logic of sensation in painting. As Tickner has noted, 'repetition in [John's] work is better understood as a typically modernist engagement with the process of picture-making as the work is tested through repeated confrontations with an identical motif' (Tickner 2004: 39).

But there are more things happening in John's portraits as the forces of solitude and imperceptibility that leap out from the canvas dismantle and reconfigure boundaries not only between the painter and the sitter, but also between the viewer, the sitter and the painter, the self and other. John was indeed a noticeable presence as a painter sending out strong emotions and affects to her sitters. She was definitely following Cézanne's advice that 'one must look at the model and feel very exactly … express oneself distinctly and with force'.[44] Jeanne Robert Foster, her American patron's partner, had definitely felt this force and did write about the unique experience of sitting for John in a letter to John Quinn on 16 September 1921:

> She cannot endure having the pose changed by a hairs breadth after she has arranged it. She takes down my hair and does it like her own. She wants to draw the shape of my head. She has made me sit as she does and I feel the absorption of her personality as I sit. She is very much annoyed with necklaces

> and bracelets … She is more myself than I am when I am with her. (Foster cited in Langdale 1987: 89)

There is an intense play of forces between the painter and the sitter making connections between the self and other. Gasquet has reported this unique and intensive relationship between the painter and the sitter in observing Cézanne painting the portrait of his father:

> Most of the time, even though he had his brushes and his palette in his hand, Cézanne looked at my father's face, examined it. He didn't paint. From time to time, with a trembling stroke of the brush, he laid on a thin touch, a bright stroke of blue, which defined an expression or brought out and highlighted a fleeting aspect of his character. (Gasquet in Doran 2001: 147)

The force of this unique I–you relationship that Gasquet recounts above and Foster expresses in her letter to Quinn – I exist through you and you become me when you paint me – radically opens up the self to the other and sets up a narratable scene into which the viewer him- or herself is irresistibly drawn.[45] The imperceptible female figures of John's portraits force the viewers to raise existential questions about themselves and the world, they interrogate the ethics and aesthetics of what human communication entails and they leave signs of an experience of time as duration (Bergson 2002), the impossibility and greatness of grasping a moment in time, momentarily living in the present. Sensory experiences of seizing the moment are invoked by the fine interplay between the ordinary and the extraordinary in many of John's paintings wherein 'unremarkable objects and ordinary people are imbued with radiance and rendered beautiful' (Tickner 2004: 45). But as Tickner further notes, beauty is very differently grasped in John's paintings:

> It is not a question of beauty … through an idealisation of the intrinsic qualities of a particular woman … It is rather to do with the way in which a certain kind of ordinariness, subjected to an intense beam of attention but depicted with a kind of calculated austerity … can evoke this feeling of delight, desire, pleasure and resignation … Something ordinary, something slipped beneath the horizon of our attention like a breath or a heartbeat, is recovered, transfigured and made luminous. (Tickner 2004: 45)

This beauty springing from the ordinary rendered extraordinary through the art of colour forces John's viewers to wonder: why haven't I noticed this little bunch of flowers or that red feather before, what is this world around me, what is this present that I find myself in and what am I doing here? These are existential questions that arise from John's own colourism, her 'oyster-whites, blue greys and duns, the closely

graded tones and occasional accents of colour' (Tickner 2004: 45). Thus, following Cézanne's wish 'to paint space and time and make them forms of the sensibility of colours' (in Doran 2001: 124), John has painted images that have inspired her viewers to reimagine women and women's times to come.

Notes

1. Gwen John (1876–1939) was born in Wales, studied at the Slade and moved to Paris in 1904 where she lived and worked till the end of her life. Her long affair with Auguste Rodin has been discussed at length in her two biographies (Chitty 1987; Roe 2002) and a series of art history monographs (Langdale 1987; Taubman 1985; Foster 1999). See Tamboukou 2010 for an extended discussion of her letters.
2. For a critical appreciation of John's work see Langdale 1987; Foster 1999; Taubman 1985; Jenkins and Stephens 2004.
3. See Deleuze and Guattari 1988, particularly chapter 5: 'On Several Regimes of Signs'.
4. As the subject of this essay is a woman, the painter is treated as feminine throughout.
5. Cézanne's letter to Emile Bernard, 15/04/1904 (in Doran 2001: 29).
6. In its Deleuzian configuration within a long philosophical tradition that goes back to the Stoics, 'the event is not what occurs (an accident), it is rather inside what occurs, the purely expressed. It signals and awaits us . . . it is what must be understood, willed and represented in that which occurs' (Deleuze 2001: 170).
7. See Deleuze 2003, particularly the chapter 'Every Painter Recapitulates the History of Painting', pp. 122–43. It also has to be noted here that Deleuze sees painting as 'an analogical language' (Deleuze 2003: 113), a concept that I will discuss in the fourth section of the paper.
8. Here I paraphrase and play with Deleuze and Guattari's questions in chapter 7 of *What Is Philosophy?* (Deleuze and Guattari 1994: 169).

A Life between the Finite and Infinite: Remarks on Deleuze, Badiou and Western Buddhism

Simon O'Sullivan Goldsmiths College, University of London

Abstract

This article explores the resonances between certain concepts of Deleuze and Badiou and a Western Buddhism that is figured, in Foucault's terminology, as a particular 'technology of the self'. In particular Deleuze's readings of Bergson and Spinoza are brought into encounter with Buddhist doctrine and practice alongside a consideration of the figure of the *bodhisattva* who is further compared to Badiou's account of the subject. At stake in these enquiries and experimental conjunctions is the laying out of a particular – and liveable – diagram of the finite–infinite relation, or, we might say, a specifically Western *dharma* for a contemporary production of subjectivity.

Keywords: Buddhism, Badiou, Bergson, Spinoza, meditation, ethics

I. Introduction: Deleuze and Buddhism

This article serves as a brief appendix, or after-thought, to my recently published monograph *On the Production of Subjectivity* (2012). Therein I staged a number of philosophical – and psychoanalytical – encounters and attempted to draw a series of diagrams of the finite–infinite relation that followed from the latter. In general, I was interested in exploring certain aspects of post-Kantian thought which, rather than positing a gap, or bar, between the finite and the infinite suggested some kind of continuum or passage between the two. I was especially interested

in how these composite diagrams might offer up different possibilities for a contemporary subjectivity beyond those lifestyle options typically proffered by neo-liberalism. In philosophical terms the key opposition I explored was between Deleuze (and Guattari) and Alain Badiou, pitching their particular and different ontological statements and concomitant theorisations of the subject against each other (although, it has to be said, Deleuze's own writings are not concerned with the subject *per se*, but rather with a kind of pre- and post-subjective state). I knew whilst writing that book that Buddhism, especially as it is practised in the West today, offered a different perspective on this particular philosophical contretemps, and indeed the themes of my book in general, but it seemed to me that such a consideration would require more than footnotes, hence the present article which returns to both Deleuze (and specifically his Bergsonism and Spinozism) and Badiou – and brings these into a further and somewhat experimental encounter with a Buddhism that is figured as what Michel Foucault might call a 'technology of the self'.[1]

Before turning to Deleuze's own writing, however, it is worth noting that the collaboration with Guattari, and especially *A Thousand Plateaus* (1988), has itself many, perhaps more explicit, resonances with contemporary Buddhism albeit, of course, it is without a Buddha (I will return to this important omission below). Certainly with concepts like 'faciality', Deleuze and Guattari have theorised the human as a particular mode of organisation that is, as it were, set against the world (a moment of fixity in a world of change). Likewise the emphasis on pragmatics – that *A Thousand Plateaus* is a book to be used and not just read – resonates with Buddhist texts that are, precisely, manuals for a subject's transformation. In this pragmatic function *and* in its own ontological pre-suppositions – which affirm becoming over Being – *A Thousand Plateaus* has profound resonances with Eastern thought in general, and, indeed, Deleuze and Guattari reference Taoism in the especially constructive and pragmatically orientated plateau 'November 28, 1947: How Do You Make Yourself a Body without Organs?'. To a certain extent the final chapter of my above-mentioned monograph explores this area through an application of the concept 'probe-head' (taken from *A Thousand Plateaus*) to the contemporary production of subjectivity. We might make the claim in the present context that probe-head names an experimental Western Buddhism released from any debt to a Buddha (or indeed to traditional Buddhism itself). In fact, we might say further, that such concepts are less Buddhist *per se* and more simply *dharmic* when this names the ontological conditions of existence, the

transitory state or mode of our own particular being, and an ethics that leads from the conjunction of these two (as we shall see this has profound resonances with Spinoza's own *Ethics* (1989)).

Buddhism then offers a particularly practical solution to a problem: simply put, our desire for permanence in a world characterised by impermanence (hence our particular existence is marked by *dukkha* – or 'unsatisfactoriness'). Indeed, Buddhism offers an ethical programme aimed, ultimately, at a kind of self-transcendence, at least of a self that is fixed and set against the world. Traditionally this has also meant a certain asceticism and, indeed, a desire to negate all sense of self. But, and this is especially the case in more Westernised practices, it also implies a constructive project – an experimental testing, in resonance with Spinoza's own ethical programme, of what our bodies are capable, and, indeed, into what we might become as individuals. Again, in Spinozist terms, this is the exploration of different modes of being, or, as Guattari might have it, simply the production of a different kind of subjectivity. Hence, for myself, the resonances between Buddhism and *A Thousand Plateaus*, and, indeed, the *Capitalism and Schizophrenia* project more generally. But what about Deleuze's single-authored and more philosophically involved writings themselves? Is there a sense in which these can also be brought into useful conjunction with a Western Buddhism (I will keep to this term in what follows), especially around this question of the finite–infinite relation?

Once again, it can be remarked straight away that Deleuze and Buddhism both hold to a similar ontology (although Buddhism is not a philosophy *per se*, it still makes ontological claims): of a kind of groundless ground of being. For Deleuze, in *Difference and Repetition* (1995), this is the thesis of difference in itself (an original difference as it were), and an idea of repetition that names a kind of generative moment/movement of this difference. It also informs his philosophical dyad of the virtual/actual and, indeed, the important thesis of their reciprocal determination (this being Deleuze's Univocity).[2] In the Buddhist tradition this ground that is not a ground is approached in different ways, but perhaps most usefully for the purposes here it can be characterised in terms of the tri-concept of impermanence–interpenetration–insubstantiality, or 'conditioned co-production'. Here, ultimately, there are only conditions producing other conditions; a web of interconnectedness that has something in common with Henri Bergson's own thesis on all matter being in constant contact and 'communication' with all other matter. Man, insofar as he has a body, is part of this 'global' network, but also, in Buddhist terms, stands

against it (in Bergson's terms man is a subtraction; he is a 'centre of indetermination', or veritable hole in the universe).

Both of these ontological claims – of Deleuze and Buddhism – can be brought under the umbrella term of immanence. Deleuze himself refers to Spinoza as the 'prince of immanence', and himself as a Spinozist before anything else insofar as his philosophy, like Spinoza's, specifically orientates itself against any form of transcendence. Buddhism's own 'turn' to immanence is perhaps what best distinguishes it from other pantheist religions that still hold to a certain transcendence (simply, God or gods). Indeed, Buddhism, we might say, is the eruption – and affirmation – of the plane of immanence within history. Or, to say the same differently, Buddhism announces the relegation of God to a minor player in man's destiny centuries before Nietzsche announces God's death. Of course, Buddhism does not stop here, that is, with the assertion of a certain ontology, but, again, as a pragmatics, offers various techniques and technologies for the subject's transformation that follow from the ontology. In Deleuzian terms we might say, Buddhism provides instruction on how to access – and in a sense determine – this groundless ground of our being: meditation, for example, that allows for a contact with an infinite potentiality that lies behind our habitual, and finite, being (following Deleuze's thesis in *Difference and Repetition*, we might say that this is contact with the third synthesis of time – the time of Aion, 'hidden' behind the first synthesis – the habitual sense of time formed by the reactive mechanisms of the organism). Paradoxically, this is not an experience a given subject can have if we understand such a subject as a bundle of habits and volitions (indeed, Deleuze very much has this conception of the subject – or individual – in common with Buddhism). But it is a state achievable by man, under his own efforts.

Buddhist meditation then allows access to an outside, to that from which our subjectivity has itself been formed or folded. Once more, in Deleuzian terms, this is to 'access' a certain virtual realm. If Deleuze's thought allows for different actualising machines – different forms of thought – then Buddhism suggests that the very virtual itself might be directly 'experienced' in some sense, albeit this experience will have to be 'translated' once a subject 'returns' to the actual. We might also say that in the different practices Buddhism advocates we also see the reciprocal determination of the actual back to the virtual (through certain processes of selection and repetition that in themselves foreground different relations of intensities). Indeed, the virtual and the actual are co-determinate in this sense. They are two sides of the same coin (and it is in this sense, ultimately, that there is no path in Buddhism,

no journey: nowhere to go). I will return to this important, but counter-intuitive 'movement' in a moment.

II. Bergsonism and Buddhism (the Gap and the Mystic)

For Bergson, especially in Deleuze's reading of him, this virtuality is accessed through a certain gap – between stimulus and response – that is opened up in experience and as a result of the increasing complexity of the brain–body assemblage. It is this gap that defines the human since it implies the possibility of moving beyond pure animal reactivity. The resonances with Buddhism are striking in this specific area and are worth tracking through. In Buddhist terms we are in contact with the world through our sense organs (and mind is also considered a sense organ in this understanding). This contact involves perceptions which then produce sensations. We are in fact very close indeed to the Bergson of *Matter and Memory* (1991) here. These sensations are themselves accompanied – we might even say, at this stage, are followed – by feelings, of either pleasure or pain. In the Buddhist understanding of the conditioned self (our transitory mode of being) all this is given. The feelings, the sensations, the perceptions, indeed, even the sensory organs themselves are the result of previous actions and volitions (they are 'old karma'). The next stage, however, is crucial: feeling produces craving and aversion, which then produces grasping and so the whole wheel of rebirth – or 're-becoming' – continues (we set up the same conditions which in the future will produce the same reactions). We might say that this is the point at which signification comes in (with the articulation of desires, or simply the affirming/negating of the world). It is also the instalment of a judging subject (who, in the terms of *Anti-Oedipus* retroactively identifies him- or herself with these judgements).

We might also, with Bergson, see this as the moment of memory, at least in its habitual sense (in Buddhist terms, these habitual reactions are our *samskharas* that, again, actually constitute our selves). However, it is also at this point that the cycle can be broken – precisely at the point between feeling and the acting on that feeling (again, the craving). Meditation, at least in one of its forms (*samadhi*), is simply the cultivation of awareness of this point, this moment of 'decision' – and the prolonging of a certain pause, a dwelling 'in' the gap. Again, for Bergson, it is also through this gap (Bergson calls it a 'hesitancy') that memory, this time in the sense of the 'pure past' (or, again, a virtuality), pours in. In itself this allows for a certain creativity to replace our more reactive modes of behaviour; a kind of liberation from the (utilitarian)

concerns of the organism. In Buddhist terms we might think of this pure past, that is also the ontological background of our limited being, as a kind of vast storehouse of memory, when this is also the memory of other humans, of animals, of plants – of all life (going further, this might also include the non-organic life of Deleuze's thesis); a veritable teeming reservoir of life worlds.

We might jump ahead slightly here and bring Deleuze's Spinozism, and specifically the concept of affect, to this Bergsonian virtual. For Deleuze–Spinoza affects are a prior moment, even before feeling. They are, as it were, themselves virtual. But in fact one does not come without the other: sensations and feelings go hand in hand (just as the virtual and actual always come together). Affects are always present in our experience albeit never in a pure state. As Brian Massumi has it in his essay on 'The Autonomy of Affect' (1996) they are not transcendent, but immanent to experience. This realm of affect is a non-personal place, before the mechanisms of the ego – the likes and dislikes (the habits) – have kicked in. Crucially, it continues to exist alongside our typical sense of self (we might say our signifying self). Indeed, this other non-human state that always and everywhere accompanies our typical sense of ourselves is what Deleuze and Guattari, in *A Thousand Plateaus*, call the 'body without organs'. Buddhist meditation, this time as insight practice (*vipassana*), allows an experimental encounter with this other place – of forever changing relations of intensities – that in itself produces a self-overcoming (again, the self here understood as a bundle of volitions). This 'knowledge' – of impermanence–insubstantiality–interconnectedness – is not solely intellectual but is, precisely, bodily. It is a direct experience, registered on the body – of the rising and fallings, the comings and goings, of sensation. This is an inhuman experience that our typical sense of a fixed self tends to obscure in the very production of that self. In Buddhism this wisdom-insight also implies an ethics insofar as an understanding of this impermanence and interconnectivity leads to compassion (I am everything, and everything is I). I will return to this properly inhuman ethics below.

Buddhist meditation is then itself an essentially creative act that is ethical (a self-overcoming), but also aesthetic insofar as it involves cultivating a certain kind of profound disinterested attitude towards the world (in fact, it is our typical craving – grasping and pushing away – that constitutes our world). Indeed, it is this 'letting be' that reveals a certain reality that was masked by our instrumental attitudes and intentions. For the Buddhist such a mode of being must involve great

mindfulness (hence, again, meditation; dwelling in the gap) but also, again, wisdom; an understanding – that might, in fact, be intellectual in the first instance – of the conditionality of all things (the arising and passing away of all phenomena, thus the futility of grasping). Hence the specific purpose of study within Buddhism. These two (meditation and study), alongside an ethical practice in what we might call a molar sense (the cultivation of a lifestyle that allows for a quieting of the mind that itself allows for the necessary focus) constitute at least one understanding of the Buddhist path. To put this in Deleuzian terms: Buddhism can be understood as an ethico-aesthetic strategy for accessing the virtual realm of affects, and in so doing producing what we might call a *trans*human becoming.

We might turn to another of Bergson's books to develop these apparent resonances with Buddhism. Indeed, Bergson's writings on the mystic, it seems to me, are a further bridge between Deleuze's own writing and Western Buddhism, for although in *Matter and Memory* Bergson only posits, as a demonstrative technique, the existence of a someone who 'experiences' the pure image and the pure past (that is, a pure virtuality), in *The Two Sources of Morality and Religion* (1935) he describes the mystic as precisely someone who inhabits the gap (in this case 'in-between' the fixed rituals and morals of society) and thus, as it were, accesses the infinite. This insight might only be temporary, but nevertheless it can transform the subject who experiences it, and indeed the world in which a mystic returns and acts. The important point here is that an individual subject, as a finite being, can experience the infinite *directly* even if only temporarily. For Bergson intelligence cannot achieve this (the latter serves the ends of a particular organism, or, simply put, is instrumental), hence, intuition, which we might characterise as the world 'thinking' through man. Here is the crucial passage on Deleuze's own take on this mystical experience – the accessing of 'creative emotion' – from towards the end of *Bergsonism*:

> The little interval 'between the pressures of society and the resistance of intelligence' defines a variability appropriate to human societies. Now, by means of this interval something extraordinary is produced or embodied: creative emotion. This no longer has anything to do with the pressures of society, nor with the disputes of the individual. It no longer has anything to do with an individual who contests or even invents, nor with a society that constrains, that persuades or even tells stories. It has only made use of their circular play in order to break the circle, just as Memory uses the circular play of excitation and reaction to embody recollections in images. And what is this creative emotion, if not precisely a cosmic Memory, that actualises all

> the levels at the same time, that liberates man from the plane (*plan*) or the level that is proper to him, in order to make him a creator, adequate to the whole movement of creation. (Deleuze 1988a: 111)

Here the mystic is an individual that moves beyond the human when the latter is defined as being pinned to the plane of matter. Indeed, the typical human, in *The Two Sources*, is a being predominantly of habit and reactivity – and is further defined by a specifically utilitarian memory (as well as by the fixed codes and morality of a given society). The mystic, on the other hand, actualises all the levels of the cone of memory, or, we might say, lives – *feels* – all of life in its plenitude and complexity (we might say that the mystic is a specifically intensive being in this sense). Crucially, this mystic is also a creator and, indeed, assumes responsibility for the creation of his or her own self. As Deleuze puts it right at the end of *Bergsonism*:

> This liberation, this embodiment of cosmic memory in creative emotions, undoubtedly only takes place in privileged souls. It leaps from one soul to another, 'every now and then', crossing closed deserts. But to each member of a closed society, if he opens himself to it, it communicates a kind of reminiscence, an excitement that allows him to follow. And from soul to soul, it traces the design of an *open* society, a society of creators, where we pass from one genius to another, through the intermediary of disciples or spectators or hearers. (Deleuze 1988a: 112)

In Buddhist terms this is the *sangha* – the community of those who follow the *dharma*. In Buddhism this defines any community of Buddhists (when this is a community defined also by friendship), but it also names the community of *arahants*, or those who have achieved 'awakening'. In the last sentence of *The Two Sources* Bergson himself suggests that it is these exceptional individuals who fulfil 'the essential function of the universe, which is a machine for the making of gods' (Bergson 1935: 317). This, it seems to me, is Bergson's own thesis of reciprocal determination in which man can come to determine the very conditions that had determined him.

This question of reciprocal determination in relation to actual Buddhist practice itself is more complex, but what can be said, in Buddhist terms, is that both the conditioned (actual) and unconditioned (virtual) are, ultimately, the same. At a certain level of understanding or awareness (we might even suggest a knowledge such as that of Spinoza's third kind) the actual *is* the virtual, just as the virtual *is* the actual. In this 'place' to speak of a subject who has this other kind of experience is no longer accurate insofar as dualisms, such as subject–object,

conditioned–unconditioned, but also, crucially, virtual–actual, no longer hold. Or, if they do hold, they are in a constant state of inter-penetration – or a reciprocal relation. It is in this sense, again, that the actual determines the virtual out of which it has itself been determined. Another way of saying this is that Deleuze's 'virtual Ideas' (relations of intensity) are determined by the life that lives them (depending on how we live, certain virtual Ideas become clear and distinct, others retreat into a darker obscurity). Or, what I am determined by is in turn determined by how I live.

III. Badiou and the *Bodhisattva*-subject

For an alternative take on this question of mysticism, and its relation to a specifically Western Buddhism, we might turn briefly to Alain Badiou and to his book on *Saint Paul* (2003), for, of course, Paul has a mystical experience – an event happens to him in Badiou's terms – that results in a dramatic conversion. Not surprisingly, however, for Badiou, it is not this experience itself that is the defining moment for Paul. Rather, it is the consequences of this experience (following the logic of *Being and Event* (2005) and *Logics of Worlds* (2009) it is the what happens *after* the event that is crucial in terms of the subject). In Badiou's case this is so pronounced that the actual content of the experience (in the case of Paul, the resurrection of Christ) is at one point in *Saint Paul* figured as superfluous to the real business of maintaining a fidelity to it through actions in the world. Paul operates then, for Badiou, as a paradigmatic case study of the production of a subject insofar as he is produced as one through an event and, crucially, an ongoing active fidelity to it.

Bergson's mystic is likewise active and very much 'in' the world. In fact, Bergson places the Christian mystic (though Paul himself is not mentioned), who re-enters and engages with the world, above, for example, the realised Buddhist, who, Bergson argues, withdraws from the world. In this sense we might say Bergson's mystic, like Badiou's Paul, also maintains a militant fidelity of sorts to their 'experience' insofar as it determines a future course of action. We might want to argue, however, given what I have written above, that meditation is certainly not a withdrawal from the world (it would seem, rather, to be a direct engagement with the world as it is incarnated in our very being), but nevertheless the point is well made that accessing the infinite has a very real impact on the finite in terms of what happens after this 'experience'. I will return in a moment to a figure in the Buddhist tradition for whom this return is defining.

In passing, it is worth noting that the content of the event for Paul – Christ's resurrection – is, in actual fact, that which allows for the infinite to enter the finite (it is, after all, a conquering of death). As such, Badiou is somewhat inconsistent in his treatment of this particular event. The resurrection allows for a thorough reordering of the relations between life and death; simply put, after the 'resurrection-event' a different course is open to any subject who wishes to 'escape' mortality or the finite – simply because he or she can 'decide' to accept the fact of resurrection (Badiou here writes of a thought of life pitched against a thought of death). To quote Badiou: 'Only a resurrection redistributes death and life to their places, by showing that life does not necessarily occupy the place of the dead' (Badiou 2003: 85). It is in this sense also that the resurrection-event – or, we might even say the 'Christ-event' – is the 'abolition of the law, which was nothing but the empire of death' (86). The latter law determines and protects a certain partiality (and particularity) against a truer universalism (and the 'greater' law of love that leads from the latter, for, as Badiou remarks, 'No truth is ever solitary, or particular' (90)). It is this true universalism – that the Christ-event is for all (this being precisely the 'Good News') that characterises Paul's fidelity (and, indeed, the interest of Christianity for Badiou). The subject then, as mapped out here, is precisely a 'universal singularity' (13). All events are for all in this sense (although specific to certain situations or 'Conditions' in their occurrence, nevertheless, they are always *transpositional*).

In *On the Production of Subjectivity* I have gone into more detail about how this thesis of the event – and of the subject attendant on it – maintains a certain gap between the finite and the infinite (despite what Badiou himself might claim). In fact, for Badiou, the event, as otherworldly occurrence, paradoxically produces this gap. We might note here, briefly, that for Deleuze events, on the other hand, are precisely worldly – when they are thought of as the reciprocal passage between the virtual and actual. In relation to Paul it is then no accident that Badiou's paradigmatic example of an event is transcendent (the hand of God as it were). In *Being and Event* itself the event is figured as precisely *not* from God (indeed it is from a not-God, or, a not-One), but there is still a definition of the event as outside the situation/world as given, and, precisely, outside of any given individual. Hence also the chief *modus operandi* of such a subject is necessarily faith.

In fact, there is a figure in the Buddhist tradition that somewhat parallels Badiou's Paul *and* Bergson's Christian mystic and yet – and this would make such a figure of particular interest to Badiou – is a figure

of immanence rather than of transcendence (that is to say, it is a figure for whom the excess that the event announces is an excess of the world rather than a beyond the world). A figure for whom resurrection is not the defining event, but who nevertheless offers a different thought of life 'beyond' the finite: the *bodhisattva*. We might say, in fact, that the *bodhisattva* – a later Mahayana construction – is conjured as a solution to the problem of the finite–infinite relation, or, in more Buddhist terms, of time and eternity. The *bodhisattva*, by definition, is a kind of not-quite-Buddha (not quite dwelling in eternity), who chooses to remain in, or, precisely, return to, this world. This is to remain in *samsara* (time), forgoing *nirvana* (eternity), until all other sentient beings have themselves passed over to this farthest shore.[3]

In Badiou's terms there is an event – or experience – that provokes this militant and compassionate activity of the *bodhisattva*: the arising of the *bodhicitta*, or, simply 'the will to enlightenment' (itself attendant on a certain tension – again, a desire to withdraw from the world versus a desire to be militantly involved with the world). It is this that sets the *bodhisattva* off on the way. It is what we might call the '*bodhisattva*-event'. This event, by definition, is universalising in that it is open to all (anyone can make the decision to follow the path of the *bodhisattva*), and also, more profoundly, it is a will to *nirvana for all*. In Badiou's terms it is a thought of the generic. This, a kind of enlightenment for all beings or for none, is again the Mahayana correction to the individualist spiritualism that the earlier Hinayana tradition became susceptible to (the retreat from society, the private thinker, and so forth). Hence, we have the '*bodhisattva* vow' to actively engage oneself in the welfare of all beings situated within time and to relinquish enlightenment until all have also achieved it. We might figure this as an extreme fidelity to an event that itself is a demonstration of the generic (and that, again, asserts a life outside of simple finitude). In terms of Badiou and *Saint Paul* it is a thought of life (the interconnectedness–interpenetration–insubstantiality of all things) pitched against a moribund thought of death (a general nihilism).

In Badiou's terms the *bodhisattva* is then precisely a subject in that he or she maintains an extreme fidelity to an event albeit it is not, strictly speaking, one that occurs in one of Badiou's four Conditions (art, science, politics and love). Indeed, it implies, we might say, a fifth Condition – or, more specifically, a kind of modification of Badiou's Condition of love insofar as here it is less the love of another individual than the love of the world itself that constitutes the event. This 'spiritual event' – the arising of the will to enlightenment *for all* – is itself dependant

on the prior event of the Buddha's enlightenment (just as Paul-as-subject, in Badiou's account, experiences his own event that is dependent on the 'Christ-event'). This fidelity is also premised on a faith of sorts – in the Buddha's enlightenment. Simply put, it is a faith that human enlightenment is possible. In relation to what I have already said about meditation it seems to me that, crucially, it is also a faith that can be tested in and against experience. In Buddhism it is never blind faith, but more a working hypothesis that is then decided by experience. The bar – between the finite and the infinite – is also configured here more as a decision than an actual bar; a decision to remain subtracted from the infinite as it were.

In fact, Western commentators have commented that the Buddha, as a figure of eternity, and the *bodhisattva*, as a figure in time, are indeed ontologically separate (one cannot get to the eternal via time), but that nevertheless it might be possible to hold both perspectives at once, a kind of holding of the two in tension (see Sangharakshita 1988). From a Deleuzian perspective we might say, in fact, that the *bodhisattva* is the site of a finite–infinite weave, or, again, of the reciprocal determination of two fields. We might say, further, that this is the difference between the two dominant models of Buddhist practice in the West: one of the path, and one of the non-path (put simply, enlightenment, from a certain perspective, is a long way off and yet, from another, is right here, right now).

Whether, in fact, an individual temporarily accesses the infinite before returning to the mundane, or it is possible to hold the two coextensively – as meditation would seem to imply – the crucial issue is that there is a two-way passage, at least of sorts, between the finite and the infinite; or to say this differently, the finite and the infinite are part of the same reality and are thus, again, in a relation of reciprocal determination. Nevertheless, as I mentioned above, the finite 'accessing' of the infinite – as Enlightenment – is paradoxically not an 'experience' one can have. In Badiou's terms a subject of this experience cannot be reduced to the 'organisation of sense experience' that defines a given individual 'in the world'. That said, such an experience can happen to one, and, indeed, and this is crucial, can and must be prepared for. This is why Buddhism places such emphasis on ethics, or what one might call in this particular context, following William Blake, the cleansing of the doors of perception – seeing the world free of *kleishas* (or 'defilements'). In terms of what we might call a subtractive ontology, it is not as if 'more' needs to be added to the subject in order that he or she transform and 'achieve' the infinite, but rather that a series of blinkers need to be

taken away (again, this would return us to Bergson's definition of the human as a series of shutters closed against the universe). There is then a further difference with Badiou here, for this notion of preparation and of the various practices implied by it, that links Buddhism to the stoics, would seem to be at odds with Badiou's notion of the unbidden nature of the event. Indeed, for Badiou no preparation is possible – it being the nature of an event to arrive unannounced and unexpectedly.

IV. Spinozism and Buddhism (Ethics and Immanence)

Our final philosophical figure can be brought in at this point as a contrast to Badiou and in resonance with Buddhism, namely, Spinoza, who is, of course, a key precursor, along with Bergson, for Deleuze. For Spinoza, preparation is not only possible, but necessary (Badiou's understanding of Spinoza, at least in *Being and Event*, seems to wilfully ignore this determining rationale of the *Ethics*, that is to say, that it is a *programmatic* text). To very briefly summarise the programme of the *Ethics* (following Deleuze's own reading): the first kind of knowledge names our typical way of being in the world in which we are ignorant of the true causes of our experience and thus subject to random encounters and the affects produced by them (this, we might say, is *samsara*, though we might also suggest that it is Bergson's plane of matter – the terrain of the reactive sensori-motor schema). The second kind of knowledge entails beginning to understand the causes of our experience and thus the concomitant organisation of life so as to produce specifically joyful encounters and the construction of 'common notions' attendant on these (this, we might say, is the Buddhist path; in relation to Bergson, we might suggest that it is also a path away from the plane of matter via the gap I mentioned above – a disjunctive synthesis in Deleuze and Guattari's terms – that thus allows a certain amount of freedom from habit).[4] This second kind of knowledge, although, as Spinoza suggests, producing a joyful life in and of itself, is but the preparation for a further third kind of knowledge, where all the world is a joyful encounter, in fact, where there is a sense of identification with the world, a veritable beatitude. This third kind of knowledge is also, according to Spinoza, 'under the aspect of eternity' – or, we might say, is an 'experience' of the infinite (in relation to my discussion of Deleuze's Bergsonism above this is a kind of dwelling in the base of the cone, the third passive synthesis of a still time in which past, present and future are equally present). Insofar as this progression in knowledge implies an ethical programme, precisely

of experimentation, selection, repetition, then we might also say that it is an example of the actual determining the virtual.[5]

Deleuze's lecture on 'The Three Kinds of Knowledge' (2003) is useful here in pointing out that the three kinds of knowledge might equally be thought as three kinds of body that we already have, or three ways in which we might relate to our existing bodies. As such, it is not so much that we 'go' anywhere with Spinoza's ethical programme, but rather that we realise certain things that are already here. The same goes for Buddhist practice: there is a path, but on reaching the end, one understands that there was never anywhere to go (after all, where could one go?). In fact, we might usefully compare Deleuze–Spinoza's three bodies with the traditional three kinds of body of the Buddha (the *trikaya* doctrine): first, the *nirmanakaya* or 'created body' that functions on a human/historical level (this is a transitory mode of being, subject to change); second, the *sambhokaya* or 'body of mutual enjoyment', an archetypal body that 'represents' different aspects of Buddhahood (we might say that this is the joyful body of the second kind of knowledge); and third, the *dharmakaya* or 'body of truth', an 'aspect of Absolute reality' that 'exists' in eternity (see Sangharakshita 1988: 6–11). The *dharmakaya*, like Spinoza's third kind of knowledge, is an experience of eternity (or, again, more precisely, *sub specie aeterni*) that is discontinuous with time but also coterminous with it. It is in this sense that Buddhism is not exactly an eternalism (believing in an immortality of the soul or, as it were, an afterlife for that soul), but rather, like Spinoza, posits an eternity that is here and now, albeit occluded.

Spinoza's 'labour' of the second kind of knowledge has its correlate in Buddhism with the 'Noble Eight Fold Path', or simply ethical living (involving 'training principles': right speech, right action, *sangha* or community, and so forth). Traditionally, these are foundational practices aimed, again, at quieting the mind, allowing for focus. Both Buddhist and Spinozist systems of ethics are then, ultimately, about the creation of the conditions that might allow for the possibility of the arising of insight or truth, which, in fact, they determine insofar as such an insight, following Spinoza, is insight into the particular modal essence that we 'are'. Again, the actual programme determines the virtual destination. The path, in this sense, determines the goal. Or, again, through this ethics we paradoxically become a cause of ourselves.

There is a discontinuity of sorts between the second and the third kinds of knowledge (they are different in kind), but there is also a passageway between them (this technology of passage being, precisely, joy). In fact, the third kind of knowledge *is* similar to the second (both

are, after all, a knowledge of modal essences), albeit with the former it is more immediate knowledge, instantaneous, the result of a realisation, or insight, rather than of the processual construction of concepts or, strictly speaking, of the 'ethical life' itself. Insight is then an event of sorts, but one that needs careful preparation (discipline and training) and, we might remark, supportive conditions in order to work through its consequences.

Spinoza's *Ethics* is then remarkably similar to a Buddhist system of ethics seeing as both emphasise a kind of programme for man, but then ultimately something more inhuman. Indeed, it is as if there are two ethics: the one of the path – human, mediated, requiring effort; and the one of the goal – inhuman, immediate, effortless. The two are connected insofar as the former builds a platform towards the latter, but they are also qualitatively different because the first is a technology of the subject, whereas the second is, properly speaking, 'of' the object – or, we might say, is the becoming-world of the subject. Indeed, for myself, Spinoza's *Ethics* reads like a treatise of a future Buddha, and a specifically Western one, insofar as it is written the other way around: whereas the Buddha, having achieved insight, then attempts to put in place a system that will allow others to reach the same destination (from goal to path), Spinoza works from the path, from a rigorously worked out ethics based on reason – that then arrives at the same place almost despite itself: two different perspectives producing two similar ethics (and two similar ethical destinations).

We might briefly turn here to Deleuze's last essay on 'Immanence: A Life' (2001) in which Deleuze's indebtedness to Spinozist formulations is made explicit, and in which we can see further resonances with Buddhist insight and experience. Deleuze writes:

> We will say of pure immanence that it is A LIFE, and nothing else. It is not immanence to life, but the immanent that is in nothing is itself a life. A life is the immanence of immanence, absolute immanence: it is complete power, complete bliss. (Deleuze 2001: 27)

For Deleuze this is also what he calls the 'transcendental field', which is 'distinct from experience in that it neither refers to an object nor belongs to a subject … It therefore appears as a pure pre-subjective current of consciousness, a qualitative duration of consciousness without self' (Deleuze 2001: 25). For Deleuze it is on the thresholds of life that this transcendental field becomes perceptible, but, we might say, this is also precisely the terrain of meditation. In this essay, perhaps Deleuze's most mysterious, the question of reciprocal determination

is again posed insofar as the 'virtualities, events, singularities' of this impersonal life 'are actualized in a state of things and of the lived *that make it happen*' (31; my emphasis). There is also, once more, the suggestion that this 'life' implies 'the immensity of an empty time where one sees the event yet to come and already happened, in the absolute of an immediate consciousness' (29). It seems to me that the same immediate consciousness is at stake in Nietzsche's eternal return; at least as Deleuze understands it, but also in the Buddhist idea of insight that precisely offers a way out from our own linear temporality and with it our finitude.

Indeed, we might say that a life of immanence is also a life of Buddhism – or, perhaps more accurately, a life of *dharma* when this names the truth of condition co-production but does not identify this with an actual figure that lived its truth – and which can thus remain tied to a particular historical moment and geographical location. Perhaps, ultimately, this is what a Western Buddhism needs to be: a *dharmic* practice released from any debt (or homage) to the Buddha, but one that is also not entirely abstract, at least insofar as this means non-corporeal, but that is, again, tested 'in' experience, on the body – when the latter is itself rethought as the site of an actual–virtual interface. A life of pure immanence then, but, crucially, also a life that needs to be lived, which is to say, a plane of immanence that must also be constructed:

> This plane of immanence or consistency is a plan, but not in the sense of a mental design, a project, a program; it is a plan in the geometric sense: a section, an intersection, a diagram. Thus, to be in the middle of Spinoza is to be on this modal plane, or rather, to install oneself on this plane – which implies a mode of living, a way of life. What is this plane and how does one construct it? For at the same it is fully a plane of immanence, and yet it has to be constructed if one is to live in a Spinozist manner. (Deleuze 1988b: 122–3)

Later, in his small book on Spinoza, *Practical Philosophy*, from where the above quote is taken, Deleuze gives a more specific description of the 'experience' (when this is not an experience of a subject) on and of this plane:

> There is no longer a form, but only relations of velocity between infinitesimal particles of unformed matter. There is no longer a subject, but only individuating affective states of an anonymous force. Here the plan is concerned only with motions and rests, with dynamic affective charges. It will be perceived with that which it makes perceptible to us, as we proceed. (Deleuze 1988b: 128)

As individuals, we are, as it were, folds in this plane – looking back at it. In fact, we are a product of this plane (what else could we be?), but we are also a kind of extraction – or transcendent capture – of certain parts of it (hence, precisely, *dukkha*). We might compare this strange description above with the words of the Buddhist Heart Sutra that likewise articulates a certain 'experience' – or intuitive understanding – of impermanence–insubstantiality–interconnectedness as that which produces form, but also non-form. A certain kind of post-human perspective on, but also of, immanence:

> Here then,
> Form is no other than emptiness,
> Emptiness no other than form.
> Form is only emptiness,
> Emptiness only form.
>
> Feeling, thought, and choice,
> Consciousness itself,
> Are the same as this.
>
> All things are by nature void
> They are not born or destroyed
> Nor are they stained or pure
> Nor do they wax or wane.
>
> So, in emptiness, no form,
> No feeling, thought, or choice,
> Nor is there consciousness.
> No eye, ear, nose, tongue, body, mind;
> No colour, sound, smell, taste, touch,
> Or what the mind takes hold of,
> Nor even act of sensing.
>
> No ignorance or end of it,
> Nor all that comes of ignorance;
> No withering, no death,
> No end of them.
>
> Nor is there pain, or cause of pain,
> Or cease in pain, or noble path
> To lead from pain;
> Not even wisdom to attain!
> Attainment too is emptiness.
> (Sangharakshita 1990: 14–15)

V. Conclusion: Towards a Western *Dharma*?

I suggested in my introduction that a Western Buddhism might be less motivated by the abolition of the self than by a more constructive project – to make the self anew and in accordance with certain truths about the world (not least its impermanence). This constructive attitude is an important feature of Deleuze's reading of Spinoza, precisely that it offers an aesthetics of living, or 'an Art, the art of the *Ethics* itself: organizing good encounters, composing actual relations, forming powers, experimenting' (Deleuze 1988b: 118). It seems to me, ultimately, that Badiou's own philosophy also lends itself to this perspective insofar as to be a subject in the world is also to create oneself anew in that world. Indeed, despite the differences I have highlighted (on the other side of the event as it were), there do seem to be further resonances between Badiou and Buddhism on this other side of the event – in terms of fidelity. In fact, from a certain perspective, insight itself is secondary to what one does with it. For both Badiou and Buddhism it is this fidelity itself that changes the situation (in Buddhism, the situation of an individual life).[6] Indeed, Spinoza's second kind of knowledge might, at least in one sense, be productively brought into encounter with Badiou's 'subject-knowledge' that is produced by grouping those positive 'post-evental' encounters that follow the logic of the event. In these terms Badiou's theory of the subject also implies an art of living, at least of a sort.

Crucially, however, for Badiou this does not seem to be a matter of what we might call affective-knowledge. Indeed, a theory of affects is inevitably – and conspicuously – missing from Badiou's system in *Being and Event* (and although *Logics of Worlds* goes some way to addressing the missing worldliness of *Being and Event*, it nevertheless pays very little attention to affect). It is as if the impermanence and radical 'undecidability' of the world – the emotional *mess* as it were – that actually constitutes lived life (the micro events of the virtual–actual weave) would only spoil the purity of the event and the matheme of the subject that follows from it. Likewise, there is no equivalent of Spinoza's third kind of knowledge, *except* as the inexplicable and unbidden event. The subject, in Badiou's system, is forever caught in knowledge of the second kind (and perhaps the first), but maintains a faith in the third from which he or she is barred by a narrow but unbridgeable chasm. The third kind of knowledge, we might say, is direct knowledge *and* experience of the generic, the universal.

With Deleuze's Bergsonism and Spinozism, as with Buddhism, there are then two important differences to Badiou: first, the infinite can be prepared for (the conditions of its arising can be put in place, albeit the arising itself is fundamentally different in kind to the efforts of that subject); and second, the infinite can be experienced – this being Spinoza's third kind of knowledge, a beatitude in which the whole world agrees with one, and Buddhist Enlightenment, again a complete identification with the world. Crucially, this experience – as evidenced by Bergson's mystic – is not just a private affair but involves a concomitant involvement in and with the world (put simply, compassion). We might say that this last characterisation of a mode of being firmly involved with the world, in fact a veritable becoming-world of the subject, operates as a necessary corrective to those who seek redemption in an escape from the world.

We might suggest here that the figure of the ontologist, the crucial figure of Badiou's theory of the subject (insofar as it also names Badiou himself) is also a figure who is necessarily barred from experiencing the generic despite being able to prove its existence. This is in contrast to the Buddha, at least as the latter accesses the infinite and incarnates it in their very being. Deleuze's actual/virtual dyad allows a way in to think this co-presence of the two realms, their mutual interpenetration. And the *bodhisattva* is a figure who operates on this edge between the actual and the virtual, with one foot in time and one in eternity, all the while maintaining an extreme fidelity to the 'truth' of the event of the Buddha's Enlightenment. Badiou's subject, in the world but barred from the truth which he or she nevertheless produces, is the melancholy double of this *bodhisattva* for whom there is no bar, or if there is, it is because a decision has been made to instate it as the condition of compassionate action. This *bodhisattva*-subject then is very much in the world, but not entirely of it.

I want to end these remarks on Deleuze, Badiou and Buddhism on a personal note. It is rare to find spaces, places or communities in which a genuine production of subjectivity is taking place. It seems to me that within certain practices of Western Buddhism there is something experimental going on – an attempt to think and practise the *dharma* in a modern and Western context, which does not involve a wholesale turn to the East and a plundering of exotic narratives and images. This has meant, for some, the utilisation of Western myth and specifically pre-modern images and narratives (and also a turn from Christianity to a renewed paganism). I have written about this utilisation of the past to

combat the impasses of the present (and, indeed, about a contemporary paganism) elsewhere – in relation to Deleuze and Guattari's own ideas of a mixed semiotic.[7] In fact, to a certain extent radically new images and narratives are required for a Western *dharma*, and, no doubt, are being drawn and written as I write (and will be based on the experiences of subjects that are themselves involved in practice). What, however, is offered here is the beginning of a more philosophical exploration of some resonances between Buddhism and certain strands of post-Kantian philosophy, when philosophy itself is to be understood, following Pierre Hadot (1995), as 'a way of life'. Indeed, this is to excavate an older model of philosophy, one that held before the splitting of the latter into theology and the more academic and hermeneutic discipline of philosophy that exists today. It is also one that is interested, following Foucault's ideas on the 'Care of the self', in spirituality – and in a transformation of the subject – rather than in a knowledge that is merely apparent to the senses as they are (and, as such, it marks a turn from the Cartesian subject). Might we also say, following François Laruelle, that this is a future-looking philosophy, or, in Laruelle's terms, a non-philosophy that is intent on renewing the conditions of thought itself (and not limiting it those to models already subsumed *by* philosophy)? If philosophy is used in this non-philosophical programme (as with my take on Bergson and Spinoza above), this will be for eminently practical ends and not as merely a further addition to philosophical discourse itself (which, as Lacan has told us, is a discourse of the master – and, as such, maintains certain power relations, or, indeed, stymies any possibility of transformation).

The next step, it seems to me, in this development of a Western *dharma* would be the integration of these different strands (conceptual and abstract – mythopoetic and embodied) and the concomitant development of different kinds of practices and new rituals that allow a subject to sidestep him- or herself, to become other. After all, it is one thing to write, or talk, about transformation but it is another to put this into practice especially in terms of an engagement with emotion – and affect – beyond the intellect. Deleuze himself offers some interesting lines of thought here, for example with his essay on Robinson's adventures on the desert island in 'Michel Tournier and the World Without Others' (1990), or, to return to the essay 'Immanence: A Life', in the cast of literary characters that themselves live different intensive states. The collaborations with Guattari go even further in this direction. Indeed, with the theorisation of the practice of schizoanalysis alongside the development of an expanded ethico-aesthetic paradigm Guattari himself,

it seems to me, has much to offer Western Buddhist practitioners (Buddhism here operating precisely between the therapeutic and aesthetic registers). Ultimately, however, although Deleuze and Guattari, alongside their philosophical precursors such as Spinoza and Bergson, offer a particular philosophical take on Western spiritual practices, the practices themselves will always operate at the sharp edge of experimentation and development. After all, a life of immanence, a life between the finite and the infinite, is always richer – and more surprising – than any philosophical account that can be given of it.

Notes

1. There have, of course, been many other comparative studies of Buddhism and Continental philosophy. As indicative see the work of David Loy, for example the volume *Lack and Transcendence: The Problem of Death and Life in Psychotherapy, Existentialism, and Buddhism* (2001). In terms of recent French thought there is now a large literature on Derrida/deconstruction and Buddhism, though still relatively little on Deleuze and Buddhism (an exception here is N. Robert Glass's essay on Tibetan Buddhism, 'The Tibetan Book of the Dead: Deleuze and the Second Light' (2000)). Although not on Deleuze and Buddhism *per se*, there is also a growing secondary literature on Deleuze and Spirituality/Mysticism. See for example the monograph by Christian Kerslake on *Deleuze and the Unconscious* (2007), the special issue of *SubStance* on 'Spiritual Politics After Deleuze' edited by Joshua Ramey (2010), and the monograph, also by Ramey, on *The Hermetic Deleuze: Philosophy and Spiritual Ordeal* (2012). In terms of Deleuze's third important philosophical precursor, Nietzsche, and the resonances with Buddhism, see Robert Morrison's book on *Nietzsche and Buddhism* (1997), and also my own comments on Nietzsche's eternal return in the third section of my first chapter of *On the Production of Subjectivity* (2012). (It seems to me that Nietzsche's overman has profound resonances with the Buddha, notwithstanding Nietzsche's own sometimes dismissive view of Buddhism which he aligns with Schopenhauer and the extinguishing of the will. It is my contention, in what follows, that a Western Buddhism – or simply *dharma* – is more usefully thought as constructive, which is to say, as offering an alternative production of subjectivity.) Finally, Hume might also be said to explore Buddhist themes, especially in his account of habit as that which, ultimately, constitutes us as individuals. My own understanding of Buddhism in what follows comes from my involvement in the Tiratna Buddhist movement and I want to thank here those Buddhist order members that introduced me to Buddhism (especially Rijumitra) or have led retreats and study days that have informed my take on it. In particular I want to acknowledge the friendship and conversations of both Nagapriya and Samudradaka and the writings of Sangharakshita whose own translation of Buddhism into the West informs more or less all of my own take on Buddhist doctrine and practice. In relation to this involvement see my two earlier attempts at bringing my understanding of Buddhism into contact with Deleuze (and Guattari) in two short articles both written for *Parallax*: 'In Violence: Three Case Studies Against the Stratum' (2000) and 'Writing on Art (Case Study: The Buddhist Puja)' (2001). The gambit of this particular essay is that Buddhism, especially in the figure of

the *bodhisattva*, figures the finite–infinite relation as a specifically liveable one. It goes without saying that my take on Buddhism leaves out far more than it contains, and, indeed, merely skims the surface of a very rich and varied tradition (and takes more than a few short cuts in its account); likewise, my accounts of Deleuze, Bergson and Spinoza, and Badiou focus solely on certain details that might be brought into productive encounter with Buddhist doctrine and/or practice. For a more sustained account of these four thinkers – specifically in relation to the production of a contemporary subjectivity – see my recent monograph mentioned above.

2. My understanding of the reciprocal determination of the actual and virtual is indebted to James Williams's laying out of this complex terrain in his critical introduction to *Difference and Repetition* (2003).
3. For an account of the *bodhisattva* vow, in relation to the *bodhicitta* and to the nature of conversion within Buddhism, see Sangharakshita 1994 (my understanding of the *bodhisattva* in general is also indebted to Sangharakshita 1988). Sangharakshita points out that the *bodhicitta* is not the only event that might produce a conversion; it is, however, one that produces a properly altruistic orientation (a fidelity to the generic). In general, however, a Buddhist might be defined by what we might call a '*dukkha*-event' (illness, old age, death, and so forth) that then begins the desire for something beyond finitude. This in itself constitutes an important difference to a thinker like Spinoza for whom the thought of death is always ethically counter-productive – although it is worth noting that it was Spinoza's grasp of his own finitude that led him to explore the terrain of the *Ethics*. In relation to this it seems to me that a further key area that needs to be addressed in terms of the mobilisation of Buddhism as a radical 'production of subjectivity' today is the relation of this inherent *dukkha* of human experience to our particular capitalist mode of production.
4. Indeed, another Buddhist doctrine – of the twelve *nidanas* – links the break in the circle of re-becoming (reactivity) to the shift to a spiral upward path (towards Enlightenment). Here *dukkha*, instead of leading to further grasping, gives way to the arising of faith. The spiral path, in an echo of Spinoza, is characterised by ever increasingly joyful states (indeed, joy itself is the technology of progression on the spiral path).
5. In passing it is interesting to note that although Ancient philosophy, at least in Pierre Hadot's account, likewise emphasises preparation and an ethical programme (precisely 'philosophy as a way of life'), the actual ethical destination differs to Buddhism, or indeed, to Spinoza. To quote Hadot: 'With the help of these exercises, we should be able to attain to wisdom; that is, to a state of complete liberation from the passions, utter lucidity, knowledge of ourselves and of the world. In fact, for Plato, Aristotle, the Epicureans, and the Stoics, such an ideal of human perfection serves to define *divine* perfection, a state by definition inaccessible to man. With the possible exception of the Epicurean school, wisdom was conceived as an ideal after which one strives without the hope of ever attaining it' (Hadot 1995: 103). It seems to me that this asymptotic account of progression has much in common with Badiou's subject who is barred from the truth although endlessly approximates it, as opposed to, for example, the mystic in Bergson's account who, we might say, becomes divine. Might this also be figured: Plato vs Buddha?
6. A more sustained and close comparative reading of Badiou's system with Buddhist doctrine would be a worthwhile pursuit, though not, perhaps, for *Deleuze Studies*. To point towards just one further resonance: the central importance of the 'void' for Badiou – the empty set that is contained within any given situation or world (and upon which the latter is constructed) – and

the centrality of *sunyata* (emptiness) within Mahayana Buddhism. This also has bearing on what I say above in my Introduction about Deleuze's ontology (of difference in itself). I have dealt with the differences between Badiou and Deleuze on these grounds (their different takes on multiplicity) in *On the Production of Subjectivity* (2012); suffice to say here that from a Buddhist perspective these ontological questions are always subsumed under the more practical concerns of a given individual's transformation.

7. See, again, the last section of the last chapter of *On the Production of Subjectivity* (2012).

The Eternal Return of Teaching in the Time of the Corporation

Greg Thompson and Ian Cook Murdoch University

Abstract

This article addresses the new conditions under which teachers are making the choice to teach. Our core contention is that the reorganisation of schools according to the logic of the corporation, as described in Deleuze's 'Postscript', is changing the flows and forces on the primary surface of 'the classroom'. These changes block the usual movements of teaching to discipline, normalise and individualise, which was the role of the school as precursor to the factory. Blocked from repeating, or returning, teaching as it has always been done, teachers must actively re-will to teach; teachers cannot use order words to name themselves and direct flows and forces as they have usually been done. While many choices to teach will be undertaken, the most popular being that of choosing to teach toward the corporation, the repetition of teaching toward enclosed spaces becomes less compelling. Like Nietzsche's Zarathustra, teachers, who have the courage to actively choose, face a new dawn in which teaching cannot be what it once was. In that moment they must choose to repeat that choice an infinite number of times, the choice of eternal return, and it is from here that new times might begin.

Keywords: teaching, eternal return, Zarathustra, Deleuze and Guattari, metallurgy, control society

I. Introduction

Calls for radical change to education in general, and teachers and teaching in particular, are not new. However, contemporary governance

Deleuze Studies 8.2 (2014): 280–298

and policy reflect an amplification and intensification of change (or reform) agendas within which teaching finds itself. Using Deleuzian notions of the control society and eternal return, this paper argues that the flows and forces of the classroom are being reshaped by the intensification of corporate logics that privilege competition, rankings and certain forms of closeness as agents for educational change. In this abstract machine, teachers are paradoxically being asked to embrace new mechanisms while repeating past teachings. However, the challenge for us is to find ways within this machine to uncode flows, release lines of flight and conceptualise teaching anew. To do this, we turn to Zarathustra and Deleuze's reading of eternal return to suggest that one possible line of flight is that of a teacher whose indeterminacy, uncertainty and disruptive immanence is war machinic, where that focus is on challenging the order-word 'teach' that binds many teaching acts to endless repetition.

A new concept is required due to the 'darker and fiercer horizons that face us' (Roy 2008: ix). Disciplinary institutions such as schools, which have traditionally functioned as places of enclosure, affecting normalisation as individualisation and marked surfaces (bodies, classrooms, knowledges), are adopting corporate and free-market ideology (Apple 2005). These surfaces break down, or deterritorialise, as discourses around education shift to embrace economic and productive logics, which, as Hardt explains, 'progressively' removes the 'distinction ... between inside and outside' (Hardt 1998: 140). One way to think of this is as a change in the different intensities of certain 'closenesses': on the one hand, the closeness of a particular notion of morality and care as affected by various disciplinary and religious logics, and on the other hand, the closeness of consumer to product, as affected by many newer, and increasingly compelling, corporate logics of education.

This is not to say that these corporate logics, which Ball (2003) describes as markets, managerialism and performativity, have not previously operated within educational surfaces. Schools have been using textbooks for decades; and using testing to bring about changes in classroom teaching that speak to business logics of efficiency has a long history (Callahan 1964). Rather, the argument we make is that these logics have become increasingly compelling, or intensified, directing flows and forming desires through these surfaces in recent times. Many of the 'reforms' of schooling, such as testing, rankings, standards, new curriculums and new pedagogies, aim to open, or make visible, the inside of the classroom, and, to an extent, the inside of the teacher and students whose interactions form classrooms.

Territories are constantly changing, shifting, as the '*machinic assemblage* of bodies, of actions and passions' meets the '*collective assemblage of enunciation*, of acts and statements, of incorporeal transformations attributed to bodies' (Deleuze and Guattari 2005: 88; original emphasis). This interaction is affected 'on a vertical axis, the assemblage has both territorial sides, or reterritorialised sides, which stabilize it, and cutting edges of deterritorialisation, which carry it away' (88). For example, teachers are called on to be professionals, while also being asked to accept 'the role of deskilled technicians groomed to service the needs of finance capital and produce students who are happy consumers' (Giroux 2012). Good teaching, as a specific sign of good sense, is changing[1] in a way dominated by the 'neoliberal governance of education itself', as exemplified by the requirement that 'educational institutions must *make themselves auditable*' (Connell 2009: 217–18; original emphasis). In education, this has led to global reform agendas that use policy and performative practices to reshape teachers' work, and by extension, teacher subjectivities (Rizvi and Lingard 2010). The imagination of good teaching is now dominated by corporatised notions of teacher effectiveness and quality (Connell 2009; Clarke 2012).

The corporatised landscape of teaching is constructed within global reform agendas (Rizvi and Lingard 2010) that increase distrust of teachers (Gale 2006) and introduce greater external surveillance and auditing in/of classrooms (Thompson and Cook 2014a; Shore 2008). This landscape is dominated by powerful corporate bodies, such as Pearson Education and Teach for America, and global policy experts, such as those in the OECD (Lingard 2010; Ball 2010), that promote the consumption of educational products by inducing flows that necessitate different returns of the teacher. While these affect discursive or signifying shifts in teaching that are both externalised and internalised by the teacher, the teaching event is also changed. Teaching events are those 'always ephemeral incidents, contingent on material circumstances, and full of action and motion and temporality. Unlike objects, events seem to gobble up space and time, taking up the flow of temporality and spilling out into surrounding space' (de Freitas 2013: 581). These new intensities and altered flows that are forming and intensifying call forth new events that are new returns of teaching.

These new abstract machines of education, which privilege specific outputs and measures, change what is being produced on this surface. Education works differently. These new returns of teaching in the classroom place less importance on flows that manifest (and induce) care for curriculum. Nor can they follow transcendent patterns of the

good student at a particular stage of his or her development. These flow patterns are losing intensity, while other lines through which forces flow intensify. It is not a question of what needs to be known but one of using, even becoming, streams of indexation or evaluation (understood simply as the ascription of some value according to an index of valuation). Wallin argues that the 'commodification of contemporary education is characterised by the often-valorised notions of *perpetual becoming, interminable prolongation*, and *recommencement*' (Wallin 2010: 133; original emphasis). These notions signal new flows into and out of the classroom, these new machines of commodification, and change what can be spoken of as teachers and teaching.

One example of this is the new flows of surveillance through databases and accountability that 'opens' the classroom. Teachers are encouraged to constantly channel and facilitate a student's willingness to swim in the sea of data (always affected by specific currents). In doing so, they prepare their students for testing and, more specifically, the test to come. The result is that the teacher no longer directs striated curriculum flows toward student bodies (teachers are not to 'teach to the test'). In this instance, the disciplinary logic of care for individual students is being overlaid (or superimposed) by the produced desire to be responsive to the data generated.

II. The Corporatisation of the School

The school, like all disciplinary institutions and, indeed, society itself, is being overtaken by what Deleuze refers to as the corporation, but what we refer to as corporate logics, or the logic of the corporation (in order to emphasise the noology in play). While Deleuze accepted Foucault's account of the organisation of disciplinary societies as a series of sites of enclosure through which individuals pass, he was convinced that 'we were leaving them [enclosed spaces of disciplinary society] behind' (Deleuze 1995b: 178). For Deleuze, the central expression in societies of control is the corporation:

> The family, the school, the army, the factory are no longer the distinct analogical spaces that converge towards an owner-state or private power – but coded figures – deformable and transformable – of a single corporation that now has only stockholders. (Deleuze 1995b: 181)

The corporation's axioms overlay (or are superimposed on) the disciplinary traditions of the liberal democratic institution (Savat 2009). Continuousness is one example. Disciplinary societies had termination

points for each of their spaces (from family to school to factory – perhaps via barracks, prison or hospital – each of which finishes with its subjects at some point). In a disciplinary society 'one was always starting again', whereas in control societies 'one is never finished with anything – the corporation, the educational system, the armed services being metastable states coexisting in one and the same modulation, like a universal system of deformation' (Deleuze 1995b: 179).

The rise and ubiquity of the corporation, understood as a noology or way of thinking, means that all other 'institutions' gradually adopt corporate logics. For, 'just as the corporation replaces the factory, perpetual training tends to replace the school, and continuous control to replace the examination, [which is] ... the surest way of delivering the school over to the corporation' (Deleuze 1995b: 179). When it came to the school system, Deleuze noted the emergence of 'continuous forms of control, and the effect on the school of perpetual training, the corresponding abandonment of all university research, the introduction of the "corporation" at all levels of schooling' (182). Schools do not disappear but are reorganised or retooled and teaching is reconfigured within modulatory policy machines (Thompson and Cook 2014a), digital surveillance technologies (Bogard 1996) and the increasingly performative cultures operating at all levels of education (Ball 2003). Certain desires are encouraged; the desire for patterns that represent better numbers as evidence of the quality, and therefore linearity and recordability, of events overlays the care for individuals.

In a control society 'Individuals have become "dividuals," and masses, samples, data, markets, or "banks" ' (Deleuze 1995b: 180). Whereas in disciplinary societies enclosures served to mould individuals according to specific requirements, 'controls are a modulation, like a self-deforming cast that will continuously change from one moment to the other, or like a sieve whose mesh will transmute from point to point' (179). The computer as database constantly evaluates the dividual's new position like 'floating rates of exchange, modulated according to a rate established by a set of standard currencies' (180). The continuous collection of data on teaching, such as through high-stakes testing, value-added measures and continual re-accreditation, exemplify this dividuation. Teachers must understand and practise teaching in the context of auditable outputs assembled anonymously and at a distance from the classroom. Care for students' knowledge (curriculum) as some concern for bodies close by, is represented, at best, through commodified measures or becomes meaningless and counter-productive (such as when schools focus attention only on the performance of those students who

may improve test scores). It is not that teachers have stopped caring for their students; it is that this does not register in databases measuring 'quality'. Mercieca argues that these corporate ethics of standardisation and performativity infusing schools 'give the teacher "permission" to not get involved in the lives of students' (Mercieca 2012: 44). The challenge is to understand teaching in terms of forces, flows and the ways teachers connect to children, despite the policy environment which aims to remove or distance them. In other words, we need new theoretical weapons that enable the 'teacher and students to "surpass" the idea of themselves and the kind of life they live' (44).

III. The Classroom as Surface

To explore the effects and affects of the logic of the corporation on the school in this paper, we conceive the classroom as a surface. This both reflects the topological character of Deleuzian theory (Thompson and Cook 2014c) and registers the character of the corporation as spirit or gas (Deleuze 1995b). In a disciplinary system a classroom is understood as an enclosed and limited space; whereas in a control society a classroom can best be understood as a surface formed by streamlines or laminar flows (Savat 2013: 175). Mechanisms on this surface combine to form machines that interrupt certain flows, release specific energies and operate with varying degrees of intensity. The 'nature' of the classroom is not given before this classroom is constituted but as it is constituted. Fixing our gaze on the classroom is a risky one, and we acknowledge the temptation to define it, set limits and codify or represent it as certainty. However, we use the term to designate the concrete space where virtual and actual flows, multiple temporalities (past, presents and futures) and events meet to produce and capacitate bodies and acts of enunciation. So 'the classroom' has to be continually made and remade as an event and is remade through the forces and flows that traverse the space to produce a territory.

'The classroom', then, is an event formed by and as specific interactions that bring 'a change in intensity where the virtual and actual re-combine and the effects of this change multiply and proliferate the many futures of the situation' (de Freitas 2013: 588). Furthermore, these events are relatively common at the molecular, albeit less common at the molar.[2] The point is not that we seek events in the classroom; they are already occurring, and will continue to occur. Rather, it is that we seek to understand which events are being enabled, affected, made more likely within the current regime of signs, and what possibilities there are to

affect new possibilities beyond that classroom. To paraphrase Deleuze, we think any classroom is defined 'by its lines of flight, it flees all over the place, and it's very interesting to try and follow the lines of flight taking shape at some particular moment or other' (Deleuze 1995a: 171). In this, we see the potential of this theorising to 'put education to work for its own undermining' (Pederson 2012: 366). To do this, we must grapple with teaching and Deleuze's eternal return.

In this construction, then, the classroom is less a static location than a moment where the two planes, or surfaces, of consistency and organisation intersect and interact to form territories. A territory 'has two notable effects: *a reorganisation of functions and a regrouping of forces*' (Deleuze and Guattari 2005: 320; original emphasis). This reorganisation and regrouping is fluid and dynamic, and constituted through the de- and re-territorialising planes of consistency and organisation. The plane of consistency is the 'relations of speed and slowness between particles' that implies 'movements of deterritorialisation' (270). The plane of consistency is continually engaging with the plane of organisation, which is 'constantly working away at the plane of consistency, always trying to plug the lines of flight, stop or interrupt the movements of deterritorialization, weigh them down, restratify them, reconstitute forms and subjects in a dimension of depth' (270). Teaching, then, is a way of occupying the territory of the classroom, in response to the flows, couplings, and forces that move with varying speeds and slownesses across that surface. While these may be spatial, they must also be temporal; the teaching-event constantly moves between organisation and consistency, while also being produced through habits and memories of past and present teaching events (Thompson and Cook 2014b). Another way to approach the teaching event is, as Zemblyas suggests, recognising that it 'has always been a game of knowing and unknowing, learning and ignorance' that requires 'a pedagogy of unknowing' (Zemblyas 2005: 140).

The important thing is that the classroom surface formed requires oscillation. The speeds and slownesses of flows that capacitate bodies in various ways, legitimate various enunciative acts on the communicative surface are always machinic. New machines, new logics and more importantly, new intensities of old logics arrayed on the surface, form and reform. How can we understand this flux, what tools do we have to begin to map the ways that this surface works? In the following section, we present the idea of oscillation as central to beginning to map the affects of educational surfaces, in which new flows and forces emerge as corporate logics interact with pre-existing assemblages of teaching.

This has the potential to produce both repetition and difference depending upon the machines at work, as we discuss in later sections.

IV. Metallurgic Returns

If we conceive the school to be a series of modern disciplinary events that continually refounded a certain territory, then the classroom was, from the beginning, a surface produced by what we describe as metallurgic returns. The metallurgic return is the repetition of the same movement, and one that we think mirrors that of Deleuze and Guattari's concept of the metallurgist. There are multiple ways of thinking teaching, and therefore the classroom, that are fundamental to the forces, flows and connections that form the teacher, student and classroom as a precursor to other institutions of enclosure. One of these noologies of the classroom reflects its place in the transitions from family to factory. It is a spatiality of preparation for a world of work. Another noology has the classroom as a space of interaction of bodies. It is a close-by state that manifests the qualities of haptic interaction. Both of these noologies operate in the disciplinary classroom and teaching becomes oscillation, an alternation between two drives or passions: one to instil knowledge, to mould or shape; the other to be with, to be close-by. It is not a case of extinguishing one drive and its passions for the other drive and its passions. Both movements must be performed for a disciplinary classroom to form, and it is a question of which prevails at some moment. As Smith points out, 'when we talk about the "I," we are primarily indicating which, at the moment, is strongest and sovereign within us; my so called "self-identity" is in fact a differential flickering from drive to drive' (Smith 2012: 327). Thus the I-teacher who adopts a close-by, haptic position and the I-teacher who adopts a transcendent, distanced or optic position is the same I-teacher, but one inhabited by a different passion or drive. In each moment a particular will is expressed against or over other wills and this becomes 'I'. For 'each of us has multiple perspectives on the world because of the multiplicity of our drives – drives that are often contradictory among themselves, and that are therefore in a constant struggle or combat with each other' (326).

The crucial point is that both the movements of moulding and the movements of being close-by must be continually enacted; for the mould can only be introduced once the ore has been found and readied for that mould. In moving close to the student a teacher affects 'passion and sincerity' that 'will permeate the atmosphere of the class, the learning context and the subsequent educational practice' (Cole 2011: 553).

This affect does not determine the encounter with students, as it will meet 'an undifferentiated plane in the educational context between the students that will draw in parts of their social lives and perhaps not actively involve the teacher' (553). This produces a surface that functions with an ethico-spatial register that regulates how a teacher moves – or more precisely, what movement is possible within which space (Deleuze and Guattari 2005). Only by moving close can the teacher fully enclose the student through normalisation as individualisation.

Teachers, in disciplinary spaces, have always moved between machines that lead them to acquire a sense of the ideal student (as the productive-disciplined student-toward-worker) and practices and affects in the classroom in face-to-face/body-to-body relations with students (Thompson and Cook 2013). The close-by captivating confluences with students that occur as teaching are not the directive-machines that provide the mould that teachers are to reproduce. There is a balance, a series of oscillations between the close-by interactions with the students and the far-away machines of curriculum, policy and other normalising machines. There is also, as de Freitas suggests, a back and forth movement between past and future, as each teaching event is 'a moving and unravelling thread trailing off behind and ahead' (de Freitas 2013: 588). It is too easy to say that these are the macro and micro effects, because they interact, overlap and flow. The importance of this discussion is that teaching oscillates to induce flows that have previously resulted in a disciplinary classroom as a matter of course.

Teachers have regularly faced a challenge of returning. For questions of what it is to be a teacher arise when teachers must link their inside (events, ethics, interactions) with the outside (logics of teaching, policy, overcoded representations, morality) associated with producing the 'right' kind of teaching through the immediacy of close-by interactions with students. In this, the teacher is like the metallurgist. Whereas the metallurgist follows the seams or flows of ore to produce metal implements, the teacher follows the flows on the planes of consistency and organisation with students that potentially produces events. The back and forth movement of territorialisation requires that the teacher/metallurgist is always having to actively choose.

Teachers, like metallurgists, are 'in themselves double: a hybrid, an alloy, a twin formation' (Deleuze and Guattari 2005: 415). This oscillation that produces events means that the classroom always contains possibilities (lines of flight) that have only been enhanced by the ways in which new (and old) forces and flows operate with altered and/or specific intensities and limits. The working to and fro between

closeness and distance places teaching in constant flux. However, we would be foolish to allow this oscillatory function to stand as some pining for a disciplinary past within these new machines. Rather, the question of what is possible, what is beyond the control, should not privilege a return of the certainty, and indeed violence, of the disciplinary.

Also like metallurgists, teachers come under the control of the state while enjoying 'a certain technological autonomy, and social clandestinity, so that, even controlled, they did not belong to the State any more than they were themselves nomads' (Deleuze and Guattari 2005: 405). They may have been exposed to ordering but remained artisans who were 'determined in such a way as to follow a flow of matter … The artisan is *the itinerant, the ambulant*. To follow the flow of matter is to itinerate, to ambulate. It is intuition in action' (409; original emphasis).

Teachers in the society of control must ask themselves new questions of return, and in enacting and instantiating those self-interrogations as will to power return same as difference. They must find new ways to finish the sentences: 'Teaching is …', 'Teachers are …', Students are …' and 'Classrooms are …'. And teaching in classrooms will be affected anew. No longer able to care as they once had and to return their teaching in a classroom striated by the state, teaching in a control society is care for scores, for externalities. It is no longer care for students in the service of the state, but care for students' scores in the service of the corporation as manifested by an 'inexorable rivalry presented as healthy competition' (Deleuze 1995b: 179). This represents a 'significant transformation' in the notion of care itself (Savat 2013: 15; Stiegler 2010).

V. Eternal Return and the Teacher

But metallurgic returns of the same are not the only forms of return, and, for Deleuze fall short of Eternal Return. The teacher is choosing, but it is not a profound existential choice of a moment to be repeated forever. Flows associated with metallurgic returns were facilitated, energised and resourced (these might all be the same thing) in the disciplinary classroom. They are no longer facilitated, energised and resourced at the same levels in a classroom coming to manifest the logic of the corporation. New horizons face teachers. They can work feverishly to maintain the flows and repeat a bizarre caricature of metallurgic returns. Or they can choose otherwise. Teachers who have been used to working

with and within the various striations that overlay and underpin the classroom may no longer be able to continue to teach as they have done previously. As a result of the effects of corporate logics in and as the classroom, teachers face a landscape unlike that for which they have been prepared and in which they are confronted with choices more direct and disturbing than those to which they are accustomed in a disciplinary society. This means that the usual (lesser) moments in which the question 'what am I doing teaching?' is becoming the question 'who am I?'

The bringing forth of a moment of deeper choice requires an engagement with eternal return (a concept from Nietzsche that Deleuze deploys in a particular manner). This is not because teachers face eternal return for the first time, as their betweenness makes eternal return always in question. Teachers face eternal return in a corporate landscape, however, that makes returning the same as the same (disciplinary copy) increasingly difficult, and the attempt to manifest sameness becomes authentic and disruptive (that is, simulacral) difference. 'Good teaching' has become coded through and within corporation-speak, rather than the disciplinary past; we hear references to value-added measures, efficiency, quality, all understood within neoliberal reforming agendas that no longer require teachers to manifest moulding.

While many teachers will refuse eternal return for as long as they are able, at some point teachers have to do something else. Each must forcefully re-will him- or herself to become another teacher. To do this they must manifest will to power, as this is crucial for the eternal return of teaching in a classroom within which important disciplinary striations have been smoothed by the corporation. For Deleuze, eternal return and will to power are 'the two most fundamental concepts in the Nietzschean corpus' (Deleuze 2004a: 117). Will to power defines human being and is the motor of return.

This is significant because on any given day, across the Western world, thousands of teachers walk into their classroom and begin to teach. While we must not forget that there was teaching before there were classrooms or even teachers, each time a teacher walks into a classroom something particular happens, a particular moment of teaching is enacted. And while this teacher finds him- or herself in this classroom, it is not for the first time and not for the last time. The questions that arise here concern what connects these moments of teaching. In the first instance, each of these teachers walking into each of these classrooms repeats what they have done before. They enact teaching as they understand it, and as they have been trained to understand it. 'This teacher' walks into 'this classroom' and his or

her teaching begins, as it has begun before by this and every other teacher.

Life, according to Nietzsche, '*must ever surpass itself*' (Nietzsche 1954: 125; original emphasis). It is a 'will to procreation, or impulse towards a goal, towards the higher, remoter, more manifold' (125). Will to power 'is not simply a drive to survive – which would be better served by maintaining a state of equilibrium – but a drive to expand, to "go forth and multiply", to become ever more numerous' (Keeping 2012: 77–8). Enacting will to power is recognising our responsibility for good and evil, and making good and evil *our* good and evil. Choosing the 'right' thing to do now is to destroy the 'right' thing to do then. Choosing the 'right' way to teach now is manifesting will to power. For 'good and evil which would be everlasting – it doth not exist! Of its own accord must it ever surpass itself anew' (Nietzsche 1954: 125). Thus, 'he who hath to be a creator in good and evil – verily, he hath first to be a destroyer, and break values in pieces' (126).

Following Deleuze, the moment of eternal return requires an embracing of my fate and not passive acceptance of my fate (as some Nietzscheans would have it[3]). In affirming my fate, *amor fati*, I embrace all that I have done in the past that leads to this moment of eternal return of the same as different. It is an active affirmative event. If the eternal return requires us to engage a will to do this forever, then it represents a profound existential moment (though not an individual moment). Eternal return requires active choosing and it is this active choosing in a landscape radically altered by the corporation that makes the return of the same as the same (copying) increasingly impossible for most teachers.[4]

Once teachers recognise and embrace eternal return (as many are being forced to do), they have no choice but to re-will to teach in a manner that they will return infinitely. They must be creative, or as Mercieca has suggested, surpass the forces and flows that have typically designated teaching in order to embrace a 'becoming-teaching' that requires new organisations of flows, forces and understandings of the limits of connectivity (Mercieca 2012: 46). 'It is the *thought* of the eternal return that selects… . The thought of the eternal return eliminates from willing everything that falls outside the eternal return, it makes willing a creation, it brings about the equation "willing = creating" ' (Deleuze 1983: 69). The principal question, though, is not one of the origins of the creativity that is affected as will to power, but of its qualities and of its force. The crucial difference is between teaching that is willed with little force or intensity and that which is

willed forcefully and with maximal intensity. 'The eternal return is the new formulation of the practical synthesis: *whatever you will, will it in such a way that you also will its eternal return*' (68; original emphasis). Another's power, a recollection of some teacher from my past, may flow through a teacher's body that affects it, but this must be done intensely to affect will to power and eternal return of *my* teaching (and not out of habit).

Even if eternal return implies recurrence, it only does so to deny the return of the same, Similar or Identical. Each of these is of the past, whereas repetition as will to power and eternal return is of the future. It is of teaching's future. It is a calling into the future, as a repetition that looks forward to future repetitions. In the end, or beginning, 'what is produced, the absolute new itself, is in turn nothing but repetition: the third repetition, this time by excess, the repetition of the future as eternal return' (Deleuze 1994: 90). Eternal return brings something 'into being which cannot do so without changing nature' (71). For teachers, this is a process of selecting as teacher, or teaching, and enacting this with force.

This reminds us that will to power and eternal return concern intensities. Nietzsche's 'eternal return is taking us into a dimension yet unexplored: neither extensive quantity nor local movement, nor physical quality, but a domain of pure intensities' (Deleuze 2004b: 122). As 'the instrument and expression of the will to power', the eternal return 'raises each thing to its superior form, that is its nth power' and 'eliminates "half-desires" ' (125). The eternal return and will to power do not demand that one cease doing, to cease teaching for example, but to do whatever we choose to do to the nth degree. In being subjected to new forces, teachers must engage teaching with a heretofore lost intensity. (To do so, for us, requires attaining the speed of the nomad and, therefore, the possibility of becoming-war machines.) It is to this future that we also look in this discussion of eternal return, will to power and teaching in the control society.

VI. Zarathustra and Teaching

If we follow Nietzsche's story of Zarathustra's returns, we think this makes sense of the situation in which teachers find themselves and the choices that confront them. For us, Zarathustra performs two metallurgic returns before realising that the only way to be a teacher (of will to power, which is the highest truth) is to engage eternal return and make an active choice Different from every choice he or she has previously made. Nietzsche's Zarathustra illustrates both the

metallurgic movement and that movement that engages eternal return. The paradox for the contemporary teacher, who understands and is comforted within contours of the disciplinary apparatus of the school but is increasingly forced to encounter a new conception of teaching in a control society (replete with heightened intensities and a sense that his or her disciplinary care is under attack), mirrors the experiences of Nietzsche's Zarathustra. To us, Zarathustra expresses the hopes and frustrations of teaching, trying to understand change and engage ethically with a post-ethical (post-disciplinary) world. Zarathustra is a teacher, and in his journey we gain some tools to better understand teaching.

While he is up the mountain (the metallurgist is likely to be digging), Nietzsche's Zarathustra discerns the coming of the Higher Ones. He descends to tell the nearby townsfolk of their future but they laugh at him and think him a fool. He has not connected. 'But still am I far from them, and my sense speaketh not unto their sense' (Nietzsche 1954: 15). He goes back up the mountain to, in our reading, reflect on his teaching practice. He realises that he must connect and seeks 'living companions, who will follow me because they want to follow themselves' (17). He fails once more, however, when his companions become believers. Believers cannot become Higher Ones.

Zarathustra's is a far more demanding mould than those teachers enact. He seeks self-made people. 'Ye had not yet sought yourselves: then did ye find me', he complains. He is forced to bid those who seek to learn from him to 'lose me and find yourselves; and only when ye have all denied me, will I return unto you' (Nietzsche 1954: 82–3). While it is demanding, it remains for us available, as a result of the effects of the logic of the corporation on the classroom. The classroom is not what it once was. The teacher can't simply return the old processes associated with moulding the future worker.

We note that leaving the classroom is the last of Zarathustra's teaching movements. He comprehends his greatest sin and what he must do as a teacher to correct this. His greatest sin turns out to be ' "*Fellow-suffering! Fellow-suffering with the higher-men!*" ' (Nietzsche 1954: 368; original emphasis). This he must end by leaving; for he has *his* work to do. ' "This is *my* morning, *my* day beginneth: *arise now, arise, thou great noontide*!" – Thus spake Zarathustra and left his cave, glowing and strong, like a morning sun coming out of gloomy mountains' (368; original emphasis).

As Deleuze pointed out, Nietzsche did not finish *Thus Spake Zarathustra* and we do not know what was to become of its central

figure (Deleuze 2004a: 117). We note, however, that for Deleuze 'the revolutionary problem today is to find some unity in our various struggles without falling back on the despotic and bureaucratic organization of the party or State apparatus' (Deleuze 2004b: 260). This eternal return has the potential to help answer Deleuze's questions: 'who are today's nomads, who are today's Nietzscheans?' in the classroom (260).

VII. The Challenge of Zarathustra

So, now that the metallurgic return is blocked, the challenge of eternal return is for the first time real and the infinitive 'to teach' and the order word 'teacher' must be actively re-willed, because teaching has to be actively re-willed Differently, due to effects of the logic of the corporation. The problem for teaching is that the usual practices for constituting the territory 'teaching' are beginning to function through different oscillations. Two affects are important. First, the corporation's logic prevents the classroom from returning individualisation, which was hitherto its function. This diminution of normalising flows toward individualisation in the classroom and the intensification of dividuating flows mean that specific flows of the close-by have increased energy. Normalisation as individualisation required acting at a distance according to a transcendent model. It necessitated the return of an optic relationship in which students were positioned according to externally determined notions of the normal and normal progression. The second affect of the increased impact of the logic of the corporation in the classroom is that haptic teacher – student relationships are more likely to eventuate. This is significant, as Roy notes, because haptic space 'is insurgent space, whose gradients are produced region by region, neighbourhood by neighbourhood, through connections, deterritorializations, intensities and observances' (Roy 2005: 32). Most importantly, for this discussion, haptic space 'induces new becomings, and is reciprocally produced by such becomings' (32). It is to the breaking of habits, or habitual returns, that we must now shift our attention, for it is here that the importance of eternal return in the classroom may be found.

There are no longer teachers and students, there are singularities, creative, unfettered and acentred, such that each becoming-teacher/student manifests speed. To put it another way, teachers must change how they move so as not to induce a classroom of any type or configuration. It is not enough to 'get close' to the students – a frequent

tactic that Foucault saw as a strategy of biopower played out in the classroom (Foucault 1988) and which we understand in terms of normalising–individualising oscillations. Rather, the event that might be called teaching requires a letting go, an embracing of '*unthought*, non-identitarian potentials' (Wallin 2011: 286; original emphasis). There is no easy movement for teachers trapped by the 'natural inner movement' of the classroom (Jones 1990: 74).

Nor is it enough to suggest that for teachers to embrace eternal return the classroom must go online or become 'flipped' by technology, because classrooms are still centred places–ordering and categorising still function. The teacher who embraces eternal return must let go of teaching and the name of the teacher. It is not possible, as some have suggested, to adopt pedagogy and curriculum practices as 'nomadic' while participating in and releasing flows as teaching through corporate logics. This must be a political act, the teacher embracing a line of flight '*that delimits nothing, that describes no contour*, that no longer goes from one point to another but instead passes between points [...] a mutant line of this kind that is without outside or inside, form or background, beginning or end' (Deleuze and Guattari 2005: 497–8; original emphasis). And this may be one possibility of Deleuze and Guattari's concept of the war machine, that turns its disruptive potential onto the Oedipalised, certain and constrained flows contained in the order-word 'teacher'. After all, as Wallin suggests:

> the task of creating *a* pedagogical life is not that of occupying a ready-made plane or territorialising a new space in one's name. Rather, the task of creating *a* life might be thought as one whereby we learn to occupy a plane in order to make it holey, that is, to introduce fractal contours upon its striated form, preparing the ground for emergence of *a people yet to come*. (Wallin 2010: 130; original emphasis)

VIII. Conclusion

The teacher is not alone in being confronted by, and being afforded the possibility of, embracing the future and the future of the future (in willing for a repetition that will be repeated, if not always in the same way, eternally). In the teacher we find at least one of those whose movements have been changed, even while staying the same, by the intensifications produced by the increasing effects of the logic of the corporation (we also find the doctor caught in the super-clinic and the politician trapped in the endless opinion poll). Joyful, exuberant and

vibrant engagement (return) to a classroom made anew and made for a future embraced becomes possible. As do darker outcomes.

Notes

1. Discursive formations and construction of good teaching have always been responsive to shifting social, political and economic imperatives (Jones 1990). These have an effect on logics of regulation and registration (Connell 2009), teacher education (Moore 2004) and public perceptions of what constitutes becoming-teacher.
2. This explains for us Deleuze's comment in an interview with Negri that: 'They say revolutions turn out badly. But they're constantly confusing two different things, the way revolutions turn out historically and people's revolutionary becoming' (Deleuze 1995a: 171).
3. This, for Deleuze, 'wrong' interpretation is forcefully presented by Malabou (2010).
4. As Ward points out, 'Deleuze seems to feel that a great deal is at stake in getting the interpretation of eternal return right' (Ward 2012: 107). Central to this 'right' interpretation is Deleuze's view that eternal return was not the 'repetition of the identical … [but] evoked a process of transformation in which "reactive" forces were eliminated' (101). Kerslake makes two vital observations in this context. Embracing my past, by understanding it as the past that I willed, necessitates that 'the "I" who wills the past must be different from the "I" who took themselves to be determined by the past' (Kerslake 2007: 36). This means that I cannot project an identical self into the future because 'the eternal return implies the dissolution of the identical subject in the future as well. Eternal return implies that if I am going to re-will a previous action, I will only be able to do so by taking it as the act of another, someone with whom I can no longer identify myself' (36–7). We also concur with those who reject the view that Nietzsche adopted a determinist position that meant that *amor fati* must be love of one's future fate. Nietzsche casts 'fate in terms of that which was rather than that which must be' (Grof 2003: 35).

Book Reviews

Ruben Borg (2007) *The Measureless Time of Joyce, Deleuze and Derrida*, London and New York: Continuum Literary Studies

When it comes to reading or reviewing books devoted to comparative philosophy, one often finds it difficult to actually come across an original perspective on the authors about whom such volumes are supposed to be. They usually present a condensed synthesis of a number of well-known concepts that are connected to those thinkers, whereas the significant commentary work ends up being neglected, making the effort of drawing connections among those ideas more difficult, or even nebulous, for the reader, who is left completely alone in confronting and elaborating a personal view on them.

In the specific case of a book which deals with a heterogeneous and elaborate subject such as literary criticism within deconstructionist theories, this task seems an extremely complicated one to accomplish, yet *The Measureless Time of Joyce, Deleuze and Derrida* manages to successfully achieve it and delivers a clear, progressively incisive outlook on how the concept of time can be turned into a *fil rouge* that fuses some central hints of the above-mentioned French thinkers with the elaborate poetics of James Joyce.

More specifically, this long essay is to be praised not only for its clarity, which is with no doubt the result of a thoughtful research on Joycean *Finnegans Wake* (1939) and a profound interest in the latest developments of French contemporary philosophy, but also for the author's ability of underlining the central focus of his own work from the very start: how can we all be true philosophical readers of Joyce? Or more precisely, how can contemporary French philosophy help us become aware of the beauty of this monumental literary work without being threatened by its bizarre, complex language?

It is in fact the choice behind the hidden mechanics of Joyce's lexical selection, grammar, puns and disparate quotes that interests Ruben

Deleuze Studies 8.2 (2014): 299–310

Borg, and the fact that such a compendium cannot and should not be reduced to a subconscious selection to be related to the so-called artistic inspiration alone, in naively romantic terms. Beyond semiotics, and beyond hermeneutics as well, the primary intent of this essay is to apply a new interpretative model to modernist literature: in other words, the principle at work here could be summed up to a single Deleuzian question: 'How does this text function?' rather than 'What does it mean?' We may find the answers to both these questions to overlap in the end; nonetheless, the path leading to such a conclusion must be discovered and elaborated individually, as the book itself will demand it.

In conclusion to this brief introduction, and before going into any further detail about the structure and the contents of the volume, there is an essential preliminary remark to be made: despite quoting a number of eminent philosophers from our tradition, namely Aristotle (2005) and Vico (1968), any possible reader of this book must be completely free from misleading preconceptions about the philosophical value of deconstructionism, in order not to perceive it as a confused compound of opinions which lead to no logical conclusion, where 'conclusion' stands, in traditional academic terms, for an unfailing and unquestionable final resolution. On the contrary, the rational scheme on which the book is organised will facilitate a deeper understanding of the basic epistemological questions at stake within deconstructionism itself (in spite of the complexity usually associated with the works of Derrida and Deleuze), accentuating how powerful their thought is when applied to literary critique.

At the same time, it also provides Joycean scholars and enthusiasts with innovative interpretative tools which resourcefully combine the contributions of renowned critics, such as Eco (1989), Attridge (1988, 1995), Lewis (1957) and Paris (1967), among others, with insightful personal philosophical declinations by the author himself.

The volume is divided into three chapters, each one centred on a different perspective on how 'time' develops within the narrative style of *Finnegans Wake*, trying to abstract general stylistic choices from seemingly paradoxical extracts of the text itself.

The very nature of the practice of reading is questioned by Borg, who aims at stressing the performative aspects of the eccentricity of the creative fluid structure of Joyce's latest masterpiece, where human language, as Derrida wrote in his 'Ulysses Gramophone: Hear Say Yes in Joyce' (1988), is committed to complete equivocity.

What does time have to do with all this?

The answer provided by the author in Chapter 1, 'Time's Nature', begins with a striking consideration: *Finnegans Wake* is a Babel of lexicon, where words which are not featured in any dictionary can find their own place without being reduced to a forced translation, but rather invalidating any authoritative definition. Yet these words are available to our reading: they appear as singular inventions which are able to represent an image of time's self-differential movement by 'staging a narrative performance that is unmoored from the synthesizing activity of the transcendental subject' (32).

The encyclopaedic aspect of *Finnegans Wake* is encountered both as a compendium of the totality of human experience on one hand, and, on the other, as a faithful acceptance of the obscurity in which human action (past, present and future) repeats itself and celebrates its own erasure and retracing. Joyce manages to do so thanks to his stunning ability to manipulate languages in order to create neologisms and paronomastic terms which, even though often annoying at a first approach, do seem to possess a unique capacity of fascination and appeal. The incongruence and the paradoxes they imply should be read as Joyce's endeavour to conjugate the deployment of a figural language with a conception of time that focuses on its peculiar (and incessant) passing and fading.

Chapter 2, 'Time in Figures', specifically deals with the impersonality of the language spoken by Joyce and the characters of his novels, paying much attention to a supposed unconscious force which is thought to be at work underneath the psyche (and the self) of both the author and the readers. This concept is close to the Bergsonian idea of an interrelatedness of past, present and future in spite of the existence of a conscience, traditionally intended to be capable of grasping the passages which should mark the boundaries between two following instants.

The reference to the works of Henri Bergson, especially *Time and Free Will* (1910) and *Creative Evolution* (1944), is essential to Borg, and the author makes a targeted and thoughtful use of some quotes taken from said volumes: the French philosopher's intuitions represent a perfect means to link the need to outline a disruptive mark between the original genius of language and logical thought, within a perspective that takes the power of metaphorical expressions into primary consideration.

From a Bergsonian point of view, as Borg repeatedly states, the nature of words is a mobile and transferable one: it is therefore only through a totally inventive syntax that the conception of time as 'now', as the living present of metaphysical tradition,[1] can be surpassed in favour of a non-mathematical, more truthful and productive relation to it.

This last assumption is not to be understood as a mere attempt at escaping the logical path of rational research, but as one of the most powerful and influential theses of twentieth-century philosophy, which has not yet been completely investigated in its theoretical potential.

When Bergson affirms that time is invented or it is nothing at all, he opens an entirely new perspective on how linguistic multiplicity can express its contents, and this can be accounted for as a reliable criterion to take into serious consideration when synthetically deciphering *Finnegans Wake*. According to such a premise, the number of forms and expressions held in everyone's conscience is indefinite and unquantifiable, pushed forward by desire, held back by unwillingness to act, unforeseeable in its combination, resisting the idea of a passing of time as a prefigured consequence of instants in linear expansion. Indeed, *Finnegans Wake* makes the now perishable, by creating a 'probapossible' future, where the surplus of citations, the almost obsessive repetition of puns, its subtle irony, all design a seemingly anarchic plot.

Past, present and future are to be perceived as an inter-subjective flow that cannot be foreseen, where everything circulates, tracing changes and nonetheless remaining unconceivable for the so-called transcendental conscience. A fluvial imagery that demands a great interpretative effort from readers and, at the same time, entails a loss of identity which is nevertheless sensed as captivating.

This chapter, therefore, aims at explaining why Joyce did not opt for a traditional narrative style, and the basic answer to such a question lies in his faith in the *élan vital*, as Bergson would have said; what Borg seems to suggest is that Joyce represents an enduring source of investigation for theorists because he intentionally provided, more than the de facto thinkers we are more accustomed to, a never-ending motive for philosophical enquiry.

Chapter 3, 'Making Time', is mostly devoted to the description of the portmanteau, the heart of Joyce's ventriloquism, his most personal elaboration of the philosophical assumptions mentioned above into a figural invention. The portmanteau is a rhetorical firework that exceeds good measure, and blurs any effect of fixity in the narrative structure of the novel; it undermines our faith in grammar and, as Borg himself affirms, reminds us that 'there are texts we still need to learn how to read' (65). The description of the internal mechanics of the portmanteau shows how the concept, any concept, can be transgressed and redirected from its regular communicative task towards a particular type of harmonic dissonance. Moreover, the portmanteau being a special kind of pun made up by the apparently mathematical sum of

different signifieds in a single signifier (Eco 1989), when this happens within a narrative scheme, it makes room for an unaccounted textual configuration which Joyce poetically shapes to purposely create an effect of duplication and bisection which is both to praise, in aesthetic terms, and to deconstructively analyse.

Does this rhetorical device have anything to do with time at all?

Deleuze's opinion about the portmanteau provides a significant explanation: as he wrote in *Proust and Signs (2000)*, the modern work of art is a truth-producing machine that has no problem of meaning, only a problem of use, and therefore it must not be accused of guilty relativism, but rather be seen as a semantic tool capable of placing truth into a temporal connection with a totality that is yet to be unified, understood or completed.

The question of time is thus interpreted as a part/whole issue, and it informs us about the importance of the fragment against the final product, stressing how a dialectic relationship is always impracticable in such occurrences, especially within modernist literature, if not at all when it comes to a description of language–subject mechanics. In other words, teleology fails at helping us approach complex semiotics, especially when they are consciously conceived in order to elude truth as a logical given statement; hence an aporetic device as the portmanteau demonstrates how close Joyce and the basic deconstructionist stances of Deleuze and Derrida are. The tales of Shem and Shaun, for instance, do fit into this conceptual frame as they represent an effective attempt at comparing two types of radical difference without reducing one to the other.

Narrative is a practice that requires an infinite work of recombination, which must have openly surrendered to errancy and dissociation. Joyce himself agreed with this when he wrote that every word we use represents a Trinity, composed by three different elements: a sense, a sound and a power to evoke pictures.

Here lies the strong bond which links and creates a transdisciplinary bridge between Joyce and the deconstructionists: what the Irish writer attempted in his long-pondered novel and Deleuze and Derrida have repeatedly asserted in their works is precisely the urge to testify a void at the origin of our so-called subjectivity, and to set this necessary incompleteness free from the ghosts of classic metaphysics. Deconstruction not only works on the discrepancies and contradictions within the text, any type of text, but it also posits them as the essential and ever-enduring elements upon which reality, the materiality we experience in our daily existence (and try to express in linguistic/aesthetic

forms), is constructed. Joyce should therefore be considered a pioneering figure of deconstructionism according to this perspective; he managed to create exceptional works of art whose design is intentionally drawn on the rhetorical dramatisation of such a logical impasse, as Borg suggests.

In Chapters 4 and 5, 'The Rhetoric of Memory' and the conclusive 'Technologies of Forgetting', this investigation is pushed even further. *Finnegans Wake* often seems to deliberately cross the line that separates hyper-productivity from waste. In doing so, it shows a profound worry for the multitude of information it carries on, through a constant display of an excessive mnemonic work that is afraid of lacking decent self-maintenance. It therefore challenges the normal egocentric schemes of progress and remembering by altering the regular distinction between the subject's interiority and the objective world. By taking into account a remarkable extract about the Willingdone Museyroom, a landmark of the Dublin landscape, we get closer to Joyce's idea of the past as a fusion of both dream-work and a cumulative recollection of objects, without any apparent criteria of selection.

Like a storage space (or a rubbish dump, as Joyce vividly describes it), individuals create history by accumulating elements from the past and including them in simulacra of their 'living presents': imagery is the focus of the ego, and in the *Wake* we can face how this interiority is intentionally shaped into words to be open for anyone to see and explore.

This aspect is matched with what Derrida describes as a work of 'spectral spiritualization':[2] we keep a memory of the other, yet this relation undergoes a fundamental phenomenological impossibility, where (as the trace of the trace, the giving of the gift, etc.) oblivion haunts our urging grasp for narcissistic completeness. Borg continues his investigation by taking into account the influence of Vico and *The New Science* (1968), focusing on the strong impact the Viconian themes about the origin of history had on making of Joyce's paragrammatical style, and he definitely makes a valid point with this: since Vico is interested in putting the obscure to work in his etymological explorations, he chooses indefinite and unthought connections to be the basis of primordial knowledge *tout court*.[3]

The true etymologist, the one who is interested in putting Time and Word at the very heart of his own research, 'establishes a symmetry between poetic instinct and the historian's principle of etymological reconstruction' (114): in the end, there is no more authoritative or self-evident way to trace the history of humanity than by producing it

through a metaphorical work of reassemblance, given that the principle which rules over the making of mankind is unconscious and primarily sensory. There cannot be any exact science capable of demonstrating that there is a rational principle to control the development of civilisation, making history foreseeable and computable. We can only rely on 'imaginative metaphysics'.

Vico's influence is not a simple supposition but a well-documented fact: in *Finnegans Wake* we can find many occurrences of the portmanteau word 'vicociclometer', a term which (explicitly recalling the name of the Italian thinker) should supposedly indicate a mechanic and simultaneously mnemonic device which rearticulates and recycles the narrative on the premise that history itself is, according to Joyce, a combination of catastrophes, eccentricities and erotic/heroic acts all unified by the legacy of the past, which is nothing but a pre-grammatical force of re-elaboration.

Quoting Deleuze, we can comprehend history through the vicociclometer as a co-implication of the virtual and the actual: time preserves itself in the totality of the past, but it also disarticulates the present by introducing a memory whose value lies in the capacity of creating an image of time as a whole. This is only partly true, and Borg highlights it; there is indeed a principle of combination at work in the Wake, but it functions in a completely different way: if there is a 'totality' of the past, it can be achieved exclusively through the dual activity of *memoria* and *fantasia*. It is not given to the human eye. It is not there to be seen or perceived as a permanent mark, and thus it could not possibly ever be posited or given for granted.

Overall, this book is an outstanding post-structuralist work that shows how self-knowledge, which is in many points of view the very first task of philosophy, necessarily entails a compromise with rhetorics, as well as with a supplement of materiality: truth needs to be *fabricated*, as it is only through a creative approach with immanence that we can try to secure ourselves some convincing, yet temporary, answers.

One might argue that the title of the volume does not suggest an exhaustive coverage of either Deleuze's thought or Derrida's, but that would be a misleading remark to make. This text disseminates scattered suggestions about how to approach their works by addressing the Joycean text (purportedly about the origins of language and time as history): in doing so, Borg's book not only delivers a brilliant application of deconstructionism to comparative studies in the Humanities (with a striking revisional reading of Joyce's most elaborate masterpiece),

but also stands out as a solid independent philosophical essay which provides a number of significant hints for the contemporary thinker.

Notes

1. And, in strictly contemporary times, the living present as intended by Husserlian phenomenology.
2. Such themes are treated in Derrida's *Spectres of Marx* (1994). Another significant comparison outlined by Borg is that with Blanchot's theory of the 'fragment': the French literary theorist develops within his text *Awaiting Oblivion* (1999) a paronomastic chain that disarticulates all secure definitions putting the accent on how thinking is only possible through thinking alone. Whereas Joyce tends to opt for cumulative series, Blanchot tries to simulate an essayistic style. Borg underlines that, despite the different styles, their idea of memory as errant thought, falling outside the economy of time self-differential logics, is ineed very similar.
3. The original Latin expression coined by Vico in *The New Science* is '*homo non intelligendo fit omnia*' (Vico 1968: 115). This is the opposite of the traditional metaphysical principle according to which man rules over things once he can prove he understands them.

Félix Guattari (2011) *The Machinic Unconscious: Essays in Schizo-analysis*, trans. T. Adkins, Los Angeles: Semiotext(e)

According to Félix Guattari, we have the unconscious we deserve. In Guattari's work the unconscious is the mirror of the ideological superstructure implanted within subjectivity, confusing us into believing that subjectivity is immanent to our 'essential nature'. In fact, the unconscious reterritorialises and deterritorialises through extreme effort, and through exertion it moves conscientiously. Dreams constitute a concrete-abstraction of the differential social dynamics housing the material aspects of our waking life. If we take Guattari seriously, dreaming is irreducible to pure physiology, as in chemicals exciting the cerebral cortex or synapses firing in the frontal lobes. For Guattari, science cannot be isolated from societal influences, and it is not advisable to group energetic, physico-chemical, biological, libidinal intensities as separate from emotional, aesthetic, revolutionary, scientific intensities. Systems of intensity are combined, even rhizomised upon themselves. Bios, or life-forces, constitute intensity, and in his analysis there is no distinction between these fields of resonance. Even physico-chemical bios is social and capable of deterritorialising (69–70). In this theory, the unconscious is never a-social or a-political, but an otherwise imaginative processes to be unleashed by its liberation, and doing so exemplifies a non-totalising creative poeisis at the threshold of reason.

Elsewhere, in *Anti-Oedipus* for instance, the unconscious is theorised as a factory capable of non-essentialist desiring-production. Content is always inextricably linked to the social field cohabitated by subjects. For instance, in this text Guattari says the social field in capitalism creates an 'intersubjective mush'. If the unconscious is a machine, it is constituted by a deterritorialising and reterritorialising mechanism because no general assemblage overhangs it in an essentialist manner. The unconscious is inscribed and can recreate itself according to its position within the social field of relations that situate, place and eventually move it. But we are not entirely passive receptacles for the dominant ideologies like doctrinaire Marxists might have us believe.

In taking on the other behemoth of modernism, namely Freud, this text provides a wonderful critique of psychoanalysis as well.

For Guattari, Freud is too reductive because epigones of his work theorise that unconscious drives relate back to repressed libidinal urges centred in the Id pushed down into latency so as to streamline the functioning of civilisation by the Super-Ego. In fact, the first line of the text points to Guattari's disgust with Freudian theorists whose work reduces the unconscious to a cinema that only shows child pornography on an endless loop. These theorists are essentialist, because they ultimately posit a hopeless world where a priori sexual instincts constitute the basis of all human agency. On the other hand, the alternative offered by Guattari claims that if the unconscious is machinic, then our psyche can be assembled and re-assembled as we so desire within very specific material conditions. In my opinion, Guattari's theorisations are far more liberating because they are never fatalistically tied to instincts, base sexual desires (the cinema with an endless loop of child pornography), or even economic determinism (material forces of production form an ideological prison). To paraphrase Lacan, God is not dead, but simply unconscious.

The unconscious is not a theatre that perennially showcases Sophocles's *Oedipus Cycle* ad nauseum. Interestingly enough according to Jacques Rancière, *The Oedipus Complex* is the most performed play in all of Western theatre. In essence, the character-archetypes in *The Oedipus Cycle* have seeped into the collective unconscious. This is not because the curtain on the Oedipal stage unveils (or manifests) the innate a priori libidinal sub-conscious. Rather, according to Guattari, subjects often 'hallucinate history' as if it were real. The Oedipal superstructure does not mirror our own unconscious nature, but vice versa. If we indeed have the unconscious we deserve, and carry around socially, what we dream culturally mirrors the semiotic impulses encoded in the ideological superstructure.

The machinic unconscious is mirrored by capitalism unceasingly recreating abstraction, the void and the reproductive splitting of isolation. An individuated subject in relation to assemblages of enunciation constitutes the media's ideological refrain in capitalism. Abstraction forms lines of flight always already linked to key institutions of power, and this produces difference and a sense of belonging to a territoriality of reference like a nation or a corporate family. Communication is resonance, and the simulacrum of concepts should fold onto reality, not the other way around. Capitalism eliminates asperity, a harsh critical tone, and replaces it with an electronic teddy

bear that warms our hearts with intersubjective soporific simulations aimed at distracting from its oppressive, fascistic, exploitative modus operandi. This is how the capitalistic dream-phantasy becomes machinic, by eliding the fact that it is mechanical, and re-presenting itself as human(e). Concealed beneath the human(e) facial surface of the capitalist lies the Terminator bent on destroying all that resists its path to global hegemony.

But abstracting machines are never completely bound to fixed universal coordinates. There is always space to manoeuvre. One can pull out, detach, or unplug from the machine by first recognising that it exists (53).

If interpellation beckons the subject towards individuation, then it can also serve as content filling the black hole of subjectification: my face is not my own. In doing this, every voice is related to a face, be they real, imaginary or composites. These facial montages open up options of assemblage that never cease intertwining with the world, and this is schizoanalysis in a nutshell. Partial objects can be split and reassembled any way one desires but always already interconnected with the political and social elements that influence its construction.

We see the smoothing of space in the single direction of faces wherein the faciality of landscaping dissolves territoriality and the limits of natural sociality neutralise 'excessive' machinic effects engendered by systematic decoding of flows. How decoding flows can be systematic is properly outlined in several places in the text.

The becomings of the multitude disappear on behalf of a central eye from which all spatial, rhythmic, moral coordinates radiate. Yet, Guattari also argues in different circumstances the 'evil eye' effect is unfathomable. Reminiscent of Lacan's definition of paranoia as a subject who knows the answer to everything, Guattari's facial formulas answer for every possible situation. His definition of the facial is that it poses a response and responsibility to all possible experiences. This is outlined in his theorisation of elementary first principles, rudiments underlying expressions of the face. His example is straight out of the Frost/Nixon interviews where he describes a 'Chief of state acquiescing into a frank and grave acquiescence' (92). No point of mystery can resist the inquisitorial gaze of the signifier.

Guattari outlines the various constellations portending real subsumption. The tendency towards relativising all universal standards means that power is soft and hard. Affects, perception, thoughts, human relations, machinic 'growth' of profit, matters of expression, all elaborate a sense of differential, decoded power that subsumes every

field so as not to appear at all. In fact, Guattari is brilliant on this point. Several times in the text he alludes to the nefarious manner in which capitalism produces interpellation machines to speak through the mouths of individuals (73).

Guattari's position is that the media is not merely 'sedating' or 'calming' instinctual representation, but rather that it creates various manipulations aimed at the operators of the enunciation capable of concentrating and minimising the semiotic components implied by power relations. This goes against structural linguistics wherein the structural dimensions of power are schizzable, but appear seamless, and practically invisible even though extremely reliant on representations and spectacles. Yet, there is hope because the unconscious is constituted by machinic propositions that no semiological or logico-scientific propositions can ever grasp in an exhaustive fashion (149). Its assemblages are not delivered randomly to the axiomatic of universals: the only 'law' they uphold is a general movement of deterritorialisation. *The Machinic Unconscious* is a careful study of tendential scattering, schizzing, becoming implacable, slipping out of place, out of line, wherein the nefariousness of social order comes undone through the breakdown of borders. In his work Guattari shows how boundaries are blurring, lines of demarcation are breaking down, and the irreducibility of unconscious powers to the reifying tendencies of any hegemonic discourse.

In this text there is a beautiful contrast between the theoretical insights in the first half of the book, and in the second half, their application to an epistemological object, namely *Remembrance of Things Past* by Marcel Proust. The first half of the book establishes the major themes, some of which presage *A Thousand Plateaus*. Concepts such as faciality and the refrain are woven into field studies on various animal species, but are also used to discuss the media and bio-physico flows of circadian rhythms; whereas the section of the text devoted entirely to Proust is so much more than a contribution to literary theory, and should not be overlooked by Deleuze scholars.

Deleuze and the Concepts of Cinema

Preface

Daniela Angelucci University of Roma Tre
Translated by Sarin Marchetti University College Dublin

Man is the animal who goes to the cinema.
Giorgio Agamben

The grounding idea of this book is the one expressed in the final pages of Gilles Deleuze's two volumes on cinema, where the author advocates the coincidence between cinematographic art and philosophy. By imagining a divinatory hour – the 'midday-midnight' – during which asking what cinema consists in means at the same time asking what is philosophy, Deleuze commenced a novel way of understanding the relationship between the two practices: the former creating images while the latter invents concepts. In this new scenario, philosophy does not consider films – and perhaps their narrative content alone – as a mere repository of examples used to corroborate its reflections as sometimes happens in the contemporary landscape of the philosophy of cinema, which goes as far as to treat stylistic choices as sheer accessories. According to Deleuze, the bond between cinema and philosophy is rather one of radical analogy, in which it can be said that both deal with the same problems although each one using its own tools and expressive devices.

Now, which form might this relationship take? If, as Deleuze writes in the context of his direct questioning about the very nature of philosophy,

'[the philosopher] assumes in advance the goodwill of thinking ... [and] all his investigation is based on "premeditated decisions"' – that is, if what is necessary to philosophise is the feeling of an urge – this need emerges when the philosopher, rather than commenting on the work of a certain director, feels that they share a certain question or a common cause. This kind of friendship based on the sharing of the same goal, of the same preoccupation, is also the moving reason for Deleuze to engage a certain philosopher (whatever his philosophical tradition) or a certain artist. However, with cinema this encounter seems to take place in a more spontaneous and powerful way than with other artistic expressions, because it originates in a collision – sometimes violent – with images. These images often reveal an 'unexpected disposition' to show the life of the mind as condensed into a vision.

In this sense, the true objects of the theory of cinema are the concepts that cinema generates when understood as a practice of images. In this sense, philosophy alone – when understood as a conceptual practice – is able to 'constitute the concepts of cinema itself', as the last line of *The Time-Image* as well as the very title of this volume read. My journey winds around some of those concepts, ten in all. The book represents in the first place an introduction to Deleuze's reflection on cinema, but aspires at the same time to emphasise some of its aspects over others – trying at once to carefully avoid, as Deleuze himself once claimed, a double reproach: namely, both excessive erudition (which makes the reading complicated and tedious) and exaggerated familiarity (which in venturing to reproduce the style of the author at hand always gives poor results).

This volume envisages an exposition, carried out in the first four chapters, of the fundamental steps of *The Movement-Image* and *The Time-Image* in the wake of Bergson's thought. First, the book presents the issues of cinema that Deleuze labels as classical: namely, the idea of movement as the smallest unit of film, that is the sequence shot (*plan-séquence*), and the articulation of the cinematographic image into perception, action and affection ('Movement'). Second, it reconstructs the emergence of modern cinema: the possibility of rendering the theme of time through images – a theme which, independently from the evolution of the plot, becomes central with the appearance and diffusion of a novel cinematographic style ('Time'). In describing the two eras of cinema I shall focus on the passage to modernity, that is to the moment in which, departing from neorealism and *nouvelle vague*, some philosophical issues such as those of virtuality and falsity seem to act as the real characters of films ('Virtual' and 'Modernity').

The central part of the book represents instead a pause in the constellation of problems originating from the theme of falsity understood as the capacity of art – and of cinema in particular – to progress in always novel and original ways falling outside the question of truth ('Falsehood'). The overcoming of truthfulness and judgement means for Deleuze believing in life as an affirmative force and in an immanent system of values ('Life'); thus conceived, the becoming of a reality gets constituted through a series of acts and inventions similar to the ones of art, which does not imitate, but rather repeats, reality. In the case of the cinematographic device, this is a repetition that is already characterised since its origin as shifting and, paradoxically, as difference ('Repetition'). As regards the issue of falsity as a potentiality of art and of modern cinema, Orson Welles is the director with whom Deleuze shares a common cause. At the origin of this encounter we can situate the thought of Nietzsche, who first inspired the concept of life as a force constantly trying to overcome itself and as faithfulness 'to the Earth and to human beings'. As regards repetition, I will instead investigate a common cause with Freud: this rather difficult task – whose outcomes will be less obvious if compared with the philosophical and cinematographic friendships just suggested – moves from the idea that the passage from the compulsion to repeat to repetition as differential movement can be envisioned already in some Freudian writings.

Finally, I shall offer a reading of some films related to some particular Deleuzian philosophical categories: the line of thought which from repetition as difference leads to the themes of the double and of the simulacrum will be reprised through a film by Raúl Ruiz ('Simulacrum'); in the film *The Most Dangerous Game* by Ernest Schoedsack and Irving Pichel, I will locate a plot, various characters and some places depicted and constructed in a modality which confirms the interpretation, critical as well clinical, of sadism (and masochism) defended by Deleuze in *Coldness and Cruelty* ('Sadism'); a confrontation with Picasso's painting as it is shown at work in the film by Henri-Georges Clouzot will represent the occasion to highlight the theme of chance, of involuntariness and of the freedom of hazard in the pictorial processes as well as in art in general ('Chance').

Movement

I.

In the first half of the 1980s, with the two volumes *The Movement-Image* and *The Time-Image*, Gilles Deleuze inaugurated a novel modality of thought on cinema that is radically distant from a simply critical perspective, but also different from an a posteriori reflection on cinema's products. The two texts, fully inscribed in the overall philosophical arch preceding them of which they embrace the theoretical premises, assume as their point of departure the affirmation of a strong analogy between the two practices: the one of cinema and the one of philosophy. Differently from other theories – for example, far removed from the semiotical attempt to grasp the semiotic structures and narrative element of films – Deleuze's theory does not consider the numerous films mentioned in his books as object to be analysed or as aesthetic outcomes to be evaluated, but rather as products of an inventive act analogous to the one taking place in philosophy.

Thus, in order to follow his investigations on the cinematographic image, the theoretical premise that we should be accepting does not regard first and foremost cinema, but rather philosophy itself, which would not be a contemplative, reflective, or communicative activity as it has been often believed, but rather is defined by Deleuze as a 'continuous creation of concepts' in a way analogous to cinema's being a creation of images. And if concepts are, and remain, signed – 'Aristotle's substance, Descartes' cogito, Leibniz's monad, Kant's condition, Shelling's power' – some of them 'make do with an ordinary everyday word that is filled with harmonics so distant that it risks being imperceptible to nonphilosophical ears', while others 'must be indicated by an extraordinary and sometimes even barbarous or shocking word' (Deleuze and Guattari 1994: 7–8). It is precisely because of the invention

Deleuze Studies 8.3 (2014): 314–323
DOI: 10.3366/dls.2014.0151
© Daniela Angelucci
www.euppublishing.com/dls

of new concepts, at times conveyed by ordinary words presented in a new light while at others invoked by means of unexpected neologisms, that Deleuze shows the intertwinement of the two practices, the one artistic and the other conceptual; an intertwinement that does not take place when one reflects on the other, but rather when we realise that both should answer with their own proper tools the very same issue, as 'the tremors are the same, but the fields are different' (Deleuze 2006: 284). The chief feature of cinema is in fact its unexpected approach to exhibiting spiritual life, so that it can be said that it partakes in the history of art and thought.[1]

The preface to *The Movement-Image* presents the work as a taxonomy, a classification of cinematographic signs explicitly referring to the categories as they have been elaborated in Charles S. Peirce's logic. It is however in the following paragraph that we find named the real tutelary deity of the work, that is Henri Bergson, to whom Deleuze had already dedicated a collection of essays twenty years earlier (Deleuze 1991a). Now, in what way does this reiterated encounter between these two philosophers take place? The punctual and even unprejudiced attitude of his remarks on Bergson as developed in the two texts under consideration says something important about Deleuze's idea of the history of philosophy.

We find the finest explanation in François Zourabichvili's *Deleuze: A Philosophy of the Event* (2012), which, by offering a key to understanding Deleuze's distinctive philosophical commentary, individuates its peculiarity in the original usage of the 'free indirect discourse'. The reference here is to Pasolini's notion of *free indirect discourse* in literature and *free indirect subjectivity* in cinema, understood as the possibility to 'speak directly … in the first person' (Pasolini 2005: 185).[2] It is with this expression stolen from Pasolini, that Zourabichvili described the continuous confrontation of Deleuze with the authors he comments on: rather than a re-elaboration of the thought surveyed, what takes place is an exchange, a process of giving and borrowing. Both in the case of the quotation of thinkers in his texts, and in that of the monographs each dedicated to a specific philosopher (not only Bergson, but also Nietzsche, Kant, Leibniz and Hume) or to a particular artist (Francis Bacon, Marcel Proust), in fact there emerges a common cause between the commentator and the one being commented on which makes their thoughts rather indiscernible. This is exactly what takes place in the two volumes on cinema, which can be also read as an original and privileged pathway to the philosophy of Bergson and, at the very same time, as an approach to the

thought of Deleuze having the advantage of immediately exhibiting his philosophical roots.

If, as we shall see, the four theses on cinema – two on movements in the first volume and two others on time in the second one – are presented as commentaries on Bergson's thought, then we can say that, in the first place, Deleuze borrows the very notion of image from *Matter and Memory*. Such a notion defines matter as it is understood by common sense, which is resistant to accepting the idea of both something whose existence is independent from the subject perceiving it, and of an object whose existence depends on its being perceived. Before any philosophising, that is before any sort of realism and idealism, we employ the language of images, as Bergson wrote in the Preface of the seventh edition of his book:

> Matter, in our view, is an aggregate of 'images'. And by 'image' we mean a certain existence which is more than that which the idealist calls a *representation*, but less than that which the realist calls a *thing* – an existence placed halfway between the 'thing' and the 'representation'. (Bergson 1988: 9)

II.

Moving from this substantial affinity, *The Movement-Image* is inspired by Bergson and, paradoxically, by his critique of cinema, which in the last chapter of *Creative Evolution* is depicted precisely as false movement. Bergson writes:

> Such is the contrivance of the cinematograph. And such is also that of our knowledge. Instead of attaching ourselves to the inner becoming of things, we place ourselves outside them in order to recompose their becoming artificially. We take snapshots, as it were, of the passing reality, and, as these are characteristic of the reality, we have only to string them on a becoming, abstract, uniform and invisible, situated at the back of the apparatus of knowledge, in order to imitate what there is that is characteristic in this becoming itself. (Bergson 1944: 332)

Deleuze will return to those pages in order to affirm, contrary to Bergson, how deeply Bergsonian cinematographic art is once presented as that image having movement, understood as unpredictability and creation, as its essence. Cinema is thus not a sum of still sections reconstructed a posteriori with the addition of movement, as mobility belongs already to its smallest unity, the sequence shot, which is a section of the duration scale witnessing a continuous qualitative modification. Deleuze opposes Bergson's thesis with the idea of movement as a constitutive,

ontological state, an immediate given of the cinematographic image understood not as an image of the object in movement but rather as *movement-image*. In cinema, the static points of false movement are replaced by shots, intrinsically mobile sections which, by determining the relationship between the elements of the definite whole selected by the framing, qualitatively modify at the same time the whole film.

The idea of cinema as adhesion to reality in its unpredictability, and thus as a device whose specificity is that of rendering movement and duration, can be found even before Deleuze in the reflection of André Bazin, to which I will return when discussing the themes of modernity and chance. If the photographic lens shoulder the burden once carried by the plastic arts by taking advantage of a 'transfer of reality' running from the thing to its reproduction made possible by its automatic genesis, the birth of cinema winds up a process launched by photography, adding to the image of things that of their movement and duration: in this sense what is shown is not a simple reproduction, but rather the 'digital imprint' of reality.

According to Deleuze, movement as qualitative transformation functions in two diverse directions, one relative and one absolute: in respect to what is framed, as the constitution of relationships internal to a closed system, and in respect to the whole – determined by a montage which is already anticipated and envisaged in the shot – as the expression of the duration which does not cease from changing. With this idea of montage as a general compositional principle, Deleuze joins an already well-established tradition, which starting with Eisenstein aimed at portraying it as a procedure of general organisation, that is, as a relationship between the various parts which is not established a posteriori, but which is rather already in place in the sequence shot. The shot, the movement-image, is the mobile section of the duration, the translation of the parts, the transformation of the whole. However, if the framing necessarily determines though its process of constitution an out-of-field (*hors-champ*) – which is not only an extension of the scene, a 'relative elsewhere', but also and most importantly a 'radical Elsewhere', a 'dimension of the spirit' – then the duration of the film is also an opening to the absolute. It is the montage, by operating on the figures already in motion, to extract the idea, the duration; the mobile sections embody in this way the image of time, an indirect image because it is independent and subordinated to movement. Deleuze writes:

> The only generality about montage is that it puts the cinematographic image into a relationship with the whole; that is, with time conceived as the Open.

> In this way it gives an indirect image of time, simultaneously in the individual movement-image and in the whole of the film. On the one hand, it is the variable present; on the other the immensity of future and past. (Deleuze 1986: 55)

Despite the shot being a unity in movement, some interruptions will always emerge in the montage so as to remind us how if on the one side there are the parts and their relative correspondence within a given system, still the Whole is elsewhere. These fractures in the montage do not witness the discontinuity of cinema, but rather remind us of its changing continuity: that is, the absolute one of duration. By breaking the unity into two or three sets, the usage of the false connection in cinema becomes thus a flight from the relative continuity of the closed system, the exhibition of a twist that is already an attitude of the spirit showing the dimension of the Open.

III.

If the first comment to Bergson can be characterised as a confutation of his critique of cinema in the direction of an acknowledgement, in this art, of the full manifestation of the Bergsonian duration, the second comment makes use of the first chapter of *Matter and Memory* – titled 'Of the Selection of Images for Conscious Presentation. What Our Body Means and Does' – with the goal in mind to track down and describe the three mutations of the movement-image: the *perception-image*, in its partial and selective grasping of the object; its extension in the reaction, that is, the *action-image*; and the gap between the two, a hesitating interval on the part of the subject which makes possible the manifestation of pure qualities, free from any kind of utility, distinctive of the *affection-image*. Departing from the assumption of the identity between movement and image Deleuze sketches a classification of the diverse modes of the cinematographic image and of the corresponding indirect marks of time, in a continuous passage from theory to concrete cinematographic examples.

To begin with perception, the speculative premise of Bergson's thought is that of the quasi-coincidence between perception and thing:

> For it is possible to sum up our conclusions as to pure perception by saying that there is in matter something more than, but not something different from, that which is actually given. Undoubtedly, conscious perception does not compass the whole of matter, since it consists, in as far as it is conscious, in the separation, or the 'discernment,' of that which, in matter, interests our

> various needs. But between this perception of matter and matter itself there is but a difference of degree and not of kind, pure perception standing toward matter in the relation of the part to the whole. (Bergson 1988: 71)

The perception of objects or of the images of matter would thus be constituted of those very objects, only framed from the point of view of another particular image. The distinction between perceiving and what is perceived is thus for Bergson only a matter of degree: while things are complete, objective images, perception is subtractive and selective, since it is a function of the interests of the subject. The definition of *perception-image*, the first modality of any cinematographic image, moves from these theses, overcoming at the same time the duality of subject and object at work in natural perception in order to delineate a precise statute of cinematographic perception, which consists in a 'being-with' of character and camera:

> It is a case of going beyond the subjective and the objective towards a pure Form which sets itself up as an autonomous vision of content. We are no longer faced with subjective *or* objective images; we are caught in a correlation between a perception-image and a camera-consciousness. (Deleuze 1986: 74)

Here Deleuze is envisioning an entwinement between two diverse perspectives: the empirical subject, the character, who acts, and the transcendental one, the camera-consciousness, watching him or her acting and reflecting on him or her. Here we encounter once more the free indirect subjective: 'the fundamental characteristic of the "free indirect point-of-view shot" is not linguistic but stylistic . . . [It can thus] be defined as an interior monologue lacking both the explicit conceptual element and the explicit abstract philosophical element' (Pasolini 2005: 178).

As reaction and unavoidable extension, the perceptual moment of the image corresponds to the active modality – *the action-image* – representing the second pole of the sensory-motor scheme; perception selects the elements, curving the universe so that the action will hit the functional aspect of the percept, which in turn is already directed and predisposed to action itself. The suspension, in the interval created between the perception and the hesitant action, is occupied by the third mutation of the image, the *affection-image*. Here the movements, which do not remain images of perception nor become action, are absorbed by the subject as expressions and pure quality. The appearance of affectivity in the image is made available by what might be

labelled as 'retracted action', to borrow Maurizio Grande's expression (in particular, in reference to expressionist cinema):

> The zone of indeterminacy of a living being allows one not to act nor to react, that is to substitute action with the expression of affectivity, of the subject's interiority conveyed by one's face – which, in its turn, becomes the glaring reflection of the affects, potentialities, and qualitative transformations of affects through a retracted action, an action we might label as *internal to the affections*. (Grande 2003: 386; original emphasis; my translation)

These movements of subjectivity characterise each film, and yet, despite there being no single work made up of a single kind of image, still one of the three species is always dominant in a certain author or genre of film, as it will be evident in the framing, in the shot or in the montage.

The archetypical work of affection-image, featuring the expressive presence of close-ups and the representation of an indefinite, anonymous space, is *The Passion of Joan of Arc* (1926) by Dreyer, 'an almost exclusively affective film'. The very exhibition of affective and sensible qualities is noticeable in Bresson's characters, in Rohmer's stories, in Bergman's close-ups and in Antonioni's colours. The typical cinematographic genres of action-image, characterised by both realism and a well-determined space and time, are instead the documentary (one might think of Flaherty's *Nanook* (1922), in which the actions of the leading character modify the environment by attenuating its hostility), the psycho-social film (Deleuze's example is the realistic look of King Vidor's production as displayed in *The Crowd*) (1928), as well as the detective story and western, in which the transformation of the initial situation through the characters' conduct follows a narrative thread which usually leads to the re-establishment of order.[3]

Besides the three fundamental modalities Deleuze individuates other models as well: the *impulse-image* – a 'degenerate affect' or 'embryonic action' determined between the idealism of affection and the realism of the act, characteristic of Buñuel's films such as *The Exterminating Angel* (1962) or *Simon of the Desert* (1965) – the *reflection-image*, intermediary between action and the *relation-image*, the last variation of the cinema of movement which goes beyond the sensory-motor scheme and guides the passage to the time-image. By overcoming – to use Peirce's terminology – the self-referring firstness of the affect as well as the secondness of the act (a dual moment in itself as it gets realised in the perception act, thus referring to itself only through something

other), the relation-image constitutes itself as thirdness, introducing a third term connecting the other objects in place. According to Deleuze, the introduction of the mental image as thirdness, that is, a relationship between the objects and the other images, takes place with Hitchcock's cinema, whose crime plot often introduces the figure of the witness as third – as in the case of the paralysed James Stewart forced to observe in *Rear Window* (1954). Deleuze writes:

> There is not only the acting and the action, the assassin and the victim, there is always a third and not accidental or apparent third, as a suspected innocent would be, but a fundamental third constituted by the relation itself, the relation of the assassin, of the victim or of the action with the apparent third … This perpetual tripling also takes over objects, perceptions, affections. (Deleuze 1986: 201)

As Deleuze explains at the beginning of the volume on time while summarising the images and signs of classical cinema, there does not exist an intermediate moment between perception-image and affection because perception functions here as an ideal zero grade, that is, as a necessary moment which is presupposed by the other modalities, which necessarily constitute themselves as its continuation. With thirdness there appears in films a reflexive, relative element that jeopardises the duality of action, in this way letting other kinds of sign emerge.

The summary of the proper forms of the cinematographic system of action and of movement taking place at the beginning of the second volume allows Deleuze to measure up with the two principles of Metz's semiology: the idea that cinema is constitutively narrative and that the shot is the smallest narrative utterance. His answer moves once again from the fundamental presupposition of movement as the most authentic and immediate given of the cinematographic image: the narration would not be one among its given elements, but rather determined as a consequence derived from the combination (montage) of images themselves. These, on the other hand, cannot be substituted by utterances because in this way they would be deprived of the essential dimension of movement. In this sense it can be said that the image is an utterable more than an utterance, that is, a sign of reality which might virtually become discourse and narration. The advantage of Peirce's semiotics, whose classification is surveyed in greater detail in the second volume, is that, at least in the beginning of the semiosis, signs are not conceived from the point of view of language, but rather from the point of view of the phenomenon itself.

IV.

The decline of the action-image is thus a constitutive aspiration of cinema, which ever since its beginnings took the form of a vocation – shared with literature – to go beyond the unitary dramatic plot: it is a representative structure carrying within itself the very possibilities and ambition of its own overcoming. That cinema has as its intimate essence the conditions of its modification, and that its actuality is produced by its progression leaving open the possibility and the necessity of the encounter with the unforeseeable, shows evidence of its Bergsonism. *The movement-image*, begun with the critique of Bergson's statement on cinema, ends up acknowledging the cinematographic image with the very essence of movement and duration:

> There is always a moment when the cinema meets the unforeseeable or the improvisation, the irreducibility of a present living under the present of narration, and the camera cannot even begin its work without engendering its own improvisations, both as obstacles and as indispensable means. There two themes, the open totality and the event in the course of happening, are part of the profound Bergsonianism of the cinema in general. (Deleuze 1986: 206)

The movement-image, having reached its limits, extends from relation-image to the mental-image, questioning its very statute with the appearance of a third element which breaks the duality of the sensory-motor scheme, and initiating a crisis in the action system representing the classical form of representational cinema. The final break of these schemes takes place only when the relation-image is not considered as the realisation of the traditional system any more, as it happened in the United States at the time of its birth, but rather as the conscious passage to a new order. The social, economic, political and ethical reasons of such a crisis were fully in place in post-war Italy, in the next decade in France and in the following one in Germany, as long as the essence of modern cinema got expressed in the urgency to abandon realism and the narrative form so as to unleash what Deleuze defines as *opsigns* and *sonsigns*, that is, purely optical and sound situations unrelated to any perceptive reference and dislocated in a void space.

In this way movement gets rid of its logical schemes, the intertwinements between perception and act, and loses its centre of determination, through which it was able to control time by indirectly representing it through the montage of the essentially mobile sections. The revelation of an aberrant and a-centred movement discloses another image that allows time – already in place before any happening – to emerge immediately. The dispersive situations typical of modern cinema,

albeit free from any relationship of cause–effect and characterised by discontinuity and fragmentation, create in fact yet another kind of bond; that is, they relate directly with thought and time making them 'sensible' and 'visible and audible'. The third and fourth commentaries on Bergson elaborated in *The Time-Image* analyse the deep meaning of this sketch of time as well as of its two dimensions of past and present in modern films:

> If normal movement subordinates the time of which it gives us an indirect representation, aberrant movement speaks up for an anteriority of time that it presents to us directly, on the basis of the disproportion of scales, the dissipation of centers and the false continuity of the images themselves. (Deleuze 1989: 37)

Notes

1. For the relationship between philosophy and cinema, see Angelucci 2013.
2. According to Pasolini, the closeness and the exchanges between the style of the author and the mood of the character depicted represent the conditions of possibility of a cinema of poetry; a cinema that would embody the nature of the cinematographic images as a 'natural language of reality'.
3. Deleuze further divides the action-image into Large and Small form: while the former follows an S A S' scheme, according to which an initial situation is outstripped by a different one through some kind of action, the latter is characterised by an A S A' scheme for which the initial action reveals a situation which invites a new action.

Time

I.

Proceeding from the coincidence between image and movement, the two comments to Bergson elaborated in *The Time-Image* investigate the characteristics of the new cinema of opsigns and sonsigns, situations which do not respond to – and are thus unrestricted by – the sensory-motor scheme. In this kind of film, movement naturally continues to be part of the image as its constitutive datum, and yet what steps in the foreground is time – temporality 'in person', as Deleuze writes – and its mechanisms. The direct performance of time in image, the essential novelty of modern cinema, allows Deleuze to get Bergson slightly closer to Kantian philosophy: by defining time as a pure form of subjectivity, Bergson operated the first reversal of the relationship between time and movement in the direction of the subordination of the latter to the former.

A synthesis of Kantian philosophy in relationship to this reversal of the concept of temporality appears in the 1986 Deleuzian essay 'On Four Poetic Formulas Which Might Summarize the Kantian Philosophy'. The liberation of pure, non-chronological time completed by Kant is here resumed by Deleuze in the poetic formula 'the time is out of joint' – a line pronounced by Hamlet, the tragic hero par excellence who brings to bear the emancipation of time:

> Time is out of joint, the door off its hinges, signifies the first great Kantian reversal: movement is now subordinated to time. Time is no longer related to the movement it measures, but rather to the time that conditions it. Moreover, movement is no longer the determination of objects, but the description of a space, a space we must set aside in order to discover time as the condition of action. (Deleuze 1998: 27–8)

In his third comment on Bergson, the first in the volume on time, Deleuze reprises the theses presented in the second chapter of *Matter*

Deleuze Studies 8.3 (2014): 324–333

and Memory dedicated to 'Of the Recognition of Images', distinguishing two different kinds of perceptual response: a habitual, mechanical one, configured as a sort of mechanical reaction of sensory-motor extension of perception itself, consisting in an '*instantaneous* recognition, of which the body is capable by itself' (Bergson 1988: 92); and an attentive, active one, characterised instead by the appearance of a hesitation when facing the perceived reality, an uncertainty in the response forcing the subject to reflect and search in his or her memory, similar to the way the camera gets a certain figure into focus. In the former type of recognition the reaction movement takes place on the very same level of the perceived object, while in the latter the subject examines his or her past before coming back to the present moving through several different dimensions in always novel circular – more or less wide – movements, which Bergson, by offering a geometrical scheme (Bergson 1988: 104), called circuits, 'circles of memory'. If the result of habitual perception is the sensory-motor image – the thing itself, exhibited in classical, narrative cinema films – in the case of attentive recognition, what is attained is a pure optical and sound image, a description of the object.

The affective-image as well, first presented in the volume dedicated to movement, is defined as what inhabits the interval between perception and reaction (as we shall see, Deleuze's critique of Jacques Rancière will revolve around this proximity). However, in Deleuze's description, affection widens the perceptual matter on its very sensory-motor dimension, while the pure optical and sound image produces a different element which does not extend but rather fulfils the gap: the dimension of the spirit or temporality, enabling the activity of the subject to attain a whole new sense. The pure optical image, which at first appears as poorer in content and more rarefied as it substitutes the thing rather than presenting it, will reveal itself as richer and more 'typical' than the former, in which perception is distracted by the activity of selection of the sensory-motor scheme in view of the action:

> Conversely, the pure optical image may be only a description, and concern a character who no longer knows how or is no longer able to react to the situation; the restraint of this image, the thinness of what it retains, line or simple point, 'slight fragment without importance', bring the thing each time to an essential singularity, and describe the inexhaustible, endlessly referring to other descriptions. (Deleuze 1989: 45)

If the sensory-motor image originates from the linear nexus between perception and reaction accompanying the narrative procedure in cinema, the answer to the question about the identity of levels, the

circuits enacted by the activity of attention in perception, and thus by the pure optical image, is much more problematical to obtain. According to Bergson, the answer consists in recollection-images, recalled in the memory by the subject during the perceptual hesitation. Deleuze opens up the range of possibilities by suggesting a series of couples in which it is essential to bear in mind that the two terms are *by nature* different: the real and the imaginary, the physical and the mental, the actual and the virtual. The linear links making possible the extension of objective perception in the associated reaction get progressively more complex, become circular and, in the continuous passage between the two different ontological dimensions, represent 'the layers of one and the same physical reality, and the levels of one and the same mental reality, memory or spirit' (Deleuze 1989: 46). It is a perpetual oscillation between two indiscernible and yet distinct moments, in which to each aspect of the perceived thing there corresponds a recollection, a thought connected via a circuit which simultaneously creates and delete its image, a unity constituted by the coalescence of all its visited and contradicted sheets. The Deleuzian definition runs as follows: 'The purely optical and sound situation (description) is an actual image, but one which, instead of extending into movement, links up with a virtual image and forms a circuit with it' (Deleuze 1989: 47).

But what, in cinema, plays the role of the virtual? I want to go straight to the answer offered by Deleuze, leaving aside for the moment the path covered to achieve it – a path which I shall survey in detail in the next chapter dedicated to this concept. The immediate and always reversible virtual double of the actual gets actualised as a point of 'indiscernibility' between the two ontologically different dimensions; such a virtual double is what Deleuze calls the *crystal-image*, that is, the heart and root of pure optical and sound images:

> But here we see that the opsign finds its true generic element when the actual optical image crystallizes with *its own* virtual image, on the small internal circuit. This is a crystal-image, which gives us the key, or rather the 'heart', of opsigns and their composition. The latter are nothing other than slivers of crystal-images. (Deleuze 1989: 69)

II.

In crystals – an ordinary word granted a new meaning, like the practice of inventing concepts acquires a new meaning – 'there is this mutual search – blind and halting – of matter and spirit' (Deleuze 1989: 75). The

actual and the virtual engage in a continuous exchange, so that the two moments, although distinct, are not discernible, as they find their existence and meaning only in their reciprocal presupposition, in their being one relative to the other: a virtuality is constituted as such only in relationship and opposition to an actuality of which it constitutes the virtual, and vice versa. This indiscernible bond is not the result of a subjective, psychological impression (in that case it would in fact only consist in an inability to distinguish them, the fruit of confusion or error), but is rather an 'objective illusion' of the image, as its duplicity is constitutive to its very nature.

The aesthetic figures proper of the structure of crystal are a series of pairs representing ways in which the couple of actual–virtual can be articulated: the opaque–limpid couple – which already gets manifested in the interplay between the visible and the obscure character of acting a certain role, in which the actor hides him- or herself and leaves the character to emerge – and the seed-surrounding couple – which instead expresses the circulation of potentialities as a germination and transformation of the surroundings. Whether the determinations of classical cinema – that is perception, action and affection – often find their cinematographic equivalent in a general characterisation of film, Deleuze individuates various poetic concretisations of the crystal-image in the objects, details and recurring motifs of many films of modern cinema: the mirror[1] reflecting the virtual figure of an actual character – think about, among the many mentioned films, some selected scenes of Losey's *The Servant* (1963), the end of Orson Welles' *The Lady from Shanghai* (1947) or the hotel of Alain Resnais's *Last Year at Marienbad*; (1961) the ship, with the upper part above the waterline visible and limpid, and the lower part hidden below the waterline and opaque (as, for example, in Federico Fellini's *And the Ship Sails On*, 1983); and the rain, which reveals itself as the seed of change in some movies by Akira Kurosawa (for example, already in *Rashomon*, 1950) and Michelangelo Antonioni (for example, *The Night*, dated 1961, in which the rain represents the sign of a transformation in the life of the characters).

However, besides the configurations of the crystal-image, what interests Deleuze is its genesis: the crystal is 'the most fundamental operation of time', constantly splitting into a past tending to its self-preservation and a passing present leaning towards the future. This differentiation into two dimensions – which, however, coexist and do not cease to swap and convert into each other, despite always in the process of their differentiation – represents accurately the Bergsonian definition

of non-chronological time, and shows also 'what we see' exhibited in the image of the crystal as its genetic element and constitutive structure: 'what we see in the crystal is time itself, a bit of time in the pure state' (Bergson 1989: 82).

> The crystal reveals a direct time-image, and no longer an indirect image of time deriving from movement. It does not abstract time; it does better: it reverses its subordination in relation to movement. The crystal is like a *ratio cognoscendi* of time, while time, conversely, is *ratio essendi*. What the crystal reveals or makes visible is the hidden ground of time, that is, its differentiation into two flows, that of presents which pass and that of pasts which are preserved. (Bergson 1989: 98)

In modern cinema the crystal appears in different shapes: the typical perfection of Max Ophüls's films (*The Earrings of Madame de . . . , dated 1953)*, which conveys the coalescence of actual and virtual in a unitary scene without gaps; the rift typical of the work of Jean Renoir through which, besides the short-circuit of real and imaginary and present and past, a new reality is revealed by means of the substitution of the simple shot with the depth of field, an opening to the future (think of the use of water in Renoir's films, as for example in *Boudu*); the formation and growth resulting from the richness and continuous multiplication of Fellini's images, true revelations of life expanding in its spontaneity; the decomposition, the object of Visconti's cinematography, revealing the historical and natural collapse of a world – not only of a certain social class, but also of a 'spiritual family' – obscured and in decline.

III.

The occasion of a perspicuous understanding of the radical difference and of the continuous exchange between present and past, actual and virtual, as well as of the preservation of pure recollections, is offered by the Bergsonian scheme of the inverse cone at play in the third chapter of *Matter and Memory*. The apex of the cone, occupied by the representation of the constantly progressing present, rests on the plane of actuality, while the volume represents the totality of recollections, the memory in itself, by nature different from the dimension of experience and yet always in potential contact with it: if pure recollection gets revealed to the sensory-motor mechanisms in its totality – thus allowing the body to react and accomplish the task suggested by the present – such mechanisms would facilitate the unconscious and idle recollections descending from the heights of pure memory to materialise and come

back to life, focusing on action. According to Deleuze, this scheme is particularly apt to represent the first non-chronological image of time, the one grounded in the past which gets preserved: in fact, the volume of the cone efficaciously depicts a memory which is *déjà-là*, which pre-exists and in which we move in the search for recollections; not some mental and interior state, but a Being-memory, a world-memory, a pure virtuality that we penetrate and in which we lose ourselves. In the geometrical figure the coexistence of the diverse moments of the past also appears evident, the more or less wide sections of the cone, each of which contains at the same time the totality of recollections:

> Between the past as pre-existence in general and the present as infinitely contracted past there are, therefore, all the circles of that past constituting so many stretched or shrunk *regions*, *strata*, and *sheets*: each region with its own characteristics, its 'tones', its 'aspects', its 'singularities', its 'shining points', and its 'dominant' figures. (Deleuze 1989: 99)

We settle – or 'jump' as Deleuze writes – in one of the two circles of memory depending on the different quality of the recollection sought through the diverse sheets of our past.

In the picture of the cone the statute of the present is also immediately apparent as a narrower and more contracted point than the past, as its extreme limit; a present which elapses in the very moment in which it is perceived, 'its pure present being the invisible progress of the past gnawing into the future' (Bergson 1988: 150). If, however, the present in itself is considered as stripped of its actuality – as the pure recollection was freed from the necessity of its actualisation in a recollection-image – we obtain the second direct figure of time, grounded on the contracted present of the apex of the cone, the 'peaks of present' freed from their sensory-motor extension. The present becomes thus an ecstatic dimension removed from its function of converting recollections into acts, a function of which Deleuze, making reference to Augustine's thought, exhibits in three simultaneous elements: *memory* (present of the past), *attention* (present of the present) and *wait* (present of the future).

> We find ourselves here in a direct time-image of a different kind from the previous one: no longer the coexistence of sheets of past, but the simultaneity of peaks of present. We therefore have two kinds of chronosigns: the first are *aspects* (regions, layers), the second *accents* (peaks of view [*pointes de vue*]). (Bergson 1989: 101)

The figure of time in person depicting the past in general despite its sheets appears in what Deleuze considers as the first film of modern

cinema: namely, *Citizen Kane* (1941) by Orson Welles, the first director who showed a time-image exploring entire sections of the past in their existence. In the film the writer of a newsreel is given the task of reconstructing the life of the tycoon Charles Foster Kane following his death: after reading his diaries, the journalist interviews his second wife, the head of the board of governors of his newspaper, his best friend and the butler who assisted him during his last years. The goal of the inquiry is that of discovering the meaning of the mysterious word uttered by Kane on his deathbed, but the enigma is revealed only to the eyes of the spectators – and not to those of the characters – in the last scene, in which is filmed a pile of by then useless objects once belonging to the protagonist in the past being thrown into the fire by the attendants: 'Rosebud' is the sign impressed on the wooden sled with which Kane used to play during his childhood.[2]

Each witness who gets interrogated about the life of the protagonist represents a section, a virtual sheet of his past, which, however, is unable to designate a re-enacted recollection, that is, a 'presentified' image which has lost its past character, as it was happening in the flashbacks typical of movement. Moving from Bergson's distinction between *recollection-image*, which actualises the past in relationship to the present in function of what it perceives, and the *pure recollection*, which should keep the mark of virtuality, Deleuze translates cinematographically this distinction by individuating a difference between flashbacks, that is, the 'presentifying' past, and sheets of the past, that is, exhibition of pure recollection in itself. Here the story, that is, the point of view of each witness on the various parts of the life of the protagonist, leads to the evocation of entire regions of virtuality precisely because it is unable to find what it was looking for and actualise it in a recollection-image. The evocation takes place not through the transformation of the past into actuality, but rather by jumping into another ontological dimension, that is, by settling itself from the present into pure recollection.

All the stylistic innovations produced by Welles with the collaboration of the director of photography Gregg Toland aim precisely at the liberation of time in itself: the use of *deep focus* with the goal of keeping contemporaneously in focus all the elements and scales of the shot; the use of the grand wide-angle lens, which enormously widens close-ups and pushes the background away; the particular illumination, emphasising volumes provoking a stark contrast between light and shadow; the shots from bottom up or from unusual angles. The result is a depth of field that substitutes a simple juxtaposition of plans

and levels independent from each other with the construction of a diagonal perspective, in which the background is in communication with the foreground as well as with the intermediate levels. Welles' aim is not only that of forcing the spectator 'to "read" all the sheets of the image, as the actions eventually taking place in the background are not inert and merely decorative anymore but rather true active operators of dramaturgy' (Provenzano 1994: 125; my translation). The liberation of this profundity allows in the first place the appearance of the *continuum* of Bergsonian duration, of the temporal dimension that, once emancipated from the subordination of space, shows itself freely. In its function of remembering, the novel conception of the depth of field allows Welles to represents also its misfortunes, the temporal disorders illuminating its double structure, its virtual side:

> The sheets of past exist, they are strata from where we draw our recollection-images. But either they are in any case unusable, because death is a permanent present, the most contracted region; or they can no longer be recalled because they are breaking up and becoming twisted, scattered in a non-stratified region. (Deleuze 1989: 115)

In *Citizen Kane* we see realised the two cases of 'illness of memory' about which Bergson wrote. The first one, in which the recollection cannot be invoked any more, represents the running theme of the film: Rosebud is an element of the life of Kane so distant and buried in the past that the images pass by and touch slightly without being able to catch and centre it, and the recollections of those who were closer to him in life are completely ineffective. The second case, in which the recollection is still evocable but cannot be utilised any more, can be appreciated in the film as well: all the images of the life of the protagonist recalled by the witnesses are revealed as useless, as there is no present able to accommodate them because of Kane's death, which imposes itself in the first scene as an unavoidable premise. At the end of the film the meaning of the word 'Rosebud' is revealed in vain, being literally 'for no one'.

In this as well as in other Welles films, the parabola of recollections – which are unable to emerge from the past or rather reappear only to fade into the void[3] – is according to Deleuze not representative of a sort of nihilism the way he understands it, whose profound sense would simply lie in the vanity of human existence. The significance of the unavoidability or the idleness of the past symbolises the origin of the 'permanent state of crisis' of the concept of time, which, by emancipating itself from the subordination of movement, forces its joints to reveal hallucinatory presences, the coexistence of

diverse moments, and paradoxical connections. In *Citizen Kane* 'all the coexistent strata are in touch and adjacent to each other' (Deleuze 1989: 115), and time secures its autonomy also through the reports of the witnesses, who are unable to solve the mystery, but who in their reports evoke events which they cannot objectively know. It is the disease of the memory, the impossibility of remembering or making use of the recollection, the incapacity to discern the various moments of the past jeopardising the very idea of truth.

The image of time as the contraction and de-actualised peaks of the present makes instead its appearance in many films of the late Buñuel. If in *The Movement-Image* Deleuze mentioned the director as a representative of affection cinema, a type of cinema in which the power of impulses emerges with emphasis, its late works, by abandoning the naturalistic perspective and the scheme of perception–action, seem to attain a vision of the image as the manifestation of different and simultaneous worlds. In this way, the finale of *Belle de jour* (1967) shows in the protagonist's husband a paralysis that took place and yet did not take place; also, *The Discreet Charm of the Bourgeoisie* (1972) offers different and irreducible versions of the very same lunch, not subjective and imaginary points of view, but rather 'different objective worlds' disclosing simultaneously.

Both figures of non-chronological time are present in the film by Alain Resnais, written and directed with the collaboration of Alain Robbe-Grillet, *Last Year at Marienbad*, which fully conveys the crisis of imagination-action and the emergence of the elements of modernity: the nomadic characters, the accumulation of cliché, the appearance of thought as the only true protagonist. The story is that of a confrontation between the irreducibly different memories of a man and a woman confronting and evoking two diverse and incommensurable pasts; it is in fact only the man who can remember what happened during the last year in Marienbad and wants to persuade the woman about his recollection. Deleuze attributes to Resnais the interest for the past and its virtual sheets, as well as for its jeopardisation dictated by abandonment of a fixed centre from which to observe it (which in the films by Welles could have been individuated, for example, in the death of Kane, while here it disappears for a multi-voiced memory, each of which is extraneous and incommensurable to the others); the feminine character, which lives in the passage between two presents, at times suspicious while at others convinced of the version offered to her, is instead more akin to the conception of Robbe-Grillet, oriented towards a perpetual present perpetually divided from its actuality. It might well be that the

two characters of the film settle on two different regions of memory, preventing them from having the same recollections, but it might also be that the authors meant to create what Deleuze defines as a 'sheet *of* transformation' – paradoxical, hypnotic, hallucinogenic – allowing the communication between fragments belonging to different ages, which establishes a continuity between the elements of the different levels.

The 'crystalline' cinema, which has abandoned the regime of action and causal connections in favour of an image which 'no longer has space and movement as its primary characteristics but topology and time' (Deleuze 1989: 125), aspires to the creation of a virtual sheet pervading all the others, it 'rolls them up and unrolls them', radically questioning identity as a principle of representation and arriving at a narration which goes beyond truth and falsity, beyond the actual and the virtual.

Notes

1. In this sense, meta-cinema, that is, the many reflections on cinema conducted through the cinematographic medium, would not be, according to Deleuze, a testimony of a lack of vitality, of the plunging of the cinematographic art to its 'death', but rather one of the modalities typical of its enrichment.
2. According to Roberto Campari, the theme of bygone childhood lies at the centre of *Citizen Kane*, as he argues in his *Film della memoria. Mondi perduti, ricordati e sognati* (2005); in an interpretation already in place in the volume by André Bazin, *Orson Welles* (1992) – which still represents an authoritative reference in the vast literature on the director – which does not stand in contradiction with the one offered by Deleuze, in which, however, the loss of the past is devoid of any individual and psychological connotation.
3. In *Mr. Arkadin* (1955), for example, the past gets re-evoked only to be cancelled and destroyed as well: the private investigator recruited by Arkadin to investigate his own past explores the virtual sheets, but such an exploration aims at eliminating all that comes to light. In his work on this film, Michele Bertolini did not neglect the link between fiction and time's disharmony (see Bertolini 2004).

Virtual

I.

In order to trace the path that brings Deleuze to the individuation of the crystal-image as the nucleus of the exchange between actual and virtual, an exchange enabling modern cinema to represent the genesis of time, we should go back to Bergson, and more precisely to the two kinds of perceptual response sketched in *Matter and Memory*. As already noted, for Bergson there is a habitual, automatic recognition having roughly the form of a mechanical reaction to perception itself, and an attentive recognition, characterised instead by a kind of hesitation, an uncertainty inducing the subject to reflect and inquire into his or her memory.

If the sensory-motor image originates from the linear link connecting perception and reaction that constitutes the relations of cause–effect structuring the narrative procedures, the question raised during attentive recognition lying at the base of the pure optical image will be much more complex to address. Linear links become circular and enact a continuous exchange between two ontologically different dimensions, that is, past and present, two indiscernible and yet distinct moments united by a bond according to which each aspect of the perceived thing corresponds to a recollection, to a thought. The two dimensions through which this perpetual exchange takes place, that is, the actual and the virtual, the present and the past, would thus necessarily coexist – a quite shocking and unsettling statement, which will be thematised in a progressively assertive way, but which in the pages dedicated to the pure optical image initially appears almost as a platitude. In this context it would thus be worth repeating the already quoted definition of this image of modern cinema offered by Deleuze: 'The purely optical and sound situation (description) is an actual image, but one which, instead of extending

Deleuze Studies 8.3 (2014): 334–341

© Daniela Angelucci
www.euppublishing.com/dls

into movement, links up with a virtual image and forms a circuit with it' (Deleuze 1989: 47).

It is also worth repeating at this stage the question on the nature and genesis of the virtual, this time following the details of the path covered by the author for its full articulation. As a first step Deleuze takes Bergson's suggestion by analysing recollection-images and their connection with the actual in cinema via the flashback. This procedure, announced by fading effects or conveyed by the overlapping of images, constitutes a conventional and extrinsic method which allows the linear progression of the narration or alternatively displays the deviation and bifurcation of time, showing enigmatically, for example, all the possible effects of a certain situation. The precise moment in which the situation splits, in which the possibility of a deviation gets revealed – a moment which cannot but display itself afterwards – is, for instance, often at the centre of some scenes of the films by Joseph Manckiewicz; for example, in a flashback scene of *All About Eve* the recounted character becomes in its turn a narrator, having sensed the duplicity of the woman and what could have had happened. In any case, the flashback falls short of its role, since, besides receiving the justification of its existence from the outside, reveals itself as non-virtual. In fact, it 'does not deliver the past to us, but only represents the former present that the past "was" ', showing in the film a recollection-image already far from pure-recollection, already 'actualized or in process of being made actual, which does not form with the actual, present image a circuit of indiscernibility' (Deleuze 1989: 54).

The Deleuzian conclusion is that actuality enters authentically in contact with virtuality only when perception, unable to form either sensory-motor images or recollection-images, fails in the recognition, thus accommodating sensations without any objective correspondence and which do not extend to the sensory-motor level. The virtual correlate of the pure optical image gets displayed in those disturbances of memory, or 'failures of recognition' – in the hallucinations and in the delirium characteristic of the most extreme situations, but also in everyday dreams and amnesias – which the Soviet expressionist and surrealist cinema elected among the most significant themes of their cinematographic production. This leads us to our second step.

Deleuze refers once again to the second and third chapters of *Matter and Memory*, in which the analysis of the dreaming state is used as confirmation of the conception of the phenomena of memory and recognition just expressed. According to Bergson, the dream is the extreme state of 'an entirely contemplative memory' (Bergson 1988: 155), the possibility of the emergence of the totality of fluctuating

recollections given the relaxation of the nervous tension and the collapse of the attention purely directed to action. The dormant person does not cease to receive sensations, but his or her perception does not result in a sensory-motor response either, rather it enters into contact with a mutable and diffused set of recollections and with the past in general. Perception is not connected here with any particular recollection-image, but rather establishes an extremely dispersive and loose connection between actuality and virtuality which Deleuze, reprising the Bergsonian scheme, defines as '*the largest circuit or "the outermost envelope" of all the circuits*' (Deleuze 1989: 56).

In comparison with recollection-image, which gets actualised by responding to the call of the perception-image, the diffused sensations of the dormant person, despite him or her being unconscious about them, provoke the transformation of the virtual into an actual which in its turn becomes the virtuality of the subsequent actualisation, in a process of infinite feedback and chasing: the most vivid cinematographic example is without doubt *An Andalusian Dog* (1928) by Luis Buñuel, with its succession of images in perpetual becoming. The images of the dream, scattered, dissociated and yet ascribable to one single sensation, the initial one which remains implicit and present, are rendered cinematographically in two different modalities: on the one side through fades, complex movements of the camera, special effects; while on the other through simple cuts in the montage, creating an unreal processuality of still real objects. On the one side, rich and overloaded means, while, on the other, ellipses. The law to which they respond is the same: namely, a wide circuit with loose perceptual links in which the preceding makes reference to the succeeding without any interruption.

However, as occurs in the recollection-image actualised in a flashback, in the film the loss of the sensory-motor connection taking place while asleep is compensated most of the time by the use of an explicit dream-image, in which, once again, the indiscernibility of the virtual and the actual is not guaranteed: we have an unaware dreamer and a spectator aware that what he or she observes is not the reality of wakefulness. In order to define these states of estrangement in which this split does not get explicitly manifested, Deleuze uses the notion of 'implied dream', a dream in which the pure optical and sound image – which has lost any automatic extension as well as a seemingly virtual recollection-image or an explicit dream image to which it relates – extends instead in a 'movement of the world', in a depersonalised movement which does not belongs to the character any more, but rather to the space around him or her:

> The world takes responsibility for the movement that the subject can no longer or cannot take. This is a virtual movement, but it becomes actual at the price of an expansion of the totality of space and of a stretching of time. It is therefore the limit of the largest circuit. (Deleuze 1989: 59)

The depersonalised movement par excellence is the musical comedy, in which the dancer-actor abandons his or her subjectivity and lets the over-personal movement carry him or her, entering the dance in the 'implied dream'. The dances of Fred Astaire and Gene Kelly give access to another world, but so also do some moments of Vincente Minnelli's films, in which the real and the imaginary become indiscernible. The very same movement of the world characterises the outcomes of the evolution of the burlesque genre, which, starting with the emphasis on sensory-motor situations (Laurel and Hardy), introduces at first some affective elements (Buster Keaton), then mental images (in Groucho Marx's nonsenses), up to provoking a rupture of the sensory-motor bounds in which the character does not act, but rather blends into the movements of the world, in an energy unconsciously sucking, involving and dragging him or her (Jerry Lewis).

Departing from a virtuality correspondent and coalescent to its own actuality, to the co-present reflection of a reality, via the hypothesis of recollection-images we thus reached the great circuit of the explicit or implicit dream-images, the continued succession of indistinguishable moments, representing the widest and most dilated level of the Bergsonian scheme. Isn't this exactly what we were looking for?

> Should not the opposite direction have been pursued? Contracting the image instead of dilating it. Searching for the smallest circuit that functions as internal limit for all the others and that puts the actual image besides a kind of immediate, symmetrical, consecutive or even simultaneous double. The broad circuits of recollection in dream assume this narrow base, this extreme point, and not the other way around. (Deleuze 1989: 68)

We thus reached our intended destination: the most contracted circuit, immediate and always reversible virtual reflection of the actual, point of indiscernibility between the two ontologically different dimensions, the root of pure optical and sound images. Here Deleuze truly brings to its extreme consequences the Bergsonian intuition about the relationship between matter and memory in hesitant recognition, and in the following words by Bergson the character of the crystal description can already be appreciated; words which also at the same time show Bergson's greater attention to external reality, although depicted in the immediacy of its opening to the spiritual dimension:

> Every *attentive* perception truly involves a *reflection*, in the etymological sense of the word that is to say the projection, outside ourselves, of an actively created image, identical with, or similar to, the object on which it comes to mold itself. (Bergson 1988: 102)

In the genesis and structure of the crystal-image we see reinstated the radical affirmation of the existence of virtuality in itself, which allows Deleuze to subtract time to its exteriorisation and at the same time rebut the interpretation of Bergsonian duration in terms of internal life and psychological state. If time continuously splits up into present and past, and each moment of life has contemporaneously in itself the two elements of perception and recollection which the crystal embodies in its constitutive double nature, then virtuality – that is, pure recollection, the past, memory, the spirit – exists *outside* one's subjectivity and consciousness, *in* time. It is rather consciousness that, by recalling, gets installed in the virtual, it moves in time, which is thus not internal to the subject but rather gets configured as a 'form of interiority' which the subject *inhabits* and is unable to escape. In this sense the idea of the crystal, as an inorganic mineral, stresses efficaciously the a-subjectivity and over-personal character of Deleuzian time, the radical questioning of personal identity and the refutation of a temporality in terms of the psychological and interior life of the mind. In *Difference and Repetition* (first published in 1968) we already find Deleuze describing virtuality in these terms:

> We opposed the virtual and the real: although it could not have been more precise before now, this terminology must be corrected. The virtual is opposed not to the real but to the actual. *The virtual is fully real in so far as it is virtual.* Exactly what Proust said of states of resonance must be said of the virtual: 'Real without being actual, ideal without being abstract'; and symbolic without being fictional. Indeed, the virtual must be defined as strictly a part of the real object – as though the object had one part of itself in the virtual into which it plunged as though into an objective dimension. (Deleuze 1994: 208–9)

II.

The idea of a duration existing outside one's subjective consciousness, although in constant touch with it, emerges as the central theme of the chapter of *Matter and Memory* titled 'Of the Survival of Images', to which Deleuze refers in his fourth comment on Bergson, following the splitting of the crystal towards the two directions of the past and the present. In those pages Bergson remarked in the first place on the

radical difference between the two dimensions: the present, being sensory-motor, consists in sensations and movements, while the past, as pure-recollection, is characterised as un-extensive and divided by perceptions, so that the contact between the two via the recollection-image, that is, the actualisation of a part of the past in view of the action, is not characterised as a gradual passage but rather as a leap between two ontologically distinct moments. This distinction in kind between matter and memory – which, although maintaining its necessity, becomes indiscernible in the smallest circuit (or, if you will, in the Deleuzian crystal) – represents the necessary condition for the existence of a virtual in itself, of a past which, even when idle, gets preserved in its state of latency. Given the definition of the present as '*what is being made*', what is no longer present would not be what is no more, but rather what is useless, unused, but not for this reason inexistent: thus 'there will no longer be any more reason to say that the past effaces itself as soon as perceived than there is to suppose that material objects cease to exist when we cease to perceive them' (Bergson 1988: 142).[1] Bergson concludes:

> This survival of the past per se forces itself upon philosophers, then, under one form or another; the difficulty that we have in conceiving it comes simply from the fact that we extend to the series of memories, in time, that obligation of containing and being contained which applies only to the collection of bodies instantaneously perceived in space. (Bergson 1988: 149)

The importance in Bergsonian philosophy of the preservation of the past in itself, which according to Deleuze is one of the less understood aspects of Bergsonism, has been already tackled in the essay 'Memory as Virtual Coexistence' (Deleuze 1991a), focused on the very question of the existential and ontological difference between the two temporal dimensions, according to which the passage from one to the other should take place by means of an immediate installation, *d'emblée*, as Bergson himself wrote. In the essay Deleuze highlights the connection of this conception with the new characterisations of the present as act and utility rather than existence, and of the past as inactivity and virtuality, as 'an immemorial or ontological Memory':

> There must be a difference in kind between matter and memory, between pure perception and pure recollection, between the present and the past … We have great difficulty in understanding a survival of the past in itself because we believe that the past is no longer, that it has ceased to be. We have thus confused Being with being-present. Nevertheless, the present *is not*; rather,

> it is pure becoming, always outside itself. It *is* not, but it acts. (Deleuze 1991a: 57)

Deleuze continues:

> The past, on the other hand, has ceased to act or to be useful. But it has not ceased to be. Useless and inactive, impassive, it IS, in the full sense of the word: It is identical with being in itself … At the limit, the ordinary determinations are reversed: of the present, we must say at every instant that it 'was,' and of the past, that it 'is,' that it is eternally, for all time. This is the difference in kind between the past and the present. (Deleuze 1991a: 55)

This point, a memory which is always 'already there', is the focus of Alain Badiou's interpretation, according to which the existence of a self-preserving past determines in Deleuze's thought a 'de-temporalisation of time' that would make him an involuntary disciple of Plato. This time passing and yet eternal as ontological and virtual memory becomes truth itself, which Deleuze substitutes for the idea of truth understood as a normative and abstract category. The power of falsity as virtual Being is nothing other than the new name which Deleuze gives to truth, a truth which is the expression of the eternal and which the philosopher defends 'with gentle violence', in a reflection which Badiou defines classical as his own thought is classical (Badiou 1999). In this sense Deleuze is even compared to Hegel, because for both the 'sovereignty of the One' implies the idea of truth as the preservation of the immanent, as absolute past (virtuality for the former, concept for the latter). The divergence between the two reflections amounts to the structure of memory, which on the one side operates through differentiations and virtualisations, while on the other through firm steps, through 'monumental figures'.

However, besides the obvious acknowledgement of this gap, whose seminal importance has been admitted by Badiou himself, it should be noted that the differentiation through relation is for Deleuze much more than a modality of the memory, as it consists indeed in its structure, that is memory itself. Pure virtuality is in fact conceived as in continuous communication and incessant relation with the actual, with which it establishes an exchange enacting a qualitative transformation: it is eternal, inasmuch as it does not cease to exist, but not static, as it keeps changing. In this sense the present is both the actual image but also what moves on because a new present comes in, while the past is pure virtuality, related to its own present. In cinema the revelation of temporality in itself – shown in the crystal of the two streams of past and present constantly encountering, exchanging and splitting – gets displayed through the two chronic images which do not make reference

to the series, but rather to the order of time: the former grounded in the past which gets preserved, existing for itself, and allowing the appearance of entire fields of memory, which Deleuze defines as sheets of the past; the latter is instead grounded in a deactualised present – already split in modern cinema by its sensory-motor extension – and becomes an ecstatic dimension subtracted to the actualising function of converting the recollection into action, using it as a response to the perceptual act.

The challenge here is that of appreciating the nature of the impulse enabling the passage to the virtuality in its irreducible ontological difference from the actual: it is surely not an intellectual or psychological process, but rather a dribbling or suspension of the habitual which forces time 'out of joint', as Hamlet said. On the other hand, if it is true that between the two dimensions – which are simultaneously indiscernible – there is a continuous short-circuit, then this disentanglement from actuality would never be absolute and complete. In his introduction to the Italian edition of Deleuze's essays on Bergsonism, individuating the two key words of his reading of the volume in the terms *difference* and *virtual*, Pier Aldo Rovatti insists on the exchange and on movement. He writes:

> The conjunction is essential; the 'and' which connects and mobilizes the virtual and the actual, since it is precisely this mobilization which confers to the virtual its character of reality. That 'coexistence' … is once again the mark of the discharging of time operated by the virtual, and yet its difference is now recognizable as a complex movement of differentiation whose circularity allows us to glimpse the rhythm of a constant oscillation rather than the pause on a position (the virtual) or the other (the actual). (Rovatti 2001: xvi; my translation)

Note

1. The affirmation of the existence of a pure past in itself cannot but make one think of Proust's conception of time. However, Deleuze himself suggests the difference between Proust and Bergson, for whom the pure past, although existent and real, is not by any means a lived experience. See Deleuze 2000.

Modernity

I.

The notion of modernity, which Deleuze connects with the emergence after the second world conflict of a new kind of image, has actually been associated by scholars with the very origins of cinema, to note in the first place its 'late arrival' compared with other forms of artistic expression. This aspect is particularly evident in the theories advanced immediately after the invention of cinema, since it has been connected to the themes of the legitimacy of cinema as an art and of the position of the new device within a stable system, thus constituting a recurrent motif of the aesthetic reflection. To claim that cinema is the latest art in terms of appearance meant for the first theorists that, although dependent on a new technical invention and born as a predominantly amusing and recreational event, still the cinematographic event should be given its rightful place among the forms of artistic expression. If it is possible to individuate some typical paradigms of modernity emerging from the course of the various theories of cinema – cinema as a technical innovation, as a possibility of a new perception typical of the modern subject, as a mirror of contemporary society – Deleuze, by reformulating a distinction already in place in the reflection of André Bazin, envisioned a radically different theoretical and stylistic division between classical and modern (De Vincenti 1993: 19).[1]

According to this reading, the essence of modernity – a notion which in Deleuze's understanding does not have a merely historical-chronological connotation but rather a 'distinctive transcendental, trans-historical character' (De Gaetano 1996: 101; my translation) – got manifested in the urgency – felt in Italy after 1945 with neorealism, in the next decade in France with *nouvelle vague*, and in the following one in Germany – to abandon the classical narrative form. In this way we see in

Deleuze Studies 8.3 (2014): 342–353
DOI: 10.3366/dls.2014.0154
© Daniela Angelucci
www.euppublishing.com/dls

films the emergence of 'purely optical and sound situations', of images disconnected from perceptual connections and dislocated in an empty space, and a precise theoretical connotation. This new modality, which seems to offer a renewed autonomy to image itself, certainly has its social, economic and political causes, but embodies in the first place a different stylistic attitude of the film, which is not centred any more on the relationships of cause–effect and perception–action typical of the concatenation of events in classical narrative cinema. As already noted, the cinematographic regime of modernity gets associated with the possibility of an immediate presentation of the virtual and of temporality 'in person': whereas in classical cinema the progress of events was conveyed through the characters' activity, through movement, the new narrative way makes truth and falsity indiscernible from the very choice of the themes through the usage of – among other things – *décadrages* and false recollections.

The novelty in the cinematographic style of movements and authors of modernity has been already stressed, obviously, by scholars; it is worth remembering, for example, the pages of Bazin on neorealism, aimed at emphasising the distance of the new cinematographic form from the classical one. In his essay on the Italian school of Liberation, referring to Roberto Rossellini's *Paisà* (1946), the French critic highlighted precisely the difference between the two narrative logics: the modern, neorealist one in which the spirit of the spectator, facing the fragments of reality jumbled by an elliptic montage, should pass from one fact to the other 'as one jumps from rock to rock in order to cross the river', and the other of classical *découpage*, in which the facts engage with each other 'as a chain in a pronged wheel', as if they are 'at the service' of our imagination.[2]

The description that Deleuze advances at the end of the first volume on cinema conveys the manifest signs of the new image, which according to him threaten in various ways the system of action: the 'dispersive situation', an ensemble of uncertain and empty spaces; the 'deliberately weak links', not following a well-defined logic any more; the 'voyage form', in which space is experienced in a casual way; the 'consciousness of clichés', the awareness that a such a loosely cohesive world might find its unity only in the current clichés of the time; and the 'condemnation of the plot' (Deleuze 1986: 210), the revelation of the existence of an occult power feeding such clichés, which, by mixing up with its very same effects, cannot be confined.

In Rossellini's *Germany, Year Zero* (1948), a film in which all these features patently appear together, the child-protagonist is certainly more

a 'seer' (*voyant*) than an 'agent' (*actant*); the child wanders in the dispersive reality of the devastated post-World War II Berlin menaced by the clichés of the time, and his suicide should be read as an extreme act of condemnation against such conditions. In France the *nouvelle vague* elaborated the features of neorealism in a reflexive direction by loosening up even further the sensory-motor bonds, creating a cinema of purely optical and sound situations in which objects, signs and acts are not functional to the scenic action anymore, but acquire autonomous value.

Among the many films one might mention, the symbol of the French *nouvelle vague* is the image of the face of Jean-Paul Belmondo covered with blue paint in the finale of *Pierrot le fou* (1965) by Jean-Luc Godard, a tale of the crazy journey of Marianne and Ferdinand-Pierrot, completely devoid of sensory-motor bonds: to the complete disorder of the narration and the rarefaction of the characters correspond the aesthetic fullness of each scene and the stylistic richness of a film which blends together analogical shots and digital video, ellipses, repetitions, citations, gazes in camera, and false connections. Deleuze comments:

> In these we see the birth of a race of charming, moving characters who are hardly concerned by the events which happen to them – even treason, even death – and experience and act out obscure events which are as poorly linked as the portion of the any-space-whatever which they traverse. (Deleuze 1986: 213)

II.

The difference between the two cinematographic regimes – classical and contemporary, organic and crystalline, of movement and of time – is articulated by Deleuze in the sixth chapter of *The Time-Image* along three registers: description, narration, and story. In the first place, from the *descriptive* point of view, organic cinema presupposes the autonomous existence of its own objects, independently from the depiction operated by the camera, in order to build a sensory-motor situation in which the character acts or reacts within the bounds of the circumstance he or she is experiencing. With the crisis of the action-image, description replaces what is being filmed, constituting itself the dismantled, created and cancelled object that the subject observes and registers but of which he or she is no 'agent' any more: the autonomy from a specific environment qualifies these objects as purely optical and sound situations, separated from any possible reaction and lacking any motor extension.

The existence of such bonds, of causal and logical connections obeying the rules of succession and simultaneity, guaranteed in classical cinema the continuity of that reality which was presupposed by, and which at the same time defined, the regime of the imaginary as its opposite pole, determined in contrast as the self-contained moment in which images would appear as incoherent and disconnected. The questioning of movement-cinema generated a novel relationship between the real and the imaginary, two ontologically different regimes which in the new kind of description constantly overrun each other to the point of becoming indiscernible. The perpetual exchange between the two dimensions is presented as an unbroken short-circuit, where the smallest circle – in which the actual, with its continuous and imperceptible oscillations, gets transformed without pause in its virtual and vice versa – represents the true essence of what Deleuze defines as the crystal.

III.

From a *narrative* perspective, in classical cinema the development of the linear scheme of perception–action guides the plot, which maintains in this way a presumption of truthfulness also in the presence of dreamlike elements or recollections in the montage, rendered through juxtapositions and ellipses. In this field of forces, corresponding to a Euclidean space, time is represented only indirectly because it derives from movement, and its flow is pictured through action: it is a chronological time. Once the sensory-motor schemes have been abandoned, modern narration gives life to characters moving into a pure optical situation in which the anomaly of movement becomes the rule and space is not organised according to Euclidean rules or determined paths any more. Deleuze writes:

> Now what characterizes these spaces is that their nature cannot be explained in a simple spatial way. They imply non-localizable relations. These are direct representations of time. We no longer have an indirect image of time which derives from movement, but a direct time-image from which movement derives. (Deleuze 1989: 129)

The general consequence of this immediate exhibition of temporality is that time in itself, chronic and no longer chronological, jeopardises the very concept of truth. What is at stake is not a simple version of content relativism, for which different opinions would correspond to different times, but rather the difficulty (for thought) of obtaining a direct connection between truth and the structure of time, as it

emerges from the history of philosophy with the ancient paradox of the contingent futures. In the context of Leibniz's proposed solution to the paradox – according to which tomorrow something can take place or not in two diverse worlds, both possible but not 'compossible', so that it is the 'incompossible' (and not the impossible) which progresses from the possible, and the past can be true but non-necessarily so – Deleuze quotes Borges's *The Garden of Forking Paths* in order to claim the co-presence in the same world of incompossible elements, in a labyrinth of time in which the 'pasts' are not necessarily true. Deleuze writes that 'nothing prevents us from affirming that incompossibles belong to the same world, that incompossible worlds belong to the same universe' (Deleuze 1989: 131); and 'contrary to what Leibniz believed, all these worlds belong to the same universe and constitute modifications of the same story' (Deleuze 1989: 132). This is the norm of the new falsifying narration of crystalline cinema, which proposes and amplifies a modality of description in which the real and the imaginary are indiscernible, displacing the narrative veracity and the sensory-motor concatenation of movement-image.

Deleuze dedicates a chapter of *The Fold: Leibniz and the Baroque* (1992) to the Leibnizian notion of incompossibility: for Leibniz, the contradiction is not between Adam sinner and Adam not sinner, but rather between Adam not sinner and the world in which he committed sin. This exemplifies the new relationship that Leibniz calls 'incompossibility', and it is from among this divergent series of possible worlds, although incompossible between each other, that God would pick the best one. Deleuze quotes Borges again, who instead would like God to keep all incompossible worlds existing at the same time. The main difficulty is that, should he actually behave like that and thus violate the rules of his own game, God would become a mendacious, trickster, deceiving deity: we face once again the problem of the false (Deleuze 1992: 71).

On this theme Deleuze's examples are copious and captivating. The abandonment of a narrative striving for truth and the emergence of the forger characterise the whole work of Alain Robbe-Grillet: in particular, the protagonist of *The Man Who Lies* (1968) is not 'a localized liar, but an unlocalizable and chronic forger' (Deleuze 1989: 132). Among the films by Alain Resnais, Deleuze mentions *Stavisky* (1974) – perhaps not his greatest achievement, but rather the one which 'contains the secret of the others': the film revolves around an investor who built his wealth on frauds, thus unmasking a world which is in its turn deceiving. Pure descriptions and the bond between falsity and temporality are the

underlying cipher of Jean-Luc Godard's work, of which in this context Deleuze mentions *The Big Swindler* (1964), inspired by an episode of Herman Melville's *The Confidence-Man*. This novel by Melville realised in literature precisely what the last book of *Zarathustra* accomplished in philosophy: the exhibition of a continuous and in-becoming series of forgers, presented through characters transforming and 'metamorphosing' into each other in a continuous shift, in which beyond each figure there always lies another. A great author of falsifying cinema is Orson Welles, whom we have already encountered as the director of *Citizen Kane*, and whom we will have the occasion to meet again.

The power of the false – not a criterion of evaluation or merit, but simply the intimate motive of modern cinema – becomes thus the general principle of the new cinematographic regime, capable of inspiring very different directors and in whose work it does not appear as a separated or self-contained moment but rather as the paradoxical foundation of all characters – including those traditionally striving for truth:

> So that investigators, witnesses and innocent or guilty heroes will participate in the same power of the false the degrees of which they will embody … The truthful man will form part of the chain, at one end like the artist, at the other end, the nth power of the false. (Deleuze 1989: 133–4)

What is missing in this continuous postponement is the undeniable element at the base of every truthful narration and in general of the regime of movement built on action: namely, the system of judgement, that is, the possibility to identify a character and to individuate its coherent and bonding features. In the perpetual becoming of the new system, characterised by a plurality from which it is impossible to obtain any unity, the 'Ego = Ego' formula gets replaced by Rimbaud's 'I is another' formula.

IV.

Eventually, as regards the register of the *story* as well – that is, the relationship between subject and object, where objective stands for what the camera sees, and subjective for the point of view of the character – crystalline cinema unhinges the element of truthfulness, that is, the encounter of the two points of view, thus making impossible any definite and unmistakable identification. In the 'cinema of poetry' theorised by Pasolini the camera adopts, for example, an inside view, which simulates the manners and point of view of the characters in a mimetic relationship, so that the objective and the subjective images blend together and contaminate each other thus becoming

indistinguishable. In his essay on the cinema of poetry of such authors as Antonioni, Godard and Bertolucci, Pasolini writes:

> The creation of a 'language of film poetry' thus implies the possibility of making pseudostories written with the language of poetry. The possibility, in short, of an art prose, of a series of lyrical pages … The camera is therefore felt for good reasons. The alternation of different lenses … etc. – this entire technical code came into being almost out of impatience with the rules, out of a need for an irregular and provocative freedom, out of an otherwise authentic or delicious enjoyment of anarchy. But then it quickly became the canon, the linguistic and prosodic patrimony that interests contemporary filmmaking the world over. (Pasolini 2005: 184)

Deleuze reprises Pasolini almost literally in his description of the style of modern cinema, neither subjective nor objective:

> The story no longer refers to an ideal of the truth which constitutes its veracity, but becomes a 'pseudo-story', a poem, a story which simulates or rather a simulation of the story. Objective and subjective images lose their distinction, but also their identification, in favor of a new circuit where they are wholly replaced, or contaminate each other, or are decomposed and recomposed. (Deleuze 1989: 150)

If Deleuze locates the origin of this change in Fritz Lang's as well as, once again, in Welles' films, this transformation of the subject–object connection is even more interesting in the cinematographic genre which more than any other aspired to the truth: namely, documentary and investigative films. This affirmation of a new will to storytelling, going beyond real and fiction, in direct and realistic cinema represents one of the most significant outcomes of the search for new expressive modalities. If the ideal of truth, sublimed by the selective and multiplying force of shots, was invariably tied to the cinematographic fiction from which it derived and on which it necessarily depended already in the masterpieces of the classical documentary cinema, in the 1970s investigative films – with the documentary films, shot in Quebec, by Pierre Perrault and the *cinéma-vérité* by Jean Rouch – tended to abandon the old schemes and get to the reality beyond the conditioning truth–fiction dichotomy as well. From the 1970s on, in fact, even in reportages and investigative cinema the relationship between the subjective and objective points of view underwent a progressive modification, aligning with *cinéma-vérité* in its search for an authenticity going beyond the truth–fiction dichotomy. A circumstance that exemplifies this cinematographic genre – in particular, Deleuze makes reference to Perrault and Rouch – is that in which the camera

catches the characters in real and daily situations, but with the aim of showing their reaction to the camera's presence, which is emphasised so as to invite an interaction on their behalf. In this way the reality–fiction alternative becomes obsolete, because the authentic effect on reality as presented by the film is produced and created by cinema itself.

The goal of Perrault's criticism against fiction was the abandonment of the model of truth underlying it, the attainment of a pure 'storytelling function' through which a certain group, by re-telling itself, becomes other than itself without betraying itself and being false; the power of the false offers to the real character, as well as to the director, the possibility to invent, converting his or her story into 'the flagrant offence of making up legends'. Cinema should not fix the identity of a character, real *or* fictitious, through its objective and subjective aspects, but rather catch the becoming of the real character when he or she starts to 'make fiction' him- or herself, when he or she enters 'the flagrant offence of making up legends', contributing in this way to the invention of his or her own people (Deleuze 1989: 150–1).

In a similar way, the work of Rouch, who began with ethnographic reports from African countries and produced fictions starting with *Dionysos* (1986), can be labelled as *cinéma-vérité* since, by going beyond any pre-established ideal of reality to which fiction refers, it became the producer and creator of truth. The characters of Rouch – and the director as well, who through the use of an active and engaged camera becomes a character himself – in the unfolding of the simulating stories, and in the perpetual becoming other than themselves, form an image exceeding the confines of the present so as to catch the before and after, dimensions connected in a continuous transformation; what emerges here is the direct image of time in the form of unbroken becoming:

> The character must first of all be real if he is to affirm fiction as a power and not as a model: he has to start to tell stories in order to affirm himself all the more as real and not fictional. The character is continually becoming another, and is no longer separable from this becoming which emerges with a people. (Deleuze 1989: 152)

V.

At this point it should be noted how the distinction between modern cinema and classical regime – which, as we saw, we found already in Bazin – is reworked by Deleuze with a different emphasis, being the foundation of his entire theory of cinema, which he divided in the

two volumes on the movement-image (the classical form) and time-image (the modern one), respectively. In *Film Fables* (Rancière 2006) Jacques Rancière questioned precisely the possibility of a neat distinction between the two ages of cinema. In the first place, Rancière does not see in the two modalities advanced by Deleuze two separate moments built in opposition, but rather two different points of view on images, united by an 'infinite spiral'. Rancière argues for this first basilar diversity in opinion by noticing the difficulty arising from the overlapping of the breaks in history and the ones internal to the image, that is, the attempt by Deleuze to envision an immediate connection between art and some of the events external to it. How is it possible, one might ask, to operate a classification about the kinds of sign by means of a heterogeneous factor? In regards to this first objection it should be noted right away that art and history represent different but not separate levels, and that the possibility of a repercussion of historical and political happenings on art can hardly be questioned, the more so from within a – convincing – conception such as Rancière's, who on more than one occasion theorised a strong bond between aesthetics and politics. In point of fact, in *The Politics of Aesthetics: The Distribution of the Sensible* (Rancière 2004) Rancière individuated in the artistic practices the visible forms of an organisation of the sensible, a 'partition' founded on the ways of life, on politics, and on the form of activities structuring the concept of citizenship.

Going back to the divide between classical and modern in cinema, which Deleuze defines in terms of two different logics of the image, it is for Rancière rather one taking place at the transcendental level: the very same images can be considered either from the point of view of a philosophy of nature, which examines them as material events, or from the point of view of a philosophy of spirit, which instead sees them as a form of thought, without assuming any breaking point pointing to the crisis of modernity. The potentialities of purely optical and sound situations of the time-image were already expressed in what Deleuze, in *The Movement-Image*, defined as the affection-image, that is, an image which, through the hesitation in the active response, gives rise to the predominance of the sensible qualities. This is demonstrated by the fact that certain authors discussed in the first volume return as an example of a new configuration of the image in the second; the example given by Rancière is Robert Bresson. According to Rancière, this notion of cinematographic image as a phase distinct from the classical age seems to be affected by the very same problems haunting modernism in general, with its affirmation of the autonomy of art as the manifestation of its peculiar essence. In fact, it conceals the complexity

of what he defines as the passage, begun in the nineteenth century, to the aesthetic regime of arts, a regime in which 'the image is not the codified expression of a thought or feeling. It is rather the way in which things themselves speak and at the same time are silent' (Rancière 2009: 13). This enfranchisement from the mimetic requirement is guaranteed not so much by the liberation and autonomy of art from any representative pressure, but rather by the unity of the opposites exhibited in this kind of image: the unity of the pure passivity of things and the pure activity of creation. Cinema thus embodies the completion (and at the same time the confutation) of the aesthetic regime, uniting the passivity of the mechanical eye of the camera with the activity of the director as sovereign will:

> Cinema, due to its technical apparatus, literally embodies this unity of contraries in the union of the passive and automatic eye of the camera and the conscious eye of the director … Unlike novelists and painters, who are themselves the agents of their becoming-passive, the camera cannot but be passive. In the cinema, the identity of contraries is there at the outset, and hence lost from the outset. (Rancière 2009: 117–8)

The necessity of a more elaborated vision of artistic modernity in general, in which the autonomy is achieved at the price of a contrast, and the unity of the opposites – activity and passivity – as the engine of cinema in particular, are certainly very important and fecund suggestions. For example, the definition of cinema as a 'countered fable', indicating a correlation between what is visible and what is sayable in terms of an interdependence, persuasively determines the debate on the topic 'cinema: visual or narrative art?' animating the first film theories (and which still animates the discussions in the Anglo-American analytic debate). The contrast between the two elements in the binary representative regime of cinema indicates, according to Rancière, that the visible element can manifest itself in all its breadth only by emerging from the plot, that is, by fighting with it, with the Aristotelian 'fable'. The power of the image shows itself as a 'gap', in collision with the narrative concatenation which becomes its antagonist, but also the necessary form for its emergence.

However, from this perspective there does not follow the impossibility of individuating a modern phase of cinema as Deleuze envisions it, keeping in mind firstly that in his writings the notion of modernity does not ever have a merely and rigidly chronological acceptance, if only in an extremely superficial understanding. Although its predominance can be appreciated starting from neorealism, the category of modernity

explicitly acquires with its classical counterpart a trans-historical meaning – it suffices to think that *Citizen Kane* by Orson Welles, dated 1941, is indicated as the first film of the new regime of time. That the two texts on cinema do not aspire to constitute a history is explicitly stated by Deleuze at the start of the first volume, while what he means by classification can be clearly learned in a conversation which appeared in 1986 in *Cahiers du cinéma*, now collected in *Two Regimes of Madness*:

> There is nothing quite so amusing as classifications and tables. A classification scheme is like the skeleton of a book; it's like a vocabulary or a dictionary ... Every classification is similar: they are flexible, their criteria vary according to the cases presented, they have a retroactive effect, and they can be infinitely refined or reorganized. Some compartments are crowded, and others are empty. In any classification scheme, some things which seem very different are brought closer together, and others which seem very close are separated. (Deleuze 2006: 285)

Therefore, a classification is thus understood by Deleuze as an infinite and always unstable list. If it is true that each film – classical or modern – presents itself as a split and contrasted fable in which it the gap existing between the passivity of the mechanical eye and the purposiveness of the director's choice is noticeable, in the narrative concatenation of events and the force of the pure image of the cinema of a certain age we can acknowledge with Deleuze a predominant mark of freedom from certain schemes and of self-reflexivity without having the pretence of building a history of cinema on it, nor a rigid scheme within which each element should square with the other in a definitive way. The clues of this transformation of the image can be appreciated in the style of the direction – the camera movements, the rhythm and system of montage – but also in the interest in some recurrent themes and figures (the child, the invalid, the fool, the neurotic). These incarnations of an impossibility in the perceptual response, rather than necessary allegories – since, as Rancière writes, the rupture of the sensory-motor connections 'cannot be identified as an actual difference between types of images' (Rancière 2006: 116) – represent the signs of a deep-seated impotence and renouncement of action.

The roots of the distinction between the two kinds of image lie precisely in the emergence of a radically different dimension – that is, virtuality as time in itself – and in the abandonment of actuality – that is, dropping the Bergsonian terminology adopted by Deleuze, the idea that in modern cinema the situation and the characters exist independently from action, acquiring on the contrary their very existence from their

being placed at the suspension of movement; that is to say, not simply overcoming the motor scheme, but rather by breaking it from within. This is also what Deleuze indicates as the difference between affection-image, the anchor internal to the organic regime of movement, and time-image: the hesitation featuring them discharges in one case in the plan of actuality while in the other through a complete immersion into memory. In this context the words of Maurizio Grande are once again of help:

> Deleuze is able to classify the affection-image as movement-image (and not as time-image) because in this case we have the indirect representation of the time of interiority through the interruption of 'edited' action. Close ups interrupt the progression of action and inscribe the duration of the expression of affection on a face inscribed in an anonymous space subtracted to any determinate space and to the indirect representation of time resulting from the montage. (Grande 2003: 386; my translation)

Going back to the Bergsonian language of *Matter and Memory*, in the case of affection we can speak of a hesitation in the response that does not provoke a 'leap' in memory, but rather stays in the sensory-motor present of mechanical recognition, while instead the time-image contemplates a search in the past animating perceptive recognition. Departing from a non-historic-chronological perspective, although descriptive and classificatory in the specific and paradoxical sense indicated by Deleuze, the identification of a tension internal to cinematographic art denoting its belonging to the aesthetic regime as the unity of contraries (the overlapping and interplay of two diverse attitudes) does not prevent the possibility of a new modern modality of the image, with its distinctive predominant character (both formal and related to its contents), and in which the virtual dimension becomes pre-eminent and directly exhibited.

Notes

1. Giorgio De Vincenti, in his volume *Il concetto di modernità nel cinema* (1993), focused on the theoretical line hailing from Bazin, individuating 'the combination of the meta-linguistic commitment with the recovery of the reproductive aspect' as its moving theme.
2. Rancière defined such a discrete character of images, which in modern cinema gain a certain aesthetic harmony by almost emerging from the narration and imposing themselves in their visual power, as the 'great parataxis' of modern cinema. See Rancière 2009.

Falsehood

I.

The question of falsehood, central to Deleuze's philosophy of cinema as already appreciated in the discussion of the difference between modern and classical cinema, animates the interpretation which he gives of the poetics of Orson Welles, an uncommon director with an overflowing personality on whom it is worthwhile to pause. The numerous interviews Welles gave during his career reveal a vital and contradictory character; the director generously offered himself to the camera, pronouncing on serious and substantive issues with self-confident nonchalance and without renouncing his taste for paradox. Always characterised by the magnitude of his style – aristocratic and yet anarchical, as he himself portrayed it – there coexisted different attitudes and reactions: the director appears authoritative with the young Peter Bogdanovich, who carefully gets prepared for their meetings for the book interview (Welles and Bogdanovich 1992);[1] he looks sincerely saddened even by the only partially negative reception of his work, which sometimes annoyed him; he is at times revengeful and occasionally elusive in revealing the well-known unlucky events related to the production of some of his films. Convinced of the primacy of the work over the author, Welles reveals at times a certain impatience for theoretical issues, as for example in his interviews with the cinematographic critiques of *Cahiers du cinéma*,[2] and he often downplays the importance attributed to the direction and to the methodology used.

Despite this plurality of behaviours and positions, or rather precisely because of the brilliant intertwinement of all these elements, there emerges a common trait representing the neatest cipher of Welles' personality and work: the love for life and for the existent, which the director fully enjoys and whose inevitable contradictions he consciously

Deleuze Studies 8.3 (2014): 354–364

endorses. The indulgent treatment that Welles reserves for the contradictoriness of reality – which is evident in his characters if it is true that, to use the words Shakespeare gave to Hamlet to talk about dramatic art, cinema should 'hold a mirror up to Nature' – does not surface only formally, but it gets explicitly thematised several times. To Kenneth Tynan, who asks him for clarification on the incompatibility of certain assertions of his, Welles replies:

> For 30 years people have been asking me how I reconcile X with Y! The truthful answer is that I don't. Everything about me is a contradiction, and so is everything about everybody I know. We are made out of oppositions; we live between two poles. There's a Philistine and an aesthete in all of us, and a murderer and a saint. You don't reconcile the poles. You just recognize them.[3]

Welles' extraordinary ability to create, and in the majority of his films also to interpret, remarkable negative characters, always animated by a tender commitment, originates within this eternally conscious acknowledgement of human duplicity and ambiguity. In fact, the director 'chivalrously' offers to felons all the possible justifications for their crimes, shrouding them in a tragic mist, preventing in this way the spectator from elaborating a clear moral evaluation. The publishing tycoon protagonist of *Citizen Kane* (1941) is a man abusing his authority and wealth, but the public cannot but feel compassionate for the character, combining the greatness of his endeavours with the melancholy of the loser. The possibility of judging him is also complicated by the fact that we are unable to decide who the true Kane is, whether he is the one described by his protector, by his wife, by his collaborator or by the butler. In *Othello* (1952) Iago certainly is the traitor, whose treachery, as Welles says, finds no other reason than his nature, but the same Othello is unable to understand the complexity of reality, and the motive for his search for truth is hideous envy. The plot of *Mr. Arkadin* (1955) consists in a continuous switch of roles, all inspired by fiction: the billionaire Arkadin is approached by the swashbuckler Van Stratten who wants to blackmail him, but who in turn gets hired to reconstruct Arkadin's past, not because the latter has completely forgotten it due to amnesia, as he wants others to believe, but rather with the goal in mind of getting rid of the witnesses to his fault, among whom, as will become clear at the end, there is the detective himself.

In *Touch of Evil* (1958) all the leading characters are on closer inspection morally dubious. Captain Quinlan, who uses false evidence

in order to frame the true culprits, has the moves and the appearance of a real felon, who however, by means of dishonest methods, operates in the service of justice: 'He was some kind of man. What does it matter what you say about people?', the ambiguous fortune-teller Tana, performed by an outstanding Marlene Dietrich, says about him after his death; Menzies, Quinlan's devout assistant, stages a plain betrayal, notwithstanding that his friend once saved his life; even the righteous agent Vargas, as Welles himself would remark in an interview, in order to reveal Quinlan's crimes obsessing him, does not hesitate to neglect his wife, exposing her and putting her in danger.

A plot full of tricks is also found in *The Lady from Shanghai* (1948), in which the seaman O'Hara falls in love with the wife of the wealthy lawyer Bannister, who hires him on their yacht leaving for the Caribbean; once back in San Francisco, the seaman – as a result of lies, shootings, and extortions – falls into Bannister's trap and is unjustly accused of the murder of his partner. The famous and visionary finale, in which O'Hara, eluding justice, assists the showdown between the billionaire and his wife Elsa (portrayed by a Rita Hayworth transformed by Welles into a dark lady far from the cliché of the Hollywood diva), which takes place in the mirror room of an amusement park, symbol of the multiplication of tricks and of the deformation of identities. In contrast to the films previously mentioned, here the director remarkably interprets the role of the positive hero, moralist and naive close to credulity. His last line, however, results in being meaningful and ironic, challenging with its jeering tone all the acquired certainties: 'I'd be innocent, officially. But that's a big word, innocent. Stupid is more like it. Well, everybody is somebody's fool. The only way to stay out of trouble is to grow old. So I guess I'll concentrate on that.'

The moral ambiguity of these figures staged by Welles – to mention only a few films in which the refusal to judge the characters is evident[4] – is an element that the critics have stressed since from his earliest works: François Truffaut remarked on it in an article on *Arts*, André Bazin in the *Observateur* and most importantly in the interview conducted together with Charles Bitsch and Jean Domarchi and published in *Cahiers du cinéma* in 1958, whose declared aim is that of 'discovering the ideal character recurring in all his films'.[5] Initially Welles tends to minimise the recurrence of a common trait in all his great interpretations: his personality as an actor is the cause of the predilection for a humanity *bigger than life*, majestic in its wickedness and often tragically defeated (the first three films mentioned, *Citizen*

Kane, *Othello* and *Mr. Arkadin*, open with the death of the protagonist). As an actor, Welles states that he feels the obligation to enrich with his better part the morally hideous characters he plays, to be loyal to the role he plays, for which he should offer the best justification. In this way, not without a certain delight in disorienting his interviewers, Welles begins the conversation manifesting his hatred for Quinlan, a 'despicable' man like Kane, for whom however – and here the subversion begins – one can feel sympathy and repugnance at the same time. In the same way, Arkadin is an opportunist born out of a corrupted world, of which he however represents the best possible expression, as his spirit is 'courageous and passionate'. In answering the many questions asked, the director reveals more and more, acknowledging that his condemnation is only intellectual, that is, conveyed only by thought and not by heart, admitting his disinterest, or even repulsion, for the rhetorical and sentimental values of bourgeois morality, in favour of an adhesion to life in all its aspects, of an aristocratic ethics:

> [Generosity is] the chief virtue. I hate all the opinions which deprive humanity of the least of its privileges; if any creed demands that one should renounce something human, then I detest it … I detest anyone who wants to cut off a note from the human scale; at every moment one ought to be able to strike any notes one desires. (Estrin 2002: 57)

It is only within this vision that one can thus appreciate the cipher of the Wellesian motif of *character*: not simply one's personality or temperament, but 'the way one behaves when one denies the laws one should obey, and refuses to act in accordance with the emotions one feels; it's the way one behaves in the face of life and death' (Estrin 2002: 74). The obvious reference is to the tale of the frog and the scorpion recounted in *Mr. Arkadin*: the frog agrees to carry the scorpion on her back beyond the river believing that the scorpion will not bite her as that would be illogical, given that in that case he would die as well; but the scorpion bites her anyway, drowning with her, because, as he replies, 'I can't help it, it is my character.' Welles plays with the possible interpretations of this fable each time someone mentions it in an interview, and if his interlocutor believed he or she had identified a 'scorpion' or a 'frog' in one of his characters, in most cases the director hastened to contest him or her or say, for example, that yes, it is true, the scorpion is a scoundrel, but, in the first place, it is the frog who behaves unwittingly. The sole certainty is the underlying conviction of this poetics, that is, once again the impossibility of reconciling

contradictions, the acknowledgement of the ineluctability of human duplicity: if it is not legitimate to justify a morally biased action with the pure and simple exhibition of one's character, doing it implies some tragic and fascinating dignity and standing, a sort of heroism whose attraction is difficult to resist.

II.

The Nietzscheism of Welles, already noticed by Bazin, Bitsch and Domarchi, lies at the centre of Deleuze's reading of his cinema; he in fact expresses the cornerstone of Welles' critique of truth with a quick and penetrating formula: 'affect as immanent evaluation, instead of judgment as transcendental value' (Deleuze 1989: 141). Welles' aim is thus not that of facilitating the collapse of an entire system of judgement in order to establish a different evaluative criterion acting as the superior principle, but rather that of judging every being and every action 'in relation to the life which they involve': 'the good is outpouring, ascending life, the kind which knows how to transform itself, to metamorphose itself according to the forces it encounters' (Deleuze 1989: 141). As he writes in conclusion to his 1962 volume on the German philosopher, Deleuze imagined 'Nietzsche withdrawing his stake from a game which is not his own' (Deleuze 1983: 195), intending to replace the usual, mistaken interpretations – first of all the one of the will to power as a will to control – with the acknowledgement of the sense of Nietzschean philosophy in the affirmation of multiplicity, of difference, of becoming.

This 'joy of the diversity', the exhibition of an always innocent life – a theme which naturally is also profoundly Deleuzian and which culminates in the affirmation of an 'aesthetic of believing' (a 'need to believe in this world, of which fools are a part', Deleuze 1989: 173, a theme which I shall reprise later) – gets realised in the cinema of Welles as well. However, if the affinity between the director and Nietzsche has been highlighted since the 1950s, and the interpretation of the power of the false in Welles' cinema offered by Deleuze reprised by the critics, only a few of them stressed and deepened its most robust theoretical aspect and import, which is, as Alain Badiou writes in his monograph on Deleuze, the 'main road' to access the Deleuzian idea of truth and his theory of time.[6] If in classical cinema, in *The Movement-Image*, narrative time emerges through movement according to the linear perception–action scheme guiding the story as well as the characters, with modernity the true protagonist of film is time itself, conveyed

through opsigns and sonsigns, purely optical and sound situations, descriptions completely disjoined from any relationship with action.

As we have already seen, in *The Time-Image* the difference between the organic regime, classical or kinetic (related to movement), and the crystalline one, modern or chronic (time-related), is reprised and specified by using three different registers: description; narration, that is, the development of the sensory-motor scheme; and the plot, that is, the elaboration of the subject–object relationship in the film. The chapter in which this survey is operated is titled 'The Powers of the False': if in these pages Deleuze stresses the connection between the exhibition of pure time and the questioning of truth, the renunciation of the pretence of a truthful narration to make space for the force of the transformation and becoming finds in the cinema of Welles a first and still unsurpassed example.

III.

The movie that Deleuze considers as the manifest of cinema as the power of the false is *F for Fake* (1975), the last film directed and presented to the public by Welles. *F for Fake* presents to the spectator as a sort of documentary, although a rather peculiar one. Using some material shot in Ibiza by François Reichenbach in 1968 for a never completed investigative film on the falsification of works of art, Welles blends the portraits of some characters connected in various ways to artistic fiction: Elmyr de Hory, forger painter theorising the indistinguishability of authentic paintings from false ones; his biographer Clifford Irving, an American reporter who authored a fake autobiography of Howard Hughes, a rather controversial figure in himself; Reichenbach himself, presented as an ex-art merchant who buys some imitations by de Hory. The insertion of some scenes filming the director in slow motion while mounting the film makes evident the reflexive character typical of post-documentarism, of which Welles has been an interpreter by imposing, as Adriano Aprà writes, 'the concept of literary cinema and together the one of *fake documentary*' (Aprà 2003: 368; original emphasis; my translation). In some interviews, refuting the over-simplifying label of documentary, Welles spoke in fact of this film as a 'personal essay', a 'free-form essay on fakery'; it thus consists in a filmed meditation 'in the first person singular',[7] whose true protagonist is the false and its relationship to art.

However – and this is the other necessary and complementary aspect of the overcoming of the alternative between truth and falsehood – the

spectator should fully adhere and trustingly abandon him- or herself to the fiction, which is the true protagonist of the film: the very act of watching and believing in what is seen seems likewise to be a decisive theme, implied by the most noticeable of the entanglements between truth and lie. This is the sense of the episode on voyeurism inserted at the beginning of the film, interpreted by Oja Kodar and inspired by her novel *The Girl Watchers*, in which a charming and showy woman walks along the street followed by the stares of the men. Welles expects from the public an enchanted gaze, a suspension of the incredulity similar to the one experienced while attending the show of an illusionist. As he replies to Bogdanovich, 'To me, magic begins and ends with the figure of the magician who asks the audience, for a moment, to believe that the lady is floating in the air' (Welles and Bogdanovich 1992: 182): the Deleuzian *croyance*, the belief in the world, extends also to its deceptions.

In the first scene the director appears precisely in the shoes of an illusionist, introducing himself as a charlatan and announcing that the themes treated in the film will be trickery, frauds and lies,[8] joining from the very beginning the unbroken series of forgers he introduces as narrator and sarcastic barker. Also evoked in the course of the film are both his debut as actor at the Dublin Gate Theatre, where he was hired after lying about his alleged long experience as a star on the American stages of Broadway, and the launch of his Hollywood success, started 'with a flight into fakery … by flying saucers' (Welles and Bogdanovich 1992: 182), thanks the radio trickery of *The War of the Worlds*. The only situation in which Welles reflects on his vision of art without any ironic tonality or mediation – in an atmosphere of nostalgia for a past time, a time before the separation between artist and artisan – is his monologue in front of Chartres cathedral, against which charm 'the juridical problem' of true and false annihilates in the aesthetic assessment: only the ugly is 'unauthentic' (Salotti 2000: 158; my translation). This extraordinary endeavour without signature is described by Welles in *F for Fake* as a 'rich stone forest' that, although perhaps will be demolished one day, now witnesses the mark of humankind and 'the anonymous glory of all things'.

The story of the false adventure of Oja Kodar as Picasso's model, ending with a fight between the painter and Oja's grandfather – who would have falsified the paintings for which she posed, destroying the originals – completes the chain of fakers. Welles intervenes again to disentangle this whirling twist of falsifications, once more in the role 'cosmopolitan hypnotist' (Deleuze 1989: 145): an hour before he promised to tell nothing but the truth while now, at the end of the film,

he confesses that for the past seventeen minutes he has lied his head off, because reality – 'the toothbrush waiting home for you in its glass, a bus ticket, a pay-check, and a grave' – does not matter at all, and the only truth the professional liar ought to serve is art.

The richness and importance of the themes surveyed show that this film is neither the result of a new idea due to fortuitous circumstances,[9] nor a sheer 'adventure of the intellect, a flickering of paradoxes ..., an amazing labyrinth of mirrors' (Farassino 2004: 99; my translation), but rather a thoroughly poetical declaration in which all the themes most cherished by the director are displayed: illusion and magic, the primacy of the endeavour over its author – claimed in many interviews given to journalists and film critics – and also what Bogdanovich labelled as the pessimism of the Wellesian vision united with the optimism of his style, but above all the false and becoming, the trickery ousting the true and radically overturning its supremacy. Borrowing the words that Eric Rohmer dedicated to another work by Welles, *Mr. Arkadin* (Rohmer 1990: 137), under the eyes of the spectator a downright 'universal deception' takes place, in which truth and appearance result as inextricably entangled in a long and evolving chain of forgers: François Reichenbach, Elmyr de Hory, Clifford Irving, Howard Hughes, Welles, Oja Kodar and her grandfather, and Picasso himself. About the painter it is said in the film that, after having branded as fakes a number of canvases carrying his signature, he would have replied to those asking for the reason for his certainty that 'I can fake a Picasso just as well as anyone else'; what has gone missing is thus the idea of truth as a model to which falsehood contrasts as a copy, as an alternative. It is the affirmation of the negative, of difference in itself not ascribable to any identity, and Welles fully achieves all the transformations of crystalline cinema previously recalled: description substitutes action; the claim of narrative truthfulness is completely suppressed; identification results in being impossible, unresolvable.

Once the ideal of truth is deposed together with the world of appearances accompanying it as its correlate, what remains for Deleuze are power relationships among bodies, the influence of some powers over others, all nevertheless devoid of any unique and identifiable centre. The alternation between long sequence shots and fragmentary montage typical of Welles' films finds coherence, equilibrium and harmony precisely in the exhibition of the intensity of the different powers, filmed simultaneously in their relationships or singularly, in a fragmented succession so as to reproduce the multiplication of driving centres which were already displayed in the narrative plot or in the ambiguity of

the characters. In the Wellesian work we witness for the first time the cinematographic mutation according to which linear movement built on an action core is replaced by an aberrant, anomalous movement which gets autonomy from its fixed structures, allowing in this way the liberation of time itself.

However, what is displayed in *F for Fake* as well as in the other films by Welles is not the total absence of a centre (which according to Deleuze is realised in the cinematography of Alain Resnais), but rather a radical metamorphosis of such a concept: 'The center ceased to be sensory-motor and, on the other hand, become optical, determining a new regime of description; on the other hand, at the same time, it became luminous, determining a new progression of narration' (Deleuze 1989: 140).[10]

The centre ceases to be a spatial and driving constant, and becomes in the first place a point of view, a glance from which the different filmed elements form a series in perpetual becoming. The succession of plain images within the short montage presents thus an alternation of descriptions and produces a concatenation and collection of different figures and aspects of the same character merging into each other. The other face of this 'architecture of vision' is instead a theory of shapes, in which the projection caused by a distant source of light marks and emphasises the volumes of the bodies and the connections among the multiple forces in play: it is the depth of field of Wellesian sequence shots.

In the end, in Welles' cinema we always have a single protagonist imposing him- or herself, that is, the forger exhibited in his or her transformations: the series of figures representing the metamorphoses of the false fastened to each other by treacheries and impostures, can be spotted from *The Lady from Shanghai* (in the 'infernal trio' composed of the attorney Bannister, the wife and her partner) up to the great series of characters in *F for Fake*. Here the collection of forgers is 'extensive and perfect', and ranges from 'the truthful man', who represents the premise for the very existence of the forger, his alibi, up to the artist himself, in whose creations the power of the false, the impossibility of distinguishing truth from mere appearance, is multiplied to the umpteenth degree. Differently from the common liar, the artist, who brings to bear the troop of fakers, does not get petrified nor crystallised in a figure of the metamorphosis 'acquiring a different form', but rather seizes the transformation itself, integrating it in the temporal perspective of becoming: the hoax becomes in this case a creation of something new. If for forgers, therefore, metamorphosis is restricted to their form of being, in art the thing in itself gets transformed in something new,

'because truth is not to be achieved, formed, or reproduced; it has to be created' (Deleuze 1989: 146). The artist – and this is the conclusion of Welles, Deleuze, but also of Nietzsche and Bergson – is the creator of truth.

With this sequence of evolving characters, which populate Welles' films as more or less elevated degrees of the will to power, is effected according to Deleuze a liberation of time from its subordination to movement, which finds its particular standing in the quality of becoming. We find here at work the second kind of chronosign, consisting in 'time as a series', that is, a succession which is not exterior, empirical or chronological any more, but rather intrinsic and chronological, in which 'the before and the after are not ... successive determinations of the course of time, but the two sides of the power, or the passage of the power to a higher power' (Deleuze 1989: 275). The series as a direct time-image has among its features that of questioning truth:

> The false ceases to be a simple appearance or even a lie, in order to achieve that power of becoming which constitutes series or degrees, which crosses limits, carries out metamorphoses, and develops along its whole path an act legend of story-telling. (Deleuze 1989: 275)

When movement loses its centre and becomes aberrant, thus encouraging the autonomy of time, the paradoxes coming to light – the impossibility of evoking the past, the emergence of an idle present, the union of a before and an after in perpetual becoming – impose a new logic which breaks up the order or the temporal series, thus making the ideal of truth collapse. This theme is connected with the Nietzschean pronouncement about the adhesion to *life* that will be the focus of the next chapter, which I shall introduce with the following long quotation from Deleuze's book on Nietzsche's philosophy:

> The activity of life is like a power of falsehood, of duping, dissimulating, dazzling and seducing. But, in order to be brought into effect, this power of falsehood must be selected, redoubled or repeated and thus elevated to a higher power. The power of falsehood must be taken as far as a *will* to deceive, an artistic will which alone is capable of competing with the ascetic ideal of successfully opposing it. It is *art* which invents the lies that raise falsehood to this highest affirmative power, that turns the will to deceive into something which is affirmed in the power of falsehood. For the artist, *appearance* no longer means the negation of the real in this world but this kind of selection, correction, redoubling and affirmation. (Deleuze 1983: 103)

Notes

1. In his introduction to the book collecting the interviews with the director from 1968–73, Bogdanovich recounts that Welles, when revising the text, modified not only his answers, but also sometimes the questions and the comments of his interviewer.
2. See the interviews to Welles by André Bazin and Charles Bitsch (*Cahiers du cinéma*, June 1958), and by Bazin, Bitsch and Jean Domarchi (September 1958), collected in Estrin 2002.
3. Interview by K. Tynan in *Playboy*, March 1967, now collected in Estrin 2002: 147.
4. The duplicity of the characters and the impossibility of judging them are also appreciable in other films by Welles beyond those mentioned. The deceit in judgement is, for example, the explicit protagonist of *The Trial* (1962), but also in this case Welles surprises his interviewers by showing his antipathy for K., very likely not responsible for what he is being persecuted for, but equally guilt, because he is an accomplice of the society in which he lives. Among the other greatly wicked figures it is worth remembering Harry Lime, a character in *The Third Man* (1949) by Carol Reed and portrayed by Welles, who contributed to the film, writing the dialogues. In the interview with A. Bazin, C. Bitsch and J. Domarchi, Welles declared about this issue that 'I wrote everything to do with this character, I created him all around' (Estrin 2002: 68); and continued 'I detest Harry Lime: he has no passion, he is cold; he is Lucifer, the fallen angel' (Estrin 2002: 71). For an account and an in-depth analysis of Welles' films, see Naremore 1978.
5. Interview with A. Bazin, C. Bitsch and J. Domarchi, in Estrin 2002: 51.
6. See Badiou 1999.
7. This is how Nepoti expresses himself in an essay titled 'Orson Welles: il cinema in prima persona' (2004), dedicated to *F for Fake* and to *Filming Othello*.
8. Before deciding on its definitive title, Welles pondered a number of titles, among which were *Hoax*, *Question Mark* and *Nothing but the Truth*.
9. The 1971 text *The 'Citizen Kane' Book* by Pauline Kael called into question the authorship of the script of *Citizen Kane* – which, by the way, was the only category of the film that won an Oscar despite being a candidate nine times with, among other things, best film, best director and best male actor in a leading role – attributing all the merit to the co-screenwriter Herman J. Manckiewicz.
10. Deleuze reprises here the analyses on the baroque by Michel Serres in his *Le Système de Leibniz* (1968). Through his depth of field Welles reproduced in the modern age the change in thought which took place in painting during the seventeenth century.

Life

I.

An overall view of the work of Gilles Deleuze discloses a strange but forceful coherence, an unexpected cohesion in a reflection open to multiple directions due to a continuous circulation of concepts, which, because they make reference to each other, result as invariably entwined. Among the issues informing virtually all his work is the recurring question about the nature of philosophy, which stands out in his two volumes on cinema as well. As we observed, if art creates sensible aggregates, characters, images and sounds, philosophy creates new concepts behind which there hide the questions and problems of a certain time. What is at stake is thus a conceptual practice which does not have to do, at least immediately, with truth and falsehood, a practice which is not abstract at all, but rather very concrete because it presents itself as a production, an invention of concepts meant to open a problematic space of discussion. Philosophy and art enter in this way into a mutual relationship of resonance with each other, not because one reflects upon the other, but rather for intrinsic reasons: both are 'sorts of separate melodic lines in constant interplay with each other' (Deleuze 1997a: 125). Philosophy does not retain any primacy in the reflective activity, and yet it does not suffer from inferiority for what concerns the act of creation.

If to philosophise means precisely to find the question, raising the problem and inventing always new concepts, the study of the history of philosophy represents thus a training, an apprenticeship in which, moving from the original concept created by a certain author, one goes back to the problem or issue that the new concept aims to answer. In commenting on philosophical texts one does not merely enact a double abstraction – that is, one does not reflect on the results of a previous reflection – but rather one engages in a philosophical portrait

Deleuze Studies 8.3 (2014): 365–374
DOI: 10.3366/dls.2014.0156
© Daniela Angelucci
www.euppublishing.com/dls

(once again the analogy with art and painting comes to view): a mental and conceptual portrait which does not reproduce what a certain thinker said, but rather explicates what he or she suggested, the unsaid implicit and present in what is said. However, it is also true that we read authors when we share with them the urgency of a problem, when we share the originality of a concept, as witnessed in Deleuze's usage of Bergson; as a result of this, there is thus no difference between philosophy and the history of philosophy.[1] In fact, in his work Deleuze never ceased to comment on other authors and at the same time, in doing so, convey his own personal and original thought.

Among the authors sharing a common cause with Deleuze we find Nietzsche, the philosopher of immanence together with Spinoza, a thinker who fought any transcendental principle. One of the 'zones of indiscernibility' between their thoughts – together with that of philosophy just mentioned – is the concept of life as inorganic power, a becoming force which incessantly struggles to overcome itself and at the same time a relationship between these elements. Once again this is a theme suffusing Deleuze's entire work, echoing and engaging many other aspects in a short-circuit which gives to its speculative movement the particular coherence just mentioned: suffice to remind that his last writing, *L'Immanence: une vie* . . . , is dedicated precisely to the idea of an indeterminate life, a life free from any individuation. However, I would like now to focus on a 1962 text by Deleuze dedicated to Nietzsche; a text which first of all takes credit for having inaugurated a new literature on the German philosopher in France, dismantling the interpretative habits of the previous decades.[2]

II.

The Deleuzian literature on Nietzsche starts from the reprisal of the now forgotten Pre-Socratic unity of thought and life, an overall unity in which life activates thought and thought affirms life. As Deleuze would write very clearly in the introduction to his 1965 anthology of Nietzschean studies (available in English in the collection Deleuze 2001):

> We now have only instances where thought bridles and mutilates life, making it sensible, and when life takes revenge and drives thought mad, losing itself along the way. Now we only have the choice between mediocre lives and mad thinkers. (Deleuze 2001: 66–7)

The loss of this overall unity of active life and affirmative thought is perspicuously introduced and explored in his earlier book on Nietzsche,

in which the attempt to free the German thinker from any dialectical reading as well as the recognition of the core of his philosophy in the pure affirmation of becoming are achieved by making use of the Nietzschean notions of sense and value.

If for Nietzsche consciousness is only the symptom of a deeper transformation, of the unconscious activity of those forces which does not belong to the spiritual order, the sense of a phenomenon, an object, a body, is represented by the quality of the power necessary to take it over by dominating another power of a different sign. The relationship among the powers in play has nothing to do with an idle body, as the latter never configures itself as something neutral, but rather it represents a force submitting to the one, among the conflicting forces, most akin to its sense. Nietzsche does not negate the essence of a phenomenon, but rather he derives it from its affinity with the forces controlling it: the question of 'what?' gets replaced by the question of 'who?', which asks in the first place about the dominant forces, understanding phenomena as symptoms of their underlying forces. A body would thus be the result of a domination, an 'arbitrary product' whose unity is determined by the relationship between dominant and dominated forces. Envisioning an equivalence among the two forces, believing that their encounter might generate an equal result, is an illusion which according to Nietzsche characterises science, because the essence of a force lies precisely in the difference of quantity between the two forces originating it, in the result of their encounter: as Deleuze would put it, it is the differential element constituting its quality. There are thus active, affirmative forces – which when pushed to their extremes affirm their difference – and reactive, negating forces – which are able to dominate the active ones not by constituting a bigger force, which would acquire in its turn an active quality, but rather by acting through decomposition, that is, by separating the active force from what is in its power and involving it in the reaction.

In his *Bios. Biopolitica e filosofia* (*Bios. Biopolitics and Philosophy*, 2006), Roberto Esposito examines the Nietzschean will to power as a continuous 'strengthening of life', and investigates the relationship between the forces and the activity of the reactive forces 'draining it from within', separating it from itself. According to the author, in Nietzsche's philosophy the modern immunitary dynamic of 'the negative protection of life' figures in two different ways: as a process against whose contamination Nietzsche warns us to protect ourselves – since what allows life's conservation is also what blocks its expansion – but also as a process of decay that should be promoted and hastened in

order to free the field to new affirmative forces. In Deleuze's reading there does not seem to take place any irreducible conflict between these two attitudes, because the triumph of affirmative forces, the necessary outcome of the history of nihilism itself, consists in a complete reversal which does not take place piecemeal or gradually, but rather through a transmutation of values: the negative to endorse is the one which becomes active, aggressive, joyful.[3]

In *The Genealogy of Morals* Nietzsche individuates the triumph of the reactive forces in history in the figures of resentment, bad consciousness and ascetic ideal, an ideal which inevitably allies with nihilism by devaluing existence and the mundane world through the fiction of a super-sensible world and values higher than life; the hatred for life results in a love for the exhausted, sick life in which what gets expressed is the will to nothing. But the ideas of good and the divine presiding over this moral and religious conception are accompanied, in the perspective of reaction, by the idea of truth typical of the speculative situation which Nietzsche radically criticises: it is from this excessive interest of thought for the reactive forces that derives the pretence, usually expressed by philosophers, that human beings strive for truth. Actually, the truthful person seeks truth because of being moved by completely different reasons, by

> something more profound: 'Life against life'. He wants life to become virtuous, to correct itself and to correct appearance, for it to serve as the way to the other world. He wants life to repudiate itself and to turn against itself. (Deleuze 1983: 96)

The conflict between knowledge and life and the contraposition of the two worlds, the one sensible and the other transcendental, thus reveals their essential moral nature: the favourite activity of the seeker of truth 'is the distribution of wrongs, he renders responsible, he denies innocence, he accuses and judges life, he denounces appearance' (Deleuze 1983: 96). Thought, on the other hand, should not be informed by truth understood as an abstract universal, but rather by the elements of meaning and value originating from it. Since from the essence of what is human necessarily follows its complicity with reactive forces, so that the presence of active forces has the only function of fostering the 'universal becoming-reactive', in order to enact a transmutation of value Nietzsche reflects on the Overman, not a human capable of surpassing himself, but rather one other than human.

According to this reading, the first misunderstanding to discard is the one regarding the will to power, which represents the genetic element

of force, the internal completion giving it meaning and value, a flexible principle inseparable from force but not identical with it. The will to power is thus not a will to control, because the will, being the very source of values and admitting no external and pre-constituted end, cannot aim at control. On the same lines, Deleuze refutes the previous interpretations of the other key Nietzschean concept of eternal return as a cycle, a return of the same, resulting in a final state allegedly identical to the initial one.

According to Deleuze, the eternal return is in the first place a cosmological doctrine implying the affirmation of pure becoming, that is, the critique of the possibility of its final stage, from which the cycle of time should commence: if becoming were meant to become something, then it would have already done it. Since instead there does not exist any being contrasting becoming in itself, there is a being of becoming itself, which is precisely the return. Second, the eternal return works as an ethical and selective principle of the will to power, on the basis of the formula according to which 'whatever you will, will it in such a way that you also will its eternal return'. This affirmation of the will, a will which desires and bears the repetition and the return of the object of its affirmation, allows thus the transmutation of value, of the reactive forces into active ones, reaching the destruction – affirmative and not reactive – of nihilism: through the eternal return negation is actively negated and 'something comes into being which cannot do so without changing nature' (Deleuze 1983: 71). Eternal return reproduces a becoming that cannot but be active, being the 'yes' that the world says to itself, the cosmic expression of the Dionysiac spirit.

From this philosophy of will and of power derives the other Nietzschean concept deeply felt and shared by Deleuze: the innocence of existence as becoming. If each force is inseparable from what is in its power, the relationship among forces is characterised in the first place as non-guilty, that is, as radically innocent:

> We create grotesque representations of force and will, we separate force from what it can do, setting it up in ourselves as 'worthy' because it holds back from what it cannot do, but as 'blameworthy' in the thing where it manifests precisely the force that it has. We split the will in two, inventing a neutral subject endowed with free will to which we give the capacity to act and refrain from action. (Deleuze 1983: 23)

The most profound sense of Nietzschean philosophy understood as the affirmation of becoming consists not only in acknowledging that life is becoming, multiplicity and chance, but also in accepting and affirming

it: the real virtue does not consist in renouncing each passion but rather in embracing them, saying 'yes' to life and to the world. For this reason, Deleuze's admiration for Kant, who invented many new concepts, led the French philosopher to the refutation of his 'system of tribunals'. Deleuze substitutes the judgement based on the value that transcends life, as if life were a sin to expiate, with an immanent evaluation carried out on the base of vital exigencies, which are in themselves innocent.

In *Essays Critical and Clinical* (1998) Deleuze dedicates an essay to the question of judgement; through the work of four authors – Nietzsche, Lawrence, Kafka and Artaud – Deleuze thematises a way of existence without judgement that, although not explicitly referred to the cinema of the time, finds in the incessant novelty of its creation the characters of pure description and of falsifying narration:

> What disturbed us was that in renouncing judgment we had the impression of depriving ourselves of any means of distinguishing between existing beings, between modes of existence, as if everything were now of equal value. But is it not rather judgment that presupposes preexisting criteria (higher values), criteria that preexist for all time (to the infinity of time), so that it can neither apprehend what is new in an existing being, nor even sense the creation of a mode of existence? Such a mode is created vitally, through combat, in the insomnia of sleep, and not without a certain cruelty toward itself: nothing of all is the result of judgment. Judgment prevents the emergence of any new mode of existence … Herein, perhaps, lies the secret: to bring into existence and not to judge. (Deleuze 1998: 134–5)

The loss of any centre is associated with the disappearance of the system of judgement, irrevocably lost in the perpetual becoming which erupts as vital force, not truthful but rather falsifying. What remains is not a centre with its confronting forces, but rather the connections of the various forces at play, each referring to the others and inseparable from them.

The practical side of this speculative project – that is, the affirmation of the manifold which Deleuze obviously welcomes – consists in feeling the joy of the diverse, having the aesthetic form of the tragic in which any form of anguish or nostalgia for something lost is replaced with the joyful acceptation of plurality and of difference: 'tragedy (is) frank, dynamic, gaiety' (Deleuze 1983: 18), and Dionysus 'is the god for whom life does not have to be justified, for whom life is essentially just' (Deleuze 1983: 16). In *Time-Image* (a book which is Nietzschean as much as Bergsonian) the vindication of an ethics of joy translates – as already

said – into the affirmation of an aesthetic of *croyance*, of faith: the need for 'Christians or atheists' to make the world an object of belief. If – as clearly appears in modern cinema, with its errant characters and disconnected spaces – the link between us and the world is broken as we are no longer organically and necessarily related to life, we need to substitute this disrupted link with faith, with the belief in 'this world, of which fools are a part' (Deleuze 1989: 173), and not in any transcendental dimension. Once the link between perception and reaction featuring the film of the classical regime is severed, cinema conveys the fragility of individuals, not agent but rather seer, facing something intolerable and unthinkable which, however, does not present as an exceptional event, but rather as a daily banality. As Deleuze writes, we should thus 'make use of this powerlessness to believe in life, and to discover the identity of thought and life' (Deleuze 1989: 170), that is, that identity which according to Nietzsche represents the Pre-Socratic secret par excellence.

The reactive judgement accusing life and its multiple becoming finds expression not only in ethics and religion, but in knowledge itself, which Nietzsche accuses of opposing vital values, considering itself as an end or offering its services to the reactive forces. Only a critique of knowledge would give new meaning to thought, making it affirmative, capable of following the vital forces to their extreme limit, so that thinking would be equated to the creation of new possibilities of life. The affinity between thought and life, concealed by a reactive understanding of knowledge, is guarded instead by art, in which takes place a sane rather than a sick will to power, totally free from the ascetic ideal. Deleuze's reading highlights two aspects of the tragic conception of art typical of Nietzsche: the vindication of an aesthetic of creation and the concept of art as the power of the false. In the first place, Nietzsche opposes the philosophical tradition that runs from Aristotle to Schopenhauer passing through Kant, for which art would be a disinterested activity. By observing art from the point of view of the artist, it would rather appear as 'a stimulant of the will to power'; the vision of a work of art does not comfort, purify or sublimate, but rather energises the will enacting the vital and active forces of the artist. If vital activity, which deceives and seduces, is akin to the power of the false, in art falsehood gets affirmed, doubled, elevated to the highest degree, making the artist a creator of new possibilities of life on par with the thinker. The power of the false is thus able to inspire very different authors and works, but the first director who endowed the image with the power of the false is, as already observed, Orson Welles, whose cinema is

dominated by one kind of protagonist, the forger, exhibited in his or her various transformations. If the Nietzscheism of Welles is manifested in the first place in the perpetual critique of truth, it clearly appears also in his refusal (obviously connected to the first aspect) of the system of judgement, revealed in the extraordinary capacity to create magnificently wicked – and often tragically and gloriously loser – characters without committing to any moral evaluation, and indeed always inspired by a tender adhesion to life.

III.

One can ask at this point, what are the consequences of this adhesion to life? The Deleuzian classification of direct time-images – coexistence with the past, simultaneity of the peaks of the present, future becoming as creation – introduces, in the second volume on cinema, the big theme of cinematographic practice: namely, the relationship with thought. The automatic movement of the image (aspired to by all arts but achieved only by cinema) is able to '*communicat*[*e*] *vibrations to the cortex, touching the nervous and cerebral system directly*' (Deleuze 1989: 156) generating a total shock to thought. This 'noochoc' (a 'barbaric' and traumatic word, designating the philosophical invention of a concept) is not characterised as a mere logical possibility, but rather as a power forcing us to think, reactivating in us a 'spiritual automaton', an automatic subjectivity able to push thought itself to its limit.

In movement cinema the image was thought as an organic totality, as a dialectical unity built around the constitution of its parts; thought was integrated in the image, shaped as a circuit, an open spiral comprising the film, the director, and the spectator. We thus have a sensory-motor unity in which the image and the concept are connect in a Hegelian way, and which represents the relationship between persons and the world, human beings and Nature, individuals and masses. According to Deleuze, in classical cinema all the modalities of the relationship between image and thought are in place in the work of Eisenstein, in which he individuates an organic moment (from perception to the concept), a pathetic one (from the concept to affection), and a dramatic one (in which image and concept coincide). However, for Deleuze the greatness of cinema as the new thinking and art of the masses ended up not only in the mediocrity of some productions, but most importantly in propagandist manipulation, which 'brought together Hitler and Hollywood, Hollywood and Hitler' (Deleuze 1989: 164): totality transforms into totalitarianism.

The occasion to abandon this phase is not offered by a renewed strength of thought, but rather by its lack, by a vacuum: the revelation of a constitutive impotence situated in its centre as an inability, an impossibility to think. Departing from the cinematographic experience and the writings of Antonin Artaud, Deleuze describes in fact a modernity that is unable to vindicate the unity of being and knowing, but only the difference, the interstices, the breaches, and a cinema forcing individuals to face the unthinkable. The films of purely optical and sound situations showed something that can be seen but not thought precisely because they have a seer character as the protagonist, deprived of any sensory-motor reaction. The way out of this sort of paralysis is for Deleuze an utterly moral choice, a wager almost *à la* Pascal. The absence of a unitary wisdom leads thought to belief, to the need of Christians and atheists to make the world an object of faith, given that we are not connected to it by an organic and necessary relationship. The Nietzschean model, by replacing wisdom with faith in the world in which we live, represents once again the end point of an idle thought.

Within the system of belief, the image of modernity develops a strong bond with the body, with its daily or ceremonial attitudes and stances representing life and the forces resisting the great categories of thought. 'Give me a body then' is the formula of a certain kind of cinema (Bene, Antonioni, Godard) built around the couple posture–voyeurism, finding its opposite pole – 'Give me a brain' – in intellectual cinema. The latter, as concrete as physical cinema, displays the cerebral mechanisms (Resnais, Kubrick), replaces the corporeal affections with the mental landscapes, which become 'our problem or our illness, our passion, rather than our mastery, our solution or decision (Deleuze 1989: 212). In fact, with the disappearance of the classical representation of the mind as interiority and harmonious totality, the determination of the cerebral activity by integration, differentiation and association necessarily fails; in this context interruptions acquire absolute value and are reproduced in modern cinema as loose images occupying the place left free by the system of movement.

The very evolution from classical to modern cinema reverberates in the issue of sound, which for Deleuze is not a separate element added a posteriori to the image, but rather a new component which radically transforms the image itself. Within the sound system – also comprising music, sounds as well as noises – words act as the herald of this shift, representing the sphere of sociality. If in the earlier phase of spoken cinema the verbal act was essentially interactive, concerning the relationship between two subjects, in the films in which the story is narrated by an

out-field voice it becomes reflexive, and eventually autonomous when, free from any visual bond and even from the invisible one of the external narrator, it becomes itself the object of an autonomous framing. When the two movements of the image become reciprocally autonomous and indispensable, and the verbal act becomes itself an act of creation, the audio-visual image originates, which marks a third period in the story of cinema after silent and spoken cinema. In its last transformation, due to aesthetic and then technological causes, the image, become digital, is a sort of tableau of information, a spurt of information skating the surface, constituting and dissolving into other images.

Once again this is the passage from one system to another, from an indirect representation of time to its transcendental presentation in modern cinema, which in conclusion to his book – after having tackled the issue of sound and mentioned the birth of the information-image – Deleuze labels as a central moment for his theory. A theory which fiercely resists the charge of being abstract, defined by Deleuze as a practice related to others, and in this case to cinema.

Notes

1. Deleuze tackles this issue at length in the video-interview with Claire Parnet (Deleuze 1997b).
2. See Vattimo 2005: 146–7 and Vozza 2006: 146–51.
3. See Esposito 2006, and in particular chapter 3 on Nietzsche, in which the Deleuzian interpretation is mentioned as well.

Repetition

I.

As its very title suggests, at the origin of the 1968 volume *Difference and Repetition* we find the intertwinement of two lines of research: the first investigating a concept of difference free from negation, that is, a difference which is not a difference from, which is not opposed to anything, but which in its being unrelated to any model is rather autonomous and not subordinated to the identical. In this sense, later in the book Deleuze will speak of the simulacrum, the reflection or double described as a copy, however lacking any identity to the thing it refers to: 'not [a] simple imitation but rather the act by which the very idea of a model or privileged position is challenged and overturned' (Deleuze 1994: 69). Deleuze's project is thus that of subtracting difference from its 'state of malediction', that is, making it thinkable in itself without predicating it on something else and mistaking the copy for the original; a project of overturning Platonism which should necessary undergo a substitution: the replacement of generality and equivalence with *repetition* understood as the elevation to power, as the always novel affirmation of singularity.

We thus reach the second line of research of the text: the advancement of a concept of repetition in which all 'bare' repetitions, mechanisms and stereotypes might find their logic, as if repetition constituted the hidden structure of an always 'differential' criterion. There is a substantive difference between repetition and resemblance. In the former the singularities constituting the series are not interchangeable: it is not a matter of adding a second, a third or a fourth instance, but rather of bringing each time the first instance to the nth power. In repetition there takes place a variation, a 'modification' in which we can trace its automatisms and compulsions as well. In short: according to Deleuze

Deleuze Studies 8.3 (2014): 375–382
DOI: 10.3366/dls.2014.0157
© Daniela Angelucci
www.euppublishing.com/dls

these two directions – repetition and difference – cannot but join forces so that repetition as the affirmation of (pre-individual) singularities defines the proper working of difference.

According to Deleuze, from this point of view it is possible to draw a connection between Kierkegaard and Nietzsche. The unbridgeable gap between Kierkegaard's God and Nietzsche's Dionysus, indeed a hardly arguable distance, makes their convergence on the theme of repetition even more momentous. In fact, both oppose repetition to all forms of generality. Kierkegaard relates repetition to a selective test, making it the supreme object of the will and of freedom, specifying that it is not a matter of drawing something new from repetition, but rather of making repetition as such a novelty. Extracting something new from it would consist in fact in a contemplative, reflective act implying a meditation, whereas renewing repetition itself by reaffirming one's choice is an action, an affirmative performance.

If Deleuze shares with Nietzsche more than a common cause, we witness here once again the staging of the theme of the eternal return, which consists precisely 'in conceiving the same on the basis of the different' (Deleuze 1994: 41). With Nietzsche the eternal return becomes a formal law overturning Kantian morality on its very field. The maxim becomes: 'whatever you will, will it in such a manner that you also will its eternal return' – a maxim in which repetition literally substitutes universality. If making repetition the very object of the will means getting free from what enchains us, Deleuze insists on the fact that what enchains us is without doubt repetition itself. The existence of the same, the alike, the mechanical and for us oppressing repetition of the 'chain' is neither negated nor ignored; simply enough, it is only by moving from these premises that it is possible to find a principle of differentiation, since 'if we die of repetition we are also saved and healed by it – healed, above all, by the other repetition' (Deleuze 1994: 6). Such repetition that saves us consists in a choice, a selective act, the staging of an element which results each time in being shifted, masked and different without there being any prototypical principle or ultimate term of the series: 'The whole mystical game of loss and salvation is therefore contained in repetition, along with the whole *theatrical game* of life and death and the whole positive game of illness and death' (Deleuze 1994: 6; my emphasis).

One might ask, where does this strange closeness between Kierkegaard and Nietzsche come from? Both are interested in movement, says Deleuze, a movement based on novelty as opposed to the idea of an abstract logical movement, that is opposed once again to mediation.

Both substitute in fact mediated representations with direct signs: the leap for the former and the dance for the latter. This non-mediated movement, which does not move through opposition but rather directly, is repetition. As Kierkegaard affirms in *Fear and Trembling*: 'I only look at movements' (Kierkegaard 1986: 67), to which Deleuze comments: '[this] is the language of a director' (Deleuze 1994: 9). This idea of a theatrical game, of dramatisation, of direct presentation, is in fact a feature of philosophy but above all of art; it is at bottom what unites art and philosophy understood as inventive practices of sensible aggregates or of concepts. Both Kierkegaard and Nietzsche, writes Deleuze, invented for philosophy 'an incredible equivalent of theatre' (Deleuze 1994: 8), a theatre made of those conceptual characters which are the product of the philosophical practice itself.

In the conclusion of the book, after speculating about the coexistence between mechanical and hidden repetition, Deleuze arrives precisely at a characterisation of art:

> Perhaps the highest object of art is to bring into play simultaneously all these repetitions, with their differences in kind and rhythm, their respective displacements and disguises, their divergences and decentrings; to embed them in one another and to envelop the one or the other in illusions the 'effect' of which varies in each case. Art does not imitate, above all because it repeats; it repeats all the repetitions, by virtue of an internal power (an imitation is a copy, but art is simulation, it reverses copies into simulacra). (Deleuze 1994: 293)

At the beginning of *Difference and Repetition* Deleuze commenced his investigation exactly from art, characterising both the unconscious and art as two manifold fields each endowed with 'a power peculiar to repetition' (Deleuze 1994: xix).[1]

II.

Granted that both the unconscious and art possess *each its peculiar power of repetition*, is it possible to imagine an encounter between the two? That is to ask: once the Deleuzian conception of creativity and the Freudian idea of the unconscious are acknowledged, is it possible to envision a point of contact between these authors over the theme of repetition? Despite the fact that in *Difference and Repetition* Deleuze criticises Freud for his use of the compulsion to repeat – a bare, mechanical and non-differential repetition – as his primary theoretical element, I think it is possible to trace such a connection. My goal is

not that of picturing a Deleuzian Freud, nor of establishing who is right, but rather that of investigating the possibility of endorsing a psychoanalytic perspective in aesthetics and in the reflection on art in general and cinema in particular, which does not endorse a symptomatic approach emphasising content over form, but rather one attentive to procedures and formal modalities. To put it in a nutshell: thinking aesthetic experience as an always different point of view on the same, a staging, a repetition employing formal processes and structures on which psychoanalysis can tell us something interesting.

In his 1914 'Remembering, Repeating and Working-Through' (Freud 1958: 147–56), Freud asserts that the first goal of the psychoanalytic technique is that of filling some memory blanks by overcoming the resistances caused by repression: *remembering*, being the chief goal of psychoanalysis, does not fill by chance the principal dominant position it does in the title. Freud observes soon after that, very often, we deal with a recollection that could not have been properly forgotten, as it was never conscious, never being present to consciousness.

If in the hypnotic method the progress of the act of recalling was simple, separated from the rest, with the application of the new psychoanalytic technique the patient does not recall the elements removed but rather puts them to work, reproducing those very elements not as recollections but rather as actions: she repeats them without being aware of it – for example, she does not claim to recall being hostile towards her parents' authority, but rather she puts to use this dynamic with the therapist from the very beginning of the treatment. The compulsion to repeat represents her way of recalling, through staging the removed elements. The bigger the patient's resistance is, the greater the intensity with which the recalling is substituted by this staging, by this repetition of the same.

Freud's conclusion is thus that, although it is always better to remember, still repetition represents the beginning of the cure:

> We render the compulsion harmless, and indeed useful, by giving it the right to assert itself in a definite field. We admit [the transfer] into the transference as a playground in which it is allowed to expand in almost complete freedom … The transference thus creates an intermediate region between illness and real life through which the transition from the one to the other is made. (Freud 1958: 154)

Repetition is thus at the same time the illness from which we necessarily depart, and the mode of treatment available to us. This repetition in a monitored setting takes place in transfer understood as exercise, gym,

implementation and staging. We are dealing with an active repetition, and not a passive movement (in fact, it has to be acknowledged, it is not enough to be aware and informed about one's own compulsion), and this same which we implement by returning to it is exactly a repetition in another environment, a repetition of the same from another point of view (perhaps with some degree of choice involved in the process).

Another place where Freud tackles this theme is his 1920 essay 'Beyond the Pleasure Principle': in this case it seems harder to relate repetition to a differential element because Freud here presents the compulsion to repeat as a manifestation of the inertia proper to the living organism, as the expression of the conservatory nature of living, the impulse to restore an ancient situation and thus the inanimate condition. However, the presentation of the *Fort-Da* advanced in this text tells us much more than that: the eighteen-month-old boy (Freud's nephew) he had the occasion to observe while repeating the game of making the wooden reel disappear (accompanying the gesture with a '*Fort*', 'go away') and sometimes, but not always, making it reappear (greeting it with a joyful '*Da*', 'there'), staging in this way the disappearance of his mother (and sometimes, but not always, her comeback), felt the pleasure of being able to dominate a situation which he previously only suffered. Freud writes:

> At the outset he was in a *passive* situation – he was overpowered by the experience; but, by repeating it, unpleasurable though it was, as a game, he took on an *active* part. These efforts might be put down to an instinct for mastery that was acting independently of whether the memory was in itself pleasurable or not. (Freud 1961: 10)

If one of the hypotheses explaining the screams of joy accompanying this game might be the revenge against his mother, whose absence makes her guilty, a better explanation is that the repetition of this act answers to an impulse of appropriation and mastery.

Later in the text Freud will return to the theme of repetition as ownership, describing it as what sometimes represents the only possibility in the analytic situation, given that, despite the patient being informed about her lost memories, since she did not actually and properly forget anything because she was never conscious of it, she cannot as a consequence be persuaded of the exactitude of what the therapist tells her. In order to stop repeating, it is thus not enough to abstractly recall, endowed with the right information passed on by the therapist, but rather it takes an operation similar to the theatrical one, that is, transfer. In this way repetition, an active staging, ceases to be

a compulsion and turns out to be the cure: it could change from one's chain to one's liberation, as Deleuze thought about Nietzsche's eternal return.[2]

In point of fact, writing about Freud in *Difference and Repetition*, Deleuze himself claims that together with the idea of inertia, which remains in any case the main Freudian paradigm, it is possible to spot another model at play: that according to which the death drive transforms repetition into an archetypical, positive and affirmative transcendental instinct. In this sense, for Deleuze Freud's abandonment of the hypothesis of a real traumatic event experienced during childhood – which would be the definitive mark of a mimetic repetition, a copy beneath which something hides – in favour of phantoms of affirmation, that is, a repetition already masked and differential – already operated by Lacan as well – is crucial.

III.

The field par excellence in which it is possible to repeat the same, elevating it to the nth power, putting it to use, presenting a different point of view by a mere ostensive act, is the one of artistic representation. Here the same which gets repeated is literally so, as it is suggested by one of the most reputable ideas in the history of aesthetics, that is, the theme of *mimesis*, and yet in artistic simulation the differential element distinct from the original reproduced is already present. In cinema the ambiguity built into the idea of repetition is particularly pronounced: films can in fact be both extremely faithful to reality, thanks to the mechanical genesis of its device, and also truly autonomous, given their exhibition to the public and precisely in virtue of their capacity of accurately reproducing reality, almost creating a world in its own right. In the history of film theory, the sensational experience of attending the creation of a world of simulacra has often been stressed: since from 1896 when Maxim Gorky reacted to the screening of the Lumière Brothers' cinematograph at Nizhny Novgorod's fair, where in an article he described the spectacle as a reign of shadows, a place inhabited by spectres and ghosts, to the work by Morin, *The Cinema, Or the Imaginary Man*, which depicts the film as a double, a reflex of the world (Morin 2005).

By welcoming the Deleuzian idea of a cinema exhibiting the working of thought first in the modalities of perception, affection and action, and later manifesting itself in the impossibility of any organic thinking – with the consequent weakening of the sensory-motor relations – the psychical

process of repetition understood as a mechanism of ownership displays as the direct affirmation of difference, of a difference autonomous from its model, and thus as the elevation of the false. The description of the object replaces the object itself; a falsifying narration takes the place of a plausible story; the truthful relationship and the neat distinction between the subjective and the objective points of view is transformed in a modality of the camera in which the gaze of the director is indiscernible from that of the character. What emerges in this kind of cinema is the thematisation and the direct presentation of the working difference of the power of the false as a series of forces which *gets repeated* by making reference to each other.

In this sense, the question of repetition thus understood has to do with art overall, but with cinema in particular, given the potentialities of its device – and, precisely because it is a device able to catch in unexpected ways the life of thought, many films and authors of the modern turn thematised this concept. Reprising some cinematographic examples already analysed and present in Deleuze's texts on cinema, in *The Discreet Charm of the Bourgeoisie* (1972) by Luis Buñuel, with its series of incomplete lunches, we can individuate a repetition in which the series is constituted by a succession of truthful and false acts blended together simultaneously; while in *F for Fake* by Orson Welles, which I have already commented at length (see chapter on 'Falsehood' above), we find a repetition in which the differential element is clearly at work through the thematisation of a 'series of fakeries'. However, in order to illustrate the idea of art as differential repetition inspired by both Deleuze and the psychoanalytic perspective, a good example of thematisation of repetition is the genre of the remake, and in particular two remakes of the very same film: Alfred Hitchcock's 1960 *Psycho*.

In 1998 Gus Van Sant realised a *shot by shot* remake using the same cuts and montage as the original film, but also with some important differences: the film is not in black and white, is staged in contemporaneity, and is more explicit in some sexual scenes. Furthermore, some hidden frames have been added (in the well-known shower scene, which in Hitchcock's original film is based on the storyboard drawn by Hollywood's most famous graphic designer Saul Bass, Van Sant adds the image of a stormy sky). This 1998 remake, not impressive in its results, is the closest thing to the original, and still the faithful reference to its model seems at once too similar and yet not similar enough.

The idea behind the video installation *24 Hour Psycho*, shown for the first time in Glasgow in 1993 by the Scottish artist Douglas

Gordon, represents instead a repetition which is at the same time a simple exhibition. In this work Gordon offers a version of Hitchcock's film slowed down to fit into 24 hours, with about two frames per second, rendering the images solemn and immersive through this simple operation of temporal alteration. Gordon himself characterised his work as an installation primarily aiming at an act of reappropriation rather than at a reproductive imitation. In the words of the artist, this remake represents an act of 'affiliation' aiming at putting in crisis the very ideas of the model, authorship and originality of a piece of work.

Notes

1. The third field mentioned by Deleuze is language.
2. This very wringing of the same content from what I suffer to what I embody refers to the theme of the symptom-sinthome in Lacan: the identification with one's symptom, with what is most singular in us, the embodiment and thus transformation from subjected element into the object of one's freedom. See Lacan 2005.

Simulacrum

I.

In the past few chapters I had the occasion to discuss the issues of difference, and the power of the false and of repetition in the theoretical exposition of Deleuze's thought; I now want to show how these are depicted cinematographically in the work of the Chilean director Raúl Ruiz, and in particular in a film which has at its centre precisely the idea of a repetition capable of subverting the model from its privileged position. The 1978 film *The Hypothesis of the Stolen Painting* is built exactly around the theme of the simulacrum, literally understood as phantasmagorical double, the creation of a 'world of ghosts'; the film, although not mentioned by Deleuze, is able to distil in images the 'conceptual characters' depicted in his thought.

Summarising in detail the plot of a film by Ruiz as well as explicating all its references is a bewildering experience, since each screening is characterised by the appreciation of new, unexpected details and references. It is also bewildering to take into consideration his entire production, which has been described as a corpus 'so big, ramified and alive that it resembles a *monumental universe*' (Turco 2007: 94; my translation); a sort of vegetal organism animated by an internal dynamism recalling the idea of a work of art typical of romanticism. The director himself defines the films as living beings: he writes that 'we watch them and they watch us back' (Bruno 2007: 350; my translation).

It is with such displacement and bewilderment that the spectator witnesses *The Hypothesis of the Stolen Painting*, screenplayed by Pierre Klossowski and organised in series of *tableaux vivants*, a combinatory play full of vanishing points, cross-references among paintings, but also literary and philosophical citations. The reference external to the film is in the first place to the work of Klossowski: the fantastical novel

Deleuze Studies 8.3 (2014): 383–390
DOI: 10.3366/dls.2014.0158

www.euppublishing.com/dls

The Baphomet (1965), focused on the mysterious figure of Baphomet, the idol who according to the legend was adored in the Middle-Ages by the Templars; but also the earlier *Diana at Her Bath* (1956), an interpretation of the myth of Diana and Actaeon, who was eaten alive by dogs after being transformed into a deer for having observed the nudity of the divinity.

The possibility of a linear vision of the film is complicated by the interplay between the two narrators, a voice out of field and the narrator internal to the film, the collector (played by the actor Jean Rougeul) guiding us through a series of paintings of the imaginary nineteenth-century painter Tonnerre (a character created by Klossowski). The two are in constant dialogue throughout the film, alluding to some mysteries never revealed before and contradicting themselves on the number, nature and meaning of the paintings displayed. The puzzlement experienced by the spectators is an intentional result sought by the director, revealed by the recurrence of the presence of mirrors in various shots and by the interplays of luminous reflections, images and atmospheres recurring also in his other works, for example in the 1999 film on Proust's *Recherche* titled *Le Temps retrouvé*.

The challenge to recount and describe the seven living paintings at the centre of this peculiar narration, although a difficult one, should be consciously accepted and possibly met if one wants to focalise those traits in which the theme of the simulacrum emerges, the philosophical theme at the heart of most of Ruiz's cinema, but even more at the core of Klossowski's literary and pictorial production, oriented towards a reinvention of the figurative departure from imaginary and mythological subjects. Even before the credits, the film begins with a long and extended framing – a city street lined by buildings and parked cars – which seems to play an intentionally disorienting function. It in fact represents a calculated hoax arranged by the director: it seems to suggest a narration staged in contemporaneity and in a precise geographical place in which the story will take place, while immediately afterwards the spectator is conducted to an isolated internal corner of the world, free from every context, in which time and space are indeterminately suspended (the garden full of fog in which some of the living paintings are displayed during the story seems a still and protected extension of such internal environments as well).

After the credits there are two quotations, both on the theme of the body escaping death: from Victor Hugo: 'Human consciousness has expired; On the cadaver he squats, gloating, mired; Seated in triumph, he turns to crow; Each time he deals the corpses a blow'; and from

Klossowski himself: 'What do you see? What do you feel? Is it pain or is it ecstasy that keeps you afloat in space?' These are the last words pronounced by the Master Knight of the Templars to the gorgeous nude adolescent, suspended in the void, whose hanging he ordered. Minutes before the Knight spoke: 'it is a body indeed, but even if it is without life it is not a corpse', and in fact the body of the young lad will come back to life again.

While the camera frames a mirror, a dispute between the two narrators in disagreement about the number of paintings left by Tonnerre takes place: according to the collector, the paintings of the series are not six, but rather seven as, each of them being connected to the next by a detail, a gap in such a thread leads to the speculation that, as the title of the film also suggests, one of them was stolen. Before the beginning of the tour of the paintings organised by the collector we see, outside the series, the canvas of a naked boy hanged, an explicit reference to the myth of Baphomet; the series begins soon after this quick shot. The first canvas is actually the second of the series: the arrival of a knight catches off guard two Templars playing chess. The canvas has an odd detail, namely two sources of illumination (suggesting, as the narrator tells us, the idea of a world with two suns). At this point the collector reveals one of the reasons for the scandal that these paintings occasioned in the nineteenth century: the series alludes to the Ceremony (most likely the ceremonies of initiation of the Knights Templar). But, as the collector reiterates, paintings do not allude to; they rather show.

The camera goes out into the garden but before it does we have a glimpse of a dummy reproducing, or rather serving as a model for, a painting hung on the facing wall. The enigma of the first canvas presented is solved by pointing to a living painting in the garden, the first of the series of Tonnerre: the scene of Diana and Actaeon, plus a third character spying on them through a mirror reflecting a ray of light which passes through the window of the canvas previously analysed. Now we see it again as a *tableau vivant*: besides two suns, there is on the one side the light of the sun, while on the other the ray of light reflected in the mirror. In this *tableau vivant* the page witnessing the chess game is also visible. At this point the collector draws our attention to the presence of a mirror shaped as a half-moon, although remarking that this is not sheer speculation on the art of reproduction, as *what matters are the figures, the shapes*.

The mirror shaped as a half-moon returns in the third canvas, the one with the hanged boy we first saw, surrounded by many characters. Here the collector turns the electric light on, playing with the illumination by

inverting light and shadow so as to concentrate attention on the figures. A mask also appears, which represents the only element we know of the stolen canvas. The fourth painting is precisely the one of the mask, but we cannot see it since, as mentioned, it has been stolen. The fifth painting is the one discarded from the 1877 exhibition due to a scandal involving some members of high society: it is a multiple painting, composed of episodes illustrating a penny dreadful about a family tormented by homosexual rivalries, ending with a suicide by hanging. Obviously we cannot determine what relates this to the preceding canvas. The narrator tells us that Tonnerre defended himself against the accusation by stating that the paintings allude to, and do not show, whereas the collector replies that they show indeed.

The sixth canvas presents the characters of the previous paintings grouped in trios. There are naked women and demons as well, whose presence is perhaps explained by the missing canvas. The movements of the characters form curves, which in turn form circles and thus spheres. The seventh canvas of the series represents a burning sphere with the figure of Baphomet at its centre, the androgynous demon venerated by the Templars, conceived as a body without soul. At this point the collector interrogates himself on the enigma of the series and on the importance of the theme of the ceremony of initiation of the Knights Templar. He thus shows the photographs, the stylised pictures of some of the anatomical models used for the paintings: in these pictures the paintings disappear and the only things left are the gestures, the bodies. The film ends with suggestive images of the collector strolling in a forest with the whole series of paintings hanging from the trees.

II.

In order to determine the atmosphere and the sensation produced by this film, which is almost without any plot and yet so complicated, I will borrow the words of Alessandro Cappabianca, who states that 'in tracing a certain profile of Ruiz it seems as if we should always be mindful of the hypothesis of a missed film (or sequence). Something is missing, and this introduces in the discourse an exciting element of chance' (Cappabianca 2007: 53; my translation). In the light of this complexity and richness of mentions and references, the spectator watching and reflecting on the film is assailed by a sort of bad conscience, according to which something seems missing, that is, 'a piece is missing', as a missing painting. However, we should stress that behind these refractions, series, combinations and multiplications there is no meta-filmic intention, no

auto-reflexive approach of the camera. There is thus no speculation on representation, but simply the revelation of a world of bodies without soul, of appearances in which is displayed what is usually hidden. This is the point of the insistence of the character of the collector on the theme of showing, of disclosing, a disclosing which gets beyond reality and is able to catch the hidden and invisible part. The director himself notes this aspect in the introduction to the volume dedicated to his work: 'cinema . . . is the art of showing the invisible part of each thing belonging to the Creation' (Bruno 2007: 9; my translation); and continues: '[my aim] is to show the invisible demons dancing in the air and eluding the drunken eye of told realities. The unmentionable *simulacra*' (Bruno 2007: 8; my emphasis; my translation).

The theme of the double and of the simulacrum is often explicated by Ruiz in his interviews, and is above all one of the recurring themes of the thought and of the narrative and pictorial work of Klossowski, co-screenwriter of the film. As Michel Foucault writes in "*The Prose of Actaeon*", all the figures which Klossowski 'delineates and brings to life in his language are "simulacra" '. And the definitions of the simulacrum that Foucault offers right after the quoted statement immediately recall the principal themes of the film by Ruiz: 'a vain image (as opposed to reality)' – in the film the paintings, the *tableaux vivants*, the models, the bodies without soul; 'a representation of something (in which this thing delegates and manifests itself, but withdraws and in a sense conceals itself)' – the game of exchanges and refractions, and even more the mystery and vacuum of the stolen painting; 'a falsehood that causes one to take one sign for another' – a hidden enigma in the images; 'a sign of the presence of a deity (and the converse possibility of taking this sign for its opposite)' – obviously the demons, and especially the figure of the androgynous, of the Baphomet who keeps appearing in the paintings and in the story; 'the simultaneous coming of the Same and the Other (originally, to simulate meant to come together)' – that is the continuous reference from the painting to the *tableaux vivants*, a repetition, however, animated by a rift, by a difference (Foucault 1998: 127).

A few lines further on Foucault adds that we need to establish a rigorous repartition between signs and simulacra, since they do not belong to the same field of experience, although sometimes they happen to coincide. The simulacrum does not in fact fix a meaning, but is rather something that *appears* and 'it is of the order of appearance in the shattering of time' (Foucault 1998: 128). Simulacra, spirits and the bodies of the living paintings are not signs of something else, but rather

they have a certain relevance of their own, in the gestures, forms and figures: the paintings, as the collector says, do not allude to, but rather show; that is, the shown paintings are not signs but rather simulacra, as one might paraphrase it. The strong analogy between the philosophical cipher of Klossowski and the thought underlying Ruiz's poetics seems thus focused around the double, the simulacrum whose nature is that of pointing to something else while at the same time revealing itself in its powerful impact as image. The result is the creation of an unfamiliar world, perplexing and yet identical to ours, in which through what Foucault calls the 'thin insinuation of the Double', the Other becomes the Same. On this point, these lines by Foucault describing Klossowski's language seem to echo the cinematographic language of the Chilean director, and of this film in particular:

> Klossowski's experience is situated . . . in a world ruled by an evil genius . . . This world would not be Heaven, or Hell, or limbo, but quite simply our world – a world, finally, that would be the same as ours except that, precisely, it is the same. In this imperceptible divergence of the same [think about the divergence between painting and *tableau vivant*], an infinite movement [the one of the camera] finds its place of emergence . . . The A = A equation is stirred by an endless internal movement that diverts each of the two terms from its own identity and refers them to each other through the action (the force, the treachery) of this divergence itself. (Foucault 1998: 126)

The description of two identical but different worlds, divided by a rift in which the movement insinuates itself, thus evokes Klossowski's language, Ruiz's films and the creative procedures proper of both thought and art suggested by Deleuze in an interplay of hopefully not too complacent references. It is Deleuze himself who in the pages of *Difference and Repetition* mentions Klossowski in this regard:

> Pierre Klossowski has clearly noted . . . [how] taken in its strict sense, eternal return, means that each thing exists only in returning, copy of an infinity of copies which allows neither original nor origin to subsist. That is why the eternal return is called 'parodic': it qualifies as simulacrum that which it causes to be (and to return). (Deleuze 1994: 66–7)

The philosophical theme of the simulacrum and of the double at play in the film, it must be repeated, does not derive from the contribution of Klossowski alone, but is completely and explicitly shared by Ruiz, who defines cinematographic images as 'instances of doubling or splitting', 'shamanic journeys mechanised by means of cinematography' (Bruno 2007: 39; my translation). The power of the double returns in its original theory of the cinematographic fruition, according to which it

can be said that during the experience of vision the spectator projects another film onto the one playing on the screen: there is a double film, projected by the single spectator, overlaying the film itself, differentiating and at the same time repeating it, making the film 'palpitat[e], as if it was breathing'. We can clearly see how this process of splitting, difference and repetition of the manifestation of simulacra might become vertiginous: we project a double of the film onto the film, which is in itself a splitting of the real thanks to its mechanical genesis; in this case what the film shows us are the paintings and the double of the paintings in the *tableaux vivants*.

III.

The elaboration on doubles, simulacra and spirits is, however, in Ruiz also an exercise in concretisation, an 'actualisation of the illusory' within matter, since the vision of the transcendent there realised is a 'tactile vision', corporeal and concrete. In this sense Edoardo Bruno (2007) defines Ruiz's cinema, which seems capable of actualising and materialising all that is metaphysical, a 'materialist' cinema – in a deeper sense of materialist than how cinema has always been anyway. The evidence of this concrete character of the work of the Chilean director can be easily appreciated in the film under discussion, whose real protagonists are the *bodies* in their almost sculptural plasticity, a plasticity emerging thanks to the style and the sinuous and engaging movement of the camera. The camera shows in fact the corporeity of the various figures by moving closer to and away from them, moving around them, making them alive in their concreteness, showing them, as Ruiz himself would say, as a totality in constant outburst.

It was the painter Mark Rothko, although starting from very different (mostly technical) considerations, who defined plasticity in painting as exactly this movement in space, as the advancement and moving back determining – in the painter as well as in the spectator – almost an 'entry' into the canvas, using a line which seems to be written for this film:

> Plasticity, then, is the sensation of reality impaired to us by means of the sensation of things moving back and forth... In painting, plasticity is achieved by a sensation of movement both into the canvas and out from the space anterior to the surface of the canvas. Actually, the painter invites the spectator to take a journey within the realm of the canvas. (Rothko 2004: 47)

Thanks to the presence of the *tableaux vivants* in *The Hypothesis of the Stolen Painting*, the camera literally insinuates into the painting,

moves and surrounds the represented bodies realising what Ruiz himself in some interviews calls a tactical vision;[1] a 'looking through one's chest, through one's skin' able to show the simulacra as well as the spirits in their corporeity.

Note

1. The language is similar to the one employed by Herder (2002) in his description of the perception of sculpture and of the close vision of the statues through an eye that pats, that touches.

Sadism

I.

The protagonist of the 1932 film *The Most Dangerous Game* by Ernest Schoedsack and Irving Pichel, taken from a story by the American writer Richard Connell published in 1924, is Count Zaroff, a Russian aristocrat who owns a castle on a desert island. The count, by moving the channel lights surrounding the island, provokes shipwrecks with the goal of kidnapping the survivors and using them as human prey for his hunting, since hunting other species had begun 'to bore' him. The castaway Bob Rainsford, a famous big-game hunter just back from Sumatra where he conducted a tiger hunt expedition and author of many books and reportage on the topic, is forced to participate in the count's cruel game and to rescue himself and Eve, the only woman present on the island. The latter, who has survived a previous shipwreck together with her brother – who will be killed first by the count – is offered by Zaroff as the 'prize' for what he considers as 'outdoor chess'.

In this film there are many aspects worth noting from a historical perspective: in the first place, its germinal character and thus its modernity, that is, the fact that it has inspired and keeps inspiring various remakes thus offering various ideas for many fantasy, horror and adventure films (the latest film inspired by *The Most Dangerous Game* is *Hard Target*, directed by John Woo in 1993). Second, its evident metaphorical character, that is, its being 'a fantastical transfiguration of the fears and aspirations of an entire epoch' (Esposito 2004: 802; my translation): the disquieting atmosphere of a menacing state of nature represented by the island and the events taking place bring to the scene the fears of post-1929 America. It is also interesting that a good part of the cast acted in the film *King Kong*, directed by Merian C. Cooper and Schoedsack himself, which came out the following year (1933);

Deleuze Studies 8.3 (2014): 391–398
DOI: 10.3366/dls.2014.0159
© Daniela Angelucci
www.euppublishing.com/dls

a film that, among other things, reprises in an even more spectacular key the theme of uncertainty and the disquietudes characteristic of the time.

The aspect of the film I would like to focus on, however, is a different one, and it will emerge only after having illuminated some elements of the plot and of the construction of the characters. In the first place, it is worth underlining the *symmetrical constitution* of the two male characters, the cruel count and the castaway hero: the former is a foreigner while the latter is American, but both are hunters and devotees of the practice of big-game hunting in two symmetrical contexts. Before the shipwreck, the character of Rainsford, while still on the boat with his crew, is called into question in a discussion on the practice of hunting where he defends its legitimacy not because it is a practice necessary for survival, but rather as a sport and amusing activity. Rainsford accurately avoids responding to one of his friend's insistent questioning about the certainty of his convictions, should he have been a tiger... After the shipwreck, we find Count Zaroff entertaining his hostages–guests during an evening at the castle, explaining his passion for hunting, the pleasure of killing and the necessity, after having tried several hunting weapons in order to escape boredom, of changing species of animal. The count starts off by telling Rainsford that he could find a reasonable point of view on hunting solely in the latter's books: 'we are kindred spirits', he asserts. Thus, the two characters are presented as each being the double of the other, although diametrically opposed as regards their most exterior traits: Rainsford is portrayed by Joel McCrea, an actor who specialised in the positive role of the American hero, that is, tall, blond-haired and athletic, with a virile and clean look; Count Zaroff is portrayed by Leslie Banks, with an asymmetric face, a gloomy appearance and a scar on the forehead that the actor stresses by continuously patting it.

The second element is the *eroticism* suffusing the whole film. The female character, attractive, fragile and almost completely passive during the whole time she and Rainsford are on the run together (she also remains an observer when the actor, a few feet from her, is about to fall into a pit while fighting with one of the count's hunting dogs), is an object of conquest for both the male characters: the sexual prey of the count but also an object of love for the hero. The conquest, however, is postponed since Eve is the very prize of the game, of the match, and as such she is part of the contest, whose reward and final verdict consists in killing. As Count Zaroff says in the middle of a disquisition on the amusement of hunting: 'Kill and then love! When you have known that, you have known ecstasy.' Only when united with the pleasure of killing

it is possible to experience the pleasure of sexual conquest. Eroticism and cruelty are thus part of the same system.

It being a game, a contest, it is obviously a system governed by rules, rules that the count values over everything else: the first step is that of showing the victims his room of trophies in which he preserves, with variously graphical devices for conservation, the heads of his prey. His declared intent is that of inculcating in the victim, considered as a 'player' on a par with himself, the seriousness of the game which is about to begin, a seriousness which – as is obvious even without taking Roger Caillois to figure it out – is the indispensable presupposition for the success of any game. Furthermore, the count concedes his prey some hours' advantage and the possibility of saving themselves: they will be free if they are able to survive the sunrise of the next day on the island. As we can see, and this is the third element, the cruelty of the count has nothing to do with uncontrolled violence, since hatred is also a natural instinct animated by a *lucid rationality*, cold, determined and objective. Zaroff is a 'sanguinary gentleman' who respects the forms, the rules of both hospitality and of the game, and naturally because of this his cruelty is even more terrifying.

II.

At this point, the comment by Paolo Mereghetti (2014) according to whom *The Most Dangerous Game* is 'one of the most Sadean films ever made' should not be surprising. Following Maurice Blanchot's analysis in his *Lautréamont and Sade* (Blanchot 2004), but also in the writings of Georges Bataille (Bataille 1986), Count Zaroff has all the features of Sade's 'sovereign man'. First of all, the external emblem of the title:

> Sadean humanity is essentially composed by a small number of all-powerful men, who had the will to raise themselves above laws and place themselves outside prejudice … These extraordinary men generally belong to a privileged class: they are dukes, kings, even the pope himself … They owe to their birth the privileges of inequality. (Blanchot 2004: 11)

There are obviously those who, although not patrician by birth, are however capable of increasing their power, because they have the power to commit a crime. Inequality is thus for Sade, and Zaroff, a fact of nature: some individuals are necessarily slaves and victims, while others are brave enough to follow their natural instincts, which are those of pleasure and egoism, of subjecting other human beings. Destruction and affirmation coincide and are natural instincts, since nature, as Sade

writes in the novel *Justine*, 'is a perpetual succession of crimes' and 'does not allow for crimes to endanger its economy', thus making it inconceivable for 'the weakest [to] really offend the strongest' (Sade 2012: 62–3).

Another element explicitly present in the construction of the character of Zaroff, noticed by virtually all interpreters of Sade, is the primacy of crime over lust. In *Justine* a man argues for the reasons of the rape he just committed on his victim by saying:

> in some people lust can be generated by the very act of crime! I'll go further, and say that it is therefore the case that crime alone arouses and precipitates it, and that there is not a single pleasure in the world that it does not inflame or increase. (Sade 2012: 186)

This quotation echoes the already mentioned line by Zaroff: 'Kill and then love! When you've known that, you have known ecstasy.' In Sade, as Blanchot writes,

> crime matters more than lust, and the cold-blooded crime is valued more than the one committed in the burst of passion; but the crime committed in the rigidifying of the sensitive part, the obscure and secret crime, is the most valued of them all. (Blanchot 2004: 37–8)

The taming of the sensitive part is thus what allows the moment of suspension, in which the instinct is curbed and subordinated to crime: 'in order for passion to transform into energy it should be contained, mediated by a necessary moment of insensibility; only in this way it would reach its greatest intensity' (Blanchot 2004: 38).

In order for the sovereign men to give priority to crime over lust it is necessary to possess cold blood and self-control, what Blanchot defines as insensibility, apathy, indifference, stoicism. About her misadventures, the virtuous Justice claims: 'such is the fatal indifference that, more than anything else, characterizes the mind of the true libertine' (Sade 2012: 174). Were Count Zaroff not focused on himself and unable to experience any kind of emotion, and his attraction for Eve held and mediated by crime, he would not be a sovereign man, but rather a mediocre man satisfied by the 'average pleasures'. This is the motif that Bataille puts at the centre of the chapter dedicated to Sade in his *Erotism*, in which the supremacy of crime over passions, insensibility and apathy, are lived as the overcoming of the personal self, which seems to be extremely well suited to Zaroff's philosophy:

> These exigencies [that the crime should reach the pinnacle of crime] lie outside the individual, or at least they set a higher value on the process begun by him

> but now detached from him and transcending him, than on the individual himself. De Sade cannot help bringing into play beyond personal variety an almost impersonal egotism. (Bataille 1986: 175)

Moreover, from the encounter of sexuality and rationality, blender together in their sharp coldness without the mediation of any feeling for others, there derives another recurrent theme of Sadean writings which seems in part suggested in this film as well: in the words of Moravia, 'the habit of rationalization, that is the systematic justification – of an intellectual and ideological kind – of one's sexuality' (Moravia 1976: xi). As we briefly saw earlier, the characters of Sade's novels argue, rationally explain and offer a justification of their cruelty, building a system of thought and restating their motivations with an almost obsessive frequency – especially in some of his writings. In a similar way the count, in particular in the first part of the film, digressing on his great passion for big-game hunts, is not satisfied merely with having some victims but moreover wants to convince them of the ineluctability of his behaviour as a strong man superior to average humanity.

III.

If anything, *The Most Dangerous Game* is a Sadean film in the Deleuzian interpretation offered in *Coldness and Cruelty* (1991b), a text declaring as its goal that of understanding the clinical dimension of sadism and masochism from a literary viewpoint. Sade and Sacher-Masoch were in fact for Deleuze first of all great writers, but also great clinicians, who gave their names to a perversion as doctors created the name of the illness studied. They were, even more, great anthropologists, because they individuated the features of a whole world view, of a conception of the human being, of nature and culture. The key point of the book is in fact the idea that both sadism and masochism have been too quickly merged under the concept of sadomasochism, that is, in particular, it was the vision of Masoch which suffered a 'spurious dialectical unity' with Sade. According to Deleuze, they represent instead two different clinical and literary entities, two completely independent systems between which there would be no contact (sadomasochism exists as a third variant distinct from either).

Let us for now accept the definition of the sadistic system as a separate system, literally and clinically. In the first place, as Deleuze remarks, 'a genuine sadist could never tolerate a masochistic victim' (Deleuze 1991b: 40), quoting in this respect a passage from *Justine* in which

the victim of the sadistic monks explains to the protagonist how they want to be certain that their crimes lead to cries, since they would refuse whoever offers him- or herself spontaneously. On the other hand, the masochist him- or herself does not really need a truly sadistic torturer, as in a masochistic situation the latter should behave without hatred, as the heroine of Sacher-Masoch's *Die Seelenfängerin* claims about the masochist practice: 'you cause suffering out of cruelty… while I kill without mercy but also without hatred' (quoted in Deleuze 1991b: 41). Furthermore, the woman torturer should be 'trained', educated by the masochist according to his most secret design, according to his desires; but the idea of an education as well as of the contractual character of the relationship between the two protagonists of the masochist system finds no space in the sadist system.

Using these affirmations as a key to reading the film, it is clear why as a victim Rainsford meets well the count's tastes, being an expert big-game hunter capable of defending himself and far from being disposed to suffering; it is worth recalling how in the 'dangerous game' the victim is Rainsford and not Eve, the female character, who is indeed the very prize of the game; that is, she could be the victim of a sadistic game only *after* the hunting, about which the film tells us nothing. This allows us to understand the disinterest of the count for the character of Eve's brother, who during the evening at the castle immediately presents himself as a 'victim of circumstances', and who will be killed as first almost with indifference because of his weakness (a 'charming child', as the count says referring to him), and complete ignorance of the practice of hunting and of the rules of the game. However, in his analysis Deleuze is far from saying that the victim of sadism is him- or herself sadistic; rather, he claims that the victim has nothing to do with masochism, being an integral part of the sadistic situation, of the sadistic system: he or she belongs to it. Whether the victim of the sadistic game carries some masochistic traits, he or she possess them as those specific masochistic traits which constitute the counterpart, the symmetrical image of the sadism of the other, and not as masochist elements in themselves, which would be completely extraneous to the whole context. Deleuze writes:

> The victim cannot be masochistic, not merely because the libertine would be irked if she were to experience pleasure, but because the victim of the sadist belongs entirely in the world of sadism and is an integral part of the sadistic situation. In some strange way she is *the counterpart of the sadistic torturer*. (Deleuze 1991b: 41–2; my emphasis)

The idea of the double is witnessed in the novels of Sade by the figures of Justine and Juliette, the virtuous and the perverse, two young women who, although having opposite reactions to their misadventures, as sisters had the same formation and came from the same parental system. The ideas of the double and of symmetry are perhaps the most evident features of *The Most Dangerous Game*, on which the film insists with an almost didactic emphasis: the two male characters seems to be in complete opposition, the contrast of the sinister aspect of the one and the bright appearance of the other; and yet the two are bound by their passion for the 'most dangerous game'. Thus, if Zaroff is the sadist par excellence, Rainsford, the hero, is not a masochist, and yet neither is he a sadist, but rather an integral part of the game, of which he knows the rules, decided by the count and received without any major dissent, and of which he employs all the possible tricks which the count reveals without any mystery.

If thus the male characters fully participate in the game, accepting its rules, tricks, spatial limits, and escape routes, this is not a mere accident, as both become strenuous and explicit advocates of it in two symmetrical discourses: the one at the beginning of the film, by Rainsford, while the other during the evening in the castle, by the count, blunt demonstrations of the necessity of evil and the survival of the fittest. The alternation of scenes of action and cruelty with moments of sheer theorisation about the desire to kill and the ineluctable character of evil recalls the theme of lucidity and cold blood noted by readers of Sade, but even more it seems to faithfully reproduce the storyline of his novels. On the one hand, we find the detailed descriptions of the particular scene of sex and cruelty, the obscene language and the obscene details, while on the other we have pure theory, the most elevated abstraction, the philosophical justification of cruelty and of the negative. For Deleuze, this double level, as I already had the occasion to comment, represents precisely the clinical and literary character of sadism:[1]

> The imperative and descriptive factor, represents the *personal* element; it directs and describes the personal violence of the sadist as well as his individual tastes; the second and higher factor represents the *impersonal* element in sadism and identifies the impersonal violence with an Idea of pure reason, with a terrifying demonstration capable of subordinating the first element. (Deleuze 1991b: 19–20)

The vision of sadism as a self-standing situation, independent and based on its own rules, recalls the spatial idea of the limit and its overcoming present in the film in various ways. The adventure begins

precisely with the violation of a limit, the one of the channel lights, a signal which should indicate the right way and which in this case should not be followed: the captain of the boat voices his doubts, since the lights seem to be in a different position than the one indicated by the maps, in an area characterised by menacing reefs and infested by sharks. Furthermore, the boat is sailing very close to an island with a sinister reputation. The owner of the boat, however, sceptical of what he calls fantasies, tells him to keep going: once the lights are passed, we witness the heralded shipwreck and the landing of the sole survivor on the sadly famous island. The hero is catapulted into a zone ruled by different regulations, beyond what is known, at the boundaries of civilisation.[2] The signals of a sinister world, different from the familiar one, are all present: in the first place the forest full of vegetation and shadows, then the castle, sadistic place par excellence, with its inhabitants – not only the count but also his uncanny servants – its disquieting position and emblems, visible already on the main entrance gates. However, once we pass through the entrance and venture beyond the boundaries we find ourselves inside yet another delimited system, the one of the sadistic game, a closed system in itself as well, represented by the confinement in the castle watched by ferocious dogs and by the island itself, a geographical space limited by the sea and by dangerous cliffs from which it is impossible to escape.

Notes

1. A personal–impersonal double level focuses on the negative and negativity, whereas masochism, by stressing the contractual and ritual element, proposes a system made by expectations, suspensions and avoidance of reality.
2. On the theme of the island, see Previti 2010.

Chance

I.

In the previous chapters I had occasion to evoke the reflection of André Bazin, the most influential post-World War II French cinematographic critic, founder of the *Cahiers du cinéma* and forefather of an interpretative line of modern cinematography in which Deleuze's thought is also inscribed. Bazin's idea of the poetics of Italian neorealist directors, to which he dedicated many essays and articles, can be well summed up in the parallel between the facts alternating as in the mechanism of a gear (the plot of classical cinema, in which each scene is replaced by the subsequent one as for the scheme of perception and action), and the images presenting to the spectator as unrelated, fragmented, each with its own narrative and aesthetic autonomy (the hesitation of the camera, the persistence on the scene of modern cinema and purely optical and sound image).

But the theoretical nucleus of Bazin's thought, that is, the constitutive relationship between cinematographic image and reality, is already in place in his 1945 seminal article 'The Ontology of the Cinematographic Image'. Those few pages, which after the death of the author in 1958 were chosen to open the comprehensive edition of his writings,[1] clearly present such a relationship not as a rhetorical, political or ingenuously idealistic device – as it has been often mistakenly portrayed – but rather as the necessary outcome of the features and possibilities of the cinematographic device capable of offering an extremely faithful reproduction of our world. Thanks to its 'mechanical genesis', cinema is configured as a 'digital imprint' of reality: the film is impressed by a trace capable of adhering to life and showing the true nature of things and human beings.

Deleuze Studies 8.3 (2014): 399–410

The concrete consequence of these theoretical premises is the fact that, according to Bazin, in order to accomplish the specificity of this medium we need a film renouncing any spectacular aim, the use of studios to shoot as well as any narrative montage envisaging a fast sequence of scenes. In order to support and show the flow of our reality, sequence shots, improvisation, externals, and amateur actors should be privileged. Italian neorealism, which Bazin followed attentively since its beginnings and on which he wrote profusely, represents the incarnation of this theory. In the work of authors such as Roberto Rossellini, Vittorio De Sica and Cesare Zavattini, the fact, the 'fragment of reality', is respected in its integrity, bringing to completion the most proper nature of the cinematographic device, representing that impulse towards reality obtained by its mechanical origin. It is necessary, however, to clear the ground of any characterisation of this realism as an ingenuous one: as the most attentive interpreters of Bazin did not fail to notice, the critic underlined several times how 'every realism in art was first profoundly aesthetic' (Bazin 2005b: 25): if every form of art is fed by the contradiction according to which the illusion of reality is always the fruit of artifices, work and technique, the contact with the immanence of reality at the centre of neorealist works does not represent a stylistic transgression and a return to the rough ground of reality, but is rather the result of an artistic evolution and of an expressive progress.

In order to show the most salient features of this reality that cinema constitutively strives to represent, I shall pause for a moment on the 1945 article. The main feature of this pioneering text, which represented a milestone for an entire generation of studies in the theory of cinema, is the multidisciplinary approach of the author, who calls into play anthropology, psychoanalysis, and the history of art in order to characterise the birth of photography and cinema as part of a precise wider evolutionary course. Such a course has as its goal the reproduction of reality, which is however caught in its flow, in its unpredictable character. Bazin considers the origin of plastic arts from a psychoanalytic point of view, individuating the motif of the birth of painting and sculpture in what is defined as the 'mummy complex':

> The religion of ancient Egypt, aimed against death, saw survival as depending on the continued existence of a corporeal body. Thus, by providing a defense against the passage of time is satisfied a basic psychological need in man, for death is but the victory of time. To preserve, artificially, his bodily appearance is to snatch it from the flow of time, to stow it away neatly, so to speak, in the hold of life. (Bazin 2005a: 9)

The defence against time and death by means of the preservation of corporeal appearances, lying at the origins of the Egyptian practice of mummification, is the primary function not only of religious sculptures but of all plastic arts in general, of sculpture and painting in their attempt to snatch life from what Bazin, following Bergson, calls the 'flow of time'. With the evolution of civilisation the belief in the magical function collapses and the portrait replaces mummification: a practice which certainly does not snatch the subject from physical death but rather saves it from the spiritual one by perpetuating its memory.

Following this direction, the arrival of photography and later on cinema would represent the fulfilment of the aspiration of Western painting, which finds its roots in a psychological need to substitute the real world by its double. The consequence is that in this framework the birth of the photographic image constitutes a fundamental event for the very evolution of the plastic arts. In the midst of the nineteenth century, the invention of photography, with its essentially objective character, enabled in fact both painting and sculpture to free themselves from the obsession with resemblance, to abandon the disposition to the plausible and to realism so as to reach a new aesthetic autonomy. The burden of realism would be carried by the photographic eye, the lens substituting for the human eye, taking advantage, thanks to its automatic working, of a transference of reality from the thing to its reproduction compelling us to believe in the existence of the represented object. The birth of cinema brought this process of adhesion to reality commenced by photography to its full realisation, adding to the image of things that of their movement and flow:

> The film is no longer content to preserve the object, enshrouded as it were in an instant, as the bodies of insects are preserved intact, out of the distant past, in amber. The film delivers baroque art from its convulsive catalepsy. Now, for the first time, the image of things is likewise the image of their duration, change mummified as it were. (Bazin 2005a: 14–15)

What is shown in films is not, therefore, a simple reproduction, but the very object made eternal and free from its contingent aspects, and yet not deprived of its movement: it is, indeed, a digital imprint.

II.

One might ask, however, what is the reality about which Bazin speaks, towards which cinema seems to constitutively lean? At this point the answer should be clear: it is neither, or at least it is not only, a political

and ethical reference to the comprehension of the post-war social reality, nor the fidelity to some model according to which the film should be a *mimesis*, a faithful copy. What is at stake is rather the realisation of the possibility which cinema alone carries among the various arts: namely, the restitution of time in itself, or, to use the words of the philosopher from which Bazin gets his inspiration, the return of duration. The philosopher is obviously Bergson, and the idea of life as real duration aims in the first place at defining time as an unbroken flux which creates in its continuous flow, as a non-mechanical evolution marked by novelty. Contrary to the mathematical representation we often employ, our consciousness tells us that our lived experience is a becoming, a flux which cannot be represented by the 'spatialised' time of the sciences made of discrete and homogenous instants, whose fixity is nothing but the illusion of our perception. In his 1907 *The Creative Evolution*, a text in which, paradoxically enough, cinema is used as the example of what for the philosopher is the contrary of duration – that is, the illusory movement of perception – Bergson writes: 'What is real is the continual change of form: *form is only a snapshot view of a transition*. Therefore, here again, our perception manages to solidify into discontinuous images the fluid continuity of reality' (Bergson 1944: 328; original emphasis).[2]

At a closer look, the theme of the possibility of a cinematographic restitution of time as becoming, which will be a central theme in the theory of cinema, can be usefully investigated by means of a concrete example. Going beyond the predictable reference to Italian neorealism – think, for example, about the poetics of shadowing by Cesare Zavattini, defined by Bazin as 'something like Proust in the present indicative tense' (Bazin 2005b: 7) – I shall concentrate on a cinematographic work of the 1950s to which Bazin dedicates a short piece, boldly titled *A Bergsonian Film: The Picasso Mystery.*

The cinematographic work is obviously *The Picasso Mystery* (1956), directed by the screenwriter and director Henri-Georges Clouzot, one of the protagonists of French noir cinema of the 1940s, a 'narrator of a violent and guilty world, depicted with anguish and lucidity free from any illusion, [an author] in whose heritance of naturalism is above all a declaration of moral coherence and expressive vigor' (McGilvray 2003: 74). In the film dedicated to Picasso, the director abandons the narrative and realist description as well as the reflection on evil that characterised many of his detective stories, and investigates the enigma of creativity in order to show the painter *at* work, in the literal sense of the words. In fact, thanks to a white canvas, made transparent by

the lighting system, behind which is placed the camera, Clouzot, with the help of the photography of Claude Renoir, is able to record live the genesis of each painting. The painted canvas completely saturates the shot so that the spectator is able to witness the creation of the work by facing it, almost assuming the point of view of the painter without having the artist in his or her field of view. To the first strokes traced on the canvas are added, through montage, layer after layer, other strokes and colours until the composition of the completed figure is obtained. Cinema, therefore, thanks to its mechanical nature, reveals in this way the 'various paintings which lie under the canvas' – as Picasso himself says in the film – each of which, at each stage, appears as the complete and definitive one. The result is a documentary on painting in general rather than on a painter in particular: in slightly more than one hour the film shows in coloured close-ups the 'making' of a dozen paintings spaced out by some black and white scenes showing the artist in his studio.[3] Picasso, meeting the challenge of the film, improvises drawings and oil paintings and accepts the restrictions due to the length of the film, which inevitably dictates the time available.

III.

In the case of literature and theatre, Bazin pronounces in favour of an 'impure cinema' that is able to – and should – blend with other artistic expressions, with pre-existing languages, and use them for its own good, representing by now a mature autonomous art and thus ready for comparisons and exchanges. In a similar way, the encounter between cinema and painting might produce remarkable results, fecund for both. If 'The higher standard and the low cost of photography and the ease with which pictures are taken, has at last contributed to the due evaluation of painting and to establishing it unalterably in its proper place' (Bazin 2005a: 119), if, thanks to colour photography, 'painting has been able to become the most individual of arts, the most onerous, the most independent of all compromise while at the same time the most accessible' (Bazin 2005a: 119), the mechanism of cinema capable of registering movement can contribute to reveal all the secrets of painting: *The Picasso Mystery* represents a shining example of this very possibility. In the first place, thus, this film shows a configuration and modality of the alliance between the two arts, in which cinema, after having freed it from the obsession with verisimilitude and offered it a wider accessibility and independence, is once again at the service of the pictorial art.

Having claimed that cinema is capable of revealing the mechanism of painting, it is still an open question how it does so. My guess is that it does not do so as a didactical film or a documentary would, but rather – as Bazin claims at the opening of his piece on film – by simply showing it and making it visible. What is excluded a priori by the director in his way of realising the film as well as in the simple choice of its subject is the idea of conveying a message or offering an explanation. Picasso himself is not able to give a key to reading his art, as his acts are not ruled by a sequence of cause and effect, but rather, as one might put it, by a continuous series of effects (as his famous phrase 'I don't search for, I find!' reminds us, depicting him as extraneous to any attempt at research, and always in possession of the result). In this sense the meaning of the film is profoundly Bergsonian: each line painted by the artist appears as totally unexpected, because it is the creation originating from another creation, such as – as Bazin writes with a certain emphasis – 'life which generates life' (Bazin 1997: 211):

> There is not in fact any line, any patch of color which do not appear – to appear is the right word – as rigorously unpredictable. An unpredictability which supposes, conversely, the non-explanation of the composed departing from the simple. The thing is so real that the whole principle of the film as spectacle and even, more precisely, as 'suspense' resides in this delay and *perpetual surprise*. (Bazin 1997: 211; my emphasis)

If the first filmic revolution affecting art consisted in the abolition of the frame, according to which thanks to the shot the pictorial universe corresponds to the whole universe,[4] this film clearly displays the second big novelty: the possibility of exhibiting the duration of the painting as its essential part, because what lies at the centre of the film is the completion of the work as a task *in fieri*, and not as a result. What we are able to see thanks to the cinematographic mechanism and to the procedure employed by Clouzot are the intermediate states considered not as inferior realities, as steps necessary to reach the fullness of the painting, but rather as the very focus of the work. In the film Picasso himself does not consider them as sketches or simple drafts, but as paintings in themselves – they are paintings under paintings – although they are sacrificed for the overlapping painting, the one with which the painter decides to interrupt the series:

> What *The Picasso Mystery* reveals is not that creation takes a certain amount of time, which we already knew, but that duration may be an integral part of the work itself, and additional dimension, which is foolishly ignored once a painting has been completed. More accurately, all we knew until now were

> 'canvases', vertical sections of a creative flow more or less arbitrarily decided upon by the painter himself, in sickness and in health. What Clouzot at least reveals is the painting itself, i.e., a work that exists in time, that has its own duration, its own life, and sometimes – as at the end of the film – a death that precedes the extinction of the artist. (Bazin 1997: 212)

If the work-in-progress of painting or its transparent realisation were not new in cinemas, Clouzot, by excluding from the film any didactical, biographical or descriptive aspect, has the merit of making them the true and only spectacular elements of his work, obtaining the entire film from the vision of duration in itself. As already said, the idea that cinema is the only device able to reveal the proper temporality of painting highlights among other things an often present and essential element of Bazin's thought: namely, the conviction that the novelty of the cinematographic image brings to bear change and evolution for all other arts as well. In this case we can say that cinema complicates the traditional system of arts as it was envisioned by Lessing in the eighteenth century, making painting – paradoxically enough – a temporal art.

The will of the director to make visible the becoming beyond the forms also justifies, according to Bazin, his decision to accelerate the action, killing any idle time or showing more than one stroke at the same time. The restrictions of montage, very far from a strict prescription as has been usually understood, are eluded when, for example, the acceleration is exhibited, manifested but not used to deceive and seduce the spectator with a false combination of images: Clouzot understood the necessity of the time of the show (as opposed to that of reality) – given that *The Picasso Mystery* is a film and not a documentary – that however neither betrays nor distorts real time, Bergson's concrete duration.

In a way, in some similar aspects to Clouzot's project on Picasso, the aspiration to make duration visible, the flow of time, lies at the centre of the poetics of the contemporary artist Bill Viola. With the aid of digital composition, in his art videos Viola presents the themes of the great pictorial works of the tradition in a composition in which movement is played in slow motion. Examples of this appearance of time in person, as Deleuze would have called it, of a fourth dimension which seems to be constituted as 'thinking' and tangible in front of the spectator (almost a concretisation of the Bergsonian idea of 'the cone of memory'), are works by Viola such as *The Greeting* (1995), inspired by Pontormo's *Visitation* (1514–16), or rather *Emergence* (2002), with Christ emerging from the baptismal font in an extreme slow motion which makes the movements of the various characters fluctuate in the visual field. As the artist himself comments:

> For me one of the decisive moments of the last one hundred and fifty years is the animation of the image, the advent of moving images. Perhaps one day we would acknowledge that the insertion of the time factor in visual arts has been as crucial as the affirmation of the value of perspective by Brunelleschi, opening in this way the three-dimensional space in painting. Nowadays painting has a fourth dimension, and images have acquired life… The true basic instruments, the true raw material, are not the video camera or the monitor, but rather time and experience. (Viola 2008: 191; my translation)

IV.

The unpredictable and surprising character of Picasso's painting revealed by Clouzot's films carries another element worth noticing, which, however, is barely appreciable in Bazin's writing, mentioned only in the long quotation reported in the previous paragraph without being properly developed. It is what we might call the role of *chance*, of the strange contingency guiding the pictorial gesture once we describe it not as the outcome of cause–effect relations, but rather, exactly, as the spontaneous outcome of the artistic process.

The theme of fortuitousness strongly emerges in the analysis of another great painter, namely Francis Bacon, that Gilles Deleuze sketches in his *Francis Bacon: The Logic of Sensation* (2003). His painting, whose aim is that of making visible the invisible forces operating on bodies, shifting them and deforming them, is defined as neither an abstract nor a figurative art, but rather as a 'figural' one. A figural painting is one capable of preserving the figure without becoming an illustrative or representative gesture, without implying a narration (curiously enough, this is the goal of Clouzot as well, who with *The Picasso Mystery* realises a film halfway between realism and abstraction, a film which is clearly neither narrative nor constituted by images alone, similarly to experimental avant-garde films). What might the painter do in order to overcome the pictorial character of painting without taking the road of pure abstraction, avoiding both painting clichés and subverting pictorial clichés by means of exclusively intellectual operations? Deleuze answers:

> 'Free marks' will have to be made rather quickly on the image being painted so as to destroy the nascent figuration in it and to give the Figure a chance, which is the *improbable itself*. These marks are accidental, 'by chance'; but clearly the same word, 'chance,' no longer designates probabilities, but now designates a type of choice or action without probability. These marks can be called 'nonrepresentative' precisely because they depend on the act of chance

> and express nothing regarding the visual image: they only concern the hand of the painter. (Deleuze 2003: 93–4)

However, the involuntary and casual aspects are necessarily accompanied by an element of selection that enables the free manual movements, the 'accidental' marks sketched by the painter, to be re-introduced in a cohesive and even more powerful whole.

This reading of the artistic activity of Bacon, so congenial to Deleuze's philosophy in its attention to the impersonal aspect of chance as to make one think of a stretching of his own thought, is in truth an almost literal transposition of what the painter himself claims in various interviews, and in particular in his conversations with the critic David Sylvester. Bacon insists more than once on the fortuitous character of his gestures as the only possibility of realising the operation he is most interested in: namely, 'opening the valves of sensation', 'placing a trap' to catch dynamism, arriving at a definition of himself as 'a medium of chance'. A too self-conscious and intentional practice, in fact, risks missing its mark of capturing the forces and the vital element, which can be truly seized only by 'inevitable' marks and colours driven by the odd necessity of chance (Sylvester 2003: 17, 50, 120, 84; my translation). And chance is recalled by Bacon as an always present vital force going beyond the specific moment of painting. For example, to the question on the reason why, if life is a game without any sense as he often claims, he still wants to live, he replies: 'I am avid of living, and I am avid as an artist. I am avid of what chance can, and I hope will, give me: what overtakes by far whatever can be logically calculated' (Sollers 2001: 13; my translation). This new logic obtained by illogical means, united to the avidity for life, places Bacon in the series of overflowing and extreme characters dear to Deleuze, in which Welles partakes as well, with whom the painter shares a love for Shakespeare and for the great tragic figures (as well as a bizarre form of Nietzscheism: as Bacon would say, 'my male ideal? The Nietzsche of the football team' (quoted in Sollers 2001: 44)).

From the point of view of the pictorial production, the casual, involuntary marks are 'capable of suggesting deeper ways with which trapping the fact one is obsessed with', without limiting oneself to the simple illustration of the object represented (Sylvester 2003: 50; my translation). This aspect, which aims at the destruction of any figurative eventuality, is well described by Deleuze:

> These almost blind manual marks attest to the intrusion of another world into the visual world of figuration. To a certain extent, they remove the painting from the optical organization that was already reigning over it and rendering

> it figurative in advance. The painter's hand intervenes in order to shake its own dependence and break up the sovereign optical organization: one can no longer see anything, as if in a catastrophe, a chaos. (Deleuze 2003: 101)

But Bacon does not fail to highlight at the same time how instinct and spontaneous gestures are rooted in a certain kind of knowledge and wisdom, and should involve the establishment of a certain order if one wants to 'open up a field of sensations', if one wants to violently affect 'the nervous system' of the spectator. In this sense, as Deleuze himself notices, chance coincides with an act of choice, free and hazardous. As we can read in a 1962 interview,

> You know, in my case each painting . . . is something fortuitous. I foresee it in my mind, I foresee it, and yet I am almost never able to realize it as I foresaw it. It transforms when I apply the color . . . And color often does better than I am able to do. Is it a fortuitous fact? Perhaps one might say that that is not accidental, because choosing to preserve a part of this chance over another becomes a selective process. One obviously tries to keep the vitality of the hazard preserving the continuity. (Sylvester 2003: 16; my translation)

The burst of hazard into continuity, of chaos into order, of recklessness in knowing, belongs for Bacon in the first place to the initial phase of a work, a pre-pictorial act in which the artist might throw the colours casually onto the canvas or draw some lines without precisely knowing where he or she is driving to ('I rush my hand. Very simply I push the painting in the hand and I rush it' (Sylvester 2003: 81; my translation)); still, such a burst can take place in the middle of the work as well, when the painting can undergo some unexpected transformations leading the artist to unforeseen places, transformations instantly hitting the spectator the more so when they are accomplished almost without will. In this respect Bacon tells us how more than once, out of pure exhaustion, he covered a painting he considered trivial and too illustrative with colours and casual brush strokes, and suddenly acknowledged that those marks, intended to destroy the painting, were closer to the image he was striving to achieve. Eventually, although not explicitly acknowledged, the casual factor seems to determine the outcome as well, given that the painter, driven by a mix of unconsciousness and consciousness, takes the instinctive choice to stop his hand.

All this – and indeed this is a result only cinema is able to obtain – is clearly noticeable at work in the Picasso painting for Clouzot, although in Bazin's piece this is related to the spontaneity and novelty of the creative act, rather than to the unconscious and irrational forces to

which Bacon often refers to in his conversations on painting. The relation between Bacon and Picasso, of which we find no trace in Deleuze, has on the other hand been stressed by Philippe Sollers who, by not overlooking the theme of chance, individuates in both painters a 'payback critical of the passive spirit', as well as the ability of their paintings of 'disorienting' the walls, obliging 'the whole room, the building and even the streets to show themselves in their fragile duration' (Sollers 2003: 29, 57, 57; my translation).

The casualness of Picasso's first manual gestures is evident in one of the earlier scenes of the film, which captures the genesis of a drawing departing from two marks, one horizontal and the other diagonal, traced by the painter utterly by chance, as is evident to any spectator, and then reconciled so as to form a figure. The infinite possibilities of metamorphosis of the painting in its composition appear, for example, in the scene in which the painter meets the director's challenge of finishing the painting in a brief time window, dictated by the length of film left. In one of the few lines of the film, Picasso says: 'Wait and see, I'll have a surprise for you.' He then draws some lines which initially form a flower bowl, which transforms itself under the eyes of the spectators into a fish, then suddenly turns into a rooster, and, at the last second, into a face. Thus, the decision sanctioning the completeness of the works seems to be guided by a will that is not entirely rational.

Bacon mentions precisely Picasso in answering a question by Sylvester about the possibility of a relationship between the very process of painting and the sensation accompanying the game of roulette (which the painter claims to love for its impersonality, as opposed to the personal relationship players often try to establish with other gambling games), the impression of being synchronised with the wheel and thus unable to fail. He answers: 'Here, I am sure that there is in point of fact a very strong connection. After all Picasso once remarkably said: "I don't need to gamble, as I constantly play with chance"' (Sylvester 2003: 88; my translation).

Notes

1. The collection of the vast majority of his writings was published in four volumes between 1958 and 1962 with the general title *Qu'est-ce que le cinéma?*, translated in English in the two volumes titled *What Is Cinema?*
2. The last chapter of *The Creative Evolution* is titled 'The Cinematographical Mechanism of Thought and the Mechanical Illusion'. In it, Bergson equates the illusory perception of a false movement composed by a series of homogenous

instants to the succession of cinematographic frames (see the first chapter in this volume, 'Movement').

3. Regarding the use of colour, Bazin comments on Clouzot's decision to realise the film in black and white (however impressed on a coloured film) except for the moments in which the (coloured) paintings are shown, stating that in this way Clouzot is able to reproduce the mental process according to which, by contemplating a painting, we annihilate natural reality to the advantage of the pictorial one.
4. Bazin speaks of this 'first revolution' in the chapter titled 'Painting and Cinema'.

Deleuze, Darwin and the Categorisation of Life

Nathan Eckstrand Duquesne University

Abstract

I begin with Deleuze's criticism of the Darwinian concept of difference as leading to the inaccurate assumption that difference occurs within individuals and species. Deleuze radicalises Darwin's theory by disrupting the ontological stability of species and extant individualities. I examine how Deleuze's project relates to punctuated equilibrium and the discovery of the amount of variation within the human genome, showing that these recent developments make Deleuze's critique less applicable by showing that Darwinian classification schemes should include a greater openness to difference. A complete alignment between evolutionary biology and Deleuze may be impossible given the limitations of evolutionary biology, but evolutionary biology can rethink the ontological permanence it gives to species and individuals.

Keywords: Deleuze, evolutionary biology, Darwin, difference, classification, species, punctuated equilibrium

I. Introduction

In the years following his trip on HMS *Beagle*, Charles Darwin challenged the meaning of variation within living things, formulating his theory of evolution by natural selection to explain the diversity of characteristics living things possess. Since that time, evolutionary biology has incorporated Mendelian inheritance and the relatively new field of genetics to offer better explanations for the origins of new

species and novel individuals. A century after Darwin, Gilles Deleuze qualifies and resituates, without opposing, philosophies of 'univocal being' in which 'Being is said in a single and same sense of everything of which it is said' (Deleuze 1994: 36) within his larger 'philosophy of difference'. As Deleuze himself recognises, there are a number of points of convergence and divergence between these two theories in their explanations of how difference appears and operates within the world. Both theories reject a typology that classifies entities into universal, absolute categories and propose a system by which new beings and new differences can come into existence; yet Darwin stops short of privileging differences over individuals, and instead provides the notion of species with a sense of ontological stability incompatible with Deleuze's concept of individuation. Darwin references individual differences rather than taxonomic structures, but from a Deleuzian perspective, Darwin's use of the categories of individuals and species presupposes processes of individuation that constitute individuals which can subsequently be sorted into species. This paper examines these similarities and differences between Deleuze's philosophy of difference[1] and Darwin's theory of evolution, focusing on Deleuze's compliments and criticisms of the Darwinian project. Deleuze critiques Darwin because the Darwinian concept of difference is 'difference inherent in individuals' rather than 'individual difference', a concept that leads Darwin to inaccurately assume that difference occurs within individuals and within species whereas a true philosophy of difference claims individuals and species develop through processes of individuation. Deleuze's philosophy of difference borrows from Darwin the critique of hierarchical classification schemes that substitutes a dynamic model, but radicalises Darwin's theory by disrupting even the ontological stability of species and extant individualities. Since there have been several important shifts in evolutionary biology since Darwin, this paper also examines how Deleuze's project relates to two more recent developments within the field, punctuated equilibrium and the discovery of the amount of genetic variation within the human genome, focusing on whether the Deleuzian critiques of Darwin's version of evolution are still applicable. These recent developments within evolutionary biology make the Deleuzian critique of Darwin less applicable to contemporary evolutionary studies, as these discoveries have shown that the Darwinian classification schemes are in need of revision to include a greater openness to difference. While a complete alignment between evolutionary biology and Deleuze may be impossible given the technological and structural limitations of evolutionary biology, at the very least evolutionary biology

can rethink the ontological permanence it gives to the categories of species and individuals.

II. Deleuzian Ontologies

A preliminary difficulty confronting this project is the variation between Deleuze's ontologies as expressed in *Difference and Repetition*, *A Thousand Plateaus* and even *What Is Philosophy?*, for how Deleuze situates and explicates both processes of individuation and their relationship to species and extant individuals shifts as Deleuze modifies his project. It is worthwhile to recall some of the differences between these works before moving into a direct comparison of Deleuze, Darwin and contemporary evolutionary biology. One of the most popular characterisations of Deleuze, made by Alain Badiou and Slavoj Žižek among others, is that Deleuze's ontology works out into a transcendental idealism inasmuch as it reinstates an ontological divide between the immanent and the transcendent. *Difference and Repetition* and *Logic of Sense*, according to this analysis, set up an ontological system where subjective processes precede and condition experience, a system that starts with the empirical and seeks its necessary transcendental conditions.[2] As Deleuze desires to escape subjectivity and the focus on the immanence of appearance that characterises phenomenology, his early work is aimed at developing a transcendental critique of representation that draws from Kant the notion of synthesis and production in order to explain the conditions necessary for the possibility of the real. Yet Deleuze wants to avoid entirely accepting the Kantian position, and so posits that the syntheses which produce the real are not subjective constructs but are embedded in the very production of reality rather than in the manner in which it is represented. Alistair Welchman's commentary on the project of the early Deleuze says 'Deleuze effects a speculative reconstruction of reality that is not relative to specifically human interests, . . . a reconstruction driven by the transcendental and critical thought that the real processes of production of empirical objects cannot themselves be objects' (Welchman 2009: 32). *Difference and Repetition* portrays the processes that produce objects as transcendental and outside the bounds of immanence for the purposes of situating them as conditions of reality rather than elements of reality itself. In studying these processes, Deleuze's investigation begins in the empirical realm and gradually traces back to their transcendental conditions; it keeps a foot in the field of experience, and in doing so essentialises the nature of the empirical just enough so that Deleuze is

never able to fully escape a concept of subjectivity nor a presupposition of the products of the transcendental processes being described. *Difference and Repetition* depends on a form of subjectivity, as in its description of the syntheses of time it posits 'larval selves' that think about and draw together temporality in order to ground it (Deleuze 1994: 78). Such larval selves are fragmented pieces of subjectivity spread out across the organic stratum, and as such they are in part necessary for the constitution of temporality as it is consciously apprehended. The fact that, as Welchman says, 'it appears that living/lived time is still *constituted* by contemplative subjects/selves . . . ' (Welchman 2009: 43; original emphasis), indicates that the subjective constitution of representation that was the hallmark of Kant's transcendental idealism is not completely absent from Deleuze's early ontology.

Yet this changes in *Anti-Oedipus* and *A Thousand Plateaus*, where, in partnership with Guattari, Deleuze resituates the transcendental as a process within the materiality – which Deleuze defines as desiring-production – of the world. The fundamental difference in method is that whereas in *Difference and Repetition* Deleuze began from the empirical, in *Anti-Oedipus* and *A Thousand Plateaus* Deleuze begins with the transcendental, or with the notion that experience is constituted. Deleuze does not work back to the syntheses, but begins with the notion of synthesis by seeing it as immanent within the empirical. One does not have to leave the empirical to get to the transcendental conditions – they are completely contained within it. The clear difference in ontology is that there is no need for a metaphysical subject, no need to ground the transcendental within the organic stratum; the transcendental now comes as part and parcel of the materiality of the world. In explaining this relationship with regards to temporality, Welchman says:

> Nevertheless, two important changes are obvious: in the first place, the role and position of anything like the subject have changed; and, in the second place, the syntheses are no longer understood as constitutive of temporality. Underlying these changes is a modification of Deleuze's basic strategy from attempting to ground his thought on a transcendental constitution of time dependent on the organic stratum to a kind of temporalisation (schematisation) of logical operators into a transcendental conception of matter. (Welchman 2009: 49)

Temporality, which in *Difference and Repetition* had been conceived of as dependant in part on a mode of subjectivity, becomes, in *Anti-Oedipus* and *A Thousand Plateaus*, caught up in the understanding of

matter as desiring-production. In making this shift, Deleuze extricates himself from a transcendentally constituting subjectivity.[3]

Deleuze's attempt to supplant Darwinian evolution refers to a constituting plane that precedes individuals, as the failures of Darwinian evolution, from a Deleuzian perspective, come from its attempt to adhere to the stability of individuality and species as ontological forms, a failure which Deleuze works to overcome by uncovering the transcendental condition for individuals, species and other kinds. How successful this attempt is, and how much it separates itself from the contemporary field of evolutionary biology, depends in part on where such transcendental conditions are located. This point can be made clearer with a discussion of Deleuze's critique of the category of species in *Difference and Repetition*.

III. Deleuze, Darwin and Speciation

Because of the problem associated with previous means of representation – that it subjugates difference to a larger unity, but only by assuming the unity rather than demonstrating it (Deleuze 1994: 33) – Deleuze argues for the primacy of individuation over species, or of the need for science and other related discourses to deal first with the conditions for the appearance of the singular individual and second with that individual's categorisation. The reason for this is that processes of individuation have ontological priority over species, as the very idea of species presupposes the existence of individuals, constituted by processes of individuation, which can be sorted into categories. Not only do species presuppose individuation, but species presuppose that individuals constituted as such are open to change through sensation and intensity (247). It is clear that Deleuze inherits this concept from Gilbert Simondon's examination of the genesis of individuals, where Simondon posits the necessity of a principle of individuation in order to properly situate the individual within the study of the growth of organisms:

> *Research carried out under these assumptions* [*that individuation need only be studied in regards to an individual's characteristics*] *accords an ontological privilege to the already constituted individual.* Such research may well prevent us from adequately representing the process of ontogenesis … *The idea that individuation might have a principle at all is a crucial postulate* … (Simondon 1992: 298; original emphasis)

Simondon opposes any study of organisms that begins by conceiving of the living individual as a constant essence, a unity incapable of

fundamental disruption. He articulates as an alternative a study of the preindividual, or the processes of individuation that provide entities and relations their eventual fixity. Albert Toscano's excellent study of theories of individuation in *The Theatre of Production* emphasises how this study is a necessary condition for any other scientific study, saying:

> Simondon proposes we turn to a domain – that of the preindividual – where neither relationality nor individuality can be branded with the fixity that would allow them to be subjected to a logic of predication. To comprehend the genesis of individuals . . . is therefore inseparable from the task of thinking the genesis or constitution of the relation itself. (Toscano 2006: 137–8)

Individuation, as the study of the processes that give determination, predicates and fixity to entities and relations one encounters, does not assume the individual but seeks the conditions of its formation. By definition it also does not assume speciation or the particular grouping of organisms along the lines of genealogy and inherited traits. For both Deleuze and Simondon, species are an illusion patterned onto the appearance of individuals via individuation. Whatever their utility in a scientific sense, they do not provide the tools for judging individuals in terms of their uniqueness and precise configuration. But it would be a mistake to think Deleuze's system of individuation exactly copies that of Simondon, for Deleuze, unlike Simondon, refers his system of individuation back to differentiality and multiplicity, thus finding a way to describe the beginnings of a system without recourse to preconstituted individualities like Simondon's preindividualities (and, arguably, the larval selves of *Difference and Repetition*). Simondon disassembles the ontological primacy of the individual, but does so by referring to the ontological order of a principle that constructs individuals in a certain way. Deleuze, by contrast, posits multiplicities that do not count as units, principles or universals, and which as a result are constantly open and productive of difference (Toscano 2006: 162). Unlike the Aristotelian ontology which designates the categories as prior to and more essential than individuals (Aristotle 1984: 1037b29), Deleuze is able to conceive of individuals apart from any categorical apparatus by looking at processes of individuation, and as a result the necessity of having an ordering concept or image prior to the individual disappears:

> It is not the individual which is an illusion in relation to the genius of the species, but the species which is an illusion – inevitable and well founded, it is true – in relation to the play of the individual and individuation. (Deleuze 1994: 250)

Scientists and philosophers have continually resorted to the method of categorising objects, ideas, faculties and other existents through generalised groups as in doing so they are able to develop a useful knowledge that seems to explain the nature of the world they inhabit. Deleuze's concern comes from the fact that the knowledge developed hides the more basic phenomenon of individuation. To use the language of species before one has understood the processes that constitute an individual is to conceal life as it actually is. Deleuzian biologist Stanley Shostak makes a similar point in *Evolution of Sameness and Difference: Perspectives on the Human Genome Project*, saying that to use characteristics to understand and classify beings before really understanding how individual beings are constructed leads to absurdity:

> In the epistemology of life, nothing ranks higher than sameness for communicating, especially communicating ideology with conviction. As a consequence, many patently absurd assertions about life go unchallenged in 'ordinary science' and are only elevated in 'revolutionary' science: molds and mosses have a thallus (even if their thalli are the same only in word); Embryophyta and Metazoa produce embryos (with nothing whatsoever to recommend the comparison); head, thorax, and abdomen, appendages, jaws (mandibles, maxillae), and limb (trochanter, tibia, etc.) exist in insects and vertebrates (sharing nothing more than their names). (Shostak 1999: 39–40)

Shostak believes the problem with science emphasising sameness is that it posits sameness without considering whether the category is warranted, and either ignores or hides the important role difference plays in constituting the unity of life. Species, as units of biological classification defined by a similarity of characteristics – conventionally, the ability of individuals within that group to interbreed – are an example par excellence of this problem, and the reason why Deleuze's critique of Darwinian evolution will focus in large part on speciation.[4]

Realising the limits of species indicates that a proper conception of difference and the correct organisation of series needs to open itself to chance, to an evolution of forms, leaving behind restrictive regimes of representation. This does not mean that categories like species or divisions by kind need to be abandoned, but they cannot be taken as ontologically sound:

> The principle of degradation obviously does not account either for the creation of the most simple system or for the evolution of systems (the threefold difference between biological systems and physical ones). The living therefore testifies to the existence of another order, a heterogeneous order of another dimension – as though individuating factors or the atoms taken

> individually with their power of mutual communication and fluent instability there enjoyed a higher degree of expression. (Deleuze 1994: 255)

In a sense, Deleuze is trying to rehabilitate a sense of creativity at the heart of reality – an opening to becomings and differences that opposes a causal or deterministic worldview. Viewed from this perspective, *Difference and Repetition* is a response to a realist understanding of the world that sees the actual as all there is and claims the only task for philosophy and science is finding the proper categories and representations to understanding the world. Deleuze's reference back to the differences underlying and conditioning representation does the work of instilling the world with a creativity which cannot be subjugated to similitude, as there is no way to take them up into an already existing category.

Before moving on to a discussion of Darwin and contemporary evolutionary biology, it is important to review the conceptualisations Deleuze gives science throughout his corpus, so as to be in a better position to see just how well contemporary evolution fits into Deleuze's ontology. Although I have so far been primarily discussing *Difference and Repetition*, because that work never provides science as a whole with a theoretical formulation, Deleuze's other works must be taken up. What is relevant within *Difference and Repetition* is what is discussed above: the critique of similitude, the call for a study based on difference, and the search for the transcendental conditions of the real. These characteristics, understood in broad strokes, continue to hold true in Deleuze's later work with Guattari, *What Is Philosophy?* The primary difference between the two works – at least in regards to scientific knowledge – is the relationship that philosophy has to science, for *Difference and Repetition*, beginning as it does in the empirical, implies that the conceptuality of philosophy must begin from the same starting point as science. From that point, philosophy delves into the transcendental conditions, while science articulates the ontology and the relationality of the entities which have been constituted (inasmuch as such things can be studied empirically and, through a scientific methodology, given a degree of intellectual rigor).[5] By contrast, *What Is Philosophy?* claims that the difference between the two fields lies in their relationships to the infinite chaos, or differences, at the heart of being. Philosophy works on concept, providing a consistency to the chaos and bringing it all together to contain it; science works on functions and propositions, attaching itself to the chaos in order to grasp its operations. Science accomplishes this by slowing down the speeds of the

chaos so it can draw up a schematic of it, one replete with formulas and variables. Science actualises the plane of immanence, in part by describing relationships and mechanisms that illustrate how objects, forces and elements behave within specific environments. Evolution by natural selection, as a model for understanding the production and perpetuation of variation within populations, operates as such a mechanism. Because of the approach science takes to the infinite chaos, it is unable to ever grasp the whole of being; instead, by its very nature, it produces breaks and discontinuities – blind spots that science recognises as thresholds beyond which it cannot function:

> It is not only the diversity of these limits that entitles us to doubt the unitary vocation of science. In fact, each limit on its own account generates irreducible, heterogeneous systems of coordinates and imposes thresholds of discontinuity depending on the proximity or distance of the variable … Science is haunted not by its own unity but by the plane of reference constituted by all the limits or borders through which it confronts chaos. (Deleuze and Guattari 1991: 119)

Science allows a grasp on the world through the construction of grids and references (Deleuze and Guattari 1991: 127). The category of species functions as a frame of reference that enables a demarcation of the world, but the category runs into its limits when it tries to conceptualise the individual. The nature of science means that the truth of species is not absolute, but relative. Science is creative, but what it creates are determinations and quantities of information (132). Describing science like this undermines arguments that portray science as the ultimate interpreter of how things are. Science adds important understandings to our collective knowledge, but it does not occupy by itself a privileged place among the various fields mobilised to engage with difference.

The limit of this reading of science to that talk of a science of functions and functives is to talk of a science expressed through theories, hypotheses and axiomatic propositions; while this is true for some variations of science, there are other means by which science is conducted. Manuel DeLanda's comparison of Deleuze's various ontologies makes this point clear, as 'All the examples of "functives" (the components of functions) given in WIP [*What Is Philosophy?*] come from classical mechanics. No mention is made, for instance, of the operators of quantum physics, which use functions themselves as inputs and outputs' (DeLanda 2002: 221–2). Recent discoveries within science have opened pathways to think of entities and forces outside the functive model, and are more open to the chaos which underlies

it. In addition to the quantum mechanics DeLanda mentions, there are also new fields of computer modelling and contemporary models for evolutionary variation. The picture of science in *What Is Philosophy?* is the modern mechanics and dynamics of individuals like Darwin, Curie and Einstein, but contemporary science is more adaptable to the organic, rhizomatic ontology Deleuze discusses in other works.

In *A Thousand Plateaus*, Deleuze and Guattari paint a different picture of what they call nomad or minor science. This science is contrasted to the royal or major science of axiomatic propositions, for while royal science deals with the field of exact and inexact, nomad science deals with anexact – that which is neither inexact nor exact, but which expresses itself as a vague essence. While royal science works to describe, set out, verify and segregate, nomad science follows, connects, flows and problematises. Whereas state science works out principles, nomad science opens itself to new problems, searching not for answers but for opportunities for new encounters:

> Royal science is inseparable from a 'hylomorphic' model implying both a form that organizes matter and a matter prepared for the form; it has been shown that this schema derives less from technology or life than from a society divided into governors and governed, and later, intellectuals and manual laborers … It seems that nomad science is more immediately in tune with the connection between content and expression in themselves, each of these two terms encompassing both form and matter … [nomad science] *follows* the connections between singularities of matter and traits of expression, and lodges on the level of these connections, whether they be natural or forced. (Deleuze and Guattari 1987: 369)

Royal science is formalised and established, and as such continues to articulate along the same lines again and again. Once chemistry received its theoretical elaboration through the concept of weight, and once Euclidean geometry articulated a theory of gravitational parallels, they both became forms of royal science (Deleuze and Guattari 1987: 370). Yet when a new element is introduced which shifts the theoretical grounding of such science, one finds a space for nomad science. Thus Deleuze calls nomad science, or smooth space, 'the space of smallest deviation' (371); it does not overturn royal science, but neither does it work with it. It vectors off in another direction, not trying to discover the forms and axioms that royal science does, but to see where the singularity of their new direction leads. Ideally, both sciences can work in concert (inasmuch as that is possible, seeing that one cannot unify the two completely), for while nomad science can invent problems, it

takes royal science to develop solutions via its theoretical apparatus (374). Nomad science deviates from the functive science of *What Is Philosophy?*, and is more open to changes than axiomatic science. As such, it can perhaps theorise contemporary scientific discoveries in a way functive science cannot; as DeLanda says, it is 'the "more Deleuzian" approach to the subject' (DeLanda 2002: 223).

These two theories of science, the functive, axiomatic one and the nomadic one, are both vital to an encounter between Deleuze and contemporary evolutionary biology, as without both it is impossible to see how science can and should react both to the Deleuzian critique from the perspective of difference, and to the recent discoveries of punctuated equilibrium and genetic diversity. Before beginning that encounter, it is necessary to discuss Darwinian evolution and Deleuze's response to it to provide the proper context for the developments in contemporary evolutionary biology.

Charles Darwin, with his book *The Origin of Species*, introduced the theory of evolution by natural selection, proposing a solution to one of biology's most fundamental problems: how to account for the similarity and diversity observed in living things and life forms. Darwin's observations suggest that individuals could be viewed as products of a sequence of certain biological events. Instead of categorising living things by morphology, Darwin proposed a mechanism or process for how groups such as species came to be. Individuals' characteristics depend on the characteristics of their ancestors:

> By the theory of natural selection all living species have been connected with the parent-species of each genus, by differences not greater than we see between the natural and the domestic varieties of the species at the present day; and these parent-species, now generally extinct, have in their turn been similarly connected with more ancient forms; and so on backwards, always converging to the common ancestor of each great class. (Darwin 1909: 335)

Knowing that there is a historical process underlying biological classification opens up the possibility that there might be more than one classification system. If the genealogies of living organisms converge in the past on a common ancestor, then at some point in the past the classes of things were different, and they will change in the future. Species once existed that have since become extinct or are present in different forms. The integration of fossils into evolutionary theory supports the thesis that natural selection can lead to extinction or to the survival of species. Darwin supports his theories of evolution by natural selection by revealing the similarities between extinct species

and currently existing species, although many forms did not contribute to current groups (Darwin 1909: 370). The Aristotelian system may have been a useful tool, but it loses its utility as it fails to account for change. Life forms must be in a state of constant change if we are to make sense of the empirical evidence provided to us. 'Scarcely any paleontological discovery is more striking than the fact that the forms of life change almost simultaneously throughout the world' (373). Change must involve the generation of variation in a manner both random and undirected, while another force – natural selection – weeds out that which is not adaptive.

Darwin develops his theory of evolution by natural selection by focusing on differences among individuals as a driver of continuous change. Darwin claims differences among individuals (even within the same species) occur naturally – some people are just taller, thinner, faster, and so on, than others – and some of these differences help individuals survive and reproduce, passing the advantageous trait to their offspring. In order for the trait to be selected for, it must be heritable, as even the traits of the most healthy and fit organism in a population will not be selected for if the organism fails to reproduce. Individuals without a selected trait will have fewer offspring – or be less fit, in Darwinian language. Over many generations, assuming that the trait continues to provide an advantage in reproduction, that trait will become common in the species, possibly displacing individuals without it. Individuals without that trait may develop a different trait that is similarly advantageous, leading to a new deviation from the original line, or they may just decline in number as the individuals with the selected trait expand:

> But if variations useful to any organic being ever do occur, assuredly individuals thus characterized will have the best chance of being preserved in the struggle for life; and from the strong principle of inheritance, these will tend to produce offspring similarly characterized. This principle of preservation, or the survival of the fittest, I have called Natural Selection. (Darwin 1909: 141)

For Darwin, there is no archetype or intelligence that is shaping the development of species and the production of new and unique individuals; it is a natural force working independently of any telos. Yet because of natural selection, small differences – a slightly larger beak, thicker fur, and so on – can become, over time, differentiating qualities that distinguish one species from another, inevitably changing

the previous classification system. Inheritance, variation and natural selection are, together, the three core elements of evolutionary theory.

Deleuze references Darwin because individual differences are critical to the process of evolution. Instead of seeing difference only through the lens of representation, Darwin's theory examines individual differences. Darwinian evolution is not motivated by movements towards similarity but by divergences of groups of organisms. Processes of individuation are highlighted rather than processes of unification:

> The great taxonomic units – genera, families, orders, and classes – no longer provide a means of understanding difference by relating it to such apparent conditions as resemblances, identities, analogies, and determined oppositions. *On the contrary*, these taxonomic units are understood on the basis of such fundamental mechanisms of natural selection, as difference and the differentiation of difference. (Deleuze 1994: 248; original emphasis)

In Darwin's view, classification systems result from fundamental processes that lead to difference – processes like natural selection of individual heritable variation. Individual differences are transmitted from one generation to another and the most fit are likely to be passed on. Thus nature selects for those traits that enable organisms to adapt to environments and may lead to divergence of populations. Deleuze identifies three Copernican revolutions at work in Darwinism: the formation of individual differences via a divergence of traits and constitution of populations, the revelation of the links between differences through the coordination of traits within a population, and the production of differences as the ongoing basis of differentiation and connection (Deleuze 1994: 249). Darwinism, in other words, allows the thought of categories reshapeable by processes of individuation and the idea that individuals have within themselves individuating differences (250). However, Darwinism fails in a crucial way for Deleuze, as it references only differences borne by individuals and not individual differences as such. Darwin still provides the notion of species with ontological stability by positing that the 'fields of individuation', as Simondon calls them, remain the same for all individuals within a certain species, that only once one goes outside the species can one find a different field of individuation:

> However, this field of individuation is posited only formally and in general: it seems to be 'the same' for a given species, and to vary in intensity from one species to another. It seems, therefore, to depend upon the species and the determination of species, and to refer us once more to differences borne by the individual, not individual differences. (Deleuze 1994: 252)

Darwin's model is still constrained by similitude and generality; whatever differences exist between individuals are dependent upon what differences the category of species will allow for, and difference is not freed from blockages and regimes of representation. Differences within individuals are still referred to a larger field of similitude (that of species), and as a result Darwin is unable to see the individual as the production of differences (or the result of processes of individuation).

Deleuze's discussion of evolution and Darwinism, both the positives and the negatives, extends beyond *Difference and Repetition* into his other work. In an essay written on Bergson, Deleuze states that biology shows the process of differentiation at work, and that life itself is the process of difference. Darwin helped associate the problem of difference with life in his theory of evolution even though he had a false conception of vital difference and conceived of it as something external rather than something internal. Bergson, according to Deleuze, fixes this problem by developing a concept of internal difference:

> Life is the process of difference. In this instance, Bergson is thinking less of embryological differentiation than the differentiation of species, i.e. evolution. In his idea of evolution, Darwin helped associate the problem of difference with life, even though Darwin himself had a false conception of vital difference. Opposing a particular mechanism, Bergson shows that vital difference is an *internal* difference. (Deleuze 2004: 39–40)

Deleuze's book on Bergson discusses Deleuze's positive view of evolution. Evolution, according to Deleuze, takes place from the virtual to the actual – it is a process of actualisation and creation. As a result, when speaking of evolution it is important to avoid interpreting evolution either as the 'possible' being made actual or in terms of pure actuality. Evolutionism is not a sequence of actual determinations along a single line; to conceive of it as such is to eliminate chance – or vital life – from it, and to again subsume life under a concept. Deleuze argues that a philosophy of life should carry three requirements: first, it must conceive of vital difference as internal to itself, not external; second, differences must be seen not as entering into relationships of association and addition, but dissociation and division; and third, vital difference must be seen as involving a virtuality that is actualised according to lines of divergence (Deleuze 1988: 98–9). It is clear from these notes that Deleuze advocates reshaping evolution and biological classification systems by emphasising internal difference and vital life over similitude and deterministic constructs.

The encounter in *A Thousand Plateaus* between the character Professor Challenger (representative of Deleuze's philosophy) and traditional evolutionary theory illuminates an alternative to biological classification systems that embodies these three requirements. This alternative can be schematically described as a relationship of double articulation between the plane of consistency and the plane of organisation that leaves open how differences are concretised in concepts, words and substances – or, to use the vocabulary of *A Thousand Plateaus*, how strata are formed. In the first articulation, the articulation of content, particular molecular units are chosen from particle flows and given form through an ordering of them in terms of relationship and sequence – as Deleuze and Guattari put it, content is 'formed matters'. The second articulation, the articulation of expression, provides mechanisms that shape such matters and produces composites with these matters – as Deleuze and Guattari put it, expression is 'functional structures' (Deleuze and Guattari 1987: 40–3). These two articulations, which exist in reciprocal presupposition, select from the differences, haecceities and speeds of the plane of consistency before ordering, binding and using them to produce entities, categories and formations. The strata formed by double articulation are characterised as

> giving form to matters, of imprisoning intensities or locking singularities into systems of resonance and redundancy, or producing upon the body of the earth molecules large and small and organizing them into molar aggregates. Strata are acts of capture, they are like 'black holes' or occlusions striving to seize whatever comes within their reach. They operate by coding and by territoriality. (Deleuze and Guattari 1987: 40)

A stratum works to subsume differences and intensities into its territorialisation – to capture whatever happens to fall into its sway. To be clear, this process that forms and perpetuates a stratum differs from the changes that entities undergo on a particular stratum, as for each stratum there is both an interior and an exterior milieu. The materials within a certain stratum have already been concretised – are already articulated – and, while it is furnished by the intensities and differences beyond it, is part of the stratum (just a different part from the formed objects) (Deleuze and Guattari 1987: 49). The value of this framework is that it rethinks biology and evolution through difference in order to avoid the pitfalls of representation. Species, organisms and differences within individuals are traceable back to individual differences and divergent series rather than categories of

similitude. Moreover, by defining materiality outside of a mechanistic or deterministic framework,[6] Deleuze accounts for the movements and changes evolutionary theory describes without binding life to a restrictive or static conception of it.

This new ontology reinterprets Darwinism by describing Darwin's two contributions to a theory of difference as 'the substitution of populations for types, and the substitution of rates or differential relations for degrees' (Deleuze and Guattari 1987: 48). By focusing on populations, Darwin uncovers a mechanism for the formation of organisms within an environment that does not posit forms as pre-established but sees individuals within species as open to a whole assemblage of possible forms. Darwin says:

> The many slight differences which appear in the offspring from the same parents, or which it may be presumed have thus arisen, from being observed in the individuals of the same species inhabiting the same confined locality, may be called individual differences. (Darwin 1909: 59)

Individual embryos themselves, according to Darwin, seem to follow some 'higher organization' (Darwin 1909: 483) which compels organisms to develop according to a previously sketched-out structure; yet embryos themselves admit to a degree of variation between them, implying that there are no eternal necessary forms organisms fall into but that the cause of an individual's development is at least in part determined by 'conditions to which either parent, or their ancestors, have been exposed' (483). Additionally, as Darwinian natural selection of organisms always occurs within an environment, a particular organism's ability to survive is not measured according to an absolute form of excellence, but in relation to other organisms and the environments it inhabits. The evolution of organisms is relative and contextual, not totalised. Nevertheless, traditional Darwinian evolution does not discuss the processes of individuation that Deleuze refers to in his work. It takes place within the strata of *A Thousand Plateaus*, or alternatively within the actual of *Difference and Repetition*, as evolution applies itself primarily to individuals and the differences that they allow; there is no discussion of the double articulation or actualisation of the virtual that Deleuze respectively discusses in these two works. Yet it does begin the process of breaking the individual down, and of opening spaces to see beyond concretised forms, as Darwin points to processes preceding the individual that are responsible for shaping it – namely, the 'conditions' inherited from ancestors. The Deleuze of *Difference and Repetition* is closer to Darwin than the Deleuze of later works,

for Deleuze, like Darwin, begins his work there by examining the empirical individual before tracing back to the conditions necessary for its constitution. Deleuze posits the virtual and 'larval selves' in that work as a condition necessary for the possibility of individuals just as Darwin posits evolution by natural selection as a condition necessary for the possibility of differences within individuals. By contrast, *A Thousand Plateaus* does not even begin in the same place as Darwin, but sees it necessary to first construct the field of empiricism from which a Darwinian study of differences within individuals can function. The Darwinian project of *On the Origin of Species* and *The Descent of Man* is conditioned by the project of *A Thousand Plateaus*. Despite these differences, Darwinism begins the process of thinking difference by avoiding reference to categorical absolutes while contributing to the study of multiplicities through seeing organisms in terms of their variable traits. What must be avoided is reifying a representation of evolution, or modelling evolution solely through categorical frameworks that hide the 'chaos' Deleuze and Guattari reference in *What Is Philosophy?*

A great deal of the literature written about the connections between Deleuze and Darwin focuses on the ways in which Deleuze tries to rescue evolution from mechanistic or reductive perspectives. To save inheritance from determinism, Deleuze warns against seeing the egg as an already elaborated place, or heredity as a known event, as to make that claim is to reduce or erase the becoming at the heart of natality. The event of a new being cannot be seen as already decided – in fact, it represents a place of decoding and deterritorialisation. Despite the knowledge scientists have gained regarding DNA and the workings of inheritance, it is impossible to know the nature of an individual when all that exists is a fertilised egg. Keith Ansell-Pearson writes:

> In both cases Deleuze's aim is to show that the question of heredity is not simply one that is *given*, either by the species or by the continuity of the germ-plasm. Rather, heredity becomes transfigured, and is made vital, through the becoming of the new individual and through a 'law of life' that goes beyond laws of genealogy and filiation … Natality is always inseparable from processes of decoding and deterritorialisation. (Ansell-Pearson 1999: 9; original emphasis)

Deleuze does not want to reduce inheritance or evolution to a geneticist account which claims that all major attributes of a person can be determined solely by examining that person's genome. An element of chance is necessarily part of any becoming, and the introduction of something new into the world opens the door to reinterpreting

sedimented ways of understanding the world.[7] Evolution cannot be reduced to a 'germ-plasm' such as DNA, but neither can it be seen as applying only to species or organisms – holding either of these views restricts the flow of difference and makes evolution conform to a certain image. Evolution is a productive power, yet when it is applied *only* to species or applied *only* to extant organisms, its ability to produce becomes limited and localised; Deleuze is interested in freeing evolution by privileging the dissolution of forms rather than containment within them (Ansell-Pearson 1999: 81). A proper conception of evolution sees it as a movement involving the production of individuals, and not as a progression from individual to individual, nor as a movement from general to particular:

> The moves Deleuze is making here are crucial to his insight into germinal life and to his attempts to articulate a philosophy that conceives of the evolution of organisms as complex systems in terms of a field of individuation and intensities. (Ansell-Pearson 1999: 95)

Among the advantages of reinterpreting evolution is that this new perspective will free up the concept of life from an attachment to a mechanistic concept of evolution, one that sees life as occurring only within certain boundaries and fields.[8] As Elizabeth Grosz points out, the concept of life is something that Deleuze returns to again and again, continually trying to elaborate a definition of it not bound by conventional notions of subjectivity or recognisable forms of what constitutes the living and non-living. Deleuze's interest in pre-subjective forces and modes of living other than the human one reveal his desire to get beyond a concept of life circumscribed by common sense (Grosz 2007: 297). It escapes any restrictions put upon it by the deterministic or mechanical explanations of science, creating a more productive and organic concept.

IV. Punctuated Equilibrium and Genetic Variation

To see how Deleuze's project applies to recent developments, this paper will focus on two specific developments in recent evolutionary biology that have important consequences for our understanding of the organisation and evolution of organisms: the theory of punctuated equilibrium and recent measurements of the amount of variation within the human genome. Both will be discussed in terms of how they have modified the conceptualisation of evolution before moving on to a discussion of how Deleuze would react to them.

Punctuated equilibrium claims that evolution is not a gradual process that shifts one form to another. Instead, variation accumulates through periods of relative stasis, followed by radical shifts over relatively short periods of time. This process creates new forms before returning to periods of relative stasis for extended periods of time. The shift often occurs in a small and isolated segment of the population. Instead of seeing the slow evolution of a large group of organisms towards a new form, one sees a subsection of the group suddenly break off from the rest of the group and rapidly evolve into a different form. In the paper generally credited with providing the first comprehensive description of punctuated equilibrium, authors Stephen Gould and Niles Eldridge write:

> In summary, we contrast the tenets and predictions of allopatric speciation with the corresponding statements of phyletic gradualism previously given: 1) New species arise by the splitting of lineages, 2) New species develop rapidly, 3) A small sub-population of the ancestral form gives rise to the new species, 4) The new species originates in a very small part of the ancestral species' geographic extent – in an isolated area at the periphery of the range. (Eldridge and Gould 1972: 96)

The picture of punctuated equilibrium keeps much of Darwin's original theory in place – the idea that new species arise from variation inherent in previous species, the claim that the specific changes are selected via natural means, and the notion that changes are passed along generation to generation by reproduction – but changes how scientists see the origin of new species. For a long time after the acceptance of evolution as a theory, scientists had no explanation for gaps in fossil records where no evidence existed of an intermediary between two distinct species. Most assumed that a lack of data was the cause. Punctuated equilibrium explains the gaps and posits a new way in which new species could occur. No evidence exists because changes occur over a relatively short period of time (evolutionarily speaking), and new species develop because they originate in an isolated part of a population (where it is easier for a mutation to spread). Punctuated equilibrium also reinterprets the creative force in the formation of individual differences, seeing such creation as more of an explosion outward than a constant pressure in one direction. One often-quoted example of punctuated equilibrium, the Cambrian Explosion (the event 600 million years ago where the number of identifiable species increased rapidly over a short period of time, establishing most of the species currently recognised), is responsible for much of the diversity existing today. According to Gould,

it seems as though this explosion was part of a naturally occurring phenomenon:

> Perhaps the explosion itself was merely the predictable outcome of a process inexorably set in motion by an earlier Precambrian event. In such a case, we would not have to believe that early Cambrian times were 'special' in any way; the cause of the explosion would be sought in an earlier event that initiated the evolution of complex life … The pattern of the Cambrian explosion seems to follow a general law of growth. This law predicts a phase of steep acceleration; the explosion is no more fundamental (or in need of special explanation) than its antecedent period of slower growth or its subsequent leveling off. (Gould 1978: 127)

Punctuated equilibrium, building on Darwin's insights, posits a new process of evolution and explains the incredible diversity of life that Darwin's theory cannot.

The second development in evolutionary biology is a relatively new one, having only recently been published, and its implications are yet to be completely understood. With the recent sequencing of the human genome, scientists such as Sarah Tishkoff, Esteban Parra and Michael Bamshad have discovered an unexpected amount of genetic variation within human individuals and populations. The result of this achievement has led to a rethinking of the role variation plays within populations. Expectations of variation prior to the sequencing of the human genome were that if one were to take two individuals at random and compare their genomes, for the most part they would be the same, with differences appearing in one in every 600 or so base pairs; however, subsequent to the completion of the human genome it was discovered that on average a difference appears in one in every 60 base pairs. This appears to contradict traditional evolutionary theory, which claims that variation is eliminated by natural selection, which weeds out variations not as fit as other variations. Darwin explains this aspect of his theory in his discussion of extermination:

> therefore if an area be inhabited by very many species, each or nearly each species will be represented by few individuals; and such species will be liable to extermination from accidental fluctuations in the nature of the seasons or in the number of their enemies. The process of extermination in such cases in such cases would be rapid, whereas the production of new species must always be slow. Imagine the extreme case of as many species as individuals in England, and the first severe winter or very dry summer would exterminate thousands on thousands of species. (Darwin 1909: 140)

While nature inevitably and necessarily produces variation by the process of mutation, it also destroys it by the process of natural selection. This does not mean that individuals within a species will eventually become identical because mutation continually generates variation. There is a constant process of generating new variation and eliminating variation. Evolution by natural selection leads to certain traits becoming less important. Many believed that the amount of variation within the genome would be limited by natural selection. Yet a number of experiments mapping genetic variation across populations have revealed that groups once thought to be mostly genetically homogenous actually contain a remarkable amount of genetic variation. Over time, the genes and DNA sequences that code for particular traits have not disappeared but formed 'dead' genes littering the human genome (Coyne 2009: 67). For example, human populations within parts of East Africa, instead of containing fairly homogenous genotypes, actually possess one of the greatest amounts of variation among all the populations on the planet (Tishkoff *et al.* 2009: 1035–44). The variation in human populations is mirrored by linguistics, culture and history as well. A recent study examining the correlation between skin pigmentation and genetic diversity discovered that even people with similar skin colours have significant amounts of genetic variation between them – as the same skin colour may be caused by multiple different genetic configurations. As the authors put it, the trait of skin pigmentation is 'an example of how misleading simplistic interpretations of human variation can be …' (Parra 2007: 101). The cause of this large amount of variation is not yet known, as this discovery is relatively new, but it has problematised how subgroups of humans are classified. While earlier discoveries regarding human genetic diversity have cast doubt upon race as a biological classification (Livingstone and Dobzhansky 1962: 279–81), the excessive amount of genetic diversity within populations calls into question categories such as population (Tishkoff and Kidd 2004: S26), ethnicity (Royal and Dunston 2004: S5) and geographic location (Bamshad *et al.* 2004: 601). As one researcher puts it,

> For hundreds of years, we have based inferences of individual ancestry on proxies, such as differences in physical appearance, language, or derivative concepts of ethnicity and race. None of these characteristics is determined entirely by genetic or environmental factors, but separating out the relative contribution of each will often require sorting individuals into ancestral groups … (Bamshad *et al.* 2004: 607–8)

The study of evolutionary biology and genetics does not support the categorisation of organisms strictly by appearance, function or other obvious categories. Instead, the processes constituting the individual – such as their genome derived from their ancestral lineages – need to be the locus from which classifications of any sort gain utility and efficacy. With the revelation of the amount of diversity within the human genome, it is possible to see the stability of species – and other representations – being undermined not only over a period of time as evolution selects for new traits, but also from within the present moment as individuals, genes and pre-subjective processes take on more ontological weight in the understanding of difference and variation within all organisms.

These developments are, of course, not representative of the entirety of evolutionary biology's development post-Darwin, since like any field there are multiple voices directing its progress which are not always in agreement; however, they are relevant to this paper as they are illustrative of several ways in which variation and difference have been reinterpreted since Darwin's time. But what would Deleuze think of such developments? Deleuze would welcome any casting off of a representation or image used to restrict the flow of difference, and both developments mentioned above can be interpreted as doing such, but it is possible that the developments just replace one representation for another. In regards to punctuated equilibrium, for example, the authors of the original paper advocate using the punctuated equilibrium model instead of the model of gradual evolution in most cases. If the punctuated equilibrium model were to replace the one of gradual evolution, then Deleuze would charge evolutionary biology with substituting one representation for another. While punctuated equilibrium has been shown to be a reasonable model in certain cases, scientists for the most part have avoided completely replacing gradualism with punctuated equilibrium, referring to individual cases and their relationships to one another to determine which model for evolutionary change is adequate. Both punctuated equilibrium and gradualism are being kept around as possible explanations, but neither is referred to as the only – or the most common – way in which evolution occurs (Coyne 2009: 4–5). Moreover, the theory of punctuated equilibrium – by referring to the production of difference in certain cases as an explosion – throws the light back upon the productive forces that create difference and variation in a way Deleuze would find positive. Yet punctuated equilibrium is not wholly Deleuzian, as it gives the concepts of species and evolution by natural selection the same epistemological cachet Darwin did. As punctuated

equilibrium still functions under these concepts, it fails to focus on processes of individuation and, according to Shostak, weakens natural selection as a scientific tool:

> The problem is that lumping everything under the aegis of natural selection may yield something too attenuated to support a scientific hypothesis. Possibly natural selection could account for 'equilibria,' or stabilizing selection, but it could not, at the same time, account for 'punctuations.' (Shostak 1999: 234)

Punctuated equilibrium loosens the restrictive representations that have characterised evolution, but does not fully open evolution to new possibilities and differences.

Next, the discovery regarding the amount of variation present in the human genome is partially consonant with Deleuzian ontology inasmuch as it problematises certain categorisations of individuals and emphasises individualising elements and processes (such as those involved in the production of the human genome and historical factors like language). Categories like race, population and ethnicity – which are unable to capture the extant individual but only approach him or her – are losing their ability to explain genetic variation while individuating processes within the human genome are becoming more useful and valuable to scientists studying this discovery. This discovery is not fully consonant as it makes no reference to the virtual, treating all the elements it discusses as actual. While certain categories and evolutionary models are destabilised, one is not returned to difference or chaos but to a different part of the stratum. Mutation and variation receive a greater emphasis, but they do not achieve an overturning of representation. Despite the differences, these developments in evolutionary biology have led to an increasing focus on difference, variation and heterogeneity, upsetting well-established views on evolution and variation.

It is uncertain whether degree science – as it is generally practised – can be made to accord with Deleuzian ontology given the divergent projects of science and philosophy. The contrasting nature of *What Is Philosophy?*'s functive model of science in comparison with *A Thousand Plateaus*' major/minor science requires a nuanced and multifaceted approach to this question. If we approach these developments with the functive model, it is unlikely that science can ever be fully reconciled with Deleuzian ontology, as both punctuated equilibrium and the discovery of greater variation are based on studies and experiments carried out under rigid methodological considerations, which, for science, are crucial for determining validity. From a

Deleuzian point of view, such considerations are interruptions that limit, slow or constrain productive difference in order to produce truth in a certain way – as a result, their ability to properly conceptualise difference is circumscribed. Additionally, while the original criticism that Deleuze had of Darwin – that he considers differences within individuals, not individual difference – has lost some of its efficacy as more scientists focus on individualising processes and avoid rigid categorical distinctions; it is not the case that scientists have abandoned their use or dismissed them as illusory and fictitious. For scientists, certain categories have proven salient through genetic research and, as a result, have an ontological reality that Deleuze would reject, claiming that their ontological reality appears only because of a certain image of thought that cannot be sustained when one moves to a philosophy of difference. A Deleuzian scientist – as much as there can be one within the functive model of *What Is Philosophy?* – should place greater emphasis on processes of individuation, and allow his or her models for individuals and populations to remain open to new formations and organisations (Deleuze and Guattari 1987: 70). Shostak's alternative to evolution, devolution, is formulated along these lines:

> Devolution is the descent (collapse) of qualities upon successors through assimilation into chimeras and parsing out into fragments. In its failure to 'differentiate' and 'equate,' devolution exchanges differences for sameness through exclusion and sameness for difference through repetition. (Shostak 1999: 151)

For Deleuze and Shostak, the fluid and discontinuous should be emphasised over the rigid and articulated.

The major/minor science model of *A Thousand Plateaus* reveals a way of aligning scientific study with Deleuzian ontology in a way that *What Is Philosophy?* does not, as its conceptualising of the relationship between the hylomorphic, striated model of major, or royal, science and the smooth model of minor, nomadic science demonstrates how a science that embraces difference and a science of theories and formulas can interact. A key point that runs throughout *A Thousand Plateaus* is that while the conceptual structures, or striations, that dominate traditional ways of conceiving of being hide difference, they are not in themselves bad, but are 'inevitable [phenomena] that [are] beneficial in many respects and unfortunate in many others' (Deleuze and Guattari 1987: 40) – conceptual structures have strategic and tactical values as points of reference but should not be misunderstood to fully articulate reality itself. As discussed above, minor science does not add to major science

but vectors off from it, pursuing singularities and their connection to traits of expression. In these terms both the theory of punctuated equilibrium and the discovery of the amount of variation in the genome have elements of minor and major science. Each can be considered in part minor science inasmuch as both follow singularities not explainable through the dominant model of evolution (for punctuated equilibrium the singularity is the lack of fossil records, while the discovery of the variation in the genome is the singularity). Scientists exploring these discoveries work to realign evolutionary theory around the singularities, in the process deterritorialising and reterritorialising the field of evolutionary biology. As can be seen from the discovery of variation, following a singularity can have repercussions far beyond the field of biology itself, but also for philosophy, history, sociology and elsewhere – as such, it does not just deterritorialise but 'constitutes and extends the territory itself' (Deleuze and Guattari 1987: 372). To the degree that these developments in evolutionary biology undo and shift the earlier model of evolution, they are analogous to the nomad science of *A Thousand Plateaus*, and as such are not incongruous with Deleuze's ontology. Yet while these developments function apart from major science, much effort is made by the scientific establishment to reincorporate them into major science; that is, to fit them into the dominant conceptual framework as much as possible rather than embrace and extend their difference. Proponents of major science have trouble accepting these singularities as such, so in order to explain the singularities in a manner amenable to them, the proponents try to reinscribe them into the manufacture of major science. That this is the case is apparent in the large portions of the papers announcing these discoveries devoted to connecting them to the strata demarcated by evolutionary biology. Deleuze and Guattari warn against doing this with minor science, as 'the extent that ambulant procedures and processes are necessarily tied to a striated space – always formalized by royal science – which deprives them of their model' is the extent to which nomad science involves itself in striations again and makes it 'still possible to cut the flow into layers' (Deleuze and Guattari 1987: 372).

The studies of the punctuated equilibrium and genetic diversity, because of the endeavour made to develop them as concepts within major science, do not truly function as minor science, but at most as a quasi-minor science. They are connected with an apparatus that seeks their description within a formula, and as a result they are not seen as 'inseparable from a sensible intuition of variation' (Deleuze and Guattari 1987: 369) as nomad science desires to be. While their opening to

singularities and to a reinterpretation of theory pushes them towards nomad science, there is no principle of difference at work in their development – only a contingent appearance of difference. For science to include a nomadic approach along with its royal approach, and thus in line with the ontology of *A Thousand Plateaus*, the study of these developments would need to be more open to following singularities and less interested in their being taken up by the strata of major science.

The manner in which biologists now approach understanding evolution and the categorisation of individuals has more in common with Deleuze's ontology than a classical Darwinian understanding of evolution, but contemporary scientific methodology and modelling techniques prevent evolutionary biology from being completely Deleuzian. A completely Deleuzian evolutionary biology may not even be a possibility, as in order to clarify what they have already determined, scientists have had to rely on increasingly complex technologies and scientific procedures (such as neuroimaging and PCR synthesis) which can be developed and programmed only by using a certain image of the human as a biological animal. Were scientists to try to let their ideas develop along more open and flexible lines, it is questionable whether they would be able to proceed along these increasingly complex lines. The development of modern evolutionary biology seems to require that scientists make use of certain representations before they move to the processes that constitute the individual, as it is only through a representation that some processes relevant to the study of evolutionary biology can be uncovered and observed. At most, were scientists to take the concept of nomad science seriously, science could develop with an eye on difference and singularity and with less of an institutionalised practice of reincorporating discoveries into major science. Even Shostak, whose reinterpretation of evolution does make a difference internal to scientific research, begins with a space where differences are already partially represented rather than with difference itself. Deleuze's characterisation of science in *What Is Philosophy?* as slowing down the infinite chaos indicates that he was aware of the challenges involved in getting science to embrace difference.

V. Conclusion

In closing, it is worth taking note of what is at stake in this discussion of the relationships between evolutionary biology and Deleuzian ontology.

Primarily, the encounter between the two calls into question our conception of what the self is. Common means of identification – be it race, gender, geographic location or otherwise – are problematised, as is a unified understanding of ourselves. How we are able to relate ourselves to others is a question that needs to be studied because of the ideas put forth in this paper. Caught up in this sense of self are the fields of ethics and politics as well, both of which often make use of one's sense of identity in developing theories and principles. Yet as neither Deleuze's nor evolutionary biology's discoveries entail the loss of the self, but rather the removal of its sense of unification, the space that needs to be theorised is not a radical departure from existent notions but a substantial modification and resituating of current knowledges. Old categories like race, ethnicity and ancestry that have shown themselves to be without justification need to be discarded, and new categories based on an individual's particular genesis – highlighting traits strongly influenced by genetic factors like physiology or the possibility that one will express a certain condition – need to be developed in line with the variety of information that has been uncovered about the nature of the self by science and philosophy.

It is likely that Deleuze would think positively of the above developments in evolutionary biology, seeing a substantial shift towards a philosophy of difference from where science was at in the time of Darwin. Since that time, science has identified a number of sites and mechanisms Darwin was unaware of – such as DNA and patterns of inheritance – that have called into question both common classification schemes and the ontological purity of the individual. The focus on studying difference and variation has increased while the biological models previously relied upon have been re-evaluated time and time again. Still, the process of articulating biology through an understanding of difference – that is, a biology that has not institutionalised an investigative model dominated primarily by conceptual structures but has the tools to study flows and singularities as well – is not complete, as certain methodological and ontological assumptions about the nature of science and its relation to the individual remain which are still grounded in a philosophy of similitude, and some recent technological advances seem conditional upon scientists not completely transferring to a Deleuzian ontology. Yet despite these apparent obstacles, it is possible that one day science will reach the point of a philosophy of difference, as science's open-ended nature and willingness to question its assumptions are some of its greatest assets.

Notes

1. Deleuze articulates this philosophy in several ways throughout his oeuvre. For the sake of consistency, this paper works primarily from the formulation it receives in *Difference and Repetition*.
2. See Žižek 2012: 19–20 and Badiou 2000: 69. Žižek claims there are two versions of Deleuze's philosophy, and that only the first version frames ontology in this way.
3. Manuel DeLanda opposes this interpretation, saying that there is no major break between early and late Deleuzian ontology, but rather that the terminological distinctions and conceptual differences between works 'are slightly displaced relative to one another but retain enough overlaps that they can be meshed together as a heterogenous assemblage' (DeLanda 2002: 202). This reading of Deleuze's work ignores the importance of contemplation Deleuze gives in *Difference and Repetition* to the constitution of the self, such as when he says 'There is a self wherever furtive contemplation has been established, whenever a contracting machine capable of drawing together a difference from repetition functions somewhere' (Deleuze 1994: 78–9). There is no corollary to such contemplation in the equivalent concept that DeLanda identifies in *A Thousand Plateaus*; rather, such constitutions occur apart from subjective contemplation, as constitutions of intensities that occur within materiality (Deleuze and Guattari 1987: 329).
4. Historically, it is worth noting that Darwin did not have a concrete definition of species in his published works, and in fact commented on the problems of defining the term on several occasions (including in *On the Origin of Species* and *The Descent of Man*). His working definition for species was 'a classificatory term provisionally given to a group for the purposes of convenience and which emphasizes resemblance, but which does not differ substantially from variation' (Darwin 1909: 68).
5. It may even be more accurate to say that science, or at the very least a scientific orientation, is part of what constitutes the entities in the world. This would make *Difference and Repetition* more akin to the later Deleuze, but it is debatable whether or not the system of *Difference and Repetition* can sustain that interpretation.
6. Material, for Deleuze, has three fundamental characteristics: it is molecularised, it has a relation to forces to be harnessed, and it is defined by the operations of consistency applied to it (Deleuze and Guattari 1987: 345). There is no such thing as base substantiality, as material for Deleuze has relations, trajectories and speeds. It thus cannot be defined according to perfunctory, automatic rules.
7. Importantly, Deleuze is joined in this view by numerous evolutionary biologists who also see knowledge of DNA and the genome being used to apply determination inappropriately, leading to reductionism. For a good example, of this view, see Lewontin 1991.
8. Several scientific discoveries support this critique of mechanistic conceptions of life. Francis Jacobs' *The Logic of Life* describes the irreducible role of difference and disparity in transcriptions of genetic codes vital to the functioning of evolution (Jacobs 1974: 290–2), while Shostak describes research that shows the possibility of conceiving of life as plural and open rather than singular and determined (Shostak 1999: 151).

The Rise and Fall of the Simulacrum

Charles Mayell The University of Liverpool

Abstract

Deleuze adopts Nietzsche's manifesto for an overturning of Platonism. However, the consensus view is that Deleuze's project is best understood as a revision not a repudiation of Platonism. Deleuze's engagement with Platonism centres on *The Sophist*. Out of Plato's concept of phantasm, Deleuze fashions a new concept: simulacrum. In *Difference and Repetition*, simulacra are invited to rise and affirm their rights; and yet Deleuze later abandons the concept entirely. Why? Although suitable for the purposes of critique, it became otiose in wider applications. More generally, and against the consensus view, I argue that the trajectory of the concept of the simulacrum is emblematic of Deleuze's anti-Platonism.

Keywords: Plato, Sophist, Aristotle, image, simulacrum, multiplicity

I. A Reversal that Changes Everything

Deleuze's ambition in his 1968 masterwork *Difference and Repetition* is 'To rescue difference from its maledictory state' (Deleuze 2001: 29). Against the backdrop of a failed classical philosophy of difference, he marks out a new domain of ontological difference that is prior to identity. Integral to this project, it seems, is the creation of the concept of simulacrum. Simulacrum can simply mean an image or a semblance. Daniel W. Smith explains that it 'is the Latin term for "statue" or "idol", and translates the Greek *phantasma*' (Smith 2006a: 89). However, Deleuze gives the term a new definition and a special status within the radical philosophy of difference: 'Simulacra are those systems in which different relates to different *by means of* difference itself' (Deleuze 2001: 299). And yet by 1993, Deleuze muses, as if only with the benefit

Deleuze Studies 8.4 (2014): 445–469
DOI: 10.3366/dls.2014.0165
© Edinburgh University Press
www.euppublishing.com/dls

of hindsight, 'It seems to me that I have completely abandoned the notion of the simulacrum' (Deleuze 1993: 8, cited in Smith 2006a: 116). Even more startlingly, 'In his ... "Preface" to ... Clet-Martin's book ... Deleuze states that the concept of "simulacrum" was never an essential part of his philosophy' (Roffe 2005: 250).

When, echoing Nietzsche, Deleuze announces, 'The task of modern philosophy has been defined: to overturn Platonism', we may understand this as a necessary condition for rescuing difference (Deleuze 2001: 59). However, the translation of '*renversement du platonisme*' has been a bone of contention (Deleuze 1968: 82). Warning of a 'fatal' misunderstanding, James Williams points out that the primary sense of '*renversement*' is 'reversing' and that this is the most apposite translation (Williams 2003: 79). I will not disagree but dispute where that leaves us. In *The Logic of Sense*, Deleuze puts the assertion made in *Difference and Repetition* into the question that we now want to ask: 'What does it mean "to reverse Platonism"?'(Deleuze 2003: 253). Although Deleuze's answer only raises more questions, it explicitly links reversed Platonism with simulacra: "'to reverse Platonism" means to make the simulacra rise and to affirm their rights among icons and copies' (262).

The secondary literature on reversed Platonism is well-trodden ground which I will not re-tread here.[1] No single or simple interpretation emerges but on one point there is a consensus. According to Williams, by reversing Platonism, Deleuze aims only 'to tweak the Platonic structure in order to avoid an error with severe consequences with regard to difference' (Williams 2003: 79). If 'tweaking' means slightly revising, this takes us uncomfortably close to validating Alain Badiou's provocative complaint that, far from overturning Platonism, Deleuze has only produced 'a Platonism with a different accentuation' (Badiou 2000: 26). Smith, like Williams, is keen to emphasise that the issue is structural and reversal (or inversion) is very far from repudiation:

> Far from refusing Platonism in its entirety ... Deleuze's inverted Platonism retrieves almost every aspect of the Platonic project ... Deleuze's inverted Platonism can ... be seen as a rejuvenated and even a completed Platonism. (Smith 2006a: 105)

This is the view against which I argue.

What is a Platonic structure? Paul Patton's adumbration of the theory of Ideas or Forms would probably pass muster as the standard account: '[Platonism is] the distinction between the realm of Ideas or that which truly is, and the sensuous realm of relative nonbeing or mere appearance' (Patton 1994: 144). So, a Platonic structure has two tiers. However,

Deleuze invariably wants to go one step beyond any standard account, and in this case, several steps. First, it is 'insufficient to define Platonism by reference to the distinction between essence and appearance. The primary distinction which Plato rigorously establishes is the one between the model and the copy' (Deleuze 2001: 264). Plato is the father of Western philosophy only because he is the creator of the malign concept of 'representation':

> Platonism . . . founds the entire domain that philosophy will later recognize as its own: the domain of representation filled by copies-icons . . . defined by an intrinsic relation to the model or foundation . . . To the pure identity of the model or original there corresponds an exemplary similitude; to the pure resemblance of the copy there corresponds the similitude called imitative. (Deleuze 2003: 259)

Representation is wholly at variance with the new domain of difference that Deleuze wishes to inaugurate: 'We propose to think difference in itself independently of the forms of representation which reduce it to the Same' (Deleuze 2001: xix).

Let us set the supposed structural affinity between Deleuzianism and Platonism alongside the following passage:

> Consider the two propositions: only that which is alike differs; and only differences are alike. The first formula posits resemblance as the condition of difference . . . According to the other formula, by contrast, resemblance, identity . . . can no longer be considered anything but effects, the products of a primary difference . . . The question is whether these two formulae are simply two manners of speaking which do not change things very much, or whether they apply to two completely different systems . . . one of which is capable of changing everything. (Deleuze 2001: 116–17)

The first formula privileges 'resemblance': the hallmark of Platonism. In choosing the second formula, Deleuze reverses the priority normally given to identity over difference but in so doing intends to leave nothing in its original place. It is a reversal that changes everything.

II. The Nature of Images

As we have seen, Deleuze baulks at defining Platonism in terms of the two-tiered distinction between essence and appearance, and proposes instead the distinction between model and copy. However, this too turns out to be insufficient. To follow in Deleuze's footsteps to the source of Platonism, we need to consider the complications that flow from Plato's treatment of the nature of images. In the *Republic*, using the example of

a bed, Socrates adds a third tier to the Platonic structure when he posits 'three kinds of beds. The first is in nature a bed, and . . . a god makes it . . . The second is the work of a carpenter . . . And the third is the one the painter makes' (Plato 1997: 1201; *597*). Socrates makes it clear that the god and the craftsman can both be said to be the 'maker of a bed'. The painter, however, is only an 'imitator of what the others make'. Deleuze notes how, in the *Sophist*, this Platonic structure is elaborated again, turning three tiers into four, by another distinction within the tier of imitation: 'Plato divides in two the domain of images-idols: on the one hand there are *copies-icons*, on the other there are *simulacra-phantasms*' (Deleuze 2003: 256). The thrust of Plato's argument runs:

> *Visitor*: One type of imitation . . . is . . . likeness-making. That's . . . whenever someone produces an imitation by keeping to the proportions of length, breadth, and depth of his model, and also by keeping to the appropriate colours . . .
>
> *Theaetetus*: But don't all imitators try to do that?
>
> *Visitor*: Not the ones who sculpt or draw very large works. If they reproduced the true proportions of their beautiful subjects . . . the upper parts would appear smaller than they should, and the lower parts would appear larger, because we see the upper parts from farther away and the lower parts from closer . . . What are we going to call something that appears to be like a beautiful thing, but only because it's seen from a viewpoint . . . ? Wouldn't appearance-making be the right thing to call expertise in producing appearances that aren't likenesses? (Plato 1997: 256; *235d–236c*)

Stepping beyond the model and the copy, Deleuze now, therefore, defines Platonism by reference to:

> [the] more profound distinction . . . between the copy itself and the phantasm. It is clear that Plato distinguishes, and even opposes, models and copies only in order to obtain a selective criterion with which to separate copies and simulacra, the former founded upon their relation to the model while the latter are disqualified because they fail both the test of the copy and the requirements of the model. (Deleuze 2001: 265)

Deleuze and Guattari defer to Jean-Pierre Vernant's analysis of the origins of Greek thought (Deleuze and Guattari 1994: 4; see n. 4). Yet Vernant flatly contradicts the crux of Deleuze's argument: 'The opposition Plato establishes at *Sophist* 235d–e between two types of *eidōla* [images] cannot have any fundamental import' (Vernant 1991: 169). He notes that Plato, having made the distinction between icon and phantasm, only a little later runs the two back together again: 'those things . . . which you [Theaetetus] thought you should call by the one

name, *copy*, to cover them all' (Plato 1997: 260; *240a*). Stanley Rosen also notices that 'the initial distinction between icons and fantasms is blurred at crucial points' (Rosen 1983: 151). For Vernant, Plato's aim is only to establish 'an opposition between demiurgic activity, on the one hand, and mimetic [imitative] activity on the other' (Vernant 1991: 170). Divine demiurges have populated the natural world with plants and animals and so forth. Human craftsmen lack true knowledge of the Idea but by virtue of what Plato, in the *Republic*, calls 'right opinion', make beds that one can actually sleep on and houses that one can actually live in (Plato 1997: 1206; *601e*). By contrast, 'Imitation is far removed from the truth, for it touches only a small part of each thing and a part that is itself only an image' (1202; *598b*).

So in Vernant's analysis, the general lesson given in the *Republic* applies with equal force to the distinction made in the *Sophist*:

> The painter's bed, whether it is a faithful copy (*eikōn*) ... or whether it is a simulacrum (*phantasma*) intended to produce an effect of trompe-l'oeil ... is ... in both cases an imitation of a visible bed produced by the artisan; it is not an imitation of ... the idea ... of the bed. (Vernant 1991: 169)

In a rather jumbled footnote, Vernant seems to include Deleuze among those 'who claim there was a mimeticism of Forms that Plato would have admitted as both possible and desirable in the domain of art' (Vernant 1991: 169; n. 6). This is, possibly, implicit in Deleuze's claim that:

> If copies or icons are good images ... it is because they are endowed with resemblance. But resemblance ... goes less from one thing to another than from one thing to an Idea, since it is the Idea which comprehends the relations and proportions constitutive of the internal essence ... The copy truly resembles something only to the degree that it resembles the Idea of that thing. (Deleuze 2003: 257)

Be that as it may, it is clear that Deleuze's more substantial point is to ask us to 'consider now the ... simulacra. That to which they pretend ... they pretend to underhandedly ... without passing through the Idea'. And in the parallel passage in *Difference and Repetition*, after first clarifying that 'the *same* ... characterises the Idea as the thing itself', he goes on, 'The whole of Platonism ... is dominated by the idea of drawing a distinction between "the thing itself" and the simulacra' (Deleuze 2001: 66). Smith defends Deleuze against Vernant's objection by claiming that Vernant 'nonetheless supports the thrust of Deleuze's reading when he says that the problem of the *Sophist* is "to articulate what an image is, not in its seeming but in its being ... the *being of*

semblance"' (Smith 2006a: 119; n. 31). But if Vernant is right and, for Plato, the domains of the Idea and the Image (be it icon or phantasm) are fundamentally disconnected, the platform for Deleuze's critique of Platonism seems rather fragile.

Which is not to say that Vernant's objection carries all before it. For example, it can be argued that the use of the Theory of Forms in the particular passage of the *Republic* upon which Vernant relies

> [Is itself] in some respects anomalous... Plato has a god bring Forms into existence, though elsewhere they exist eternally and no one creates them. Forms are often thought to be paradigms existing in nature, which perhaps makes it puzzling how there could be Forms of man-made objects such as a bed (as opposed to the Forms of Justice, Beauty ...) For someone seeking a coherent interpretation of Plato's philosophy, this passage... may raise more puzzles than it solves. (Janaway 2009: 392)

So, perhaps Deleuze's claim can evade Vernant's objection entirely. Deleuze argues that 'Plato distinguishes, and even opposes, models and copies only in order to obtain a selective criterion with which to separate copies and simulacra'. Deleuze is, in effect, claiming that Platonism is not founded on the Theory of Forms; it is instead the Theory of Forms that is founded on the distinction between icons and simulacra. Ideas or Forms are only a downstream effect, a consequence of Plato's more covert concerns. Hence, Deleuze and Guattari can complain: 'Plato said that Ideas must be contemplated, but first of all he had to create the concept of Idea' (Deleuze and Guattari 1994: 6). Smith gestures towards a similar reading when he says that 'In Deleuze's interpretation, Plato's singularity lies in a delicate operation of sorting or selection that *precedes* the discovery of the Idea' (Smith 2006a: 91). On this view, Plato's real concerns ultimately find their best expression in the distinction between two kinds of image. If that is the case, Deleuze can still coherently claim that the distinction between images is the fulcrum of Platonism. Whether it *is* the case, comes down to an analysis of Plato's motives.

III. Plato's Motives

Deleuze is not alone in reading the *Sophist* as an experimental Platonism that is not necessarily consistent with the *Republic*.[2] More importantly, Deleuze's readings in the history of philosophy are always partisan and creative, always a matter of looking through the cracks. Returning to the question of what it means to reverse Platonism, Deleuze tells us that 'to reverse Platonism must mean to bring... [its] motivation out into the

light of day, to "track it down" – the way Plato tracks down the Sophist' (Deleuze 2003: 253).[3] So, if 'reverse' is the right word to use, it may be because the reversal which is at stake is what we might now call 'reverse engineering': taking an existing product or application apart and finding how it works, reducing it to formula, tracking it back to the machine code, as it were. Hence, Deleuze takes yet another step in search of the motive power of Platonism. Before following, let us notice that if Deleuze finds no sympathy with Plato's motives, then 'reversing' Platonism is a repudiation of it.

According to Deleuze,

> The motive of the theory of Ideas must be sought in a will to select and to choose. It is a question of 'making a difference', of distinguishing the 'thing' itself from its images, the original from the copy, the model from the simulacrum . . . The Platonic project comes to light only when we turn back to the method of division. (Deleuze 2003: 253)

The following questions are supposed to be rhetorical:

> Far from being one dialectical procedure among others . . . is not division the one which replaces all the other procedures from the moment it appears, and gathers up all the dialectical power in favour of a genuine philosophy of difference? Is it not simultaneously the measure of both Platonism and the possibility of overturning Platonism? (Deleuze 2001: 59)

I still feel in need of an answer. Why does division deserve this status? Deleuze does not provide an answer until his final summing up:

> In [Plato's] case . . . a moral motivation in all its purity is avowed: the will to eliminate simulacra or phantasms has no motivation apart from the moral. What is condemned in the figure of the simulacra is the state of free, oceanic differences. (Deleuze 2001: 265)

Ultimately then, behind the method of division lies Plato's will to separate the sheep of identity/sameness (the originals and icons) from the goats of pure difference (the simulacra). Deleuze makes it clear that Plato's project is inimical to his own.

According to Deleuze, Plato's dialectical method for achieving his moral ends comprises 'four figures: . . . the selection of difference, the installation of a mythic circle, the establishment of a foundation, and the position of a question–problem complex' (Deleuze 2001: 66). This emphasis on method and structure supports Williams' case for arguing that reversal is not repudiation but revision:

> Each of the figures of the Platonic structure corresponds to an aspect of Deleuze's own work . . . Thus, in parallel to Plato's structure . . . we find

> Deleuze's structure of selection through affirmation or expression, of eternal return and dramatisation, of ideas as multiplicities of pure differences and problems. (Williams 2003: 80, 82)

Williams goes on to concede: 'That this is only a parallel and not an exact correspondence can be explained through Deleuze's main criticism of Plato. For Deleuze, ideas do not have an identity – they are multiplicities of pure differences' (Williams 2003: 82). What strikes me about the above elements is how stratospherically far they take us from Plato: it is not Plato's name that resonates in the background but Nietzsche (affirmation, eternal return and dramatisation), Spinoza (expression), Bergson (multiplicities) and Kant (ideas and problems).

What is more, the 'four figures of the Platonic dialectic' are only that because Deleuze told us that they were in the first place. Contrast it, for example, with what has come to be called Plato's method of hypothesis:

> First, it consists of the process of identifying a hypothesis such that its truth is necessary and sufficient for a determinate answer to the question under consideration . . . The second process is to determine whether the hypothesis in question is true. (Benson 2009: 88)

Is there not already a suspicion that Deleuze has created a Platonic dialectic in his own image? If so, it is not particularly surprising that Williams should be able to map elements of Deleuze's project onto it. Moreover, quite apart from the supposed Platonic dialectic, there is the problem of the supposed Deleuzian dialectic. Constructing a Deleuzian dialectic of any sort flies in the face of the fact, as Ian Buchanan puts it, that 'Deleuze does not have any truck with dialectics in general' (Buchanan 2000: 192). Insofar as Buchanan then goes on to construct a Deleuzian dialectic, it is notable that it is closer to Adorno than to Plato. Williams himself offers yet another version of a Deleuzian dialectic: '[1] Critique; [2] The reciprocal search for actual and virtual conditions; [3] The search for completeness in terms of reasons determined by conditions; [4] The dice throw, or creative and destructive forgetting' (Williams 2003: 19). My point is that, when freed from the factitious constraint of a Platonic context, the Deleuzian dialectic, if there is one, turns out to be remote from the supposed four figures of the Platonic dialectic; that being said, I will now track Deleuze's account of those four figures.

IV. The Selection of Difference

Deleuze's grand project is to rescue difference. Accordingly, the first substantive chapter of *Difference and Repetition* is entitled 'Difference in Itself'. If reversing Platonism involves bringing its motivation to light, and if that motivation is a will to select or choose, then one must be clear about the nature of the concept of difference within which one is operating. If one is going to try to discriminate between true images (icons) and false ones (simulacra), how does one tell the difference, without knowing what makes a difference in the first place? Deleuze goes on to write an alternative history of Western philosophy from the perspective of a concept of difference; a history that starts with Aristotle and ends with Plato, having gone via Hegel and Leibniz (Deleuze 2001: 30–68). This bizarre trajectory can only be justified by the fact that, for a reason yet to be determined, Deleuze wants to end with Plato. But for the moment, let us note that Deleuze's reading of Plato is set in the context of his reading of Aristotle.

It is not fanciful of Deleuze to attribute a concept of difference to Aristotle: 'Aristotle says: there is a difference which is at once the greatest and the most perfect' (Deleuze 2001: 30); and references *Metaphysics X* (Deleuze 2001: 308; n. 2). Thus Aristotle lends his huge authority to Deleuze's project. Aristotle interprets the search for the greatest difference in terms of seeking the maximum scope, or stretch, of difference. He seeks a perfect difference. Deleuze's critique of Aristotle's concept of difference operates at three levels: genus; species; and the individual. Deleuze, like Aristotle, begins in the middle. Aristotle is here accused of a 'confusion disastrous for the entire philosophy of difference: assigning a distinctive concept of difference is confused with the inscription of difference within concepts in general' (Deleuze 2001: 32). What characterises Aristotle's concept of specific difference is that 'two terms differ when they are other, not in themselves, but in something else, thus when they also agree in something else' (Deleuze 2001: 30). Aristotle operates within the horizontal plane, distinguishing one species from another species (e.g., bird from man) by their unique differentiating features (see Widder 2001: 439). But by Aristotle's account, for two things to differ at all, they must first be gathered under a higher overarching conceptual identity (e.g., animal). Identity is prior to difference; and it is Aristotle's deference to identity that is the target of Deleuze's negative critique: 'only in relation to the supposed identity of a concept is specific difference called the greatest' (Deleuze 2001: 31).

Damned as the enemy of difference, Aristotle is also, however, recognised as its friend. Deleuze warms to the manner in which, for Aristotle, difference can only operate over a certain range. Once over-stretched, difference breaks and assumes a different nature; once it escapes the domain of identity, it 'tends to become simple otherness . . . established between uncombinable objects' (Deleuze 2001: 30). Aristotle is the fair-weather friend of difference because for Aristotle, difference is a means of connection not disconnection. This explains why Williams, for example, can distil out of *Difference and Repetition* the ethical principle that: 'It is best for our actions to connect with all things that have brought them about and that they can bring about' (Williams 2003: 5). It is a principle that has a future in Deleuzianism: 'Principles of connection and heterogeneity: any point of a rhizome can be connected to anything other, and must be' (Deleuze and Guattari 2002: 7). In Aristotle's philosophy, as much as in Plato's, Deleuze looks for points of contact with his own philosophy of difference.

Deleuze's history of the philosophy of difference moves on to Hegel and Leibniz; it is a catalogue of errors, albeit that Leibniz emerges with the most credit of anyone (even if we included Plato). So, why does Deleuze want to end with Plato? Plato, like Aristotle, turns out to be not only villain but also hero; or more precisely, he *could* have been the hero. Deleuze ends his history of difference with Platonism because here Deleuze claims to detect the first glimmer of the gold that is pure difference. Difference has, we are told, been placed under cruel constraint by Aristotle and Hegel: 'like an animal in the process of being tamed, whose final resistant movements bear witness . . . to a nature soon to be lost . . . With Plato [however] the issue is still in doubt' (Deleuze 2001: 59). Deleuze's support for this assertion lies in his analysis of the *Sophist*.

Deleuze's critique of Plato begins by looking back to Aristotle: 'Our mistake lies in trying to understand Platonic division on the basis of Aristotelian requirements. According to Aristotle, it is a question of dividing a genus into opposing species' (Deleuze 2001: 59). Rosen concurs that 'diaeresis, or the division and collection in accordance with kinds [is] a method that will play an important role in the *Sophist*' (Rosen 1983: 2). Whether Plato is, in fact, collecting 'in accordance with kinds' is precisely the issue that Deleuze will dispute. Were one to orientate the *Sophist* relative to Aristotle's method, one might say that the parties were setting out to differentiate the species 'sophist' from that of 'statesman' and 'philosopher', each of which is part of some

larger genus. Deleuze asks an apparently incongruous question: '[Plato] divide[s] art into arts of production and arts of acquisition: but then why is fishing among the arts of acquisition?' (Deleuze 2001: 59).

The relevance of this question is partly explained by the fact that before beginning the serious business of tracking down the nature of the sophist himself, the parties to the dialogue agree to try out the method of division on '*an angler* . . . recognizable to everybody, but not worth being too serious about' (Plato 1997: 239; *218e*). Rosen sees more Platonic irony at work here than Deleuze, and accordingly offers yet another definition of Platonism:

> Platonism may be equated . . . with the thesis that human beings in general, and philosophers in particular, have access to the true nature of things. Platonism in this sense asserts that vision of pure form is the acquisition, not the production, of truth. (Rosen 1983: 14)

So, Plato's otherwise rather capricious-sounding choice to begin the divisions by dividing acquisition and production is already philosophically loaded. Rosen, like Vernant, argues that, for Plato, 'Images in general "are and are not" and are thus *all* [i.e., icons as well as phantasms] associated with non-being and falsehood' (Rosen 1983: 152). And yet the crucial distinction between the acquisition of truth and the production of truth still seems to be bubbling underneath the Platonic distinction between images; Rosen goes on: 'An accurate image [an icon] is not false in the same sense as an inaccurate image [a phantasm]. The latter deceives, whereas the former does not, concerning the proportions of the original' (152). Plato surely intends us to align the maker of accurate images with the philosopher, who 'acquires' the truth, ugly though it might seem, and the maker of beautiful but inaccurate images with the sophist, who 'produces' a truth tailored to human desires and matching a distorted human perspective.

The Visitor asks Theaetetus 'If every expertise falls under acquisition or production . . . which one shall we put angling in?'; and Theaetetus answers, 'Acquisition, obviously' (Plato 1997: 239; *219d*). So, to go back to the point of Deleuze's earlier question, Deleuze is, in effect, asking, why is it obvious? But this, in turn, is only an echo of Aristotle's famous critique of Plato's method: 'According to Aristotle . . . [the method of division] not only lacks "reason" by itself, it lacks a reason in terms of which we could decide whether something falls into one species rather than another' (Deleuze 2001: 59). Aristotle complains that it is simply assumed that it does. To see Aristotle's point we might consider how the method is applied once matters *do* become serious. After the practice

session, the Visitor and Theaetetus go on to make five different episodes of division. At the end of each of the divisions they locate the sophist. Taking the first division as an example, it is agreed that the sophist and the angler are both hunters. Hunting is divided into two: 'one for land animals and one for swimming animals' (Plato 1997: 242; *221e*). They choose to follow the branch devoted to land animals because they already know that is where the sophist is to be found. This branch is further divided into 'Tame things and wild ones' (*222b*). After some discussion as to whether human beings are wild or tame, they settle on tame; and they choose that branch of the division because they know that is where the sophist is to be found, no other reason is offered. And so on and so on, down and down.

We see, therefore, the wisdom of Deleuze's insight that unlike Aristotle, 'The essence of division does not appear in its breadth, in the determination of the species of a genus, but in its depth, in the selection of the lineage' (Deleuze 2003: 254). Plato is drawing a family tree: 'Difference is not between species . . . but entirely on one side, within the chosen line of descent: there are no longer contraries within a single genus but pure and impure, good and bad' (Deleuze 2001: 60). For Deleuze, Aristotle's objection is a cause for celebration not condemnation:

> Aristotle . . . saw what is irreplaceable in Platonism, even though he made it precisely the basis of a criticism of Plato: the dialectic of difference has its own method – division – but this operates without mediation, without middle term or reason; it acts in the immediate and is inspired by Ideas. (Deleuze 2001: 59)

This is how Plato 'makes a difference' in contrast to how Aristotle does it.

For reasons that will become plain in a moment, Deleuze's analysis shifts at this point, from the *Sophist* to the *Statesman*:

> The statesman is defined as the one who knows 'the pastoral care of men' but many introduce themselves by saying 'I am the true shepherd of men', including merchants, farmers, bakers, as well as athletes and the entire medical profession. (Deleuze 2001: 60)

These people seem to have nothing to do with one another. The Platonic process seems to have produced a muddle but, according to Deleuze, this is because we are thinking too much like Aristotle. According to Deleuze, the method of division has nothing to do with species: 'The meaning and the goal of the method of division is [not the analysis of species among

a larger genus but] the selection among rivals, the testing of claimants' (Deleuze 2001: 60).

What is germane for my general purposes, and has special relevance in the context of 'the selection of difference', is that, even if Deleuze has rescued Plato from Aristotle's objection, it is not so as to give Platonism a stake in the modern philosophy of difference. Plato's vertically orientated branching structure is an example of what Deleuze and Guattari will come to describe as arborescent: 'Arborescent systems are hierarchical systems . . . [in which] an individual has only one active neighbour, his or her hierarchical superior . . . The channels of transmission are preestablished' (Deleuze and Guattari 2002: 16). Far from it being the case that, despite wide differences in philosophical content, there are, nonetheless, structural affinities between Deleuze and Plato, the iconic Platonic structure, the tree, is entirely inimical to Deleuze's project: 'We're tired of trees . . . They've made us suffer too much' (15). The authors place their modern schema in sharp opposition:

> Multiplicities are rhizomatic, and expose arborescent pseudomultiplicities for what they are . . . An assemblage is precisely this increase in the dimensions of a multiplicity that necessarily changes in nature as it expands its connections. There are no points or positions in a rhizome, such as those found in a structure, tree, or root. (Deleuze and Guattari 2002: 8)

The concept of multiplicity, with its components of rhizome and assemblage, will fill the place left by simulacra.

V. The Installation of a Mythic Circle

I left Plato in an apparent muddle. Deleuze rightly reflects 'the reader's great surprise' when the way out of it comes 'by introducing a myth' (Deleuze 2001: 60). The role of the myth in Deleuze's reading of Plato can be expressed more clearly in the context of the *Phaedrus*. Here the target is the lover: the one who has 'lost his head', has gone mad. Should he/she still enjoy our favour? According to Plato's voicing of Socrates, it would be an easy question to answer 'if madness were bad, pure and simple; but in fact the best things we have come from madness when it is given as a gift of the god' (Plato 1997: 522; *244a*). Plato tells a complex story about the origin and nature of souls. Souls chase the chariots of the gods around a circuit, beyond the rim of which lies 'the plain where truth stands': the realm of the Ideas or Forms. All the souls strain to keep pace with the gods so as to be able to see what lies there (526; *248c–d*). For Deleuze, this allows Plato to 'determine which – lover,

poet, priest, soothsayer or philosopher – is elected to participation in reminiscence . . . : which is the true claimant, the true participant, and in what order the others follow' (Deleuze 2001: 61). How exactly?

Williams advises: 'the myth tells of how things were originally divided and it allows that division to return later' (Williams 2003: 81). By 'originally', I gather we are to understand an archetype in the manner of Mircea Eliade's thesis with regard to the structure of Platonism: 'reality is acquired solely through repetition or participation; everything which lacks an exemplary model is "meaningless" i.e., it lacks reality' (Eliade 1989: 34). Such a philosophy of static identity clearly has no Deleuzian future. Indeed, Williams' point is only that a modern dynamic Deleuzian concept of the Idea will, as we shall see, come to occupy a similar position in an overall structure. Deleuze emphasises that even if the Platonic Idea allows a 'return', of some kind, 'Plato is certainly not a protagonist of eternal return' (Deleuze 2001: 61). Certainly not, because Deleuze is invoking his radical reading of Nietzsche:

> We misinterpret the . . . 'eternal return' if we understand it as 'return of the same'. It is not being that returns but rather the returning itself that constitutes being insofar as it is affirmed of becoming and of that which passes. (Deleuze 1983: 48)

Deleuze remains loyal to the doctrine of the eternal return and yet abandons the concept of the simulacrum. This presents a problem because Deleuze explicitly connects the eternal return with the concept of the simulacrum: 'What . . . is the content of this third time . . . What is this content which is affected . . . by the eternal return? . . . it is a question of simulacra, and simulacra alone' (Deleuze 2001: 299). In his book on Deleuze's philosophy of time, Williams has no doubt that 'The content of eternal return is series and simulacra' (Williams 2011: 127). I am arguing that Deleuze abandons the concept of the simulacrum because it becomes otiose. However, if the concept of the simulacrum includes a component of 'novelty', without which we cannot drive the eternal return, my argument is stopped dead in its tracks. In a seminal article Smith asks: 'What are the conditions of the new that one finds laid out in Gilles Deleuze's philosophy?' (Smith 2007: 1). The concept of the simulacrum finds no place in his reply. Instead we find: 'When the virtual is actualised, it *differentiates* itself, it produces the new' (17). I, therefore, agree with Smith, who concludes, in the wake of Deleuze's abandonment of the concept of the simulacrum, that 'The process of simulation is more properly characterized as the process of actualization (or even more precisely, the complex process of "different/ciation")'

(Smith 2006a: 116). If this is all the conceptual machinery we need for radical novelty, I may now take up again Deleuze's critique of Plato.

We have seen that Deleuze claims to detect in the dialogues of 'division' a repeated four-fold pattern, the third element of which is the invocation of a myth. However, this scheme is immediately threatened (and this explains the earlier mentioned shift to the *Statesman*): 'It will be objected that... the *Sophist*, presents no such myth' (Deleuze 2001: 61).[4] Deleuze replies that this is because 'in this text, by a paradoxical utilization of the method, a counter-utilization, Plato proposes to isolate the false claimant *par excellence*, the one who lays claim to everything, without any right: the "sophist"'. Smith notes how

> Deleuze distinguishes between two spatial dimensions in Plato's thought. The dialogues of the *Phaedrus* and the *Statesman* move upward toward the 'true lover' or the 'true statesman', which are legitimated by their resemblance to the pure model... Platonic *irony* is, in this sense, a technique of *ascent*. (Smith 2006a: 98)

In Deleuze's own words: 'The popular and technical images of the philosopher seem to have been set by Platonism: the philosopher is a being of ascents' (Deleuze 2003: 127). Whereas, 'The *Sophist*, by contrast, follows a descending movement... a technique of descent' (Smith 2006a: 98). Rosen, in turn, reflects that 'We are not simply engaged in the task of defining a pure form... We are hunting men' (Rosen 1983: 84). The distinction between the directions of the dialogues adds lustre to Deleuze's claim that, at the nadir of the descent, Plato himself is the first to toy with a radical anti-Platonism: 'It may be that the end of the *Sophist* contains the most extraordinary adventure of Platonism: as a consequence of searching in the direction of the simulacrum and of leaning over its abyss' (Deleuze 2003: 256).

Rosen quotes, initially with approval, Deleuze's general claim that 'In Plato, an obscure debate is carried out in the depths of things, between that which submits to the action of the Idea and that which escapes this action (copies and simulacra)' (Deleuze 2003: 7, cited in Rosen 1983: 172). However, Rosen objects that 'Deleuze oversimplifies in saying that "the copy is an image endowed with resemblance; the simulacrum is an image without resemblance"' (Rosen 1983: 172, citing Deleuze 2003: 257). To follow Rosen's objection we need to recall the paradigm of monumental statuary or huge paintings that is played out in the *Sophist*. Deleuze seems to be content to remain within this paradigm of the observer of an optical image:

> Plato specifies how this nonproductive effect is obtained: the simulacrum implies huge dimensions, depths and distances that the observer cannot master. It is precisely because he cannot master them that he experiences an impression of resemblance. This simulacrum includes the differential point of view . . . which is transformed and deformed by his point of view. (Deleuze 2003: 258)

But Rosen argues, 'An image that does not resemble X cannot be an image of X. Despite its "dissymmetry," the fantasm looks like the original to the viewer' (Rosen 1983: 172–3). From the observer's point of view, the huge statue has 'the look' of a human being: it is, therefore, contrary to Deleuze's claim, an image that resembles something, namely that 'look' that we recognise as human.

Rosen's objection is reasonable, but is it fatal to Deleuze's argument? To oversimplify is not the same as being wrong. But perhaps the more accurate accusation, in this context, is exaggeration rather than oversimplification. Deleuze can quite coherently concede the existence of the phenomenon of resemblance, indeed at times he does. All that he needs to deny is that resemblance is fundamental. Beyond that, perhaps Rosen's objection would be fatal, if it were to be the case that one could not, even in principle, make sense of an 'image without resemblance'. And yet Rosen, earlier, manages to make sense of it himself. He notes how the Visitor is happy to shift the paradigm away from the optical, and towards the discursive, by the dramatic device of speculating that the sophist will sometimes 'seem to you [Theaetetus] to have his eyes shut, or else not to have any eyes at all' (Plato 1997: 260; *239e*). Now, a true statement, about a tree, for example, does not look like a tree. Yet Rosen concludes that, for the Stranger, 'true statements are images as well [as false statements]' (Rosen 1983: 155). This kind of linguistic turn is not the direction of Deleuze's argument, but we may grant that Deleuze has, thus far, only given a negative definition: the simulacrum is an 'image without resemblance'. If Deleuze can also make positive sense of the nature of an image without resemblance, then Rosen's objection is not fatal. I shall return to this later.

VI. The Establishment of a Foundation

For Deleuze, the essence of Platonism is its four-fold method. We are now brought to see how the third element of that method is the establishment of a foundation: 'The role of the ground appears in all clarity in the Platonic conception of participation . . . (And no doubt it is this foundation which provides division with the mediation it seems to

lack . . .)' (Deleuze 2001: 62). Williams is the first to admit that, having established such a foundation, Deleuze and Plato part company forever: 'For Deleuze, ideas do not have an identity – they are multiplicities of pure differences . . . Deleuze and Plato cannot be reconciled on this issue' (Williams 2003: 82).

So far, I have characterised 'simulacral' as being the nature of images without resemblance, as images built on difference. In fact, Deleuze's definition of the concept is much denser: 'These differential systems with their disparate and resonating series, their dark precursor and forced movements, are what we call simulacra' (Deleuze 2001: 126). Indeed, it conforms to Deleuze and Guattari's stricture that 'Every concept has components that may, in turn, be grasped as concepts' (Deleuze and Guattari 1994: 19). Let us take just one of those components, namely, the concept of 'series'. Does it have a Platonic parallel? I raise this question here because one might seek such a parallel in the seminal Platonic doctrine of 'participation'. The Idea of Justice, for example, possesses justice in 'first place': 'What possesses in first place is the ground itself . . . As for those whom we call just, they possess the quality of being just in second, third or fourth place . . . or in simulacral fashion' (Deleuze 2001: 62). However, the instances of justice do not form a series. To be a series entails a connection between the members of the series, whereas here the only connection is back to the Idea, albeit at varying levels of participation. What is more, for Plato, to the extent that the actual diverse instances of justice participate in the Idea, at whatever remove, they are, by definition, not simulacra.

However, perhaps a more obvious place to look for a Platonic parallel might be in reading the Platonic concept to mean copies of copies. But this is the very interpretation that Deleuze denies:

> If we say of the simulacrum that it is a copy of a copy, an infinitely degraded icon, an infinitely loose resemblance, we then miss the essential, that is, the difference in nature between simulacrum and copy . . . If the simulacrum still has a model, it is . . . a model of the Other. (Deleuze 2003: 257–8)

In other words, there is, on the basis of Deleuze's own reading of Plato, only the false image and the Idea of dissemblance which it internalises: there is no series. As we have seen, the concept of series is but one of a number of necessary components of Deleuze's larger concept of simulacrum, and yet it is already a component that finds no Platonic parallel. My interim conclusion is that the point of contact between Deleuze's dense concept of simulacrum and Plato's phantasm is, at best, skin-deep. Although well adapted for the purposes of Deleuze's critique

of Plato, once the Deleuzian concept broke free of those confines it became otiose.

VII. The Position of a Question–problem Complex

Let us move on to the final stage of Deleuze's reading of the Platonic dialectic. Deleuze presses Plato for an answer to the question, 'In what, exactly, does the grounding test consist?' (Deleuze 2001: 63). Smith explains that 'If the foundation as essence is defined by the original and superior identity or *sameness* of the Idea, the claimant will be well-founded only to the degree that it *resembles* or imitates the foundation' (Smith 2006a: 96). However, to know to what extent the image resembles the Idea, one would first have to know what the Idea, in some sense beyond the limits of a purely visual paradigm, looked like. Yet, as Rosen points out: '[the Visitor] never explains how we know pure forms. They are simply cited as though they are directly accessible; and in discussing them, [he] continues to use cognitive terms derived primarily from the language of vision' (Rosen 1983: 87). Rosen seems to settle for the Platonic myth and signs off with: 'If Plato teaches us anything, it is that philosophers identify themselves, through speeches and deeds, by the nobility and comprehensive eros of their souls' and sophists by 'the weakness of their souls' (326). In effect, philosophers will just know how to pass the grounding test, whereas sophists will not.

Deleuze is not content with either of the above replies to the question: 'In what, exactly, does the grounding test consist?' In the most innovative part of his critique of Plato, Deleuze links the mythical component of the Platonic dialectic with what he calls the question–problem complex:

> Myth tells us that it always involves a further task to be performed, an enigma to be resolved. The oracle is questioned, but the oracle's response is itself a problem . . . We must recall that Plato defined the dialectic as proceeding by 'problems'. (Deleuze 2001: 63)

This explains Deleuze's claim that 'within Platonism in general, myth and dialectic are distinct forces . . . Division overcomes this duality and integrates myth into the dialectic' (Deleuze 2001: 61). Rosen offers some general support: 'Philosophy, as portrayed in the *Sophist*, and in the entire Platonic corpus, is not a doctrine but a problem' (Rosen 1983: 324). However, Deleuze presses this insight further than Rosen, or possibly, Plato would be prepared to go.

The argument is akin to that which begins *The Logic of Sense*. Here, the text at stake is the famous passage in *Alice in Wonderland* when Alice changes size. Why should this be seen as problematic in any fundamental sense? Williams, in his book on Deleuze's philosophy of time, translates the relevant passage: 'It is at the same time, in the same play, that one becomes bigger than one was, and that one renders oneself smaller than one becomes' (Williams 2011: 139). One might object that this is obfuscation on Deleuze's part because Alice is never both larger and smaller in the same instant of time. However, as Williams goes on to explain, 'Deleuze is not referring to instants but to plays, to a process like a move in a game' (139). This is to say, not unreasonably, that the implications of the current move, in a game of chess for example, reverberate through all the previous moves, as well as the moves yet to come, but not within any conventional measurable stretch of time. It is, instead, part of a process, and Deleuze's general point, as Williams puts it, is that 'all processes of becoming take place together' (139).

But what has it got to do with Plato? According to Deleuze, Plato invites us to 'distinguish between two dimensions: (1) that of limited and measured things... and (2) a pure becoming without measure' (Deleuze 2003: 1). The allusion is to the following passage from *Philebus*:

> *Socrates*: Check first in the case of the hotter and the colder whether you can conceive of a limit, or whether the 'more and less' do not rather reside in these kinds, and... do not permit the attainment of any end... [Protarchus agrees 'strongly']. You... remind me rightly with your pronouncement of 'strongly' that it and equally its counterpart 'gently' are of the same caliber as the more and less. Wherever they apply, they prevent everything from adopting a definite quantity. (Plato 1997: 411–12; *24a–c*)

As Deleuze takes up the story, "'Hotter" never stops where it is but is always going a point further, and the same applies to "colder"' (Deleuze 2003: 2). Deleuze looks only for what he needs in the history of philosophy. Accordingly, in Platonism he finds traces of the fecund problematicity that we recognise as central to his own theory of Ideas, but it places Deleuze in closer proximity to Kant than to Plato.

Indeed, elsewhere, this is exactly how Smith argues: '*Difference and Repetition* can be read as Deleuze's *Critique of Pure Reason*' (Smith 2006b: 45). The grand structure of *Difference and Repetition* traces a series of transcendental deductions, very loosely in the manner of Kant. In chapter two for example, Deleuze deduces the existence of the three

syntheses of Time; in chapter five, he carries out a parallel deduction with regard to the nature of Space. The Deleuzian theory of Ideas may have a Platonic ring to it, but it owes more to Kant. The opening of chapter four makes it evident that Deleuze intends it to be a creative reworking of the Transcendental Dialectic: 'Kant never ceased to remind us that Ideas are essentially "problematic"' (Deleuze 2001: 168). Kant distinguishes three such Ideas: 'Pure reason ... furnishes the idea for a transcendental doctrine of the soul ... a transcendental science of the world ... and ... a transcendental knowledge of God' (Kant 1983: 323; *A334–5*). Smith explains that 'Such Ideas are *thinkable* ... but they are not *knowable*, since there could never be an object of experience that would correspond to them' (Smith 2007: 4–5).

For Kant, therefore, it is not the world (*qua* an actual thing) that is the object of 'the Idea of the world', it is rather this 'problem'. Conventional wisdom has it that, for Kant, Ideas are concepts that lack an intuition. Deleuze radicalises this by arguing that Kant had a better insight (but did not realise it): the Idea is, in Kant's own words, 'a *problem* to which there is no solution' (Kant 1983: 319; *A328*). Deleuze extends Kant's unwitting insight to argue for Ideas as structures that are inherently and infinitely problematic: 'These Ideas do not disappear with "their" solutions, since they are the indispensable condition without which no solution would ever exist' (Deleuze 2001: 168). Deleuze's complaint against Kant is that it is only the Idea that is inherently problematic: 'The problem lies wholly with the Idea – objects of experience and concepts can be detached from its problems' (Williams 2003: 142). Deleuze aims to make actual things inherently problematic.

For Deleuze, 'Every thing, animal or being assumes the status of simulacrum' (Deleuze 2001: 67). But it is equally true that 'Everything is a multiplicity in so far as it incarnates an Idea' (182). And it is the concept of multiplicity that stands the test of time. Deleuze claims 'that Ideas ... do not exist only in our heads but occur here and there in the production of an actual historical world' (190). Ideas have us, rather than the other way around. Deleuze transmutes Kantian Ideas into vehicles of ontological difference: 'Modern thought and the renaissance of ontology is based upon the question–problem complex' (195). To answer the question from Rosen, that I left hanging earlier, Deleuze *does* provide a positive account of how there can be an image of X that does not resemble X: the relation of actual things to Ideas is not one of resemblance but is, instead, akin to the intimate relationship between a question and an answer.

VIII. The Fall of the Simulacrum

What, then, are we to make of the peculiar fate of the concept that ties Deleuze most closely to Plato? Smith offers the following conjecture on Deleuze's abandonment of the concept of simulacrum: 'That things simulate a transcendent Idea has a meaning only in the context of Platonism. In Deleuze's own ontology, things no longer "simulate" anything' (Smith 2006a: 116). In other words, Deleuze drops the concept because it becomes not only otiose but also potentially misleading. Smith also extends the scope of the question I have posed in this article by asking: why does Deleuze not turn to Plato again, in earnest, until *What Is Philosophy?* (Deleuze and Guattari 1994).[5] He answers:

> Deleuze does not ascribe to Greek thought the importance that one finds in Nietzsche... or Heidegger... Deleuze's philosophical heroes... tend to be found, not at the origins of philosophical thought (Socrates, Plato), but in its maturation in the seventeenth century (Spinoza, Leibniz). (Smith 2006a: 116)

Agreed, but this sits unhappily with the same author's claim that Deleuzianism can be seen as a completion of Platonism.

I have to some extent already anticipated the starkest challenge to the redundancy of the concept of the simulacrum, which comes from Williams: 'The concept of the simulacrum is crucial to understanding the relation between times and between the actual and virtual in Deleuze's thought' (Williams 2011: 190; n. 5). If this is right, then I am wrong, but then again, so, apparently, is Deleuze. However, in the same endnote, Williams offers only 'reservations' about 'approaches that leave it [simulacra] out', citing Miguel de Beistegui's *Truth and Genesis: Philosophy as Differential Ontology* (2004). Earlier Williams stresses 'the parallels between [Beistegui's] process account of genesis and Deleuze's process account of time' (Williams 2011: 190; n. 2). But Williams goes on to claim that Beistegui is forced to introduce 'a Kantian and phenomenological vocabulary of noumenon and phenomenon which remains abstract in terms of actual processes and ties Deleuze too closely to phenomenology' (190; n.5).[6] To my mind, Beistegui's explicit denial of such a charge remains fully Deleuzian in vocabulary and structure:

> If there is anything like a phenomenological reduction in Deleuze's thought... it lies... not in the reduction of... [the] phenomenon to the transcendent sphere of consciousness... but in the reduction of the phenomenal to its... pre-individual and genetic horizon... In other words,

> phenomena are themselves reductions, they are … instances of the solutions of problems or differential relations that constitute them. (Beistegui 2004: 286)

If Beistegui really does leave the simulacrum out whilst remaining fully Deleuzian, he must, on the face of it, be an ally to any thesis concerning the redundancy of the concept of the simulacrum. In fact, things do not turn out that way. Deep in the endnotes we find: 'In a way … the entirety of Deleuze's thought … can be seen as a meditation on the simulacrum' (Beistegui 2004: 371–2; n. 56). And in plain sight:

> Phenomena are not so much constituted or given as they are generated or produced, not by external causes and first principles … but by a pre-individual differential complex that is entirely immanent to the system in which it explicates itself, a set of conditions that are far more impersonal than phenomenology will have ever allowed. This … is what allows Deleuze to speak of the phenomenal as 'illusory' … and … brings Deleuze in great proximity to Plato. (Beistegui 2004: 311)

However having built this sandcastle, Beistegui immediately knocks it down by clarifying that if phenomena, for Deleuze, are illusions, it is not by virtue of their relation to 'a sphere of being … that would be less illusory, more real, really real as it were … Such a view would amount to … the crudest of Platonism' (Beistegui 2004: 311). Beistegui seems to argue that it is to avoid such crudity that Deleuze calls phenomena 'simulacra'. In other words, there are no foundational identities of the sort we find in Plato.

And yet, ironically, the concept of the simulacrum seems to court the very misunderstanding that Deleuze, it seems, wished to avoid. Williams is forced to address it:

> The misunderstanding would be that he is opposing simulacra to another kind of real entity in his system. This is not the case: simulacra and differences are all that there is in series and an error is made when something that is a simulacrum is taken to be objectively real. (Williams 2011: 128)

Does this mean that the phenomenal world of actual things is, in some way, not real? Williams plays this question through Deleuze's philosophy of time which is not quite the same thing, and yet he is prepared to go as far as to say that 'It would be a mistake to speak of the real time of objects, because when viewed in relation to the processes giving rise to them, the objects are not real' (Williams 2011: 129). Yet, if we take the longer view, we cannot seriously doubt Deleuze's commitment to the reality of the world: 'It may be that believing in

this world ... becomes our most difficult task ... This is the empiricist conversion ... we have lost the world' (Deleuze and Guattari 1994: 75).

In the longer run too, and despite his own testimony, in what sense can Deleuze really be said to have abandoned the concept of the simulacrum? The answer is not purely a matter of conjecture. We know that, for Deleuze, a philosophical concept is not the same as the name of that concept: 'Although concepts are ... baptized, they have their own way of not dying while remaining subject to constraints of renewal' (Deleuze and Guattari 1994: 8). Concepts are, instead, multiplicities: 'There are no simple concepts. Every concept has components and is defined by them' (15). Accordingly, as we have seen, the concept of the simulacrum contains the components of 'series', 'dark precursor' and more; one can, however, find very little parallel for this inner conceptual machinery in Deleuze's critique of Plato. Looking at Deleuze's philosophy as a whole, it is clear that he does not abandon the concept of series, for example, when he abandons the concept of simulacrum. All he realises he has thrown overboard, I suggest, is the name of the concept and with it the Platonic ballast that was never really an important part of his system and which muddles us more than it enlightens us. Deleuze knows that 'Concepts are not eternal'; they are born and die in response 'to our problems, to our history, and above all, to our becomings' (27). In what sense, therefore, had the problem or history changed? Not because difference had been rescued but, possibly, because Plato had been overthrown.

Notes

1. Patton, for example, argues that 'both senses [overturning and reversing] are involved in Deleuze's version of the escape from philosophy's Platonic past' (Patton 1994: 143).
2. Much of Stanley Rosen's commentary is devoted to refuting the so-called 'predicationalists' (e.g., G. E. L. Owen) for whom 'Plato's "metaphysics" is a gradually ripening episode in the ancestral saga of Fregean analysis ... Owen's assertion that the paradigm-copy model does not appear in Plato's "later" dialogues ... is ... indefensible' (Rosen 1983: 196).
3. Typographical error corrected: the English text reads 'reserve' instead of 'reverse'.
4. In fact the *Sophist* does contain a myth: the Visitor tells the story of the Battle of the Giants (Plato 1997: 267; *246a*). We must conclude that, for Deleuze, it is the wrong kind of myth.
5. There is also the, breathtakingly brief, late essay, 'Plato, the Greeks' (Deleuze 1997: 136–7).
6. Williams' reference to Beistegui 2004: 227 is incorrect. Perhaps p. 277 was intended; also see p. 311.

Scoring the Rhizome: Bussotti's Musical Diagram

Ronald Bogue University of Georgia

Abstract

The score of Piece Four of Sylvano Bussotti's *Five Piano Pieces for David Tudor* is the most important image in *A Thousand Plateaus*. It serves as a prefatory image not only to the Rhizome plateau, but also to the work as a whole. It functions as the book's musical score, guiding readers in their performance of the text. Embracing John Cage's graphism and aleatory practices, Bussotti created his own 'aserial' new music, one that celebrated passion and Bussotti's open homosexuality. The visual elements of Piece Four include a deterritorialisation of the standard piano score, a diagram of the composition's abstract machine, and a drawing that Bussotti had produced ten years before writing *Five Piano Pieces for David Tudor*. The drawing itself is a rhizomic artwork, with details that echo visual motifs throughout *A Thousand Plateaus*. The superimposition of the drawing on the deterritorialised framework of the standard piano score conjoins the visible and the audible, faciality and the refrain, in a single artefact.

Keywords: Sylvano Bussotti, John Cage, David Tudor, graphism, art and music

During the last decade, I have taught a semester-long seminar on *A Thousand Plateaus* five times, and last fall I thought I was well prepared for the fifth iteration. But at the end of my lecture on the book's first section, a student who had been an aspiring opera soprano in a previous life asked, 'What do you have to say about the musical score on the opening page?' and all I really had to say was, 'I've never given it

much thought.' I managed to improvise a few vague observations until the class period came to a welcome end, but after class I began studying the score and its provenance, discovering very soon that the work is not only fascinating in its own right, but also of great significance for *A Thousand Plateaus*. Like so many references in *A Thousand Plateaus*, the Bussotti score operates both internally and externally, reverberating within the book while opening the text to proliferating connections with the outside world, those rhizomatic connections extending so seamlessly that it is impossible to determine which elements are intentionally referenced by Deleuze and Guattari, and which are fortuitously evoked through the citation.

Each of *A Thousand Plateaus*' fifteen textual sections is preceded by a visual image, and that of Bussotti's score is the most important of them all. Aside from Bussotti's score, few of the visual images add a great deal to the text. Some are mere visual examples of specific elements in the plateau that follows (the Ark of the Covenant preceding 'On Regimes of Signs'; the wooden chariot drawing at the beginning of the Nomadology plateau; the photographs of an Etruscan amphora and plate prefacing the Becoming plateau; the crazy quilt before 'The Smooth and the Striated'). Others have a humorous or sardonic edge: the lobster of 'The Geology of Morals' ('God is a Lobster, or a double pincer, a double bind' [Deleuze and Guattari 1987: 40]); the Buster Brown comic of 'Three Novellas'; the partridge trap of 'Apparatus of Capture'; the Postulates of Linguistics plateau's image of the ominous Doctor Mabuse issuing *mots d'ordre*; the Conclusion's 'Computer Einstein' portrait, representing the machine–human interface of the electronic, the inorganic, the corporeal and the mythical.

A few require more careful elucidation. Deleuze and Guattari's poetic caption for the photograph preceding 'One or Several Wolves', 'Field of Tracks, or Wolf Line', only attains full clarity after one consults the list of Illustrations and learns that the photograph is titled 'Wolf Tracks on Snow'. Here, the text–image relation is more complex than in many other plateaus, in that the literal wolf's trace is a figurative image of the Freudian erasure of wolves as packs and the wolf as animal (rather than substitute father). The image captioned 'Dogon Egg and Distribution of Intensities', which precedes the Body without Organs plateau, has a textual counterpart in the reference to 'the BwO as the full egg' and 'The tantric egg' (Deleuze and Guattari 1987: 153), but its full significance is only made evident in *Anti-Oedipus*, where Deleuze and Guattari expound at length on the Dogon's world-egg as Body without Organs and its relation to the status of incest within the Dogon's complex

mythology (Deleuze and Guattari 1977: 154–8). A similar expanded resonance emerges if one uncovers the reference that inspired Deleuze and Guattari to preface the Faciality plateau with Duccio's *The Calling of Saint Peter and Saint Andrew*. Deleuze and Guattari's contrast of the frontal face and the profile is mapped onto the distinction between the despotic and passional regimes, but only upon consultation of Jean Paris's *L'Espace et le regard* (1965), a central source in the plateau, can one appreciate the rich network of artistic associations that Duccio's painting is capable of activating.

If there are images that might rival Bussotti's score in importance, they would be Léger's *Men in the Cities* (preceding the Segmentarity plateau) and Klee's *Twittering Machine* (placed before the Refrain plateau). Without Léger's title (provided solely in the list of Illustrations), the relationship between the image and the plateau is only intuitively evident, but once identified, the painting lends the plateau added resonances, linking it to discussions of the city in the Nomadology and Apparatus of Capture plateaus, while retaining its implicit echoes of the Faciality plateau through its 'probe-head' images of abstract frontal and profile faces. Klee's *Twittering Machine* obviously evokes birds and refrains, but the reference to Klee itself brings to mind Klee's writings on music and painting and his own practice as a painter, dancing to music as he painted. In the cases of both Léger and Klee, modern painting's polysemic densities lend the images a considerable power as components of *A Thousand Plateaus*, and this power is only reinforced by their association with such key concepts as micropolitics, segmentarity and the refrain.

Nonetheless, Bussotti's score still remains *A Thousand Plateaus*' most important image, and for a number of reasons. If nothing else, it has pride of place – it is the first image you see when you start reading the book. The 'Authors' Note' ('*avant-propos*' in the French) advises the reader that 'To a certain extent, these plateaus may be read independently of one another, except the conclusion, which should be read at the end', and in the English translation, the reader could possibly choose to turn first to a plateau other than the Rhizome plateau and thereby avoid viewing Bussotti's score, since the 'Authors' Note' is on a right-hand page facing a blank left-hand page. But in the original French edition, the '*avant-propos*' is on the left-hand page directly opposite Bussotti's score on the right. Hence, even if you should choose to read other plateaus before the Rhizome plateau, you have already seen this image. Of course, you have also seen the opening text of the Rhizome

chapter, but significantly, seeing the text provides very little information about the section in question. No doubt you cannot help instantly deciphering the plateau's large-font title, but the rest of the text is merely generic typography, meaningful only when you actually start reading the smaller-font text. By contrast, the image of Bussotti's score is absorbed as a single entity, and, as we shall see, this fact is central to Bussotti's interrogation of the relationship between the visual and the aural, as well as the verbal.

Further, the Rhizome plateau itself has a special significance among the fifteen sections. It is titled 'Introduction', and if the conclusion should be read last, it would seem that the introduction should be read first, even if Deleuze and Guattari do not say as much. The rhizome text was published as a separate book in 1976, the only plateau to appear by itself. ('One or Several Wolves' and 'How Do You Make Yourself a Body without Organs?' also were published before 1980, but as articles in the journal *Minuit*.) In the 1976 book, as in *A Thousand Plateaus*, the text is labelled 'introduction' (though the word followed 'rhizome' rather than preceding it), which indicates that even in its early formulation, the section possessed an introductory function, though in its 1976 form, the question must arise, 'introduction to what?' An introductory exposition of a concept that deserves further exploration? Or an introductory harbinger of things to come, a tantalising preview of the rhizomatic complex that will be published as *A Thousand Plateaus*? Both seem plausible, and both stress the text's position as something preceding something else.

More important, the concept of the rhizome, among all those of *A Thousand Plateaus*, best characterises the book itself, and indeed, Deleuze and Guattari directly address the questions of the Book and their own status as authors in the Rhizome plateau. And finally, 'Introduction: Rhizome' is something like an operatic overture to the book, densely packed with motifs whose full significance will become apparent only after reading the entire text. If read first, and read carefully, the Rhizome plateau should be confusing, difficult, even opaque at times, and in that sense, it is a baptism by fire, a fitting introduction to the authors' uncompromising strategy of always working in the middle and of forcing readers to leap unprepared into the middle with them.

Bussotti's score has a similar inaugural, introductory function. It was not included in the 1976 book *Rhizome: Introduction*, which, despite what one might initially think, indicates not the score's lesser but its greater importance. Both the plateau and the score can stand alone,

and hence the image has a certain autonomy. It is a fitting image to introduce the first plateau, but it should also be seen as the entire book's master image. If the Rhizome plateau is the work's overture, Bussotti's composition is its score. It tells us how to perform *A Thousand Plateaus*, how we should play the book.

Bussotti is a multi-talented artist whose productions include music, drawings, paintings, costumes, theatrical productions, films, poems and prose works. Born in 1931, he came to international prominence in 1959 with the composition under consideration here, *Five Piano Pieces for David Tudor*, a piece inspired by his experiences the previous year when he first attended the Internationale Ferienkurse für Neue Musik (International Summer Courses for New Music) in Darmstadt, Germany. Initiated in 1946 by Wolfgang Steinecke, the Darmstadt Ferienkurse in its early years focused on works of quasi-tonal modernism, but by 1952, three young composers had emerged as leaders of an increasingly influential avant-garde: Luigi Nono, Karlheinz Stockhausen and Pierre Boulez. They were proponents of atonal serialism, a rigorous and severe formalism that severed musical elements, in Attinello's words, 'from any continuous and meaningful context and reformulated [them] as nondirected, temporally arbitrary (i.e. reversible) patterns' (Attinello 2007: 29). However rich the variations in serial practice, 'the *style* (as distinguished from the technique) of serialism, as it is usually understood, [was] one of nearly mathematical purity' (29).

The year Bussotti first attended the Ferienkurse, 1958, was also the year John Cage made his inaugural appearance at Darmstadt. On 3 September, Cage collaborated with David Tudor in two-piano performances of works by Earle Brown, Morton Feldman, Christian Wolff and himself; later, Cage delivered three lectures, during which Tudor played various works by Cage and others. Cage's presentations were highly controversial and their subsequent influence on avant-garde music was profound. For some composers, Cage's experimentations with sonic textures and chance were inspirational; for others, they were anathema. Among those most opposed to the aleatory aspect of Cage's approach was Boulez, who later caustically derided the post-Cage adoption of chance as a compositional practice:

> Notable in several composers of our generation at the present time is a constant preoccupation, not to say obsession, with chance… . The most elementary form of the transmutation of chance is located in the addition of a philosophy dyed with Orientalism and masking a fundamental weakness in

> the technique of composition; this would be a recourse against the asphyxia of invention, recourse to a more subtle poison that destroys every embryo of artisanship; I should willingly qualify that experience – if it is one – in which the individual, not feeling responsible for his work, simply throws himself into a puerile magic out of unavowed weakness, out of confusion, for temporary assuagements – I should willingly qualify that experience as chance by inadvertence. (Boulez 1968: 35)

Bussotti, by contrast, was among those who responded positively to Cage's experimentations with chance, adopting aleatory effects in many of his compositions in the decade following 1958, as is evident in the *Five Piano Pieces for David Tudor* of 1959.

It is important to note, however, that Bussotti's embrace of chance was idiosyncratic, and in one major regard, antithetical to Cage's sensibility. Boulez saw in Cage's aleatory methods a retreat from the responsibilities of a rigorous serialism, but both composers treated sounds in a detached and intellectual fashion, whereas Bussotti approached music as a personal, emotional and erotic medium. In the prefatory note to *Due voci*, composed between May and December 1958, Bussotti declared himself an advocate of 'aserialism', which he defined as the 'dialectical rebellion of the humanistic attitude in the man who writes music, against the stiff aridity of systems' (cited in Ulman 1996: 188). As Ulman observes, what Bussotti sought in *Due voci*, and in many of his subsequent compositions, was to infuse 'the gestural and sonic world of the serial avant-garde with the intimacy and subjectivity which serialism had sought through impersonal rationality to avoid' (188). The aim of Bussotti's aleatory methods was not, as Cage advocated, 'to let sounds be themselves' (Cage 1961: 10), but to invite performers to participate with the composer in an affective interpersonal event. In this regard, Tudor's influence was essential. A champion of American new music and the leading avant-garde pianist of his generation, Tudor was not simply a technical virtuoso but also a gifted improviser whose manipulations of all components of the piano greatly expanded the instrument's range of sonic possibilities. He tapped, thumped and beat the wooden frame, operated the pedals as percussive accessories, reached inside the piano and plucked, scratched, rapped and strummed the strings, sliding fingers up and down, coaxing overtones and eerie whispers from the instrument. Of necessity, given the elaborate gestures and broad movements required to execute the score, Tudor's stage performances, besides generating exotic sounds, also functioned as theatrical events, during which, as Richard Toop writes of another Bussotti piano composition for three players, the piano becomes 'a prone

body, alternately caressed, cajoled and assaulted by its suitors' (cited in Griffiths 1981: 127).[1] It is no doubt in large part this theatrical and affective dimension of improvisatory practice that drew Bussotti to experimentations with chance.

Bussotti's theatrical and libidinal proclivities, it should be noted, were manifest not only in his music but also in his person. Many have remarked on the tumultuous effect of Cage's presentations at Darmstadt in 1958, the theoretical repercussions of which were compounded by the personal animosities Cage's appearance unleashed – Boulez and Stockhausen had long vied for dominance at Darmstadt, often acrimoniously, and it was Stockhausen who had invited Cage to Darmstadt and who defended Cage's music from the vociferous attacks launched by many of the participants in the 1958 Ferienkurse. But Smith and Attinello argue persuasively that Bussotti may well have been an even more disturbing presence than Cage at Darmstadt in 1958, chiefly because of his flamboyant and forthright gay sexuality. Boulez and Cage, like many gay men in the 1950s, were quiet about their sexual orientation, and in the closed, hothouse atmosphere of Darmstadt, Bussotti's frank behaviour seems to have provoked considerable unease:

> Bussotti made certain underlying connections between music, avant-gardism and homosexuality all too evident; while inspiring some of the younger gay figures to be less secretive about their behaviour, and even apparently introducing some participants to sexual experiences heretofore only imagined by them, he also definitely alarmed and annoyed the senior figures, particularly Boulez. (Ormond-Smith and Attinello 2007: 110)

Bussotti's homoerotic approach to music was already implicit in his 1958 *Due voci*, with its text from La Fontaine celebrating voluptuousness, and it was explicit in the texts of *Pièces de chair II*, composed between 1959 and 1960. In the fifth of the *Five Piano Pieces for David Tudor*, Bussotti provides above the two-stave piano score a third line labelled '*voce*', apparently meant to be sung, with a text reading, 'I don't say no to the boys with clear eyes/ but I LOVE/ more than all those the ones with/ black eyes that shine' (cited in Ormond-Smith and Attinello 2007: 112). Bussotti's eroticism reached full efflorescence in his 1964 composition *La Passion selon Sade*, a musical and theatrical work whose score combines musical notations, complex charts, diagrams, drawings of characters and other graphic elements. As Ulman comments,

> In *La Passion* the latent eroticism of Bussotti's graphic style and opulent instrumental writing becomes explicit: the flautist must strip partially, the

> singer and conductor lie together on a divan, the percussionist functions as torturer, and the two pianos characteristically alternate between violent deluges and delicate explorations of unusual sonorities [...] Cage's theater of the absurd had been transformed, with the added inspiration of Artaud's 'theatre of cruelty', into Bussotti's 'theatre of Eros', which would grow ever more expansive: by the end of the sixties, Bussotti had even embarked on his first grand opera, *Lorenzaccio* (1968–72). (Ulman 1996: 189)

The chance Cage advocated, then, was for Bussotti a mere vehicle for creating improvisatory music-theatre. Yet if Bussotti responded favourably to Cage's experiments with chance, he was even more deeply affected by Cage's explorations of the graphic dimension of musical scores. A number of Cage's scores from the 1950s departed radically from standard notational practices. Many consisted solely of graphic, non-musical elements, as in *Variations 1* (for any instrument), *Aria* (for solo voice) and *Fontana Mix* (electronic score), all produced in 1958. *Variations I* consists of a prefatory page of instructions and six plastic transparencies, the first of which bears twenty-seven dots of various sizes, the following five of which have five randomly drawn lines each. The performer(s) is (are) to superimpose the lines on the dots in any way, using the dots as notes and the lines as trajectories of five sonic elements. *Aria* is a twenty-page setting of words and word fragments in Armenian, Russian, Italian, French and English. The vocal lines, Cage explains, 'are drawn in black, with or without parallel dotted lines, or in one or more of 8 colors. These differences represent 10 styles of singing. Any 10 styles may be used and any correspondence between color and style maybe established' (Cage 1960: preface). Near each squiggle are snippets of text that the soloist is to render in song. *Fontana Mix* includes ten pages with six curved lines each, ten transparencies with randomly placed points, and a transparency with a rectangular, ruler-like grid of small squares, 100 squares long, 20 squares wide. The performer generates the score by placing a transparency of points on a sheet of lines, and then superimposing the grid at any chosen angle. Once assembled, the given complex of points, lines and grid are translated into electronic sounds according to Cage's general instructions for utilising the graphic elements to generate the tone, colour and pitch of sonic events.

The influence of Cage's treatment of the score as visual artefact is immediately evident in the *Five Piano Pieces for David Tudor*, especially in Piece Four, and throughout much of his career, Bussotti continued to

make dual use of the score as musical notation and graphic medium – to such an extent that he is typically classified in music histories as an exponent of 'graphism' (a movement all too often dismissed as a frivolous musical dead-end).

Three of the *Five Piano Pieces for David Tudor* premiered at Darmstadt in 1959, with Tudor at the keyboard, and from its initial execution, Bussotti's aleatory methods came under fire. Following the performance of one of the pieces, an audience member asked Tudor to play the piece again – obviously, in an effort to question the validity of the entire improvisatory enterprise. Stockhausen refused to allow a repeat performance.[2] That same year, the complete score appeared in print. Since then, the piece has remained one of the best-known of Bussotti's compositions, and the image of Piece Four perhaps the most-often reproduced of all Bussotti's scores.

Thus, the opening visual image of *A Thousand Plateaus*, when contextually situated, brings together a number of themes. Generated amidst the 1958 Darmstadt turmoil surrounding Cage's lectures, Tudor's performances and Bussotti's gay flamboyance, the *Five Piano Pieces for David Tudor* represents a challenge to the ascetic serialism of Boulez, an 'aserial' amalgamation of aleatory composition, theatrical performance, unconventional graphic notation and affectively charged textures. To label the score as inherently 'homoerotic' would be far-fetched, but, as I hope to show, it does possess a decided sensuality that unsettles the score's more conventional, geometric elements. This interplay of chance, corporeal performativity, graphic experimentation and affective intensity provides a fitting preface to the entirety of *A Thousand Plateaus*.

To understand Piece Four of *Five Piano Pieces for David Tudor*, we must first consider the composition's prefatory page, which bears a brief text by Bussotti in Italian and German translation. In English, the text reads as follows:

> The expression 'David Tudor' used in the title is not a dedication but, so to speak, a kind of indication of the instrument.
>
> The written musical characters realize a scale that goes from traditional written notes to signs as yet musically unknown: *disegno* [drawing, design].
>
> In one case (piano piece 4), an autonomous *disegno* by the author, from ten years earlier, is pianistically adapted. Often the sonic acts that such a *disegno* may generate remain in the hands of the pianist.

> The five pieces, taken from a more vast cycle and hence dissociated from that cycle, reunite here in a minor cycle virtually placed within the global cycle. Thus, a finished part (piano piece 2) in its global context becomes unfinished, a complete part (piano piece 5) incomplete. (My translation)

Bussotti's first prefatory sentence tells us that the musical instrument is the machinic assemblage 'Tudor-piano' (and since Tudor died in 1996, the composition is now unplayable – at least if one takes Bussotti's comment literally). Just as Deleuze and Guattari insist that the book is a machine plugged into other machines (Deleuze and Guattari 1987: 6) and that there is no separation between the lives and times of authors and their works (41), so Bussotti writes for a Tudor-piano machine, and invites us to view the composition as a machinic assemblage of 'Bussotti-score-Tudor-piano' and to plug that machine into other machines. Bussotti then states that the score's components run the gamut from conventional musical notation to unknown graphic signs. A quick glance at the score's five pieces confirms Bussotti's assertion, though it would seem that in each piece conventional notation is scarcely present, and is almost immediately sent speeding along a deterritorialising line of flight into a galaxy of cryptic signs and designs.

Bussotti's score stages a confrontation of the aural and the visual, of music and the plastic arts, a fact Bussotti explicitly states in the preface's third sentence, informing us that Piece Four started as an autonomous 1949 *disegno* that was 'adapted pianistically' ten years later. As Roland Barthes says in a profound one-page essay on Bussotti, the composer's basic principle is that 'writing is not a simple instrument'. A Bussotti score

> constructs a homological space [...] one part wizard's book of multiple signs, refined, coded with infinite minutiae, and one part vast analogical composition, in which the lines, the locations, the flights, the stripes are charged with suggesting, if not imitating, *what is actually happening* on the concert stage [...] A Sylvano Bussotti manuscript is *already* a total work [...] visibly, it is an ordered jumble of drives, desires, obsessions, which expresses itself graphically, spatially, *in ink*, one might say, independently of what the music communicates. (Barthes 1995: III, 387–8)

As overture to *A Thousand Plateaus*, Piano Piece Four juxtaposes two of the book's central aesthetic concerns: painting (the Faciality plateau) and music (the Refrain plateau), each art with its own problem: painting, that of the face-landscape, and music, that of the refrain. But just as music proves to have '*rhythmic faces or characters* and [...] *melodic landscapes*' (Deleuze and Guattari 1987: 318), so painting

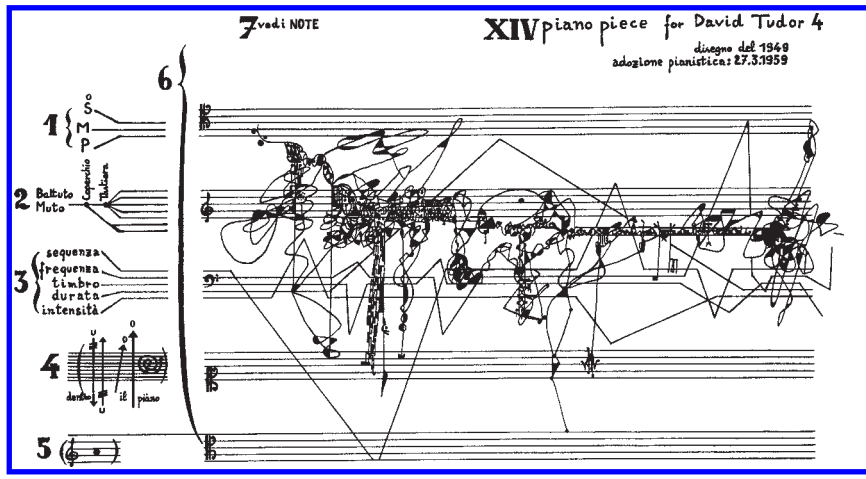

Figure 1. Piece Four, Sylvano Bussotti's *Five Piano Pieces for David Tudor*. © 1959 Ricordi, Milano. (Reproduced with permission of the publisher.)

has its refrains, and in Bussotti's score, sonic and visual landscapes and refrains enter a zone of indiscernibility that opens onto a plane of consistency composed of speeds and intensities within an unformed matter.

And now to the score of Piano Piece Four (Figure 1). The composition title is preceded by the Roman numeral XIV, indicating that this is part fourteen of the virtual 'global cycle' from which it has been extracted. (That global cycle, consisting of fourteen sections, was published in 1960 as *Pièces de chair II*.) The other four piano pieces for David Tudor are labelled in accordance with their positions within *Pièces de chair II*, as 'V b)', 'VIII', 'd)' and 'I a)'. The basic unit of a traditional piano score consists of a two-stave system, the top stave most often registering notes for the right hand and marked with a treble clef, the bottom, bass clef stave bearing notes for the left hand. Lines two and three of the score have the traditional treble and bass clefs, but the five lines of the bass stave zigzag wildly across the other four staves (Figure 2). Lines one, four and five have C-clefs, the line bisecting the capital-B-like shape representing middle C. The C-clef on line one is conventionally referred to as a 'tenor clef', line four a 'soprano clef' and line five an 'alto clef'. C-clefs have specialised uses for certain instruments, and are virtually unheard of in piano music, as are piano scores with five staves (designed for five-handed pianists, perhaps?). And as we shall see, only line five's C-clef actually designates a specific musical note.

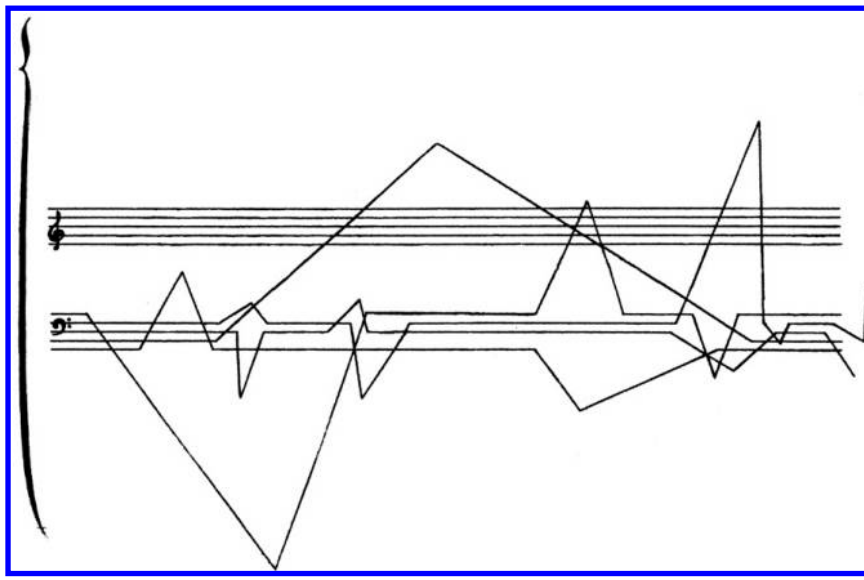

Figure 2. Treble and bass clef of Piece Four.

In my reading of the score, the left-hand margin units numbered one through five indicate the performance components that will be activated when the full composition, labelled six, is actually played.[3] Unit One is the most obscure of the score's components. No explanation of the significance of the P, M and S is provided in the score, but according to Bussotti (personal communication),

> The three letters in question signify: P = pizzicato M = muted (stop the sonority) and S = *sordina* [muffled] with all the means of directly transforming the sounds; introduction of paper between the strings, application of different pieces of material between the same.[4] (My translation)

Hence, when graphic marks touch the top stave, the performer is to reach into the piano, pluck the strings (*pizzicato*), dampen the strings with the hands (muted), and sound the strings prepared with paper and other materials, either by striking the corresponding keys of the keyboard or by sounding the strings directly (plucking, striking). (The use of the 'prepared piano' was one frequently employed by David Tudor in compositions he performed, and hence an appropriate component of a score dedicated to him.)

Unit Two designates the two fundamental operations of all piano playing: striking strings and muting them. But Bussotti extends these

operations beyond the keyboard to the lid of the piano, scored with an additional two lines. If you follow stave two left to right, in fact, you find that midway through the piece two extra lines appear, replete with enigmatic markings. Hence, all the standard keyboard functions of piano playing are represented by one treble clef stave, rather than the two stave, treble–bass clef system, and the lid is assigned a role comparable to that of the keyboard.

Unit Three is the most complex and most important of the five units. Its components are the basic elements of any sound. Each of the five zigzag lines charts movements in an analogue scale of less and more, of increases and decreases in some continuum. The intensity line charts volume, louder and softer. The duration line registers the tempo, faster and slower (the peak of the duration triangle marking the composition's fastest tempo). Timbre in music designates the quality of a sound, that which differentiates a flute from an oboe, for example. The timbre line's continuum, I propose, is that of dark and light, or if you have a synaesthetic mind, like Olivier Messiaen's, the line might be seen as traversing the sonic analogue of the visual chromatic spectrum from the edge of the infrared to the limits of the ultraviolet, or from cool to warm colours, or from light to heavy saturation. (Such visual analogues of sonic qualities are legitimate here since Bussotti's score is both an aural and a visual artefact.) The frequency line designates variations in pitch, lower and higher sounds, from 20 hertz to 20 kilohertz. I have concluded that 'Sequenza', the most puzzling of the terms, refers to the sequentiality of sonic elements, that is, the differentiation of separate sonic events via the temporal gaps between sounds. The continuum charted by the sequence line ranges from a maximum distance between sounds, to the minimum of simultaneity. Thus, the base of the sequence line marks a moment of simultaneity, in which the player makes all sounds at once – and that nadir coincides with the greatest concentration of design marks on the score.

If you extract the five lines (Figure 3), what you have is the diagram of the composition, in Bonta and Protevi's words, 'the outline of the traits of expression of an abstract machine, the "nonformal functions" linked to the "phyla" of "unformed matters" or "traits of expression"' (Bonta and Protevi 2004: 79). The five components of Unit Three name the unformed matter and nonformal functions of sound in general, and the lines outline the specific disposition of that matter/function within this composition.

Unit Four, 'inside the piano', directs the performer to reach into the piano and strum the undampered strings up, down and in an outward

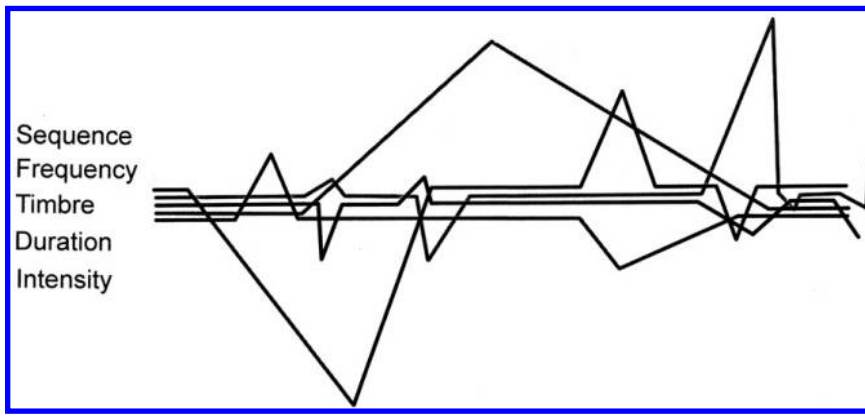

Figure 3. Unit Three of Piece Four.

spiral motion. Unit Five is Bussotti's little joke. The score's drawing touches the fifth stave only at one small point atop the stave. That point, if read as a musical note on the alto clef, is A above middle C. Five's parenthesis notates the same pitch with the more common treble clef, as if to remind the performer how to read the unusual alto clef, lest he or she forget how to do so.

Unit Seven, atop the score, says 'see note', in other words, see the prefatory sentence indicating that the score was originally a 1947 *disegno* that was 'pianistically adapted' on 27 March 1959. With some laborious graphics editing, you can expose the original drawing, which, to my eye, is a thoroughly rhizomatic design (Figure 4). The clear horizontal axis of the drawing delineates the plane of some undetermined rhizomatic growth suspended in space, such that the elements below the horizontal axis are as rootless as the elements that rise above the axis. The drawing's forms are non-representational, but decidedly organic rather than geometrical. Amid the drawing, one finds shapes resembling a tendril and fruit, a spider-like creature suspended from a thread, a column of shapes resembling plant cells or rock crystals.

Tubers, polyps, leaves, stamens, pistils, shoots and stems may be discerned in the thicket of forms (Figure 5).

The composition has a vertical axis, and if one wishes to formulate an analysis correlative to that which Deleuze conducts in *Francis Bacon* (1981), one might situate the drawing's generative locus of chaos, which Bacon calls the 'graph' ('*diagram*' in the French translation), in the zero

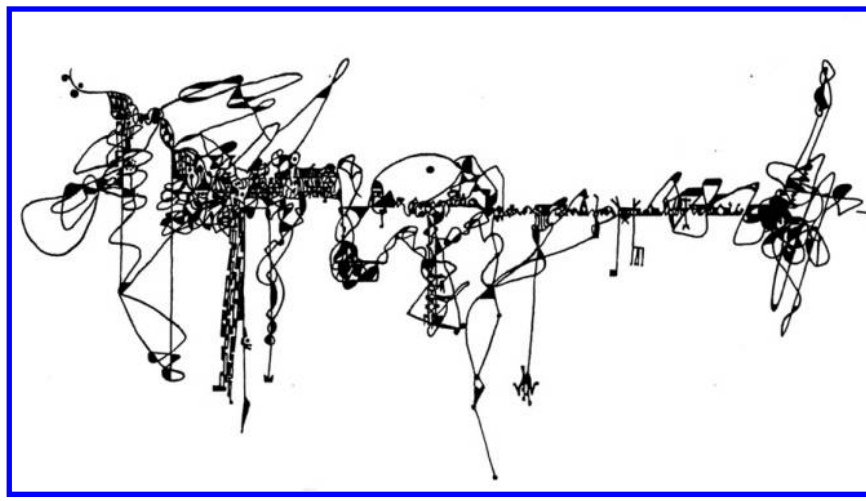

Figure 4. Bussotti's 1947 *disegno*.

point of the X–Y axes (Figure 6). From that site one can imagine the form emerging. But any one of the lines of flight so designated could be an initiating line of involution, from which the acentred rhizomatic design emerges.

My hypothesis, however, is that the point on the bottom stave, the A above middle C, is the generative source of the composition (Figure 7). It is Paul Klee's 'grey point', a 'nowhere-existent something' or 'somewhere-existent nothing' (cited in Bogue 2004: 80), a fundamental point of chaos that leaps out of itself, tracing a line that may eventually delineate all forms and volumes. Deleuze and Guattari invoke Klee's originary point of chaos at the inception of the Refrain plateau, providing a visual analogue of music's generation of refrains from a sonic point of chaos. In Bussotti's A above middle C, then, the sonic and visual meet. That point may be read as a musical symbol and as a drawing component. There the realms of sound and sight converge in a point of undecidability, which generates the soundscape and landscape inscribed on the ink-covered paper of the score.

If music and art are envisioned as planes of consistency, the musical score exists on one plane, the drawing on the other (Figure 8). The A above middle C, the point common to the two planes, fixes the line of intersection of the two planes. If the planes are then rotated toward one another, they merge in a single plane, a plane of consistency

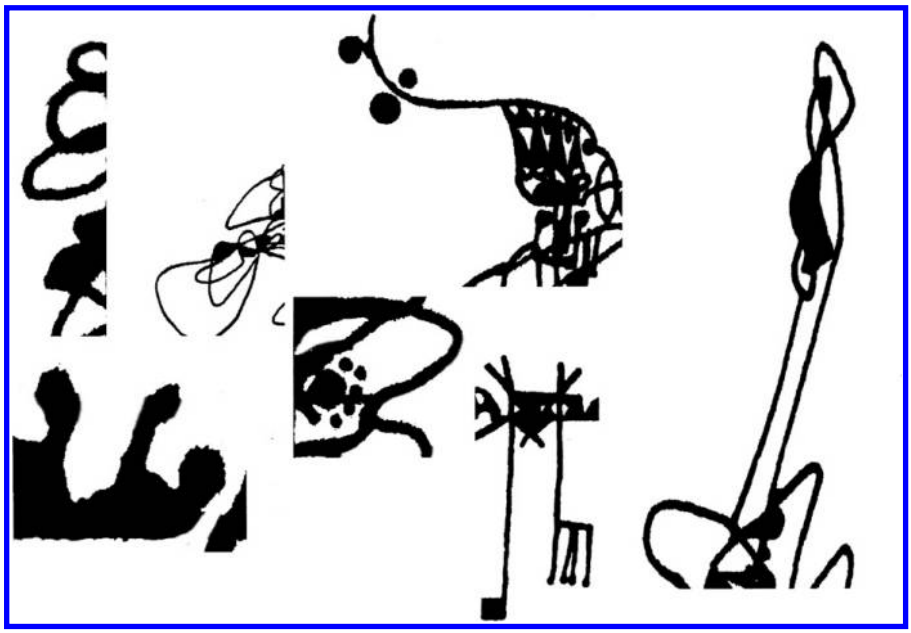

Figure 5. Tubers, polyps, leaves, stamens, pistils, shoots and stems.

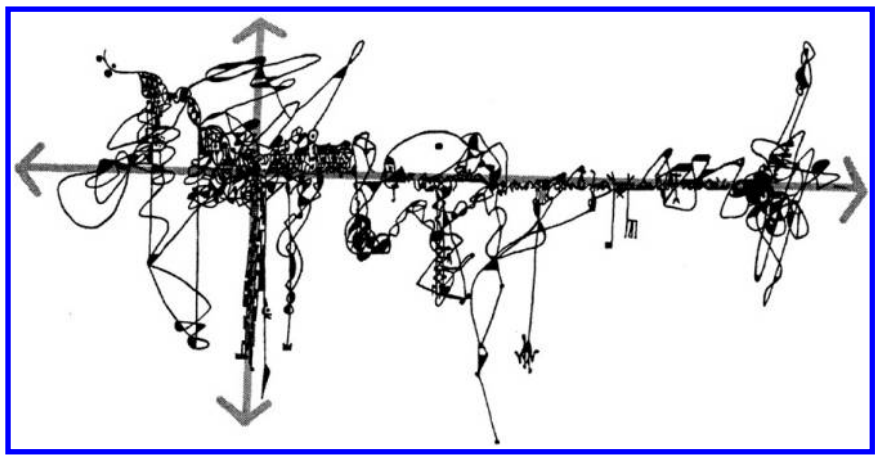

Figure 6. Horizontal and vertical axes of Bussotti's drawing.

common to the drawing and the sound score, and that plane is embodied in the score itself, a sheet of paper diagraming an abstract machine.

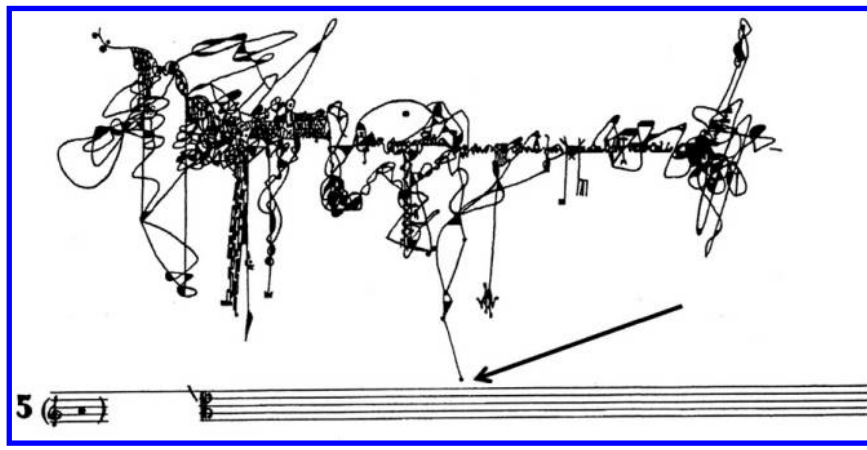

Figure 7. A above middle C (Klee's 'grey point').

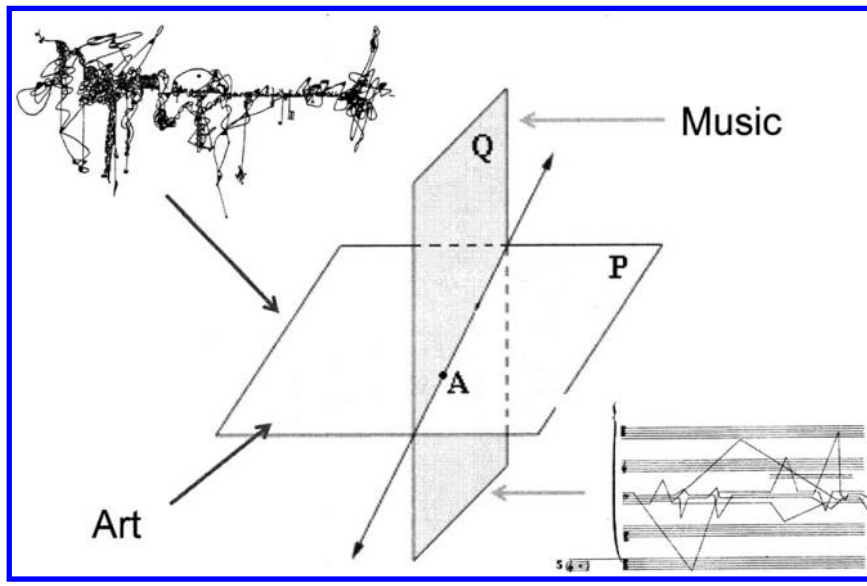

Figure 8. Planes of art and music.

But Piano Piece Four is also the score of *A Thousand Plateaus*. It serves as an overture to the book, replete with strata of sedimentation, abstract lines of flight, becomings-animal, plant and mineral, supple and rigid lines of segmentarity (Figure 9), white wall–black hole machines of

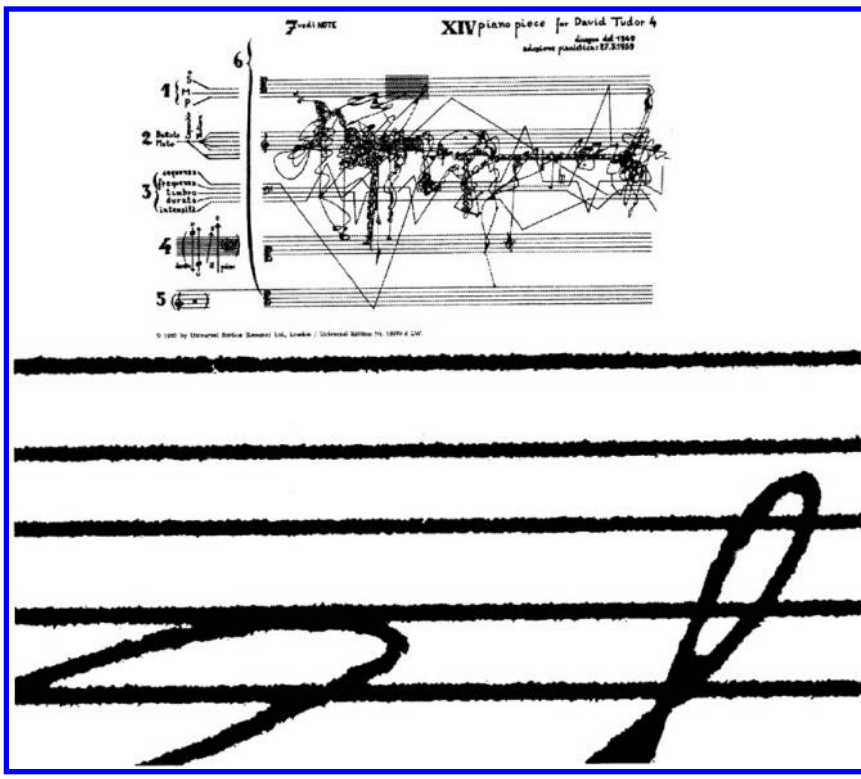

Figure 9. Supple and rigid lines of segmentarity.

faciality (Figure 10), regimes of signs (Figure 11), smooth and striated spaces. Bussotti's score tells us how to perform the book – to follow and enact its variations in intensity; to explore the varying duration of tempos of reading; to savour the timbres of tones, voices and vocabularies; to discover the work's varying frequencies and resonances; and to sample its component textual passages in sequences separated by varying distances, or to perform components in simultaneities assembled in the virtual memory space of coexisting sheets of the past. In engaging these five elements, we activate the diagram of *A Thousand Plateaus*' abstract machine, a realm of pure speeds (duration, frequency, sequence) and affects (intensities, timbral qualities).

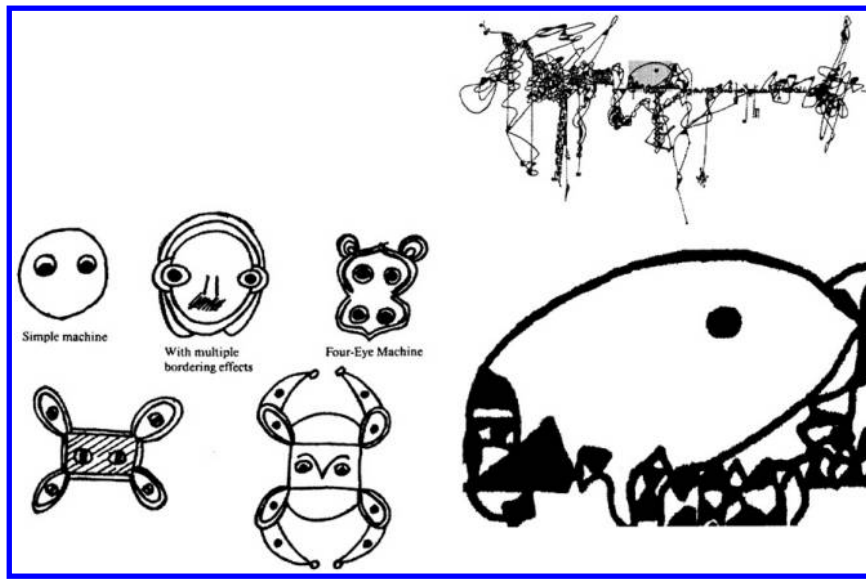

Figure 10. Machines of faciality in *A Thousand Plateaus* and Piece Four.

Notes

1. Besides playing a key role in the development of the New York School's early piano music, Tudor was also an influential force in the dissemination of American new music in Europe. As Beal shows, 'Over a brief but fertile period of unprecedented international exchange, Tudor operated as an ambassador of [American new music], and his diplomatic presence at key new music venues in West Germany—especially at the *Internationale Ferienkurse für Neue Musik* (International Holiday Courses for New Music) in Darmstadt between 1956 and 1961—established American experimentation's controversial yet ultimately stimulating presence in conversations about new music' (Beal 2007: 78).
2. Similar objections to the improvisatory nature of the composition arose during performances of *Five Piano Pieces for David Tudor* in other venues. Cope records that 'Bussotti's *Five Pieces* was performed in Los Angeles three times in one concert, by three different performers. More conservative members of the audience, obviously appalled by the lack of recognizable similarities among the performances in structure, length, instrumentation, or motive, reacted antagonistically to both performers and work… . In reference to these performances Halsey Stevens has pointed out that : "… if Mr. Bussotti had wandered into the hall and didn't know what was going on, he would not have had the remotest idea that those three performances, or any one of them, might have been his own piece. They were so totally different in every respect that the only thing he could lay claim to was having designed the score, not to have composed the piece. Aleatory music, it seems to me, as it is frequently pursued, is an amusing parlor game …"' (Cope 1989: 165).
3. Other readings of the score, of course, are possible. Erik Ulman, in personal correspondence, argues that the numbered elements (save number seven) are to be performed in sequence. No doubt his alternative is but one of several other possibilities, all of which may be justified by Bussotti's prefatory remark that the execution of the score rests 'in the hands of the pianist'.
4. Bussotti's email message of 18 October 2012, written in French, reads as follows: 'Les trois lettres en question signifient: P = pizzicato M = muted (estomper la sonorité) et S = sordina avec tous le moyens de transformer directement les sons; introductions de papier entre les cordes, applications de morceaux différents entre les mêmes.'

A Redemptive Deleuze? Choked Passages or the Politics of Contraction

Erik Bordeleau Brussels Free University

Abstract

When they want to discredit the political relevance of Deleuze's thought, Hallward considers counter-effectuation as a 'redemptive gesture', and Rancière describes Deleuze's history of cinema as a 'history of redemption'. Each time, redemption refers pejoratively to a break 'out of this world' and a form of apolitical passivity, in an attempt to reduce Deleuze to be a mere 'spiritual' thinker, simply renewing 'that "Oriental intuition" which Hegel found at work in Spinoza's philosophy' (Hallward 2006: 6). But is it all that simple? How should we envisage the relationship between creativity and redemption, politics and passivity in Deleuze's work? And in what way does that concern Deleuze's philosophy connection to the Non-West, and namely China?

Keywords: spirituality, China, subjectivity, Peter Hallward, dramatisation, politics

> Contemplating is creating, mystery of passive creation, sensation.
> Deleuze and Guattari 1994: 212

In the conclusion of *Time-Image*, discussing Syberberg's cinema, Deleuze opposes the time-image and the creative fabulation to the realm of information. Quite surprisingly, this opposition is placed under the sign of redemption: 'redemption, art beyond knowledge, is also creation beyond information.' (Deleuze 1989: 270) This passage finds a strange – one might say apocalyptic – echo toward the end of *Difference and Repetition*, where art's highest possibility is defined as

Deleuze Studies 8.4 (2014): 491–508

the production of a repetition or contraction, that is, 'a freedom for the end of a world' (Deleuze 1994: 293).

Incidentally, when they want to discredit the political relevance of Deleuze's thought, Hallward considers counter-effectuation as a 'redemptive gesture', and Rancière describes Deleuze's history of cinema as a 'history of redemption' (Rancière 2001: 150). Each time, redemption refers pejoratively to a break 'out of this world' and a form of apolitical passivity, in an attempt to reduce Deleuze to be a mere 'spiritual' thinker, simply renewing 'that "Oriental intuition" which Hegel found at work in Spinoza's philosophy' (Hallward 2006: 6). But is it all that simple? How should we envisage the relationship between creativity and redemption, politics and passivity in Deleuze's work? And in what way does that concern Deleuze's philosophy relation to the Non-West?

It will become clear soon enough that I mostly disagree with Hallward's rigorous yet quite reductive reading of Deleuze. As I shall argue in more details, Hallward's spiritual anathema directed against Deleuze, although suggestive in many ways, largely misses its target. Nevertheless, I do believe it is important to give an echo to Hallward's critique and to directly put into discussion the so-called 'spiritual' aspects – and effects – of Deleuze's philosophy. Spirituality is a tricky word, and we can easily see how it can work as an insult, especially when coming from the 'pure politics' end of the contemporary philo-political spectrum. Let me thus say for now that where Hallward wishes to nail down Deleuze's philosophy using words like 'redemptive' or 'spiritual', I will read these characterisations as attempts to problematise the (a)politicality of modes of existence induced by Deleuze's philosophy.

Avoiding the comfort zone of simply commenting (or joyfully banging) on Hallward's rather disincarnated critique of Deleuze's work, I will first try to briefly and reflexively address the production of subjectivity in Deleuzian academic milieus. The idea here is to give Hallward's critique some sort of anthropological and practical ground, fleshing out Deleuzian processes of political subjectivation by relating them to the emergence, in recent years, of a transnational Deleuzian academic community and, to a certain extent, hegemony. This committed or self-compromising characterisation of some potentially undesirable side-effects that might derive from a Deleuzian stance articulates around the danger, acknowledged by Deleuze in the first place, of becoming beautiful souls through the affirmation of 'pure differences'. This first section could thus be read as a sort of distant but potentially sympathetic echo to Hallward's repeated affirmation that

Deleuze's thought is ultimately useless politically speaking, and that it is better understood as a 'redemptive' and deceptively academic way *out* of this world.

I will then move to a more direct discussion of some of Hallward's thesis, which he mainly develops in three different occasions: in a 1997 article entitled 'Gilles Deleuze and the Redemption from Interest', in his 2001 book *Absolutely Postcolonial*, and most importantly in his 2006 monograph on Deleuze, *Out of this World: Deleuze and the Philosophy of Creation*. The point will be to show just how unspecific, instrumental and, in the end, little convincing Hallward's use of the spiritual reference is in his inquiry into Deleuze's philosophy. This will be followed by a rather contrasting reading of Deleuze focused on some of the many *choked passages* he dramatically stages in his writings and which are, symptomatically indeed, mostly overlooked by the Badiou-inspired readings of his work. What is at stake here is Deleuze's *method of dramatisation* and its culmination in what I will call a *politics of contraction* innerving all of his work. Deleuze's dramatisations are of the foremost importance if one is to seriously take into account his complex and stimulating relation to the Non-West – and namely, China.

I. The Problem of the Beautiful Soul

'Give me a body then'!
Deleuze 1989: 189

In the *Hermeneutics of the Subject*, Foucault defines spirituality as an 'ethical work on oneself' (*un travail intérieur d'ordre éthique*). Discussing the concrete social conditions of this ethical work, its relation to the moral law and the kind of practical challenges it involves, Foucault goes on to suggest that the care for the self and its ethopoietical effects necessarily involve some form of contrasting social belonging:

> The care of the self cannot appear and, above all, cannot be practiced simply by virtue of being human as such, just by belonging to the human community, although this membership is very important. It can only be practiced within the group, and within the group in its distinctive character. (Foucault 2005: 117)

I think that, for the sake of this article at least, Deleuzian milieus and the intense affective commerce they generate are consisting and 'distinctive' enough to be envisaged not only as academic circles, but as potential forms of the kind of spiritual or ethopoietic groups Foucault alludes to.

From this (insider) perspective, the first element that I would like to discuss in echo to Hallward's critique is the danger of becoming beautiful souls. As far as I know, Hallward does not directly use this term to describe Deleuze's position; nonetheless, it is easy to imagine how he could have done so, describing a Deleuzian subjectivity that refuses acting, moving out of history and in order 'to preserve the purity of its heart, flees from contact with actuality' (Hegel 1967). Interestingly, Deleuze himself discusses the problem of the beautiful soul in the preface of *Difference and Repetition* and later in this same book:

> There are certainly many dangers in invoking pure differences which have become independent of the negative and liberated from the identical. The greatest danger is that of lapsing into the representations of a beautiful soul: there are only reconcilable and federative differences, far removed from bloody struggles. The beautiful soul says: we are different, but not opposed. [...] The *notion of a problem*, which we see linked to that of difference, also seems to nurture the sentiments of the beautiful soul: only problems and questions matter. (Deleuze 1994: xx; original emphasis)

This passage strikes me as a quite convincing description of an obvious tendency among contemporary academic Deleuzians, a tendency disturbingly compatible with communicational consensus and open-ended relational aesthetics. Indeed, it is easy to imagine how a misunderstood philosophy of difference can very well blend with existential liberalism, or how a vulgar understanding of Nietzsche's critics of resentment can fit with omnipresent psycho-pop positive thinking and its horror of 'negative feelings'. Here, one might think of Žižek's famous characterisation of North Americans as natural-born Deleuzians, suggesting that Deleuze's philosophy is perfectly suited for late capitalist yuppies (Žižek 2004: 183). Or again, as Stengers puts it in her discussion about how the capacities of practitioners must be conceived of as *situated*: 'When it is a question of "politics", even cosmopolitics, this constraint is crucial if we are to avoid the trivial dream of an angelic future: souls, now without bodies, would assume a relationship of perpetual peace' (Stengers 2011: 395).

Deleuze spells out the danger of the beautiful soul by asserting not only the affirmative and potentially aggressive and selective power of difference, but also the contractive power of wrath,[1] although adding that practical struggles or 'Revolution never proceed by way of the negative' (Deleuze 1994: 208). Significantly, as he contemplates the danger of the beautiful soul, Deleuze ultimately invokes Marx as some sort of political guarantee against it: 'Differences, nothing but

differences, in a peaceful coexistence in the Idea of social places and functions … but the name of Marx is sufficient to save [the philosophy of Difference] from this danger' (207). The idea of revolution deprived of its negativity is not politically radical enough in the eyes of Žižek, Hallward and the like. For them, the invocation of Marx here does not preserve Deleuze from ultimately being a mere 'spiritual' thinker, unable to properly and wilfully face 'the abyss of the [revolutionary] act' (Žižek 2002: 8).

II. Redemption or Dramatisation?

Hallward's reading of Deleuze aims to unveil the unifying redemptive logic he finds at work in his philosophy. Part of the interest and originality of Hallward's reading is that it gives great importance to the idea of becoming-imperceptible, which he describes as the 'exclusive telos' and 'the redemptive re-orientation of any particular creature towards its own dissolution' (Hallward 2006: 3). I will propose an alternative analysis of this undoubtedly crucial idea in the following section. For now, suffice it to say that Hallward considers Deleuze's philosophy as a way to escape the world's actual constraints, a dematerialising body of thought 'oriented by lines of flight that lead out of the world' (3), toward blissful virtuality. In this perspective, becoming-imperceptible constitutes the utmost expression of Deleuze's spiritual attempt at self-virtualisation.

Hallward situates Deleuze's thought as part of a 'late-modern revival of post-theophanic conception of thought' (Hallward 2006: 160), that is, a conception of the world in which 'God expresses himself in all things, and all things are an expression of God' (5). Hallward considers that this theophanic conception of the world merges with what he calls a 'singular mode of individuation', defined as an ongoing, self-constituent process of differentiation 'that creates its own medium of existence or expansion' (xii). Hallward identifies this logic of the singular as the main *modus operandi* of postcolonial studies:

> Singular configurations replace the interpretation or representation of reality with an immanent participation in its production or creation: in the end, at the limit of 'absolute postcoloniality', there will be nothing left, nothing outside itself, to which it could be specific. (Hallward 2001: xii)

Opposed to that logic of the singular we find what Hallward calls the specific, a mode of apprehending the real that takes into account the actual constraints of the material and historical world. The specific is

'the space of the historical as such [...], the place where we make our own history, but not in the circumstances of our choosing' (Hallward 2001: xii). What matters here is how this specific, historical materialist approach is said to allow for an 'active negotiation of relations and the deliberate taking of sides, choices and risks' (xii), while the singular logic tends to dissolve any subject–subject or subject–object relation into one 'beyond-subject' (5). The keywords here are of course 'active', 'deliberate', 'choices' and 'risks', as opposed to a presumably passive process of dissolution into the Oneness of Being.

That being said, what is most striking in Hallward's description of Deleuze's project is how little specific he is in associating Deleuze with just about any religious strands of thought. In his quite influential 1997 article 'Gilles Deleuze and the Redemption from Interest', Hallward even draws a parallel between Deleuze and Saint Paul, simply because the later also favours an 'other-worldly redemptive force' (Hallward 1997: 6). This of course sounds retrospectively quite ironic when considering that one of Hallward's main philosophical influences, Alain Badiou, turns precisely to Paul in his *Saint Paul: The Foundation of Universalism* (1997) in order to further exemplify his notion of the Truth-Event and the conversion process of his 'subject to truth', as the title of Hallward's book on Badiou goes.[2] Fortunately though, in *Absolutely Postcolonial* and *Out of this World*, Hallward becomes somewhat more specific, dropping the reference to Paul and mostly insisting on Bergson, Spinoza, Ibn-Arabi, Suhrawardi, Meister Eckhart, Plotin, Eurigena and just about anybody part of the Neoplatonic tradition, suggesting that 'Deleuze's project resonates with and renews that "Oriental intuition" which Hegel found at work in Spinoza's philosophy' (Hallward 2006: 6).[3] To understand just how all these references ultimately work as an all-encompassing and virulent spiritual anathema, one has to keep mind that in his book *Absolutely Postcolonial*, Hallward comes to define the singular mode of individuation as some sort of creationist power, thus suggesting that 'Deleuze's philosophy might best be approached as the reinvention (in apparently post-Darwinian terms) of a genuinely contemporary version of radical creationism' (Hallward 2001: 15). In the endnote following this excerpt, Hallward indeed reveals that the title of the book on Deleuze he was working on at that time is entitled *Creationism in Philosophy: Deleuze* (342). Fortunately, Hallward was convinced in one way or another that it would be better to drop this reference to creationism, which indeed is nowhere to be found in what became *Out of this World: Deleuze and the Philosophy of Creation*. Nevertheless, I do believe this anecdote is most significant,

as it highlights Hallward's unspecific and largely instrumental use of the spiritual reference in his inquiry into Deleuze's philosophy.[4] In the end, one might ask: if Hallward really wanted to tackle the issue of the so-called redemptive or spiritual dimension of Deleuze's thought, should he not at least have considered minimally Deleuze and Guattari's crucial references to Taoism and witchcraft in *A Thousand Plateaus* (1987), those to Zen Buddhism in *Logic of Sense* (1990), or better still, his explicit insistence on the theme of belief in the world in *Time-Image* (1989) or to empiricist conversion in *What Is Philosophy?* (1994)? A little bit further but still not out of reach, could he not have taken a better look at Whitehead's crucial influence on Deleuze's cosmic vitalism, and how it potentially intersects with Process theology?[5]

The main reason why Hallward believes he can call Deleuze a redemptive philosopher without considering Deleuze and Guattari's enunciative position as sorcerers in *A Thousand Plateaus* and their almost indecent reference, academically speaking, to Carlos Castaneda's initiatory journey, and more generally, to anything that would bring us closer to what in *Anti-Oedipus* (1983) is defined as the 'living center of matter' (Deleuze and Guattari 1983: 19), has probably to do with how he fully endorses Badiou's interpretation of univocal ontology as a mere variation amongst neoplatonic philosophies of the One. Here, I agree with Daniel Smith when he suggests that 'one must not be led astray as [Alain Badiou seems to have been] by the prefix "uni" in the term "univocity": a univocal ontology is by definition irreconcilable with a philosophy of the One' (Smith 2001: 174). Along the same line, I would argue that Badiou's and Hallward's overtly metaphysical readings hypostase Deleuze's dramatic movement of thought, systematically missing the practical and ethical horizon in which speculative propositions concerning univocity can be judged properly – is it not for this very reason that Spinoza's ontology is called an *ethics*? Hallward largely ignores the question of the modes of existence and its corresponding material passages and ethical *mises en jeu*. He consistently leaves aside all these moments where Deleuze describes and stages movements of plunging into chaos, dramatic passages on the line, struggles for creating planes of consistency, all of which concern the lived relation to events in the first place. 'The whole world had passed what seemed like a physical crisis point', Deleuze writes in *Difference and Repetition* (Deleuze 1994: 189); 'The event, once willed, is actualized on its most contracted point, on the cutting edge of an operation' (Deleuze 1990: 149); 'A concept is therefore a chaoid state par excellence; it refers back to a chaos rendered consistent,

become Thought, mental chaosmos. And what would thinking be if it did not constantly confront chaos?' (Deleuze and Guattari 1994: 208); or again, on a more openly revolutionary mode:

> 'We' must condense all the singularities, precipitate all the circumstances, points of fusion, congelation or condensation in a sublime occasion, Kairos, which makes the solution explode like something abrupt, brutal and revolutionary. Having an Idea is this as well. It is as though every Idea has two faces, which are like love and anger: love in the search for fragments, the progressive determination and linking of the ideal adjoint fields; anger in the condensation of singularities which, by dint of ideal events, defines the concentration of a 'revolutionary situation' and causes the Idea to explode into the actual. It is in this sense that Lenin had Ideas. [. . .] Anger and love are powers of the Idea. (Deleuze 1994: 190–1)

With Hallward, we simply lose sight of this type of critical passage: everything is said to divinely flow upward on some sort of philosophical stairway to heaven, in a unilateral (and apolitical) movement toward God and its own redemptive dissolution. Instead of putting so much emphasis on the theophanic, it would have been much more interesting to see Hallward discussing Deleuze's conception of the dynamic and dramatic processes by which Ideas are actualised and differentiated. It could have brought him to ask Deleuze, more than thirty years after Maurice de Gandillac: 'Is your dramatization a theodicy?' (Deleuze 2004: 107)

In the last instance, what is at stake here is Hallward's transcendentalist and deeply voluntarist interpretation of creation in Deleuze's philosophy. Like God, creation is everywhere in Hallward's book: every single chapter's title in *Out of this World* bears mention of it. And even if he does not explicitly refer to creationism any more, one cannot miss how he conceives of creation in a manner as voluntaristic as a creationist might imagine God's initial act of creation to be. If Hallward proves himself to be so blind to the corporal and transversal dimension of creative passages and transmutations in Deleuze, it is because his radically voluntarist political stance makes him totally oblivious to the question of the soul and its contractive power, or what Deleuze, in the conclusion of *What Is Philosophy?*, calls 'the mystery of passive creation, sensation' (Deleuze and Guattari 1994: 212). Deleuze's cosmic vitalism indeed requires a conception of creation that is not simply a matter of how to actively access God or the Truly Creative as Hallward would like us to believe. It always involves an intimate and complex relation to an outside felt as necessity and imposing its

corporeal constraints. This is precisely what Deleuze means when, in a crucial passage of *Time-Image*, he requires a (forced) body for thought:

> 'Give me a body then': this is the formula of philosophical reversal. The body is no longer the obstacle that separates thought from itself, that which it has to overcome to reach thinking. It is on the contrary that which it plunges into or must plunge into, in order to reach the unthought, that is life. Not that the body thinks, but, obstinate and stubborn, it forces us to think, and forces us to think what is concealed from thought, life. Life will no longer be made to appear before the categories of thought; thought will be thrown into the categories of life. The categories of life are precisely the attitudes of the body, its posture. 'We do not even know what a body can do': in its sleep, in its drunkenness, in its efforts and resistances. To think is to learn what a non-thinking body is capable of, its capacity, its postures. (Deleuze 1989: 189)

To put it in other words: one has to feel oneself as trapped (*s'éprouver coincé*) (Deleuze 1989: 170), for 'creation takes place in choked passages' (Deleuze 1995: 133). Paradoxically enough considering Hallward's view on the matter, it is perhaps the very idea of becoming-imperceptible and its embedded reference to China that best illustrates how creation in choked passages and dramatic becomings *actually* take place in a Deleuzian perspective.

III. China and the Line[6]

> *To have become a line was a catastrophe, but, even more, it was a surprise, a prodigy*. All of me had to pass along this line. *And with the most appalling jolts*.
>
> Henri Michaux [1956] 2002: ch. 5, 'Experimental Schizophrenia'; my emphasis

At the core of Hallward's peremptory dismissal of Deleuze's philosophy's political relevance, we find the concept of becoming-imperceptible. And at first sight, Hallward does seem to have a point: for what does it mean to pass along the lines of creation and become-imperceptible, if not to vanish and dissolve in cosmic anonymity? Is that all that Deleuzian micropolitics has to offer? In what sense is becoming-imperceptible supposed to allow for renewed ways of conceiving the production of political subjectivities in a time of media saturation and global mobilisation? In what way does it contribute to a 'redemptive' interruption of the flow of information or connect with Deleuze and Guattari's famous statement about how, nowadays, 'we do not lack

communication [...] we lack resistance to the present?' (Deleuze and Guattari 1994: 108)

Considering Hallward's spiritual anathema and the way he confines Deleuze's philosophy to be a mere theophanic extension of some 'oriental intuition', what is most delightfully striking perhaps in the unfolding of the idea of becoming-imperceptible is to see just how embedded in the Far East it appears to be in the first place. For a close reading of Deleuze and Guattari's *A Thousand Plateaus* reveals something that has remained relatively unnoticed among Deleuze and Guattari's readers: the progressive emergence of the concept of becoming-imperceptible in that book is intimately intertwined with references to China, the main one referring to the figure of the Chinese traditional painter-poet. Significantly, while going into much detail when elaborating his wild spiritual orientalist argument about a post-theophanic Deleuze with the becoming-imperceptible for 'exclusive telos', Hallward simply ignores the very poetics of this crucial idea, which is not theophanic at all and refers to what could arguably be considered one of Deleuze's (and Guattari's) most significant engagements with the Non-West in his work – namely China.[7]

The first reference to China in *A Thousand Plateaus* is made right in the introduction, amidst a discussion opposing transcendence and the search for the root-foundation, 'a specifically European disease' as Deleuze and Guattari say (1987: 18), and oriental immanence and its rhizomatic structure. 'Of course it is all too easy to depict an Orient of rhizomes and immanence', they write (20); and in fact, they do not insist much on this contrast. But it is in this context that an image appears, an image that will permeate the entire book, that of grass:

> China is the weed in the human cabbage patch... . The weed is the Nemesis of human endeavor... . Of all the imaginary existences we attribute to plant, beast and star the weed leads the most satisfactory life of all. [...] Eventually the weed gets the upper hand. Eventually things fall back into a state of China. The weed exists only to fill the waste spaces left by cultivated areas. It grows between, among other things. The lily is beautiful, the cabbage is provender, the poppy is maddening—but the weed is rank growth ...: it points a moral. (Miller, cited in Deleuze and Guattari 1987: 18–19)

This first reference, through Henry Miller's work (it is a quote from his *Hamlet*), is quite unaccommodating, seemingly giving way to an unrestricted orientalism. But *A Thousand Plateaus* is not exactly concerned with questions about adequate or politically correct cross-cultural representation or of how to talk properly of the cultural 'other'.

In fact, if they do question rapidly the validity of such a delirious description of a weed China, they immediately redirect this interrogation into an openly prospective sense: 'Which China is Miller talking about? The old China, the new, an imaginary one, or yet another located on a shifting map?' (Deleuze and Guattari 1987: 19) The question of an adequate representation of the cultural other is thus methodically let in abeyance. Methodically, that is, insofar as the introduction of *A Thousand Plateaus* seeks to define a method not so much to describe but to effectively reach for the multiple.

The first seven chapters of *A Thousand Plateaus* read as so many approaches toward a radical critique of psychoanalysis, linguistics and ultimately, of the problem of the signifier. Progressively, the idea of making the multiple takes shape, through concepts like collective assemblages of enunciation (*agencement collectif d'énonciation*) and the Body without Organs, up to the asserted necessity of 'undoing the face':

> If human beings have a destiny, it is rather to escape the face, to dismantle the face and facializations, to become imperceptible, to become clandestine, not by returning to animality, nor even by returning to the head, but by quite spiritual and special becomings-animal, by strange true becomings that get past the wall and get out of the black holes, that make faciality traits themselves finally elude the organization of the face. (Deleuze and Guattari 1987: 171)

The expression 'escaping the face' marks a distance in relation to antagonistic models (face-to-face politics, so to speak), and defines a micropolitical field characterised by the exigency to dis-occupy identity. It is in the midst of this philosophical journey that we find the second Chinese reference, which comes up in a totally unexpected way – a rapturous line of flight: 'Cross the wall, the Chinese perhaps, but at what price? At the price of a becoming-animal, a becoming-flower or rock, and beyond that a strange becoming-imperceptible, a becoming-hard now one with loving' (Deleuze and Guattari 1987: 187). If the Chinese reference here remains quite unspecific (which Chinese are we in fact talking about?), its direction and its function, nonetheless, are indisputable: it is a breach made in the horizon of the signifier, a vanishing point from which to organise an escape. But this remains nevertheless all too abstract. We lack an indispensable relay between 'making the multiple', 'undoing the face' and 'becoming-imperceptible': art, an artistic doing, which the third reference makes more intelligible.

The conception of art exposed in *A Thousand Plateaus* takes on the developments on incorporeal transformations and the shaping up

of bodies that were initiated in the discussion on linguistics and the signifier. For Deleuze and Guattari, it is never something like art for art's sake that is at stake, but a conception of art that directly involves *life*:

> Art is never an end in itself; it is only a tool for blazing life lines, in other words, all of those real becomings that are not produced only in art, and all of those active escapes that do not consist in fleeing into art, taking refuge in art, and all of those positive deterritorializations that never reterritorialize on art, but instead sweep it away with them toward the realms of the asignifying, asubjective, and faceless. (Deleuze and Guattari 1987: 187)

Deleuze and Guattari insist repeatedly on the active nature of the line of flight, which is never a flight into passivity or imagination. If that was the case, it would immediately lose its political dimension, as Hallward misguidedly suggests. The theme of the line, which runs through all of *A Thousand Plateaus*, ties together art, politics, ethics and the cosmic. And it is precisely in this passage from ethics to the cosmic that we find the third reference to China. In the chapter 'Becoming-intense, Becoming-animal, Becoming-imperceptible', the work on oneself and the cosmic dimension it involves are summed up in the idea of 'becoming like everybody else'. First, the properly ethical challenges are brought forth:

> If it is so difficult to be 'like' everybody else, it is because it is an affair of becoming. Not everybody becomes everybody [and everything: tout le monde – trans.], makes a becoming of everybody/everything. This requires much asceticism, much sobriety, much creative involution: an English elegance, an English fabric, blend in with the walls, eliminate the too-perceived, the too-much-to-be-perceived. (Deleuze and Guattari 1987: 279)

Deleuze and Guattari insist on the very materiality of this work of elimination and reduction at the level of the living tissues of the human. They then write: 'By process of elimination, one is no longer anything more than an abstract line' (Deleuze and Guattari 1987: 280). What matters here is that this becoming-line involves a radical putting at stake of existence, in the realm of impersonality. Becoming-line is a highly dramatic contraction – a life in one stroke, a stroke of life.

To become-line is never to close oneself up: on the contrary, it is an essential condition to communicability and availability, a way to directly participate in the gestation of the world. 'Becoming everybody/everything (*tout le monde*) is to world (*faire monde*), to make a world' (Deleuze and Guattari 1987: 280). Drawing lines that world: this is the meaning of the becoming-imperceptible and everybody put forth in *A Thousand Plateaus*. It is in this very passage of the

becoming-line and the making-world that we find the third Chinese reference, which is undoubtedly the most serious and suggestive one. At the meeting point of ethics and the cosmic, Deleuze and Guattari encounter the traditional Chinese painter-poet as described by François Cheng in *L'Écriture poétique chinoise*. A painter-poet that, instead of pursuing the resemblance, 'retain[s], extract[s] only the essential lines and movements of nature' (280): an artist-abstractor that is therefore 'not imitative or structural, but cosmic' (280). The Chinese artist invoked in *A Thousand Plateaus* is the figure who, after ethical work on herself, is able to make of the world a becoming, to pass entirely along the lines she draws, in the impersonality of creation. 'One is then like grass', Deleuze and Guattari finally say, 'because one has made a necessarily communicating world, because one has suppressed in oneself everything that prevents us from slipping between things and growing in the midst of things' (280). It is perhaps Li He, a Buddhist Chinese poet of the late Tang dynasty, who best sums up this etho-cosmic participative becoming with the world:

> The brush perfects the creation
> Heaven has not all the merit! (Cheng 1996: 17)

After this close reading of the emerging of the idea of becoming-imperceptible in *A Thousand Plateaus*, a question remains: does the micropolitical horizon of thought, culminating in the idea of becoming-imperceptible, really lead to any actual production of political subjectivities? Do we not find in it the seed of a form of life exclusively concerned with existential flexibility and ways of adapting to all circumstances, in brief, a perfect guide for survival in the era of neoliberal productivism and globalisation of precariousness? Rancière, for example, is categorical: indirectly criticising Deleuze among others and disqualifying any focus put on metamorphosis and becomings, he unambiguously states: 'There is no such thing as Dionysian politics' (Rancière 1998: 200).

The becoming-imperceptible and the becoming-line involve a dramatic experience of stifling or of ethopoietical claustrophobia, as Wittgenstein would put it. There lies the politics of contraction that innerves all of Deleuze's work: choked passages where one experiences oneself as stuck, plunges into chaos from which no one comes back unscathed. *A Thousand Plateaus*' reference to Henri Michaux is crucial here, with his evocation of 'major ordeals of the mind' and other 'miserable miracles', accelerated linearity experienced in the flesh and moments of schizophrenia that tear down the sphere that we normally are and in

which we 'survey panoramas' (Michaux [1956] 2002: ch. 5). Michaux's description of the passage along the line (cited in the epigraph of this section) expresses a sense of danger, a perilous threshold, a challenge which is simultaneously intimate and tearing off the outside: to become a line, 'only a line', the horror of a line along which 'all of me had to pass'. This 'all of me' suggests something both necessary and exhaustive: the concentration of oneself must be total; its achievement cannot suffer any failing; it is all or nothing. It is by this very condition, it is according to this capacity or power that the body can find and create new marks. The passage along the line entails a transformative interruption of the ordinary relation to oneself. It involves a performative moment 'on the line', in which the movement of abstraction ensures its unity, or better, its watertightness. The becoming-line is a moment of sustained tension, a moment of anonymity in the surpassing of oneself, a dramatic desubjectivation that ultimately amounts to an interruption of the identity service. And this process of desubjectivation can as well give way to a becoming-Chinese.

IV. (Un)timely Contractions

In the conclusion of *Out of this World*, Hallward claims that 'by posing the question of politics [. . .] in the apocalyptic terms of a new people and a new earth [. . .], the political aspect of Deleuze's philosophy amounts to little more than utopian distraction' (Hallward 2006: 162). In the light of this article, we can easily imagine that what Hallward intends by 'apocalyptic politics' is yet another way to evoke the redemptive dissolution of all things in the ecstatic process of absolute creation. Yet, to a certain extent, I agree with Hallward that Deleuze's politics does involve some sort of apocalyptic component. One might think of *Difference and Repetition*'s foreword here, with its somewhat cryptic affirmation that this book 'should have been an apocalyptic book (the third time in the series of times)' (Deleuze 1994: xxi); or again, in the conclusion of *What Is Philosophy?*, where we read that as the brain plunges into chaos, 'In this submersion it seems that there is extracted from chaos the shadow of the "people to come" in the form that art, but also philosophy and science, summon forth' (Deleuze and Guattari 1994: 218). But instead of interpreting these passages in terms of ethereal or utopian dissolution, I believe we should read them in terms of ethical, aesthetical, political and, ultimately, *temporal contractions*. Redemption? A limit happens – and in its drawing, a virtual becoming-line.

In this regard, and as far as a people to come is concerned, I would suggest, following Agamben's distinction in *The Time that Remains*, that the word 'messianic' is more accurate than 'apocalyptic' to describe this process of temporal-liminal contraction. For are we not intimately confronted here with the very necessity of a time-image, that is, not an image of the end of time (apocalypse proper), but rather an image to bring (chronological) time to an end – a messianic or contracted time thus understood as 'the time the mind takes to realize a time-image' (Agamben 2005: 66)? What matters here is how value is introduced in the world, or in other words, how a certain mode of existence is intensified and brought to its creative limit. To believe in the world, then, is indiscernibly active and passive; it is to contemplate – and *be contracted*.

It is a convincing account of this movement of exacerbation of difference or (un)timely contraction which is utterly missing in Hallward's reading of Deleuze. Nowhere is it clearer than at the very point where Badiou paradigmatically extracts, in a typical bad-faith-subject-to-truth way, the expression that will become his war cry against Deleuze: 'the Clamor of Being'. As is well known, the expression is taken from the very last lines of *Difference and Repetition*, which read as follows: 'A single and same voice for the whole thousand-voiced multiple, a single and same Ocean for all the drops, a single clamor of Being for all beings: [. . .]'. Everything happens as if Badiou has stopped reading at this point and refuses to consider what follows the colon, that is, the affirmation of the disjunctive and dramatic play of difference and repetition as such: ' . . . on condition that each being, each drop and each voice has reached the state of excess – in other words, the difference which displaces and disguises them and, in turning upon its mobile cusp, causes them to return' (Deleuze 1994: 304).

If we define politics as a matter of contraction in the element of ethics, the problem of believing in this world becomes politically crucial and should not be confused with any simple wilful belief or 'will of the people', as the title goes of one recent article by Hallward. In order to be brought to a level of political intensity, the problem of believing in the world, in this 'specific' world, requires envisaging a *singular end* to it – its Eternal Return, in the terms of *Difference and Repetition*. A singular end thus, so that

> Difference may at last be expressed with a force of anger which is itself repetitive and capable of introducing the strangest selection, even if this is only a contraction here and there – in other words, a freedom for the end of *a* world. (Deleuze 1994: 293; my emphasis)

Notes

1. 'Nevertheless, we believe that when these problems attain their proper degree of *positivity*, and when difference becomes the object of a corresponding *affirmation*, they release a power of aggression and selection which destroys the beautiful soul by depriving it of its very identity and breaking its good will' (Deleuze 1994: xx; original emphasis).
2. Hallward would probably reject this rapprochement altogether, since he disagrees in the first place with Žižek's idea that 'religious revelation is the unavowed paradigm of his [Badiou's] notion of the Truth-Event' (Žižek 2000: 183), arguing instead that 'the model for Badiou's fidelity is not religious faith but mathematical deduction pure and simple' (Hallward 2003: 149).
3. Perhaps due to the excitement of having found yet another religious reference in Deleuze's writing, Hallward symptomatically misreads a reference to Zen Buddhism in *What Is Philosophy?* (Hallward 2001: 11), missing the yet simple fact that in this passage, Deleuze and Guattari establish a correspondence between Zen Buddhism and Wittgensteinian 'silence of logic', *not* with their own philosophy (Deleuze and Guattari 1994: 140). For a more conclusive reference to Zen Buddhism in Deleuze's philosophy, Hallward should have looked, for instance, at the passages in *Logic of Sense* where he discusses the wise (stoic) man's humoristic stance and the ethics of the mime.
4. Hallward's demeaning use of the word 'creationism' should therefore be radically contrasted with Guattari's 'axiological creationism'. 'The (Guattarian) "creationist" perspective celebrates the existence of every given type of being that specifically poses the question of what counts for its mode of life. Axiological creationism concerns the production of existence for everything for which existence implies a "gamble", a risk, the creation of a point of view about what, from then on, will become a milieu' (Stengers 2010: 37). Note that Guattari's notion of creationism involves a radical implication *in* the world and the production of a highly specific mode of existence.
5. For an interesting discussion of the partly missed encounter between Deleuze and Process Theology, see Isabelle Stengers, 'Beyond Conversation. The Risks of Peace' (2002).
6. This section is a condensed and revised version of 'La Chine et la ligne. Une étude de la référence chinoise dans *Mille Plateaux*' (Bordeleau 2009).
7. In Deleuze's later books, there are at least three other significant references to the East, each of them being irreducible to Hallward's simplistic theophanic schema. In his *Foucault*, the Far East is associated with a 'culture of annihilation' (Deleuze 1988: 106); in *The Fold*, with what he calls the 'Eastern line' as opposed to the full Baroque line. Then, in *What Is Philosophy?*, Deleuze discusses his notion of the plane of immanence in contrast with François Jullien's idea of an 'absolutisation of immanence' found in antic Chinese thinking (Deleuze 1994: 74). From the perspective of the production of subjectivities, it is certainly the passage in *Foucault* that is most interesting. In the chapter 'Foldings, or the Inside of Thought', a certain Orient is opposed to the Western subjective folding: 'The appearance of a folding of the outside can seem unique to Western development. Perhaps the Orient does not present such a phenomenon, and the line of the outside continues to flow across a stifling hollowness: in that case asceticism would be a culture of annihilation or an effort to breathe in such a void, without any particular production of subjectivity' (Deleuze 1988: 106). For a more detailed discussion of this passage in relation with the Chinese-Buddhist idea of inferno, see Bordeleau 2013.

Deleuze, the '(Si)neo-realist' Break and the Emergence of Chinese Any-now(here)-spaces[1]

David H. Fleming University of Nottingham Ningbo China

Abstract

By creatively expanding Deleuze's concept of the time-image crystal, I productively fold together and engineer an encounter between two comparable cinematic movements otherwise separated by huge vistas of time and space. Here, I work to plicate the post-war Italian neorealist movement which Deleuze saw inaugurating the modern cinema, with a 'postsocialist' mainland Chinese movement that I playfully call '(si)neo-realism'. The films of both historical moments formulate comparable break-away cinemas which are often considered moral or socially responsible art cinemas best approached through André Bazin's 'ontological' film philosophy lens. By using Deleuze, however, I hope to move beyond these realist discussions to explore how both movements are also fruitfully thought in terms of introducing distinct yet analogous mental relations into the image during historical junctures defined by radically transforming psycho-geographies. Like Deleuze's discussions of neorealism, (si)neo-realism is considered a loose impulse or mode that collectively bears witness to confusing and bewildering mental experiences from within a turbulent period of cultural, ideological and historical upheaval: which demands new ways of perceiving, thinking and acting. Without wanting to fall into a problematic auteur paradigm, I necessarily employ the films of Wang Xiaoshuai as emblematic examples of the wider impulse or trend. Indeed, Wang's films perfectly reify a new ethico-aesthetic form of Chinese cinema marked by a proliferation of new spaces, characters,

experiences and narrative structures. Here, I also strive to do what Deleuze did not in his writing upon film, and explore the break-ups, breakdowns and breakthroughs in specific relation to a complex contextual web of political and cinematic ecosystems. Throughout this process I try to put Deleuze to work by using the films and context to re-interrogate and re-evaluate the time-image models as they appear within and across his *Cinema* books.

Keywords: Deleuze, Chinese cinema, André Bazin, neorealism, time-images

I. Introduction

Since the 1990s, mainland China's biggest contender for an 'alternative' or 'break-away' cinema has been pinned to a loose band of maverick directors hailing from what has variously been called the Postsocialist, Post-Wave, Newborn-, Sixth-, Post-Sixth-, or Urban-Generation of filmmakers. This mixed grab bag of directors boasts state-school graduates from the Fifth-, Sixth- and D-Generations respectively, alongside a wider cohort of amateur and non-professionals.[2] The films are usually assembled on account of a perceived predilection for an unpolished style, raw gritty realism, Art film ethico-aesthetics, or for unflinchingly focusing upon social problems affecting the culture's non-official underbelly. Over the past twenty years the impulse has often been branded an underground, avant-garde or – if one buys into the self-aggrandising myths – 'illegal' cinema.[3] If we uncritically accept the 'Banned in Beijing' branding many of these films receive, we also necessarily confront one of film history's most glaring ironies. For these films are deemed inappropriate on account of exposing issues of class inequality, powerlessness and systemic corruption confronting individuals (and groups) under an insidious system of capitalism and foreign influence (globalisation): which is to say, exactly the sort of stories previously sought by the ruling Party to propagandise and extol the virtues of communism. Beyond this historical repetition (or Nietzschean return) in the form of political farce, any opprobrium or unfavourable domestic reception must be linked to the filmmakers' adoption of a warts-and-all 'docu-style' that seditiously records China's profoundly uneven and unprecedentedly rapid process of modernisation and globalisation.

The new impulse crystallised in Wang Xiaoshuai's *The Days* (1993) and Zhang Yuan's *Beijing Bastards* (1994), with both being observed

to blur the boundaries between documentary and fiction in Chinese cinema for the first time. Each embraced a low-budget 'on the street' video style, to relate dispersed and distended narratives that traced the interweaving lives of disaffected artists and social outsiders. Thereafter a growing wave of stark realist films – including *Postman* (1995), *On the Beat* (1995), *Pickpocket* (1997), *So Close to Paradise* (1998), *I Love Beijing* (2000), *Beijing Bicycle* (2001), *The World* (2003), *Blind Shaft* (2003), *Drifters* (2003) and *Lost in Beijing* (2007) – aesthetically, formally and politically (or in various combinations thereof) followed suit, by focusing upon disempowered characters confronting new social problems and ideological/identity issues.[4] By sharing common ethico-aesthetic characteristics, the films can be understood as delimiting the territories of a loose movement or style which typically focuses upon disempowered or disenfranchised agents, underclass migrants or adult-children struggling to come to terms with China's rapidly transforming socio-political psycho-geography.

The multiplicit movement is often understood as marking a decisive break with China's established artistic and 'literary' cinematic traditions; especially its national and nation-building models. The decidedly alien politics and aesthetic have often forced domestic and foreign critics to seek international trends or movements for comparison, or to help describe the texture and feel of the new impulse. The renewed drive for stark social (as opposed to socialist or revolutionary) realism, for instance, leads many to compare the trend to a post-war European vérité or neorealist style (see *inter alia* Wright 2001; Zhang Yingjin 2006, 2007; Berry 2006, 2007; Johnson 2006; Tonglin Lu 2006; Braester 2007; Reynaud 2007). Such discourses often emerge alongside a renewed critical encounter with André Bazin's neorealist exegesis and/or ontological writings. And although these coordinates remain useful, and undoubtedly enrich any consideration of the Chinese films, I maintain that beyond the obvious drive for higher levels of social realism, the films also appear symptomatic of a more fundamental philosophical and ideological rupture, which erects thought-provoking parallels with Deleuze's philosophical writing on the neorealist tradition. Taking Deleuze's lead, I argue that the Chinese films can also be understood as part of a wider response to comparably disorienting and confusing experiences emerging in the wake of disjunctive and disruptive historical events. Indeed, many critics discuss the Chinese films' reflecting a cultural zeitgeist, or marking a significant 'paradigm shift' (Lai 2007: 232) in Chinese filmmaking linked to a wider 'existential crisis' (Zhang Yingjin 2007: 49). Such views also invoke Deleuze's writing

upon the Italian post-war cinema, then, and can help account for a motific loosening of action-image drives, the introduction of new mutant characters, the breaking down of traditional ways of perceiving and acting, and the introduction of new mental relations into the image. Elsewhere I ultimately maintain that these films set the scene for the full-blown emergence of a PRC time-image within Lou Ye's *Suzhou River* (2000): a film I read as an autodidactic philosophical equivalent to *Last Year in Marienbad* (1961), and which for Deleuze, following André Labarthe, was the apogee and 'last of the great neo-realist films' (see Deleuze 2005b: 7; Fleming 2014).[5]

For me, the Chinese impulse autodidactically reifies or transmutates what Bazin and Deleuze each saw as the most important features and enduring value of the neorealist 'event'. Although some critics have already employed distinctly Deleuzo-Guattarian labels including 'minor' (Zhen 2007: 1) or 'nomadic' (Johnson 2006: 49) to describe this alternative film movement, I argue that Deleuze's neorealist time-image models offer the best ethico-aesthetic fit for explaining and understanding the wider movement. Conceptually expanding Deleuze's time-image crystalline model allows us to fold together, and engineer an encounter between, two historical movements otherwise separated by huge vistas of time and space. Here, plicating the post-war neorealist movement with a postsocialist mainland cinema that I playfully call '(si)neo-realism'.[6] For the sake of space, I predominantly limit analysis to key similarities and commonalities flowing between the movements at the expense of differences, which are obviously multiple and vary in degrees. In passing we could enumerate the appearance of newer digital spaces and virtual communication realms opened up and explored in the modern Chinese films (such as the animated SMS spaces in *The World*, or the computer game realms in *Beijing Bicycle*), or the unique and key role of female directors in the Chinese movement (like Ning Ying or Li Yu, for example), or even some differences that are quasi-similarities, such as both movements employing operatic sounds from their respective national traditions to score images of poor marginal characters.

Although I necessarily skirt the work of multiple directors in a compare and contrast fashion, space dictates I limit the focus to the work of Wang Xiaoshuai, who offers himself up as the best fit for this particular exercise, not only because his films inaugurated the (si)neo-realist trend, but also because they remain emblematic of the wider impulse as the new millennium unfolded. What is more, in films such as *The Days*, *So Close to Paradise*, *Beijing Bicycle* and *Drifters*, Wang forces viewers to engage with time as a pertinent theme or loaded

and spatialised trope. More pragmatically, Wang also literally serves to bridge the Italian and Chinese traditions in both his capacity as board member for the *BigScreen Italia* film festival (a festival exclusively dedicated to links between Chinese and Italian cinemas) and on account of directing *Beijing Bicycle* (*Seventeen Year Old's Bicycle* in its Chinese formulation), which is an overt homage to, and expansion upon, Vittorio De Sica's 1948 masterpiece *The Bicycle Thieves*: which Bazin felt formulated the ultimate 'expression of neorealism' (Bazin 1999: 205).

As *Beijing Bicycle* constitutes Wang's most 'commercial' and internationally famous film to date, I use it here as a path into his lesser known or distributed works (and the movement more generally). Beyond being an updating and transmutation of an earlier film, *Beijing Bicycle* can be understood as an expansion of De Sica's work because it follows the dispersed and fragmented story of two interconnected characters linked by one stolen bicycle, as opposed to De Sica's sole focus upon Ricci (Lamberto Maggiorani). *Beijing Bicycle* first follows the story of the migrant worker Guei (Cui Lin) who uses the bike as a courier after having moved to Beijing from the countryside. The following section introduces a Beijing schoolboy called Jian (Li Bin) who buys the bike in a narrative ellipsis after it has been stolen from Guei. The film thereafter cuts back and forth between two patchwork assemblages of places, characters, relationships and desires that constitute the characters' lives. We follow Guei's hopeless search around Beijing for his missing bike, his somewhat contrived ('unrealistic'?) chance re-encounter, and subsequent battle to get it back from Jian; whom he and the audience assume stole it. Viewers learn Jian 'legitimately' bought the bike on the black market, though, and we see how the prized 'libidinal' (Lin 2009: 98) commodity helps him get a girlfriend and acceptance from bicycle-gang peers. The film's ethical texture is complicated by learning that Jian bought the bike illegally because his father failed to deliver on a promise: to gift him one if he succeeded at school. The boys thereafter attempt a doomed (quasi-socialist) time-share agreement, but problems and violence follow the bike, until the film ends with the brutal destruction of the bicycle and the savage murder of a gang member.

Wang employs the bike as a loaded and load-bearing prop, then, to help expose the changing reality of Beijing (and by extension China) as a material and ideological space and place, and as a tool to open up some of the different concomitant and heterotopic realities facing migrant and city people within the same mental-material spaces. Beyond its representational value, the bike also serves to affectively bring to the fore newer forms of implanted capitalist desire associated with objects

and commodities under China's rapid process of modernisation and globalisation. Besides plot and dispersed narrative structure, though, we must also question how it is that this film, or indeed the wider movement to which Wang belongs, reflects Italian neorealism as a historical movement and as a 'philosophical' cinema that provokes or stimulates new ways of perceiving and thinking. To do this we have to begin plugging Deleuze's film-philosophy into the sino-cinematic *mode*, albeit refraining from uncritically forcing Deleuze's (predominantly European) models onto or over an unwitting and uninviting Chinese movement. In striving to put the Deleuzian theory to work, we must also use the films to re-interrogate Deleuze's *Cinema* project, then, and employ the (si)neo-realist cinema to rethink the factors and conditions Deleuze originally attributed to the 'global' shift from movement- to time-image categories.

By using this modern Chinese movement to rethink Deleuze's film-philosophy on fresh terrain, this project necessarily follows in the wake of David Martin-Jones's pioneering work into world cinemas that threaten to destabilise Deleuze's *Cinema* project. Martin-Jones repeatedly illuminates how 'non-European' films challenge us to refine, adapt and develop Deleuze's global distinction between movement- and time-image regimes: whilst themselves encouraging a productive deterritorialisation of his models in relation to a wider cinematic context. Martin-Jones examines how Hong Kong films (a non-mainland Chinese national cinema) leading up to and overlapping the 1997 handover, for example, expressively toys with movement- and time-images as part of a wider response to an intense period of socio-political turbulence. He here deepens our understanding of how notions of national identity are historically constructed or delimited by film (Martin-Jones 2006). In *Deleuze and World Cinemas* (2011) he further deterritorialises Deleuze's Eurocentric models by exploring yet more moments of global crisis emerging during other historical junctures, all the while stressing that to better understand world cinemas, scholars must practise what Deleuze did not, and re-situate or re-connect discussions with the surrounding rhizomatic web of economic, social, historical, geopolitical and cultural forces affecting the cultures and filmmakers (Martin-Jones 2011: 16). Taking heed, I thus strive to contextualise the emergence of this new break by situating it within the historical and cultural (and cinematic) events that help constitute the before and after of the movement-event. I thereafter work to draw out Deleuze and Bazin's different philosophical approaches to neorealism, before using Deleuze to explore the aesthetic and stylistic features that link together this Chinese impulse with the earlier Italian movement. At this point, then, we must first turn to the

disjunctive or disruptive concept of a historical or 'cinematic' break typically used to frame and contextualise both movements, as this in part factored into what interested both Bazin and Deleuze in neorealism in the first place.

II. On Clean Breaks and Breakdowns

Deleuze argued the most decisive break in cinematic history was grounded in the aftermath of World War II, and was related to the breakdown of older ideological systems and the emergence of new experiences of space-time fostered by a devastated post-war situation and new atomic age. In cinematic terms, these contributed to a shift away from the classical action-image era of storytelling towards a new modulating (art cinema) time-image mode in the (predominantly) European context (Deleuze 2000). This period was concomitant with a return to cinematic or artistic *zero* by the Italian filmmakers who 'politically' sought to escape cinematic artifice and escapism (qua mindless entertainment). Much ink has already been spilled over the historical conditions and cultural context that Italian neorealism marks a break from. Deleuze, for example, predominantly linked it with a break from an American or Hollywood tradition, but it is also fruitful to point out that neorealism also marked a national break from the 'micro-fascist' escapist cinema of Mussolini. It is well known to nearly all Western film students that since the mid to late 1930s Italian cinema was tightly imbricated with church and fascist politics under Mussolini's Ministry of Popular Culture. And that after nationalising the industry, the Italian Dictator controlled filmmakers by schooling them at the new Centro Spermentale di Cinematografia: a state-sponsored film-school that encouraged the production of escapist 'white telephone films' which idealised patriarchal power and promoted obedience to state and family. With the advent of synchronised sound, Mussolini strove to foster a unified national identity by eliminating regional dialects or accents from domestic screens, forcing films to address audiences in an official standardised Italian for the first time. Until relatively recently, far less was taught about Chinese cinematic history and traditions in the Western university circuit, and although this is something being redressed by many institutions today, it is worth while taking time to sketch out what exactly constitutes the before and after of the (si)neo-realist movement.

We can begin with the founding of the People's Republic of China (PRC) in 1949, when the film industry was first nationalised.

Since then, Chinese filmmakers were retroactively and teleologically arranged into a chronological progression of generations, backdated to the 'First Generation' of silent pioneers. The newly nationalised industry then began operating under the strict control of the Chinese Communist Party's (CCP) Ministry of Culture, who no longer viewed film as entertainment, art or business. As the Party began exploring cinema's political potentials, the production of films began to dramatically increase, albeit from pre-production stages through scripting, shooting, post-production and distribution it was now open to the scrutiny and demands of various censorship bodies (Zhang Yingjin 2004: 191). If film was to be an important political tool, it was recognised that it would first have to start reaching greater numbers of Chinese citizens. This was immediately addressed, and by the end of 1950, 100 million extra people were able to watch new nation-building films: courtesy of the CCP training armies of projection teams, opening new exhibition sites, and creating 15,000 mobile projection units designed to take cinema to the remotest regions (see Zhang Yingjin 2004: 190–2; Bordwell and Thompson 2003: 405).

Zhang Yingjin argues the first waves of national cinema typically took the form of war films like *The Bridge* (1949), designed to rewrite modern history 'as a teleological process' (or action-image qua Deleuze) wherein the CCP steers the people from one victory to the next into a bright and prosperous future (see Zhang Yingjin 2004: 193). This politicisation of the cinema coincided with an audio transformation, as the majority of Chinese films began uniformly addressing audiences in the official state language of Mandarin for the first time.[7] Qua Benedict Anderson, the use of a fixed and stable language within a prescribed national border can be understood as a strategy to help foster and maintain an imagined solidarity and national community. What is more, under CCP rule almost all previous Chinese films – specifically the Second Generation's Golden era movies – were banned. In 1956 the Beijing Film Academy (BFA) was founded, as part of an attempt to restrict the training of filmmakers and limit their work to approved ideology (Nochimson 2010: 388).[8] Third Generation directors were thereafter schooled to produce nationalist communist agitprop fashioned after a Soviet model of socialist realism.

Throughout the 'Great Leap Forward' Bordwell and Thompson trace how mainland filmmakers faced intermittent periods of tightening control followed by relative relaxation, until the chaos of the Cultural Revolution (1967–72) ground the industry to a veritable halt, with only a few highly regulated films such as *The Red Detachment of Women*

(1970) and *Breaking with Old Ideas* (1975) being produced. Around 1978 the BFA reopened for business amidst the implementation of Post-Mao reform programmes. As China began to reshape and adapt to this 'New-Era', a new wave of Fourth Generation graduates began producing a series of 'scar dramas' that obliquely explored the traumatic aftermath of these turbulent times. This New-Era is broadly outlined in terms of gradual incremental reforms in China's agricultural and service sectors, and as bearing witness to the emergence of an embryonic mass consumer culture within key urban centres.[9] By 1986 ongoing systemic reforms witnessed China's film industry come under the control of a new State Administration of Radio, Film and Television (SARFT), which immediately began tightening up control measures. The Fifth Generation's rise to prominence during this era thus schizophrenically coincided with China's ever-tightening domestic control on filmmaking practice and a period of international 'opening up' heralded as the 'march into the world' (Zhen 2007: 3).

Facing stricter domestic control, many young directors began embracing overseas investment to produce personal projects, or utilising foreign locations for the editing and post-production of festival films that would be deemed politically unsanitary. Accordingly many produced films that tackled controversial subject matter or employed 'avant-garde' aesthetics. Directors like Zhang Yimou and Chen Kaige famously began entering their films into international festivals without submitting them to SARFT for permission to release. Their politically charged films helped the Fifth Generation gain international prizes and prestige, but domestic bans on films – like Chen's *Farewell my Concubine* (1994) – and the temporary blacklisting of filmmakers helped 'tame' the Fifth Generation's subversive side (see Zhu 2003: 143). The government also began closing the bureaucratic loopholes which allowed films to escape the scrutiny of censorship bodies, and in 1996 a law was passed making it illegal to produce any film outside the state-owned studio system (Berry 2007: 129).

As the Fifth Generation predominantly worked within the state studio system, Zhang Zhen and Xiaping Lin argue their subsequent waves of 'lavish historical melodramas' and 'cultural allegories' (Zhang Zhen 2007: 23) became 'main melody' films (Lin 2009: 93), that helped re-establish a predominantly fictional national cinema within China. For many it was to be the nonstate or so-called Sixth Generation, working in an 'independent' or 'underground' context, which would finally challenge China's monolithic national cinema models. Filmmakers like Wang and Zhang began making no- or low-budget films (latterly with

foreign or private investment), originally distributing them domestically through nonofficial video, VCD or DVD networks. These began focusing upon a new alienated or marginalised generation and character that was increasingly lost or confused within a rapidly and radically transforming country.[10] On account of this, many like Zhang Zhen claim a new 'minor cinema'[11] surfaced, featuring characters which Sheldon Lu in turn argues began displaying a paradigmatic 'unmooring of identities', that shifted away from the nation or village – the traditional sources of cinematic identity (Lu 2007: 138).

This Sixth Generation is often discussed in terms of being the first to openly receive transnational investment to make low-budget films that do not get official domestic releases. These filmmakers are also often discussed in terms of being exposed (in differing degrees) to key foreign directors and critics whilst at film school. Bazin often appears as a source of inspiration too, being singled out in discussions and interviews as a key influence. Martha P. Nochimson and Matthew David Johnson note that besides Bazin, the Sixth Generation were also exposed to/influenced by Robert Flaherty and Frederick Wiseman's documentaries (see Nochimson 2010: 390; Johnson 2006: 65), whilst Tonglin Lu, Tian Zhuandzhuang and Zhang Yingjin specifically point to the appearance of Italian neorealist films in the BFA diet as another major influence (Zhang Yingjin 2006; Jaffee 2006; Tonglin Lu 2006). Accordingly, critics often tease out the new impulse's Bazinian aesthetic preference for long takes and a 'hyperrealist aesthetic' that helps foreground 'the rawness and emotional charge of social experience' (Zhang Zhen 2007: 7). Other temper such discussions by claiming they also drew upon 'the Chinese legacy of critical realism' (Zhang Zhen 2007: 7), however, or the work of the new Chinese documentary filmmakers who ran a parallel and at times intersecting path (see Zhang Zhen 2007: 17; Berry 2007).

Zhu argues that because the Sixth Generation had such a diverse range of foreign and domestic influences, they were the first generation of Chinese filmmaker to produce films that were more 'cinematic than dramatic' (Zhu 2003: 166). But on account of excluding or overlooking the work of talented Fifth Generation directors like Ning Ying, who also displays a comparable style, the 'Sixth Generation' label has increasingly proved problematic. In the first instance, if this new impulse truly demonstrates a break with the older national traditions, it is questionable whether or not we should maintain a chronological ordering that implies the same national teleology or continuity. Many simply opt to describe the new impulse as part of an 'amateur' movement

(Jaffee 2006: 81; Zhen 2007: 17), or in terms of displaying 'anti-art' or 'degree zero' aesthetics (Johnson 2006: 68) different to the official films. Others stick to the renewed desire for higher degrees of realism as the most defining feature, reflecting upon a preference for a 'on-the-spot-realism' (Berry 2007: 123), 'negative poetics' (Lai 2007: 205), 'stream of life' style (Chaudhuri 2005: 98), or 'urban realism' (Reynaud 2007: 265). The 'realism' proved problematic for many Chinese critics and directors too, though, so some opt to outline the new approach in terms of a distinctive attitude that cuts across different genres, styles and generations (see Braester 2007: 161).[12] Lai and Zhu similarly opt to describe a style marked out by a 'pervasive pessimism' (Zhu 2003: 166) or new 'urban attitude' (Lai 2007: 206). Chris Berry offers an approach that helps re-establish connections with Deleuze, by arguing that the new documentary and fiction filmmakers came to operate under a new imperative to *get real*. Which is to say, at once an aesthetic drive to represent the social in a new (Bazinian) realist way, whilst simultaneously inferring another shade of meaning invoking the Western slang phrase to 'wise up' and 'stop dreaming' (Berry 2007: 114). This latter meaning again becomes suggestive of a Deleuzian movement of mind that is introduced into the thinking-image.

Historically, no consideration of this era and its new cinema can be complete – in Western academic discourses at least – without also addressing the 1989 Tiananmen Square massacre. Dror Kochan points out that it is near customary in Western discourses to link the new forms and characters to the aftermath of the brutal repression of democratic protesters. However, he also argues we must counterbalance this Western political obsession by paying attention to the wider Chinese context, and specific changes affecting a wider society as it came to terms with a profound crisis in its 'traditional' value systems and the loss of its cultural heritage (Kochan 2003). Indeed, this 'Post-New-Era' bore witness to an intensification of systemic transformations, which (contingently) heralded in a radical paradigmatic shift in China's future direction.

The famous Deng Xiaoping slogan 'To make money is glorious!' helps crystallise China's wider socio-political systemic reforms, which inexorably led toward the 'incursion of global capitalism' and the emergence of a 'ruthlessly advancing market economy' (Zhen 2007: 2–5). This marched in lock step with the largest human population shift the world has ever witnessed. And it arguably becomes in relation to these wider shifts, and the confusing experiences of suddenly confronting a new psycho-geography and overwhelming urban reality that many

of the (si)neo-realist films take as their subject. The title of Lin Xiaoping's book on Chinese Art and Film from this period, *Children of Marx and Coca-Cola* (2009), perfectly draws out the nature of the confusing material and ideological in-between space confronting this new generation of Chinese character, and hints towards the new disjunctive form of perception and action they must encounter and learn to understand. On account of these wider socio-geo-political transformations, many feel the new Chinese cinema is best approached through a critical lens of *postsocialism* (see for example Pickowicz 2006; McGrath 2007; Nochimson 2010).

Zhang Yingjin argues postsocialism should be understood as a specifically Chinese equivalent to Jean-François Lyotard's concept of *postmodernism*, and can be expanded to account for a diverse post-Maoist artistic-cultural landscape that includes a broad range of filmmakers hailing from 'different generations, aesthetic aspirations, and ideological persuasions [that] struggle to readjust or redefine their different strategic positions in different social, political, and economic situations' (Zhang Yingjin 2007: 50–2). Berry argues that postsocialism, like postmodernism, must be understood in terms of the stubborn persistence of grand myths (or narratives) long after any real faith in them has been lost (Berry 2007: 116). To bring back Deleuze momentarily, we could begin aligning this with his arguments regarding the modern cinema's playful awareness of the old clichés.

Before proceeding, we must take pause to highlight one significant industrial difference emerging between the Chinese and Italian film-histories. For in the Chinese context we cannot ignore the omnipresence of a parallel national (or nation-building) and commercial cinema that remains running alongside this alternative trend: as the production of epic clichés like *Founding of the Republic* (2009) attest. Against these ongoing official (action-image models) histories and archaeologies of the present, then, the (si)neo-realist films should be understood as recording and documenting an alternative history of the present or 'now'. That is, in difference and opposition to the complete demolition job that defines the before and after of the Italian neorealist impulse, the (si)neo-realist cinema is best understood in terms of a breakdown or partial architectural collapse, as if the ceiling and walls have crumbled in while the roof and façade remain standing.[13] This image of collapsing architecture serves to bring us neatly back to Deleuze's reading of the Italian neorealist movement, particularly regarding his discussions of the new mental relations introduced into the image

which emerged amidst the broken architecture and post-war rubble. But before returning to these, we should first examine how Deleuze's film-philosophy approaches differ from those offered by Bazin.

III. Neorealism and (Si)neo-realism: Bazin and Ontology

Film critics problematise any fixed definition of neorealism as a cohesive movement, by highlighting how there are so few 'pure' neorealist films (see Wagstaff 1989; Dyer 2006). David Bordwell and Kristin Thompson further remind us that neorealism had no manifesto: rather, it was only contingently conceptualised as a moralistic movement that focused on contemporary issues, and strove for greater levels of *social realism*.[14] In a manner reminiscent of the discourses surrounding the (si)neo-realist impulse outlined above, many settled for a definition that was more akin to a mode, attitude, or heterogeneous blend of realist and generic elements found within the work of various filmmakers hailing from different zones and 'generations'. Richard Dyer thus offers and incorporates Vittorio Spinazzola's illuminating distinction wherein neorealism appears to be an art cinema 'about the people' as opposed to a popular cinema 'for them' (see Wagstaff 1989: 72; Dyer 2006: 28). This distinction likewise becomes relevant to our understanding of the (si)neo-realist impulse, specifically with regards to how filmmakers began coveting domestic bans as a strategy designed to increase 'political capital' and appeal to foreign curators, critics and what Zhang describes as 'a respectable' (foreign art festival) audience (Zhang Yingjin 2006: 33), which is to say, the same form of European art cinema crowd that the neorealist directors sought half a century before. Thus, domestic bans, samizdat distribution networks and the films' clear ethico-aesthetic fit within foreign festival circuits illuminate how the Chinese films also cannot be considered a popular cinema for the people the narratives are about.[15]

Arguably Bazin's writing upon neorealism still displayed the most enduring impact and influence within Anglophone Film Studies. For Bazin was most attracted to neorealism's ideologically 'pure' form and content, and impressed by how directors like De Sica coupled their crusade for realism with a moral desire to draw out and expose the secret beauty of the 'everyday'. Bazin wrote passionately about the qualitative beauty of the father's and son's gaits in *The Bicycle Thieves*, for example, which the andante narrative form allowed to surface and unfold (Bazin 1999). Bazin also lauded the movement's aesthetic use of long takes and

deep focus, which unlike dialectical montage, played to the strengths of film's indexical photographic ontology, which is to say, cinema's ability to take a decal imprint from reality without the intervention of man or any ideological false consciousness. As already indicated, the (si)neo-realist directors often surface as autodidacts of the Bazinian-neorealists' impulses and political drives. Zhang Yingjin notes how Jia Zhangke is often credited within China for introducing a 'groundbreaking' use of the 'fixed-frame long take that minimizes the director's influence on the cast and environments', and exemplifies the new 'zero degree' style that marks the break away from China's 'literary' cinematic heritage (Zhang Yingjin 2006: 29).

Beyond their embrace of a new technological zero degree, though, Bazin also applauded the Italian directors for employing non-actors and types to flesh out their roles as this also called upon the actual character-types 'to be' rather than 'to act' (in a false theatrical manner). Problems with this notion aside, we can again locate strong ties between the neorealist and (si)neo-realist trends surfacing here via a shared attempt to differentiate the social and moral texture of their films from the surrounding web of national and commercial products, which typically employed known actors (professionals) and stars (commodities). Wang and Zhang began this trend by casting their friends, who *were* Beijing artists and singers, as self-proclaimed 'social outsiders' identical or comparable with themselves within *The Days* and *Beijing Bastards*.[16] Wang adhered to this 'realist' impulse as the new millennium unfolded, casting first-time actors Cui Lin and Li Bin within his most commercial 'overground' film, *Beijing Bicycle*. Interestingly, for this film Wang also employed two professional actresses, Zhou Xun and Gao Yuanyuan, to play the respective love interests. This mixing of non- and professional casting also finds parallels with neorealism, of course, but is here part of a deliberate strategy worked into the narrative tapestry, with both female characters surfacing as somewhat unobtainable movie star-like figures for the male protagonists. Both are clearly signalled as commodities or 'objects' to-be-looked-at and desired, often appearing framed behind large windows or frame-within-a-frame devices that highlight their quasi-cinematic status (appended to their upper-middle-class lives).[17] If the use of non-professional actors and types becomes another overt 'Bazinian' trope linking together a whole raft of (si)neo-realist films, though, we must turn to the fictional dimensions of the characters to see if these too also reflect what Deleuze valued in the neorealist movement. To do this we must first return to Deleuze's writing upon neorealism.

IV. Neorealism and (Si)neo-realism: From Bazin to Deleuze, or Ontology to Noology

Deleuze's engagement with neorealism suffered a satellite delay before impacting Anglophone Film Studies: partially on account of the first English translations of the *Cinema* books not appearing until 1986 and 1989, and appearing during an era when many had grown weary of *Theory*.[18] Deleuze was aware of Bazin's writing, reflecting upon how for him, the value of neorealism lay in a consideration of form *and* content: with 'real life' stories being conveyed by what Bazin called *fact-images*. Deleuze also describes how for others, neorealism was best defined by the unpredictable encounter, or its preference for fragmentary narrative structures that appeared ephemeral, lacunal and piecemeal. What is more, filmmakers moved away from focusing upon exceptional individuals that could marshal narrative resources, and instead began approaching the ideals of screenwriters like Cesare Zavattini, who expressed a desire to document the slow weary step of the unexceptional worker returning home … in all its raw and 'aristocratic beauty'.[19]

Deleuze doubted the most radical or valuable feature of the Italian movement lay in its drive towards ever-higher degrees of social or ontological 'realism' though. Instead, he argued the true value lay in a consideration of the new mental relations introduced into the image in films like *Piasà* (1946), *Germany Year Zero* (1948) and *Umberto D* (1952). For Deleuze, these films worked to stimulate different ways of perceiving (in the brain) and provoked viewers to think the new (Deleuze 2005b: 1). Thus, if Bazin was primarily concerned with cinema's ontological ability to reflect an already existing (social) reality, Deleuze demanded cinema do something else, which is, to bring forth a new vision of the world, or use new forms of visionary characters to renew our belief *in* the world. The unique value of Deleuze's approaches, then, lie in the manner in which they allow us to re-evaluate films from an alternative philosophical perspective, and to transcend discourses of socio-political realism and false consciousness to instead mount a positive creative critique of the present that sets out to immanently think the new. Or again, to understand (si)neo-realist films, like neorealist films before them, as being primarily concerned with restructuring perception and revitalising thought (see for example Kelso 2004; Åkervall 2008).

It becomes useful here to return specifically to Deleuze's writing on time-image cinema, which he understood as marking a crisis in the classical action-image, and wherein he identifies images beginning to

surface where time appears loosened from its subjugation to movement, knocked out of joint, or no longer slave to action. Although Deleuze actually described the time-image being invented by the Japanese director Yasujiro Ozu – to whom we will return in specific relation to Wang's work below – he demonstrates how it did not appear as part of a wider film tradition until it surfaced in the Italian films. At the end of *Cinema 1* (2005a) Deleuze accordingly asks why the time-image appeared in Italy first. Qua Martin-Jones, his answer becomes illuminating for its wider application to other world-cinemas, for he argues it ostensibly emerged because of an 'essential reason', or again, one external to cinema itself and linked to contextual factors; at once historical, technological, social, political, material (and aesthetic). For one, Deleuze argues that Italy could not claim the same rank or uphold any illusion of being a victor after the war like the French. He also observed how the Italian cinema was very different to that of the defeated Germany. Deleuze remarks:

> In contrast to Germany, on the one hand [the Italian cinema] had at its disposal a cinematographic institution which had escaped fascism relatively successfully, on the other hand it could *point to a resistance and a popular life underlying oppression, although one without illusion*. To grasp these, all that was needed was a new type of tale capable of including the elliptical and the unorganized, as if the cinema had to begin again from zero. (Deleuze 2005a: 215–16; my emphasis)

This stressed point highlights another significant parallel with (si)neo-realist films, which also appear to grasp for and privilege a new non-official perspective on China's changing and transforming reality, without upholding any illusion.[20] Wang's characters appear particularly emblematic of the wider trend in this regard, formulating disempowered outsiders, underclass migrant workers, deported illegal refugees, river workers and bewildered adult-children. Much like the Italian cohort of characters, these men are often left unable to act or react to a range of overwhelming situations surrounding them, and in this sense find yet more parallels with Deleuze's understanding of the mental disruption underpinning the neorealist films.

Deleuze ultimately identified five distinct tropes or characteristics that distinguished neorealism as a break-away cinema. As already discussed, he understood the modern cinema to be partially defined by its (postmodern) awareness of clichés. But neorealism was also discussed in terms of its embrace of dispersive situations; the emergence of deliberately weak links; harnessing andante ballade or stroll structures;

and the denunciation of conspiracy (for more on this see Kelso 2004: 4). Deleuze linked all of these to an essential or contextual situation appearing around and within the films. For after the war, Italy, like most of Europe, found itself materially and ideologically shattered. As the majority of early neorealist stories took place within derelict and rubbled cities, Deleuze strongly identified these spaces as key factors linked to the emergence of the new characteristics, and the newer forms of perception and thought. Indeed, Deleuze thought neorealist films were collectively marked by an increase in the number of situations characters no longer knew how to act or react to, in spaces we no longer knew how to describe (Deleuze 2005b: xi). These were any-space-whatevers (*espaces quelconques*), deserted but inhabited waste grounds, disused warehouses and rubbled lots within cities undergoing ongoing processes of demolition and reconstruction. Between the two *Cinema* books, these spaces are described not only as providing the neorealist films with a loaded and load bearing mise-en-scène, but as also serving to nurture a new race of character, a stirring mutant rendered unsure of how to move, act or react to what was around them. As we will see below, similar factors can also be identified at work within and across the (si)neo-realist spaces.

V. On Breakdowns and Construction Site Futures

The politico-economic shifts undergirding China during the late twentieth and early twenty-first centuries led to a radical transformation and reorganisation of the nation's social structuring and geo-political topology. Nowhere was this more obvious than in the cities and urban centres, which became marked by huge material and social engineering programmes that bore witness to the ruthless demolition of old buildings (and lifestyles) and the unmitigated construction of a new urban psycho-geography and reality. As the ideological and material breakdown and reconstruction of China occurred concomitantly, Zhang Zhen points to how the historicity of the new (si)neo-realist impulse must be anchored to 'the unprecedented large-scale urbanization and globalization of China on the threshold of a new century': or in terms of dealing with urbanisation as a process (Zhang Zhen 2007: 25). The disappearing and transforming city/nation often becomes elevated to a character in its own right, or appears as a form of living landscape across the whole body of (si)neo-realist films. The non-studio locations and on-the-street shooting (often without permits or official permission) that define much of the trend's new political sharpness also often result in

Bazinian comparisons linked to a perceived moral impulse to capture and document a rapidly changing social reality. Ning's Beijing trilogy makes for an interesting case in point here, by displaying a truly Bazinian impulse to realistically mummify Beijing's rapidly (and traumatically) transforming time-spaces in a clear neorealist style. Ning, like Wang, is another Chinese director that has strong personal links with the Italian cinematic traditions (see for example Zhang Zhen 2004).[21] In *On the Beat*, Ning opens with a protracted scene tracking two policemen cycling past expansive rubbled lots within their administrative district. They are heard discussing 700 recently demolished houses as they pass expansive demolition sights/sites, and are heard mourning the replacement of their horizontal communities with newly planned vertical ones. As they turn into a narrow hutong they are forced to dismount to allow a steam-roller to move towards its next job. In *For Fun* she similarly focuses upon traditional spaces ear-marked for demolition or decommission, capturing an opera theatre, and traditional community spaces that, like the old men who populate them, have no clear place in China's new future. Accordingly, Ning's films work in a manner that becomes reminiscent of the ghostly and pregnant photographic images of Eugène Atget. Accordingly, for Zhang Zhen, these films stubbornly reveal the spots branded with social and historical traces, and document a past on the cusp of disappearance (Zhang Zhen 2007: 21).

Jia's *Pickpocket* and *The World* are also emblematic of these spatial trends, embedding old buildings marked with demolition symbols, rubbled lots and new construction sites as loaded spaces in which to set his stories. Yomi Braester argues that, because such images appear in so many (si)neo-realist films, and narratives often come to a turning point when characters discover buildings being demolished or literally cross the wreckage and debris, the movement should largely be understood in terms of employing 'demolition as a symbol': at once expressing a sudden 'need to chronicle the city's transformation', and as part of an attempt to stop or slow down the 'process of forgetting' (Braester 2007: 162–5). Zhang Zhen similarly describes the (si)neo-realists as a new breed of unofficial documenter or chronicler of 'the demolition of old cities, lifestyles, and identities and the construction of new ones' (Zhang Zhen 2007: 9). It is thus the actual space and time documented by the amateur actors and filmmakers that arguably becomes the main focus of the whole movement. For Zhang Zhen, these glimpsed images become incorporated into the films as part of a larger strategy to bear witness to a radical 'rupture and transformation of history' taking place before the lens (Zhang Zhen 2007: 18).

Beyond Bazinian readings, the depictions of demolition as a process contributes to a temporalisation of cinematic space that emerges concomitantly alongside a materialisation of changing mental relations: thus literally refolding the changing geo-political landscape with that of the material urban milieu. For Shohini Chaudhuri, similar features of the (si)neo-realist impulse thus begin to reveal a characteristic 'split or schizophrenic subjectivity' common to the era, 'which apathetically registers the shocks of endless historic reversals demanded by the "architects of one new China after another"' (Chaudhuri 2006: 99). Soviet-style socialism with Chinese characteristics; The Great leap Forwards; the Cultural Revolution; Post-Mao reforms; Opening up; the March into the world; the New-Era; the Post-New-Era; Deng's Capitalism with Asian values … or *Communism and Schizophrenia*?

Braester points to, but refrains from developing, Deleuze's concept of the any-space-whatever to help describe these loaded sino-cinematic spaces, which somehow always appear 'universal and suspended outside any power structure', yet 'reterritorialise ideological abstractions' (Braester 2010: 25). But beyond this signposting, we must ask; can we unproblematically link these Chinese space-images to those found informing Deleuze's time-image models in *Cinema 2*? To move beyond how such filmic-spaces merely (ontologically) bear witness to the destruction of the old, then, we must also engage with how they introduce or provoke a thinking of the new. To understand this, we must now consider the concomitant rebuilding or reconstruction linked to the complexities of China's modernisation process. For it is with regards to this that the (si)neo-realist films introduce new perceptual and mental relations into the image to help confront the emergence of unfamiliar places and spaces symptomatic of globalisation.

Taking this into account, we must concede that the Chinese *any-spaces-whatever* also display a unique pole altogether absent from the earlier Italian films and Deleuzian discussions thereof. To address this, I propose to imbricate Marc Augé's (1995) concept of the supermodern 'non-place', which is often discussed in terms of homogenous highways, airport buildings, international hotels and shopping malls that signal the spread of globalisation everywhere.[22] For it is these that begin to emerge out of the rubble of the old. We will momentarily return in more detail to these forms of place in specific relation to Wang's *Beijing Bicycle*, but in order to conceptually differentiate these forms of space from the Deleuzian neorealist models, I propose to introduce another new term – *any-now(here)-spaces* – which helps synthesise certain unique dimensions peculiar to the (si)neo-realist films.

VI. Fragmenting Forms, Any-now(here)-spaces and (Si)neo-realist Seers

At the turn of the new millennium, Sheldon Lu highlighted how the addition of new streets and neighbourhoods had become a regular phenomenon in China. In 2001 alone, the year *Beijing Bicycle* was released, there were over 300 new place names added to the Beijing map (Lu 2007: 139). This phenomenon is clearly reflected in Wang's film, which contains a proliferation of images which document the destruction of the old alongside the appearance of newer any-now(here)-spaces emblematic of the new global Empire (qua Hardt and Negri 2000). The transforming material space first surfaces as a pertinent theme in an early sequence that introduces a band of provincial migrant workers recently employed as Beijing couriers. The migrants are ordered by their boss to examine a huge map of Beijing that fills the entire wall of the depot, as he instructs them to 'learn every street name by heart', and 'memorise all the different intersections and winding hutongs'. The impossibility of their task initially provides the film with a light-hearted comedic moment, as the migrants eagerly scan the minute detail of the expansive cartographic wall with their eyes and fingertips. Throughout the film the idea of memorising Beijing is shown to be a doubly impossible task, however, in that even if they could memorise the extensive map, the material city beyond is always undergoing an intensive process of change and transformation. This is most overtly highlighted by the different spaces the film opts to set its loosely interconnected scenes: scraps of wasteland, building sites, skyscrapers in the process of construction, modern any-now(here)-spaces, or in older labyrinthine alleys already ear-marked with demolition symbols.

Significantly, narrative form begins to reflect mise-en-scène in these spaces, which is to say, in the broken rubble lots or construction spaces, both action and the action-image form appear to break down and re-compose. As if reflecting upon this at a performative level of action, Wang frames a series of shots of the bicycle gangs executing tricks within de/reterritorialising urban spaces (demolition/building sites). Here, the manner in which the bikes and riders move is stylistically defamiliarised, as instead of riding backwards and forwards in flowing movements, the riders bounce, jump and hop in a series of disconnected motions and staccato arabesque poses. In this manner, the de/reterritorialisation of space is directly matched by a de/reterritorialisation of regular movement and action, which plays out upon a variety of different levels including that of the large form action-image. Linked to similar phenomena,

Deleuze saw neorealism's deterritorialisation of movement-image drives lead to the introduction of purely optical and sound situations, and consequently, a focus upon a series of fragmentary or chopped-up encounters that helped destroy the dominant narrative structures of Hollywood, Soviet and Italian cinemas.

Lai explicitly picks up on comparable aspects as a defining feature of the (si)neo-realist stories, observing how their 'negative poetics' emerged alongside a new 'self-conscious choice of doubt and hesitancy' that defined their modes of narrative progression (Lai 2007: 227). Zhu draws explicit parallels between neorealism and the Chinese narratives by highlighting how both typically came to feature 'goal-bereft' protagonists embedded within loosely connected 'episodic' stories (Zhu 2003: 166). Chaudhuri too sees the protagonists being defined by an 'overwhelming sense of directionlessness', which she explicitly links to characters and forms (Chaudhuri 2005: 99). Berry adopts an explicitly Deleuzian language to describe the emergence of new fictional and documentary sequences that also began breaking away from dominant movement-image regimes, and increasingly embedded a distended temporal logic (Berry 2007: 124). It is also worth stressing here that the encounters with these spaces often leave the characters coated in the dust and dirt which sticks to their clothes, gets up their noses or into their eyes. The experiences thus often emerge as embodied and sensual ones too, which further tie into the depowering of the protagonists' ability to physically marshal the body through an action-image narrative time-space. Zhang Zhen invokes these features of the new impulse by linking the transforming context directly to the mode's new ethico-aesthetics. Here, the new cinema not only remains anchored to the social here and now (qua Bazin), but also creates an 'alternative cinematic space that is haptic rather than optic, sensuous and open rather than abstract and closed' in a manner suggestive of Deleuze's time-image models (Zhang Zhen 2007: 21).

This haptic quality of the Deleuzian any-space-whatever is literally tied to a complex temporal dimension of the (si)neo-realist city, then, as China increasingly appears disconnected and removed from its own history, politics and society, which increasingly appear in a process of erasure: for '[t]oday is centre stage; there is no yesterday' (Pickowicz 2006: 16–17). For Bérénice Reynaud this leads to the emergence of a distinctly temporal setting and surface that appears caught somewhere 'between the past and the future' (Reynaud 2007: 266), echoing in turn Lin's view of protagonists 'trapped in an intense present' (Lin 2009: 93). More recently Philippa Lovatt has explored how the use of sounds

in Jia Zhangke's urban films invokes multiple, divergent temporalities, linked to a disjunctive postsocialist feeling by using Derridean theories and coordinates, amongst others, to help describe and account for these confusing cinematic experiences (Lovatt 2012). Beyond Deleuze and Derrida, though, many critics introduce comparable temporal dimensions of the film movement via a wider set of philosophical coordinates. For example, Braester (2010), Reynaud (2007) and Shuqin Cui (2007) apply Ackbar Abbas's concept of *déjà disparu* or 'culture of disappearance' to better delimit and describe these complex images of material and mental transformation. For them, the depictions of space foster a form of 'reverse hallucination', which again finds significant overlaps with Deleuze's visionary neorealist models (Kelso 2004). But to better get at these issues, we must turn to the narrative forms that prompt a thinking otherwise of the new, and the visionary characters that must first become prey to the overwhelming present and confusing any-now(here)-spaces within it.

Indeed, the narrative encounters taking place across these liminal cinematic spaces offer up a litany of purely optical situations that again help draw out a Deleuzian link between the two historical movements. In both trends the in-between spaces often prevent characters from moving and acting in traditional action-image oriented manners. For such reasons, the narrative forms, character types and spaces all contribute to a deviation from existing mainstream standards, with part of the breakdown formulating a reaction against 'the demand for psychologically motivated characters [. . .] whose presence has an overarching influence over the state of events' (Lai 2007: 227). Wang's films again make for an interesting case in point as they overwhelmingly tend to focus upon bewildered characters moving within and through any-(now)here-spaces, in films that can collectively be understood in terms of unleashing what Martin-Jones calls hybrid-images: expressively de- and reterritorialising the movement- and time-image categories in an aesthetic attempt to reflect content and develop underlying themes linked to reinvigorating perception and thinking differently.

Beijing Bicycle toys with a motific de- and reterritorialisation of movement- and time-image categories, with cracks appearing in the action-image that are not prised fully apart. Part of this is reflected by using two dispersed and fragmented straight movement-image stories that draw together and apart in a manner that formally reflects the subterranean faults breaking apart and reconstructing the movement and the embedded material and ideological spaces. In an asymmetrical episodic section of the narrative following each of the boys' stealing or repossessing the bike from the other, it is possible to locate an interesting

Bazinian neorealist-esque shot that appears to playfully zigzag from a movement- to time-image pole and back (or from one action-image to another via a formal gap or fissure) in a manner conducive with Deleuzian models. The long take begins in the disorienting hutong labyrinth, with a mounted still camera framing a deep-focus shot of Jian beginning to stash his bike behind a series of objects and dust covers within a cluttered nook. During the protracted long shot a female extra enters the background, and begins hanging washed clothes upon a line strung across the alley. After Jian is satisfied his bike is well hidden he exits towards the shot's foreground. The camera thereafter lingers on the unfolding scene, and by refusing to cut, invites viewers to observe the woman and her washing. By degrees she completes her task and evacuates the shot, which continues, reflecting an Ozu-esque signature: the still life of a washing line. In this homage to the inventor of the time-image we can locate a clichéd deterritorialisation of the action-image form, with the shot beginning to nod towards, or suggest, an underlying time-image mode. However, after a protracted focus upon the evacuated scene of washing, another action-image reterritorialises as Guei pokes his head around the corner into the depths of frame. The unexpected action suggests he was hiding in the background all along, within the folds of the image, and his unexpected movement reactivates another action-image drive and sequence within the larger narrative framework.

In Wang's *Drifters* the action-image is deterritorialised further, aesthetically reflecting this film's intensified temporal themes and motifs. Wang strings together a series of long takes, focusing on Little Brother (Duan Long) just waiting around in moments in-between action, often doing very little or nothing. A relentless focus upon moments of stillness, inaction or waiting around highlights a literal destabilisation of narrative action, formally reflecting Little Brother's own disjunctive experience of being a migrant who has escaped China to the US twice, only to be deported back on both occasions. He surfaces as an inactive seer caught between two disconnected space-times, and by properly belonging to neither, becomes dislocated within a state of inaction and disjointed time. This is arguably Wang's most overtly (si)neo-realist film, with the concept of drifting between China and the US, a communist past and an unknown future (China's joining the WTO being a prominent subtext referenced via the television throughout) becoming expressively reflected and made manifest in the film's episodic ballade forms and refusals to cut.[23] For when the sensory-motor linkage has decomposed to such a state, Deleuze argues that a visionary mode takes over, and time itself surfaces as a theme.

Neorealist filmmakers such as De Sica and Luchino Visconti were observed by Deleuze to focus upon a new breed of 'mutant', who moved through 'cities in the course of demolition or reconstruction' (Deleuze 2005b: xi). These were the Italian band of seer and wanderer who no longer knew how to act: 'He shifts, runs and becomes animated in vain, the situation he is in outstrips his motor capacities on all sides, and makes him see and hear what is no longer subject to the rules of a response or an action' (Deleuze 2005b: 3). As discussed, the materially broken and ruined Chinese streets perfectly reflect and mirror the breaking apart of older ways of thinking, including those linked to the traditional sources of identity (clichés), but we find a toying with another cliché upon the level of form that unfolds differently in the new psycho-geography. For the lost migrant seer is not exactly new to Chinese cinema, and can be understood as part of a complex dialogue with the official overground cinema. Indeed, a focus upon disabused country peasants has always been a prominent feature of Chinese national cinema, even if there appears to be a significant difference in the casting and characterisation in the newer trend qua Bazin. Zhang Zhen touches upon this transformation by highlighting how the earlier national films typically focused on the 'mythic, larger-than-life icons of the repressed peasant', whereas the new trend tends to focus upon 'a motley crew of plebeian but nonetheless troubled people on the margins of the age of transformation' who no longer qualify as suitable icons for a national cinema (Zhang Zhen 2007: 3–6). Instead they formulate a band of 'aimless bohemians, petty thieves, KTV bar hostesses, prostitutes, and postmen to neighbourhood police officers, taxi drivers, alcoholics, homosexuals, the disabled, migrant workers, and others' (3). Or as Pickowicz acerbically renders the same change: in the old Chinese cinema identity was unproblematic because everyone was a patriot, a revolutionary, or one of Mao's little red soldiers; in the new cinema, however, everything has broken down and fragmented into specialised individualised identities:

> I'm homeless. I'm a prostitute. I'm a club singer. I'm a homosexual. I'm confused. I'm a drug addict. I'm a lesbian. I'm a migrant. I'm really confused. I'm a bohemian. I'm a con artist. I have AIDS. I'm a criminal. I'm crazy. I'm confused beyond imagination. (Pickowicz 2006: 15)

We can concede, then, that if it remains the same sort of character that becomes the migrant worker in this alternative (si)neo-realist impulse, the filmmakers are aware of the old clichés, and appear to have transplanted them into a hellish new any-now(here)-space that

render them confused by demanding new forms of action or reaction that they no longer understand. Linda Chiu-Han Lai accordingly identifies the new characters as non-action takers, very different from the previous breed of national cinema hero. They formulate aimless beings, condemned to 'wander around, withdrawn from conscious engagement with any productive, meaningful activities in the normative sense' (Lai 2007: 215). Surprisingly, Cui sees the new characters constitute freewheeling urban dwellers that the filmmakers harness as a form of wandering flâneur to help dissect the new situation (Cui 2007: 243). But one instinctively feels this position is too difficult to defend in relation to the entire movement, and that Cui unconsciously conflates the characters with the critics or art cinema audiences that (re)view them. Lai counters such positions best by pointing to how the characters are far from rational, self-driven or purposeful flâneurs. Instead they do very little, aimlessly wander around, digress into unplanned encounters, or let 'whatever comes by take them on the spot' (Lai 2007: 215). As these characters display too little certainty about their place, or invest so little effort into 'sorting out the mysteries that trouble them', Lai instead appends a more passive and pessimistic modality outlined as *derive*: linked to a decentred aimless drifting (205–20).[24]

Whatever the case, Deleuze's model of the mutant seer and wanderer appears productive for understanding the emergence of these character types, and for understanding their visionary encounters with paralysing situations that leave them unsure of how to act or react.[25] Such features arguably become most pronounced in the (si)neo-realist scenes that chart the migrant-mutants' confused passage into, or blockage from, supermodern any-now(here)-spaces. Several scenes throughout *Beijing Bicycle*, for example, depict the naïve migrant Guei's encountering unfamiliar spaces associated with China's embrace of globalisation and modernisation. In one Guei delivers documents to a plush (non-place) international hotel. We first find him having an overwhelming encounter with a glass and brass revolving door that literally leaves him paralysed; unsure of how to react, to or navigate through, the strange rotating machine. When he braves the mechanism he is unceremoniously spat into the foyer, where he is again left transfixed by the glittering mirrored ceiling and shiny marble reception. He is left further confused by the fact that the hotel staff are not expecting him, nor do they know who his parcel is for. In another scene he is mistakenly guided into the hotel's massage parlour with a package, where it is believed someone bearing the recipient's name is. En route he is mistakenly identified as a customer, by other (presumably) migrant staff, stripped naked, forced to shower,

and led into the massage area wearing a hotel robe. By degrees he is sent to a man in the process of getting a rub from a blind masseuse. Guei hesitantly approaches, again not knowing how to act or respond to the bewildering optical and sound situation unfolding around him. The blind masseuses are also of the same social status as Guei, but as literal non-seers they appear as decisive actors who contrast his hesitant and timid movements. Finally realising the man on the table is not the recipient, Guei is led back to the foyer to be castigated by the real client for being late. The receptionist also informs him he must pay for the shower and massage. Unable to pay, he bolts, only to be accosted by security and reported to his boss.

Observing similar themes of confusing 'everydayness' littering other (si)neo-realist narratives, Zhang Zhen introduces Harry Harootunian's notions of a fragmented and ceaseless 'new' associated with globalisation, which can also be neatly synthesised with our (si)neo-realist concept of the any-now(here)-space, and help understand a whole host of comparable seer scenes that expose the mutant migrants' being left unsure of how to react to an new alienating and unfamiliar 'now' or ever-changing present (Zhang Zhen 2007: 2). In this sense the proliferation of new supermodern and globalised any-now(here)-spaces outstrip the migrant characters on each side, at the same time as they signal a new form of socio-political reality that needs to be re-perceived and conceptualised. In this sense we begin to find the emergence of a proto-crystal image within the Chinese cinema, which also becomes literally reflected within the new any-now(here)-spaces and mise-en-scène. For everywhere reflections and doublings begin to appear and proliferate within and across these films. But these are typically bent, twisted, skewed or distended within strange glass any-now(here)-space architecture, and warped by neon lamps and refracting electric lights emblematic of a parallel and distant new reality.

Notes

1. An abridged version this paper was delivered at the 2012 International Deleuze Conference at Henan University in Kaifeng, PRC and appears as part of the collected conference papers (see Fleming 2013).
2. Since the early 1990s a variety of new terms have been tried or applied to this new impulse beyond Sixth-, Post-Sixth- or Newborn-Generation labels. Amongst others, Chinese and foreign critics have discussed the films in terms of belonging to a 'Post-wave' (Zhu 2003: 143), 'Postsocialist' (McGrath 2007; Zhang Zhen 2007), or 'post-sixth-generation' (Pickowicz 2006) of filmmakers. Many settle for the more popular and inclusive label of 'Urban Generation' or 'Urban Cinema', as a kind of catch-all for many of the aesthetic and stylistic features (see Zhang Zhen 2007; Berry 2007; Braester 2012). As part of an attempt to expand

the category even further, though, and move beyond previous discussions by using Deleuze, I opt to drop the 'urban realism' label too and create a new concept of (si)neo-realism. In the first place, this allows me to account for and include films like Wang's *Drifters*, which is clearly also part of the same impulse and style but does not focus upon specifically urban characters or issues and to allow for a wider range of directors and influences not typically considered part of the Urban movement.

3. Amongst others, Paul Pickowicz, Ying Zhu, Jason McGrath and Shohini Chaudhuri describe a complex and ever-changing relationship between Chinese censorship bodies and the so-called 'illegal' filmmakers. Pickowicz outlines this in terms of a complicated and dangerous 'dance' which Western critics typically misunderstand. He offers a 'velvet prison' model comparable to that encountered by Czechoslovakian New Wave filmmakers in the late 1960s. Although many of the films are often considered 'illegal' or 'banned' by foreign and domestic audiences, in matter of fact, neither the films nor the filmmakers are actually considered *real* political 'dissidents' as such (see Chaudhuri 2005: pp. 98–9; Pickowicz 2006; McGrath 2007). Rather, films that are not directly critical of the ruling Party are tolerated as an acceptable or allowable form of 'political' or artistic venting. What is more, both authorities and filmmakers are aware that in a global context of international film festivals, being perceived as an 'illegal' Chinese filmmaker, or having your film 'banned in Beijing' can be seen as a benefit, or tantamount to a good marketing: 'After all, a government ban would guarantee international attention' (Zhu 2003: 166) or else offer the filmmaker the required 'pedigree to get attention abroad' (Pickowicz 2006: 12). On account of this, Yomi Braester and Zhu argue that in a global context these filmmakers increasingly became 'self-packaged dissidents' who came to exploit or exercise a 'marketing strategy of wilful self-marginalisation to promote their products globally' (Zhu 2003: 166; Braester 2012: 357).
4. For an exhaustive list of films we can rhizomatically link to this movement see Cheng 2006: 209–44.
5. David H. Fleming, 'Deleuze and the (si)neorealist break?', Paper delivered at *Deleuze, Guattari and China*, University of Nottingham Ningbo China, 23 May 2012; Fleming 2014.
6. I have coined my own neologistic term here as part of a wider strategy to at once forge nomenclatural links to the Italian neorealist movement whilst at the same time tying the concept to a specifically sino-cinematic break or context. Besides employing this to erect links with a familiar historical movement and ethico-aesthetics, I also hope to introduce a new dimension of 'sin' related to illicit images of sex, drugs and deviant behaviour that was typically lacking from both the earlier Italian movement and previous waves of national Chinese cinema. This of course also relates to filmmakers' trying to covet official opprobrium and entice international curators and audiences.
7. There remained certain exceptions which prove the rule, with some musical opera films from regional studios producing films in different 'traditional' dialects or provincial languages (for more on this see Zhu 2003: 168; Zhang Zhen 2007: 20). It should also be noted that more genres appeared in Chinese cinema under CCP rule than ever before, and after the Cultural Revolution films about the Chinese ethnic minorities became popular. For a more detailed account of the complex history of Socialist cinema in China see Zhang Yingjin 2004, 2012; Clark 2012.
8. Zhang Yingjin notes that before the BFA there was a Beijing Film School which had been operating since 1951. Of interest to this paper, education-related projects saw the introduction of Italian neorealist films as early as

1954. Other foreign cinemas continued to filter in as part of specialised 'film weeks' and arguably influence these Chinese student-directors. In 1956 Japanese, French, Soviet and Yugoslavian films were shown, and thereafter Indian and Mexican films were known to be screened as part of film and culture exchanges (see Zhang Yingjin 2004: 201). Michelangelo Antonioni was also invited into China during the Cultural Revolution to make an epic documentary and controlled 'Chinese self-portrait' (see King 2010) *Chung Kuo, Cina* (1972). Although several scathing public reviews appeared bemoaning the traitorous and slanderous nature of the film, many Chinese filmmakers or viewers got to see parts of the finished product (see for example Yang 1974).

9. Yomi Braester notes that this era already began to bear witness to a range of 'urban films' (not yet an Urban Cinema) set in Guangzhou where Deng's economic reforms were targeted. He pinpoints how narratives such as Zhang Liang's *Yamaha Fish Stall* (1984), *Juvenile Delinquents* (1985), Zhang Zeming's *Sunshine and Rain* (1987) and Sun Zhou's *With Sugar* (1987) focus upon the ways in which the youth began 'coming to grips with a budding consumerist society, running unattached and often alienated lives, exploring sexual freedom and dabbling in avant-garde art'. These 'parables for modern existence' (Braester 2012: 347–8) can also be considered reflecting and anticipating the unfolding cultural event that results in the (si)neo-realist break. David Bordwell and Kristin Thompson note how Zhang Yuan's earlier film *Mama* (1990) also formulates part of a studio-sanctioned stylistic precursor to the later 'illegal' or 'underground' movement (Bordwell and Thompson 2003: 651).
10. For more on the specificities and complexities of the transnational and domestic funding or financing of these films see Pickowicz 2006 and Zhang Yingjin 2007.
11. The term 'minor cinema' is here simultaneously understood in terms of being a 'coming of age' youth cinema and a minoritarian cinema in relation to 'but also in dialogue with the officially sanctioned mainstream cinema' (see Zhang Zhen 2007: 2).
12. Satisfactorily labelling the new impulse proves complicated. Chinese filmmakers and scholars often displayed a desire to drop the use of terms like 'realism', due in part to the concept's long association with state-sponsored socialist- and revolutionary-realism (see Zhang Yingjin 2006). Foreign critics tend to favour labels like 'nonstate' or 'underground', as these help advertise the perceived subversive political dimension of the films. Both sides often use the label 'independent' (or *duli*), but Pickowicz is drawn to correct this misnomer and recalibrate the term to read 'in dependence': to better announce the strong reliance upon transnational funding bodies and foreign 'political capital' that allows the films to be made and screened (Pickowicz 2006: vii). I again use this as part of the desire to create a new concept.
13. It may also be helpful to consider another form of distinction wherein we can outline the Italian neorealist movement in terms of breaking clean from the past while the Chinese filmmakers are merely considered commenting or quoting this earlier movement in a postmodern or postsocialist gesture that signals a different form of postsocialist break (albeit whilst still remaining within the conventions of world art cinema). I would like to thank the article's reviewer for highlighting this interesting dimension.
14. David Bordwell and Kristin Thompson highlight how discourses of realism were initially appended on account of the stylistic contrast with previous waves of Italian and Hollywood cinema (see Bordwell and Thompson 2003: 360).
15. We are still forced to wonder to what extent the newly emerging ethico-aesthetics and drive towards greater degrees of 'ontological' realism relate to the Chinese filmmakers anticipating what would appeal to foreign art cinema audiences.

Many (cynically) argue that on account of a cultural deterritorialisation and capitalistic reterritorialisation, the films began to display a certain degree of formulisation, conventionalisation and quotidianisation (see for example Zhang Zhen 2007: 16; Kraicer 2009; Zhang Yingjin 2012: 66).

16. Demonstrating that these are not isolated cases, we can also find Ning Ying using actual Beijing policemen, migrants and taxi drivers to perform as fictionalised versions of 'themselves' throughout her Beijing Trilogy, and Jia employing non-professional actors to appear in his low-budget underground film *Pickpocket* and his higher-budget state-sponsored *The World*.
17. Judging females by their appearance is a complex and textured factor expressively toyed with throughout the film. Guei and his uncle voyeuristically leer/peer at what they think is a rich female housewife living in a posh apartment behind the hutongs. They watch undetected through a peephole, enjoying her pose in expensive gowns before a mirror whilst speculating as to why the rich never appear happy. This woman finally turns out to be a maid, however, yet another migrant worker like them, albeit one who takes an opportunity to dress up in her employer's clothes and make-up when she is not home.
18. David Bordwell and Noel Carroll's *Post-Theory* (1996) debates proclaimed the death of grand narratives such as Psychoanalysis or Linguistics as suitable tools for approaching or reading film. D. N. Rodowick's 'An Elegy for Theory' (2007), however, can be employed to bookend this period, marking a renaissance of film-philosophy that was in part linked to the Anglophone translations of Deleuze's *Cinema 1* (1986) and *Cinema 2* (1989).
19. From 'Ancora di Verga e del cinema Italiana' (published in the November 1941 edition of *Cinema*), Mario Alicata and Giuseppe De Santis reflect the views of the famous neorealist screenwriter Cesare Zavattini by arguing that the neorealist movement desired to take their cameras into the Italian streets, ports and factories and became 'convinced that one day we will make our most beautiful film following the slow, tired step of the worker returning to his home, narrating the essential poetry of a new and pure life that contains within itself the secret of its aristocratic beauty' (republished in translation by Ennio Di Nolfo 2002: 85).
20. Of course this can also be related to the Chinese context and the very real fear of imprisonment facing artists being directly critical of the Party or suggesting alternatives to the current hegemony and status quo.
21. Ning gives Wang a run for his money as a Chinese director with strong ties to Italian cinematic traditions. She encountered classic neorealist films alongside Bazin's writing whilst at the BFA, for example, and studied at the Centro Sperimentale di Cinematografia in Italy where she likewise acted as Bernardo Bertolucci's assistant director (see Zhang Zhen 2004).
22. Ronald Bogue 2003, amongst others, mistakenly suggested Marc Augé's notion of the non-space inspired Deleuze's original any-space-whatever. William Brown resolved this misunderstanding by demonstrating that Deleuze was really influenced by his own student Pascal Auger.
23. Besides these features, Wang's films can also be understood as reflecting the breaking down of the traditional modes of thinking and acting via the use of audio and sound situations. Like neorealism before them, many of these films began to appear audibly and ontologically distinct from the studio films by employing naturalistic on-location noises and sounds. As part of the break with these state traditions, and forging yet more links with neorealism, the (si)neo-realist filmmakers began employing actors, dialects and accents that sounded distinctly different. We could link these drives back to a Deleuzo-Guattarian minor cinema model, of course, by claiming this new audio impulse in part made the dominant cinematic language stutter, stumble and break down into

a series of non-official dialects, accents and slangs. This wider trope is also evidenced in the opening of *Beijing Bicycle*, where a group of non-actor migrants are interviewed in a montage of dislocated close-ups. The obvious accents and regional inflections often lead to confusion, or create comical misunderstandings between the migrants and their off-screen interlocutor speaking in Mandarin.

24. Pickowicz goes some way towards indicating how this trope can be traced to some of the restraints placed upon the filmmakers themselves; or at least their unwillingness to risk jail for directly criticising the state via characters, dialogue or plot. This can in part account for why it rarely occurs to these characters to 'connect their problems to trends unfolding in the larger society', and explains why they remain 'utterly uniformed' and have 'few or no political or social ideas' (Pickowicz 2006: 15).
25. Admittedly, we could also understand this transformation in terms of Deleuze's modern political cinema again, wherein the people are understood to be missing. The use of migrant characters (often with a political non-status) reflects the absent people of the modern political cinema. Like the powerless cart driver of Ousmane Sembène's *Borom Sarret* (1969), for example, the disempowered characters are often discovered lurking in the margins, wandering aimlessly amongst and between highly divided and codified milieus, reacting and adapting to chance encounters or opportunities, and struggling against new and bewildering power structures.

Abstract

Two books on Whitehead, a major study by the noted philosopher of science, Isabelle Stengers, and a shorter one by Didier Debaise are reviewed, along with two earlier mathematical and scientific works by Whitehead himself, which have been re-issued. This provides the basis for a wide-ranging discussion of the relationships between Whitehead's love of poetry and Heidegger's approach to it, Whitehead's background in mathematics and theoretical physics and his attitude to empirical science and more general problems of the philosophy of the event, in particular how radical change can come about.

Keywords: Whitehead, Heidegger, poetry, philosophy of the event, philosophy of science, Marceline Desbordes-Valmore

Deleuze Studies 8.4 (2014): 542–568

A. N. Whitehead (1861–1947) has a rather peculiar place in the history of modern Western philosophy. His books on mathematics and theoretical physics are still read by specialists in those fields, but his philosophical work has never really become part of the mainstream curriculum of the subject in Anglo-Saxon countries. Indeed analytic philosophers have sometimes regarded him as slightly 'loopy' and not entirely to be taken seriously.[2] It is mostly theologians and educationalists who have been attracted by his metaphysical ideas and have sometimes responded to him as a kind of cult figure. The situation is definitely better with regard to Francophone philosophy, where there has been a small but steady current of interest in his thought, starting with the seminal work by Jean Wahl, *Vers Le Concret*, where the treatment of Whitehead is remarkable, given the fact that it was published as early as 1932, that is only three years after the publication of *Process and Reality*.[3] The problem with Francophone philosophers is that they have had a tendency, at least until fairly recently, to subtly elide Whitehead's ideas with those of Bergson and Husserl. Of course, there are real affinities between the work of the three philosophers, all of whom started as mathematicians, and Whitehead does refer positively to Bergson, but there are also real differences. This is important, not only for the history of ideas, but also for precision of thought in any creative philosophy that draws on the work of any or all of these three thinkers.

Bergson, Husserl and Whitehead all started off as mathematicians, but the first two moved on to philosophy very quickly, whereas Whitehead was still producing works on mathematics and theoretical physics in his fifties. This is the key to understanding the difference between Whitehead and the other two thinkers. Both Bergson and Husserl tried to establish an autonomous, well-grounded mode of thought which was an alternative to positivist science. In Bergson, this mode of thought is intuition, and the contrast between it and science is unequivocal, but Husserl's mode of thought is ambiguous: he was trying to establish a type of science that did not depend upon objective fact external to consciousness. In later phenomenology, this became a primordial pre-scientific mode of thought, upon which scientific or logical modes of thought were necessarily based, but there were also tinges of anti-science. One can see why Bergson's ideas had such an enormous impact on the arts, while those of Husserl were immensely important for the social and human sciences.[4] By contrast, Whitehead continued to think like a mathematician throughout his career, and he never lost faith in science, which he greatly stretched from the empirical towards the speculative by

means of his mathematics. In a sense, he is not far from a philosopher of science such as Meyerson or Duhem or a philosophical mathematician such as Poincaré, even if there are clear divergences between their ideas and his. Whitehead's ideas can also be related to more theoretical and/or holistic currents in twentieth-century science, such as quantum physics, evolutionary development biology (Evo Devo) or ethology.[5]

However, there is another dimension to Whitehead which takes him beyond a subtle philosophy of science or a more holistic scientific practice. In 1932, another seminal work was published, this time in England: *New Bearings in English Poetry* by F. R. Leavis. In it, the author traced the marginalisation and decline of English poetry in the face of the modern industrial world in the late nineteenth and twentieth centuries, and he saw Ezra Pound, T. S. Eliot and Gerard Manley Hopkins as the initiators of poetic renewal.[6] Near the beginning of the second chapter of *The Concept of Nature*, Whitehead states that natural philosophers should consider everything perceived as being in nature, the glow of the sunset just as much as the molecules and electric waves used to explain the phenomenon.[7] A sense of poetic and scientific observations being equally valid as empirically based knowledge is bound up with the rejection of the bifurcation of nature, and Whitehead does indeed cite verses by Shakespeare or the English Romantic poets in support of his philosophical arguments.[8] Of course, he is going back to writers from before the decline noted in *New Bearings in English Poetry*, but Leavis' judgement, which could also be applied to other art forms in England, would not be relevant to poetry or other art forms of the same time in French- or German-speaking countries. Here, an autonomous, self-referential, aestheticising, proto-modernist culture exploring inner consciousness grew up, particularly in France after the *débâcle* of 1870–1 and in the Austro-Hungarian empire, where psychoanalysis originated, but there were clear tendencies in this direction, not simply in Austria and France, much earlier in the nineteenth century. This is the kind of shift in subjectivity that prepared the way for Bergson and Husserl and to which they greatly contributed.[9]

Except perhaps for Keats, the major English Romantic poets managed to more or less bypass the problematic subject bequeathed to Western culture by Descartes. Even if Coleridge became a drug addict and lost his poetic gift and Wordsworth a pompous bore, their achievement in the *Lyrical Ballads* – its first edition was in 1798 – was astonishing, even if one tends to forget this because of the familiarity of the poems. There is a limpid ease with which the subject encounters nature, other humans, both strangers and intimate family members, and its own thoughtful

self-reflection. The latter is deep and not infrequently troubled – this unproblematic subject is not a shallow one – but this trouble is never all-engulfing and can always be assuaged in a way that is spritually profound but not invested with excessive angst. Perception is direct, observation acute, nature is felt on a delicate scale, and language is transparent and simple. Of course, all this 'artlessness' comes from very complex art, as is made explicit in the fairly short 'Advertisement' to the original edition of the *Lyrical Ballads*, which became a greatly expanded 'Preface' in the later editions. 'Tintern Abbey' demonstrates very clearly the combination of a gentle but complex emotional chiaroscuro with a smooth movement across the boundaries of the body and mind within the subject, subject and nature, past, present and future of the subject and subject and other related subject, in this case Wordsworth's sister. The lines: 'And I have felt/ A presence that disturbs me with the joy/ Of elevated thoughts; a sense sublime/ Of something far more deeply interfused,/ Whose dwelling is the light of setting suns/ And the round ocean and the living air,/ And the blue sky, and in the mind of man,/ A motion and a spirit, that impels/ All thinking things, all objects of all thought,/ And rolls through all things' shows the scumbled blurring of what could have been broken down into its discrete parts by a more rigourous, problematising analysis. This kind of intuitional, holistic empiricism will be very important for Whitehead.[10]

Yet there is a complexity in what 'Tintern Abbey' omits: one would never know from the poem that the Wye valley had been an important metallurgical centre since the sixteenth century and played an important role in the early Industrial Revolution. There is a real element of denial here, which will lead to Leavis' diagnosis of the marginalisation and decline of poetry in the course of the nineteenth century. There is an interesting contrast with a slightly later, major French writer, Nerval. Four works from the end of his life, that is from the early 1850s, involve quasi-autobiographical journeys to the north of Paris, where the author had partly grown up: *Angélique*, *Les Nuits d'octobre*, *Sylvie* and *Promenades et souvenirs*. They epitomise a problematic, disjunctive, fragmented subject, at times ironic, at times overwhelmed by intense emotions, at times on the edge of hallucination. All four works, especially *Sylvie*, contain impressive descriptions of nature and local customs – Nerval is much more 'self-projective' or immersed in these descriptions than Wordsworth – but there are also references to the railways that had only recently been built to the north of Paris in three of the works and to social changes that resulted from the railways in *Sylvie*.[11]

Nerval was strongly influenced by German literature, which, along with mental illness, brings him very close to two of Heidegger's poets: Hölderlin and Trakl. There are also interesting affinities between Heidegger and Whitehead, in that there is a similarly concrete quality to the relationship between the human subject and the world of objects in the former and the actual entity among other actual entities in the latter. Heidegger clearly focuses on poetry in a much more sustained way than Whitehead, but neither isolates it as aesthetic. Whitehead moves easily from the glow of the sunset to molecules and electric waves, from poetry to science, while Heidegger is well known for not reading poems as a literary critic or historian. Indeed his readings often feel like medieval biblical exegesis, with quasi-decontextualised utterances being turned into insights into the essence of being in his case or Christian spirituality in the case of the commentators from the Middle Ages. With Heidegger, this is part of a deliberate process of de-subjectivising and de-aestheticising artistic modernism in order to regain a primordial, authentic access to the essence of being, but there is a correlate: technology is rejected along with artistic modernism. Whitehead has no problems with technology, and he does not need to confront artistic modernism in English Romantic poetry. In a sense, Heidegger had to reject the technology to which modernism was reacting when he rejected modernism, while Whitehead was able to establish an undifferentiated creativity as ultimate in *Process and Reality*.[12] It also means that the latter's anti-Cartesianism is very nuanced: he does not so much launch a frontal attack on the problematic subject as conduct subtle operations that transform it, and he greatly enriches the notion of modern science that had Cartesian thought as its basis without completely destroying those foundations. This is why he was so drawn to Leibniz, who fully accepted the philosophy, science and mathematics of his age but maintained a highly fruitful, very critical dialogue with the ideas of Descartes, Locke and Newton throughout his career.[13]

Language and Frege's theory of meaning (or the philosophical tradition behind it) are central concerns in both analytic philosophy and Heidegger, even if they approach it in almost diametrically opposed ways. As has been shown, the latter extensively explores poetic language and is trying to uncover a primordial truth anterior to propositional truth, while the former uses simplified, clear statements, such as 'The present King of France is bald' to pursue an essentially Fregean programme. That the binary quality of subject and predicate, sense and reference in analytic philosphy reinforces the rigidity of Cartesian

subject–object relations is evident, but one could say that Heidegger never really succeeds in overcoming them, in spite of all his efforts to do so. Whitehead was not insensitive to language: indeed he is always a very precise and not infrequently a downright elegant writer, but he thought like a mathematician or geometrician, not in the narrow, reductive sense of the isolating of variables and finding a function to link them, in order to establish a numerical essence for reality, but in the infinitely expanding sense of continuously reframing mathematical problems in novel and illuminating ways. One is reminded of Emerson:

> Our life is an apprenticeship to the truth that around every circle another can be drawn; that there is no end in nature, but every end is a beginning; that there is always another dawn risen on mid-noon, and under every deep a lower deep opens. (Emerson 2003: 225)[14]

This enabled him to put subject–object relations into a new context, in which they could be opened out and radically rethought. Clearly, this was of immense importance for Deleuze: *Difference and Repetition* and *The Fold* are profoundly influenced by this aspect of Whitehead's philosophy.

However, there is an important distinction to be made here, in that one can argue as to how metaphorical Deleuze's mathematics are,[15] whereas the difficulty simply does not arise with Whitehead: he simply was a mathematician, and he published mathematical work. The problem, though, is that the mathematical work is difficult for non-mathematicians and can be separated out from the rest of his thought, so there is a tendency to ignore it. This is particularly true of the response to *The Concept of Nature*, where the geometric sections are usually skipped and the metaphysical comments are extracted as indications of how its author was to develop as a fully-fledged philosopher, but this is a profoundly mistaken approach, as it is precisely the grittiness of Whitehead's relational mathematical engineering that takes him beyond a vague Swedenborgian panpsychism, however mystical or poetical he sometimes is. This is why the paperback re-issue of *An Enquiry Concerning the Principles of Natural Knowledge* and *The Principle of Relativity with Applications to Physical Science* is particularly significant. The former first appeared in 1919 but had a second edition in 1925, while the latter was published in 1922: together with *The Concept of Nature*, which came out in 1920, they form a kind of interlocking trilogy.

An Enquiry Concerning the Principles of Natural Knowledge covers much the same material as *The Concept of Nature*, but it is not

mostly based on lectures, as the latter book is: it is more like a well-organised textbook, broken down into a very clearly defined structure of larger sections and smaller subsections. This means that although it is more dense scientifically and has a fair sprinkling of reasonably complicated diagrams and equations, an attentive reading of it is an invaluable supplement to *The Concept of Nature*, where the long verbal descriptions and lack of diagrams sometimes make it hard to grasp Whitehead's four-dimensional geometry in a precise, concrete way, and the different concepts can begin to blend into each other in a kind of oral flow, even if there is a visionary element in compensation for this. Near the beginning of *An Enquiry Concerning the Principles of Natural Knowledge*, Whitehead deals with Berkeley in the same way that a mathematician would deal with another mathematician: he goes back to the problem behind the solution and recasts it in a way that transforms it. The gap between moment by moment perception and the world of objects is replaced, with some intervening input from Kant, by the relationship between perceptual experience and knowledge, with the latter only occurring within the former.[16] There are two mathematical systems elaborated in both *An Enquiry Concerning the Principles of Natural Knowledge* and *The Concept of Nature*: (1) extensive abstraction, which corresponds to the basis for scientific exploration and (2) a four-dimensional relational geometry of instantaneous space, which is a way of trying to understand ongoing, lived perceptual experience, with the former being derived from the latter. Hard work on these systems enormously enhances one's understanding of Whitehead's philosphy, even when it shifts from the relationship between perception and knowledge to that of perception and ontology in his more mature philosophical thought.

The Concept of Nature is pervaded by the theory of relativity or aspects of science, mathematics or geometry associated with it, but it is only mentioned specifically in chapter VIII, where Whitehead briefly explores the differences between his ideas and those of Einstein. This means that *The Concept of Nature* can to a certain extent be read in a relatively non-scientific way, even if such a reading is bound to be somewhat skewed, but this is definitely not true of *The Principle of Relativity*, which is a sustained contribution by a practising mathematical physicist to the extraordinarily rich debate concerning relativity in the scientific community around 1920, with important books by Weyl, Lorentz, Born and Pauli, all offering subtle developments and alternatives to Einstein's theories: even when these authors have ideas which are no longer accepted today, they are still

very thought-provoking. This is true of the most interesting divergence from the classic model in *The Principle of Relativity*:

> The possibility of other such laws [of gravitation], expressed in sets of differential equations other than Einstein's, arises from the fact that on my theory there is a relevant fact of nature which is absent on Einstein's theory. This fact is the whole bundle of alternative time stratifications arising from the uniform significance of events. (85)

As this quotation indicates, there are some serious alternative mathematics associated with this divergence in what is a very mathematical book, but the idea had already been explored *en passant* in *The Concept of Nature*. Here it emerges as a consequence of the four-dimensional instantaneous (as opposed to timeless) space configured around the event-particle. One could say that the event-particle and its spacetime relationship with the rest of the universe form a radically singular, momentary, indissoluable cluster, and that none of the elements of this cluster can be fully generalised to *any* other such cluster. What is beautiful about this thought is that it can be built into a world that sings with a deep harmony between interdependence and spontaneity: it is as if Leibniz's monads still reflected the other monads but had been put in Brownian motion.[17]

This network of related movement in spacetime, electromagnetic waves and gravitational pull, explored in an ongoing way by four-dimensional geometry and equations, the latter mostly coming from tensor calculus, is not without real emotional investment by Whitehead. The very first page of *An Enquiry Concerning the Principles of Natural Knowledge* contains a prominent dedication to Whitehead's youngest son, who was killed in action in France in 1918, and at the end of the 'Preface' there is a reference to the 'anxiety' during the war 'and at last the anguish which is the price of victory' (viii). The final section of the 1919 edition of the book, that is just before the 'Notes' added in 1925, concludes that 'the permanence of the individual rhythm within nature is not absolutely associated with one definite set of material objects', and then Whitehead quotes poetry from Tennyson and Wordsworth and cites Bergson's *élan vital* (199–200).

At the beginning of his beautiful essay, 'Wozu Dichter?', first delivered in 1946 after another world war, Heidegger speaks of the poet's ability to feel the traces of the departed gods in the abyss at the centre of the night of the world's misery, so that this abyss can become the ground of a change in direction for humanity. How is this done? One can avoid concentrating exclusively on poetry and therefore parallel the dual use

of geometry and equations in Whitehead's mathematics (and elsewhere in the theory of relativity) by comparing Trakl and Van Gogh, both of whom were very important to Heidegger. The poet and painter put objects on the paper or canvas in a way that is not aesthetic, emphasising their 'isness' or 'thingness', and compacting object and object or object and space together so that lines of force appear between and around those objects. These are the traces of the gods and of the future, but as Heidegger says near the end of 'Wozu Dichter?', these are not overt predictions of a future which is to come, but traces from the future which work best when their action is unconscious. The lines of force are also the 'Wesen', that is essence, of being, but 'Wesen' in Heidegger is never transcendent or eternal: it is always immanent and of the moment of perception and/or revelation.

Strictly speaking, mathematical physics does come close to making predictions, in that there is hope that what has been posited geometrically or in equations will eventually be observed empirically. This means that one should be very careful about crossing the boundary between the theory of relativity and philosophy, however stimulating the former may be to the latter, especially with regard to the nature of time. Furthermore, the theory of relativity does not necessarily lend itself to one particular type of philosophy: Cassirer's neo-Kantian, Marburg school approach to it is quite different from that of Whitehead, who is already beginning to speculate about its application outside physics in the very first sentence of the main text of *The Principle of Relativity* (3).

It is worth noting that the tensor calculus brought into the theory of relativity by Einstein is also used by engineers to determine the stresses and strains in solids and liquids, and this gives it a quality of an explorative-constructive instrument that has definite affinities with what is happening in Trakl's poems or Van Gogh's paintings. Even if Heidegger is a mystical philospher of poetic depths and Whitehead a mathematician of heuristic conceptual frames, both avoid the discrete, circumscribed object and resolve its finitude or transience in eternal, continuous process. One could argue that Deleuze brings these two visions together and adds a mediating surface between them, with *Logic of Sense* having a rather more interior quality than the very Whiteheadian *Difference and Repetition*. Derrida may refer more overtly to Heidegger, but there is a definite element of Heideggerian authenticity in Deleuze's concept of being worthy of the event, although the influence may have been felt indirectly via Sartre.[18]

Isabelle Stengers and Didier Debaise are both at the Université Libre de Bruxelles, which means that there is a certain family resemblance

between their two books – Stengers' *Thinking with Whitehead*[19] and Debaise's *Un Empirisme spéculatif* – even if the two works are rather different in scope. Stengers is a distinguished doyenne of the philosophy of science, and her book is her magnum opus, in which she exhaustively explores all of Whitehead's metaphysical work in relation to her own richly matured thoughts on science and ontology, while Debaise is a talented younger colleague and former student of hers who has produced an excellent but relatively limited study of a single text, *Process and Reality*. Nevertheless, there are a number of shared elements in the approaches of the two authors. First, an important problem in Whitehead scholarship is the degree to which there is a radical break or continuity between *The Concept of Nature* and the later metaphysics. Both Stengers and Debaise opt for nuanced continuity, with extensive passages in *Thinking with Whitehead* being devoted to *Science and the Modern World* and *Religion in the Making*, two understudied transitional works between *The Concept of Nature* and *Process and Reality*. Second, both authors also try to rectify the subtle assimilation of Whitehead's ideas to those of Bergson or phenomenology in Continental philosophy, while simultaneously establishing affinities with William James. There are excellent passages doing one or the other in both Stengers and Debaise, although hers are more extensive, as hers is by far the longer book. Third, Whitehead has a very distinctive, rather creative and not un-Deleuzian relationship with the philosophers from Descartes to Kant, even if, as Stengers says, he tends to treat them as other mathematicians, appropriating individual ideas and transforming them, whereas Deleuze is more in the mould of Gueroult, a radical but scholarly re-interpreter of the thought as a whole of significant figures from the philosophical past. There are many excellent passages detailing Whitehead's treatment of individual concepts in Descartes, Leibniz, Locke or Hume in both Stengers and Debaise, and the former comes very close indeed to cracking one of the key problems in Whitehead: how he scrambles the history of the philosophy of perception in the West and ontology in an interlocking and reflecting but complexly asymmetrical way.[20] Fourth, both authors mention Deleuze, but Stengers does not always clearly distinguish between the ideas of Whitehead and those of solo Deleuze or Deleuze and Guattari, while Debaise has a very interesting section in which he explores the differences between individuation in Whitehead and in Deleuze and Simondon. This contrast probably stems from the fact that Stengers is often discussing her own ideas with reference to other philosophers or thinkers who have influenced her at the same time as she is maintaining an ongoing dialogue

with Whitehead, who of course is the main influence on her. Fifth, both Debaise and Stengers are very good at dealing with the etymology or associations of important words in Whitehead, in particular the names he gives to concepts, types of entity or operations to which entities are subject. Stengers is also aware of subtle problems in the existing French translations of Whitehead, but obviously his texts are now given in their original English. Debaise is a little disappointing in this respect: he only cites these French translations of Whitehead, which are actually as competent as translations can be, and some of them do have running page references to the original English publications, but citations of both French and English texts would have been better. Sixth, Stengers demonstrates a quite exceptional mastery of Whitehead's work – from which she can pretty much quote at will – and the literature connected with it and with his creative process, but she has opted for a book without footnotes and a relatively limited bibliography, while Debaise has scholarly footnotes and an exhaustive and up-to-date bibliography of publications on Whitehead in both English and French. One should not allow the vast scale of *Thinking with Whitehead* to diminish the very considerable achievement of *Un Empirisme spéculatif*: in not that much more than 150 pages of main text, Debaise has managed to produce an admirably lucid, very concise, intellectually subtle and beautifully organised account of the principal themes of *Process and Reality*, a work that is renowned for its sprawling and rather inaccessible nature.

The central spine of Stengers' book is made up of extended and dense exegeses of Whitehead's most important works from *The Concept of Nature* onwards. She follows the twists and turns of thought from work to work in a way that respects individual moments of creativity in problem solving but also establishes a remarkably unified trajectory for Whitehead's overall philosophical journey. Broadly, it is a vision that combines a belief in traditional empirical science with elements of speculation, holistic thinking and inclusivity that prevent it from being reductive and an ontology that involves a very amorphous subject in a very interactive relationship with its world. What is missing is the kind of divided subject one finds in Deleuze, Lyotard or Derrida, and this is because such a subject is probably missing from Whitehead's philosophy and has to be added to it, but that may be a way of developing or expanding his work, which is something Stengers wishes to do. While a divided subject can seem too binary, as if it were simply two partial subjects instead of one, Stengers' amorphous subject can still seem too individualistic, only with more blurred boundaries and a less solid internal consistency. This is not to say that she is 'wrong' – there

is a great deal of validity in her approach – but that by eschewing the divided subject, she is forgoing the opportunities it gives as an operation for collapsing the subject from within and turning it into drives, which can be linked to external forces. For example, in Arnold's problem of whether the perimeter of a rectangle is increased by a sequence of folding and unfolding, one can relate the pattern of the folding and unfolding to the actions that have caused them and see the perimeter as something responding to continuities that cross it rather than the result of something within it.[21] The divided subject is probably associated with the types of thought that Stengers seems to be attacking in an oblique way throughout the whole of *Thinking with Whitehead*. It is difficult to be sure about what she is attacking – critical epistemology, something like Marxist critique and Rorty are alluded to *en passant* – but one assumes that deconstruction and poststructuralism would be part of what she is rejecting in favour of her very subtle but still rather traditional belief in the efficacy of empirical science. Again, she is not 'wrong', but as with Heidegger, there are aspects of Derrida and Lyotard that could be cross-phased in a fruitful and complementary way with Whitehead's philosophy.

However much one might disagree with certain aspects of the direction in which Stengers takes Whitehead's ideas, there is no doubt that her exegesis of his work is superb and that it benefits enormously from her being a creative philosopher in her own right. She begins with *The Concept of Nature*, concentrating on its metaphysical side and ignoring the extensive discussions of geometry, as is normal in Whitehead studies. This section of Stengers' book seems longer than it is: it takes up seven of the main twenty-five chapters, but these chapters are quite short, and there is quite a lot of quotation from Whitehead. Nevertheless, she distils the essence of *The Concept of Nature*: with mind as ultimate, it circumvents the bifurcation of nature. Everything – the glow of the sunset *and* the molecules and electric waves – is in the same boat. With due attention, one can extend one's perceptual capacity, so that one is not seeing a 'reality' behind 'appearance' but a further dimension of a reality that always remains undivided. A sort of *engrenage* or complementarity is proposed between respondent and world: there seems to be enough of a fit between what one can perceive and what is out there that one can in general rely on one's perceptions as a basis for knowledge and survival. Mind is still ultimate here, so that is why interlocking is closer to what is happening than fusion. Stengers introduces the image of the mountaineer climbing the mountain as a means of conveying what this relationship is like, and it turns

into the concept of having a hold on the world as she enters into a very long discussion of *Science and the Modern World*, a rather hybrid and confusing work that Whitehead specialists have tended to neglect. Stengers' thorough exploration of this text is a particularly original aspect of *Thinking with Whitehead*, and it very much provides the basis for the rich and convincing link she makes between *The Concept of Nature* and the later more purely metaphysical work.

It is now that the problem of misplaced concreteness is tackled. One can observe reality and isolate certain variables, say: velocity, frequency and wavelength, and then combine them into a function, in this case $v = f\lambda$, which can be tested empirically. Even if there continues to be no disproof of the function, and it remains 'true', it is still not 'out there'. To think so is misplaced abstraction, that is confusing the tool that one has used to come to grips with reality with something that is actually 'out there' and has been 'discovered'. There is an important distinction to be made between the fact that the universe appears to be mathematisable and human beings seem to be able to do it and the existence of a kind of 'mathematical fact' at the root of the universe. This is very much the way mathematicians think: they usually prefer to make ongoing contributions to as yet unsolved or perhaps insoluble problems, rather than just finding answers.[22] Stengers continually emphasises the way in which Whitehead thinks like a mathematician throughout the whole of her book. This means that it is particularly clear that the expansive quality of due attention in *The Concept of Nature* and the arguments against the reductive quality of misplaced concreteness in *Science and the Modern World* are two sides of the same intellectual coin and how much the holistic quality of their author's thought comes from his training as a mathematician.

Another key problem in Whitehead is how one moves from eternal objects to actual entities. He addresses this problem in a sustained way in *Science and the Modern World*, using God as ultimate, and Stengers closely tracks what one could call his 'rough workings' for the more finished achievement of *Process and Reality*, although even here, Whitehead was continuously fine-tuning his ideas by inserting new sentences into paragraphs which had already been written. Part of Stengers' purpose in making this detailed exposition is to show how Whitehead was driven by the logic of the problem, but what is perhaps more interesting is that it allows her to treat *Process and Reality* in a less monolithic way and to see what it says as in a certain sense provisional and therefore capable of further extension, something she herself does in the later chapters of her book. It also helps one to understand how

difficult ontology is, how difficult it is to understand the relationship between permanence and transience, how easy formulae or positions will not work and how the problem is perhaps insoluble but always open to fresh attempts at a deeper understanding by heuristic reframings.

God is replaced as ultimate by creativity in *Processs and Reality*, but he is still there in another very important role. How Whitehead uses God is a third key problem in the philosopher's work, and Stengers handles it very impressively. She does not simply 'block' at the word God and the religious vocabulary associated with him: she gets behind this to see what problem Whitehead is trying to solve and how he is using God as a concept in relation to it.[23] This is in fact an approach one could use with the seventeenth- and eighteenth-century philosophers that were so important to Whitehead, and it is not surprising that Stengers is particularly good at the difference between his notion of God and that of Leibniz. For the Whiteheadian, what is best for that impasse seems initially quite close to the Leibnizian best of all possible worlds, and both conceptions are trying to get hold of the fact that the universe somehow seems to 'work', but one involves omniscient divine foresight from the outside, while the other has God as a kind of operator within actuality inducing a certain overall positive directionality. Divine eternity becomes more about conserving what is transient by allowing it to somehow be incorporated into what is to come, rather than some permanent ground beyond or within the transient. Stengers' chapter twenty-four, 'God and the World', is a long, intellectually very disciplined and extremely beautiful exploration of the relationship between God, the world, creativity and actuality.

What one could call the other side of the intellectual coin of what is best for that impasse is the trick of evil. This is when the progress of actuality is forced, when something comes before its time, and it is undoubtedly an important Whiteheadian concept, but Stengers also emphasises it for her own reasons. Her resistence to types of thought such as critical epistemology and Rorty's philosophy is not unconnected with her antipathy to what one could call vanguard radicalism. By and large, one is happy to eschew along with her the 'I'm so left-wing, I wouldn't even suck milk from my mother's right breast' tendency, and Whitehead himself was probably a consensual progressive, as Stengers seems to be, but the very methodical nature of his system means that there is potentially much more room for spontaneity than she seems to allow. Indeed it is possible that she never quite succeeds in bringing together and defining properly the parallel leaps in speculative empiricism and in the movement from eternal objects

to actual entities.[24] The way in which the link between the methodical and the spontaneous can be developed in Whitehead can be explored in relation to Stanislavskian theatre technique, in which there has been a bifurcation between (1) the early Stanislavskian technique of emotional recall which was taken up in particular by Lee Strasberg in America but generally dropped in Russia itself and (2) the detailed scoring of the text, breaking the action down into beats and units, something that is done everywhere to a certain degree but can be done in minute detail in Russia.

When one puts these two strands back together, one can go well beyond the bourgeois naturalism or emotional self-indulgence often associated with Stanislavskian work. The present author played Mordecai in Lope de Vega's *Esther* as a Hasidic Jew in a production set in something like 1940s Hungary during the Horty regime. The theatre was small, with the audience on the same level as the actors, so close contact was possible between them. There was an intensely emotional scene in which Mordecai was told of the impending holocaust of the Jews, for which the present author used emotional recall based on a personal traumatic childhood episode, of course stitched into other elements of historical or mimetic research, but not in itself to do with being Jewish or the Holocaust. Such use of emotional recall is not an exploratory exercise, the results of which are later repeated by the use of motor memory, but the reproduction of the actual emotional experience every performance, with however the use of muscular controls, in the present author's case mainly learnt through isolation work with Ryszard Cieslak and biomechanics with Gennadi Bogdanov. It is as if one's body has become a map of muscles that can be pressed like the stops of a musical instrument to mould the palpable emotional flow one seems to be channelling. The key to Stanislavski is production from the inside, not copying from the outside, and such work has an 'authenticity' that can impact directly on the nervous system of audience members. In the case of 'Esther', a significant percentage of the spectators on certain nights were Jewish concentration camp survivors. On those nights, audience members began spontaneously to talk to Mordecai, to console him, and he began to have a probing, gliding motion, similar to African performers using masks to be spirits, with whom the present author had worked.

It is important to underline the highly personal and apparently 'irrelevant' nature of the emotional recall material. Plaited into the more 'objective' elements of the process, this material helps to create a kind of broad space, simultaneously low density and superconductive,

permitting slides between self and other, and higher density, solidifying, connecting them, but this could not happen if the material was not in some way a response to the text or the director's interpretation of it, however intuitive a leap it might be. The author played the older of two male characters in a shortish piece by Dostoyevsky ('Another Man's Wife or The Husband Under The Bed'), where the director (Anatoli Vasiliev) wanted to explore the bullying of the older generation by the younger one and a certain collapse of shared Enlightenment values in post-Soviet Russia. The author happens to be male to female transgendered, but has not had a sex change, and drew on an episode in what one would now call her female (or transgendered)[25] experience for a certain section. This choice was primarily triggered by a scene from a production of Lermontov's 'Masquarade' by Vasiliev which he showed in rehearsal, where the bullied character was female. This element of *clivage* in the preparation was the basis for a complex effect during a monologue in the section in question, where the author's character talked about his feelings as if he were someone else in the distance looking at the scene. The distance between the character and his 'double' was felt, but the two points were brought together, while the emotional moment was extended, mainly by controlling the muscles of the face. One seems very close here to the contraction of space and dilation of time that one finds in the theory of relativity and that underpin Whitehead's beautiful descriptions of the event, simultaneity and temporal thickness in *The Concept of Nature*.[26]

Stengers' first degree was in chemistry, and she is a distinguished philosopher of science, so she tends to turn to the natural sciences when she wants to explore her own ideas as a response to and development of Whitehead's thought. This happens throughout *Thinking with Whitehead*, but the roughly 140-page section of chapters nineteen to twenty-three does this in an especially concentrated way. Each of these five chapters uses exegeses of short passages from *Process and Reality* or *Modes of Thought* as a springboard for an extended discussion of a particular area. Chapter twenty-three, 'Modes of Existence, Modes of Thought', which moves from a relatively reductive but important biochemical model of life to a more holistic ethological one, is especially impressive, but chapter nineteen, 'Justifying Life?', in which the subtle Whiteheadian notion of a society is explored, and chapter twenty, 'The Adventure of the Senses', which involves a very sophisticated discussion of the problem of sensa, are also both extremely stimulating. Quantum physics is perhaps less successfully examined in chapter twenty-one, 'Actuality between Physics and the Divine': the connections

with Whitehead possibly are not established with sufficient precision. His ideas do 'feel' close to quantum physics because of his sustained engagement with the theory of relativity, but while the two approaches to physics are definitely 'cousins', in practice they tended to evolve separately from each other, so some bridging work needs to be done when one brings them together.

Another key problem in Whitehead is how his scrambling of the history of the philosophy of perception in the West and ontology is related to feeling in the broader sense: the holistic tendency in his thought is very much bound up with this relationship. Stengers deals as impressively with this problem as she does with the other ones, but there is a subtle difficulty here. Her predilection for the natural sciences induces, perhaps semi-consciously, a self that is rather autonomous, unfissured and slightly passive, that progresses evenly towards a richer understanding of the world, based on a sophisticated model of speculative leaps and empirical observation. She is so concerned to overcome the bifurcation of nature and to establish the *engrenage* between mountaineer and mountain and the hold that humans have on what is external to them that she does not sufficiently convey the real dangers of mountain climbing and losing one's hold and their effect on the psyche. Even her excellent discussion of negative prehensions and the scars they leave at the end of chapter eighteen, 'Feeling One's World', makes what is happening seem very safe. There is never the sense of disturbing disjunction of Rimbaud's 'Le Dormeur du val', a short but very intense sonnet from 1870 in which a young soldier appears to be sleeping in a delicately described landscape only for one to discover in the last line that he has 'deux trous rouges au côté droit'. Of course, Stengers is not 'wrong' in terms of a strict exegesis of Whitehead's thought: his obsessiveness probably betrays some kind of underlying disquiet or anxiety, but it is very much sublimated in mathematics, metaphysics and poetic beauty. He is more Upanishadic or Buddhist than tantric in his approach to evil, death or impermanence.

Nevertheless, one needs to look at activities which are more proactive, constructive or engaged, such as the arts, engineering, medical research or social or political action, to fully understand Whiteheadian creativity, even if one wishes to remain within the relatively smooth connectivity and progession of his universe. One could take team sports as a model, where there are moments of exceptional individual brilliance that completely change matches, but they are still very much bound into the rhythm of the team and the game as a whole. However, the structure developed by Whitehead is so strong that one can explore a much higher

level of fear and inner turmoil to be mastered in the self and much more radical and surprising transformations of the world, times when new heaven, new earth and new self all emerge together. Heideggerian authenticity and prophecy can be fused in a complementary way with Whiteheadian mathematics and cosmology, thus avoiding the perils of either 'going off the rails' or simply 'going with the flow'. There is also a real parallel between Whitehead's very Shakespearean sense of time and the event and Heidegger's use of *kairos*, an early Greek concept that was also very important in the Renaissance.[27] One could go even further and factor in poststructuralist or deconstructive techniques from Deleuze, Derrida and Lyotard, all of which enable desire to pick out latent strands from dominant ones and resculpt reality as a painter employs the strokes of his or her brush to pull and push colours into different shapes and textures.

The 1834 workers' uprising in Lyons was the second of two such uprisings in that city after the regime change that took place in France in 1830. The first one, which happened in 1831, had been more of a general workers' uprising, but the 1834 event was distinctly political, that is republican. By then, a large number of regular troops had been stationed in the city, and the insurrection was put down with great brutality and destruction. It was much closer to civil war or what is happening in Homs or Aleppo today than to large-scale urban rioting. Was it a trick of evil in the Whiteheadian sense, an action at the wrong time which led to nothing but bloodshed and chaos? It is very difficult to be sure about what was a trick of evil in the extremely fluid and conflictive politics of nineteenth-century France, out of which, however, a very serviceable democratic model did emerge. Which 'trick of evil' led to which component of that model? Was the *monarchie de Juillet* 'progressive' in the way that it allowed the bourgeoisie to establish its political power, or did it continue to betray the 'real' ideals of the Revolution? Were the *insurgés lyonnais* simply trouble-makers harking back to a Revolution that was in itself a 'trick of evil', or were they asserting a 'right' to take to the streets that their non-white French descendants could take up? The modern French state inherits from both sides in 1834, in that the bourgeoisie will never be in work camps, but barricades will always be a possibility.[28]

A major poet – Marceline Desbordes-Valmore (1786–1859) – was in Lyons throughout the 1834 uprising. She was working as an actress at the Grand Théâtre, but she also had three children with her who were still quite young: they had all been born in the first half of the 1820s. She wrote a number of poems in connection with the uprising, but two stand

out as being particularly significant: 'A Monsieur A.L.', which appeared in *Pauvres Fleurs* in 1839, and 'Dans La Rue', which no one dared to publish until after her death. The first poem is very intense emotionally and needs to be taken in slowly in order for its complexity to come through. Three images of birds are very beautifully deployed in it: (1) a swallow that returns to its young ones in its nest during a lightning storm in the first two stanzas; (2) a bird that is trying to hide from hunters in a forest in the third and fourth stanzas; and (3) a nightingale in the two penultimate stanzas that the poet can hear singing in the destroyed city until it is killed by an exploding shell. The deployment of the images is beautiful because the birds are simultaneously vulnerable creatures in peril imagined or heard by the poet, but they are also the poet herself staying in her house in Lyons, protecting her children and hiding from the soldiers brutally putting down the insurrection.

This link is established in the 'swallow stanzas' in a way that has all of the simultaneity and thickness of the event in Whitehead. Initially, the flight of the swallow is crossed by a lightning flash. This pulls the swallow back to the 'flatness' of the sky and makes the crossing of the two lines seem like an image seen by an observer in the distance. But the swallow is afraid and is flying to its nest to be with its eggs, which become hatched fledglings in the next stanza: this sudden shift from 'tendres oeufs' to 'le duvet dont se recouvre à peine,/ Leur petite âme nue et leur gosier chanteur' (Desbordes-Valmore 1983: 123) is an example of the quite magical effects of Desbordes-Valmore's language. Because the swallow in its nest 'becomes' the poet in her house in later stanzas, it is as if the swallow has flown into the observer's house and become her. A swallow's flight has a rapidly skimming, bobbing up and gliding quality to it that seems to fill up the space between the far-off image and the observer. There is a similar link between the bird in the forest hiding from the hunters and the poet in the house hiding from the soldiers and the nightingale singing its lament in the devastated city and the poet 'singing' the lament that is her poem. There is a beautiful movement here from being silenced by terror to crying out against injustice, which finds a parallel in the bold fifth stanza of 'Dans La Rue', where 'Les vivants n'osent plus se hasarder à vivre./ Sentinelle soldée, au milieu du chemin,/ La mort est un soldat qui vise et qui délivre/ Le témoin révolté qui parlerait demain . . . ' (144).

This network of interconnections acts as a kind of Whiteheadian four-dimensional instantaneous space, and they frame the central section of 'A Monsieur A.L.', which is the 'tableau' of the city's destruction through her window. Even here there is spatial ambiguity: the twice

repeated 'J'étais là!' (Desbordes-Valmore 1983: 124) can mean both 'I was in Lyons during the uprising' and 'I was out there when it was happening'. But now the extraordinary concrete, compacted, 'slam dunk' imagery makes Desbordes-Valmore one of Heidegger's poets that feel the traces of the departed gods in the abyss at the centre of the night of the world's misery. Lines such as 'Tuant jusqu'à l'enfant qui regardait sans voir,/ Et rougissant le lait encore chaud dans sa bouche . . . ' (124) and 'Et cousant au linceul sa livide moitié,/ Ecrasée au galop de la guerre civile!/ Savez-vous que c'est froid le linceul d'une ville!' (125) could be Trakl, and one can see why Nerval read Desbordes-Valmore, who does indeed feel the traces of the gods in the Whiteheadian event that fuses her fear as a vulnerable mother with her defiant empathy for the brutalised citizens of Lyons. One can still read her and hope for Homs and Aleppo, that their suffering is not in vain.[29]

One cannot really do this with a poem one could compare with 'A Monsieur A.L.' and 'Dans La Rue': Shelley's 'The Mask of Anarchy' written in 1819 in response to the 'Peterloo Massacre', which was of course a relatively minor incident compared with the Lyons uprising of 1834. Nevertheless, the authorities still behaved in a violent and repressive way. Shelley's poem is intellectually complex: it uses the double meaning of 'mask' as 'masquerade' and 'false disguise' to explore how the government and not the people are the real perpetrators of anarchy. This analysis of the ruses of power is astute, and it is achieved through subtle poetic means, but one does not really have the same sense of a swelling towards the future that one has in Desbordes-Valmore, even though parliamentary reform was eventually achieved, and over half of the poem is an address by Hope to the men of England. Shelley is in Italy, far away from what is happening – which he does acknowledge – but he increases that distance by his very rhetorical language, however strong some of the ideas and images may be.[30] Desbordes-Valmore is physically with the insurgents, and she is pushing language to express her emotional journey of fear, compassion and defiance. She is also on a more novel trajectory as a poet, emerging as a very distinctive female voice. She had already published the utterly sweet but rather thoughful 'Le Coucher d'un petit garçon' in 1830, and she was to compose the heartbreaking and profound *durcharbeitung* of 'Rêve intermittent d'une nuit triste', one of the most powerful of all poems in French, in 1846. In 1834, Lyons saw the cross-phasing of two emerging entities, intersecting like waves from two sources in a ripple tank, but this image is not enough. It gives a good idea of a Whiteheadian network, but it does not fully explore tapping

into the latent or virtual that one can find in Deleuze, Derrida and Lyotard.

Thinking with Whitehead is an exceptionally rich and deep book. It is not easy to take in on a first reading, but it does have to be read through from beginning to end to sense the overall compelling shape of its argument. It is also a book to return to on innumerable occasions. Whatever criticisms this author may have levelled at Stengers, they have always been a response to the stimulus of her well-sustained and vigorous mental energy, and it has always felt as if it was a privilege to review her work.

Notes

1. The ideas in this review have benefited from enormously stimulating and generous exchanges with James Williams.
2. A random example of this is Kneale 1949: 72–3, where the author adopts a distinctly patronising tone in his discussion of Whitehead's arguments against the unrestricted universality of natural laws.
3. See Wahl 2004. There are three studies in this book: one on William James, which is based on a reading of his letters; another on the speculative philosophy of Whitehead; and a third on Marcel's *Journal métaphysique*. The Whitehead study is remarkably scholarly: Wahl uses all of the solo works published by the philosopher up to 1929 and refers to innumerable reviews, books and articles that respond to them. The essay is quite balanced in the weight it gives to Whitehead as contributor to the theory of relativity, philosopher of science and metaphysician. There are also some interesting comparisons between his ideas and those of Heidegger.
4. Bergson deals most extensively with intuition as such in *La Pensée et le mouvant*, which has been re-edited with an extensive *dossier critique* by Presses Universitaires de France as part of its superb critical edition of all of Bergson's work: see Bergson [1938] 2009. There is an English translation of this text with the title *The Creative Mind*: see Bergson 1992. For Husserl's final, posthumously published statement on his phenomenology – the *Krisis* – see Husserl 1970. It is illuminating to compare what Husserl is trying to do in the famous appendix to this work, *The Origin of Geometry*, with Whitehead's extensive use of geometry in *The Concept of Nature*. Husserl considers geometry only in the context of the relationship between a specifically human consciousness and the world, and he seeks a primal, hidden geometry underneath or within the history of geometry, that is an imminent universal for any lived particular. Whitehead discusses geometry in a number of different ways, but he mainly develops it as a required spatial framework, embedded in the moment and not timeless, for exploring the implications of knowledge as ultimate, with nature not being bifurcated in relation to mind, that is an enabling structure permitting subject and object to be fused in a perceptual event without being abstracted from the infinite continuum. Of course, these two approaches do not have to be mutually exclusive. Merleau-Ponty was influenced by both Husserl, especially by his late work, and Whitehead. For the latter's influence on him, see Robert 2011 and the exceptionally rich and scholarly Hamrick and Van der Veken 2011.

5. For Whitehead and quantum physics, see Lacoste Lareymondie 2006. For a good recent book on evolutionary development biology, see Carroll 2006. The key idea in Evo Devo is that all the organs and appendages in all animals have evolved from a very limited number of basic genes, which means that fins, wings, arms and legs all come from the same primordial gene, for example. It would be interesting to connect this with the relationship between eternal ideas and the ongoing capacity for new singularites in actual entities in Whitehead. Of couse, the Deleuze who co-wrote *A Thousand Plateaus*, in which ethology is absolutely central, had already been deeply influenced by Whitehead.
6. See Leavis 2008.
7. Whitehead 1964: 29. It is worth noting that the choice of this example for exploring the bifurcation of nature almost certainly reflects the central importance of electromagnetic waves and the speed of light in the earlier special theory of relativity.
8. In particular, his lectures at Harvard were sprinkled with references to his favourite poets, Wordsworth and Shelley. Notes taken from Whitehead's lectures are being transcribed and made accessible online by the Whitehead Research Project at < http://www.whiteheadresearch.org > . Look under 'Research' and then 'Whitehead Lecture Notes'.
9. Obviously, the literature on poetry and other art forms in the nineteenth and early twentieth centuries in French- and German-speaking countries is vast, but see Richard 1955 for a very beautiful, now classic, phenomenological study of nineteenth-century French poetry, with essays on Nerval, Baudelaire, Verlaine and Rimbaud, and see Raitt 1981 and 1986 for excellent scholarship on Villiers de l'Isle-Adam, a very important figure in French symbolism. For Husserl and Freud, see Trincia 2008. Trincia is an Italian philosopher who has produced valuable work on the area between Husserl, Heidegger and Freud; he also publishes in English.
10. For a recent edition of the *Lyrical Ballads*, see Wordsworth and Coleridge 2006. For extremely perceptive remarks on Wordsworth within a number of different, fruitful contexts, see Man 1984, in particular the chapter on his poetry and that of Hölderlin (1984: 47–65).
11. There is an enormous amount of excellent criticism devoted to Nerval, but Chambers 1969: 168–219, 238–68, 307–42 and 1993: 83–117 are especially illuminating for the four works in question. See also Kofman 1979 and Kristeva 1992: 139–72 for extremely stimulating philosophical/psychoanalytic treatments of Nerval.
12. A certain amount of clarity is required in citing the English translations of Heidegger's works on poetry, as they did not initially correspond to the original German publications, as the French translations did. More recently, though, they have done so: Heidegger 2000 translates all of *Erlauterungen zu Hölderlins Dichtung*, while Heidegger 2002 does the same for *Holzwege*. Heidegger 1982 did translate all bar one of the essays in *Unterwegs zur Sprache* – the piece on Trakl is in this volume – but Heidegger 1975 includes the essay omitted from Heidegger 1982 and various essays from Heidegger's other German publications, including three pieces from *Vorträge und Aufsätze* and two from *Holzwege*. The introduction to Heidegger 1975 by the translator is short but excellent. Heidegger 1977 includes two essays from *Holzwege* and two from *Vorträge und Aufsätze*, one of which is 'The Question Concerning Technology'. Heidegger also gave three lecture series on hymns by Hölderlin, which have been published as volumes 39 (on 'Germanien' and 'Der Rhein'), 52 (on 'Andenken') and 53 (on 'Der Ister') in the *Gesamtausgabe*. Only the series on 'Der Ister' has been translated into English: see Heidegger 1996. For recent high-quality work

on Heidegger and poetry, see Lacoue-Labarthe 2007 and Stephens 2007, while Thomson 2011 is a valuable book that deals primarily with Heidegger and the visual arts.

13. For Leibniz and Descartes, see the very scholarly Belaval 1960, and for Leibniz and Locke, see the equally impressive Jolley 1986.
14. This quotation is from the end of the first paragraph of 'Circles', which is the tenth essay in *First Essays*. Emerson was a close friend of William James' father: James is the contemporary philosopher with whom Whitehead almost certainly had the greatest affinity. For Emerson and the James family, see James 2008: xv–xxxiv. For an important book of contributions by various authors on perspective in Leibniz, Whitehead and Deleuze, see Timmermans 2006.
15. It is mainly Badiou, originally trained as a mathematician, who has criticised Deleuze for not being genuinely mathematical: see in particular Badiou 2000. See Hallward 2003 for an excellent work on Badiou as philosopher *and* mathematician. Of course, Badiou deals with the philosophy of the subject and the event in a way that is quite different from Deleuze and is not especially Whiteheadian, although it would be interesting to explore Badiou's Platonic side in relation to the residual traces of Platonism in Whitehead.
16. It is not surprising that Whitehead had a sustained interest in Berkeley. The latter had anti-Cartesian and anti-Newtonian positions with regard to mathematics, motion, abstraction and scientific method. There has been an immense amount of excellent work on him in the last thirty or forty years. For his ideas on mathematics, see Jesseph 1993, and for two important general interpretations, see Winkler 1994 and Pappas 2000. André Breton was also interested in Berkeley, and Gueroult wrote on him: as with his beautiful work on Malebranche, he manages to combine an impeccable historical sense with the capacity to make the ideas as fresh as if they had been written yesterday. It would be interesting to compare Whitehead's, Gueroult's and Deleuze's treatment of late seventeenth- and early eighteenth-century Western philosophy.
17. See Whitehead 1964: 96–7, 176–9, 192. One cannot emphasise enough that an understanding of Whitehead and the philosophy of the event can be greatly enhanced by some serious reading on concepts of space and time in modern physics. Four books, none of which requires difficult mathematics, initially stand out. Born 1965 is a revision of the author's text first published in German in 1920 and is a deep but accessible work by a brilliant physicist, Davies 1977 is over thirty years old but is still fine for the classic model and is exceptionally clear, Sklar 1992 is a now classic work that combines physics and philosophy, while the more recent Ryckman 2005 does the same, but his book takes a different approach from that of Sklar: he focuses on what he sees as a transcendental idealist tendency early on in the theory of relativity as opposed to the logical empiricist one which eventually became dominant. Whitehead does not really fit into either of these categories: he was not Kantian and Husserlian in the way that Weyl was – Weyl was a major figure in the first tendency – but he was clearly not a logical empiricist. Reichenbach, a key influence on Sklar, is the main theorist for this second tendency, which is explicitly anti-metaphysical.
18. For 'Wozu Dichter?', see 'What Are Poets For?' in Heidegger 1975: 91–142 or 'Why Poets' in Heidegger 2002: 200–41; for Heidegger on Trakl, see 'Language' in Heidegger 1975: 189–210 and 'Language in the Poem' in Heidegger 1982: 159–98 – these are different essays; and for Heidegger on Van Gogh, see 'The Origin of the Work of Art' in either Heidegger 1975: 17–87 or Heidegger 2002: 1–56. For a recent discussion of Heidegger and Van Gogh, see Thomson 2011, especially ch. 3, 'Heidegger's Postmodern Understanding of Art', pp. 65–120.

For a valuable study on poetry and language that deals extensively with Heidegger, see Allen 2008. For an important work on time combining physics and philosophy, see Reichenbach 1999. For Cassirer's approach to the theory of relativity, see Cassirer 1953. For a book on tensor calculus and the theory of relativity that begins at a reasonably simple level mathematically, see Lowden 2002.

19. For the original French edition, see Stengers 2002. The English translation is excellent: it was done by Michael Chase, who has an Australian master's degree and a French doctorate in the history of philosophy, specialising in neo-Platonism. He has also translated at least five books by Pierre Hadot.
20. A second reading of Stengers' very long and dense book might show that she has in fact succeeded in doing this.
21. For 'the rumpled dollar problem', see Arnold 2005.
22. Arnold 2005 is a beautiful book by a great mathematician that exemplifies this approach, which does not of course have to be limited to mathematics. For example, the idea in Barthes that there can be multiple readings of a text comes to mind: see especially Barthes 1991.
23. Her exploration of how Whitehead uses God in various ways as a concept in *Science and the Modern World* and *Process and Reality* is enriched by her discussion of *Religion in the Making*, a neglected work by Whitehead that comes between the other two works. Both *Science and the Modern World* and *Religion in the Making* have recently been re-issued by Cambridge University Press.
24. Again, a second reading of her book might show that she does do this.
25. The present author lives full-time as female, but she used to do male roles in the theatre: hence the radical split in her experience she could draw on in this production. She no longer plays male roles, so the process would be different, although something similar would clearly be possible.
26. See Whitehead 1964, in particular pp. 52–6. The great twentieth-century Russian theatre practitioner/theorists treat performance problems in a way that brings them very close indeed to philosophical problems, such as identity, self and other, intention, agency, emotion, actions and events, even if the material is obviously not presented as philosophy. One has more substantial writings, occasional pieces, transcriptions of teaching and reported remarks. For Stanislavski, one is well served in English, and Michael Chekhov ended up in America, so the material connected with him was in English from the start. With Meyerhold, Tairov and Vakhtangov, one is better off in French, in which L'Age d'Homme has published complete editions of all three directors' writings. Meyerhold's ideas on actions and emotions are remarkably close to those of William James in *The Principles of Psychology*. Vasiliev (or Vassiliev when transliterated into French) has worked a great deal in France, so there is a great deal of material connected with him in French. He initially trained as a chemical engineer before moving on to study theatre. One should also not forget Lee Strasberg, who was American but is important, and Grotowski, who was Polish but trained in Russia.
27. See Sipiora and Baumlin 2002 for a volume of excellent essays on *kairos* at different periods in history and Dosse 2010 for an extremely wide-ranging discussion of the concept of the event in modern thought.
28. For the classic work on the Lyons uprisings, see Rude 2007, which was first published in 1982. The 2007 re-edition has a valuable postface by Ludovic Frobert. It is important to remember there were ex-combattants from the Napoleonic Wars amongst the insurgents, which meant that they were tactically aware. In 1834, they used a very successful combination of defensive barricades and attacking columns, while in 1834, they could be said to have founded

modern urban guerrilla warfare. In a real sense, they created a new 'physical language' of resistence.

29. Yves Bonnefoy's preface to this volume is very perceptive. For a good recent book on Desbordes-Valmore by the main specialist on her, see Bertrand 2009.
30. See Shelley 2009: 400–11, 759–62.

Book Review

Craig Lundy (2012) *History and Becoming: Deleuze's Philosophy of Creativity*, Edinburgh: Edinburgh University Press

As is well known, Deleuze and Guattari are notable for their eschewal of the word 'or' in relation to potential conceptual and creative encounters. It is always a question of 'and' as a means of propagating difference and becoming through a combination of rupture *and* affirmation, thereby circumventing the capture of signification, recognition and representation, binary structures which stymie the production of new subjectivities. It thus seems anomalous to discover in the Deleuzian canon as well as Deleuze and Guattari's later collaborations a stubborn predilection for opposing history and becoming as mutually incompatible, largely because the former is always identified with a capturing, *ex post facto* 'historicism' while the latter, because of its trans-situational potential, is the very stuff (as indeterminate excess) of philosophy. In *Negotiations*, for example, Deleuze unequivocally states that 'Becoming isn't part of history; history amounts only to the set of preconditions, however recent, that one leaves behind in order to "become", that is, to create something new' (Deleuze 1995: 171). *A Thousand Plateaus* continues the polemic, aligning history with a syntagmatic teleology: 'All history does is to translate a coexistence of becomings into a succession' (Deleuze and Guattari 1987: 430). Even worse, 'History is always written from the sedentary point of view and in the name of the unitary State apparatus, at least a possible one, even when the topic is nomads. What is lacking is a Nomadology, the opposite of a history' (Deleuze and Guattari 1987: 23). Becoming is always viewed as a productive, virtual force for change (*puissance*); while history/historicism is equated with power/control (*pouvoir*): the actual of the State. Deleuze even goes so far as to contrast history unfavourably with geography: 'We think too much in terms of history,

Deleuze Studies 8.4 (2014): 569–578

www.euppublishing.com/dls

whether personal or universal. Becomings belong to geography, they are orientations, directions, entries and exits' (Deleuze and Parnet 1987: 2).

In his provocative new book, Craig Lundy subjects Deleuze and Guattari's uncharacteristic binary tendencies in reducing history to historicism to a form of immanent critique, in effect putting the 'and' back in the equation to create a hybrid, composite form that is neither pure history nor pure becoming, thereby folding the virtual into the actual and vice versa. Thus Lundy attempts to show that historical reality is always more than the actual through its productive, transmuting relationship with the virtual and incorporeal (and by extension the two different forms of Stoic temporality – that of Chronos and of Aion). The result is a history irreducible to both historicism and pure becoming – an 'in-between' composite that Lundy variously calls 'history/becoming' or 'historiophilosophy'. This entails the construction of a model of history that can be explained in five different ways (corresponding to Lundy's five different chapters), namely, the abyss of the intensive-depth (focusing largely on the corporeal intensities of *Difference and Repetition*); the dynamic surface (via the incorporeal event of *The Logic of Sense*); the nomadic of *A Thousand Plateaus*; the universal-contingent; and finally historiophilosophy itself through a detailed look at the use of conceptual personae in Deleuze and Guattari's *What Is Philosophy?*

In the final chapter of *Difference and Repetition*, Deleuze sees creativity as a relation of depth and surface to the movement between them, a trial run perhaps for the subsequent transverse relation of chaoids to chaos in *What Is Philosophy?* Thus, as Lundy, echoing Deleuze's position, argues,

> all extensive reality is the product of an intensive process that comes from the depths and emerges at the surface. While the creative movement from depth to surface is referred to as a 'becoming', 'history' concerns the retrospective identification and representation of this productive process. Or does it? (10)

In attempting to rephrase this question in terms of history-as-becoming, Lundy draws on Deleuze himself, Henri Bergson, Fernand Braudel, Charles Péguy and Nietzsche to posit history as an intensive-depth that, far from being anti-becoming, is actually in productive relation with it, for 'if an intensive force is to move from depth to the surface, then the historical process of production will need to be enlisted, not overcome' (10). Significantly, in *On History* (1980), Braudel saw this as a *historical* process-in-depth, arguing that we can only come to know the life of an event by living with it, not by externally tracking its movement.

In contrast, in *What Is Philosophy?*, Deleuze and Guattari cite Péguy on the same lines but in terms of *philosophy*, not history:

> [T]here are two ways of considering the event. One consists in going over the course of the event, in recording its effectuation in history, its conditioning and deterioration in history. But the other consists in reassembling the event, installing oneself in it as in a becoming, becoming young again and aging in it, both at the same time, going through all its components or singularities. (Deleuze and Guattari 1994: 111)

Lundy convincingly makes the latter process compatible with history by turning to one of Deleuze's chief philosophical forebears, Nietzsche, who was never against history *per se*, only its 'timely' incarnations (the monumental and the antiquarian) as opposed to critical, useful history 'for life'. It is Nietzsche's critical scepticism that questions whether a philosopher could ever have 'ultimate and real' opinions, 'whether behind every one of his caves there is not, must not be, another deeper cave – a more comprehensive, stranger, richer world beyond the surface, an abysmally deep ground behind every ground, under every attempt to furnish "grounds"' (Nietzsche 1996: 229).

Deleuze of course sees these intensities as becomings, while history can only account for an extensive *recording* of intensities. This raises an obvious series of questions: can history be intensive? Is the latter a viable ontology and methodology of history? What would this alternative, creative history bring into being? Following Bergson, the identity of intensity is produced by a constitutive difference. Indeed, Deleuze is not concerned in *Difference and Repetition* with a difference predicated on spatio-temporal divisions such as past/present/future but, following Spinoza, speeds and slownesses, issues of level, temperature, pressure, potential – in short, difference of/as intensity. Far from being cowed, Lundy takes this as a challenge, arguing that history cannot be reducible to time alone but must also include space – that is, nomadology, topology, geophilosophy – which are all based on intensity-as-difference.

This produces an innate *aporia*, for if intensity/difference is to be conditioned and correlated in and through extensivity, it ultimately must put an end to itself: intensity is inherently suicidal. As Deleuze points out,

> Intensity is difference, but this difference tends to deny or to cancel itself out in extensity and underneath quality. It is true that qualities are signs which flash across the interval of a difference. In so doing, however, they measure the time of an equalization – in other words, the time taken by the difference to cancel itself out in the extensity in which it is distributed. (Deleuze 1994: 223)

A way out of this double bind is to show that history is itself constitutive. Taking his lead from far-from-equilibrium thermodynamics – which evades a radical finalism – Lundy attempts to show that intensive productivity can remain open and contingent, producing differentiated histories that can no longer be taken for granted: 'History becomes constitutive at precisely that point where the future becomes open [. . .] Thus to allow for the contingency of the event is to affirm the historical processes of production, not to deny them' (20).

It Is here that Lundy turns to Bergson's heterogeneous multiplicity of duration – an indivisible movement irreducible to a shared homogeneous space (epitomised by the race between Achilles and the tortoise, where each participant is placed on their own indivisible duration, thereby allowing Achilles to ultimately overtake his slower opponent) – in order to make history compatible with depth. Situating ourselves within the intensive depths entails placing ourselves within the past as it moves towards the present in order to make a composite of the two – as duration. Braudel ties this process directly to a history 'for life': 'Just like life itself, history seems to us to be a fleeting spectacle, always in movement, made up of a web of problems meshed inextricably together, and able to assume a hundred different and contradictory aspects in turn' (Braudel 1980: 10). Lundy argues that each form of history needs an appropriate explication of the different durations involved – of men and women, of societies, of worlds. Thus there can be no unilateral history, whether dubbed economic, racial or technological.

However,

> Whereas depth for Bergson, Braudel and Péguy is in many respects an historical depth that is intensively productive in relation to the present and future, for Deleuze depth is a realm of becoming that is in turn *overlaid* by historical extensities. How then are we to explain this discrepancy? (27)

Lundy argues that Deleuze repositions Bergson, Braudel and Péguy *against* history to emphasise the future orientation of his own philosophy-qua-philosophy. Yet the others are also future-oriented – so what is the creative role of history in this relation of depths of past to what is to come? 'My claim is not just that the empirical facts of history have an impact on what comes next', argues Lundy, 'but rather that the intensive features of history are productive of the empirical extensive facts of history (hence two kinds of history)' (29). In short, intensive-depths produce identities through their very difference, what Nietzsche called will to power. It is the affirmation of this becoming – as Being – that Nietzsche called the eternal return, for 'while the will to

power is the play of difference, the eternal return is the being of that difference – it is that which is said of difference' (32). Nietzsche's history is untimely, it acts "'counter to our time [...] for the benefit of a time to come"' (Nietzsche 1983: 60, cited in Lundy 2012: 35). Significantly, when Deleuze quotes this line he omits the first half of the phrase because of his vested interest in pitting the future against the past, contrasting becoming to history. Conversely, Nietzsche stresses the importance of both philology *and* history for life, for becoming is instrumental in creating that very history – it must be *made* experimental as a history for the future. In this regard Nietzsche is perfectly Deleuzian – he also attacks historicism – but *in the name of history*.

Shifting his attention to Deleuze's *The Logic of Sense*, Lundy extends this argument from a focus on the intensive depths to the incorporeal surface in an attempt to make this surface-becoming compatible with nomadology and the different chaoid planes of *What Is Philosophy?* Obviously, surface becoming is different than that of the depths and requires a different model: it is organised like a chessboard with a given plan. It has a logical organisation (the chaoid planes of immanence, organisation and composition) which is given all at once and stretches to infinite limits, in a constant state of renewal. This dynamic process of creation also spills beyond each level of systematicity as the dynamic process works transversally across and between planes and their different levels. As Lundy points out,

> The historical process that Deleuze describes and employs in the latter series of *The Logic of Sense* will thus lie somewhere *between* these two extremes of 'pure' becoming and historicism. It will also lie between the depths of corporeal bodies and the incorporeal surface, insofar as it is what generates the movement from the former to the latter through a process of historical creativity. (40–1)

Developmental becoming and historical progression cannot be reduced to the surface itself as this will negate the innate difference of the steps between and across the planes. This accounts for the key role of the 'between' in Lundy's methodology.

One of the innate shortcomings of the incorporeal surface is that it transforms the dynamic intensities of the corporeal depths into static states of equilibrium as a base for judgement and comparison by the intellect. Surfaces thus create actual things but these 'becomings' are also sterile and fixed: a form of 'static genesis'. The latter proceeds by processes such as prolongation, convergence, envelopment, stabilisation and limitation in much the same way that Bergson's perception-image is

extracted from an aggregate of images or Nietzsche's creation requires a modicum of limitation via forgetting and turning away from the abyss of becoming. In other words, static genesis requires a dynamic genesis to complement it, which for Lundy means that the logic of surfaces requires a *history of surfaces*, in effect a history of developmental becoming. True becoming can only unravel through the continually shifting relation between two different realms: the corporeal/incorporeal; states of affairs/pure events. They remain different despite their transmutations, which allows them to collude in the task of creation. As Lundy argues, 'The significance of developmental becoming thus lies in its unfinished and dynamically progressive nature, as opposed to the already delimited infinitives of various surface becomings' (48). Developmental becoming must not be equalised; it must be 'far-from-equilibrium' – a history open to the future.

Lundy's main metaphor here is the Herculean form, the mythic figure who moves effortlessly between the surface and the depths, as well as to the heights of the heavens: 'It is no longer a question of Dionysus down below, or of Apollo up above', notes Deleuze, 'but of Hercules of the surface, in his dual battle against both depth and height: reorientation of the entire thought and a new geography' (Deleuze 1990: 131–2). With Hercules, it is more a question of his return to the surface *from elsewhere* with his plunder – so that the surface is capable of refashioning height and depth into an immanent monism or productive composite. In other words, the surface is no longer just an enveloper, but it also moves in a dynamic way between dualisms – deep bodies and lofty ideals. This allows Lundy to overcome the opposition between history and becoming whereby the *between* is able to bring them together through an ontology of historical creativity. This move also takes Lundy to a new threshold and a harnessing of history to a new form of geography – nomadology – and the key equation of multiplicity. To avoid regression into an initial capturing dualism, we need to progress to a nomadic history whereby PLURALISM = MONISM.

As we noted above, the 'Treatise on Nomadology – The War Machine' in *A Thousand Plateaus* completely dismisses history as counter to nomadology. Indeed, if nomadology opposes history, it is due to its concern with space – territory, topology – rather than time. It is geographical, aligned with becoming. The question for Lundy then becomes: how can we excavate a Deleuzian philosophy of history from within nomadology, the very thing that seems to most malign it? The answer partially lies in nomadology's tendency towards metamorphosis and deterritorialisation rather than confining itself to

strict binary oppositions. Thus the apparent distinctions between the smooth and the striated, the war machine and State machine (and, by extension, pure becoming and pure history) are always mutually implicated, often by a mediating third term that breaks the dialectic. For example, the nomad/State dualism is split by a third element: the machinic phylum – the subterranean flow of pure becoming (Nietzsche) or universal aggregate of action/reaction (Bergson) that flows between them and on which they depend. As Deleuze and Guattari point out, the great phylum is what selects 'through the intermediary of assemblages' (Deleuze and Guattari 1987: 398).

The same is true for the smooth and the striated, for their key mechanism is the transmutation of form and how one part of the dualism migrates to the other – not just how transmutations occur between fixed entities of smooth and striated, but how they themselves metamorphose (that is, how the relation can differ from itself). Thus the nuclear submarine does not convert the smooth space of the ocean into a striated space but harnesses it for State control:

> the smooth is employed by the State *as smooth* for the purposes of striation. The smooth characteristics of the sea are thus maintained, but they are redirected by State powers to achieve a level of control that the State on its own would be incapable of. (79)

One thus can become the other while also remaining the same. 'Never believe that a smooth space will suffice to save us', warn Deleuze and Guattari in *A Thousand Plateaus* (Deleuze and Guattari 1987: 500). While revolutionary becomings can spawn micro-fascisms, conversely histories can be intensified as *history* for smoothing processes: the nomad and the State can be brought back together through a shared immanence: 'The smooth and the striated, in other words, are expressions of a machinic phylum that gives itself to both' (416).

While this might sound at first like a pragmatic compromise, one should note that it is not uncharacteristic, for Deleuze and Guattari invariably move towards a middle ethic of the 'between', for this is where everything happens – between pure being and pure becoming – tempered by prudence and caution.

> This is how it should be done: Lodge yourself on a stratum, experiment with the opportunities it offers, find an advantageous place on it, find potential movements of deterritorialization, possible lines of flight, experience them, produce flow conjunctions here and there, try out continuums of intensities segment by segment, have a small plot of new land at all times. It is through a meticulous relation with the strata that one succeeds in freeing lines of flight,

> causing conjugated flows to pass and escape and bringing forth continuous intensities for a BwO. Connect, conjugate, continue . . . (Deleuze and Guattari 1987: 161)

For Lundy, this shows the immense importance of historical processes and relational mechanisms that link strata with lines of flight in order to produce that 'small plot of new land' (141).

Lundy then turns his attention to the problem of how history begins. For example, the question of when the State apparatus emerges cannot be found *in* history for it pre-exists and outlasts history – it is *suprahistorical*. Instead, Lundy calls for a contingent model of simultaneity and non-linearity where the virtual (pre-history) and the actual (history) co-exist: in short, universal history. This contingency has three lines of creativity: (1) it remains open to the future and change; (2) it is created by a presently existing power; and (3) it is approached non-linearly so that it can have an influence on what it becomes. In this sense, the traditional Marxist chronological development of State forms – for example, in the Asiatic formation the emperor-despot is always prior to private property; agriculture gives rise to State stock – is replaced by a non-linear simultaneity. Thus 'the archaic State did not come "before" the primitive development of a potential surplus, nor the opposite, for they both *coexist*' (108). Or, to put it in Deleuze and Guattari's language, social formations are defined not by modes of production but by the different social machines that produce those modes.

More importantly, these modes are as much virtual as actual, and indeed this virtuality has a concrete history: 'Universal history makes a composite out of succession and simultaneity from its ability to array an entire successive progression simultaneously' (116). Capitalism is the classic condition of this simultaneity as it determines the conditions and possibility of its own universal history via its twin functions: its superior power of decoding and deterritorialisation through exchange and the endless flow of capital; and its flexible axiomatic structure which allows it to set and then repel its own limits as well as account for all previous (and future) societies. It universalises because of its relativity (in contrast to the absolutism of schizophrenia which is an attempt to liberate the world from these axiomatics). As Lundy argues,

> Capitalism is able to occupy every point in history, for it has no point of its own; it is able to interpret every coding and overcoding throughout history, for it has no essential code or sign of its own. Like a spectre or faceless ghost,

> capitalism haunts all previous forms of society 'as their terrifying nightmare, [. . .] the dread they feel of a flow that would elude their codes'. (122)

Lundy concludes with a look at the role of history and becoming in Deleuze and Guattari's definition of philosophy, which leads him to historiophilosophy as a call for a 'minor' history. Deleuze and Guattari define philosophy as the art of forming, inventing and fabricating concepts which link together on the plane of immanence via their common consistency. At the same time, 'every concept always has a *history*, even though this history zigzags, though it passes, if need be, through other problems or onto different planes' (Deleuze and Guattari 1994: 18). These concepts are not represented by flesh-and-blood philosophers themselves – Plato, Descartes, Nietzsche – but rather their conceptual personae who fabulate on their behalf – Socrates, Descartes' idiot, Zarathustra, Dionysus. The latter encompass a certain geographical uniqueness – philosophy could only have come into being given the specific conditions of ancient Greece at that time – but also historically according to the concerns of different eras. Thus Plato's concepts of One, Being and non-Being, and the Idea (predicated on time as anterior) undergo a creative 'movement' via Descartes' 'cogito' (which expels time as anteriority in order to make it a simple mode of succession referring to continuous creation). 'Put simply, the novelty that is engendered by Descartes – his creative act – specifically occurs *with respect to* Plato's creation' (149), whereby the cogito is 'prepared' by the Greek plane that precedes it (even if it is not fully accomplished). This is surely a case of historical *puissance* rather than *pouvoir*.

Creative becoming is further exacerbated by the zigzag transverse movement that occurs between planes of consistency which is an inherently dynamic and nomadic movement combining intensive and extensive forces in each measure. For Lundy, it is clear that all these levels are directly susceptible to time (that is, it is a model of duration), 'But', note Deleuze and Guattari,

> if it is true that the plane of immanence is always single, being itself pure variation, then it is all the more necessary to explain why there are varied and distinct planes of immanence that, depending upon which infinite movements are retained and selected, succeed and contest each other in history. The plane is certainly not the same in the time of the Greeks, in the seventeenth century, and today . . . (Deleuze and Guattari 1994: 39)

Thus planes pass into and out of existence in time, so that the logic of planes needs a history of planes. This does not necessarily have to be linear, for 'every plane is not only interleaved but holed, letting

through the fogs that surround it' (Deleuze and Guattari 1994: 51). Consequently, a singular feature cannot be isolated from the plane that gives it voice – the breath that suffuses the different/separate parts. Lundy concludes by calling for a historical version of what Deleuze and Guattari call 'stratigraphic time', 'where "before" and "after" indicate only an order of superimpositions' (Deleuze and Guattari 1994: 58). In this respect, far from being an apparatus of capture in opposition to becoming, '*philosophy necessarily becomes indistinguishable from its own history*' (Deleuze and Guattari 1994: 95; original emphasis), albeit holey rather than linear.
